AALOU, Akim Said* (Vrije Universiteit Brussel (VUB), Belgium)

Rethinking Homophily and Its Limits to Reconsider the Possibilities of Heterophily

In response to the ever-diversifying social landscape and the pursuit of equality and conviviality, the social sciences—particularly social psychology—have made intergroup relations a prominent field of study. This research consistently demonstrates that individuals tend to form friendships with those similar to themselves—a phenomenon known as friendship homophily—across major social divisions (e.g., gender) and behavioral characteristics (e.g., academic dispositions). A critical review of ethno-racial homophily, however, reveals that despite the tendency to befriend individuals of the same ethno-racial group, ethnicity and race may not be as determinative as commonly assumed. Expanding on this critique, our understanding of intergroup relations could—and perhaps must—be radically revised. Homophily may be a more powerful relational principle than current findings suggest, due to a bias introduced by the uncritical reliance on categorical or “objective” identities rather than processes of socialization and identification. This reliance distorts our understanding of homophily. Instead, I propose a cultural sociology of homophily, which views it as structured by both objective relations in social space and by boundary work enacted through empirical relations. A post-Bourdieuian framework further highlights the central role of context in shaping which similarities become relevant in situated relations and which do not. By reframing homophily, we can better grasp both its power and its limits. Concurrently, the study of heterophilous relations remains a glaring gap in the literature. Some heterophilous relations may in fact be “false positives,” misclassified due to overlooked similarities. Others, to the contrary, may offer insights into the conditions under and the ways through which heterophily can prosper. Hence, I conclude the critique on homophily by briefly introducing concepts such as outgroup orientation, convivial disposition, and familiarity (extending the notion of similarity) as processes that make difference attractive, allowing us to imagine the long-neglected possibilities of heterophily.

Navigating Precarity: Indian Migrant Workers in the Gulf Labour Markets

This study delves into the precarious experiences of Indian migrant workers in the Gulf labour markets, focusing on emerging trends from North and East India. It explores how recruitment intermediaries—ranging from formal agencies to informal brokers—shape, mediate, and commodify cross-border labour migration. Drawing on detailed interviews with low-wage migrants (n=10), the study underscores that the migration process is not merely a linear trajectory between two points but a multifaceted space of mediation (Xiang & Lindquist, 2014), where actors such as recruitment agencies, brokers and migrants themselves interact within increasingly decentralised labour markets (Lindquist et al., 2012).

Central to the analysis is the concept of “infrastructure from below,” which refers to the informal networks, temporary space, and platforms that Gulf migrants actively cultivate during their migration process and use to navigate the labour markets. Gulf labour migrants, mediated by brokers and state-outsourced migration governance, are frequently trapped in cycles of debt and dependency (Babar & Gardner, 2016; Valenta, 2020) reflecting power imbalances between sending and receiving countries.

The Emigration Act of 1983 and subsequent regulations aimed to protect migrants inadequately address precarious recruitment practices and labour conditions in destination countries. This study highlights how these structural weaknesses perpetuate vulnerability, with migrants subject to inconsistent medical testing, visa irregularities, skill mismatches, and limited legal protections.

Despite these challenges, low-wage Indian migrants exhibit resilience through their use of informal infrastructures to resist marginalisation and commodification. This aligns with the growing discourse around the “infrastructuring process” (Khan, 2019; Lin et al., 2017), where migrants actively shape their own mobility within complex operational systems. The study calls for a nuanced understanding of migration infrastructure that considers not only the regulatory and commercial dimensions but also the agency of migrants as they co-create infrastructures that support their survival in precarious environments.

AAZIZ, AMAL* (University of Paris Nanterre, France)

L'expertise Au Sein D'une Diplomatie Multilatérale - Expertise in the Multilateral Diplomacy

In an increasingly interconnected global context, multilateral negotiations have become more complex, requiring specialized expertise to enhance international discussions and global decision-making in the face of common challenges. However, the need for expertise continues to increase.

The paper focuses on understanding social relations and the various forms of expertise that emerge, establish themselves, and gain legitimacy within the arenas of multilateral diplomacy, such as United Nations agencies. In other words, how do expertise interact in this environment, and how are these skills convened, legitimized, or contested during decision-making processes?

To address these questions, we will discuss several authors' studies, particularly focusing on Francis Chateauraynaud whose work examines pragmatic transformation illustrated by six social logics: the dominant discourse, the dominant device, the milieu, controlled by a hegemonic entity, the heterogeneous interacting milieux, the alternative device (emerging risks and protests), and counter-discourse. The interaction of these elements signifies transformations. The first occurs through the encounter between the dominant discourse and the counter-discourse, the device and alternative device, and the controlled and heterogeneous environments.

Studying these transformations enables us to understand how expertise is formed, circulated, and realized, whether claimed or not. The paper highlights the process of socializing diplomatic and technical expertise within these complex and dynamic arenas, where alliances are easily forged and dissolved according to specific compromises and diplomatic protocols. Consequently, various forms of hybridization of expertise deserve to be examined further.

To this end, empirical research will gather participatory observations, interviews, and documentary investigations.

ABBASI, PARVEZ AHMAD* (VNSG University Surat, India)

Globalization and Empowerment of the Muslim Women in India

Originally, Islam developed in nomadic socio-cultural milieu and its social structure had egalitarian character. With expansion, the nomadic economic base of Islam was exposed to a mercantile and agrarian economy. which had brought structural changes, particularly in the politico-economic nature of Islam and its egalitarian and democratic structure of power was transformed into a feudal-authoritarian pattern. The former unity between political and religious leadership was weakened. The contradiction between political elite and religious elite became more sharpen as time passed. It still continues as an important factor in the process of modernization of Islamic society of India. The *Ulema* as representative of Islamic Great tradition tend to be conservative and reject innovations which they think are not within the framework of Islamic tradition. This basic contradiction still persists in different societies where ruling elites attempted to adopt modern way of life. The expansion of Islam in India faced typical confrontation with local stratification system based on castes which still exists in various forms. The status of Muslim women in Indian society changed after their conversion of Islamic faith and they were prescribed Islamic values and beliefs which resulted into a conservative way of life. The modernization process, which began during the British rule, however, opened some opportunities to the higher-class Muslim women to get western secular education. Although, the number such women were very limited but they provided apposite reference group to the mass of Muslim women. This process enhanced in post-independent period with an increase in enrolment of Muslim girls in government, missionary and public schools very significantly. As a result, they joined modern occupations, though initially in a limited number but during the globalization phase, their media exposure in different walks of life not only increased but they are struggling to get their legal rights as well.

WG01-886.1

ABBASI, PARVEZ AHMAD* (VNSG University Surat, India)

Rural-Urban Relations and Modernization of a Pastoral Caste in North Indian Regional Setting

Meerut region is situated between the two rivers of north India- the *Ganga* and the *Yamuna*. The region has well-developed agriculture as the markets of the national capital Delhi and the regional town, Meerut provide incentives for agriculture. The region has a rich history and mythological connections which goes back to the *Mahabharata* and the *Ramayana* period. The *Gaddi* is traditionally a pastoral caste among the Muslims of the Meerut region who are said to have been converted from *Ahirs* during the Mughal rule. They still practice their traditional occupation of cattle rearing and milk supply in the towns which is also one of the reasons that their settlements are either on the outskirts of the town or in nearby areas. They are found in cities, small towns as well as in villages and are engaged in similar kinds of occupational activities of cattle rearing and selling of milk and milk products like *Khoya* (concentrated milk cake). They were also supplying milk in Meerut Cantonment Military Supply Depot. Some of the *Gaddis* of *Hazipur* village were having partnerships in the Zamindari of that area granted by the Britishers to a wealthy merchant of Meerut city. During the post-independence period, they owned vast land in rural areas being used by them for agricultural purposes. They adopted modern agricultural technology and started growing and supplying potato and other vegetables to local markets which brought prosperity among them in the rural as well as in urban settings. Consequently, their lifestyle and consumption patterns improved a lot as they have all modern gadgets in their household. They have acquired modern education and have limited mobility in modern professions, business, and politics. The paper aims to understand the modernization process of the *Gaddi* of Meerut region in both the rural and urban settings.

ABDALLAH, EL MEZIANE* (FSLH UH2C, Morocco)

Women with Disabilities and Accessibility Issues in the City: Between Spatial Equity and Social Exclusion.

In the world, as in Morocco, people with disabilities (PDH) are among the most marginalized people. People with disabilities are subject to multiple forms of social disqualification throughout their lives due to significant and multiple obstacles. The application of laws regarding disability is still incomplete. Disability constitutes an additional burden on households and families of people with disabilities who do not have sufficient resources and means to meet their health and educational needs (Khalil, J. (Ed); (2018). In public spaces, people with disabilities will not be able to access them or carry out any action due to the lack of accessibility and tools adapted to their situation. The objective of this work is to raise awareness of the conditions of accessibility and mobility of women with disabilities in the city and examine the impact of these conditions on their daily lives. This is a socio-anthropological and qualitative study. This study is still ongoing. The work is particularly interested in the complex effects on individuals of the conditions of accessibility and mobility in the city according to the following three axes linked to three major issues: dependence on means of transport, metropolitan mobility and the built environment and accessibility. The preliminary results of interviews with women with disabilities about mobility in the city and urban lifestyle report that physical exclusion constitutes a first aspect in public transport. Women also report double discrimination. The daily work mobility of women in the suburbs of Casablanca combines physical accessibility and specificities linked to the status of women in our society. The length, cost and inconvenience of travel contribute to making the lives of women seeking a minimum of financial independence very difficult, to the point of dissuading a significant number of them from entering the labor market on a long-term basis. .

ABDALLAH, OUNOUR* (University of Urbino Carlo Bo – Italy & University of Bayreuth – Germany)

"The Camera Is on! Exploring Migration in a Digital Community of Practice"

Migration has long been an integral part of Sudanese society, with movement from Sudan historically tied to broader patterns of migration across the Sahel and North Africa. Today, digital technology plays a vital role in facilitating migration, enabling migrants to access real-time information and advice during their journeys. This technological shift has sparked both interest and concern, particularly regarding the use of apps to support irregular migration and help migrants avoid exploitation by smugglers and human traffickers. At the same time, migrants have also used technology to aid in their integration into host countries while maintaining connections with their families and communities back home (IOM 2022).

This paper explores how the Sudanese migrant community leverages Facebook groups and other social media platforms to acquire knowledge and navigate migration processes. The research is framed within the concept of "communities of practice," as proposed by Wenger (1986), which refers to people engaging in collective learning within a specific domain.

The study employs qualitative research methods, including online ethnography and contextual analysis, to examine posts from 12 Facebook groups and the content of a YouTube channel. These sources offer valuable insights into how migrants share information about migration routes, costs, smugglers, and challenges they may encounter, particularly in transit countries such as Libya, Tunisia, Niger, Algeria, Morocco, Turkey, and along the Balkan route.

Initial findings reveal that Facebook groups have become a critical source of information for prospective migrants. They also serve as a platform where migrants form a shared identity, using specialized terminology related to migration. As Facebook began to restrict content, migrants adapted by using local languages and coded terms to bypass detection algorithms.

Identity Tethers: How the Secular Stay Muslim

What sustains affiliation as religiosity wanes? In American religion, increasing disaffiliation and liminality and decreasing religiosity tell a story of general religious decline. Yet despite decreasing levels of belief and ties to religious institutions, the overwhelming majority of Americans maintain a religious affiliation in some form, and identities based in religion continue to play an important role in American society and politics. We take the case of Muslim Americans and ask what sustains their ties to Muslim identity when religiosity and community ties falter. Using life history interviews with a uniquely varied sample of Muslims in the US, we find that Muslims can assert "political" or "cultural" Muslim identities that offer alternative ways of being Muslim: ones that allow respondents to simultaneously claim Islam while distancing themselves from some aspects of it. We argue that being "politically" or "culturally" Muslim functions as an *identity tether* for secular individuals. The paper places this phenomenon in conversation with growing literature on non-religion.

The Racialization of Syrian Refugees in Jordanian and Turkish Media

This paper examines media narratives surrounding Syrian refugees in Jordan and Turkey, exploring how othering occurs in news discourse despite shared religious and cultural backgrounds between refugees and host populations. The analysis focuses on how mainstream newspapers in both countries construct and reinforce differences, even when refugees share significant traits with locals.

Through discourse analysis of newspaper content, the study reveals that uncertainty and contradiction are common features in media representations of Syrian refugees. These contradictory portrayals, however, do not preclude the othering of refugees. The research introduces the concept of "inclusive othering," where media narratives simultaneously depict Syrians as brothers and sisters with shared Arab or Muslim identities, while also portraying them as a threatening mass whose displacement implies moral inferiority compared to their hosts.

This complex representation challenges simplistic assumptions about shared cultural traits facilitating integration. The study finds that media discourse can intensify efforts to construct difference, even in contexts of cultural proximity. Newspapers often seek alternative ways to distinguish refugees from host populations, resulting in exacerbated group boundaries.

The paper highlights the nuanced dynamics of media representation, particularly in contexts where traditional markers of difference may not be immediately apparent. By examining these media narratives, the research contributes to a broader understanding of how racial, ethnic, and cultural differences are produced and maintained in public discourse, even in seemingly homogeneous cultural contexts. This analysis sheds light on the power of media in shaping public perceptions of refugees and influencing the process of othering in host societies.

L'Impact De L'Usage Des Plateformes Numériques Dans La Promotion De L'auto-Emploi Chez Les Jeunes Entrepreneurs De La Ville De Fès

Cette étude vise à analyser le rôle des technologies numériques dans l'auto-emploi et le développement entrepreneurial. Pour aborder cette problématique, je m'appuie sur la théorie des réseaux sociaux développée par Pierre Mercklé (2016), qui permet de comprendre comment les jeunes entrepreneurs utilisent les plateformes numériques pour entretenir des réseaux de contacts essentiels à l'accès aux ressources et aux opportunités professionnelles. Ce processus favorise la création de nouvelles formes de travail autonome ainsi que l'essor des initiatives entrepreneuriales locales. La réflexion s'appuie également sur la théorie de l'entrepreneuriat, telle que développée par Joseph Schumpeter (1983), Renaud Saint-Saulieu (1995), Michel Crozier (1977) et Philippe Bernoux (1999).

L'étude s'est focalisée sur un focus group avec 10 jeunes entrepreneurs à la ville de Fès. Ils ont été sélectionnés par la méthode de boule de neige. Cela nous a permis de révéler des relations et des tendances importantes qui contribuent à la compréhension des dynamiques sociales de l'impact des technologies numériques sur l'entrepreneuriat. Cet outil fournit également des informations stratégiques pour mieux comprendre l'environnement entrepreneurial dans le monde virtuel.

Les résultats montrent que les technologies numériques ont profondément transformé l'écosystème entrepreneurial et l'auto-emploi. Le numérique offre aux jeunes un accès facile à des formations à moindre coût via des cours en ligne, des webinaires et des tutoriels sur des sites comme Coursera ou YouTube, facilitant l'acquisition de compétences entrepreneuriales. Cet accès réduit les barrières à l'entrée et encourage l'auto-emploi.

Les jeunes peuvent ainsi lancer des start-ups avec des ressources éducatives gratuites et un investissement initial modeste. Les réseaux sociaux et les plateformes d'e-commerce créent de nouvelles opportunités pour toucher des clients et interagir avec eux, tout en renforçant leur présence en ligne. De plus, le télétravail et l'externalisation permettent d'embaucher des talents à l'échelle mondiale, réduisant les coûts et élargissant les compétences.

FALLONE, ANDREW (University of Cambridge, United Kingdom)

Crossing the Border on TikTok: Documenting Irregular Journeys through Novel Social Media Platforms

The rising popularity of the new social media app TikTok coincides with the appearance of new accounts that both document irregular journeys and advertise smuggling services. In the absence of sufficient regular migration pathways into Europe, information on social media regarding irregular journeys can provide individuals with concrete and immediate next steps. With the existence of evidence that migrants implicitly distrust smuggling services providers, migrants seek trustworthy sources. The usage of digital media platforms in spreading information on migratory projects, or even connecting transnational families is not a new phenomenon. However, the usage of TikTok, a video-based platform, presents a new opportunity to migrants as it adds a visual element to their information dissemination tactics, making it more accessible, and providing visual evidence to their audience beyond closed circles of other digital media platforms. TikTok is a catalyst in diminishing the information asymmetry experienced by people on the move by enhancing transparency in documenting individual journeys and disseminating information. Native dialectics are used in these TikTok videos, which eases the communication, and TikTok's For You page and hashtags features provide easy access to this mode of social capital. Discourse analysis was used to understand the divergent narratives of both individuals documenting their own irregular journeys without the assistance of smuggling services, and the advertisers of smuggling services on TikTok. The engagement of the audience with such videos is compared to explore the resonance of different content with its audience. The findings of our analysis reveal that content from migrants traveling independently receives greater attention and engagement than that of individuals advertising their services, indicating the higher level of trust that a lack of profit-motive can confer.

The Use of Psychiatric Drugs in Morocco: Between Family Experience and Medical Dialogue

This paper tends to compare the caregivers views on psychotropic drugs to those of patient's families with mental illness. The results indicate that despite some resemblance, the families representations concerning psychotropic drugs differ from those of the mental health professionals. The latter consider drugs as a quick remedy whose prescription is justified by their effectiveness on the daily symptoms subjectively experienced as painful or disabling for both family and patient. Families, in turn, express mixed even paradoxical attitudes. Psychotropic drugs are sometimes perceived as a solution that alleviates and legitimizes deviant behavior, that are sometimes seen as a stigmatizing element. Families also complain about the high cost of psychotropic drugs and their many side-effects, which condemn the patient to a bodiless death, a social death. However, families and caregivers agree that psychotropic drugs remain essential at times of crisis.

ABDI, CAWO* (University of Minnesota, USA)

Refugee Public Education and Transnational Families

This paper shares preliminary findings from my book project *Public Education Inequities and The School Choice Debate: Somali Students in Minnesota*. The project investigates how recent refugee communities such as Somalis partake in the educational choice debate in Minnesota and how these students and their parents navigate the rhetoric of Americanization and integration considering the structural conditions and axis of inequality that persist in the United States. I argue that refugee children's education can only be understood with the dual lenses of what it means to be a refugee from a country where access to education was limited, and of how children with transnational families get situated in racialized struggling urban schools. Research on refugee families' cultural, racial, religious, and socioeconomic status and its impact on their educational experiences can help inform educators, researchers and policymakers. This work also speaks to the theoretical dilemmas around school choice and whether this opens new democratic spaces or simply more segregated ones.

ABDILLAH, IDIL* (Toronto Metropolitan University, Canada)

LEFRANCOIS, BRENDA* (Memorial University, Newfoundland, Canada)

An Ethics of Care As Anti-Sanist and Anti-Racist Research Practice

With mad theory as methodology, there has been a plethora of research innovations that counter dominant biomedical narratives of disease, deviance and disturbance. The foregrounding of anti-racist and anti-sanist praxis within mad studies research has been key for many researchers but has been less well-attended to by others. This has led to wider questions around the origins of mad studies within social movements and the implications of these origins for the rise in community-based research practices. Arguably, an ethics of care emanating from mad communities and other social movements must better inform the epistemological, methodological and ethical approaches within community-based mad studies research. In particular, the ways in which queer of colour and mad community practice may be instructive to modes of research production within an academia that is at odds with mad and disability justice values will be discussed and underscored. Dr. Idil Abdillahi and Dr. Bren LeFrançois are two editors of the second edition of *Mad Matters* (along with Geoffrey Reaume), the seminal text in mad studies. In this presentation, they will provide an assessment of the evolution of mad studies as a field over the past 10 years, with special attention to research practices that centre mad people, mad knowledge and mad communities. In addition to critiques of expert-driven quantitative research practices that are inherently sanist and racist, mad studies foregrounds the importance of mad people as knowledge holders. Here, experiential knowledge is not seen as an add-on but instead as of central importance to knowledge production about madness, mad cultural production, mad interventions and the institutional failings of mad people.

ABDUL BAKI, NOUR* (Erasmus University Rotterdam , Lebanon)

Warfare in Welfare: Faith-Based Housing in Lebanon and the Politics of Division

This study examines the relationship between (in)adequate housing provision by faith-based organizations and socio-spatial segregation as perceived by residents in the sectarian-divided context of Lebanon. Through a case study of Project 896, a Druze-exclusive faith-based housing project in Choueifat, the research aims to understand how (in)adequate housing provision shapes residents' perceptions of segregation in a contested urban landscape. The study engages with broader literature on faith-based housing and welfare systems in the West and the Middle East, by drawing similarities in housing provision modes. The research tackles three key objectives: analyzing the housing provision mode of the faith-based organization and linking it to broader models of housing provision; assessing the adequacy of the housing project in terms of adequacy principles; and exploring how residents experience and perceive socio-spatial segregation in a divided urban context. Findings suggest the housing provision of this FBO is similar to other local and global examples, however, doesn't qualify as a social housing model. Moreover, while the housing project successfully met basic needs in adequate housing, such as affordability and design quality, it also maintained socio-spatial segregation through selective accessibility and infrastructural and land contestations. Furthermore, results showed that the faith-based housing project didn't reproduce a strong place identity, albeit strengthened territorial boundaries. The study concludes that in a context of weak state governance, faith-based organizations play a crucial role in housing provision, yet their projects can inadvertently further weaken the state giving power to alternative authorities, thus maintaining socio-spatial segregation.

ABDULLAH, NOORMAN* (National University of Singapore, Singapore)

Teaching about the City through the Sensory: Pedagogical Interventions in Equality, Diversity and Inclusion (EDI)

This paper explores the pedagogical approaches of teaching sociological and anthropological concepts through sensory experiences in urban spaces, emphasizing key principles of equality, diversity, and inclusion (EDI). Traditional pedagogy often relies heavily on textual analysis and theoretical discourse, which may inadvertently marginalize diverse perspectives and learning styles. By deploying sensory pedagogical methods that include visual arts, soundscapes, and tactile experiences, educators can harness a more inclusive environment that resonates with a wider range of students. Employing the sensory as pedagogical tools not only enriches the learning experience but also highlights the varied social realities shaped by culture, identity, and environment in cities. These interventions thereby allow students to engage with sociological concepts on a personal level, bridging theoretical knowledge with lived experiences. At the same time, this method strives to advance forward equity by recognizing and valuing the diverse backgrounds of students, encouraging participation from those who may feel marginalized in traditional discourse. By facilitating discussions around sensory experiences, educators can create a safe space for dialogue, where all voices are acknowledged and valued. This not only enhances critical thinking but also empowers students to explore their identities and the sociocultural factors that shape them. Ultimately, incorporating EDI principles into sensory-based teaching fosters a holistic learning milieu that respects and celebrates diversity that not only deepens students' understanding of sociological and anthropological concepts but also prepares them to engage thoughtfully, critically and empathetically with and in a complex world.

RC15-235.4

ABESAMIS, LUIS EMMANUEL* (University of the Philippines, Philippines)

Transgender Health Dilemmas: An Intersectional Analysis of the Therapeutic Itineraries of Transgender Communities in the Philippines

This study leverages an intersectional lens to characterize the therapeutic itineraries of local transgender (trans) communities vis-à-vis salient cisnormative and capitalist structures in Philippine society that produce trans health inequities. Interpretative phenomenological analysis of online interviews with thirteen (13) self-identified trans Filipinos reveals how the inaccessibility of trans-responsive care in the Philippines fosters trans health dilemmas, or the dilemmatic decision-making circumstances and processes

that force trans Filipinos to choose between their trans-specific health needs and other needs. Such dilemmas valorize the deprioritization of trans health, disengagement with the health system, and the pursuit of alternative pathways to care oftentimes at the expense of their overall well-being. Addressing these dilemmas entails research, policy, and advocacy work that contend with the implicated structures of domination through systemic interventions initiated in partnership with local trans communities.

Uncertainty and the 'Halal' Status of Vaccines in Indonesia

This paper examines the socio-political construction of risk and uncertainty by policy and practice actors in relation to the halal status of vaccines in Indonesia. Religious values play an important role in the public health presentation and uptake of vaccines in Indonesia. The COVID-19 pandemic highlights these, where the halal ('lawful') status of vaccines was an important concern. For example, the AstraZeneca vaccine was initially considered haram ('unlawful') by the Indonesian Ulema Council (MUI) due to the use of trypsin derived from pigs in the production process (Fatwa No. 14/2021). Later, an emergency legal standing was provided by the MUI to declare the use of the AstraZeneca vaccine halal; under Islamic law, emergency public health needs allowed for the use of products that might be considered haram under other circumstances. However, some communities contested these declarations, resulting in distrust and non-compliance with vaccination strategies. This effect is also seen in relation to endemic, emerging and re-emerging infectious disease (Alsuwaidi, 2023). Although Indonesia is uniquely positioned in relation to local capacity for vaccine development, there are challenges in developing vaccines that carry halal status. This includes the perception among industry actors that there is inconsistency around the process and criteria for establishing a halal designation. Vaccine manufacturers report inconsistencies surrounding the forms of evidence required to obtain halal status, and conversely, members of the Halal Product Fatwa Committee often lack expertise or insight into the manufacturing process. This paper analyses the contrasting narratives of the stakeholder groups engaged with the determination of halal vaccine status in Indonesia, highlighting the construction of uncertainties surrounding this process. Through semi-structured interviews with policy actors, NGO representatives, and religious leaders, we articulate the complex socio-political framing of halal vaccines and how this has contributed to contestations of halal vaccine status.

ABI CHEDID, CAMALE* (Université la Sagesse, Lebanon)

The Gendered Dimensions of Digital Labor: A Qualitative Study of Lebanese Women Entrepreneurs in E-Commerce

The rapid expansion of digital labor has transformed traditional work structures, offering new opportunities while amplifying the precariousness of employment, particularly for women entrepreneurs. This study examines the gendered dimensions of digital labor, focusing on how Lebanese women entrepreneurs in e-commerce navigate the challenges of work-life balance, job insecurity, and the demands of "always-on" digital work cultures.

Using qualitative research methods, including semi-structured interviews and thematic analysis, the study explores the lived experiences of 25 Lebanese women running e-commerce businesses on platforms such as social media and online marketplaces.

The study aims to reveal key tensions between perceived entrepreneurial freedom and the hidden pressures of maintaining digital business operations while balancing unpaid domestic responsibilities. These dynamics are shown to significantly affect women's mental health, family relationships, and long-term career prospects.

ABID, MUJIB* (University of Melbourne, Australia)
 MILETIC, TANIA* (University of Melbourne, Initiative for
 Peacebuilding, Australia)

*Sustaining Peace Studies: A Sociological Inquiry into the Future
 of Peace Studies in Australia*

Australian peace studies is currently facing significant challenges, including diminishing funding, reduced institutional recognition, and pressures to compromise progressive political commitments. Over the past two decades, numerous peace research and peacebuilding centres in Australia have been closed due to neoliberal restructuring, shifts in cultural attitudes, and changing government funding priorities. Despite these challenges, the discipline's core objectives — understanding approaches to conflict prevention and peacebuilding, promoting positive peace, principled and strategic nonviolence, and social justice — remain vital for theorising and facilitating global conflict transformation. In this context, the University of Melbourne's Initiative for Peacebuilding (IfPB) has emerged as a multidisciplinary research group dedicated to advancing peace research, education, and practice. While the Initiative has achieved some progress in the past three years, it remains acutely aware of the precarious status of programs within the Australian academic landscape. This paper reflects on the state of peace studies in Australia and employs a sociological lens to explore the future of peace research initiatives like IfPB. We prioritize sociological frameworks, particularly conflict theory—which examines social structures—and symbolic interactionism, which focuses on discursive formations. Drawing on our experiences in supporting, designing, implementing, and evaluating IfPB's efforts, we argue that social structures and symbolic capital are critical determinants in the sustainability of such initiatives. We propose that understanding the interplay between these factors, rather than treating them in isolation, can illuminate the emergence and ongoing viability of the IfPB. Furthermore, we contend that integrating sociological perspectives enhances our epistemic toolkit, as peace researchers and peacebuilders, enabling more robust engagement with knowledge production and critical inquiry into everyday peacebuilding, positive peace, and pressing issues related to violence and conflict transformation.

 Universidade de Lisboa, Portugal)

*Rethinking Modernity through Empire: Coloniality, Borders and
 the Politics of Power*

This paper challenges the concept of modernity as a construct that overlooks the impact of power and imperialism on the global order. While modernity has been idealised as a path to progress, rationality and development, this vision obscures its entanglement with, and often facilitation by, imperialism, especially colonialism. The global expansion of modernity was a violent process that created the material and ideological conditions for the global flourishing of modernity. This paper has two central tasks. First, it revisits the phases of modernity, arguing imperial projects, colonialism and imperialism, allowed modernity to spread and take root, giving rise to old-fashioned and colonial theories of modernisation. Inspired by Michael Hardt and Antonio Negri's *Empire* (2000), the paper argues that modernity can be understood through imperialism – a system that exported Western norms and institutions globally through economic exploitation, cultural domination and the militarised control of colonised territories. Second, these lenses allow us to rethink the coloniality of modernity, while keeping in sight how colonialism and imperialism remain relevant to the contemporary global order. If there is a strengthening of the nation-state at the same time as transnational capitalism increases the mobility of finance and labour across the globe, we need to rethink our conceptual tools.

Empirical examples support our argument. By examining migration routes and border tensions – particularly between Africa and Europe – the paper illustrates how borders are sites where imperial/colonial power dynamics continue to manifest themselves. By framing modernity itself as permeated by imperialism, the paper argues that empire – whether colonial, postcolonial or neo-colonial – provides a more fertile ground for understanding ongoing global power struggles. It becomes clearer how colonialism and imperialism – while distinct – are intimately linked in shaping the global economy, migration patterns and border politics.

 Universidade de Lisboa, Portugal)

*Sensory Intersections. Experiences of Racialisation and Gender
 Violence Among Migrants in Lisbon*

Based on 40 in-depth interviews with migrants (men and women) living in Lisbon from former colonies in Africa, Brazil and Hindustan, this paper develops the notion of sensory intersectionality to understand narratives of racial categorisation and gendered violence. Narratives collected using the Biographical Narrative Interpretive Method (BNIM) provided insights into the nuanced complexities of racial and gender identification, highlighting the key role of sensory experiences of otherness. Sensory experiences contribute to identity construction and perceptions of self and otherness. Rather than static belonging to predetermined identity categorisations, the migrants interviewed provided deeply emotional – often painful and distressing – accounts of the violence they experienced as racialised and gendered subjects. Experiences of intersectional violence, shaped by racialised and gendered forms of oppression, are often deeply and viscerally felt. The rapid growth of the far right, based on a lusotropicalist ideology that continues to the present day, has fuelled a sense of fear and suspicion, leading to palpable accounts of suffering.

Against this backdrop, this paper examines how different groups of migrants – men and women – experience intersectional violence as a result of multiple and interdependent processes of social inequality in which race and gender play a key role. However, these intersectional inequalities are given further materiality through emotional embodiments of subalternity. Migrants' stories of violence and discrimination can only be understood through the plural mobilisation of intersectional framings and will illustrate the importance of including sensory elements in accounts of intersectional discrimination and violence. Masculinities and femininities are deeply imbued with these dynamics and become palpable realities through narratives of sensory embodiment.

*Navigating Polycrises through Collaboration: Uncovering the
 Political and Institutional Dynamics of Crisis Governance in
 Beirut, Lebanon*

This research examines the factors that promote or limit collaboration between actors responding to polycrises, focusing on nonprofits that deliver shelter services to vulnerable groups and displaced populations. It focuses on Beirut (Lebanon), which has been grappling with compound crises under the strain of a hegemonic dysfunctional state (Harb et al., 2024) and an outbreak of a new war with Israel. Whether those actors are “thrust into” roles or voluntarily “step up” to address governance failures in crisis response, they do so by forming collaboration activities (Simo & Bies, 2007), and the politics of this dynamic along with their roles (Hardy & Phillips, 1998), is the core focus of this research. Collaboration is particularly challenging when it involves different types of organizations (Hooper, 2019), no spans across departments and sectors (de Jong et al., 2021), and addresses complex problems, crises, and disasters (Zoraster, 2006; Uhr, 2017). When multiple risks collide – they produce what has been termed polycrises – the phenomenon of interwoven and overlapping crises. This research asks how and why actors responding to Polycrises collaborate and engage in bridging work to understand the political and organizational landscape of actors involved in crisis response, their relationships, and what these actors consider the barriers/limits to addressing interlinked crises. In doing so, the research seeks to provide lessons for crisis governance in dysfunctional states. Methodologically, this research takes an in-depth case study approach. It takes crisis response plans addressing the different crises, starting with the Syrian refugee crisis until today's displacement crisis caused by the war. The first part of the research analyzes crisis governance strategies, institutional frameworks, and actor networks through desk review and power mapping of actors. The second part examines how collaboration actually happens on the ground at a mesoscale through semi-structured interviews with organizational representatives of shelter organizations.

Gender-Based and Intersectional Violence: A Contextual Global Approach

Social scientists/sociologists, activists, and anti-violence movements have drawn attention to the roles of states and non-state actors in the global problem of violence and society. Significant contributions have been made, especially by feminist, anti-racist, decolonial, and social justice researchers, activists, practitioners, and survivors. They have highlighted how the state and other actors create the conditions that enable violence with implications for individuals, families, and communities at the micro, meso, and macro levels. This presentation aims to further the notion of a contextual global sociology in relation to the critical issue of gender-based and intersectional violence. We use a contextual global approach to recognize the global prevalence of phenomena and processes, but also emphasize the need to examine the specific historical, spatial, economic, social, political, structural, and cultural contexts and their connections in our global analysis. The presentation will highlight some contextual, comparative, collaborative, transnational, and interdisciplinary research on gender-based and intersectional violence by drawing upon contributions to a special issue in different local and national contexts. Specific attention will be paid to how violence is rendered invisible, incited or abetted by state and non-state actors; and the implications for families and communities, activists, states and international systems.

Sociologists Engage Gaza: Scholarship, Pedagogy and Practice

The ISA has been predicated on the belief that sociology matters and that sociologists can play a transformational role in creating a more just, gender equal and decolonized world. Drawing on sociologists' writings, public interviews and commentaries, I will discuss how sociologists have challenged and mobilized their professional associations, collaborated with students at universities, and created collectives and solidarities to protest mass displacement, deprivation and deaths in Gaza. The hope is that we will engage in such conversations at the ISA Forum to share how sociologists have been involved in addressing the violence and devastation in Gaza through their scholarship, pedagogy and practice.

Violence, Power, and Work within Couples: Evidence from a German Panel Study

The article examines to what extent economic dependence increases the likelihood of experiencing intimate partner violence (IPV) in Germany. Most prior research on IPV in Germany has thematically been focused on the relationship between violence and health or has used data sources based on non-probability samples, small sample sizes, and cross-sectional data. Large-scale panel analyses on violence, work, and the socio-economic situation of couples in Germany are as of yet lacking. Within the framework of an economic power resource approach, this study aims to investigate the impact of economic dependencies on intimate partner violence using the German Family Panel pairfam. Results of linear probability models show that being unemployed, having children, and being unsatisfied with the household finances, as indicators of economic dependence, significantly increase the risk of experiencing IPV. A range of sensitivity checks corroborate these findings. Using a probability-based sample, our study is thus one of the first to show that economic dependency plays a crucial role for the risk of experiencing IPV for women in Germany.

ABRIL, PACO* (Universitat de Girona, Spain)
Apropiación Del Maltrato Masculino Por La Derecha y Ultraderecha: Un Análisis De Los Discursos Sobre El Victimismo Masculino.

Esta comunicación examina cómo la derecha y la ultraderecha han instrumentalizado el discurso del maltrato masculino para generar apoyo entre un sector de hombres que perciben al feminismo como una amenaza a sus derechos. Se argumenta que, a través del victimismo masculino, estos

movimientos políticos buscan captar el respaldo de quienes consideran que el feminismo ha ido demasiado lejos, creando una narrativa en la que los hombres ahora son los discriminados.

El análisis se centra en dos casos recientes en España: el apoyo a una asociación de hombres maltratados en Valencia y la creación de un centro para hombres maltratados en Madrid, ambas comunidades gobernadas por la derecha y con el respaldo de la ultraderecha. A través del estudio de noticias de prensa, declaraciones de políticos de ambos espectros ideológicos y el discurso público en torno a estos casos, se explora cómo la derecha ha construido un relato que legitima el malestar masculino como reacción a los avances feministas.

La comunicación también aborda la falta de respuesta por parte de la izquierda y el feminismo ante ciertas preocupaciones masculinas, lo que ha dejado un vacío que la derecha ha aprovechado. Se plantea la hipótesis de que esta falta de atención a las dificultades de algunos hombres, como el sentimiento de alienación o la percepción de injusticia en el marco de la igualdad de género, ha facilitado la apropiación de este discurso por sectores conservadores.

El trabajo concluye reflexionando sobre las implicaciones de esta narrativa y cuestiona si la izquierda y el feminismo deberían reconsiderar su enfoque para evitar que el malestar masculino siga siendo monopolizado por fuerzas reaccionarias.

From 'Warehouse Workers' to 'Humanitarian Professionals'? the Contested Value of Supply Chain Expertise in Transnational Aid

This paper looks at changing notions of 'skill' and 'expertise' within one ever-growing transnational profession: humanitarianism. In a so-called polycrisis era, humanitarian supply chains and their management have never been more vital for ensuring effective and timely aid distributions. Yet, workers employed in supply chain positions within the transnational aid sector have often been overlooked as 'humanitarians' and 'professionals' in social analyses. We therefore focus on this particular group of aid workers, many of whom are located in or 'come from' the so-called global South to consider: What does humanitarian-as-a-profession actually mean, and for whom? Drawing upon interviews with these workers as well as other aid stakeholders, we find that first, their labor, knowledge and expertise are valued in various and even contradictory ways within and between humanitarian organizations despite the criticality of their roles for ensuring 'successful' aid outcomes. Second, global North-South relational frameworks of power can only partially explain these contradictions. We therefore draw upon critical interdisciplinary scholarship on logistics, which encourages scholars to 'see' social relations 'like a supply chain' (Hockenberry et al. 2021) in order to account for the factors driving these workers' perceived worth in various 'nodes' of humanitarian operations accordingly. We argue that humanitarian professionalism(s) are made and unmade through the supply chain via various articulations of racialized, gendered and classed power. Why these various articulations matter are because they lead to ambiguous, yet constant contestations of who can claim 'humanitarian expertise' and 'skill(s)' for certain groups versus others. We further argue that our analysis provides an important way to contextualize the imperial standpoint (Go 2016) embedded in explanations about the organization of humanitarianism specifically, and conceptualizations of 'professions', 'knowledge' and 'skill' in the world economy broadly.

Embodied Resistance: The Role of Palestinian Women in the 2023 Gaza Genocide

This paper examines the vital role of Palestinian women in resistance during the 2023 Gaza genocide, focusing on their embodied resilience in the face of colonial violence. Using post-colonial feminist perspectives, the study explores how women in Gaza transform their bodies into tools of defiance. Tactics include cutting their hair to adapt to harsh sanitary conditions, writing their children's names on their bodies during airstrikes, and covering themselves to avoid exposure amid bombings. The research also highlights women's efforts to create alternative food for their families during famine, develop sleeping methods in tents to resist heat, cold, insects, and diseases, and perform hard labor in the absence of husbands and amid family dispersion. Additionally, the study examines the profound psychological and physical toll on women due to the lack of hygiene supplies and other basic needs during the war. Through unstructured interviews following the oral history method and participant observation based on the author's experience as a war correspondent, this research sheds light on how Palestinian women embody resistance, becoming symbols of steadfastness in the struggle for autonomy. By focusing on the specific experiences of women in Gaza, the paper aims to contribute to the broader discourse on gendered resistance in colonized societies.

RC33-544.1ACAMPA, SUANIA* (University of Naples Federico II, Italy)
DE ANGELIS, MATTIA (University of Naples Federico II, Italy)*Beyond the Duopoly: An Analysis of the Discursive Strategies of the Actors of the Centre in the 2024 European Elections.*

Our paper explores the digital narratives of Italian political actors during the 2024 European elections, focusing on those commonly referred to as 'Centre' actors, who do not align along the 'left-right' ideological axis. Polarisation is often studied in terms of sharp opposition, as described by McCoy et al. (2018) and Sartori (2005), with politics understood as a clash between 'Us vs Them'. However, our focus on the actors at the Centre, who do not fit into a clear duopoly, reveals a discursive complexity peculiar to the Italian political landscape. Investigating the dynamics of polarisation beyond ideological extremes allows us to explore how Centre actors contribute to fragmenting or mediating political tensions without openly taking sides. McCoy and Somer (2019) argue that polarisation emerges from the alignment of social and political fractures, simplifying the complexity of politics into sharp divisions. Centre actors operate in a context where such dynamics are less pronounced. However, their ability to attract support depends on managing diversified positions and responses to the electorate's demands. By analysing posts on X (formerly Twitter) and Facebook between 24 May and 10 June 2024, we will study how these actors use discursive strategies that fall within polarisation without being directly linked to the political extremes. McCoy and Somer's (2018) theories will help us interpret these dynamics in contexts that do not strictly follow the 'dual' model. A particular focus will be placed on the issue of post-truth and populism, phenomena that can also emerge in the narratives of centrist actors in a less obvious but significant way. Due to their intermediate position, we argue that centrist actors can influence political balances and create new polarisation forms that are less tied to traditional alignments.

RC45-712.2ACERBI, ALBERTO* (Università di Trento, Italy)
STUBBERSFIELD, JOE (University of Winchester, United Kingdom)*Large Language Models Show Human-like Content Biases in Transmission Chain Experiments*

As the use of large language models (LLMs) grows, it is important to examine whether they exhibit biases in their output. Research in cultural evolution, using transmission chain experiments, demonstrates that humans have biases to attend to, remember, and transmit some types of content over others. Here, in five preregistered experiments using material from previous studies with human participants, we use the same, transmission chain-like methodology, and find that the LLM ChatGPT-3 shows biases analogous to humans for content that is gender-stereotype-consistent, social, negative, threat-related, and biologically counterintuitive, over other content. The presence of these biases in LLM output suggests that such content is widespread in its training data and could have consequential downstream effects, by magnifying preexisting human tendencies for cognitively appealing and not necessarily informative, or valuable, content.

The Rhythms of Time and Taste: Sor Juana Inés De La Cruz and the Temporalities of Culinary Knowledge

This paper explores how time shapes sensory perceptions and knowledge production through the figure of Sor Juana Inés de la Cruz, focusing on her engagement with culinary and intellectual practices. Sor Juana's reflections on cooking, particularly in *Respuesta a sor Filotea* and the contested *Libro de cocina del convento de San Jerónimo*, reveal how everyday culinary routines in the convent embody cyclical temporalities. These practices—centered on waiting, observing transformations, and feeling textures—illustrate a sensory-driven form of knowledge that contrasts with the linear, abstract time associated with the library and formal intellectual labor.

Through a Lefebvrian lens, the convent's kitchen emerges as a site where time, culture, and sensory experience converge. The temporal rhythms of cooking—measured not by precision but by sensory intuition and memory—allow for a unique epistemological framework that foregrounds embodied learning. This cyclical notion of time, passed down through generations of women in the convent, fosters a collective, transgenerational mode of knowledge transmission, where sensory experiences like taste and touch are central.

In examining these temporal and sensory dynamics, this paper also touches on how nostalgia and memory play roles in the preservation of feminine knowledge. Sor Juana's culinary philosophy demonstrates that the sensory and the intellectual are not distinct domains but interconnected practices shaped by daily temporal rhythms. By reconsidering time through these everyday rituals, this study contributes to a broader understanding of how sensory experiences and knowledge are constructed in non-linear, embodied ways.

RC31-JS-82.4ACHARYA, ARUN KUMAR (Sambalpur University, India)
JENA, BIKRAM KUMAR* (Sambalpur University, India)*Cultural Capital, Caste Structure and Trafficking of Dalit Girls in India*

Caste plays a significant role in driving trafficking in India, especially among lower-caste communities. Dalits, historically oppressed and marginalized by upper castes, face systemic challenges such as untouchability, limited inheritance rights, occupational marginalization, and restricted access to education. Dalit girls, positioned at the intersection of caste and gender, face heightened risks of sexual violence and exploitation. Their marginalized socio-economic status, lack of legal protection, and educational deprivation limit their survival options, often pushing them into structural vulnerability. Traffickers, brothel owners, clients, and sardar manipulate these socio-cultural traits, seen as forms of "cultural capital," to exploit vulnerable girls.

This study uses a content analysis to examine the trafficking of Dalit girls, incorporating Bourdieu's concept of cultural capital and Sen's capability approach. Bourdieu's framework helps illustrate how traffickers exploit caste hierarchies through embodied, objectified, and institutionalized cultural capital. Sen's capability approach highlights how structural barriers—economic, social, and cultural, further limit Dalit families' ability to escape cycles of exploitation. The research demonstrates how the lack of cultural and economic capital, combined with restricted capabilities, perpetuates vulnerability across generations, making Dalit girls particularly susceptible to trafficking.

ACHARYYA, MAYURAKSHI* (Indian Institute of Technology Kanpur, India)

Intergenerational Justice and Just Transitions in the Coal Districts of India

The climate crisis forces humankind to find alternative energy sources beyond fossil fuels. The transition to newer forms of energy has inherent scientific and political challenges and raises the question of intergenerational justice. Historically, many generations have used fossil fuels for a better lifestyle. Then why should future generations suffer from uncertain sources of energy? We, therefore, arrive at the pressing issue of just energy transitions.

Current social science literature on energy acknowledges it as an issue of intergenerational justice but is limited to theoretical debates. In particular, existing literature does not address what communities perceive as intergenerational energy justice and how it intersects with social identities. Thus, we investigate what constitutes intergenerational justice for a coal community in India. Using the Bourdieusian formulation of capital, we examine the scope and pattern of justice that underpins a just energy transition. We analyse 25 semi-structured interviews with various categories of coal workers to determine what intergenerational justice means to them.

First, our results show that energy transitions are not recognised as an intergenerational justice issue. Instead, they are perceived as abstract future events without real connections to the present generation. Second, we find that articulating energy transition as an issue of intergenerational mobility allows local communities to establish links between the present generation and a future event. Finally, the results indicate that intersections of social identities and occupational positions produce heterogeneous ideas of intergenerational justice. Our analysis of intergenerational justice contributes to energy justice literature and enables decision-makers to refine their conceptualisation of just transitions.

Tribal Women, Gender Norms and Precarity: A Case Study of Santal from West Bengal, India

Tribal women in India are primary workers who work along with their male family members (red-collar workers) and receive equal remuneration regardless of gender. They are offered the same benefits – such as holidays, work environment, or workplace treatment – as their male counterparts. However, they have no decision-making freedom or agency within professions, which they share with their male counterparts. Tribal women farmers do not enjoy the freedom to decide the number of cultivation cycles that would be followed. Even women who join self-help groups to earn their livelihood – and thus empowerment – are compelled to spend their earnings towards family expenses and fiscal support towards their kin. Their husbands are not obligated to demonstrate a similar degree of cooperation. Tribal women who are involved in animal husbandry report that their husbands make decisions regarding their business. Similarly, women who have received professional training outside their villages have reported that their in-laws have restricted their activities. The paper is based its argument on empirical study, and both Primary and secondary data are collected for further analysis from study village Bolpur, West Bengal.

Une Communauté En Résilience Après Le Traumatisme Du 7 Octobre 2023 En Israël

Le 7 Octobre 2023, une vague terroriste du Hamas déferlait sur les agglomérations Israéliennes proches de la bande de Gaza. Le bilan de cette attaque s'élève à plus de 1200 morts et 251 otages enlevés à Gaza. Au lendemain de cette attaque et à la suite des bombardements du Hezbollah depuis le Liban, des dizaines de communautés rurales et urbaines du sud comme du nord du pays étaient évacuées. En quelques jours 253.000 Israéliens deviennent «refugiés» dans leur propre pays (INSS, 2024. <https://www.inss.org.il/he/publication/evacuation/>). La plupart des communautés ont été dispersées, d'autres sont restées unies sur un même site.

Kibbutz Reeim, proche de la bande de Gaza, est un des kibboutz dont la population de 450 habitants a vécu le traumatisme du 7 Octobre 2023. D'abord hébergé dans un hôtel à Eilat, le kibboutz dans sa totalité, s'est relogé après deux mois dans deux tours d'habitations à Tel-Aviv. Comment les habitants de Reeim vivent-ils leur situation de déplacés? Comment une communauté rurale s'adapte-t-elle à un environnement urbain? Après plusieurs mois à Tel-Aviv, que reste-t-il de l'esprit communautaire, de la solidarité, de la cohésion sociale généralement significatifs du kibboutz ? Comment les habitants de Reeim analysent-ils leur parcours et évaluent leur communauté ? Leur expérience reflète-t-elle un processus de résilience? Mon intervention répondra à ces questions sur la base d'une série d'entretiens réalisés auprès des membres du kibboutz durant l'été 2024.

The National Diaspora Summit and the Role of Migrant Associations in International Cooperation

This paper examines the National Diaspora Summit as a case study within the MIGREM project, "Migrant Remittances and Transnational Ties: Care, Social Change, and Development Across Borders," highlighting the crucial role of migrant associations in international cooperation. The Summit serves as a platform for these associations to evolve from beneficiaries to promoters in development processes, enabling them to promote bidirectional development and create mutual benefits between countries of origin and destination countries.

The analysis will delve into the significant contributions of diaspora members to local entrepreneurship and capacity building. Another aim of the work is to examine to what extent destination countries are truly able to empower these communities and allow them to effectively influence public policies and promote economic and social development. Furthermore, the paper will differentiate between sustainable development cooperation and sporadic solidarity actions, exploring how social change can be influenced by the reproduction of existing power dynamics.

To enrich this analysis, in-depth interviews with institutional members, including diaspora forum participants and sector experts, will be presented. These testimonies will provide valuable insights into the dynamics of representation and the strategies employed to overcome barriers to participation.

Finally, the paper will highlight the importance of measuring the impact of diaspora-led projects to ensure that they produce lasting and meaningful results in the communities involved. By evaluating these outcomes, the presentation aims to analyze the transformative potential and key challenges faced by diasporas in shaping international cooperation frameworks through effective, inclusive, and sustainable actions.

ACOSTA UPEGUI, JONATHON* (Annenberg Institute at Brown University, USA)

The New Latinos

What role does location play in panethnic Latino identity? The salience and adoption of a panethnic identity are contested issues in the study of Latinos in contemporary American society. Using the case of Central Falls, Rhode Island, a "Hispanic/Latino majority" community, I bring together the literatures in context of reception and panethnicity to show how these inform each other. I show that contemporary identity adoption is informed by the panethnic origins of various institutions and the heterogeneous flow of migrants from multiple countries across Latin America. Central Falls and other postindustrial communities like it are small to midsize cities that served as the first homes for Ellis Island era migrants in the late 19th and early 20th centuries. Today these communities have undergone profound economic, social, and political changes that invite us to reconceptualize their role in American society. The panethnic postindustrial city can be characterized by several observable phenomena I go on to sketch. In this paper I contend that Latino panethnic identity adoption goes beyond the "censusfication" of the group (Nobles 2000). My interviews trace how the origins of Latino identity adoption are rooted in institutions such as churches, social service agencies, and schools. I then use data from a household survey to offer a snapshot of how migrants in the city see themselves. Using these data, I contend that studying panethnic Latino identity adoption requires closer attention to the context of reception at the local unit of analysis in order to better understand its various iterations and orientations. As migration from a broad range of Latin American countries to postindustrial cities across the northeast continues, the lessons from panethnic postindustrial Central Falls may provide insights into the direction that panethnic group identity will take in these communities.

Theorizing Digital Methods: Digital Sociology's Potential Anchor?

Given the complexities of digital society and phenomena associated to digital age, digital sociology has been emerging as a vital subdiscipline within sociology - but not without challenges. We begin by briefly drawing on bibliometric analysis and controversy mapping of the theoretical foundations of digital sociology from the mid-2010s, thus underscoring the "polite divergence" that exists in interaction between different authors and their respective theoretical approaches. Consequently, we argue that the lack of controversy and constructive conflict in theoretical approaches between authors could result in the epistemological sterility of digital sociology. The main objective of this presentation is to examine and theorize its methodological grounds. As a result of the "crisis of an empirical sociology" proposed by Savage and Burrows and the emergence of digitally mediated communication on the internet, there has been an uptake in the application of digital methods in social research in the last decade. This aspect of digital sociology has the potential to be a crucial element in the further development of the discipline. In this regard, we aim to implement controversy mapping of digital methods debate and their respective authors. As controversies are the most fruitful areas of knowledge production, this could be the basis of the argument for the importance of digital sociology and its future development. We begin with a bibliometric analysis of the theoretical and reflexive work being done on digital methods. Utilizing Andrew Abbott's concept of "fractal distinctions," we situate and map the most prolific directions and branches of digital methods, identifying the most fertile fields of controversy. Finally, we explore the potential challenges and implications arising from the asymmetric development of theoretical frameworks and methodological solutions within digital sociology, considering their impact on the discipline's future.

Studying Resistance to Racial Inequalities in Higher Education: Moving Beyond an Evaluation of Equity, Diversity, and Inclusion (EDI) Policies

The persistence of racial inequalities in higher education remains a significant societal problem in Europe and beyond. Since the 2010s, and

particularly following the rise of Black Lives Matter in Europe in 2020, racialized students have increasingly mobilized to demand more inclusive and equitable universities. As European higher education becomes more diverse, the voices of racialized minority students, along with their majority allies, are likely to become even more prominent in advocating for change. However, their calls for racial equality are unfolding in a political climate where "culture wars", backlash on "wokeness" and accusations of "reverse discrimination" are increasingly used to delegitimize existing efforts for social change.

This paper presents our initial exploration of initiatives aimed at advancing racial equity in higher education, using data from Flanders, Belgium. Rather than limiting our focus to the evaluation of the popular top-down, institutional Equity, Diversity, and Inclusion (EDI) policies—which have often been criticized as non-performative (Ahmed, 2007)—we expand our scope to include the role of grass-roots, bottom-up initiatives, such as the formation of racialized student organizations, bottom-up staff initiatives and protest movements. While these top-down and bottom-up efforts are frequently studied in isolation, our aim is to bridge these perspectives.

We integrate these approaches using Patricia Hill Collins' (2000) typology of activism for social change, particularly her concepts of institutional politics, survival politics, protest politics, and cultural politics. Through this lens, this paper contributes to discussions about the barriers that racialized minority students face in their educational pathways, particularly in the context of rising political resistance to equity initiatives. It highlights how grassroots resistance intersects with institutional efforts, ultimately expanding the theoretical understanding of strategies to counter educational inequalities.

ADELMAN, MIRIAM* (Abranches, Brazil)

Our Horses, Our Lives: Families and Communities in Popular Brazilian Equestrian Cultures

Historical research, literary tradition, and our own ethnographic research reveal, in the Brazilian context, the existence of rich and unique popular equestrian cultures, whose impressive number of participants (Brazil has the third or fourth largest equine population in the world, with horses spread across diverse walks of interspecies existence) include many humans who cannot imagine their lives without horses by their side. The present paper explores the daily life, family and community aspects of this relationship within rural and semi-rural communities in Southern Brazil, without excluding the testimony of urban informants whose domestic venue precludes the possibility of keeping a "backyard horse" but nonetheless consider their equines as family members and "significant others". Based on participant observation, interviewing and questionnaire responses, we examine the meanings that people attribute to their equine 'friends', *parceiros* or 'family members'. Gender and generation are influential factors that our research explores, although we cannot yet suggest any clearly defined patterns regarding their effect on how this intimate human-horse bond is experienced, represented and expressed.

RC36-589.1

ADELMAN, MIRIAM* (Abranches, Brazil)

Rodeio, Cavalgada e Cotidiano : Women and Girls in Contemporary Brazilian Equestrian Communities.

In the late 1990s, girls and women who were part of southern Brazilian equestrian communities staked their claims as participants in local and regional *gaucho* (*campeiro*) rodeos which, although functioning as integrative community festivities, had relegated women to a limited set of cultural and supporting (non-sporting) activities. Since then, women of all ages have gained entrance, as well as increasingly visibility and recognition, within *campeiro* rodeo, alongside other growing roles (notably, as equine veterinarians, but also as horse trainers or breeders, riding instructors, agronomists and agricultural technicians, and equine-assisted therapies practitioners) in the Brazilian equestrian world. I examine these changes in gender relations at the meso- (equine industry) and micro (local community) levels, looking specifically at a recent cultural wave of "all-women's rides". As participant-observer of equestrienne communities of practice, I strive to capture the embodied subjectivities of women and girls who take part in them. The visual anthropology component of my work uses images to document aspects of (female) human/ (equine) animal embodied interactions (or "mutual corporealities" (Birke and Brandt, 2009)). My theoretical and methodological framework brings references and concerns from the relatively new field of Human-Animal Studies into conversation with other sources and fields of contemporary sociology/social theory (gender studies, cultural studies, sociology of sport, etc.).

ADENSTEDT, THERESA* (Technical University of Berlin, Germany)

Spatial and Temporal References of Climate-Related Vulnerability and Risk Perception

The physical injuries that are attributed to the consequences of climate change take a wide variety of forms and are unevenly distributed both spatially and socially. The contribution discusses the theoretical and empirical relevance of spatial and temporal distance for the bodily experience of risk perceptions of climate-related injuries in the present. Even if people do not yet see their individual lifestyle and physical integrity directly affected by the consequences of climate change, they seem to be increasingly affected by their own vulnerability in the present. In this process, spatial references to regions where the consequences of the climate crisis are much more visible play a central role. Looking at the socio-political discourse, it becomes clear that it is quite controversial whether these physical injuries can also be understood as violence. However, the debate on the phenomenology of suffering from violence shows that the relationship between vulnerability and violence is also negotiated on a theoretical level. The significance of spatial references in this context remains largely unexamined in the debate.

Based on biographical-narrative interviews with people from Germany who are involved in climate policy, the contribution focuses on how spatial and temporal references structure climate-related perceptions of vulnerability and the subjective experience of violence. It highlights the spatial reference points for the perception of risk potentials and vulnerability and the spatial strategies that are developed in order to react to them.

From a socio-theoretical perspective, the presentation ties in with recent social science debates in which the relationship between climate change and violence has been problematized from different angles in recent years. Furthermore, it uses the phenomenon of climate-related vulnerability to outline the question of how the space-time relationship in the risk perception of vulnerability and violence can also be conceptualized in terms of social theory.

Scientism, Antropocene and Society: How Science Delusion Is Limiting Justice, Human Progress and Development

The article explores the apparent divide in the philosophies of two prominent patron saints of Classical Philosophy: Socrates, representing Europe, and Orunmila, representing Africa. This dichotomy lends credence to the fact that each region or society possesses its own distinct thought patterns that shape and inform its worldview and relationships. The assertion of superiority between these perspectives, particularly in the context of evolution and development, proves to be highly contentious. However, this is not intended to dismiss the observable differences in developmental levels across various regions at specific points in time. Each society evolves and advances at its own pace, contributing unique value to existence and imbuing meaning into their respective worlds. The contrasting philosophies became particularly evident in the wake of COVID-19, where its origin was shrouded in secrecy amid disputes between the USA and China. The solution, cure or vaccine to tackle the virus became a contentious issue involving some of the wealthiest individuals and nations, as well as organisations like the World Health Organisation (WHO) and African nations. The paper argues that the global management and control of COVID-19 represent a pivotal moment in human history where scientific inquiry was heavily influenced by significant anthropocentric dynamics. The paper concludes that during this period, scientism infiltrated scientific discourse, thereby limiting its openness to alternative worldviews that affect humanity.

Leaking Milk, and Falling Hair Embodied Experiences and Technological Remaking's of Becoming a Mother to a Dead Child

There is a lack of words for being a mother to a dead child, and no easy ways to work out how to mother after infant death. With Facebook, blogs and Instagram, ways of practicing motherhood after the loss of a child, is however becoming increasingly available on social media. In this presentation, I explore how social media is being used by women that have ended their pregnancy

or lost a child, due to a severe congenital heart defect by asking: How does women use social media to become mothers to a dead child, and how does social media take part in remaking motherhood of the dead? Methodologically, the presentation draws on a multi-modal material that includes: 18 interviews with women that have lost a child or ended a pregnancy, autoethnographic material from the loss of my first child, and social media material. Inspired by Haraway and Barad, I read the stories of becoming mothers to a deceased child diffractively. I hereby show how social media remake and reconstitute norms of motherhood. It is at the same time stories, that calls for being circulated as part of a feminist reproductive future, that can teach us about the experience of infant loss, and the need for support of women that face embodied loss and grief, as they go through and live with abortions or the loss of a child.

Income Inequality, Political Ideology, and Environmental Concern in the United States

We examine the relationship between income inequality and environmental concern, while accounting for the moderating influence of political ideology, which has been identified as a stable covariate of views on the environment. While income inequality, a social problem that has worsened over the past several decades, has been shown to influence several environmental outcomes—measures of environmental degradation—less work has considered how it shapes environmental views, especially in conjunction with political ideology. Yet, public opinions/views are known to affect policies and responses to social problems, including those pertaining to the environment. Based on data from the U.S. General Social Survey, we find evidence that income inequality influences environmental concern. Most importantly, the relationship between income inequality and environmental concern differentiates along political ideological lines. Among liberals, income share is associated with greater environmental concern, while among conservatives, the opposite pertains. In comparison to absolute income, income share emerges as a stronger predictor of environmental concern. This study is among the first to examine the relationship between income inequality and environmental concern at the micro (individual) level.

Standing with the Status Quo! How Social Connections to Energy Resources Shape Views about and Participation in Energy Transition

There is near-unanimous consensus within the scientific community that mitigating unimaginable future climate disasters requires rapid transition away from fossil fuel. Already, mega-storms that are consistent with climate models' predictions, including recent Hurricanes Helene and Milton, which hit the Florida Gulf Coast area and caused hundreds of fatalities and catastrophic property damages, are taking place. While the threat of climate change is readily apparent, we cannot take for granted that everyone will be supportive of replacing fossil fuels with other energy sources. This resistance is, in part, driven by the fact that all transitions, whether planned or forced by emergent socio-environmental circumstances, often create winners and losers. Our study draws on the multi-level perspective (MLP), developed in the field of innovation studies, to examine how social connections to energy resources (that is, social distance) shape views about and participation in energy transition. The MLP argues that socio-technical transitions are shaped by interactions between actors within and between the incumbent regime (the status quo subject to change), radical niche-innovations (the regime seeking to supplant the status quo), and the socio-technical landscape (the broader social context). Our study utilizes both qualitative and quantitative data collected in Uinta County, Utah, United States. Preliminary results suggest that social connection to the fossil fuel industry is a significant predictor of views about energy transition and participation in it. This is consistent with the MLP perspective, which indicates we should expect resistance to energy transition from individuals and families with social connection to fossil fuels. Thus, a crucial aspect of advancing an energy transition involves how to convince specific people to accept and take advantage of the opportunities available in a move away from fossil fuels and how to ensure that they are not left behind in a losing situation, worse off than they currently are.

Private Museums: Privatization of Art History?

In recent decades, individual art collectors have expanded their engagement in the realm of art provision by opening hundreds of private art museums. Whereas previously collectors donated or loaned their collection or exercised influence as board members of existing institutions, private art museums offer private collectors unprecedented control over how their art collections are exhibited. Among scholars of this new phenomenon a recurring question has been whether these museums allow collectors to influence the canon of contemporary art by consecrating the artists they exhibit, motivated by two related concerns.

First, private museums might not be as interested in academic, art-historical evaluation, but rather reflect the idiosyncratic taste of their founders, and possibly their financial interests. Secondly, private collectors' idiosyncratic tastes may not include progressive notions of e.g. gender equality and decolonization which have been increasingly adopted by more accountable public institutions. Private museums thus may give art collectors a way to write art history to their own benefit, without consideration for other stakeholders.

However, previous research has been speculative or focused on few cases; systematic quantitative research on the consecrating power of private museums has been absent. Addressing this gap we analyze the careers of over 40 000 artists participating in over 540 000 exhibitions using panel regression and survival models. Preliminary findings show a small but substantial increase in exhibitions in public institutions following exhibitions in private museums, and a lower chance of exiting the art field entirely. Together these demonstrate that private museums are indeed able to support the careers of the artists they exhibit, possibly leading to an art canon shaped by unaccountable private interests.

Further research will more clearly identify this effect of private museum exhibition on artist careers and explore different forms of career success via auction sales data.

Alternative Credentials As Social Policy: A Lifecourse Perspective on Skill Certification for Disadvantaged Groups

Possessing certified skills is essential in today's knowledge economies. For most, these can be acquired through the standard route i.e. a period spent in a learning environment. This standard path to the acquisition of educational credentials, however, may be unsuitable for many vulnerable groups. These include individuals who have learned a job through practical experience or those who have obtained a degree in a foreign country that is not recognised. Possessing skills that are not certified by a recognized credential is arguably a major source of disadvantage.

To deal with this issue, interest in alternative paths to skill credentials has been rapidly gaining ground. The concrete tools and policies that are deployed are known as alternative credentials. Examples include processes that allow the recognition of prior learning (RPL) which provide the certification of skills gained through practical experience, the recognition of foreign degrees, the modularisation of standard VET or adult education programmes, which allow individuals to obtain partial certification without the need to complete a full programme.

Against this background, the objective of this paper is to identify and discuss the social policy implications of alternative credentials. We argue that the distributional impact of these credentials is not predetermined. Drawing on insights from life course research, we identify two key dimensions that are likely to shape the distributional impact of alternative credentials. First, the degree to which these alternative credentials are cumulative and can provide access to standard educational and training offers (or "stackability"). Second, the extent to which such credentials are known to and recognised as valuable by employers. These are two important qualities of credentials. Failure to meet them may result in alternative credentials being the source of segmentation instead of integration.

Promises of Ideational Analysis within Global Social Policy

Global social policy (GSP) as an approach crystallized at the same time as the 'ideational turn' (Blyth 1997) in comparative politics and in social policy analysis. Because international organizations are so central to global social policy and because they are also directly involved in the production and dissemination of policy ideas, there is clear potential for ideational analysis within GSP. Co-authored by one current (Tuba Agartan) and one former (Daniel Béland) Global Social editor, this paper takes a systematic look at the scholarship dealing with the role of ideas since the creation of the journal to assess the relationship between ideational analysis and global social policy. This critical review demonstrates the second key potential for ideational analysis within GSP: the ability to challenge methodological nationalism by exploring how national (and even subnational) policy ideas interact with cross-cutting institutions and actors within a global social system. This analysis will be followed by a new research agenda about the study of the role of ideas across global, regional, national, local policy scales that bridges global social policy and the contemporary ideational scholarship in public policy and welfare state studies.

AGARTAN, TUBA* (Providence College, USA)

Universal Health Coverage between Universalism and Financialization

This paper focuses on an agenda to reform our health systems, Universal Health Coverage (UHC) that emerged in the 2000s as a key idea to build a strong and more equitable health care system. The paper aims to explore the political dynamics of its rise and impact in the global health and development agendas. Using historian Fernand Braudel's conceptual tools, the paper traces the formulation of 'universalism' in a particular world context shaped by major shifts in capitalism. Through an exploration of its journey through interviews, reports and declarations, workshop and high-level meeting proceedings, I identify the key dynamics that constitute UHC as a significant idea, probably the most prominent idea, since the Alma Ata Declaration of 1978. This analysis suggests two processes between the broader dynamics in the global political economy and the specific debates about health systems. First, health systems are part of the effort, once again, to embed economic relations where UHC promotes financial protection against high out-of-pocket costs and improves access to essential services. By ensuring healthy populations, UHC also serves as an 'investment' because healthier children are more likely to attend school and become healthier adults. The second process involves the financialization dynamics that shape health care systems, especially with regard to the relations between the public and private sectors. Major shifts in the dynamics of capitalist accumulation, especially the growing influence of financial markets and transactions over trade and commodity production, have implications that reach beyond the markets into social realms. Financialization represents the latest transformations in capitalism, altering the purpose and tools of social policy with its emphasis on expanding demand and incorporating more areas into the market (hence, marketization).

AGARWAL, SUGANDHA* (University of Manchester, United Kingdom)

Re-Making Citizenship: Migrant Women's Activism in the UK

Situated at the theoretical intersection of sociology and politics, this paper brings a critical lens to the study of citizenship by investigating and analysing the lives of migrant women living in the UK. Through interviews and participant observation conducted over a year, this paper examines how migrant women engage in individual and collective community work and activism against the backdrop of the UK's changing immigration policies. The objective of this research is to shift away from the narrative of migrant women as passive victims to recognize the multiple ways in which they exercise agency, and in doing so, enact their own forms of "activist citizenship." Isin (2009) uses the term to characterize the newly emerging types of citizen subjectivities that challenge the traditional notions of citizenship attached to modern liberal democracies. This paper asks a central question: what claims to "citizenship" are migrant women making through activism? How do these intersect with notions of belonging and identity? Ultimately, it seeks to understand how 'non-citizen' migrants engage, contest, transform, and otherwise resist new ways of regulating mobility and in doing so "enact forms of transnationalism and citizenship 'from below,'" drawing our attention to "new spaces of citizenship that potentially enable both new ways of being political and new visions for the type of politics we wish to imagine in the world" (Nyers and Rygiel, 2012: 9). A rapidly growing international diaspora teamed with anti-

immigration political discourse across the UK lends this research particular urgency, making it doubly important to centre the marginalized narratives of migrant women. This research will contribute to existing literature on forced migration, citizenship and migrant activism in the UK, particularly on the largely obscured narratives of women activists in Manchester.

Migration Development Regime

This panel seeks to deepen our understanding of how migration states (as sending and receiving nations) and migrants (as immigrants and emigrants) have long interacted to shape global inequality and well-being across and within countries. To do so, this panel interrogates a new framework—the Migration-Development Regime or MDR—to analyze the political economy of labor migration. MDRs offer a more refined theorization of labor migration that is refracted by a truly global gaze that includes the global North and South, a historical perspective that can isolate the continuities and discontinuities of global labor migration, and a comparative lens across nation, gender, race, caste, and class. Although the MDR framework is intended to cover different national and sub-national contexts, the papers in this panel draw from the case of India—the world's largest migrant exporter and remittance recipient, and a major migrant importer. The panel's anchor paper (by Agarwala) explains the MDR framework in the context of state-migrant relations among low-skilled Indian emigrants to the Gulf and high-skilled Indian emigrants to the US from the 1800s to the present. The other five papers employ varying methodologies (archival, quantitative, and qualitative) to engage the analytical utility of the MDR framework by extending it across new historical time periods and engaging it against additional analytical vectors including gender, race, and caste.

A Gendered Perspective on Environmental (im)Mobility in Bangladesh

The nature of the relationship between climate change and migration is complex, context specific, and often shaped by social factors such as gender. This study examines how gender influences perceptions of environmental change and decisions related to mobility or immobility. Using a mixed-methods approach, we combine qualitative data from semi-structured interviews with 34 women and original survey panel data from 1700 households living along the Jamuna River in Bangladesh, a region severely impacted by environmental change, particularly flooding and riverbank erosion. Our findings reveal that women's roles and responsibilities within their household and communities significantly influence their perspectives on environmental migration. While migration due to environmental changes exacerbates hardships for many women, they can also lead to unanticipated opportunities. The findings highlight that impacts of both, climate change and the resulting (im)mobility, are not uniform but rather highly varied across population subgroups. Thereby, they underscore the importance of integrating a gendered lens into policy interventions addressing climate change and migration.

"on My Native Land, I'm Already a Stranger": Post-Soviet Women Artists Reshaping Conflict Narratives

The collapse of the Soviet Union left behind complex legacies that continue to shape the political, social, and cultural landscapes of post-Soviet countries. While much scholarly attention has been directed at Eastern and Central Europe, regions like the Caucasus and Central Asia remain overlooked. In these regions, women artists have emerged as powerful voices of resistance, using their creative expressions to reshape narratives of conflict and challenge the

enduring colonial legacies of Soviet rule—legacies that, following the Union's collapse, fueled internal conflicts, ethnic tensions, and struggles over national identity across the post-Soviet states. This abstract focuses on Tajik-Russian singer Manizha Sanghin, whose music videos serve as a platform to confront national identity struggles, war, and societal taboos.

Drawing on postcolonial theory, decolonial thought, and media studies, this research explores how Manizha uses her artistry to critique sociopolitical conditions in Russia and Central Asia. Inspired by theorists such as Edward Said, Gayatri Spivak, and Madina Tlostanova, the analysis will highlight how Manizha's work embodies a decolonial aesthetic, functioning as a form of activism in spaces where traditional activism is often suppressed. Her artistry engages with topics such as racism, feminism, LGBTQ+ rights, and authoritarianism, defying both governmental and societal censorship.

This research emphasizes how Manizha's artistry subverts post-colonial narratives, confronting the colonial residue of Soviet multiculturalism, Russification, and cultural erasure. Through a critical analysis of her video clips and their reception, this study delves into how popular music intersects with broader decolonization efforts in conservative post-Soviet societies.

In doing so, Manizha not only subverts dominant political structures that seek to silence dissenting voices but also reimagines conflict narratives, challenges the status quo, and directly confronts the lasting impact of Soviet colonialism.

AGOAS, FREDERICO* (Interdisciplinary Centre of Social Sciences, NOVA University Lisbon (CICS.NOVA), Portugal)

Transimperial Sociologies: Colonial Legacies and the Globalization of Social Science in Africa after World War II

Prevailing narratives about the internationalization of sociology after World War II often emphasize the growing global influence of American social theory and empirical sociology, particularly the structural functionalism that dominated the era. These narratives also highlight the role of international organisations that emerged in the post-war period, especially UNESCO, which promoted the International Sociological Association and supported various international social-scientific projects and regional initiatives.

However, these accounts frequently overlook other international bodies, both public and private, that were established or revitalized during this time to renew imperial governance and re-legitimize colonialism. In these contexts, the social sciences – especially sociology – played a crucial role. While the activities of the International African Institute are relatively well-known, the histories of transimperial organisations such as the International Conference of Western Africanists (1945), the International Institute of Differing Civilizations (1946), and the Commission for Technical Cooperation in Africa South of the Sahara (1950), are only now beginning to receive scholarly attention.

Based on the study of Portugal's involvement in these organisations, this paper explores their broader implications for the development of sociology. By adding a colonial layer to the history of the discipline's internationalization in the second half of the 20th century, it also seeks to introduce a transimperial perspective to the narratives about sociology's colonial roots, which have typically been studied from a national viewpoint.

PICARDI, ILENIA (University of Naples Federico II, Italy)

Biotech and the Redefinition of Old Age: Successful Ageing As a New Challenge for Social Justice

The institutionalisation of a redefined molecular ageing process was central to the progression of anti-ageing bio-technoscience, both symbolically and pragmatically. As a result, anti-ageing knowledge claims became ambivalent about whether old age was a disease, while reframing it by the opposition of what was called successful ageing to senescence. This rhetorical manoeuvre led to the reconstruction of ageing as a process, amenable to intervention and change. A reconstituted and now institutionalized technoscientific field shared both the medicalisation of old age and the search for solutions to old age decrement in the body. The once refused anti-ageing medicine conceptualisations were brought into the reconfigured medicine of ageing. The result has been a transformation of gerontology principles and geriatric medicine and the re-framing of the bio-technoscientific field of anti-ageing. A substantial field of anti-ageing medical practice has also emerged, while a

dominant culture and policies stressing individual responsibility for health encourage rejuvenation consumption and practices as ethical imperatives. On the other hand, the extension of health duration favours state initiatives to extend working life and the erosion of welfare provision in old age. In this context, the recent expansion of anti-ageing bio-technoscience is closely related to a specific bio-politics of ageing, based on technologies of the self, in which «rational autonomy and self-determination are generated in connection with the acts of liberal power» (Moreira 2017, 37). It also opens growing opportunities to venture capital and to consumer demand for promissory biotech, thus becoming more susceptible to the conditions of neoliberal capitalism, while generating new dimensions of social inequality in access to the biotech antiaging market.

WG08-JS-23.4

AGUIAR, FERNANDO* (CSIC, Spain)

Emotion and Exclusion: Disgust, Contempt, and the 'welfare Queen' Stereotype

The stereotype of the "welfare queen," analyzed in Ange-Marie Hancock's (2004) groundbreaking book *The Politics of Disgust*, exemplifies the emotional forces that shape political discourse and public policy in the U.S. The term, popularized by Ronald Reagan during the 1976 presidential campaign, stigmatizes black single mothers by portraying them as manipulative individuals who exploit the welfare system for personal gain. This image is laden with emotions of disgust and contempt, reinforcing racial and gender biases that denigrate poor women. Hancock argues that this stereotype evokes public disgust, a moral emotion that distances the "welfare queen" from societal norms, casting her as morally deviant.

Disgust in this context does not simply express individual feelings, but becomes a political tool to justify harmful welfare policies. It reinforces narratives that link welfare dependency to laziness, uncontrolled reproduction, and financial irresponsibility, especially among marginalized communities. As a result, welfare reforms such as the introduction of Temporary Assistance for Needy Families (TANF) in 1996 have been shaped by this rhetoric, placing strict limits on assistance and reinforcing the view that welfare recipients are undeserving.

This talk explores how disgust fuels political narratives that both reflect and shape social attitudes toward poverty and race. Drawing on Hancock's work and recent research on the stigmatization of welfare, I argue that the "welfare queen" trope perpetuates a cycle of exclusion. It perpetuates systemic inequalities by justifying policies that punish rather than alleviate poverty. Through a sociological lens, I examine how disgust and contempt drive policymaking and create lasting social stigmas.

AGUIAR, FERNANDO* (CSIC, Spain)

CORRADI, GUIDO (Universidad Complutense de Madrid, Spain)

Emotions in Hiring: An Experimental Survey on Compassion and Intellectual Disability

The sociology of emotions has grown significantly in recent years, with some scholars referring to this shift as the "emotional or affective turn." Alongside this, the sociological study of compassion in complex market societies, shaped by inequalities and conflicts, is also gaining traction. This presentation aims to contribute to this growing body of research by exploring the role of compassion in hiring individuals with intellectual disabilities— a group that, though stigmatized, often evokes compassion, as highlighted by Susan Fiske's Stereotype Content Model.

By means of an experimental survey with a sample of 1,600 Spanish participants, we examine whether compassion influences the decision to hire individuals with intellectual disabilities, who frequently face stigmatization and exclusion in the labor market. It was initially hypothesized that compassion, as an emotional response to the suffering of others, would help reduce negative biases and foster more inclusive hiring practices.

However, the results revealed an unexpected finding: *compassion had a negative impact on the decision to hire individuals with intellectual disabilities*. Despite its power as a social emotion, compassion did not lead to positive action in this context. Instead, emotions like respect and pride, as well as perceptions of effort, played a more significant role in determining hiring decisions.

This research highlights the complexity of emotions in labor market behavior and suggests that, while compassion may be influential in some areas, respect and recognition of effort are more crucial in overcoming labor market stigmatization. The findings call for further exploration of how emotions interact to shape inclusive hiring practices, particularly for marginalized groups.

AHMAD, SANA* (Helmut Schmidt University, Germany)

Entrepreneurship and Meaningful Work in Gig Economy

Existing research has shown that migrant labor is crucial for the gig economy in Germany, particularly in ride-hailing, food and grocery delivery, and cleaning services. This literature includes how gig economy companies or platform companies act as migration infrastructures that mediate mobility of migrants in the local labor markets. Although platforms reduce barriers for migrants, work is precarious with short term or zero hour contracts, limited social protection and uncertain wages. Increasing use of algorithmic control to extract labor productivity has further implications for labor autonomy and bargaining possibilities. The paper here is interested in moving beyond the discussion of platform work as solely motivated by immigration mechanisms and labor market barriers by studying the transition from standard employment to crowdwork. I approach this question through the conceptual lens of 'meaningful work' and measure it through the dimensions of autonomy, self-actualization, social value, and safe and inclusive working conditions. These subjective perceptions are based in objective conditions including border policies in European Union and racial segmentation of labor market on one hand, and labor process, management control and discrimination at workplace on the other. The experience of meaningfulness but also precarity on these platforms informs workers' current and future strategies of creating ideal work scenarios, including their own entrepreneurial ventures. Data informing this research is based on document analysis and 15 semi-structured interviews including narrative elements with non-EU migrant workers who use both microwork and profession-based work platforms.

RC30-479.3

AHMAD, SANA* (Helmut Schmidt University, Germany)

Why Work? Seeking Meaningfulness in Platform Economy

Meaningful work has become an important subject of interest for organization scholars but also philosophers interested in understanding how it is a fundamental human need and a right. Despite the interdisciplinary interest, most of this research draws upon standard employment with autonomy and flexibility as focus points. Furthermore, what counts as meaningful work is based on research on native workers in the Global North, thereby creating a large research gap on what constitutes as meaningful work for workers in the Global South and minoritized population such as migrant workers. The paper here approaches the theme of 'Justice in the modern world of work' through a sociological inquiry of meaningful work in low wage service work in the platform economy. This includes on one hand, migrant crowdworkers in Germany who have moved from standard employment to crowdwork platforms in search for meaningfulness, and on the other, content moderators in India who work in psychologically distressing work of cleaning global social media platforms. Across both these sites, four dimensions of meaningful work are generated, namely autonomy, self actualization, social value, and safe and inclusive working conditions. These subjective perceptions are based in objective conditions including border policies in European Union and racial segmentation of labor market on one hand, and management control and labor agency in the labor process on the other. The analysis here goes on to show that experiences of meaningfulness undergo temporal shifts and are met with precarious nature of platform labor. At the same time, these experiences inform workers' current and future strategies of creating ideal work scenarios. Data informing this research is based on 66 semi-structured interviews with content moderators and platform management from India and 15 semistructured interviews including narrative elements with non-EU migrant crowdworkers in Germany.

Enacting Utopia(s) in Times of Contention – the Creation of Imaginaries through the Khartoum Sit-in

The city of Khartoum, caught in the middle of fights between the Sudanese Armed Forces and the Rapid Support Forces, is currently experiencing its destruction and leaving millions of people displaced. But before the capital city had become one of the epicenters of the war, it was also the locus of one of the largest sit-ins in the country during the years of the Third Sudanese Revolution. The sit-in in front of the military headquarters or 'itisam al-qiyyadah – one of several set up all over the country in April 2019 – lasted for 58 days, during which president Omar al-Bashir was ousted, but more importantly it became the physical and spatial manifestation of what some called "the liberated land". Aside from the physical restructuring, the setting up of infrastructures and the implementation security measures to accommodate people living and occupying the space, it also became to represent an alternative to the existing governing powers and governance

structures. Against this background and based on a triangulation of narrative and expert interviews, as well as visual analysis this paper aims to trace the creation and development of the sit-in space and understand the imaginaries that were created through the occupation of the military headquarters. It aims to understand the role of the creation of an alternative ecology during times of contention in catalyzing new imaginaries and the enactment of prefigurations. But it also asks, in how far already existing differences and rifts were also present in the sit-in and how these possibly affected the further trajectory of the revolution. Finally, it sheds light on the violent dispersal of the sit-in and how this event affected the perceptions of those imaginaries.

Forms of Knowledge in the Dual Vocational Training Regulations and Their Effect on Employment Trajectories

A person's vocational qualification is crucial for their position in the labour market (Woessmann, 2018). However, dual training occupations differ significantly in their characteristics. And because these occupational characteristics also affect employment trajectories, such as unemployment risk and occupational mobility, over the long term, it is essential to study these differences.

Little is known about how the content of training regulations influences careers, mainly due to a lack of data. In Germany, training regulations regulate the content of the training as well as the content of the subsequent examinations and are therefore strictly followed. Training regulations also offer valuable insights, as they consist of different types of knowledge, including specialized knowledge, manual skills, and process-oriented knowledge. It is to be expected that the advancing technological changes will affect the forms of knowledge taught to varying degrees. In addition, the returns on the labour market in Germany are also influenced differently by the forms of knowledge.

To analyse the effects of occupational characteristics on employment trajectories, we developed a systematic coding scheme for German dual training regulations. We categorized knowledge into three forms: process-oriented knowledge, specialized knowledge, and manual skills. Using this framework, we systematically categorized the regulations of the training occupations and combined this data with the NEPS SC4 dataset (Blossfeld & Roßbach, 2019), allowing us to consider individual selection effects and career trajectories.

Our hypothesis state that differences in labour market outcomes are linked to the type of knowledge taught in each occupation. The results will reveal how inequalities within the dual system manifest. This analysis will help inform decisions about updating training regulations and guide individuals in making more informed, long-term career choices. In addition, our novel knowledge categories for the respective dual training occupations can be used for occupational research (via the kldB).

AHSAN, MANZUMA* (East West University, Dhaka, Bangladesh)

The 'Chhuta Bua' Culture in Bangladesh : Exploring Women Empowerment in the Urban Informal Employment Sector

The 'Chhuta Bua' is the Bangla word for Temporary House Maids. Though Temporary House Maids involve both male and female, but the word 'Bua' (in 'Chhuta Bua') specially indicates the females. Following this, the profession has a feminized nature in its essence. These women are engaged as wage labourers, self-employed persons, unpaid family labour, piece-rate workers, and other hired labours mostly in the urban areas. Therefore, they are of great concerns for their contributions to fight the many odds of the society, particularly poverty. Poverty is a gruesome reality for Bangladesh among the other countries in global south. Despite the significant achievements in terms of growth in GDP, human development, and environmental responsiveness, Bangladesh still encounters a major challenge on poverty. This paper has made an effort in exploring the 'Chhuta Bua' culture in Bangladesh as a way of women empowerment among the poor women from the low-income settlements. By focusing the capital city of Dhaka, this study has extracted the stories of these women in terms of their status, abilities, and coping strategies in the informal employment sector. While exploring the 'Chhuta Bua's', the Pandemic situation due to novel coronavirus (covid-19) has been taken into consideration. By employing a qualitative research design, the study has found out that these women have been facing many adverse situations

starting from earning a low/insufficient income to problems of social crimes. There are few positive changes too (i.e., saving money to send their sons to abroad as migrant workers). All these have provided them a distinct way of life, a trait of potential abilities, and a significant coping strategies against the existing challenges. Finally this study has suggested that there should be guidelines from all stakeholders to help these women to gain meaningful insights for their empowerment within the informal sector in Bangladesh.

AHSAN, S M MONJURUL* (Center for Climate Justice- (CCJ-B), Bangladesh)

Impact of Climate Change on Local Communities of Southern Bengal: A Case Study in Dhangmari Village

The settlement of Dhangmari is located outside the polder 33 embankment in Dacope, Khulna, Bangladesh. The settlement now resembles a tiny island with the powerful Posur River flowing through the west and the relatively small Dhangmari River next to the Sunderban reserve forest in the east. Approximately 80% of the hamlet's land has already been eroded, and the village is currently under danger of being eroded from both sides of rivers. Reportedly, the village's river erosion is exacerbated by the tidal surges' with increased height as a result of climate change. The 1960s-era polder system that formerly safeguarded the community was already in ruins. The century-old community is currently vulnerable to cyclones, tidal surges, and other natural disasters.

Community is experiencing that cyclones are more frequent, tidal surges with more height which penetrates in the locality while agricultural production, diversity of fishes, wild life, birds, plants and trees are declining due to increasing salinity. All of the residents of Dhangmari village currently reside in a small, crowded area without access to basic civic amenities like clean water, sanitary facilities, housing, education, healthcare, and opportunities for employment. The lack of drinkable water to meet family demands for cleanliness and cleaning is a severe concern, especially for women. Again, the lack of fresh water and rising salinity are causing various water-borne illnesses and skin issues. The community is constantly in danger of being evicted from their ancestral land and becoming a climate refugee, just like millions of others.

Supporting Climate and Disaster Risk Financing at Community Level and Needed Devolution of Power at Local Government Institutions in Bangladesh

Although Bangladesh contributes a very small part of global emissions but most affected by extreme climate conditions due to its geographic location and flat, low-lying topography. As per the Disaster Management Act, 2012, the local government in Bangladesh is authorized to play a crucial role for disaster management and adaptation to climate change. Among tiers of Local Government Institutes (LGIs), the Union Parishad (UP) is the lowest tier of the local government's elected body, which has direct connection with the local community for providing services at the local level and has wider acceptance at the local community. However, this century old organization could not play its expected role for the disaster preparedness and adaptation activities and other services as per need in face of the adverse effects of climate change due to a lack of funds and manpower.

The study found that most of the government funds relating to climate change and disaster management are controlled by different government departments, while a tiny fraction of the fund can be reached at the local level from the Annual Development Plan (ADP) of the government budget as the planning process is centralized and those planning processes hardly consider the needs of the local government. Again, donor supported projects are time-bound; they lack the needed long term coordinated support. Again, donors have their own priorities and areas of interest for bilateral support for technical assistance, capital, and aid. The study argues that money should not be halted at the hands of central government; rather, a substantial proportion of the funding directly should be made available to local government institutions to support grassroots climate and disaster risk financing purposes. Again, donor's need to consider the specific needs of the local community regarding climate and disaster risks rather than their own agenda.

Later-Life Cohabitation in Progress: Navigating Agency through Everyday Care and Gender Dynamics

This paper explores gender dynamics of cohabitation as a new “peer-ageing” strategy in urban China, highlighting the emotional value of companionship in later-life partnerships. It presents cohabitation not only as an innovative eldercare strategy but also as a living arrangement that provides emotional and physical support. Matchmaking is one of the most popular methods for older singles in urban China to find a cohabiting partner. However, other contingent methods exist, such as introductions by friends or reconnecting with old friends or colleagues. Drawing upon rich fieldwork data collected in Beijing in 2023, including interviews and participant observation in elders’ matchmaking corners, this paper reveals that once a cohabitation unit is formed, cohabitators must negotiate their agency within the context of mutual dependence in daily life, particularly in light of the deinstitutionalization of marriage in later life. It begins with introducing the initial stage of “contract” drafting, then focuses on how male and female cohabitators share the responsibility of caring for one another while navigating their agency and gendered responsibilities through everyday family processes. It also examines how intergenerational relationships, involving family members, adult children, and grandchildren, influence these dynamics. This paper explores how the older cohabitators’ agency is negotiated in the daily lives of cohabitators and how intergenerational relationships reveal and impact the agency of older cohabitators within the family, highlighting the processes, challenges, and opportunities for seeking agency within the dynamics of family life. Furthermore, this paper compares other forms of later-life cohabitation strategies, including homosexual, homosocial, and group cohabitation. It compares the informal care received through heterosexual cohabitation with its agentic strategies and alternative possibilities, providing a supplementary extension to the discussion. Overall, men and women navigate agency and the accompanying gendered expectations differently, remaking gender norms through the process of negotiating care in later-life cohabitation.

RC11-162.5

AINIWAER, AIKEDAN* (University of Oxford, China)

Negotiating Agency and Expectations through Cohabitation: Dynamics of Elderly Matchmaking and Later-Life Romance in Urban China

This paper explores the formation and gender dynamics of cohabitation as a “peer-ageing” strategy in urban China, emphasizing the emotional and practical significance of companionship in later-life partnerships. Drawing on fieldwork data collected in Beijing 2023, including interviews, participant observation at matchmaking corners, and visual data, it investigates how older singles seeking cohabitation partners present themselves in public settings and how they interact, communicate, and negotiate their expectations for romance and care. The paper begins by introducing the history and development of matchmaking corners (Xiangqin Jiao) in the parks of modern Chinese cities, then moves to analyze the “E-Corner,” where WeChat groups—created through social networks established in the parks and managed by matchmakers—facilitate online interactions for older cohabitation seekers. It also explores matchmakers’ evolving role and power dynamics, both in physical spaces and online, in shaping these relationships. Moreover, the emergence of dancing, singing, and acting corners within the matchmaking space reflects older people’s agency in transforming public spaces to serve creative purposes. I also analyzed 237 dating profiles (those printed CVs that older people bring and present in the park) and examined how a social support network forms unintentionally in the name of “partner-seeking”. Nevertheless, contrasting with socioemotional selectivity theory (SST), which suggests that older individuals focus on emotionally meaningful goals as they age, this paper highlights a different perspective among elderly singles in Chinese matchmaking parks negotiating care through public matchmaking spaces. Rather than solely prioritising emotional fulfilment, many older individuals are driven by pragmatic and materialistic motivations rooted in concerns about livelihood insecurity. The paper analyzes how older men and women navigate their agency and expectations in the initial stages of cohabitation while dealing with the contradiction between their optimism and the intersection of gendered expectations, social pressures, and economic anxieties in contemporary China.

A Critical Examination of AI Integration in Moroccan Education for Inclusion: Historical Perspectives, Stakeholders, and Policy Outcomes

The integration of Artificial Intelligence (AI) in Moroccan secondary education has been promoted as a key strategy to enhance educational inclusion, particularly through educational policies. This study offers a critical analysis of the historical evolution of this policy, tracing its roots to broader global trends and Morocco's own educational reforms aimed at equity and modernization. By situating the current AI initiatives within the larger context of Morocco's digital transformation in education, we highlight the complex interplay between technological optimism and systemic challenges in fostering true inclusion.

The research draws on a multi-stakeholder approach, involving policymakers, educators, students, and technology providers, to uncover differing perspectives on the potential and limitations of AI. Key issues examined include disparities in access to AI-driven platforms, digital literacy gaps, and the role of AI in perpetuating existing inequalities rather than addressing them. Additionally, we assess the impact of these policies on historically marginalized groups, particularly rural students, girls, and students with disabilities, questioning whether AI truly delivers on its promise of inclusive education.

The findings suggest that while AI offers new opportunities for educational engagement, its effectiveness in promoting inclusion remains contingent on addressing deeper structural inequalities. The study concludes with policy recommendations aimed at ensuring that AI's integration is not only technologically sound but also socially just, contributing to a more equitable education system in Morocco.

Post-Truth in the Security Field: What Impact?

In the current post-truth era, standard verification methods, deemed to be intrinsically based on expertise, become mired under a nebulous mass of information where facts, opinions, propaganda, influence, manipulation, blurring of the lines between truth and falsehood, and indifference to the truth intermingle. A context where signs of erosion in trust in the ability of experts to generate the knowledge required for decision-making have reached a heightened degree, giving rise to a landscape marked by a tendency to bend the truth and adapt it.

This contribution focuses on investigating the dimensions of the impact of post-truth on security-related decision-making processes, supporting in passing the hypothesis that facets of post-truth have infiltrated various fields, including security, leading to a certain reduction in the quality of truth.

It aims to investigate the impacts of post-truth on security-related decision-making and contribute, through a mixed quali-quantitative approach, to the identification of the causative factors behind it. It has just supported the assertion that the phenomenon of post-truth fuels the fire of confusion between the true and the false and thus further complicates the task of identifying and grasping reality and subsequently making the right decisions, including in security matters. It underpins and contributes to warning and drawing attention to the crisis, duly acknowledged that our relationship with facts is undergoing today, a crisis with undeniably fundamental stakes that affect security and democracy foundations.

More precisely, the main contribution of this work is to highlight that post-truth presents a genuine challenge to the quest for discerning the truth and making sound decisions, particularly those with security implications, owing to technological, socio-philosophical, ideological, and operational reasons.

Challenging Hegemonic Narratives: Centering Marginalized Voices in the Study of Nationalism and Ethnicity

Historically, the study of nationalism and ethnicity has overlooked minority, indigenous, and subaltern perspectives, aligning instead with the worldviews and priorities of dominant nation-states, colonial powers, and ethnic majorities. This paper advocates for a transformative approach rooted in postcolonial, critical race, and feminist theoretical frameworks, emphasizing the perspectives and agency of marginalized groups. Drawing on Siniša Malešević's concept of 'grounded nationalism,' the presentation explores how nationalism is deeply integrated into contemporary life, manifesting in everyday domains such as sports, cultural practices, culinary traditions, and land identities. These manifestations illustrate nationalism's pervasive influence on societal symbols, rituals, and spatial arrangements, shaping both individual identities and collective consciousness.

By prioritizing marginalized voices, this presentation highlights how these communities conceive alternative notions of identity, belonging, and political mobilization, challenging dominant nationalist narratives. Through detailed case studies, it demonstrates how foregrounding marginalized perspectives offers profound insights into nationalism, ethnicity, and inter-group dynamics. Ultimately, this keynote argues for a reflexive, inclusive, and emancipatory approach to studying nationalism and ethnicity, positioning marginalized experiences as crucial frameworks for critically examining the socio-economic and political dynamics shaping contemporary global realities.

AIT MOUS, FADMA* (Hassan II University of Casablanca, Morocco)

Resilience and Justice: The Aït Débouille Ethos in Rural Moroccan Communities

Fatima Mernissi's *Aït Débouille* critically examines the stark disparities and lack of justice faced by rural communities in Morocco, particularly among the youth. Often marginalized in the development narrative, these communities have demonstrated remarkable resilience by establishing essential services such as electricity and potable water through their own ingenuity. Mernissi coins the term "Aït Débouille" to highlight their self-reliance, encapsulated in the motto "to manage or perish," which reflects a deep-rooted cultural ethos. During her visit to the Ghojdama, she was inspired by their collective efforts to install an electricity network, showcasing their ability to organize despite systemic neglect. Even amidst crises like COVID-19, these mountain dwellers continued to rely on their resourcefulness rather than waiting for external aid. Mernissi's work underscores how these communities, often overlooked by policymakers, embody a form of justice that challenges traditional frameworks, emphasizing the need for recognition and support of their grassroots initiatives.

Le Plaidoyer Associatif Pour La Protection d'Environnement Dans Le Moyen Atlas Au Maroc

Après la création des institutions étatiques de l'environnement, la protection de l'environnement devient une tâche sous le contrôle de l'Etat. Ces institutions mettent en œuvre des programmes étatiques de la protection de l'environnement. Mais, parfois ces programmes se heurtent au dysfonctionnement dans leur mise en œuvre à cause de lacunes dans la loi, du manque de contrôle de l'Etat ou de la cupidité capitaliste. Ce qui expose l'environnement à la destruction et la dégradation. Devant ce dilemme, La société marocaine, notamment la société rurale, s'est retrouvée face à un défi environnemental envers la protection de son environnement, notamment la surexploitation des ressources naturelles et la détérioration des écosystèmes. Ce qui mène l'action collective de ses acteurs à développer le plaidoyer associatif pour la protection de l'environnement comme une nouvelle forme de protestation, et un nouveau moyen de médiation entre l'Etat et la société. Cet article tente, par une démarche qualitative basée sur les entretiens semi-directifs, de mettre en évidence cette action collective dans la province Midelt au moyen Atlas du Maroc, il vise à montrer les mobilisations et les modalités de la lutte conduit par ces acteurs face aux inégalités environnementales. En citant quelques expériences de plaidoyer associatif pour la protection de l'environnement et le développement durable de la province de Midelt, cet article essaie de comprendre la position de ces acteurs dans l'arène environnementale de la région, leurs modalités d'intervention, les contraintes

auxquelles ils font face et les alternatives déployées. La valeur scientifique ajoutée de cette recherche est d'enrichir le champ sociologique marocain qui s'intéresse aux questions environnementales.

Strategies for the Survival of Catholic Secondary Schools in Japan's Declining Population Society

This study investigates the characteristics of Catholic high schools in Japan through a quantitative analysis of a 2024 survey conducted among private high school principals. Building on Kagawa, Kodama, and Aizawa's (2014) research, which underscored the historical importance of private high schools in Japan, this study delves deeper into the specific challenges Catholic schools face in a society with a declining population. Previous studies have shown that Christian schools significantly contributed to the development of private education in Japan, often producing students seen as "well-bred" (Sato 2006; Inoue et al. 2018). However, Catholic schools struggle with lower resilience compared to family- or business-run schools (Cummings 1997; Breaden & Goodman 2020). This study draws on data from 417 private high schools across Japan, with a 41% response rate (171 schools), including 40 Catholic institutions. Regression analysis reveals that urban-based schools and those with diversified curricula tend to have larger student populations, while Catholic schools generally have smaller enrollments. Despite their size, Catholic schools exhibited stronger community cohesion, with positive outcomes related to shared mottos and symbols that foster intergenerational belonging. However, the data show no significant impact on student relationships compared to non-religious schools. Based on these quantitative findings, this research concludes that while Catholic schools maintain strong communal identities, they face significant challenges in sustaining enrollment numbers amidst modern educational demands. In the upcoming presentation, qualitative interview results will also be discussed to provide a more comprehensive understanding of these trends.

Encounters and Lessons from Researching Nigerian Military Widows and Soldiers of the Boko Haram Conflict

The military is an institution that closely guards its methods and operations from outsiders. This presents unique challenges for researchers interested in studying the institution and its members. These challenges are evident in the Nigerian military, which has been engaged in conflicts with Islamist terrorist groups like Boko Haram and the Islamic State in the West African Province in the northeastern region of the country. The Nigerian military community has felt the impact of the conflict, resulting in thousands of military widows and a significant number of permanently incapacitated and deceased soldiers.

This presentation aims to reflect on the experiences and outcomes of conducting fieldwork on the Nigerian military. I conducted field research in 2021 and 2024 for my doctoral dissertation on Nigerian military widows of the Boko Haram conflict and for independent research on narratives of post-combat stress among Nigerian soldiers who have participated in the Boko Haram conflict. This presentation provides a sneak peek into how I accessed, navigated, and negotiated the Nigerian military during these two research engagements and how I utilized both formal and informal means to achieve this.

Reflections on the methods and approaches used to access the Nigerian military contribute to the global literature on methodological issues in military social research. They underscore the importance of researchers reflecting on their work and striving to produce critical and socially enlightening knowledge about the military. This approach can deepen our understanding of and engagement with the institution.

The Influence of Inequality across the Life Course: Gender and Health in Lebanon

Indicators of gender inequality include socioeconomic and social dimensions, both of which influence health over the life course. The Lebanese population has endured declining economic conditions, political instability and conflict, which likely create unique contextual factors that shape experiences of inequality for men and women, including health over the life course. In this paper, a profile of inequality regarding family structure and social relations, as well as education level and income in a lifenspan sample in Lebanon are presented. Data were drawn from a representative sample of adults aged 18 and older in Greater Beirut, Lebanon ($N = 500$). Descriptive analysis and structural equation models were conducted to examine gender patterns in inequality, and to investigate main and interactive effects of age, gender, and inequality on physical and psychological health. Women report on average lower levels of education and income. Social network size does not vary among men and women, yet women are less likely to be married. Female respondents reported worse physical and psychological health than male respondents on average. When we interact gender with age, we see that the gender difference in physical health is largest for older respondents. Female respondents also scored higher than male respondents on depressive symptoms, but the difference is reduced by about 33% and becomes non-significant after controlling for measures of inequality. Education level, above and beyond other indicators of inequality, explains the link between gender and health for both physical and psychological dimensions, and is most prominent among the oldest segment of the population. Findings suggest that gender inequalities are greatest in later life in Lebanon. The Lebanese context provides insights into the heterogeneity of gender experiences to showcase unique social, economic, and health needs over the life course.

AKAHORI, SABURO* (Tokyo Woman's Christian University, Japan)

A Copernican Revolution in Seeing Social Paradoxes

In this report, we attempt to construct a general theory of social paradox from the standpoint of sociocybernetics.

The so-called counter-productivity arguments have been made about schools, health care, and high-speed transportation; here we apply them to the subject of AI and social intelligence, testing hypotheses such as AI making people's intelligence more heteronomous and less autonomous, or people's behavior being controlled as a result of delegating decision-making to AI.

In the discussion of counter-productivity, von Foerster's conjecture is cited to describe the concern that individuals will become "trivial machines". From a sociological standpoint, however, the view that individuals are connected to each other or that individuals constitute society is too naive.

To convert the counter-productivity argument, which is based on cybernetics ideas of autonomy/heteronomy and control, into a more sociological form of consideration, it is useful to take the perspective of sociocybernetics, which takes communication system (*social system*) as an "observer," and it will be useful to ask what the blind spots in the "observation" are.

RC51-789.3

AKAHORI, SABURO* (Tokyo Woman's Christian University, Japan)

Observing Algorithmic Decision-Making: From the Perspective of Sociocybernetics

This report aims to explore a sociological framework for understanding algorithmic decision making and algorithmic decision support, which is becoming increasingly prevalent today.

First, we ask what the interpretive framework for AI is (how AI is interpreted by people, how *social systems* observe AI, second-order observations), independent of what AI itself is (first-order observations).

Next, we will focus on the point where "final judgment by humans" is the breaking point in the acceptance of decision-making by AI. Then we sort out what is being backgrounded in the series of interpretive schemes concerning AI. For example, who (or what) makes decisions, what is called decision-making, and how is the distinction drawn between AI decision-making and "human" decision-making, and so on.

As a result of the spread of algorithmic decision-making, it is expected that the pattern of social interpretive frameworks of "human," "self," "subject," and "decision-making" will change (*evolution of meaning*), and that will require sociology to abandon the representation of "human" as a theoretical starting point.

In conclusion, we point out that in cases where we can find a feedback loop between the subject making decisions and the object being decided, the key to understanding this issue is how to position the algorithm within that loop.

SADIKOĞLU, ZEHRA ZEYNEP (Istanbul University, Turkey)
KARAKAYA, M. FATİH (Istanbul University, Turkey)
AKYURT, MEHMET ALI (Istanbul University, Turkey)*Between Scylla and Charybdis: How Turkish Financial Mid-Level Managers Handle Challenges of Teleworking for Organizational Sustainability*

Many have been announcing that teleworking is the "new normal". While teleworking has historically been prevalent in knowledge-intensive sectors, it has become a widespread business practice during the Covid-19 pandemic. Empirical studies have demonstrated the positive effects of teleworking on various aspects of work performance, including efficiency, performance, autonomy, information technology skills, flexibility, and time savings. The rise in teleworking also has the potential to boost women employment, cut greenhouse gases and slow urbanization, which align with the sustainable development goals, although integrated policies are required to address challenges including work-life balance, energy consumption, sedentary lifestyles, time constraints, and social isolation. Nevertheless, the recent decision by big corporations (such as Alphabet and Apple) to recall their employees back to the office suggests that there are some underlying issues with teleworking. In this context, to gain insight into the relation between organizational sustainability and teleworking we conducted in-depth interviews with employees of one of Türkiye's major commercial banks who were gradually recalled as of summer 2024. Our preliminary findings indicate that the parameters affecting this relation from the employees' perspectives are the requirements of the department, organizational position, changing work motivations across generations, socialization as a means of satisfaction, and other parameters (family life, time budgeting, and so on). The results also demonstrate that organizations encounter an impasse in achieving organizational sustainability through teleworking that pertains to group dynamics, including organizational climate, organizational culture, and organizational learning. In addressing this impasse, it becomes evident that those occupying mid-level managerial positions assume a proxy mission that links lower-level staff with upper-level managers both of whom face difficulties in navigating the complexities of teleworking. This study examines the challenges mid-level managers in the finance sector encountered and the practices they developed in response to them in fulfilling their proxy mission.

RC17-250.1

ÅKERSTRØM ANDERSEN, NIELS* (Copenhagen Business School, Denmark)

Saying No to Structures Is to Say No to Regulated Conflicts

The Danish welfare state is currently undergoing yet another wave of debureaucratization, characterized by buzzwords such as “turn everything upside down,” “liberation,” “agility,” “flexibility,” “think outside the box,” “we’ll pave the road as we go,” and “break away from tradition.” Unlike earlier debureaucratization reforms, it is no longer just specific structures being targeted. This is an attack on structures in general, including laws and regulations, professional expertise, and organizational structures. The ideal is temporariness.

For instance, when a vulnerable citizen approaches the social administration today with a request for a particular service, they no longer receive a simple yes or no. The social administration typically responds: “we need to discuss this further.” Legal administrative decisions are postponed as long as possible. The effect is that the citizen cannot complain or disagree with the administration because there is nothing to disagree with. One never receives a rejection, and therefore no reasoning. “Maybe” is the only answer the administration provides.

This paper addresses how the formal administration, which emerged in Denmark from the 1860s, recognized and institutionalized the value of conflicts with citizens. The article will analyze how formal administration invited conflicts and how conflicts became a kind of creative immune mechanism for public administration. Thus, the article tries to argue for a close connection between the form of “formal administration” and the acceptance of conflicts. When today’s reforms dismantle all kinds of structures, they also dismantle the citizens’ ability to say no. The new debureaucratization expresses a kind of autoimmune reaction that combats the possibility of conflicts.

The article theoretically draws on thinkers such as Niklas Luhmann, Roberto Esposito, Hannah Richter, Jacques Derrida, and Peter Sloterdijk.

RC05-83.3

AKRIMI, YASMINE* (Ghent University, Tunisia)

Racialized Modernities: Gender and the Chromatic Economy of Contemporary Tunisia

My paper explores the cultural dimensions of race in postcolonial Tunisia, moving beyond traditional analyses that focus on structural racism (e.g., legal inequalities, segregation, access to public services). Drawing on Ergin’s concept of “chromatism,” (Ergin, 2008; 2016) a fascination with skin color and physiognomic features, I examine how racial metaphors shape Tunisian modernity, particularly through the dualistic understanding of whiteness as both physical appearance and a colonial mode of thought (Khiari, 2016). In contrast to overtly racist acts, I focus on how racialized ideas about “Tunisianity” subtly inform everyday life, influencing norms and tastes. These chromatic imageries, deeply rooted in Tunisia’s complex negotiations with modernity, persist in mundane aspects of daily life, shaping societal distinctions and cultural preferences.

Through a combination of ethnographic and digital fieldwork, I look at the marketing of skin-whitening products in contemporary Tunisia, particularly through the lens of ‘aesthetic entrepreneurs’—social media beauty influencers who sell these products by capitalizing on shifting western ideals of white beauty. I argue that while social media may suggest an increase in racial diversity, it simultaneously reinforces anti-Black racism and Tunisia’s epistemological dependence on the West. Black Tunisian women, in particular, face heightened marginalization due to deviations from these normative beauty standards. My overarching argument is that to understand racism in Tunisia, we must integrate the region into the global framework of white supremacy, particularly under neoliberalism, and move beyond the exclusive traditional focus on the legacy of trans-Saharan slavery.

AKSOY, OZAN* (University College London, United Kingdom)

SONMEZ, BURAK (University College London, United Kingdom)

Educational Policies and the Socialisation of Youth in Civic Values: Evidence from the 2015 Fundamental British Values Initiative

In 2014, the Department for Education in the United Kingdom, in conjunction with the Government’s Prevent plan, launched an initiative instructing all schools to promote “Fundamental British Values” (FBV) comprising “democracy,

rule of law, individual liberty, mutual respect and tolerance of those with different faiths and beliefs”. The ultimate aims of the policy are to promote a shared “Britishness” and prevent violent extremism. Concerns were raised about the policy’s overall effectiveness, and that rather than instilling those values, it may alienate minorities. No research, however, has systematically evaluated the long-term consequences of the FBV initiative. This paper evaluates the FBV initiative in terms of both its intended and potentially unintended consequences. This aim is attained by (1) comparing cohorts of citizens graduated from lower-secondary school right before the initiative with those who graduated after; and (2) comparing graduates in England who were under the FBV jurisdiction with those in Wales, Northern Ireland, and Scotland for whom the Prevent and FBV initiatives did not apply as strongly. The paper makes use of various data sources such as the British Census, Understanding Society Survey, and the Integrated Values Survey. Overall, the study presents the first systematic evidence base on the long-term, large-scale, intended and possibly unintended consequences of the FBV initiative. Ultimately, the findings address questions related to the mechanisms of socialisation of youth, development of civic and political values, and the extent to which large-scale educational policies can affect these mechanisms.

AKTAŞ, DENİZ* (VU Amsterdam & KU Leuven, Netherlands)

The (F)rictions between (non)Whites and Whiteness in the Netherlands: Race, Religion, and Christian-Muslim Intimacies

How can the concept of whiteness be understood and applied in the Netherlands? This paper examines the socio-cultural constructions and expressions of whiteness that are multiply (re)formed, often contradictory, and contingent upon its various racialized Others within the Dutch context. In the Netherlands, where the notion of “race” is still virtually an inadequate paradigm, whiteness operates as a convoluted and shifting signifier, intricately entangled with religion, ethnicity, and class. To explore these relational and entangled formations on a more intersubjective micro-level, this paper draws on ethnographic insights from Christian-Muslim couples in the Netherlands, focusing on how these formations are understood, experienced, questioned, and challenged by the couples themselves. Given the co-constitutive relation between race and religion, particularly in the context of European nativist discourses that correlate whiteness with Christianity and/or secularism—and thus Europeanness, often in opposition to Islam—examining the discursive accounts and experiences of Christian-Muslim couples, where each partner embodies different degrees of normativity, can provide us deeper insights into the ambivalent, contextual, as well as malleable forms of whiteness. By contemplating on whiteness as a valid category of analysis and putting it in a conversation with other modes of differentiation, particularly Christianity and secularism, I explore how it functions as an instantaneous element of natural belonging to the nation for certain racialized groups, an indelible mark of foreignness for others, and as a site of provisional acceptance or impossible inclusion for some. By highlighting the intimate lives of these couples, I aim to go beyond asserting the normative and invisibilized construction of whiteness, and instead, explore its divergent registers, forms, and expressions, which can, in turn, contribute to the ongoing scholarly and activist efforts of anti-racism and socio-cultural change.

What’s in a Name? on Religious Identities, Methodological Challenges, and Responsibilities

In this paper, I examine the methodological issues surrounding the construction, use, and implications of categories such as “Muslim,” “religious,” and “minority” within the context of European Muslim subjectivities, drawing on ethnographic insights from Christian-Muslim couples in the Netherlands. Who gets to define such notions and categories, under what conditions, and how are they then ‘lived’? By understanding these categories as situated within a relationship between broader regimes of structural control—legal, sovereign, and discursive—and as floating signifiers that generate relational meanings depending on time, place, setting, and purpose, I look at the conditions of possibility for these categorizations to function and explore what it means to destabilize their presence as fixed referents. Ethnographic research frequently takes self-identification as a given, but the contradictions and ambiguities in lived experiences challenge static classifications. How should the researcher navigate moments when interlocutors’ definitions and categorizations diverge from their own, or when categories such as “Muslim” and “religious” are not shared or stabilized in the interview context? Should the researcher go along with self-identifications, push against them, focus on non-verbal cues and other modes of expression, or recognize them as symptomatic of a deeper structural impossibility? And what kind of social and political effects do such decisions have? The stakes of these methodological questions are heightened in the case of Muslims in European contexts, where they are often under scrutiny, and in intimate interreligious dynamics, such as

those between Muslims and (secular) Christians, these stakes are particularly pronounced. This paper resists the impulse to render minoritized Muslim subjects merely as objects of analysis through the binary of sameness/difference; instead, it interrogates the methodological imperatives of defining and naming—by whom, for whom, and to what end—and examines how such definitions inscribe and delimit particular forms of life.

Narratives of Hope Among the Formerly Homeless People in Istanbul

While Bloch's conception based on the suspension of the human condition between being and not-yet-being, as opposed to being and non-being, opens a space for hope, Arendt's emphasis on labor and emancipation provides a concrete program for future expectations. The hope that emerges from the tension between individual isolation and collective practices is vital for society as a whole, but it is even more important for those on the margins, as a kind of validation and safeguard for the hope of the broader society. Studies of homeless people as one of the marginalized groups pay much attention to the act of escaping homelessness, yet the emotional dimensions of this process remain underexplored in sociological research. This qualitative study focuses on the personal stories and experiences of formerly homeless people, exploring themes of recovery, resilience, overcoming homelessness and reintegration, with a particular focus on the emotions surrounding the process of overcoming homelessness, particularly hope. Supported by Scientific and Technological Research Council of Türkiye (TÜBİTAK, 121K287), this 24-month research project was conducted between 2021 and 2023. In-depth interviews with 81 participants (service providers and formerly homeless people) and 120 hours of observation were carried out in Istanbul. The hope narratives of formerly homeless people offer a glimpse of hope both from the past and the future, as they are success stories that have not yet been fully realized. These individuals navigate lives divided between concerns about becoming homeless again, the quality of their current lives, and their plans for the future. What causes them to lose and regain hope? In addition to Ravenhill's four catalysts - hitting bottom, lifestyle becoming too much, sudden shock/trauma, and someone caring - factors such as marriage, having children, supportive social circles, respectful coworkers, full-time employment, and distance from the past are key contributors to rebuilding hope.

AL-HARDAN, ANAHEED* (Howard University, USA)

Palestinian Anticolonial National Liberation in the Present

This paper examines a group of anticolonial and anti-imperialist intellectuals of different political persuasions (nationalist, Marxist) thinking on Palestinian anticolonial national liberation at key moments in Palestinian history. It argues that central to these thinkers and their analyses is a collapse in distinction between 1948- and 1967- occupied Palestine in Zionist settlercolonial ambitions; the umbilical relationship between Zionism and US-Euro imperialism; as well as the centrality of Arab ruling classes to Zionist hegemony in Palestine. This paper extends this thinking to the question of Palestinian anticolonial national liberation in the present.

AL-ORAIMI, SUAAD ZAYED* (UAE University, United Arab Emirates)

Breaking Barriers: Emirati Women, Feminism and Challenges to the Status Quo

This paper investigates women's perceptions of feminism in the 21st-century in the United Arab Emirates. As an oil-rich country located in the Arab Gulf, traditionally composed of traditional tribal sheikhdoms, the UAE has achieved advanced levels of human, social and economic development. It has provided educational opportunities for women in tandem with men, as well as empowering women to pursue decision-making positions. Yet despite the opportunities afforded to women by the state, questions still remain about whether they can develop feminist subjectivity and leadership capabilities in the face of prevailing traditional cultural norms and values. In this study we investigate what barriers exist to challenging the status quo. Using a qualitative study comprised of face-to-face interviews and focus group discussions, we

set out to ascertain how women view mobility, social freedom and feminism. We find that while the nature of male authority has indeed changed within the society, the demographics of the UAE have placed cultural stress on women to fulfil role expectations within the family, extended kinship networks and wider society. We argue that a form of neo-patriarchy has emerged, which now replaces original forms of domination. In practice this means that although women have gained higher positions in the decision-making arena, the opportunities for change that were envisaged are also entangled within social and cultural expectations in the society and home. The net result is that women's emancipation and familial expectations walk side by side in the UAE, creating outcomes and tensions that are hard to overcome.

BYRNE, CAT (Save the Children International, United Kingdom)

Palestinian Childhoods: Exploring Mother and Child Love and Affection in a Conflict Zone

Through a case study approach, this paper seeks to explore the physical interactions between children and their mothers in a conflict zone. By focusing on Gaza since 7 October 2023, we outline our joint activities between children and mothers/caregivers. In particular, we focus on physical affection between mothers and children in safe spaces created by our Save the Children projects in the Gaza strip. During this activity, the impact of war on the social and emotional bonds between the child and the source of security (the mother/caregiver) come into sharp focus. This paper seeks to highlight the practice-based work in which we engage. For example, some mothers cry because this is the first time they have hugged their child in a long time. Notably, mothers do not find the space to express physical affection for their children due to being occupied with exhausting daily tasks to provide basic needs for everyday survival, such as providing firewood, cooking, baking and washing. Some children stay longer in the hug and do not want to leave their mother. In a few cases, children refuse to hug their mothers, which makes us provide individual attention to such cases. Our project's action-oriented approach reveals that many mothers themselves identified that the project's dedicated activity caught their attention; and it highlighted the importance of strengthening the relationship with their children. They reported their own realisation of their busy lives, and how this was preventing them from meeting their children's social and psychological needs, which are no less important than the basic needs of food. In this paper, in addition to mothers' meaning-making; we identify key areas of concern impacting Palestinian childhood in a war zone. Our findings demonstrate a wider significance.

ALAA, BADR* (Sciences Po Paris, France)

Public Pedagogy As an Agent of Social Transformation in Post-2011 Arab Societies.

The Post-2011 Arab world witnessed a profound disillusionment with public intellectuals, whose response to the uprisings was either silence or, worse, opposition, thereby betraying **their social role**. However, this void was quickly filled by a younger generation of knowledge producers who did not fit the traditional 'category' of the public intellectual and were dismissed as a result. This was because they departed from their elders' modus operandi and adopted novel mechanisms for engaging with their audience, particularly an emphasis on the collective co-creation of knowledge and its dissemination through **public pedagogy (PP)**.

It is within this context that the presentation explores the relationship between society and sociology through the prism of PP. It argues that PP serves as both a **means** to teach sociological theories and an **end** by transforming societal relationships and attitudes towards sociological knowledge, as well as communities of knowledge creators. My case studies include *el Da7ee7* YouTube show, *CILAS* education program, and the *Sekket Ma3aref* public lecture series. All three were created after 2011 and have succeeded in (1) providing Egyptian audiences with sociological knowledge and (2) shaping the way citizens interact with their social context—emotionally, politically, and economically. These three instances of PP exemplify a **dialectical** relationship between sociology and society, where both continually influence one another. For example, the uprisings changed Arab societies' social makeup, leading to a shift in the definition of the public intellectual, which, in turn, prompted further alterations in social structures. One aspect of this transformation is the blurring of boundaries between social roles: the boundary between educators and activists has brought together theory and praxis, while the boundary between the public and private spheres helped evade censorship. Furthermore, the blurred line between teacher and student has emphasized a liberating pedagogy, granting greater political agency.

ALAM, JAN* (Department of Sociology, Kohat University of Science and Technology, Kohat KPK, Pakistan)

Religious Identity and Politics: Exploring the Causes of the Political Persecution of Religious Minorities in Kohat District, Pakistan

Religious minorities are victims of political isolation and persecution in societies, where they are subject to violence and discrimination. This study was undertaken in a terrorism-affected area to explore those elements that subjugate and suppress religious minorities' political participation and representation. To conduct an in-depth analysis, a qualitative inquiry was used for data collection and analysis. The researcher interviewed thirteen Christians, seven Hindus, and six Sikhs, using a purposive sampling technique and a semi-structured interview guide. The primary data were analyzed using the thematic analysis technique. The researcher found that some of the underlying factors behind the political persecution are leadership vacuum, political neglect, post-election negligence, vote dislocation, political ignorance, and political subordination. This study presented a framework for policymakers to solve minorities' political problems, and for researchers to better understand the minorities' political oppression on local and international levels.

Language, Society and AI Large Language Models: Challenges for the Sociology of Language

The imitation of human languages is at the heart of what is known as generative AI or large language models (LLMs). Different types of linguistic representation systems are subject to this technological revolution. To cite key ones: a) natural language; b) numerical languages or c) programming languages.

Current trends suggests that we are on a new edge of the revolution from print to digital capitalism (Anderson 1991, Coulmas 2022). Although the increasing number of documents on the topic, the understanding of large language models nearly lacks original approaches from the sociology of language regarding this technological change. Some disciplines in the social sciences and humanities, especially those significantly affected, like Translation and Interpretation Studies, have recently turned to studying this phenomenon due to the risks of re-skilling and job displacement that LLMs entail. Nevertheless, based on recent reviews of scientific literature by our research group, the sociology of language, the economics of language, or sociolinguistics have not yet analyzed this phenomenon with enough emphasis nor academic discussion.

Based on 131 documents obtained from a systematic literature review on "social sciences", "LLMs" and "Generative AI" (among other keywords and filters we will detail), in this presentation we identify five groups of contributions with relevant implications for the sociology of language, which we classify and name as follows: a) LLMs and Print/Digital Capitalism (Coulmas 2022); b) Division of Labor, Work, and LLMs; c) AI Symbolic representation, power and identity, d) human-computer ethics and common sense building in the AI digital sphere, and e) Language Policy and Planning, including language diversity, in the Age of AI.

By exploring these areas, we aim to shed light on the implications of LLMs from a sociology of language perspective and encourage a deeper engagement with this emerging technological phenomenon.

Large Language Models and Symbolic Analysts: Re-Skilling and Job Displacement Among Journalists, Accountants, and Software Developers

Building upon Reich's (1991) classification of worker types and the relevance of Print/Digital Capitalism (Coulmas, 2022), this paper analyzes to what extent Large Language Models (LLMs) of generative AI imply re-skilling and job displacement among qualified workers. Our research questions focus on the extent to which language models, considered as symbol systems—including natural languages, numeric systems, and programming languages—are key in job performance, and how different types of workers are exposed to generative AI.

The automation of complex writing/speech, numerical calculations, and programming abilities challenges classical views on which groups are most exposed to technological change. The "linguistic part of work" (in our case 3 types of linguistic systems: natural language, numerical, software programming) is crucial in the knowledge economy; thus, machines capable of producing written text or "natural" speech are essential factors in understanding transformations in skilled labor.

Our methodology involves conducting in-depth interviews with 20 individuals from each of three professions that work with linguistic symbols: journalists, accountants, and software developers, totaling 60 interviews in Tarragona, Spain. The interviews capture experiences, perceptions, and strategies related to LLMs' impact on their professions. Data analysis focuses on AI tools, management changes, common themes and differences regarding re-skilling needs and job displacement risks.

By examining these professions, which represent three different types of symbolic/language systems, the study aims to deepen understanding of how generative AI affects symbolic analysts and to inform policy and educational strategies to mitigate adverse impacts while leveraging professional development opportunities. The findings are expected to provide insights into the evolving nature of work in the AI era and to challenge or support existing theories about technological displacement and the future of skilled labor.

ALBANESE, ANTONINA* (Università degli Studi di Palermo, Italy)

Money Transfer Locations: From Core to Margins? Border, Spatiality, and Participatory Insights from the City of Palermo

This paper explores the evolving concept of 'dirty work', traditionally associated with stigmatised occupations perceived as degrading or morally compromised, expanding it to encompass a wider range of professional roles that challenge established boundaries. The study aims to contribute to the ongoing discourse on 'dirty work' by focusing on the role of money transfer operators in urban settings, with specific reference to the city of Palermo. Palermo's 81 money transfers—47 of which are operated by migrant-run businesses—act as critical infrastructure, facilitating the formation of cross-border identities and recognition, whilst also making a significant contribution to both the local and transnational economies.

By positioning money transfer work within the existing literature, this research highlights the tension between the material and symbolic dimensions of the profession. Workers in these roles frequently confront societal stigmas associated with migrant status, financial transactions viewed as having low prestige, and the perception of informality surrounding their operations. However, these individuals actively reshape their professional identities by providing services that meet the financial needs of migrant and EU populations. The spatial distribution of money transfer outlets across Palermo underlines their significance as economic nodes and social institutions, embedded in the fabric of community life. Preliminary observations suggest that migrant-operated outlets primarily cater to the needs of remittances, whereas those owned by nationals tend to serve the financial demands of EU citizens.

The paper further investigates the agency of money transfer workers in navigating physical and symbolic borders, fostering community resistance, and facilitating pathways to financial inclusion. By rethinking the context of emerging professions, particularly in marginalised settings, this analysis offers new insights into how stigmatised labour can act as a transformative force. In doing so, it enriches the sociology of work by bridging the gap between stigmatised occupations and their potential to drive social and economic change.

Italian Retirees Abroad: New Horizons for Aging and Quality of Life

Aging is increasingly seen not just as a biological process, but as an opportunity to enhance quality of life and well-being. This research, grounded in the life course framework (Elder et al., 2002) and the theory of "successful aging" (Rowe & Kahn, 1997), explores how Italian retirees are redefining aging by migrating to countries with favorable climatic and economic conditions, such as Tunisia, Portugal, Spain, and Albania. These moves are deliberate choices aimed at improving lifestyle and financial stability during retirement.

Fieldwork was conducted in these countries, which have a growing presence of Italian retirees. We spent 10-15 days in each location, conducting 80-90 semi-structured interviews with Italian retirees and key local stakeholders, such as association leaders, Comites representatives, and patronati. While not representative of the entire migrant population, these interviews offer rich insights into the motivations, challenges, and benefits of retirement migration.

The findings reveal that retirees experience significant improvements in quality of life, driven by lower costs of living, favorable tax regimes, and better climates, rather than a deep integration into local communities. This pattern reflects broader trends of transnational aging, where older adults maintain strong ties to their home country while optimizing their lifestyle abroad.

This study expands the sociological understanding of aging and migration by focusing on how Italian retirees reshape the aging process through transnational choices. It contrasts their experiences with more vulnerable elderly populations in Italy and explores the broader implications of lifestyle migration for host countries, particularly regarding the growing demand for eldercare workers.

Our findings contribute to the literature on transnational aging, highlighting how migration in later life can redefine aging as a time of personal growth and well-being.

RC11-JS-156.3

ALBERIO, MARCO* (Università di Bologna, Italy)
LOMONACO, ALICE (University of Bologna, Italy)

Redefining Aging through Transnational Mobility: The Case of Italian Retirees

This paper investigates the mobility experiences of Italian retirees who relocate to countries offering favorable climatic and economic conditions, such as Tunisia, Portugal, Spain, and Albania. Traditionally, aging and migration have been viewed as separate processes; however, this study highlights how older adults are challenging these conventional frameworks by embracing migration as a strategy for enhancing their later life. Drawing on the life course perspective (Elder et al., 2002; Heinz & Kruger, 2001) and the theory of "successful aging" (Rowe & Kahn, 1997), we examine how Italian retirees navigate this transnational landscape in pursuit of improved well-being.

The research is based on 80-90 semi-structured interviews conducted with Italian retirees and key stakeholders, including representatives from expatriate associations, Comites, and patronati, in the aforementioned countries. Although the sample is not representative of the entire retiree population, the qualitative data provide nuanced insights into the complex motivations, challenges, and socio-economic impacts of retirement migration. The findings suggest that these retirees are primarily driven by the desire to enhance their quality of life, benefiting from lower living costs, favorable tax regimes, and more temperate climates. Unlike traditional migration flows, integration into local communities is not a priority; instead, these retirees maintain strong transnational ties with Italy, contributing to a form of aging that transcends national borders.

This study also explores the precariousness that some retirees face in adapting to new social and economic environments. Additionally, it addresses the broader socio-economic implications of this form of mobility, such as the impact on local real estate markets and the increasing demand for eldercare services. These findings contribute to a growing body of literature that seeks to understand the intersection of aging and migration, offering new perspectives on how later-life mobility can reshape aging experiences while reflecting broader global inequalities.

RC53-811.2

ALBERTH, LARS* (Leuphana University of Lüneburg, Germany)

Of Specific Children and Seperative Institutions: A Model Case of Research Ethics in German Childhood Studies

Taking up Monika Krause's concept of "model cases" in Sociology, recent literature from German-speaking childhood studies explicitly reflecting research ethics was inductively analyzed. Thus, the "specific child in institutionally segregating contexts" embodies the respective model case in those applied research ethical considerations.

The empirical basis of the sample mainly consists of qualitative, primarily ethnographic or interview-based research with individual children or smaller groups of children in educational and care institutions. These children are thus sought out in social contexts that allow the researchers easy access, precisely because these institutions remove children from wider social srenas (e.g. from their families and friendship networks) and transfer them into areas that are spatially, temporally, functionally and symbolically tailored to childhood.

Based on this model case, four primary epistemic objects were identified, which govern the research-ethical reflection of research on children and childhood:

- the relationship between adult researchers and participating children,
- the complicity of participants with the generational order,
- a research ethical stance for research with children, and
- scientific authority in childhood research.

While these considerations are highly self-reflective in nature, they value ethical stance/habitus over standards of procedures.

ALCALÀ I RAMS, MARC* (Universitat Autònoma de Barcelona, Spain)

Identities and Senses of Belonging of Koreans from and in Catalonia and Spain: Rethinking Methodological Nationalism.

The population of Korean origin in Spain (including permanent residents, descendants of Koreans, temporary workers, exchange students and other cases) is an understudied community compared to other communities of Asian origin such as the Chinese. Yet, it stands out as a relevant empirical case for the study of nationalism and ethnicity because of the complex notions of Koreanness that the Korean people handle after the consequences of Japanese colonization (mainly, the division into two different states, and a worldwide diaspora of 7 million people, with specific minorities such as the Chaoxianzu, the Zainichi and the Koryo-saram) and the multiple national identities present in Spain, all while Korean culture becomes increasingly popular around them. More specifically, I focus on those living in the political and administrative division of Catalonia (mostly in the city of Barcelona) and accounting for half of the community, who face the challenge of keeping their ties to Korea and to Koreanness while navigating between two other (often contrasting) identities within the broader concept of Europe: a Spanish one aligned with the nation-state (for which they are expected to know the Spanish language) and a Catalan one associated with what is locally known as a "historical nationality" (for which they might be expected to use the Catalan language). Through a combination of ethnographic fieldwork in Barcelona, in-depth qualitative interviews and personal network analysis with members of the Korean community in Spain, I explore their past and current expectations as Asian immigrants or descendants of immigrants in Europe, their experiences of racism and discrimination in Spain, their identities as members of the Korean diaspora and their senses of belonging to the host society. As a particularly relevant outcome of this analysis, I discuss the implications that this combination of multiple identities might have for methodological nationalism, and transnationalism.

La Violencia Online Contra Las Mujeres y Las Niñas: Cambios y Continuidades Respecto De La Violencia Offline

Las tecnologías digitales se han difundido exponencialmente en los últimos años: son utilizadas por el 67% de la población mundial ofrecen oportunidades en distintos ámbitos sociales. Investigaciones feministas e informes internacionales respaldan que el espacio digital se está convirtiendo en un ámbito peligrosos para mujeres y niñas al favorecer el surgimiento de nuevas formas de violencia online que evidencian la continuidad de las desigualdades y de la dominación patriarcal. La violencia contra las mujeres se incluyó en la agenda política internacional con la aprobación de la Declaración sobre la

eliminación de la violencia contra la mujer (1993) estableciendo los ámbitos donde se podía desarrollar la violencia así como la responsabilidad de los estados para atacarla. El objetivo de la comunicación se centra en analizar los tipos de violencia ejercida online sobre las mujeres en España, favorecidos por el anonimato, la difusión de contenidos y la facilidad de acceso al espacio digital. La metodología utilizada es cuantitativa y documental analizando estadísticas y encuestas que presentan datos sobre la ciberviolencia en el espacio digital. Las conclusiones apuntan a una expansión de estos comportamientos que hacen necesaria su regulación normativa por los estados y plataformas así como favorecer una educación digital que conciencie a usuarios y usuarias de los peligros que entraña el uso de las redes sociales.

Critical Perspectives on Subjective Well-Being Indicators

This paper critically examines the use of subjective well-being indicators, particularly in the context of non-Western and developing nations. Dominant frameworks for measuring subjective well-being, often rooted in individualistic and Western-centric perspectives, have come under scrutiny for their limitations in capturing the complexity of well-being across diverse cultural and socioeconomic contexts. These approaches typically emphasize life satisfaction, happiness, and material conditions but often overlook the relational, cultural, and contextual factors that shape well-being in non-Western societies.

The paper explores alternative approaches, particularly the relational well-being framework, which emphasizes the interconnectedness of individuals, communities, and their environments. By examining how traditional subjective well-being indicators perform in contrasting environments such as Timor-Leste and Mongolia, the paper highlights the challenges of relying on universal, quantitative measures. Using data from national surveys in these countries, the analysis delves into how these indicators align—or fail to align—with the lived experiences of different population groups, taking into account the socio-cultural, political, and economic dimensions that influence well-being.

The paper argues for a more context-sensitive approach to well-being research, advocating for the integration of qualitative and relational indicators to better reflect the diverse realities of subjective well-being, particularly in young and developing democracies. It also discusses the potential implications for policy and development interventions aimed at improving the quality of life in the Global South.

ALEXANDRA, ANA* (Université de Montréal, Canada)

An Intersectional Politics of Hope: Building Deep Coalitions in Resistance to Anti-Gender Politics

Over the past decades, the progress made by LGBTQIA+ and feminist movements has encountered obstacles posed by the growth and solidification of anti-gender mobilizations. These movements, at times successful, have contributed to a rollback and dismantling of policies and institutions supporting gender emancipation, being part of larger trends of democratic backsliding. While the expanding literature on anti-gender campaigns has allowed us to gain insights about the larger political project of those involved, we know less about resistance to anti-gender politics. Existing research tends to narrow its focus on single-issue movements or campaigns, often overlooking the multitude of actors involved and the interconnected nature of the targeted issues. When considering the diversity of actors, studies frequently operate under the assumption that specific social groups (women, LGBTQIA+, racialized people) are “natural” allies, failing to address the underlying tensions and challenges in the formation of coalitions and the processes that establish and perpetuate boundaries between actors. This research investigates the building of **deep coalitions** across non-dominant communities, targeted by anti-gender politics, by exploring the ways to overcome the obstacles in going towards each other and engaging in complex communication. The study poses **deep coalitions** at the basis of an **intersectional** politics of hope. Although coalition work is challenging, due to enduring separations among people, it harbors the potential to establish a relationship among the terms of the alliance and to ensure the co-existence of different groups, rather than building a collective identity based on the opposition towards the antagonist, whether institutions or actors that produce vulnerability.

RC02-41.5

ALEXANDRA, KEINER* (Weizenbaum Institute, Germany)

Migrant Money: Financial Infrastructures for Remittances

Every year, millions of migrants send money to family and friends in their home countries. By 2022, these remittances have reached more than \$647 billion - three times the amount of official development assistance. To send money, migrants use either informal channels or channels provided by private companies, such as banks and money transfer companies, which charge high fees or require long waiting times. Remittances are also often considered risky or suspicious by countries and companies because of the lack of traceability of transaction channels, or because migrants themselves and their money transactions are perceived as suspicious.

Digital technologies promise to make international payments, including remittances, more convenient, cheaper and faster through borderless communication channels. Although fees for digital transaction services are now cheaper than those for cash, the extent to which digital services actually lead to greater inclusion and reduce social inequalities in remittances is questionable. Due to the concentration of power and the lack of a global payment infrastructure, remittances remain costly, opaque and slow. To understand remittances, I argue that cross-border monetary transactions involve inequalities that are more akin to the mobility of people or goods than to the transfer of communication data.

Using annual reports and qualitative interviews with companies—money transfer operators such as Western Union and Money Gram, FinTechs, banks and remittance experts, as well as remittance senders and receivers—the suggested paper pursues two main objectives: First, to provide an overview of the technical and (geo)political difficulties and barriers that can arise in the digital transfer of remittances. Second, to identify which challenges related to remittances can be addressed by technological/digital solutions, private companies or by state and supranational actors.

RC19-273.4

ALEXANDRA, KEINER* (Weizenbaum Institute, Germany)

Payment Cards for Asylum Seekers: Nexus of Financial and Migration Infrastructures

The increasing substitution of social benefits with vouchers or goods instead of cash has a long tradition in the US, dating back to the 19th century. Particularly in the case of social benefits for refugees, cash is increasingly seen as suspicious or dangerous. Against this background, a “payment card” or “social card” for asylum seekers was introduced in Germany in 2023 to replace cash payments. However, the aim of the payment card is not only to provide access to cashless transactions, but rather to restrict and monitor the payments and transactions of asylum seekers. For example, the payment card is intended to restrict money transfers, online shopping and cash withdrawals. Various solutions have been introduced in the past year, but in all cases it has been a prepaid debit card issued by payment services in cooperation with Visa or Mastercard. This places the payment card at the intersection of financial and migration infrastructures.

Payment service providers and policy makers suggest that the payment card is not only a financial infrastructure for asylum seekers or for monitoring migration, but could potentially be adapted to other areas such as social welfare, student grants/loans or services for the homeless. It seems that migration is serving as a testing ground for future financial and migration infrastructures, not only for the state but also for companies such as credit card providers.

What dynamics of social inequality and financial inclusion/exclusion of asylum seekers are created by the payment card? What does it mean for social welfare in general that payments are made through proprietary infrastructures? These questions will be explored through a document analysis of the policy process of implementing the card and qualitative interviews with payment and credit card providers, stakeholders from municipalities, NGOs and asylum seekers using the payment card

RC30-485.1

ALEXANDRA, MANSKE* (University of Hamburg, Germany)

Hybrid Work Is More Than Just a New Form of Precarious Work. on the Multi-Dimensional Porosity of New Atypical Forms of Labor: The Case of the Performing Arts

The transformation of the working world has led to ambivalent work forms, such as hybrid work, which blurs traditional employment categories. Hybrid work combines self-employment and dependent employment, reflecting a fuzzy work status. While not new, its prevalence has doubled since the mid-1990s. This paper explores hybrid work in the cultural industries, focusing on agency. While some see hybrid work as a pathway to entrepreneurship, others view it as domination in an era of precarity. However, hybrid work is distinct from both precarious and entrepreneurial work, representing a unique state of insecurity with fragmented work histories. It is part of broader trends in contemporary capitalism, yet little is known about how individuals navigate it.

The paper examines how cultural workers in the performing arts are affected by hybrid work, utilizing Bourdieu's field sociology within the sociology of work. Based on two empirical case studies in major German cities from 2019 to 2021, funded by the Boeckler Foundation, the study involved respondents from various fields of cultural production, including public theatre, independent performing arts, and lateral entrants. The research introduces a typology of hybrid work strategies: "reputation-winner," "position-defender," and "position-seeker." These strategies reflect how workers aim to improve, maintain, or establish their positions within a social field.

The study expands the understanding of hybrid work by linking it to occupational fields, showing that hybrid work is not just a new form of employment but part of ongoing transformations in work and power relations. Therefore, the findings suggest that hybrid work is not merely a response to weak economic conditions but can be a deliberate strategy for gaining reputation and financial stability. In sum, the typology sheds light on the socioeconomic and cultural dynamics of hybrid work, offering a deeper understanding of this increasingly prevalent employment model.

RC14-215.1

ALEXIS, TREPIER* (Sorbonne Nouvelle, IRMECCEN, France)

Is It Sufficient to Propose Inclusive Representations to Attract Inclusive Audiences? the Case of Eternals (Marvel, 2021)

The necessary growth of cultural industries relies on the conquest of new markets, which involves reaching audiences that have been remaining marginalized from productions (Mingant, 2010). These industries aim to engage individuals from sexual, gender, and racial minorities, which requires a greater emphasis on diversity in representation, creating a risk to produce only stereotypical portrayals (Macé, 2007). They may showcase diversity while simultaneously alienating its participants.

In the film *Eternals* (2021), Marvel introduces its first gay superhero in cinema, intending to capitalize on this new audience. Nevertheless, the film proves to be a commercial failure, receiving mixed reviews. Drawing from a sample of ten interviews from my thesis research and an analysis of the film's promotional strategies, we will demonstrate that the "fragmented" approach to identity results in counter-stereotypical representations that overlook the complex and intersectional nature of identities (Crenshaw, 2005), much to the detriment of the minorities it aims to represent.

As a superhero team film, *Eternals* features a diverse cast that is largely ignored in its promotion. Promotional materials, including posters and trailers, predominantly focus on its internationally recognized American stars and the heteronormative love story. Consequently, the representation of the film's minority characters is relegated to specialized media outlets, which struggle to portray these characters with depth.

As a result, these portrayals alienate LGBTQIA+ audiences, as well as the reactionary fans who criticize the film. Such representations ultimately cater to a silent majority that is massively indifferent to the issues of diversity.

However, in contrast to the recurring male gaze (Mulvey, 1975) in these productions, the writing and direction by Oscar-winning filmmaker Chloé Zhao successfully offer a narrative and representations centered on care, which have gone unnoticed by audiences who, for the most part, did not take the time to engage with the film.

ALFANDARI, NELLY* (LSBU London, United Kingdom)

FRANK, MAGNUS (University Flensburg, Germany)
CHAMAKALAYIL, LALITHA (University of Applied Sciences
and Art, Northwestern Switzerland, Switzerland)WEITKÄMPER, FLORIAN (University of Education Freiburg,
Germany)*Feeling Our Ways: Convergences and Differences in Our Positionalities and Theoretical Perspectives As Ethnographers of Emotions*

The aim of this paper is to engage with the body of a researcher as a means of exploring emotions and to relate it to recent ethnographic educational research (Zembylas 2016; Gallagher 2016; Schoerer & Schmitt 2018). In doing so, the affective atmosphere in the classroom and the 'norms' it produces will be explored, as four researchers reflect together on their positionalities and emotions in the field. Thereby, we are engaging with two ethnographically oriented research projects in primary and secondary school classrooms in England and Germany, and compare our field experiences and emotions with each other in a performative approach (Denzin 2018), as we are visibly engaging with our shared dialogue.

We explore the different narratives and attributions of specific emotions in the context of researching social inequalities (Ahmed 2004/2014) and how they shape the learning and research space, impacting who participates in it and how, and who and what we engage with as researchers entangled in the emotional playing field (Denzin 2018). For this, we look at the constellations of "discomfort" and "feeling powerful" in different scenes across our studies, and compare them and reflect them in the experiences of the other. Thereby, our 'researcher bodies' act as means of knowledge and are simultaneously reflected in the process of reflection and resonance. Drawing on Ahmed (2014) in the sense of "feeling our way", we reflect on the complexities of a sense of 'empowerment' in the classroom: A reversal of status thereby highlights problematic norms.

We engage with the ambiguity of emotions, but believe that dialogical reflection can help to illuminate different aspects beyond the researcher's individual reflections. Our performative, dialogic research on emotions (discomfort interacting with feeling powerful) is new in itself and can also enrich the scientific debate with both reflection and experience through the researcher's body.

ALI, HARRIS* (York University, Canada)

Pandemic Experiences in the Urban Periphery

Certain regions were "left-behind" during the COVID-19 pandemic response and were therefore forced to bear the brunt of the consequences in various ways. There is however an important spatial component associated with these "forgotten densities". Namely, these areas were peripherally situated at the outskirts of urban centres. They include for instance, areas that hosted large tracts of lands that could accommodate airports, large-scale farms, factories, warehouses, meatpacking facilities, suburban residential neighbourhoods, indigenous reserves, as well as informal settlement areas in the Global South. These peripheral sites were also host to a disproportionate number of outbreaks (i.e. they were pandemic "hot spots").

Notably, many residing and working in the urban periphery are members of socially marginalized communities, yet they were the ones tasked with the "essential" work necessary to for the day-to-day survival of those in the centre, while at the same time increasing their own vulnerability to viral exposure. We focus here on the pandemic challenges faced by various groups in the periphery of Toronto, Canada. As such, we consider the pandemic experiences of racialized and ethnic minorities in Toronto suburbs (which is home to a very high proportion of minorities and newcomers), First Nations people on reserves located outside the Greater Toronto Area, and migrant agricultural workers employed in the fertile Niagara Falls. All of these sites had elevated rates of COVID-19 infection relative to the urban core. To round out the analysis of peripheral areas we also consider the experiences of those in informal settlement areas in the Global South. Further, we discuss how, despite resistance from neoliberal and far-right forces, members of the periphery were able to challenge the existing public health governance structure to have their needs addressed, at least to some degree, during the pandemic.

ALI, MEHRUNNISA* (Toronto Metropolitan University, Canada)
'north-South' Collaborative Research

Migration affects countries of origin, transition and destination. But migration discourses and international policies are dominated by countries of the Global North because they finance research to protect and promote their interests. Findings from their studies inform decisions that have international consequences. Those whose lives are shaped by these decisions have no voice in the matter. However, scholars and policy makers are beginning to see the limits of this knowledge (Adamson & Tsourapas, 2020; Takahashi, 2022). They realize that to understand phenomena that cross national boundaries, such as migration, researchers must collaborate across geopolitical borders. They must consider various socio-political histories; ideological and theoretical orientations; institutional resources and practices; conceptual and linguistic variation; and knowledge, skills, and habits of minds. While there is ample agreement on the value of collaborative international research on migration there are few granular descriptions of how such projects are managed, how roles and relationship are negotiated, how institutional and national regulations and practices facilitate or impede such collaborations.

In this presentation we will describe and discuss how a group of migration scholars, working in university-based research centres in Australia, Canada, China and India – two predominantly countries of origin and two migrant destinations – navigated structural and cultural differences to undertake joint research projects. We will examine how colonial histories and academic resources shaped our knowledge production and dissemination. We will assess how we crossed some barriers, where we failed to make progress, and why. Finally, we offer some suggestions on how future collaborative migration research may work better.

ALI, ZAHRA* (Rutgers University-Newark, USA)

Studying the 2019 Uprising in Iraq

Studying the 2019 Uprising in Iraq

When deciding to start researching an event, a group, a place, scholars make a countless number of passive decisions that are never truly questioned or examined. The interest for a theme, the design of a research project, the elaboration of research questions, constitute a process that is not always clearly articulated by the researcher, and almost never fully revealed in academic writings. So much is taken for granted, so much is lost in the institutional mechanisms, the academic fields, and the theoretical jargon, that condition the very possibility and practice of research. Recent debates on the relationship between research, space/place, and positionality have enriched the understanding of the political, social, economic, and structural dimensions that shape research, as well as the researchers themselves. Feminist and decolonial scholarship have interrogated the political economy, and the geopolitics of doing research and producing knowledge. In this panel, I want to explore my own experience and trajectory in choosing to research the 2019 Iraqi uprising -Thawra Teshreen-. I want to reflect on, not only what led me to study Thawra Teshreen, and issues of positionality, but also on the theoretical, and methodological choices that I made. I also want to explore the challenges, the limitations, as well as the institutional, and structural dimensions that have shaped the process of researching, and its results. I want to show how the dynamics of the uprising impacted me and the way I decided to theorize about it, and the different ways in which my own personal diasporic background and feminist approach, impacted the research itself and the theory drawn from it.

Extractivist Policies in Intercultural Contexts: An Approach to Socio-Environmental Tensions from Relational Ontologies.

This research aims to explore the controversies and ontological differences in intercultural relations associated with socio-environmental conflicts in Mapuche territory in Chile. Through situated methodologies (Hirt & Lerch, 2014; Doyle-Yamaguchi & Smith, 2024), it aims to analyse the construction of 'objects of territory' from three key components: ontological, material and discursive.

The hypotheses put forward suggest that disputes over extractive initiatives cannot be resolved through consensus due to fundamental ontological differences. Moreover, intercultural relations in indigenous resistance processes are shaped by ontological configurations that oppose the capitalist extractivist model. Finally, it is proposed that actors access repertoires of justifications as strategies to confront controversies, seeking to close them unilaterally.

The methodology will be exploratory and descriptive, analysing cases in different indigenous territories with diverse extractivist initiatives. Three key industries present in the indigenous territory will be addressed: the forestry industry in the communities of Lumaco, mining in the Curarrehue sector, and the energy industry in the communities of Negrete and Collipulli.

The methodological approach combines documentary analysis, controversy analysis and participatory mapping, adopting an approach that values the indigenous perspective and the self-reflection of the researcher. The work will be carried out in collaboration with communities in the Araucanía region, supported by the concept of 'Two-Eyed Seeing', which seeks to understand the territory relationally and build networks of actors. It will also include the construction of territorial autobiographies to understand, from the communities' own voice, their relationship with the extractive industries.

In this way, the research aims to understand the perceptions and effects, whether positive or negative, that the communities experience when faced with the operation of the extractive industries analysed.

ALISTER SANHUEZA, CRISTIAN* (Universidad de La Frontera, Chile)

Taxonomy of Digital Nomads. New Subjectivities of the Delocalisation of Work

In recent decades, new forms of work have gained attention in both public opinion and academic research. The proliferation of information and communication technologies, together with the impact of the COVID-19 pandemic, has diversified the ways of working away from the physical workplace. Although the literature has delved into teleworking and freelance or self-employed forms, there is a modality that, while retaining a direct employment relationship with an employer and a defined schedule, dispenses with physical dependence on the workplace. These workers, after a period of conventional teleworking, expanded their work routines from home to different parts of the world, becoming digital nomads.

On the one hand, the motivation of these nomads is driven by short-term migratory tendencies, characterised by interests associated with utopian migration. These workers have personal configurations that allow them to work remotely, combining their working day with recreational or tourism activities. This modality of work presents personal configurations and consequences that are different from other forms of employment.

This research is based on in-depth interviews with digital nomads who enjoy job stability, high qualifications and economic sufficiency, which allows them to delocalise their work, but at the same time maintain a lifestyle detached from family, personal and economic relationships associated with traditional models of modern life. The results of the study reveal personality traits that facilitate the mobility of these workers, but also show emotional consequences, derived from the absence of conventional life patterns, exposure to risk, lack of support networks, the need to adapt to different lifestyles and social norms, which in some cases generates negative effects on their experience.

ALKHTIB, MUSAAB* (Qatar University, Qatar)

The Social and Legal Situations of the Second-Generation Arab Migrants in Qatar (SGAM) Case Study: Permanent Residency

Qatar has a population mainly composed of migrants, with more than 90% of the country's population being non-Qatari citizens. Qatar received many migrants from Arab countries during the 1970s and 1980s because of the oil boom; many remained there for decades. Therefore, the main characteristic of second-generation Arab migrants (SGAM) is that they are the offspring of migrants who migrated to Qatar within the last half-century. They were born and raised in Qatar, where they received their education and worked in the private and government sectors.

The SGAMs have high levels of productivity and engagement within Qatari society due to their predominantly young age and the expectation to live most of their life in Qatar, unlike most of the foreign migrants who usually stay for a temporary period. In addition, they could feel more attached to Qatar and bonded with Qatari citizens than other migrants because of the shared culture and language. Therefore, studying issues and policies related to their social aspects is essential.

This study evaluates the effects of the new migration laws in Qatar, particularly the introduction of the permanent residency law in 2018. Despite Qatar being a second home for most of the SGAM community, their residency situation is often considered temporary. They can return to their country of citizenship at any time. Qatar does offer some privileges to SGAMs born in the country, such as priority hiring status, especially in the government sector. However, the introduction of the permanent residency law in 2018 could alter

the SGAMS' relationship with Qatar, fostering a stronger sense of attachment and belonging.

L'Autorité Religieuse Pour Un Islam Au Féminin En Italie

En Italie, l'interaction et le dialogue entre les institutions de l'État et l'islam produisent des effets significatifs au-delà de l'objectif insaisissable d'une reconnaissance formelle par l'islam. L'évolution de la figure de l'imam en est un exemple frappant. Ce dernier assume une pluralité de fonctions dans de nouveaux processus qui le sortent du contexte traditionnel de la mosquée et l'exposent aux dynamiques d'un espace public caractérisé, selon Berger (1967), par le « nouveau pluralisme religieux » de l'époque contemporaine.

C'est dans ce scénario que l'imam a pris une centralité, dans la sphère des figures d'autorité religieuse traditionnelles, d'un l'islam « migrant » vivant la condition de religion minoritaire, jouant non seulement le rôle de lien entre la communauté et la mosquée, mais aussi celui de leader et de représentant « politique » dans l'espace public.

Cette évolution crée progressivement un espace inédit dans le champ religieux pour la valorisation de l'élément féminin (Rhazzali 2017). Dans le contexte de la multiplication des fonctions confiées aux imams, les femmes leaders trouvent également leur place en remettant en cause un modèle exclusivement masculin de leadership communautaire, suivant le modèle de d'autres pays à majorité musulmane (Dirèche 2010).

Nous sommes donc confrontés à un processus de changement complexe, et les demandes des communautés et des institutions de l'État finissent par produire de nouveaux rôles liés à des dimensions importantes.

Avec la création des figures de la « Murchida » en Italie, grâce également au soutien obtenu par le biais de cours de formation offerts par un consortium d'universités italiennes, certaines femmes musulmanes commencent à revendiquer leur rôle public de « Murshidat », contribuant ainsi à la consolidation de cette nouvelle figure.

Quel est le rôle des femmes dans la sphère religieuse en Italie ?

Quels sont les différents domaines d'intervention religieuse des femmes ?

Another World Is Possible? Exploring the Use of Alternative Social Imaginaries Amongst Youth-Led Climate Organisations and Young Climate Activists' Discourses in Italy

This paper presents the findings from the YECEI research project (Young Entrepreneurs of Creative Environmental Imagery) led jointly by the Universities of Pavia, Milano-Bicocca and Milano Statale. This project explores the youth-led organizational and individual production of fictional and political writings about climate and social imaginaries. Using Castoriadis and Taylor's concepts of social imaginaries (Castoriadis, 1987, 1997; Taylor, 2005), this presentation explores how young climate activists and their organisations formulate different social imaginaries through their discourses on climate change. As noticed by Marlon et al (2019), regarding climate breakdowns and public beliefs, there is a lack of discourses on what may promote hope and fuel activism. Imagination remains crucial to allow activists to envision a model of society beyond the current one (De Maggio, 2023; Herfort et al., 2023). Imaginaries, however, remain tied to specific interests, meaning that they can also enter in conflict with other imaginaries arising from different values (Colombo and Rebughini, forthcoming). This research particularly focuses on eliciting the tensions and conflicts between different types of imaginaries formulated by young people, such as young climate activists and their organisations.

Drawing on a mixed methods approach, combining critical document analysis and interviews, we mobilise Castoriadis and Taylor's concepts of social imaginaries to examine how young climate activists formulate different social imaginaries through their public discourses, how alternative imaginaries are represented in these discourses, what type of values they enact (e.g., justice, care for the world, etc), and whether these discourses can fuel motivation for undertaking political action. Findings rely on the combined analysis of 60-80 public discourses interviews, articles, social media posts, and other types of divulgatory documents produced by 14 Italian-based youth activist movements (such as Friday for Future, Extinction Rebellion, Ultima Generazione, etc), as well as interviews with individual activists and young people (x40-50).

ALLASTE, AIRI-ALINA* (Tallinn University, Estonia)

International Students' Views on Political Participation in Estonia

The political participation of international students—young people who live temporarily in another country—has been relatively underexplored, despite the increasing number and significance of this group. Young people with temporary residence permits are often excluded from traditional forms of participation, as they do not have the right to vote, and other forms of engagement have remained largely unstudied. This paper focuses on the experiences and views of secondary school and university students regarding their views on political participation in Estonia. Drawing on evidence from qualitative interviews, the paper analyses the informants' understanding of citizenship and the meanings they attach to participation in elections, organisations, public events, and community-level activities.

The study is based on interviews with international students aged 16 to 29. The participants were from, or had spent part of their childhood in, Europe, the Middle East, North America, or Asia. They had lived in Estonia for between one and five years and had open-ended plans for the future. The interview data were transcribed and analysed using NVivo software, with a partially grounded theory approach, incorporating methods such as open coding, axial coding, and focused coding.

The analysis shows that the participants had an interest in the politics of their host country, while often remaining connected to their countries of origin. Discussions about political issues and awareness of political situations were seen as important. Although voting was considered one form of participation among others, it carried the strongest connotations of being a citizen. Younger informants viewed political participation more narrowly, emphasising involvement in organisations and political party activities. Some differences in the conceptualisation of citizenship and defining political participation emerge also due to country of origin.

Addressing the Hyper(In)Visibility of Liberation Sociology

While liberation, or the process of freeing marginalized individuals and groups from societal oppression and domination, is referenced across many sub-disciplines of sociology, it surprisingly remains under-conceptualized in sociological literature. To address this hyper(in)visibility, the present study responds to the following query: how, if at all, do Black individuals conceive of a Black liberated future? I draw on data from 65 in-depth interviews with Black Millennials during Black Lives Matter to capture their imaginings of a Black liberated future. Findings reveal that participants construct four types of liberation narratives when detailing their perceptions of a Black free future: 1) Liberation via Reformation, 2) Liberation via Reconstruction, 3) Liberation via Afrocentrism, and 4) Liberation as Inconceivable. I ultimately argue that liberation narratives function as resistant knowledge projects and, as such, are significant socio-political artifacts and resources for future generations of change agents, community organizers, and social movements actors. Altogether, this study demonstrates how rectifying the omission of liberation narratives magnifies our sociological knowledge about marginalized groups and deepens our analytic capacity to make sense of their ontological approaches toward politics of liberation and imaginings of their collective future.

ALLEN, SHAONTA* (Dartmouth College USA)

Conceptualizing Emotional Agency: How Black Millennials Use Religion to Manage Socio-Emotional Conflict during Black Lives Matter

Scholars of social movements have examined how emotions impact social change efforts at the structural level but less is known about the ways individuals among the younger generations leverage emotions when cultivating their political ideologies and engaging civically. What role are emotions playing in the current and on-going Black Lives Matter Movement? How do Black Lives Matter activists maneuver when these emotions conflict? What role does religion play, if any, throughout these processes? The present study explores these questions by analyzing how Black Christian Millennials who are engaged with the Black Lives Matter movement responded to the Botham Jean murder trial, a prominent yet unique and thus lesser-explored case of police brutality. Drawing on qualitative data from in-depth interviews with 65 Black Christian Millennials (born between 1981-1996), I find that study participants use three filters when emotionally responded to this trial: 1) *Black Rage- The Racialized*

Emotions Filter in which they leaned on their racial subjectivities, 2) *Christian Forgiveness- The Spiritualized Emotions Filter* where they centered their religious convictions, and 3) *Righteous Indignation- The Intersectional Emotions Filter* which harmonized these presumably competing emotions. Altogether, this study reveals a process, I refer to as *Emotional Agency*. Emotional agency offers a framework that helps us to better understand the strategies employed by Black Millennial activists when cultivating religio-political stances. I conclude with a discussion of why more scholarly attention should be paid to socio-emotional lives of youth and emerging adults and why continued focus on the spiritual and emotional elements of social movements is necessary.

DAVIS, ARIELLE (University of California, Los Angeles, USA)

Benefits of Educational Diversity in US Law Schools

Power and privilege concentrate in U.S. law schools, where the majority of key decision makers are educated (lawyers, judges, government bureaucrats, and elected officials). Law schools are challenged to engage their complicity in Slavery, Imperialism, and Mass Incarceration. We recognize race, racism, and anti-Black racism are fundamental elements of American society. Law plays explicit and implicit roles helping create and perpetuate racial injustice, so we ask, "How do US Law Schools address race in the teaching, learning and practice of law."

We analyze survey, focus group, document and media data to determine how Race Matters in US Legal Education. We focus on Black Law students in NC, a state at the center of the Supreme Court's Affirmative Action ban.

The Educational Diversity Project gathered 2005 survey data from 8,000 students attending 70 Law Schools. A 2007 Web- Survey collected follow-up data the final year of Law School. Focus groups in 2005, 2006 and 2007 explored classroom content, discussions and dynamics. Law faculty were also surveyed about student diversity, class content, and classroom discussions.

Key findings: Whites and men were less supportive of affirmative action; females, especially women of color, perceived more discrimination; few Black men and women found law school "open to new ideas;" Women more likely work for social justice law school organizations and have different race/ethnic mentors. Diversity and Inclusion benefits legal education, as true for education and learning in other settings.

We discuss how curricula in law school (and other fields) can be revised to advance justice and equity. Critical Race Theory is a possible corrective for bias in legal theory and education. CRT challenges dominant white narratives defending racism, racist thinking and racial exploitation. We also consider Racial Reparations is also a possible corrective for historical racial inequities in wealth and power.

Life Stages and Religious Renewal. Young Muslims Transitioning to Adulthood in Italy and Their Conception of Islam

Religion is often associated with the image of a path that accompanies and crosses the course of life and its different stages. The studies developed at the intersection between religion and biographical research have frequently focused on those changes in faith that open up new existential phases (e.g. research on conversion: Allievi, 2017) or looked at those life stages in which religion assumes a central role (e.g. research on faith in older people: Dalby, 2006). However, many other intersections remain under-researched, including that between faith and the increasingly complex and delayed entry into adulthood (Biggart & Walther, 2006).

With the aim of shedding light on the relationship between religion and transition to adulthood, the paper draws on the narratives of a group of young Muslims with migration backgrounds who are growing up in Italy. In particular, the paper explores how the transition to adulthood is associated with a renewal in the relationship with Islam and its moral values. The research is part of the 'Growing old, feeling like citizens?' project (Universities of Padua and Milan-Bicocca) which is based on 80 biographical interviews with young Muslim adults in Italy and 8 focus groups.

Based on the data collected and their analysis, the paper provides some interesting insights. First, it emerges a link between the representation of adulthood as a stage of maturity and the development of a more intense relationship with religion and its values. However, this relationship takes place in a minority context, with consequences for interviewees' identity definition and their claim for a legitimate presence of Islam in the Italian landscape.

Finally, the intersection between religion and adulthood is shaped by the previous biography of the young people interviewed, who often developed de-cultured readings of Islam during adolescence (Acocella, 2018) that persist into adulthood.

ALLY, AMINA* (Norwegian University of Science and Technology (NTNU), Norway)

Diffraction Cultural Identity: A Reflection on Arts-Based Approaches to Data Generation and Analysis with Children in a Nordic Context

A two-dimensional model of identity (ethnic identity vs. national identity) has been prominent in studies on first-generation immigrant children (Phinney, 1992; Maehler, Daikeler et. al, 2021). However, postcolonial theorist Stuart Hall (1996) proposes a theory of cultural identity where identities are viewed as multiple and fractured, the meeting place between subjectivity and societal expectations of self. In childhood studies scholars such as Spyrou (2018) and Sparrman (2020) have drawn on concepts such as multiplicity and diffraction in the construction of childhood, including the subjects, materials, affects, discourses and images associated.

In this paper I draw on arts-based approaches to data collection and analysis in working with children to understand processes of identification. Participants in the research study answered questions about identity using material and digital artifacts. Following this, in-depth, semi-structured interview were conducted on the topic of cultural identity and digital practices. Finally, an arts-based workshop with project participants was held to discuss preliminary project findings. Participants were from ages 12-15 and identified as having a multicultural background. Data generation occurred from March-September 2024 in Trondheim, Norway.

Diffraction is the work of mapping entanglements and the effects of difference, and the researcher "participates in the materialization and re-materialization of the world" (Spyrou, 2018). Research material that has been generated from this project include images of physical and digital artifacts, field notes, interview transcripts, recordings of the arts-based workshop and the art-work created, and various other materials produced by participants throughout this process. How do diffractive and narrative approaches allow for analysis of a diverse range of data generated from arts-based research? How might narrative analysis through digital animation and storytelling address ethical challenges when doing research with children? Finally, this paper reflects on how creative methodologies in empirical research support new materialist framings of children's agency.

PESSOA-DE-OLIVEIRA, ANA KATARINA (Universidad de Zaragoza, Spain)

Social Citizen Science and Social Reflexivity

This paper proposes a literature review searching for the relation between social citizen science and social reflexivity. It analyses the development of citizen science and particularly social citizen science in the light of sociocybernetic concepts, particularly social reflexivity and second order observation. The paper presents in the second part, a methodological development based in social diagnosis applied to projects linked to social development.

Citizen science, is a collaborative process where volunteers partner with scientists to conduct and develop research. We look to discuss how such processes lead to group and community empowerment. Particularly attention is given to the challenges and dilemmas at a methodological level as citizen-science is principally inter and transdisciplinary, engaging different levels of practical and theoretical knowledge, scientific debate co-designing and co-decision.

Embracing and investing in citizen science is not only a strategic move for advancing scientific knowledge but also a vital step towards achieving justice and sustainability in the face of global change. Social citizen science goes into the path of participatory action research and other methodologies that promote reflexivity in the research design, process and results.

Sustainable Development Goals and Community Diagnosis: Insights of the SDG Rural Lab Project

This paper presents a methodological development based in social diagnosis. It analyses the strength to approach Sustainable Development Goals to process of community diagnosis in order to reinforce collective social analysis.

The SDGs RURAL LABS is a participatory action research project designed ad-hoc by a team of university experts from the University of Zaragoza, with which we contribute to the appropriation of the 2030 Agenda in rural and peri-urban contexts.

We use citizen science and the social innovation laboratory model to contribute to the landing of the 2030 Agenda in local rural environments and create community diagnoses "in the key of SDGs" where a key piece is the associative, institutional, educational and neighborhood fabric of the community and open "down-up" dialogue.

Our innovation proposal consists of promoting, through Citizen Science, knowledge, awareness, collective diagnosis, co-design of actions and search for alternatives by local actors, facilitating a strategic vision of the 2030 Agenda as the basis of a development agenda. local. The SDGs RURAL LABS aim to collectively identify existing local challenges while seeking to reinforce existing initiatives by making them visible as contributions to the 2030 Agenda.

The presentation emphasizes the theoretical and methodological components of the project: sociocybernetics, community diagnosis and participatory action research. It discusses different case studies and results in the implementation phase.

Care Home from Home: Towards a Theory of the Reproductive Labour Process

This paper explores the application of labour process theory developed by Burawoy (1982) to reproductive labour, expanding its scope beyond the factory floor to include the affective and ideologically mediated dynamics of social reproduction. Building on Marxist Feminist scholarship, the paper argues that reproductive labour, both paid and unpaid, plays a fundamental role in the capitalist production of surplus-value, as it is essential to the creation of labour power. By developing the theoretical contours of a reproductive labour process, we explore how relations of coercion, consent, and resistance manifest in the daily experiences of carers, drawing from both primary ethnographic research and secondary data. In doing so, the paper illustrates how contemporary reproductive labour reflects dynamics similar to those identified by Burawoy, though within the context of commercial care work, migration, feminisation of caregiving, and the precarious conditions of modern service work. The findings reveal that reproductive labourers, whether paid or unpaid, face unique challenges, including financial hardship and the necessity of negotiating competing roles within the labour process. The paper concludes by discussing how these workers navigate the dual pressures of waged work and the unpaid labour of the home, offering new insights into the relationship between reproductive labour and the broader capitalist system. Through this analysis, we contribute to ongoing debates in Marxist Feminist theory, calling for greater integration of reproductive labour within labour process theory.

Experiences and Attitudes of Women and Maternity Care Professionals Towards the Use of Traditional, Complementary, and Alternative Medicines and Therapies during and after Pregnancy: A Qualitative Evidence Synthesis

Background

This paper explores the preliminary findings on the experiences and attitudes of women and maternity care professionals towards the use of traditional, complementary, and alternative medicines and therapies (TCAMTs) during and after pregnancy in high-income countries.

Objective

We aim to answer the following research questions: (1) What are the experiences and attitudes of women towards the use of TCAMTs during and after pregnancy? (2) What are the attitudes of maternity care professionals towards women's use of TCAMTs during and after pregnancy?

Methods

A systematic literature review of peer-reviewed qualitative and mixed-methods studies published in English, German, Portuguese, and Spanish between January 2014 and November 2024. Comprehensive searches were conducted using the following electronic databases: CINAHL Complete (EBSCO), MEDLINE (EBSCO), EMBASE (Ovid), APA PsycINFO (EBSCO), Web of Science (Clarivate Analytics), SocINDEX, and Scopus(Ovid).

Findings

Women often relied on self-prescribed herbal treatments or therapies recommended by friends, fellow pregnant women, and family rather than healthcare specialists. Their use of TCAMTs focused on: pain management (pregnancy-related, labour, and post-partum, particularly post-caesarean, pain); labour preparation (particularly spontaneous labour without pain relief intervention); emotional regulation; reclaiming post-partum femininity and sexuality; being in control and actively engaging in their healthcare and not just being instructed; seeking what they perceived as 'safe' and non-invasive therapies or remedies. They often perceived biomedical consultations as being insufficient and cited concerns over short consultations, avoidance of TCAMTs discussions, and lack of information about TCAMTs by maternity care professionals. Women, however, also raised concerns about TCAMTs safety and the lack of available information. Studies on healthcare professionals' attitudes were limited, but one noted concerns about the lack of evidence for TCAMTs, their complementary nature, and their potential to empower women.

Conclusion

Improving communication between women and healthcare professionals is essential for shared decision-making and maximising the benefits of TCAMTs.

Community Land Trust: An Alternative Path to Conventional Policy and Planning Approaches Towards Urban Rights in Self-Built Neighborhoods

The ongoing housing affordability crisis, driven by speculative real estate trends, demands alternative approaches to secure adequate living environments and uphold residents' land rights. The Community Land Trust (CLT) model, first established by civil rights activists in the U.S. during the

late 1960s, offers a compelling solution by promoting non-speculative urban development and collective land ownership. With successful implementations in various European countries and emerging examples in the Global South, CLTs advocate for communal ownership and collective efforts to improve housing conditions, presenting a viable response to the current housing challenges. This paper explores the feasibility of implementing a CLT in Cova da Moura, a historically marginalized, self-built neighborhood on the outskirts of Lisbon, where residents have long struggled to secure their urban rights. Unlike most CLTs worldwide, which are typically designed for new housing developments, this study draws on experiences from Puerto Rico and Brazil to propose a CLT as a tool for land tenure regularization and urban planning in an established informal settlement. The paper details the participatory process involved in the study and evaluates the potential for applying the CLT model within Cova da Moura, considering the existing urban, legal, economic, and institutional frameworks. By showcasing the potential of the CLT model to revitalize the community, empower residents, and offer sustainable long-term housing solutions, this paper underscores the need for innovative urban policies grounded in the concept of urban commons. It argues for a participatory and inclusive approach to address the housing crisis, secure tenure, and protect against evictions in vulnerable neighborhoods, ultimately advocating for a shift in urban policy design.

Studying Political Assassination: Definitions and Challenges

this presentation will discuss the sociological literature on political conflict that ended up in lethal political violence, based on a on-going research on political assassinations in Brazil (2003-2033). Two dimensions will be addressed: 1) the definitions of "political assassination" in use in the sociological literature; 2) the methodologies researchers have been used to capture empirically the phenomena

Institutional Conflicts in Urban Land Use: Land Regularization in Environmental Conservation Areas in Mexico City and São Paulo

There is a broad consensus that public policies must be changed to address the urgent challenges of climate change. However, environmental policies may clash with social policies, placing policymakers and politicians in a dilemma about which policies to pursue. This paper explores a recurring conflict in large Global South cities: between environmental conservation areas and the regularization of informal settlements. Focusing on Mexico City and São Paulo, where informal settlements have expanded into areas designated as conservation and watershed protection zones, housing 242,000 people and 172,000 households, respectively, it investigates how this conflict played out from the 1990s to the 2020s. Using a comparative process-tracing methodology, it explores how land regularization was made "compatible" with environmental regulations in both cases. However, the leading actors, arrangements, and outcomes differed substantially.

In Mexico City, the city government avoided taking sides and delegated decision-making to a collegiate body of multiple actors. With the upper hand of environmentalists, the collegiate developed a complex procedure to assess environmental damage and implement mitigation. While inefficient in practice, it allowed the government to avoid blame and partially address both sides' concerns. In São Paulo, a pro-housing coalition of bureaucrats embedded in civil society pushed for legal changes, especially during the Workers' Party mandates. They leveraged political connections and partisan alignment at local and federal levels to override environmental rules and frame land regularization as environmentally beneficial.

In summary, the arrangement in Mexico City increased veto points, stalling land regularization, while in São Paulo, it decreased opportunities for opposition, streamlining and accelerating regularization in environmental conservation areas. This comparative analysis thus underscores how institutional arrangements and political dynamics shape the conflicts between environmental and social policies in urban governance.

The Gender Perspective in the Management of the Tajogaite Volcano Eruption in La Palma (Spain, 2021)

Previous research on gender and disasters shows that the incorporation of a gender perspective in disaster risk management and/or reduction is very limited, despite the evidence that these phenomena have a differentiated impact on men and women. The aim of this communication is to analyse whether both the public administration and third sector organisations have adopted a gender perspective in the management of the eruption of the Tajogaite volcano in La Palma (Spain, 2021). To this end we carried out, within the framework of the GENDER-IN project (Gender and disaster risk management: Comparative analysis and recommendations for intervention, PID2021-126195NB-I00), 41 interviews with technical staff, decision-makers, and socio-community activists who were involved in the eruption. The findings of this study revealed that gender issues were not taken into account in a mainstream way throughout the process of managing the disaster. The lack of formal gender intervention procedures meant that the gender response was only partially implemented through specific projects or actions in specific areas.

Furthermore, it has been observed that the population affected by the eruption played a crucial role in the management of the disaster, particularly through their involvement as volunteers or as socio-community activists. Those affected by the event were engaged in a range of activities, many of which were in line with traditional gender roles. It is therefore noteworthy that women played an active role in all phases of the disaster, despite their limited participation and/or influence in the decision-making processes related to the disaster. The results of this study provide suggestions for gender risk management and post-disaster recovery strategies.

The Tensions between Productive and Reproductive Roles in Professionals Involved in Disaster Risk Management: Analysis from a Gender Perspective

Disasters of natural origin are disruptive events that affect people's daily lives and lead to changes in their activities. This study is developed within the framework of the GENDER-IN project (Gender and disaster risk management: Comparative analysis and recommendations for intervention, PID2021-126195NB-I00). Previous research has shown that in emergency and post-disaster situations, women assume a greater overall workload (reproductive, productive and community) than in the pre-disaster context. However, few studies have addressed this issue in relation to professionals involved in disaster risk management (DRM). In this sense, this paper aims to analyse the experiences of the staff involved in the network of social care resources set up after the eruption of the Tajogaite volcano on the island of La Palma (Spain, 2021). To this end, an interpretative analysis was carried out of the testimonies collected in 23 interviews with three types of professionals involved in DRM: frontline workers, technical decision-makers and political decision-makers. The results reveal that gender intersects with professional position, both in the experience itself and in the effects it produces. Our findings show that the women interviewed, regardless of the professional group to which they belong, report the existence of tensions between the productive and reproductive spheres to a greater extent. Moreover, these tensions are exacerbated in the case of professionals who are also part of the affected population. As far as the men interviewed are concerned, family care does not occupy a central place in their discourse and the tensions between the productive and reproductive spheres are not clearly identified. From the results obtained, recommendations are derived that could facilitate more effective disaster management from a gender perspective, with a positive impact on the professionals involved, especially women.

ALSHEHAB, NAWAFEL* (University of Exeter, United Kingdom)

Dispossession of Land and Sea: Resisting Urbanormativity in Bahrain

In the small island-state of Bahrain, authorities have extensively employed coastal land reclamation as an urban development strategy, under the guise of land scarcity, following models seen in the Netherlands, Singapore, and Hong Kong. These efforts have drastically reshaped the island's coastline and sparked collective nostalgia for the lost seascapes. For Bahrainis, the coast once served as a space for leisure, economic activities such as shipbuilding, fishing, and pearling, and as an environmental common. Dredging has demolished traditional *hadhras* (fish traps), *hayrat* (oyster banks), and *chawachib* (freshwater springs). Despite its detrimental impact on the marine habitat, dredging and reclamation projects have created numerous artificial landforms in the middle of the sea, ostensibly to address the housing shortage. However, these developments predominantly consist of luxury seafront projects, unaffordable for the majority of the population.

This paper examines equal public claims to both land and sea in the context of 'dispossession of land.' The pressures of Gulf urbanization have pushed for a uniform, urban-centered development model that often marginalizes traditional coastal communities and their intimate connection to both land and sea. Through archival research and ethnographic fieldwork in Bahrain's western seaside villages, I explore how community-led action is challenging conventional economic and urban development approaches in the region, aiming to preserve communal access to maritime spaces and to resist the privatization of coastal territories. Reflecting on Bahrain's history of feudalism and the legacy of British colonialism—when the island was used as a naval base in the twentieth century—this paper argues that reclaiming access to the coast is a means of preserving rural forms of life in the face of Gulf urbanormativity.

Transformative Agri-Food Supply Chains for Climate Resilience – Which Indicators Are Suitable to Measure Resilience and Social Transformation and Foster Farmers' Involvement?

Resilience in agri-food supply chains refers to the ability of the system to withstand and recover from various shocks and stresses while maintaining its functionality. However, there are several challenges and problems that can hinder the resilience of agri-food supply chains, like climate change impacts, long supply chains, environmental degradation, as well as social and economic disparities. Addressing these problems requires a holistic and collaborative approach that involves various stakeholders, including government bodies, researchers, industry participants and should especially foster farmers involvement. We work on transdisciplinary research that unites stakeholders from diverse sectors, including coffee, cocoa, herbs, and livestock farming, with a specific focus on family farmers. Grounded in national and international best-practice examples on farmers' involvement, our research aims to advance our understanding of effective strategies for fostering resilience and social transformation within the agri-food sector. We develop indicators for measuring resilience and social transformation within agri-food supply chains, aligning with the Proximity Framework by Edelmann et al. (2022) and incorporating the Resilience Concept from relevant literature, which we want to present and discuss in this session. Through consultations and collaborative discussions scaling-out, scaling-up, and scaling-deep strategies (Moore et al. 2015) will be explored, to inform effective approaches that directly profit agricultural communities and fosters the role of farmers. We will apply gender-transformative approaches and feminist perspectives throughout the research process, to ensure a nuanced understanding of gender dynamics in agri-food-supply chains. The inclusion of diverse sectors is strategically motivated, providing a comprehensive exploration of resilience and social transformation, with a specific emphasis on improving the livelihoods of family farmers and directly profiting agricultural communities' future.

Urban Capitalism Concreteness without New Cementation: Gentrification and Grassroots Resilience

A large body of political and scientific literature certifies that the success of capitalism, ever since its emergence in the history of economics, is due to its great "transformative capacity". In the contemporary city, characterized by a post-productive structure, the regression of welfare, and a lack of trust in the political class, capitalism no longer needs to build new structures to extract value from the land: the line of the best income is represented by the "temporary population", made up of tourists who visit a city for a few days, seeking moderately priced accommodation, and are then replaced by other tourists. Such a mechanism does not require additional constructions: in neighborhoods with an established or innovative tourist vocation, the B&Bs offered on informal tourist accommodation platforms are created from apartments that previously housed the local population, who can no longer afford the cost of living in the gentrified neighborhood.

What are the social consequences of this phenomenon? Central districts, semi-peripheral areas, and the entire "consolidated city" become depopulated and lack generational renewal because new families, seeking long-term contracts, are not temporary enough. There are however some seeds of resilience: through in-depth interviews and focus groups, this paper has investigated a group of apartment owners in the city of Rome who have decided to offer rentals at controlled prices, i.e., in line with the low wage levels of the labor market in Italy. Their goal is to encourage the arrival of young couples or individual renters, rejecting the "allure" of short-term informal tourist accommodation through sharing platforms.

The analysis has been conducted with the Nvivo and IRAMUTEQ programmes. Though the survey is still in progress, the paper offers some finding useful to capture general trends of tourism industry in Rome, just at the eve of 2025 Jubilee.

ALTGLAS, VERONIQUE* (Queen's University Belfast, United Kingdom)

Critical Sociology(ies) of Religion: Unity in Diversity?

This paper sets out to examine the diverse interpretations of a "critical sociology of religion" as proposed by various scholars. Some have argued that scholars should avoid acting as guardians or protectors of their object of study, advocating instead for a more critical stance that positions them as cultural critics (McCutcheon 2001). Others emphasize the roles religion plays in both oppression and emancipation, arguing that a value-based perspective evaluates religion in relation to key principles such as democracy, freedom, equality, justice, and inclusion (Goldstein 2009). Hjelm (2014) suggests that a critical sociology of religion should investigate how religion contributes to the reproduction or transformation of social inequalities. Meanwhile, Altglas and Wood (2018) propose a reflexive approach, seeking to distance critical sociology from the belief systems within the religious field itself. Advocating the return of the social into the study of religion, they also view religion as a lens through which broader social dynamics can be understood. This paper will explore the differences and shared points among these perspectives, particularly their common focus on social power and its role in the study of religion. Finally, it will consider whether a unified agenda for this approach to the subfield might be possible.

Cultivating Feminist Mentoring and Resisting Authoritarianism in the Academy and Beyond

This presentation/paper comprises three women (Özlem Altioğ, Yakın Ertürk and Alicia Re Cruz), and two stories based on their experiences of working within the academy in the United States, and within the women's movement in Turkey. These experiences illustrate how feminist mentoring and strategizing help us resist authoritarianism across borders. Through what we call an "emergency feminism," we invite teachers, scholars and activists to reflect on how we can collectively create and sustain relationships to resist authoritarian politics in the academy and beyond.

ALTMANN, PHILIPP* (Universidad Central del Ecuador, Ecuador)

Cold War Sociology in Ecuador? History of a Failed Intervention during the 1960s

In the late 1950s, Ecuadorian universities were in a crisis. The old structure did not suffice for a modernizing society with the need for professional state servants. The same happened to Ecuadorian sociology. Despite the creation of research institutes and academic conferences, sociology seemed to have ended. The pioneers were dead, their students almost all had migrated to other courses or even outside of academia, and a new generation of sociologists was not to be found.

In this panorama, attempts at reform were undertaken to improve research and education. The Central University of Ecuador was pioneering. Attempts to acquire external support led, in 1963, to a collaboration with the University of Pittsburgh in the context of the Alliance for Progress with the backing of USAID. Only shortly after the first mission of professors and technical assistants had arrived, a military coup established a fiercely anti-communist dictatorship that pushed for a renewal of the universities in the sense of technical formation. The mission of UPitt was functional in this: they created a Faculty for Basic Sciences that included a school for social sciences and what would become the country's first degree course in sociology. However, this attempt to establish a scientific sociology happened without any sociologist or influential intellectual supporting it. Instead, anthropologists, social psychologists, historians, and others tried to establish a sociology focusing on social research, rurality, and cooperatives. The lack of support from established academics meant that this attempt ended with the dictatorship in 1966 and the end of funding by USAID in 1968. Even worse: the connection between the reform and the dictatorship led to an open fight against this US-American positivist sociology in favor of a Marxist one.

ALTMANN, PHILIPP* (Universidad Central del Ecuador, Ecuador)

The Indigenous Movement in Ecuador between Ethnic Identity, Eco-Social Struggles, and Class Alliances

The indigenous movement in Ecuador changed during the 1970s, leading to demands around a strong concept of territory as the basis of material and cultural reproduction of indigenous nationalities. Territorial autonomy became a central element of the discourse of the movement, amplified into the demand for a plurinational state since the 1980s. While this renewal was at first connected to the Catholic Church, the biggest national indigenous organization, CONAIE, focused on the double dimension of the problems of indigenous nationalities: as oppressed people and exploited class. This allowed to widen alliances with other social movements, since the 1990s, to NGOs, and finally to environmentalists. Since the 1990s, a part of the discourse of the movement has been shaped to embrace ecologist ideas, presenting indigenous peoples as allies in the fight to protect the environment. With this, the insistence on territorial autonomy acquired an anti-extractivist touch that had been initially absent and still contested within the movement.

The 1990s saw the strongest indigenous or even social movement on the continent, paralyzing the country several times between 1990 and 2001. But shortly after, the movement entered a long crisis, deepened by the government Correa (2007-2017). During this time, most major movement actions happened in cooperation with environmentalists. As a result, anti-extractivism was strengthened and the fight for water protection and rights became central. Thus, the relative weakness of environmental demands in the uprisings of 2019 and 2022, marking a revival of the movement, is so

surprising. Instead, alliances with the urban poor seem to become more relevant.

This presentation will trace the changing role of eco-social struggles and alliance politics of the indigenous movement in Ecuador since the 1970s, with a focus on the renewal of the movement since 2019.

Political Violence and Criminal Governance, México in a Comparative Perspective, 2012-2024

The paper analyses the evolution of political violence in México, and the intervention of criminal organizations in the recent elections (2018-2024). Proposes that political violence have evolve, affecting electoral process. Both criminal groups have been more interested in either influence elections or participate in them, financing candidates, supporting certain actors and controlling the electoral trough both clientelist and illicit-coercive actions.

Mexican Elections of 2024 resulted in one of the more violent electoral processes in history, with dramatic homicides of candidates, militants and citizens.

The paper will compare the problem of political and electoral violence in recente elections in Latin America

RC29-470.2

ALVARADO MENDOZA, ARTURO* (El Colegio de México, Mexico)

The Impact of Illicit Economies in Urban Activities. a Comparison between Three Megalopolis, Mexico City, Sao Paulo and Jakarta

Global illicit activities are significant components of the world economy, causing serious issues for people, economic actors, and governments as well. Illicit activities distort the articulation of the public sector and represent a heavy toll on individuals and communities. However, our understanding of how these transgressive activities are embedded within urban contexts, as well as the impact on regional and national territories, remains limited. This chapter aims to estimate the scale and impacts of local and transnational transgressions, by comparing two major urban centers in Latin America, São Paulo in the south and Mexico City in the North. We aim to contribute to the existing literature on city making, by shedding light on the destructive role of illicit global activities. Additionally, we will present some examples of economies of violence endured by/impact the lives of millions of people. Cities are places where multiple forms of law transgressions take place in mixed environments, making it difficult to discern the extent of destruction that illegal actors produce. To provide a more precise approach to this topic, our interpretation will be based on Bauer (2022: 6-7),¹ who characterizes illicit economy as ... "all (individual and group) actions or behaviors leading to a benefit in terms of power and/or financial gains to the detriment of another person, organization or institution." The economies of violence can be either financial or economic gains (Bauer, 2022: 5),² and might be motivated by the lure of gain and/or the establishment of power relations. And ... "the harm endured by another person or entity following the perpetuated action, which

resulted in a financial gain, being physical/moral/psychological, remains a common denominator qualifying the latter act as "violent" (Bauer, 2022: 6).

ALVARADO VIVAS, SERGIO* (Corporación Universitaria Minuto de Dios - UNIMINUTO, Colombia)

Narratives of Colombianness: An Analysis of Social Representations in Netflix and Amazon Prime Video Series

In the platformization era, TV series are crucial in constructing and diffusing cultural identities. This study examines Colombian series on platforms such as Netflix and Amazon Prime Video, including *Eva Lasting*, *Green Frontier*, *Wild District*, *News of a kidnapping*, *The hijacking of flight 601*, *Los Billis*, and *The great heist*, and how they project representations of Colombian identity in a globalized context. Using the social representations theory, we analyze how these productions transform abstract concepts about Colombian identity into narratives accessible to local and international audiences through anchoring and objectification. The qualitative methodology includes an analysis of the themes addressed in the series and their relationship with other international series hosted on streaming platforms. The findings reveal that these series tend to anchor Colombian identity in issues of violence and armed conflict,

presenting these elements as central to the national experience. Violence is represented not only as a structural problem but as a daily occurrence that has profoundly shaped the country's life. This anchoring in violence contributes to a global perception of the country as a place marked by conflict.

In addition, the series carries out a process of objectification by highlighting the resilience and adaptability of Colombians in the face of adverse situations, presenting ingenuity and cunning as defining characteristics of national identity. To a lesser extent, they also explore mysticism and connection with nature, reflecting indigenous and Afro-descendant cultures as a process of objectification that offers an additional perspective on Colombian identity beyond the urban. As a result, streaming platforms shape global perceptions, encouraging us to find similarities with productions such as *Stranger Things* or *Money Heist*. This suggests that digital platforms, driven by their algorithms, configure ecosystems of recommended content to build subscriber loyalty by referencing global values, while also preserving the specific nuances of Colombian idiosyncrasy.

ZUBIRI, HARKAITZ (University of the Basque Country, Spain)

The Social Impact of a Youtube Channel and Tiktok for the Dissemination of Dialogic Sociology

Access to scientific knowledge and the benefits derived from it is a fundamental right of citizenship. The scientific literature has provided substantial evidence on the increasing role of social media in disseminating specialized knowledge, promoting access to scientific evidence for everyone. Recent studies highlight platforms such as YouTube and TikTok as key tools in facilitating access to scientific content for diverse audiences, thereby contributing to the democratization of knowledge. However, a gap in the literature remains regarding how these platforms can promote "dialogic sociology," an approach that fosters interaction between experts and citizens, making sociological theories more comprehensible and applicable to users' everyday lives.

Thus, the aim of this research is to examine the impact of a YouTube channel and TikTok account, specifically created to disseminate sociological concepts, on users' understanding of the social dynamics that shape their environment. To address this, a mixed-methods approach has been employed. First, social media analytics have been utilized to quantitatively analyze user interactions on both platforms, measuring metrics such as comments, likes, and shares to identify patterns of engagement and knowledge dissemination. Second, qualitative interviews were conducted with a purposive sample of followers from both platforms to explore their perceptions of how these contents impact their daily lives and understanding of sociology.

A key preliminary finding is that interviewed users reported a significant improvement in their ability to critically interpret social phenomena, applying the sociological concepts learned from the videos to real-life situations. This suggests that dialogic sociology through social media can be an effective means of fostering critical thinking and enhancing users' sociological awareness.

ALVAREZ MORA, BRUNA* (Universitat Autònoma de Barcelona, Spain)

Reflexive Intra-Action to (re)Territorialize Sex and Gender Relations at Primary Schools

Childhood studies have explored how gender inequalities are learned through everyday practices (Davis, 1989), framed by dominant representations of heterosexuality (Renold, 2006). These inequalities contrast sharply with institutional efforts—such as policies and educational reforms in Catalonia (Spain) since the 1970s—that promote co-education. An institutionalization of feminism (Reverter, 2011), has shaped educational discourses. When feminism entered institutional spaces and public administration, it began to serve as a governance mechanism (Morgan and Roberts, 2012) for educational narratives, reinforcing the transmission of gender norms while teachers and students continue to reproduce these inequalities.

Educational institutions thus function as spaces of symbolic power for adults, encouraging children to provide "correct" answers (Spyrou, 2011). In terms of gender discourse, the "correct" answer is typically an equitable

one; however, gender has not been integrated in a way that fosters critical consciousness (Freire, 1970). This means that while there is an emphasis on equitable gender relations, many children still absorb narratives that naturalize gender inequalities, leading to the reproduction of both equitable discourses and unconscious unequal practices.

This article aims to describe how reflective processes are used to deterritorialize a gender assemblage characterized by equitable discourse and unequal practices. The focus is on an activity where children and researchers analyze drawings and verbatim statements produced by the same group of children. Children, researchers, drawings, verbatims, classroom, ideas, norms, and gender discourses, among other elements, intra-act (Barad, 2007) reflectively to deterritorialize the gender assemblage. The findings suggest that this process raises children's awareness of specific gender roles and performativities, allowing for the emergence of new, more equitable practices.

ALVAREZ-BENAVIDES, ANTONIO* (National Distance Education University / GESP, Spain)

JIMÉNEZ AGUILAR, FRANCISCO (University of the Basque Country, Spain)

#Thebestwoman(s). Religion, Secularization and Conservatism in the Femininities of the Spanish Radical Populist Right

During the celebration of International Women's Day (8M) in 2021, Carla Toscano, a member of the far-right Spanish party Vox, supported a campaign promoted by the Catholic Association of Propagandists (ACdP) on social media and in the streets. The campaign presented the Virgin Mary as *#TheBestWoman*: "devoted, attentive, sweet, generous, strong, helpful, modest, faithful, prayerful, guide, companion, wife, mother, queen". Billboards in over 30 Spanish municipalities displayed the beginning of the Hail Mary with "8M" as the headline, a purple background, with the words "women" and "mother" underlined.

This campaign was part of the far-right party's anti-feminist agenda during the COVID-19 pandemic, which has become central to its ideology and political strategy. Vox has positioned itself as one of the main opponents of feminism and legislative advances in gender equality, consistently rejecting all laws and measures that stem from what they call "gender ideology."

However, the femininities and other gender roles promoted by Vox—and especially represented by its voters—are not limited to the religious and traditional forms characteristic of ultra-conservative Catholicism. Alongside these, other models of femininity have emerged, shaped by processes of secularization, modernization, and innovation, which align with the party's nativist and traditionalist ultranationalism. This diversification in the forms of femininity accepted within the party has simultaneously allowed for a more complex opposition to public policies promoted by feminism in areas such as work, sexuality, and education.

In this study, we will explore the party's diverse opposition to equality policies, drawing on digital ethnography, 16 in-depth interviews, and 3 focus groups with young Vox voters. First, we will review the literature on Vox's conceptions of gender and its politics. Then, we will demonstrate, through empirical material, how their electorate reinterprets and re-elaborates certain religious and traditional assumptions.

JIMÉNEZ AGUILAR, FRANCISCO (University of the Basque Country, Spain)

Consuming Far-Right Extremism. Consumption, Alter-Activism and Charity Ultranationalism in Recent Spain

One of the increasingly common ways the far right extends its influence is through consumption. As recent academic literature has reflected, beyond classic socialization such as the acquisition of past extremist literature, there are others that involve the consumption of everyday goods like clothing, food, or memorabilia. These products are created or promoted by far-right actors themselves, both to finance their activities and in alignment with their nationalist worldview. Although this is not the goal of their political action, such products play an indispensable role in the social contest, which has recently drawn public attention. In Spain, for instance, the recent Democratic Memory Law (2022) has persecuted the direct legitimization of the dictatorship through these objects.

This paper will analyze the consumer goods and the implications of its consumption among the adolescent and young Spanish population since

the 2008 crisis. Through digital ethnography, we will focus on clothing, consumer goods in social spaces, and the consumption of past objects. Some preliminary results of this study include the systematic incorporation of goods with alter-activist/partisan, patriotic, or anti-feminist motifs to create an affective community among these age groups, as well as the use of these goods to generate antagonisms.

In conclusion, we reveal the importance of consumption as one more facet of Spanish far right "ultranationalist charity", which distributes desirability and access to goods, thereby challenging hegemonic political or national conceptions. Furthermore, we will observe how consumption also intervenes in the creation of hierarchies within the nation, with particular attention to sexual difference and the possibilities for social transformation

ALVARIÑO VAZQUEZ, MANUEL* (European University Institute, Spain)

LEÓN BORJA, MARGARITA (Universitat Autònoma de Barcelona, Spain)

Future Directions for Family Research

Leave policy, as a crucial element of family policy, profoundly shapes gendered work-family choices, while also reflecting deep political cleavages regarding family models and gender roles. This paper engages both theoretically and empirically with two key trade-offs in leave policy design: work versus care, and gender equality versus gender difference.

Historically, conservative forces promoted familistic male-breadwinner models through long, transferable parental leave, which allowed women extended time off for caregiving, often hindering their re-entry into the labour market. These policies have been progressively reformed into shorter, better-paid leave periods designed to encourage quicker returns to work and improve mothers' employment trajectories. However, feminist scholars have criticised the emphasis on employment over caregiving, calling to shift back from a universal breadwinner to a universal carer model. Meanwhile, there has been growing attention to the gender distribution of caregiving responsibilities and to the role of men. Trends such as reserving portions of leave exclusively for fathers, exemplified by the European Union's work-life balance directive, reflect this shift. Yet, debates persist over whether fully equalizing leave rights for men and women accounts for their different conditions and needs.

Thus, parental leave design serves as a battleground for classic and evolving debates: the tension between the right to work and the right to care, and the quest for gender equality preserving an acknowledgement of sexual difference. This article addresses the complexity of these dimensions at both theoretical and empirical levels. Using comparative OECD data from 1990 to 2021, it maps national leave policy reforms and observes emerging patterns and trends. The findings reveal that policy legacies and the timing of parental leave reforms have shaped current trajectories toward greater 'degenderization', although progress varies significantly across countries.

Co-Creation in Teacher Education to Prevent Gender-Based Violence Based on Scientific Evidence of Social Impact

Educational interventions are proliferating but results do not always demonstrate improvement in children's lives. Therefore, teachers feel that they are not sufficiently prepared to be able to intervene in cases of gender violence at school or to select the best actions to implement that will result in violence free contexts. Education plays an important role in the prevention of gender violence and scientific literature has shown evidence of how, given its increase at an early age, educational materials on its prevention should be based on scientific evidence. However, unlike other disciplines, how scientific evidence is built upon social impact and co-creation is not much considered in education.

In the framework of the ANONYMIZED project (ANONYMIZED ref), a co-creation process of didactic materials for primary and secondary education teachers was conducted to fill this gap. The objective of this research is to examine the process and positive implications of this co-creation process. For this purpose, the communicative methodology has been followed, a Transnational Project Meeting and 3 teacher education pilot seminars that involved in dialogue 77 people in Spain and Portugal, both researchers, teachers and teacher trainers were implemented. These sessions were recorded, and their qualitative content has been analyzed.

A key finding is how the democratic and innovative co-creation process of didactic building promoted the collaboration and networking among

different educational agents. These dialogic interactions based on scientific evidence of social impact had a positive impact on teachers' awareness and reflection about the co-created materials, opening up effective procedures to implement preventive actions to overcome gender violence.

ALZARIF, MOHAMAD* (The American University in Cairo, Egypt)

The Role of Quotas in Advancing Women's Political Representation in Egypt

This paper examines the impact of gender quotas on women's political representation in Egypt, with a focus on both successes and ongoing challenges. Egypt introduced a quota system to increase women's participation in political bodies, most notably in its 2015 constitutional amendment, which mandated 25 percent of parliamentary seats for women. While these quotas have led to significant increases in women's representation, they have not eliminated the deeper structural barriers that limit women's full political engagement and leadership. This paper will analyze the effectiveness of these quotas, compare Egypt's efforts with other MENA countries, and assess how gendered political culture, legal frameworks, and socio-economic conditions continue to shape political participation. The research draws on interviews, parliamentary records, and case studies, contributing to broader discussions on achieving gender equality in global politics, particularly in emerging democracies. The paper concludes by offering policy recommendations to enhance the sustainability of women's political gains in Egypt and beyond.

Procesos De Subjetivación Contemporáneos y Blanquitud. Revisión Crítica Desde El Ethos Barroco

En "Imágenes de Blanquitud" (2007), Bolívar Echeverría argumenta que un elemento clave en la subjetivación del hombre moderno occidental es la formación de la moralidad puritana, la cual define el perfil del trabajador dentro de las relaciones de producción capitalistas. Esta moralidad no solo moldea la conducta del trabajador, sino que se integra en el tejido social y cultural de la modernidad occidental. Echeverría describe cómo ciertas características actitudinales de las poblaciones del centro-norte de Europa, como el color de piel y la religión, se identifican con rasgos étnico-nacionales. Este proceso de identificación conduce a la creación de un vínculo fundamental entre el puritanismo, que exige vocación al trabajo, y la "blancura" tanto material como espiritual, que pasa a ser parte esencial de la subjetividad moderna. El autor ve esta interrelación como el grado cero de la identidad del sujeto moderno, lo que da lugar a una demanda racial que abarca expresiones étnicas, biológicas y culturales. Esta demanda culmina en la formación de un prototipo racial que se convierte en el ideal identitario y civilizatorio del capitalismo. La interrelación racial-cultural de la modernidad genera un mandato de "blanqueamiento" de hombres y mujeres, amalgamando las relaciones económico-sociales en torno a la ostentación de la blancura para obtener reconocimiento social. En América Latina, y especialmente en México, este mandato ha impulsado estrategias de gobierno y políticas públicas dirigidas a la modernización del Estado, buscando superar identidades indígenas o afrodescendientes. El objetivo ha sido un mestizaje que blanquee moral, cultural y biológicamente a la población.

El propósito de esta intervención es ensayar críticamente los alcances y los límites de las estrategias barrocas de supervivencia a la modernidad en el análisis y / o superación de dicho mandato en la actualidad.

AMAO CENICEROS, MELINA* (Universidad Autónoma de Baja California, Mexico)

Colonialismo Afectivo: Economía Moral De Las Emociones En Los Activismos Del Sur Global

La construcción del sistema-mundo euro-norteamericano capitalista/patriarcal moderno/colonial (Grosfoguel, 2005) ha implicado la imposición de jerarquizaciones corporales-sociales-territoriales, cuyos significados se actualizan bajo una lógica globalizante. Así, podemos hablar de la colonialidad del poder/saber (Quijano, 2005), del ser (Maldonado-Torres, 2005), la biocolonialidad (Cajigas-Rotundo, 2005), y la colonialidad del género (Lugones, 2008), en tanto sistemas que se construyen sobre binarismos que producen situaciones epistemológicas asimétricas (Guerrero, 2021). Así, es posible identificar una colonialidad afectiva que se entrama sobre binarismos jerarquizantes en los que se feminizan aquellas

emocionalidades vinculadas al sostenimiento de la vida, como el amor empático y compasivo (Aya-Angarita y García, 2022), al pensarlas como emocionalidades domésticas y privadas (Jelin, 2006). Es decir: hay una colonización sistemática de los seres humanos como cuerpos/emociones (Scribano, 2022), que se sostiene sobre una política de los cuerpos y una política de las emociones (Scribano, 2013). Esto ha supuesto para los activismos del Sur Global la gestión de una economía moral de las emociones como táctica de supervivencia, pues las luchas por la vida ante el despojo del antropoceno/capitaloceno implica enfrentarse fuerzas geo-corporo-necro-políticas. Esta ponencia discute el colonialismo afectivo en los activismos del Sur Global en tanto emocionalidades subalternizadas frente a la racionalidad heterocolonial, y su negociación/modulación como gestión de la vida, ejemplificando luchas ambientales, como la de Homero Gómez, y sociales, como la que ha impulsado Kenya Cuevas, en México. El primero asesinado en 2020, y la segunda luchando desde 2016 entre amenazas de muerte. Como base empírica se retoman dos largometrajes documentales: "El guardián de las monarcas" (2024) y "Kenya" (2022), así como un diálogo virtual con Kenya Cuevas realizado el 6 de septiembre de 2024. De ello, se analizan las emocionalidades encarnadas, el acuerpar (como acción autoconvocante ante demandas sociales) y la economía moral de las emociones (hacia la consolidación de acuerdos).

AI-Powered Methods in Digital Sociology: Opportunities and Challenges for Researchers

This paper explores the transformative role of AI-Powered Methods in digital sociology, particularly in enhancing the speed and adaptability of social research to pressing social issues. Traditional methods often struggle to keep pace with the rapid changes in digital society.

AI-powered methods, such as automated and enhanced data collection and data analysis through machine learning applications, may allow researchers to quickly collect, process, and interpret different data types, including texts, images, audio, and videos.

These methods may be crucial for addressing pressing social issues and making research more responsive and proactive. However, while these methods offer significant benefits, they also pose challenges related to the technological affordances of AI systems, such as the underlying statistical models and algorithmic processes they are built on.

This paper shows the risks of adopting AI uncritically, which could result in a simplistic view of social research that overlooks crucial methodological and epistemological considerations about data construction and analysis. The article's results critically examine the effects of AI affordances, emphasising the importance of balancing technological applications with a nuanced understanding of AI's impact on research practices.

Bridging Generations: Intergenerational Living in the UK Park Home Communities

This study aims to explore the potential of intergenerational living that can bridge generations within a unique setting of UK park home communities.

Park homes have become a suitable alternative of living for many. This is a small niche sector of the UK housing market presenting a low-cost lifestyle choice for a growing elderly population. The Ministry of Housing states that approximately a quarter of a million people live across two thousand licensed park sites and 68% of these residents are over 60, in many sites governed by a lower age restriction of 45 or 50 years.

These restrictions and problems for young tenants to raise capital via mortgage lead to questions about the potential impact on intergenerational living in British park homes. There are several sites without an age limit, but entering them can still be challenging for many individuals unless they have previously been homeowners or possess substantial savings.

The findings have been gathered from ongoing interviews with over 20 residents and a few site owners. It has provided valuable insights into both the benefits, such as strong communities in attractive locations and complexities, such as stigma due to their choice of home.

This study will contribute to the broader discourse on alternative housing models, mixed-tenure neighbourhoods, and inter-generational living. It enhances the understanding of living in this type of accommodation and its future prospects for long-term viability.

DE FALCO, CIRO CLEMENTE* (University of Naples Federico II, Italy)

Rage Against the Algorithms: The Case of Activists in the Italian City of Naples

The aim of this research is to explore the concept of algorithmic resistance through a case study on a group of political activists from Naples. This study is situated within the broader field of research on the relationship between humans and digital technologies (Kitchin, 2014). While algorithms and artificial intelligence are often portrayed as neutral tools, Actor Network Theory (ANT) defines them as "socio-technical actants" (Latour, 2006) with authority (Cheney-Lippold, 2011) capable of influencing individuals and social phenomena.

Contrary to the perspective of technological determinism (Marres, 2017), individuals are aware of the role algorithms play and develop "folk theories" (Dogruel, 2021) to explain their functioning. These folk theories are employed for various purposes, including attempts to tame or subvert algorithms and AI by repurposing them for unintended uses. Such practices, termed algorithmic resistance, have been documented in contexts like delivery platforms (Tuomi et al., 2023) and among Instagram influencers (Bonini, 2022), where individuals are more cognizant of algorithmic impacts and thus more inclined to develop counter-strategies.

Activists were selected as the focus of this research for two primary reasons: (a) in the realm of online politics, they frequently engage in direct interactions and confrontations with algorithms; and (b) they approach these technologies with a set of values often at odds with the underlying logic of the algorithms.

Between April and May 2024, semi-structured interviews were conducted with 20 activists. The participants demonstrated a repertoire of both evasive and proactive practices, informed by their folk theories regarding algorithmic operations (Karizat et al., 2021). The findings underscore the necessity to reconceptualize the human-digital relationship as one of mutual influence rather than a unidirectional interaction. Furthermore, the study offers valuable insights into the strategies activists employ to resist or counteract algorithms in their political activities on social media platforms.

AMBIKAR, RUCHA* (Bemidji State University, USA)

From Marginalized to Supremacist: The Use of Intersectional Identities in Online Networks

The emergence of social media has allowed for new forms of local-global solidarity networks and the sophisticated analysis of their participants' intersectional identities to achieve their goals. This paper focuses on one particular form of such online networks - those in support of Hindu supremacist ideology and politics in India. Comprising both Indians located in India and NRIs or non resident Indians located largely in Western countries like the US or UK; such networks understand themselves through an intersectional lens as both victims of racism abroad and in danger of marginalization at home. Valid critiques of racism and other forms of minoritization in the Western context are parlayed into evidence of such existential threat in India, despite being both demographically and politically dominant in local contexts.

My paper is a theoretical examination of how the intersectional identities of participants in cross border, online networks allows for new justifications of majoritarianism to emerge. I argue that while consciousness raising of participants' identities in social networks has often been considered a tool for mobilizing support for social justice - counter movements like the ones in support of Hindu majoritarianism use similar tactics in order to further their goals. I argue that these movements use the rhetoric of intersectionality, particularly the language of inequality and subalternity in the West to posit a sense of victimhood at home that engenders support for Hindu supremacist politics. The language of subalternity is used to win recognition and legitimacy both in India and abroad, allowing for the creation of a compelling counter narrative to democratic solidarity networks. Such networks not only attract further support for right wing supremacist viewpoints, but also succeed in positioning themselves as legitimate spaces that arbitrate the future of Indian nationhood.

AMEZQUITA, ALEXANDER* (Facultad Latinoamericana de Ciencias Sociales (Sede Ecuador), Ecuador)

Funambulists in Power Lines: Gendered Pathways of Technical Workers in the Andean Region

This paper presents a historical and ethnographic analysis of technical work in the installation and maintenance of power lines in Ecuador and Colombia, tracing its evolution from late 19th-century trade schools to modern national systems of qualifications. By examining Colombia's privatized, market-driven model and Ecuador's public, stable model, I explore how different levels of privatization shape the career paths of linemen. In Colombia, privatization has led to greater job mobility and dynamism in training and employment, with a networked involvement of ministries, companies, and regional organizations. In contrast, Ecuador's public sector model offers more stability but limited opportunities for formal technical education, largely dependent on cultural transmission among peers.

Since 2014, policy initiatives in Colombia have also supported the inclusion of women in this field, backed by targeted training programs and multi-stakeholder involvement. Meanwhile, Ecuador's female inclusion remains sporadic, often influenced by individual drive or populist patronage practices rather than comprehensive long-term strategies. Unlike the activist-led struggles of female electricians in the 1960s United States, women's entry into this field in Andean region reflects global inclusion policies rather than grassroots resistance. This institutionalized inclusion has fostered a grammar of domination, rather than resistance, in the female workforce's experience, sometimes obscuring the gendered inequalities and violence they face.

Distinct motivations emerge for men and women entering this field. While men emphasize physical aptitude, women are drawn to the extreme nature of the work. This gendered approach also affects their learning focus, with women delving deeper into technical electrical knowledge and men emphasizing height-related skills. This dynamic contributes with unique forms of labor practices among technical workers, evolving grammar of professional identity and even the debate on professions and occupations, which in Latin America has a different character than in Europe or the Anglo-Saxon world.

El Impacto De Los Cambios Ambientales En Las Experiencias De Vida De Los Jóvenes Rurales En El Rif Marroquí: Un Estudio Sociológico Sobre Los Jóvenes En La Aldea De Beni Guemil Maksouline, En Alhucemas

Partiendo de un estudio sociológico basado en técnicas de investigación cualitativa, este artículo aborda el impacto que tienen los cambios ambientales en las experiencias de vida de los jóvenes en Beni Guemil Maksouline, una aldea situada en el norte del país en el Rif marroquí. Se destaca cómo el uso del espacio ecológico por parte de los jóvenes y la sociedad en general ha pasado por tres periodos cruciales: antes del cultivo de cannabis, durante el cultivo y después de este, así como los cambios climáticos que han ocurrido en estos tres periodos. Además, el trabajo muestra la influencia en las percepciones, prácticas y estrategias de los jóvenes a lo largo de estas etapas, evidenciando su transición de la resistencia al cambio a la expresión de una demanda por el derecho al desarrollo.

At the Intersection of State Law and Non-State Law: Implications of the New Divorce Amendment Act on the Fundamental Rights of Muslims in South Africa

Until 28 June 2022, all religious marriages in South Africa were not legally recognised. On 28 June 2022, the South African Constitutional Court found that the non-recognition of Muslim marriages is unconstitutional because it violates the rights to equality, access to justice, and children's rights among others. The Court held that the common law definition of marriage was unconstitutional to the extent that it does not include Muslim marriages. The Court further ordered the South African state to amend existing legislation or enact new legislation to recognise and regulate the consequences of Muslim marriages. Until that happened, the Court ordered the implementation of an interim measure to enable Muslim spouses who were or are undergoing Muslim divorce to institute a civil divorce in terms of the Divorce Act 70 of 1979. Early in 2024, the Al Jama'ah party, a party that purports to represent a Muslim constituency in South Africa, successfully had amendments to the Divorce Act enacted through the Divorce Amendment Act 1 of 2024. The latter purports to implement the interim measures anticipated by the Constitutional

Court. In this paper, I consider the point at which Muslim family law meets civil family law through the Divorce Amendment Act. I examine the implications of the amendments for Muslim parties and children born of Muslim marriages. I especially explore the extent to which the intersection between state and non-state law allows Muslim marriages and divorces to be incorporated into a secular legal framework, and the implications of such incorporation for the rights to freedom of religion, gender equality and children's rights.

Gouverner (par) La Pénurie. Une Socio-Histoire Des Subventions Alimentaires En Tunisie

Depuis 2022, la Tunisie fait face à des pénuries alimentaires et énergétiques croissantes, exacerbées par la hausse des prix internationaux de l'énergie et des céréales due à la guerre russo-ukrainienne. Dans ce contexte, le gouvernement tunisien est engagé dans des négociations avec le FMI, en vue d'obtenir un prêt conditionné à une levée progressive des subventions alimentaires et énergétiques. Le refus du président Kaïs Saïed de conclure un accord, par crainte des répercussions sociales liées à ces réformes, semble avoir aggravé les tensions.

Pourtant, cette analyse conjoncturelle de la crise actuelle masque le fait que la pénurie est un mode de gouvernement ancien en Tunisie. Si les récentes décisions visent à contrôler la balance des paiements, et à prioriser le remboursement des créanciers, elles s'inscrivent dans une histoire plus longue de gouvernement par la pénurie, qui permet de naviguer entre la satisfaction des exigences des institutions financières internationales et la légitimation de régimes successifs. Comprendre la crise actuelle nécessite ainsi de replacer ces pénuries dans une socio-histoire des subventions alimentaires tunisiennes, façonnée par des dynamiques de dépendance économique et de gestion des tensions sociales, depuis l'échec des coopératives socialisantes (1961-1969) jusqu'à aujourd'hui. Elle ne se comprend qu'en analysant l'agenda historique – à maintes reprises différé – des réformes néolibérales de la Caisse Générale de Compensation.

Si les pénuries agissent comme des variables d'ajustement entre les attentes des classes populaires et les injonctions économiques internationales, elles engendrent des conflits dans les filières subventionnées. Les mobilisations corporatistes diverses, portées notamment par les acteurs de la filière, traduisent des revendications qui mettent sous tension les différents circuits de subvention. Une enquête multi-située par entretiens sur les liens métaboliques de fonctionnement des filières, leurs chocs et ajustements successifs offre des pistes pour comprendre ce gouvernement du social depuis longtemps à bout de souffle.

RC37-617.5

AMR, ABDELRAHIM* (Sciences Po, France)

Turning Rhymes into Dimes: Intermediaries in the Egyptian Rap World

Over the past five years, Egyptian rap has achieved unprecedented commercial success. Much has been written about how "new school" rappers and producers were able to create a sound that resonates with a broader public than their predecessors. Conversely, music, marketing, and advertisement professionals who played an integral part in these artists' careers have received limited attention. This paper follows in American sociologist Howard Becker's footsteps by analyzing "not the genesis of innovations, but rather the process of mobilizing people to join in a cooperative activity on a regular basis" (Becker, 2008: 310). It sets the framework for a history of the Egyptian rap world centered on "commercial bets" (Hammou, 2012).

Many of these intermediaries (Lizé, Naudier, and Roueff, 2011) began their careers as musicians in the nascent "underground" scene of the 2000s before joining labels, advertising agencies, marketing departments, or streaming platforms. I suggest that they subsequently leveraged the social and cultural capital acquired during their musical and corporate careers to give "new school" rappers access to previously unattainable resources, spaces, and publics.

I attempt to analyze the practices of intermediaries in the current configuration of the Egyptian rap world without succumbing to a normative discourse on the "commodification" of art. I distinguish between aesthetic interventions, where intermediaries attempt to stage their version of authenticity, and strategic interventions that seek to "rationalize" the management of an artists' career through knowledge production. I claim that these actors are not only intermediaries who insert the Egyptian rap world into global value chains by making it intelligible, predictable, and exploitable (Tsing, 2015), but full-fledged participants who shape rap songs and videos through their many mediations (Henion, 1993).

AMWE, RUTH* (Princeton Theological Seminary, USA)

"It Is My Family!": African Immigrant Congregations and the Politics of Belonging in North America

In January of 1991, Bernice Boakye welcomed her three friends: Adelaide Agyemang, Elizabeth Andoh and Grace Ocansey, into her home. As one of many such informal gatherings among friends, a distinct chord was struck on that day. The women talked about their cultural and religious experiences as Ghanaian immigrants in America and concluded on the need for a congregation that would serve the growing number of Ghanaians living in the neighborhoods of Brooklyn, New York, USA. This idea received support leading to the birth of Bethel Presbyterian Reformed Church (BPRC). Today, BPRC serves formative functions in the lives of its congregants, the immediate neighborhoods of Brooklyn, and within the umbrella organization of the Conference of Ghanaian Presbyterian Churches in North America (CGPCNA).

Against this backdrop, this paper will attempt to understand how African congregations construct their identities as supportive spaces for African immigrants in the diaspora. The translocation of Christian congregations is engineering scholarly interest. However, what has remained understudied is how congregational identities and theologies are specifically fashioned to cater to the wellbeing of African immigrants. Using BPRC and CGPCNA as a case studies, this paper will attempt to understand how theologies of belonging emerge against the backdrop of the politics of migration and difference in North America and how individual immigrants experience succor within these frameworks. I will unpack how the term "Bethel" is both reframed and embodied in BPRC's denominational and social outlook of belonging for African immigrants in the United States and how women contribute to these processes.

ANANE-BEDIAKOH, BEATRICE* (York University, Canada)

Reimagining Black Livability: Exploring Black Aliveness in Toronto's Racialized Neighborhoods

Black Creek, dubbed as Toronto's *least livable* neighbourhood (McKnight, 2014), Flemingdon Park, charged as containing one of *Toronto's most violent high schools* (Laczko, 2014), Glenfield-Jane Heights, home to Jane and Finch, *Toronto's most dangerous place to be a kid* (Pagliaro, 2013), and Regent Park, *notorious for bedbugs and crime that badly needed intervention* (Hayes, 2016), have two things apparently in-common – firstly, they are negatively coded in the public imagination as 'Black neighbourhoods', and secondly, they are generally discussed as in need of interventionist strategies. Racialized neighbourhood narratives present Black residents as objects to be either feared or targets of rescue. With hopes of strengthening the social, economic, and physical conditions of these neighbourhoods, through narratives of crisis, interventionist action plans and state funding investments developed to target communities labelled "the poorest neighbourhoods" reinscribe territorial stigmatization. Yet, within discussions of Black well-being, scant attention has been given to how Black residents respond to the racialization of their geographies, how racialization impacts Black residents' sense of self and the strategies for reclaiming Black life in their racialized neighbourhoods. And so, this research project asks, what are the possibilities of Black aliveness in racialized neighbourhoods? What are the strategies, agentic efforts and pathways of resistance or non-resistance adopted by Black residents *held in their neighbourhoods*? Drawing on Kevin Quashie's (2012) notion of "the quiet", a concept elucidating the constraints of Blackness as a public discourse that privileges defiance as the prevailing framework, offers a different kind of expressiveness—a sensibility of being that is concerned with the inner life of Black existence. As a methodological tool to make legible the material reality of Black life, "in the midst of so much death", this session seeks to provide a window into the interiority of Black livability that makes possible pathways through racialized neighbourhoods (Sharpe, 2016).

ANANE-BEDIAKOH, BEATRICE* (York University, Canada)

The Disappearing Act: Racial Banishment and the Geography of Black Lives in Canada

Mechanisms of removal have always been employed to extract or sever Black people from geographical landscapes. Geographical removal, a form of violence, not only ruptures connections between people and place but is a process of racial violence that is situated in histories of racial exclusion and colonial domination. This paper pays particular attention to cases of green dispossession and white gentrification as key contemporary sites through which racialized techniques of removal are practiced, enacted, and narrated to structure geographic domination. These violent acts of dispossession operate under the auspicious language of urban renewal/revitalization projects that underwrites and neatly

erases the racialized management of Black bodies. Drawing on Ananya Roy's concept of racial banishment, this paper sheds light on racial-colonial-state-instituted structures that function to propel processes of removal, while bringing attention to the ways that mechanisms of removal operate differently on Black geographies. I contend that the material and discursive work of (re)presenting Canadian landscapes through revitalization projects, and varying processes of legally imposed spatial exclusion, is not merely a practice of capital accumulation or burial, but also that of racial banishment which brings into focus the legal disappearance of African/Black Canadians in geography.

ANANGWE, KATHLEEN* (University of Nairobi, Kenya)

"Hashtags, Music and Water" the Mobilizing Ingredients of Kenya's Gen Z Uprising: A Case Study of Digitized Activism As Re-Imagined Resistance

A newly emerging economy in Sub Sahara Africa recently experienced an unprecedented wave of street protest against unjust governance and economic systems mid-year 2024. Although Kenya frequently experiences politically motivated demonstrations agitating for increase in democratic space and rights, the recent street protests differed from previous types in form, character and method. The young protesters were different, well-informed, creative and educated youth devoid of political or ethnic affiliation, class and gender stratification seemingly inspired by their democratic right to participation and self-expression. Their singular aim was to check the government on its intent to burden citizens through tax in a proposed Finance bill 2024. Using innovative and colorful approaches, symbolic dress, speech, pseudonyms, modern liberation songs, memes and hashtags a peaceful start filled with fanfare and dance evolved into bloody confrontation with law enforcement, leading to mass casualties and fatalities. Observers identified unique features including mobilization strategy, dependence on social media platforms - Tiktok, Instagram, WhatsApp and X (formerly Twitter) leading to digitized activism and social networks providing buffers of protection and access. Subsequently an uncanny resemblance to Egypt's uprising of 2011 and 2019, Arab springs and the "Occupy" movement of 2011 became apparent. Little is known through empirical study of the Gen Z experience before, during and post the uprising. The specific drivers, remain obscured. Using contemporary approaches and based on social constructivism as theoretical frames, in-depth interviews were conducted with 16 Gen Z youth selected by urban area of residence, class, gender and educational attainment. A postmodernist design was utilized to respond to the question "is digitized activism the new form of resistance?", and to explore the performances and interactions shaping immediate and future meanings among the Gen Z, the newly activated agents of Social Change with grassroots mindsets and little interest in the boardroom.

ANANIAS AGNES, JANET* (University of Namibia, Namibia)

Growing Cost of Family Care of Older Persons in Namibia: Droughts, Disabling Environments and Interdependence

Living arrangements for older persons in Namibia are essential for understanding the cost of care. Older person households are large but very few family members receive social grants, including children. Moreover, four out of five older persons in Namibia are living in a rural area and disabling environments in rural areas increase the cost of care, as older persons have to use more resources in accessing the limited services available. By drawing on semi-structured interviews with 80 caregivers and older persons, the paper reveals how older person households distribute resources within the household as a way of sustaining themselves, their family members and their communities. In the absence of better social protection measures or (especially for children), direct care provision, female family caregivers of older persons are often challenged in meeting the needs of older persons and children.

ANANYA, ANANYA* (The London School of Economics, United Kingdom)

Not in Our Name : Mapping Pro-Palestinian Student Movement at the London School of Economics

On April 30th 2024, the world woke up to the images of students occupying the Hamilton Hall, as part of the Gaza Solidarity Movement, at Columbia University in the City of New York. This was a culmination of historical linkages of student movement against apartheid regimes and demands for immediate ceasefire in Gaza by the contemporary global pro-Palestinian Protest. Here, students set up an encampment & demanded their university to disclose their investment & divest from companies complicit in human rights violation & financially supporting Israel in ongoing genocide of Palestine. What shook the

student community across the globe was the use of police force at Columbia University which dismantled the peaceful protest in the middle of the night. As a result, it led to the rise of 174 encampments across the globe, resisting for the future of Palestine in their own campus & holding their institutions accountable when there are no universities left in Gaza.

In this paper, I centre LSE Solidarity Encampment as a case study with the dual aim to underline the constituent elements of the movement and the symbolic solidarities between student's encampments & Palestinian struggle for right to exist defying Israel's settler colonial project. This ethnographic study brings together field notes and interviews with student activist reflecting on their journey of becoming an 'activist' and creating a 'solidarity' movement at LSE. Secondly, it maps student's strategic negotiations with the university administration & collective struggle against discursive politics of senior administration, national media & UK government. Lastly, I adopt Katz's concept of 'common camp' (ibid 4:2022) & keffiyeh as two symbolic tools to highlight interconnections among the historical embeddedness of resistance, intimate social linkages between different anti-colonial struggles & global solidarity for Palestinian liberation.

Navigating the Anthropocene: Local Ecological Knowledge and the Future of Fisheries in Croatia

In the context of the Anthropocene, where human impact on ecosystems is profound and pervasive, understanding diverse epistemologies on which extraction is based becomes crucial for effective fisheries management. This study investigates the Local Ecological Knowledge (LEK) of Croatian fishers, emphasizing the interplay between socioeconomic factors, support for sustainable management tools, long-term career prospects, and concern about climate change. Acknowledging the significance of diverse epistemologies in fisheries management, we analyze how fishers perceive the overexploitation of fish species in relation to socioeconomic indicators.

Our research further examines the fishers' views on climate change and their attitudes toward various fisheries management strategies, such as no-take zones, closed seasons, and enhanced bycatch control. By integrating these perspectives, we aim to shed light on the relationship between local ecological knowledge and the future aspirations of fishers, exploring whether they envision a sustainable career in fishing over the next five years and if they desire for their children to pursue this profession.

Our sample includes small-scale, large-scale, subsistence, and recreational fishers, allowing for a comparative analysis across different sectors. The findings are based on a survey of 550 fishers conducted as part of the project "Sustainable fishing: social relations, identity and co-management of Adriatic fishery resources", funded by the Croatian Science Foundation. This research contributes valuable insights into the role of local knowledge in promoting sustainable fisheries management and supporting the livelihoods of fishing communities in Europe and in the Mediterranean.

The Role of Caring in Authenticating the Self: Transgender and Gender-Nonconforming Individuals' Experiences of Care

For transgender and gender-nonconforming (TGNC) populations, socializing can be unpredictable and unstable. Research emphasizes the breadth and depth of harm incurred from socially adverse and violent experiences yet frequently overlooks daily experiences of care and their long-term impacts on well-being. The present study fills this gap by illuminating transgender and gender-nonconforming individuals' experiences with caring. Thirty TGNC individuals from across the globe representing a spectrum of gender identities and social experiences participated in life history narrative interviews. Using Giddens' structuration theory and Sartrean and Beauvoirian existentialist lenses, the findings elaborate on three types of caring practices exercised by the participants and their peers, spouses, families, and communities: caring through occupational roles, caring through daily practices, and caring as support. Caring played an integral role in authenticating the self through social interaction. Caring further acted as a regenerative resource, replenishing mental, emotional, and social resources and facilitating individual and collective well-being. The findings have vast implications, including enhancing sociological and philosophical discussions on care and authenticity, employing caring practices in interpersonal and group interventions, and supporting TGNC populations' social adaptation and life fulfilment.

White Supremacy in the Education System: Enduring Coloniality in the Jamaican Textbook

This presentation considers education in a postcolonial site. In a country of very few white bodies, and even fewer *visible* white bodies, white supremacy still makes itself felt in a crucial Jamaican space. White supremacy, or "coloniality," can be identified through text: through the epistemology underpinning that text. A study of secondary level Jamaican textbooks reveals the subtle and not-so-subtle ways in which coloniality endures in a black-majority postcolony more than sixty years after ostensible independence from the United Kingdom. A close reading of these texts reveals in some a central tension between Jamaican-focused depictions of history and culture and the persistence of the British-derived, imperialist web in which Jamaicans have been caught for centuries. My presentation will show that in a country often celebrated internationally as an icon of anti-imperialism, even after decades of deliberate attempts to decolonize the curriculum, there is an epistemological battle at play in the classroom. Overall, the textbooks represent a "third space" wherein the margin (Jamaica) and the core (Britain) are enmeshed in complex ways. In this hybridity, marginality is reinforced, as some texts de-centre Jamaicans in their own stories. Coloniality's epistemological assumptions and models are often left unquestioned, even as efforts are made to present Jamaican subjectivities. This both obscures the need for extrication from the Eurocentric web and makes that disentanglement very difficult. The presentation will conclude with a discussion of strategies that have been engaged and are envisioned to counteract this manifestation of white supremacy.

Interconnected Aging: An Ontological Turn Towards a Sustainability Perspective in Aging Research.

For the first time in history, a climate change case focusing on aging has been addressed to the European Court of Human Rights. The urgent effects of climate change and the need for a more sustainable future highlight the importance of creating not only age-friendly environments but also environmentally friendly and sustainable aging. In this presentation, we explore ways to move beyond the anthropocentric perspective in aging research. We demonstrate how aging research that is informed by the ontological turn holds the potential to significantly broaden our understanding of aging as an eco-social process and phenomena and how this may have important consequences for issues on increased sustainability. The ontological turn implies that the borders between nature/culture, human/non-human as well as time and place become blurred and even dissolved. The ontological turn means the end of human exceptionalism as we know it.

From our reading of important theoretical contributions to the ontological turn we introduce the concept of "interconnected aging." Interconnected aging brings forwards questions that asks not only how climate changes are affecting aging humans but also how aging humans affect climate changes.

Understanding the Impact of Vision Loss on Quality of Life Amongst Older People

Aging is known to significantly impact visual acuity, leading to a series of consequences that affect individual well-being and societal dynamics. Impaired vision is closely associated with diminished quality of life, social isolation, increased vulnerability, and heightened demand for societal intervention. This study aims to elucidate the lived experiences of individuals coping with vision loss, thereby enhancing understanding of their reflections and identifying viable strategies for managing life with visual impairment. We explore the navigational pathways that visually impaired individuals traverse within the welfare system, detailing interactions with both private and public entities. The findings are primarily derived from qualitative interviews, supplemented by quantitative data from questionnaires and eye examinations. Results indicate a prevalence of undetected visual changes among older adults, which adversely impact daily functioning. Informants frequently attribute their visual changes to normal aging, leading to varying responses: while some delay or avoid seeking assistance, others pursue timely intervention. Notably, a prominent barrier to seeking help emerged as the fear of losing once driving privileges. In response to visual decline, informants have developed coping strategies to adapt to their changing functionalities. This study underscores the necessity of increased awareness and responsive services to support aging individuals experiencing vision loss.

ANDHARIA, JANKI* (Tata Institute of Social Sciences, Mumbai, India)

Disaster Justice in Recovery Processes: Exploring Bhabha's 'Third Space' and Soja's Trialectics

It is well acknowledged that impacts of disasters are socially and spatially uneven, and the worst affected are the poor and those who live in marginal and hazard-prone geographies, experience diverse risks and precarity in their everyday lives. These are manifestations of the working of hegemonic systems of power social, economic, and political which often have a strong institutional sanction /base. Disaster justice is an issue of governance that draws from studies of social vulnerability, justice theory, disaster law, and the environmental justice movement.

Recognising in the way that poor and vulnerable populations inhabit hazardous zones in pre and post-disaster recovery phases is important. Similarly recognising that the exclusion, lack of participation, and silencing, results in the absence of diversity of the in knowledge production, and disaster recovery becomes a site where colonial approaches are reproduced. In order to decolonise practices, the paper argues for an exploration of how multiple social identities and forms of discrimination interact to create unique experiences of oppression or privilege for people affected by disasters. The experiences of their access to relief and rehabilitation, or their denial and exclusion needs to be viewed within the broader frame of disaster justice. While exploring research and practices around post-disaster recovery that value local ontologies and epistemologies, Bhabha's (1994) concepts of "Third Space" and "hybridity" are useful. Post disaster recovery processes provide opportunities to "displace the histories that constitute it and set up new structures of authority, new political initiatives" (Rutherford 1998). At a conceptual level, the paper further contextualises disaster justice, in the socio-economic manifestation of space/ spatiality in disaster recovery, using Soja's concept of "trialectics" (1996).

ANDO, KEITA* (Rikkyo University, Japan)

The Emergence of Affective Polarization in Japan: The Interplay of Right-Wing Movements and Political Leadership

In recent years, affective polarization, which inhibits civic communication and erodes democracy, has intensified in many democratic countries. Even in Japan, where the Liberal Democratic Party's (LDP) one-party dominance has persisted for decades, emotionally charged confrontations over controversial political issues such as security-related legislation and constitutional amendments have markedly escalated since Shinzo Abe's second administration in the 2010s. As in other countries, both Abe and his supporters, as well as his opponents, have used moralized political discourse that describes their own and opposing groups in black-and-white terms as good and evil. Thus, this presentation explores the social and historical context that influenced Abe's adoption of moralized political discourse. The presentation employs a historical discourse analysis, focusing on Abe's parliamentary speeches and publications, alongside publications from key members of the Japanese Society for History Textbook Reform (Tsukuru-kai), a right-wing social movement organization that significantly affected Abe. The findings reveal that in his pursuit of solidifying the LDP's position as the leading conservative party, Abe adopted the moralized political discourse of Tsukuru-kai, which gained prominence as a new conservative force in the 1990s. Tsukuru-kai, which focused on reforming postwar education to compete with other countries, rapidly expanded its membership, developing moralized discourse that portrayed domestic left-wing forces as submissive to foreign interests that undermined Japan. During the same period, Abe was acutely aware of the need to rebuild the LDP's conservative principles to counter the rise of emerging parties. These included the New Frontier Party, which took conservative votes away from the LDP, and the Democratic Party of Japan, which was strong among swing voters. Consequently, Abe integrated Tsukuru-kai's discourse into his own, thus embedding antagonistic sentiments toward left-wing forces within the broader political system. The presentation demonstrates how social movements can supply moralized discourse to political elites, potentially driving democratic backsliding.

Does Muslim Immigrant Health Decline from Sociopolitical Stress? Evidence from County-Level Election Results and Birth Outcomes in the Trump Era

The 2016 U.S. presidential election cycle intensified political partisanship in the presence of well institutionalized and racially coded campaign strategies and rhetoric from Donald J. Trump, much of which centered on Muslim immigrants. Muslim immigrants living in this sociopolitical climate may experience intensified and direct day-to-day racism, in addition to vicarious (second-hand) racism encountered through online news and social media, all of which has been associated with heightened stress and worsened health. Health impacts may be differentially patterned by ethnoracial categorization of Muslim immigrants, given the distinct racialized experiences of MENA, South Asian and Black Muslim immigrants. This study examines the relationship between residing in hostile local sociopolitical contexts and birth outcomes among Muslim immigrant mothers by ethnoracial categorization. I identify a unique form of sociopolitical stress – residing in a county that pivoted from voting Democratic in the 2012 elections to voting for a divisive and prejudiced Republican candidate in 2016. I examine the potential health consequences of this local climate through the prevalence of PTB and LBW before (2013-2016) and after (2017-2019) the 2016 U.S. Presidential election among Muslim immigrant mothers residing in pivot counties (2012: Democrat; 2016: Republican) compared to non-pivot counties (2012: Democrat; 2016: Republican). MENA and South Asian Muslim immigrant women living in pivot counties are at increased risk for PTB after the Trump election compared to their counterparts in reliably Democrat counties. The rate of PTB increased most severely for South Asian Muslim immigrant mothers. The findings from this study suggest that religion, specifically Muslimness, is another potentially marginalized social status and important axis of analytical consideration for population health research in the U.S. Just as intersectional work on immigrant health has elaborated how nativity and ethnoracial categorization are experienced simultaneously, we must wrestle with the complexities of how Muslimness crosscuts these social positions.

Rights of Paid Home Care Workers in Brazil: An Evaluation Using the Global Care Policy Index

The paper aims to explore the potential of employing the Global Care Policy Index to assess the level of state protection afforded to paid home care workers in Brazil prior to the pandemic. One of the key challenges in utilizing the index within the Brazilian context stems from the substantial fragmentation concerning the occupational circumstances of these workers resulting in significant heterogeneity in coverage and rights attainment.

Two distinctive attributes of the Brazilian care labor market merit attention within this assessment: firstly, the notable proportion of informal labor within the sector, and secondly, the diverse contractual frameworks, each offering varying levels of protection, which depend on the weekly frequency of work and the parties involved in signing the contract.

Given this reality, we chose to segment the analysis into groups reflecting the different occupational situations of these workers for the purposes of applying the international index. We then examined the rights guaranteed by law for each group, using ILO Convention 189 as a reference. The result is a diverse evaluation for each group, which negatively impacts Brazil's overall score in the ranking of countries assessed by the index.

To summarize, in four of the five categories evaluated, the weight of the groups is quite significant in assigning scores: labor protections apply only to groups with a formal employment contract. Protections related to social insurance, such as maternity leave, retirement and sick pay, apply to formal groups and also to informal workers who voluntarily join the system at their own expense. The category that differs from the standard concerns the prohibition of the exploitation of child and forced domestic labor, as the rules extend to all.

ANDRE, GERALDINE* (UCLouvain, Belgium)

School-to-Work Transitions and Digitalization. the Added-Value of "Extended" Ethnography

Since the economic crisis of 2008, school-to-work transitions have become even more unstable and precarious than in the 1990s, particularly for the least qualified and most precarious classes of young people. A collective ethnography conducted between 2017 and 2019 among a variety of young people from working-class neighbourhoods in Brussels has generated a NEET/non-NEET typology that highlights the various societal processes at work in young people's school-to-work transitions, whether these processes are linked to the dynamics of inequality or to the functioning of public institutions (André & Crosby 2022). These processes explain why the most marginalised fractions of young people in working-class neighbourhoods become involved in informal organisations, which are to some extent parallel to the official institutions in Brussels. Since then, many changes have taken place, including the pandemic and the growing use of digital technologies, particularly in the labour market and public services (Georges 2019). What are the effects of these changes on the school-to-work transitions of urban lower-class young people? We will answer this question on the basis of the results of an "extended" ethnography (Burawoy 1998) conducted in the same neighbourhoods. In particular, we will be looking at how young people, especially those from working-class and immigrant backgrounds, appropriate digital technologies in their daily lives in general, and in particular in their adult lives, i.e. in their search for employment or training, in their search for housing? The new observations and discussions with young people will be compared with the data previously collected. "Extended" ethnography provides a temporal resonance in which the analysis of school-to-work transitions is linked to wider changes in the organisation of labour and public institutions. In doing so, this paper aims to contribute to the field of study on school-to-work transitions and their determinants.

ANDRE, PATRICIA* (CEDIS - NOVA School of Law / DINÂMIA'CET-Iscte, Portugal)

Legal Consciousness and the Belittlement of Insolvency Law: A Case Study of Portuguese Judicial Proceedings

This paper presents the main findings of a qualitative analysis of Portuguese case law in insolvency and pre-insolvency proceedings, conducted as part of the IN_SOLVENS research project. The study reveals significant shortcomings in the application of insolvency law, highlighting procedural inertia, disengagement by parties, insufficient data on debtors, and the reinforcement of both epistemic and social vulnerabilities.

Framing these findings within a broad notion of legal consciousness, which encompasses both internal and external legal perspectives, this study argues that insolvency law is systematically disregarded by legal actors—judges, attorneys, and even the individuals involved as parties to the proceedings. This disregard reflects not only the traditional stigma associated with insolvency but also an overarching legal obliviousness. Courts and legal professionals often display a lack of interest and engagement with the socio-political goals underlying insolvency law, contributing to its downplaying as a secondary or less important legal field.

Through this lens, we observe how both everyday and professional legal consciousness are shaped by absences and voids, reinforcing the estrangement of ordinary individuals from the law. In particular, the procedural disengagement observed in the courts—alongside parties' own inertia—suggests a deeper detachment, where the potential of insolvency law to restructure financial and social vulnerabilities is overlooked. This contributes to a broader belittlement of insolvency law, perpetuating the very vulnerabilities it seeks to address.

The Role of Social Impact in Science Evaluation: Challenges and Contradictions

The increasing use of science to provide evidence-based support for public policy has created a growing demand for monitoring and evaluating scientific work in research centers. In this context, the notion of social impact has become key to demonstrating how scientific knowledge can address societal

problems. This "impact agenda" also stems from evolving science funding models, which seek to assess research institutions through the lens of social impact.

At DINÂMIA'CET-Iscte, the Thematic Line *Reflexivity, Communication, and Social Responsibility of Science* has been examining these developments. Transforming how scientific work is evaluated in interdisciplinary centers like D'C, where social sciences play a central role in studying societal changes, brings forth significant challenges and contradictions. Social impact assessment requires narratives, case studies, success stories, and the involvement of actors outside the traditional scientific process. However, this agenda paradoxically responds to critiques of quantitative evaluation methods: while now incorporating qualitative approaches, it still demands objective proof of social impact, creating tension between qualitative assessments and quantitative metrics.

Documental analysis revealed conflicts between collective goals and individual researcher evaluation criteria. In precarious academic environments, researchers face a dilemma between contributing to collective success and advancing their careers. Work focused on direct social impact demands greater emotional commitment and reduces time for publications, perpetuating hierarchies where junior researchers handle fieldwork, while senior researchers, with better contracts, focus on theoretical analysis and claim lead authorship. Monitoring these dynamics also remains a challenge, affecting the evaluation of science's social impact.

The impact agenda can thus conflict with individual evaluation criteria. So, one may: prioritize collective goals at the expense of individual conditions, perpetuating precarity and hierarchies, or fight scientific precarity, promote equality among researchers, and build a collective beyond individual contributions. Research centers could turn the "impact agenda" into an inclusive and unifying "impact culture."

How Universities Differentiate Work Values of Its Students: Evidence from 350 Universities with Different Places in Ratings

Work values are considered to be significant predictors of career paths and future success of the individuals. Classical and contemporary research acknowledge that work values are formed while studying at university through the process of acquainting particular professional identity and work ethic. Thus, it becomes important to understand how work values of students are differentiated in the period of getting education and discuss how certain characteristics of universities can differentiate attitudes to future jobs. In current study I focus on the ratings of the universities which was composed by Forbes Education Russian agency in 2021 and accounted for four substantial parameters of universities: demand of graduates from potential employers, networking opportunities, quality of education, international recognition of university. That data on university ratings was combined with the data from a survey of Russian university students, which was carried out in summer of 2021 online. The final sample comprises of 14,8 thousand students under the age of 29 from more than 350 universities with diverse characteristics and missions. Work values were measured through the questions about preferable characteristics of future work places as well as via agreement with statements about attitudes towards future jobs. The results of multilevel multinomial logistic regression analysis demonstrated that students from *top-20 universities with best networking capabilities* tend to proclaim intrinsic and socially oriented work values, as well as lower orientation on entrepreneurship; students from *top-15 internationally recognized universities* are more oriented on flexible work arrangements and show higher orientation on work-life balance; students from *top-20 universities with best quality of education* are more confident in finding job positions of a high quality and ready to work overtime; students from *top-20 universities in demand by employers* are less oriented on entrepreneurship. The results were controlled for socio-demographic characteristics of respondents and other independent variables.

ANDREEVNA POPLAVSKAYA, ANITA* (National Research University Higher School of Economics, Russian Federation)

Value Conflict While Choosing a Future Job: A Mixed-Method Study on University Students' Work Values

The attitude to future job is commonly conceptualized with the help of work values theory. Work values are defined as subjectively chosen important characteristics of a job position. It is generally accepted to draw distinction between extrinsic and intrinsic work values. However, it seems that such a dichotomy does not take into account well-elaborated classical typologies of life values as well as misses individualistic and collectivistic orientations which partly frame the meaning and goals of personal attitude to work. Basing assumptions on the analysis of questionnaires from comparative cross-country studies over the last 30 years the problem of "ethical turn" in work values studies was elucidated. In order to overcome such a problem an updated theoretical typology of work values was proposed. Its relevance was asserted by virtue of mixed-method research. Firstly, nationally representative survey of Russian university students was used (summer 2021, N=14795). The author added more options in the questionnaire and with the help of factor analysis seven higher order variables of work values were revealed. It was demonstrated that work values can be typologies on two scales: extrinsic-intrinsic, collectivistic-individualistic. On second step interpretivist approach was implemented in order to reveal the meanings behind statistics. The analysis of narratives from interviews with students aged from 18 to 24 years old was implemented (winter 2021, N=38). It was revealed that meaning of work value is constructed within the framework of opposition between the focus on satisfying individual utilities or social needs. The main area of inner value conflict was located in the sphere of choices between well paid and interesting job positions which seems to be valued by market economy VS socially useful job positions which are hardly recognized as status worthy in contemporary society and seems to be badly remunerated even in the future perspective.

ANDREICA GHEORGHE, ZENaida* (AFIN -UAB, Spain)

Children's Perspectives on Pornography and Other Online Sexual Practices in Catalonia, Spain.

Infancy, historically seen as asexual (Davies & Robinson, 2010), contrasts with recent findings of pornography consumption starting at age 8 in Spain (Ballester & Orte, 2019). This discrepancy has sparked societal concern, as reflected in the Spanish press. Our study's primary objective was to explore the nature, usage patterns, information sources, and coping mechanisms related to explicit sexual content accessed by children aged 9 to 11. Throughout 2022-2023 our research engaged in 27 focus groups involving over 250 children from nine schools in the province of Barcelona. We used drawings as narrative triggers (Eldén, 2013), to encourage discussions and insights among the participants. The collected data underwent a qualitative analysis employing discourse analysis and visuals. Initial findings reveal a significant deviation from conventional literature, which suggests pornography serves as a learning tool for children (Save the Children, 2020; Diputació de Barcelona, 2023). Contrarily, our results indicate that, through family dialogue and guidance, children do not perceive pornography as educational but rather seek it for pleasure. Furthermore, our study revealed children's adeptness at devising strategies to avoid unwanted content and combat online risks like bullying or grooming. However, it also unveiled the perpetuation of gender disparities within accessed content and the methods by which they access it. These findings underscore the pressing need for affective-sexual education programs tailored to children's requirements. Our aim is to advocate for the development of such programs and to offer guidance for parents and teachers on initiating meaningful conversations about these sensitive topics with children.

A Netnographic Study on ART in Italy: A Culturally Controversial Practice.

Assisted Reproductive Technologies (ART) is a clinical field that encompasses various therapeutic practices. In 2021 86,090 couples in Italy underwent treatment, with 108,067 initiated cycles and 16,625 live births. Since its introduction in 2004, Law no.40, the first to regulate ART, has sparked widespread legal, bioethical, cultural, and social controversies. The law adopted a conservative approach, restricting access to ART to heterosexual

couples, married or cohabiting, of fertile age, infertile but not sterile and without genetically transmissible diseases. The legislation aimed to promote a "traditional" family model, reflecting a Catholic context and maintaining a naturalistic procreation paradigm (Saraceno, Naldini 2021).

Consequently, Law 40 raised legal and legitimacy issues, leading to amendments that expanded access to treatments. These practices address certain reproductive difficulties while challenging legal and cultural boundaries surrounding family, parenthood, and bodily autonomy (Borgna, 2005).

Within a broader interdisciplinary and mixed-methods study on late parenthood, a specific strand explores the experiences of heterosexual couples undergoing ART through netnography (useful for analyzing online communities, Kozinets 2010). This research focuses on three platforms dedicated to discussing ART experiences: Forums, Facebook groups and Telegram chats.

The aim is to analyze these parenthood trajectories and shared meanings among those navigating ART, which are often judged from a paternalistic and conservative viewpoint. The analysis reveals clinical challenges, cultural narratives and the crucial role of online communities in providing medical and emotional support (Rogers, 2009). These spaces foster participatory medical knowledge and offer opportunities for sharing, often absent offline due to societal insensitivity. Moreover, the predominance of women in these groups highlights a gender dimension that warrants further exploration.

ANDREONI, ELENA* (University of Milan Bicocca, Italy)
DECATALDO, ALESSANDRA (University of Milan Bicocca, Italy)

Netnography on Italian Assisted Reproductive Technology: An Onlife Phenomenon.

The web can be a privileged setting for studying socially connoted and private spheres, fostering the sharing of experiences that might be inhibited in everyday life. This is the case of Assisted Reproductive Technology (ART), a multimodal phenomenon that begins offline but finds space for discussion online (Garcia et al., 2009).

As part of a broader interdisciplinary and mixed-methods investigation on late parenthood in Italy, a specific strand explores the experiences of heterosexual couples undergoing ART treatments.

This study employs netnography (Kozinets 2010) across three online fields focused on ART experiences: Forums, Facebook groups and Telegram chats.

The heterogeneity of these environments allows for observation of the impact of different platform architectures on the quality of interactions and content (Latour 2005, Rogers 2009).

The concept of *onlife*, which rejects the distinction between physical and virtual reality by recognizing their daily interconnection (Floridi, 2014), enriches the epistemological reflection and the analysis of empirical material. Preliminary findings reveal the supportive medical and emotional role of *online communities*. They create spaces for participatory discussion of medical expertise and for sharing emotions, often absent in offline life.

Methodologically, challenges arise at every stage of research: field identification to the definition of techniques, from data collection to the analysis of empirical material. Additionally, difficulties concern ethical and deontological dimensions, raising issues about personal data protection and respect for privacy, requiring ongoing reflection on ethical research practices (Ess 2007).

 RAZETTI, FEDERICO (University of Milano-Bicocca, Italy)

Professionals without a Profession? Discretion, Professional Knowledge, and the Use of Digital Profiling in Active Labour Market Policies

In the field of active labour market policies (ALMPs), caseworkers have been described as "professionals without a profession" (van Berkel et al. 2010) due to the low level of institutionalisation of the profession. This could negatively affect how operators exercise their discretion, making case management almost unpredictable (Delpierre et al. 2024), and vulnerable to individual frontline workers' preferences and biases. Against this backdrop, the paper examines the discretion of street-level bureaucrats (SLBs; Lipsky 2010) in implementing an ALMP specifically designed to limit their discretionary space and increase policy standardisation through the use of an increasingly utilised instrument in this policy area (Desiere et al. 2019), an algorithm-based tool for profiling users and "tailoring" services. The policy in question is the EU-funded, Italian program "GOL – Worker Employability Guarantee", adopted by the government within the National Recovery and Resilience Plan. Based on extensive ethnographic observation in three Lombardy PES (Milan, Monza, and Mantua), documentary analysis, and in-depth interviews with frontline workers and middle management, we present empirical evidence regarding the behaviours of SLBs directly tasked with users' profiling. We suggest that caseworkers continue to carve out spaces of autonomy and exercise discretion through various strategies, so the question becomes what factors influence their discretion. We focus on the role of "meso" conditions to address this issue. On the one hand, we explore the influence of a professional status still "under construction." On the other hand, we investigate the potential impact of the organisational setting by examining differences across the three cases under analysis (e.g., caseloads, management styles, recruitment policies, and the mix of operators' educational profiles). In this way, we aim to contribute to current debates on the interplay between (new) professional expertise, the use of digital technologies, and SLBs' discretion.

Decolonizing Planning Studio Pedagogy: Grappling with Tensions and Dissonances

This presentation reflects on two community planning studios in Lakeland, an African American community in Maryland, the U.S. The tensions faced in planning pedagogy highlight the controversies and resistances that arise as dominant paradigms oppose efforts to decolonize planning, including: Top-down versus bottom-up planning, or the struggle between authoritative models and community-driven approaches; planning to fix versus planning to heal, and the need for trauma-informed practices; temporal mismatches, where long-term community processes conflict with the shorter timelines of studios; process versus project emphasis, reflecting differing planning priorities; mismatched agendas and goals among stakeholders, including community members, instructors, and students; competing planning ideologies or lenses, where priorities such as planning for profit versus people come into conflict; the tension between maintaining the status quo and advancing revolutionary planning; and the discomfort experienced by students, which impacts teaching evaluations. These tensions highlight the complexities of fostering a decolonial planning environment.

ANDRIJASEVIC, PROF RUTVICA* (University of Bristol, United Kingdom)

Opening the Black Box of Business: Firm-Led Approach to Studying Cross-Border Labour Migration

The argument this paper puts forward is that current approaches to labour migration black box the firm. Infrastructural approaches showed that intermediaries and industry associations are all part and parcel of the increased outsourcing of migration management. Market sociological approaches surfaced the macrostructures and institutions governing labour migration. Yet, both approaches overlook the firm/business; we still know exceptionally little

about the ways in which industry structure and firm business model shape migratory flows as well as worker agency. Drawing on over 170 interviews with migrant workers and managers in electronics manufacturing in Eastern Europe, I will illustrate how -- within transnationally organised circuits of production--transnational corporations pursue profitability and efficiency by attempting to synchronize the supply of labour with time of production. I refer to this model as 'just-in-time labour' and I suggest that firms treat migrant workers according to the logic of just-in-time assembly, that is, attempt to acquire the type of workers needed, at the time needed, and in the quantity needed. Apart from showing how the just-in-time logic is reshaping migration flows into shorter and quicker migration circuits, I will also examine the ways in which the on-demand industry imperative is expediting cross-border mobility of labour. I will show how such mobility is not confined to a single workplace or a single country, but is enacted across the transnational labour market and shaped by workers knowledge about cross-country job search strategies, by work and pay levels in different locations, and by migrants' networks. Centring these practices is pivotal, I suggest, in order to theorise the ways in which the mobility of labour, in addition to that of capital, is a constituent force in the production of cross-border labour markets.

Meet Me Halfway: Mainstream Media Ambivalent Coverage of Feminism

Feminism has become an increasingly important movement globally. But how is this feminism depicted by mainstream media? To approach this question, we analyse all news including "feminis*" terms published in the main Spanish media outlets between 2013 and 2019. We explore how feminism's coverage has evolved overtime, whether the ideological inclinations of media outlets and global events matter to this coverage, what are the sentiments that can be identified, and what are the main issues associated to the word (equality, violence, culture, protest, institutions, new debates). Our initial expectation was that resistance against feminism could be traced back to a predominantly negative portrayal of feminism in mainstream media. However, our findings do not offer outright and unequivocal evidence of this. Our tone analysis, suggests that, if anything, a slightly positive tone outweighed the negative one, although the media's stance leaned more towards ambivalence. A deeper understanding emerges if we account for the topics that feminism is associated to. Equality, which is one of the core fights of feminism, and one that harnesses transversal public support, is in fact a minor aspect in the media's coverage of feminism. Instead, cultural issues, protests, policies, and violence emerged as predominant themes. This nuanced perspective sheds light on why feminism might struggle to gain a more favourable perception among the public through mainstream media channels, as these pervasive topics overshadow the discourse surrounding other aspects of feminism that may gain more consensus.

Institutional Mental Health Support Systems Towards Ukrainian Adolescents Refugee after 24.02.2022 on the Example of Poland and France.

The process of being forcibly resettled in another country is usually so difficult that everything that the definition of health created by the WHO, namely that it is a state of mental well-being that allows people to cope with stress, realize their potential, learn and work effectively and organize themselves in social life (WHO, 2024) remains overwhelmingly beyond the reach of migrants, especially those in their teens. Repeatedly misunderstood by the institutional or non-governmental support system, they represent the 'refugee' syndrome, which we understand as a set of negative emotional reactions such as sadness, depression, irritability, disorientation due to separation from family and leaving their homeland (Bryant, Nickerson, Morina & Liddell, 2023), further reinforced by the developmental stage that adolescents undergo during their transition into adulthood. In terms of data analysis, I will undertake a systemic analysis of the organization of institutional and non-governmental assistance in both countries. Their scope of assistance (bottom-up, short-term, long-term) and the obstacles associated with them towards adolescents. The methodology will include a systemic analysis of the two systems of organizing psychiatric assistance and the challenges

associated with their organization. As coordinator of the Multicultural Center in Krakow (2022-2023), with experience of receiving and supporting UA migrants, working with the national mental health consultant for children and adolescents in Poland (2023), and having interviewed Ukrainians NGOs that have undertaken psychological and psychiatric support for this group (2024), so particularly vulnerable even without such dramatic experiences as forced resettlement, I will present the results of my research, where both cultural proximity and the organization of the support system are important for the psychological well-being of young adults.

ANGELCOS GUTIÉRREZ, NICOLÁS* (Universidad de Chile/COES, Chile)

ABUFHELE MILAD, VALENTINA PAZ (Universidad de Chile, Chile)

Far from Politics. Space and Political Strategies in Popular Neighborhoods in Chile

In recent years, Latin America has been the scene of significant urban revolts. In October 2019, Chile witnessed the most important mobilization since the restoration of democracy in 1990. Unlike other national-scale mobilizations, the "social uprising" was not exclusively led by young students. Although most of the protesters were young people with greater cultural capital (González and Le Foulon, 2020), there were significant demonstrations in the urban peripheries (Álvarez-López et al., 2024; Escoffier, 2023). This broad participation of residents from marginalized neighborhoods in the protests, while common in the region, challenged previous knowledge regarding the influence of the "space" in political participation. Previous research suggests that residential segregation and territorial stigma produce fatalistic attitudes that discourage political engagement, weakening democracy (Desmond and Travis, 2018; Rodgers, 2019).

Contrary to this approach, this study shows that the spatial marginalization of popular sectors, while creating obstacles to participation, does not lead to depoliticization. Based on qualitative research conducted in two popular neighborhoods in Santiago, this research examines three political strategies—institutional, collaborative, and oppositional—through which residents of marginalized neighborhoods seek to address their everyday material hardships, influence national politics, and contest the neighborhood's reputation in the metropolitan imaginary. Using Bourdieu's perspective, this study analyzes how these strategies are influenced by the interactions between the social, physical, and symbolic dimensions of space (Wacquant, 2023).

ANGELINI, CARLA* (CDD- Brasil, Brazil)

El Activismo Político De La Campaña Como Construcción De Un Lenguaje Crítico- Esperanzoso Para El Feminismo Latinoamericano.

La Marea Verde, tal como se ha denominado la masiva organización del Movimiento Feminista en Argentina y posteriormente en América Latina, implicó la creciente movilización de colectivos de mujeres e identidades diversas que fueron ocupando espacios públicos para expresar demandas históricas relacionadas con situaciones opresivas que viven en lo cotidiano. Entre ellas, aparecen las violencias ejercidas a través de discursos y prácticas que garantizan la reproducción del orden capitalista, patriarcal y neocolonialista.

Una de las principales pautas que logró ser incorporada en la agenda pública se relaciona con la legalización de la interrupción voluntaria del embarazo, derecho conquistado en 2020 a partir de la demanda motorizada por la Campaña Nacional por el Derecho al Aborto Legal, Seguro y Gratuito. La Campaña se constituyó formalmente en 2005 y articula una inmensa diversidad de agrupaciones sociales y políticas (académico-científicas, sindicales, político-partidarias, artísticas, entre otras). El horizonte político de la organización se ve cristalizado en la triple consigna 'Educación sexual para decidir, anticonceptivos para no abortar, aborto legal para no morir'; en ella, queda evidenciado que la lucha trasciende la legalización del aborto *per se*, orientándose a generar un genuino proceso emancipatorio. La Campaña, en su propia historicidad, no sólo acompañó indeclinablemente situaciones de interrupciones de embarazos no deseados, sino que aprendió -y desaprendió- a disputar sentidos en diversos territorios y en una amplia variedad de situaciones que, en ocasiones, excedían los objetivos primarios.

Esta presentación se orienta a problematizar el campo de la salud sexual reproductiva y no reproductiva, revalorizando el lugar protagónico de la Campaña en la visibilización de violencias estructurales y en la organización colectiva como estrategia de activismo político en la conquista de derechos.

RC54-830.1

ANGELINI, CARLA* (CDD- Brasil, Brazil)

The (in)Visibility of Bodies in Aesthetic-Political Narratives in Public Manifestations. Learnings and Concerns in Argentine Contemporary Democracy.

Occupying the street means politicizing it, transforming it from a place of transit to an active space for denunciation. The street is the meeting point of different social actors, a space that allows the flow of demonstrations and the dispute of meanings in relation to a multiplicity of dimensions of social life. In this logic, public space becomes a space of visibility for social actors and their agendas.

This work analyzes the occupation of Argentine public space from two different experiences: on the one hand, the Madres de Plaza de Mayo, an icon of resistance to the last dictatorship and defense of human rights, and, on the other, Catholic neoconservatism, which organized different public demonstrations during the parliamentary debates to legalize abortion in Argentina between 2018 and 2020.

The strategies they have developed to materialize constitutive elements of their narratives will be analyzed, identifying which arguments they prioritize and how they materialize them visually in public space.

In the trajectory of Madres, the effort to embody absences in public space is evident, whether through silhouette shots or the use of photographs with the biographies of their detained-disappeared sons/daughters. On the other hand, Catholic neoconservatism makes a strategic suppression of pregnant bodies in its visual narratives, which generates the strengthening of the idea of autonomy of the fetus.

Madres' experience shows that the invisibility of bodies must be understood as a form of violence, since it denies the existence of the other. The democratic parameters for discussing human rights issues force us to humanize absences in incomplete narratives, which implies making visible in the public space what we want to silence.

ANGELUCCI, ALBA* (University of Eastern Piedmont, Italy)
ZALTRON, FRANCESCA* (University of Eastern Piedmont, Italy)

What Participation in Socio-Health Services? the Organisational Dimension of Services for Migrants Analysed through Representations, Structures and Networks.

This article seeks to explore the concept of participation in socio-health services, particularly focusing on the organisational dimension of services designed for migrants. Participation has become a key aspect in the governance of public services, yet its definition and practical implementation often remain unclear (de Fraités, Martin, 2015; Cervia, 2014), especially when it comes to the inclusion of marginalised groups like migrants. Using two case studies from the Campania region in Italy, this paper focuses on narratives and representations concerning two key concepts: on the one hand, it examines how participation is represented and enacted in the planning and implementation of socio-health services for migrants; on the other hand, it will highlight how migrants are represented within participatory processes. Integrating these two perspectives, the study will highlight if and how migrants are involved in decision-making processes and the extent to which their needs and voices are considered in the development of services designed for them.

The study, part of a larger research project funded by ministerial grants entitled *Participation and Integration of Migrants in Small and Medium Towns*, was conducted through semi-structured interviews with institutional actors, civil society representatives, and migrant community members, combined with a document analysis of relevant policies and legislation. By employing Critical Discourse Analysis (Fairclough, 1995), the article explores the multiple meanings attached to (migrants') participation and how they shape power dynamics within the local networks that provide these services.

The findings reveal the strengths and weaknesses of the organisational structure of territorial networks within the socio-health policies for migrants. Only by addressing these organisational and structural challenges socio-health services can become more inclusive and better suited to the needs of migrant populations. The study concludes with recommendations for enhancing participation, and strategies for the formulation of inclusive and efficient local social and health policies.

Aging in Situ: A New Methodological Tool for the Study of Health and Wellbeing in Older Adulthood

In rapidly aging societies experiencing complex health transitions, socio-demographic shifts, and limited alternatives to family-based care, understanding the aging experience is essential at both individual and population levels. This paper focuses on rural South Africa, where over 70% of adults aged 50 and older live with at least two chronic conditions. We describe the development, implementation, and application of a novel observational tool designed to explore how older adults navigate their health and wellbeing in daily life. Twelve women and men (aged 60+) with varying health conditions and living arrangements—living alone, with a spouse, or in multigenerational households—were observed for nine hours per week over six weeks, totaling over 50 hours per participant. Observations were conducted at different times of day and across various days of the week to capture daily activities (e.g., cooking, resting, praying), social interactions (e.g., with family members, neighbors), and general disposition (e.g., tired, joyful, in pain). Ethnographic field notes provided additional context. Between visits, participants reported routine medical activities (e.g., medication collection) and any recent illnesses or injuries (e.g., acute illness, falls). These observations enable multiple avenues for analysis, including calculating duration of isolation, age distribution of visitors, and the gendered experience of aging. This approach was embedded in a broader multi-method study, which included 30 in-depth interviews with older adults and select household members, drawn from a population-based cohort study of older rural South Africans. This methodology offers a new layer of data, complementing standard tools and enabling more nuanced insights into the risk and resilience factors that influence older adults' health and wellbeing. Data from this new methodological tool offer valuable insights for researchers, healthcare providers, and policymakers addressing the unique challenges faced by aging populations in diverse contexts.

Los Retos De La Inclusión Educativa De Personas Con Autismo Desde La Teoría De Las Representaciones Sociales

El autismo es un trastorno del neurodesarrollo que se caracteriza por dificultades en la interacción social y la comunicación. Se trata de una discapacidad psicosocial, aunque cada vez se hacen más presentes personas con esta condición en todos los niveles educativos, la representación social que se tiene de la discapacidad y las personas con esta condición, así como de la inclusión educativa, representa un reto para que puedan ejercer sus derechos humanos.

La teoría de las representaciones sociales propone que las personas con autismo tienen dificultades específicas en la capacidad de desarrollar representaciones mentales complejas, lo que afecta su procesamiento de la información y su comprensión del mundo. Estas representaciones mentales se refieren a la capacidad de formar conceptos, comprender el lenguaje y las metáforas, y tener una comprensión abstracta del entorno.

Según esta teoría, las personas con autismo pueden tener dificultades para generalizar la información y transferir el conocimiento de una situación a otra. Esto significa que pueden tener dificultades para aplicar habilidades aprendidas en un contexto a situaciones similares. También pueden tener dificultades para comprender el lenguaje figurado y las sutilezas sociales, ya que tienen una comprensión más literal y concreta del lenguaje y el comportamiento.

La teoría de las representaciones sociales ha tenido buena aceptación en la investigación educativa y ha permitido conocer una faceta indispensable de la realidad educativa, específicamente, el pensamiento de los actores. Las problemáticas de investigación seleccionadas han sido pertinentes con la situación sociohistórica de las instituciones educativas de nuestro país.

Esta ponencia pretende describir y analizar, desde la teoría de las representaciones sociales, los procesos de inclusión educativa en algunos casos de educación superior en México, utilizando esta teoría para deconstruir la representación que algunos docentes han realizado de éstos estudiantes, y su impacto en la inclusión-exclusión de tales estudiantes.

(Re)Formuler Ses Droits Dans l'Exil : Le Cas Des Réfugiés Syriens Dans Le Grand Beyrouth

L'arrivée au Liban depuis 2012 d'environ 1,5 million de réfugiés syriens a posé de façon aiguë la question de leur accès aux droits à la santé en situation d'exil dans ce pays. Cette communication tâchera de répondre à cette question faussement simple : comment se soignent-ils en exil dans un pays où les soins de santé sont très coûteux et où leurs droits réels n'ont cessé d'être liquéfiés par certaines politiques publiques répressives depuis 2014? Elle s'appuiera sur deux enquêtes par entretiens et observations menées dans le cadre de mon Master 2 et de celui de ma thèse de doctorat, entre le camp de Sabra et Chatila, les quartiers de Nabaa, de Karm el-Zeitoun et de Hay el-Sellom, tous situés dans le Grand Beyrouth. Ces enquêtes ont été menées au long cours depuis décembre 2018, auprès de groupes de Syriens, d'autres étrangers et de Libanais particulièrement vulnérables et dominés. Cette communication visera à répondre à plusieurs questions emboîtées : quels droits revendiquent-ils dans un contexte où leurs droits se résorbent rapidement dès 2014, où leur accès à une santé onéreuse au Liban devient de plus en plus difficile? Comment entretiennent-ils des rapports avec le droit à la santé - libanais, syrien et humanitaire international - dans une situation d'exil que la littérature de sciences sociales associe souvent à une condition de «sans droit»? En quoi leur double expérience - et double référentiel - de réfugié au Liban et de citoyen dans leur pays d'origine se manifeste-t-elle au cœur des formulations de leur mécontentement tout comme dans leur quête de reconnaissance juridique?

ANITHA, SUNDARI* (University of Sheffield, United Kingdom)

Domestic Violence in Nonmarital Intimate Relationships in India: Women's Narratives about Their Experiences and Constrained Agency

Research on sexual and gender-based violence (SGBV) in India predominantly focuses upon sexual violence and harassment perpetrated by strangers or child sexual abuse, while in relation to domestic violence and abuse (DVA), the overwhelming focus remains on marital relationships. The recent surge of research, feminist activism and policy attention to SGBV in India has scarcely addressed DVA within non-marital intimate relationships, in a context where such relationships are becoming more commonplace yet attract gendered risks and penalties for women/girls.

Drawing upon life/relationship history interviews with victim-survivors, this presentation will apply a gender lens to this gap by exploring the nature, forms and impact of DVA within young women's intimate relationships in India and and victim-survivors' constrained agency in response to this violence. The findings examine how intersecting social relations of power based on gender, age, class, caste and religion shape the manifestations and impact of DVA. Additionally, dominant discourses about gender and sexuality - which intersect with caste, religion and class - also have implications for women's/girls' exercise of agency in the context of DVA as they seek to navigate and survive the interconnected interpersonal and structural violence that shapes their everyday life. This includes the ways in which intimacy - particularly across caste or religious boundaries - has increasingly become a politicised site of contestation within Hindu fundamentalist discourses about gender, family and the community.

Understanding the nature of DVA in young people's relationships can inform much-needed understanding and recognition of this problem and the development of appropriate responses in India. Though this presentation focuses on India, it has wider implications across the Global South due to similar increases in age of marriage and demographic changes in populations of unmarried young people, as well as increasing prevalence of non-marital relationships.

WG11-944.4

ANITHA, SUNDARI* (University of Sheffield, United Kingdom)

Violence, Abuse and Exploitation in Relation to Women's Domestic Labour in Diverse Contexts

This presentation brings together my recent research on domestic violence and labour exploitation to draw upon and extend prevailing conceptualisations of economic abuse through a focus on the abuse and exploitation of women's reproductive labour – their gendered domestic work. It draws upon two previous studies on domestic violence experienced by South Asian women and by Polish women in the UK and a recent study on trafficking and labour exploitation experienced by migrant domestic workers in the UK. The narratives of the victim-survivors enable us to understand the continuums in the nature and contours of violence, abuse and exploitation across different contexts in the paid and unpaid working lives of these women. Some of the themes I will explore include the ways in which violence, control and coercion are deployed by perpetrators to impose an intensified labour regime, to erode working conditions, to dehumanise the women, to deny them health and social protections and to withhold the reward for their labour – whether in the form of pay or their entitlement to the family's resources. I take stock of the limitations of prevailing characterisation of this problem – where the focus is on coercion and control in women's performance of feminine roles through domestic work of caring/mothering, cooking and housework with little attention to how violence and abuse is deployed to exploit the economic resource that their labour represents, and scant analysis of the commonalities between such abuse and exploitation in relation to women's paid and unpaid work and its impact. I also explore how intersecting social relations of power based on gender, migration status, bordering regimes and race shape the nature and forms of abuse and exploitation across diverse contexts. I argue that more expansive understanding of economic abuse can help academic scholarship reflect the lived experiences of victim-survivors.

Regulation of Public Parks and Space Production: A Multiple Case Study in Brazil

This research project, part of my doctoral thesis, investigates how the regulation of public parks granted to private companies impacts space production in urban Brazil. The study focuses on three parks located in the cities of Porto Alegre and São Paulo, analyzing them in the context of the federal government's intensified push for public-private partnerships (PPPs) in recent years. The research adopts a multiple case study approach, enabling a comparison of regulatory and spatial dynamics between the parks and cities. Grounded in the theory of urban governance by Mariana Valverde (2015), particularly her discussions on jurisdiction and scale, this work seeks to understand how the concession of public spaces influences the creation and enforcement of norms and how these shape social interactions and space usage. The study also engages with the theory of space regulation (Konzen, 2021), exploring the role of concessionary companies not only as administrators but as regulatory agents. By examining how these regulatory dynamics operate in practice, the research aims to contribute to a critical understanding of urban management and its implications for public spaces.

The Mobilization of Legal Discourse in the Approval of Laws Restricting Circulation in Public Streets in Brazil

Public security is a major concern in Brazil, generating legislative proposals at all levels. However, public debate often diverges from evidence-based analysis, relying on perceptions and popular opinions. This is especially evident in local contexts with limited access to specialized advisory resources, leading to public policies that may not effectively meet security needs. It is crucial to analyze how these debates are shaped, particularly the mobilization of legal concepts, which serve as tools of persuasion, legitimacy, and respect for legality. The central question is: "What legal arguments are mobilized by municipal legislators for the approval of laws restricting circulation in public streets in Brazil, and how are they presented?"

This study conducts a multiple-case analysis of legislative sessions that approved circulation restrictions in the cities of Natal (Law No. 531/2018), Porto Alegre (Law No. 938/2022), and São Paulo (Law No. 16.439/2016). These cases were chosen for their geographic representativeness, potential to

reveal differences, and the availability of necessary documents for content analysis. The debates were examined based on four categories: (1) What legal arguments were mobilized? (2) How were these concepts used for persuasion and legitimacy? (3) How were opposition and civil society reactions addressed? (4) What were the main points of divergence?

In Natal, the discourse framed security as a right justifying circulation restrictions, contrasting the right to life with the right to freedom of movement. In Porto Alegre, the debate focused on the legality of private security, pitting the right to protection against the right to the city. In São Paulo, the discussion centered on balancing acquired rights and judicial decisions after constitutional challenges. These legislative discourses reflect local sociopolitical climates and national ideological interests.

ANNA, KORN* (Ruhr-Universität Bochum, Germany)

Gendered Work Ethic of Informal Caregivers on Digital Platforms

The proportion of elderly individuals in need of care who are looked after at home is steadily increasing in Germany. In addition to relatives and professional care services—many of whom are already overburdened and often have limited time to address the medical aspects of care—outpatient informal caregivers are playing an increasingly significant role. These informal caregivers provide supplemental care, offering psychological and social support to help elderly individuals manage daily life in their own homes. Given the growing shortage of skilled workers in the care sector and the aging population, the importance of less formally trained outpatient caregivers and daily living assistance is expected to rise in the coming years.

In response to this shortage, online platforms with various business models have emerged to connect caregivers with individuals in need of care or their families. These platforms re-present a gig economy for care work. However, compared to other, more researched areas of the gig economy, care work as an interactive activity within private households presents unique challenges. As a result, findings from research on other gig economy sectors cannot simply be transferred to this area (Ecker et al., 2021). Prior research (e.g., Staab, 2014) has shown that in elderly care—a sub-sector of care work—workers often internalize a gendered work ethic characterized by caring and helpfulness, which can also lead to the exploitation of their own resources. However, this work ethos has not yet been studied specifically within the context of platform-mediated care.

Drawing on a qualitative survey of platform workers, this contribution explores how the work ethic, and the closely related processes of certification and qualification assessment, are shaped within the framework of the platform economy.

Drivers of Masculinity: Marginality, Manhood, and Mobilities during a Pandemic

The social, economic, psychological, and epidemiological impact of the COVID-19 pandemic in India has been well-documented in academic writing. A common finding in this writing is that the risk of viral contagion and the economic disaster that followed intersected with the reality of economic marginality, precarity, and systemic vulnerability of those who were always already at the cusp of financial risk in the country. In India, one group profoundly affected by these "compounding risks" exacerbated by the pandemic were drivers of app-based cab aggregators like Uber and Ola. While there has been notable documentation of how app-based cabdrivers coped with the conditions of precarity made worse by the pandemic, we know little about how the pandemic has transformed and/or affirmed ideas and practices of masculinities during this time. Extending research on the pandemic's effect on economically and socially marginalized groups such as app-based cabdrivers and by taking into account masculinity as a framework of analysis, I ask: how does a crisis like the pandemic impact self-understandings of men cabdrivers? How does the intensification of precarity during a global crisis affect the way men understand themselves as gendered selves? In this exploratory paper, I show how the pandemic reproduced certain norms of masculinity (such as the "provider" and "protector" norm), while complicating practices and performances of care, outside the home. Ultimately, I argue that interrogating "men as gendered, and not only empirical, subjects" (Hopkins & Murray, 2019, p. 303) opens up the possibility of exploring the links between crisis, gender, and social change – particularly in the Global South.

RC11-171.3

ANNE, RAFFIN* (National University of Singapore, Singapore)

French Retirees in Asia: Aging in the Right Place Abroad

This paper looks at the recently acknowledged migration of French seniors to Asia. Based on 68 interviews with French retirees in Vietnam, Cambodia, Laos and India, the research examines retirement migration as a strategy to pursue one's desire for a comfortable life. The results show a correlation between gender and the chosen place of retirement. On balance, male subjects preferred to retire in Southeast countries while females were inclined to choose Puducherry in India. Besides gender, other aspects of social identity, such as education level, age, sexual orientation, family life, "able-bodiedness", and social/cultural/personal imaginings contributed to interviewees' choice and experience of retirement abroad. Conceptually, the study argues that retirement abroad is linked to the notion of "aging in the right place" within specific environments offering lifestyles suitable to particular groups.

ANNELIES, SCHEERS* (University of Hasselt, Belgium)
ZANONI, PATRIZIA (University of Hasselt, Belgium)

Labour As 'Residue': Unpacking Client-Appealing Technology Fetishism in Warehouse Fantasies of Seamless Logistics

The pursuit of "seamless logistics" – a vision of perfect, uninterrupted global supply chains – is increasingly facilitated by the widespread adoption of digital Taylorist principles in warehouses. Algorithmic management systems optimise operations, automate labour coordination and impose unprecedented levels of micro-surveillance. Research indicates that these digital technologies have fundamentally transformed warehouse operations, resulting in heightened workloads, diminished worker autonomy, and deskilled work, enabling the further casualisation of employment.

This study aims to deepen our understanding of digital Taylorism in warehousing by examining how this reorganisation of the labour process redefines meaning and value of labour. We argue that algorithmic technologies and casual employment not only control labour in new, highly coercive ways, but also fundamentally reconstitute it as the 'living residue' in the fantasy of fully automated seamless logistics that meet client demands.

We theorise this fantasy and its production of labour as human residue through Žižek's theory of the fetish explaining subjects' "refusal-to-know". Drawing on Freud, he theorises that subjects recognise harsh realities but continue to act as though they are unaware. Fetish-objects enable such "divided attitude", as they symbolically embody the phantasmatic, and more desirable, version of reality the subject should have abandoned.

Our analysis is mainly based on in-depth interviews with various types of managers in three Belgian warehouses using different digital technologies, triangulated with interviews with other actors and complementary data. Preliminary analysis indicates that, independent of its specific material features, digital technology operate as a fetish embodying the fantasy of fully automated, seamless warehousing freed from all living labour. This fetish sustains the disavowal of the harsh reality of management's dependence on labour for keeping warehouse operations running. It moreover underpins narratives of labour as residue, at once less than human and less than machine, that justify control, casualisation and – ultimately – elimination.

ANNY, HESIUS* (New Humanity NGO at UE, Belgium)
JAMOUCI, MOHAMMED (Independent researcher in epistemology, Belgium)

Bridging Worlds: The Integration Journey of Moroccan Youth in Belgium

In 2024, the 60th anniversary of the labor agreements between Morocco and Belgium marks a significant moment in the history of migration. Moroccan guest workers and their families, now representing 17% of Brussels' population, have shaped the city's demographic landscape. Moroccan youth, in particular, face distinct challenges in navigating the integration process within Belgium's multicultural framework.

This paper explores how social love and solidarity influence the experiences of young Moroccans in Belgium. The focus lies on identifying the obstacles encountered during the integration process and evaluating whether policies, such as compulsory integration courses, align more with fostering inclusion or promoting self-interest. Insights are drawn on how Moroccan youth experience belonging or exclusion within Belgian society.

Unlike the French model of assimilation, the Belgian approach promotes integration as a two-way process, which raises important questions about the contributions and perceptions of Moroccan youth. The role of religion and cultural heritage in shaping their path to integration is also explored.

Additionally, the concept of "waaf" (common goods) and the impact of small acts of kindness, such as smiling, are examined as potential contributors to fostering unity and a sense of fraternity. In a secularized, post-industrial society, identifying shared values among youth is crucial for strengthening social cohesion and promoting collective well-being.

Through this analysis, the paper highlights the potential for building a more inclusive and integrated future for Moroccan youth in Belgium.

ANSARI, ARVINDER A.* (Jamia Millia Islamia, India)

Resisting on Two Fronts: The Intersection of Gender and Political Violence in the Lives of Palestinian Women

This paper explores the pervasive and multi-faceted violence faced by women in Palestine, focusing on the complex intersection of political, social, and gendered violence. Palestinian women endure daily acts of aggression not only from the prolonged Israeli occupation but also from within their own socio-cultural frameworks, which often perpetuate patriarchal norms and gender inequality. The occupation exacerbates their vulnerability, as they face physical, psychological, and economic hardships, including displacement, military checkpoints, imprisonment, and loss of family members. Simultaneously, traditional gender roles and societal expectations compound the challenges they encounter, often resulting in domestic violence, limited access to healthcare, education, and employment, and marginalization from decision-making processes. The analysis emphasizes how the intersection of occupation, patriarchy, and socio-economic factors creates a unique context of violence for Palestinian women, undermining their agency and rights. By incorporating testimonies, human rights reports, and feminist theory, this paper highlights the urgent need for international and regional efforts to address the systemic violence against women in Palestine, promoting their safety, empowerment, and active participation in peacebuilding and social reconstruction.

Third Sector Facing Gender Issues: Training Sessions on Gender Gap and Female Empowerment for Achieving Gender Equality

This contribution presents the results of the "Third Sector and Gender Issues" formative sessions, developed as part of the FQTS project (*Third Sector Executive Training*) aimed at training managers and representatives of non-profit organizations in Southern Italy. This multi-year project (2023-2024) is promoted by the National Third Sector Forum and Sapienza University of Rome's "Communication and Social Research" Department. The initiative seeks to foster a deeper understanding of gender issues and to promote the implementation of inclusive policies in organizations towards Goal 5 of Agenda 2030.

Although the Third Sector in Italy plays a vital role in advancing the 2030 Agenda for Sustainable Development, including gender equality, there is still no concrete data on women's representation in leadership roles within non-profit organizations. This study seeks to address this gap by leveraging the educational project to explore opportunities, challenges and resistance to women's empowerment in Third Sector organizations.

The training is designed to equip managers and representatives with skills needed to identify and address gender inequalities with an intersectional perspective. It includes an initial top-down phase, where gender experts present data and reports to inform and sensitize participants, followed by bottom-up discussions (focus groups and interviews that gather and compare participants' experiences of discrimination).

The uniqueness of the "Third Sector and Gender Issues" course lies in (I) involving both men and women from Third Sector, emphasizing that gender issues are not "just a woman's concern." (II) It also provides practical tools for organizations to draft their own gender reports, addressing the lack of reliable data on the sector's gender gap. These reports help assess the current situation and set concrete goals toward achieving Goal 5. Results from about 8 focus groups, 15 interviews and 10 reports have highlighted obstacles, opportunities, and contradictions that need to be addressed to reach gender equality.

Lost in Translation? Brazilian Tech Workers and Colonial Linguistic Imbalance in Global Development Teams

The wide extension of remote work in the wake of the COVID-19 pandemic saw a significant acceleration of pre-existing trends towards global development teams bringing together tech workers based in Brazil or India to work directly for European or North American clients or subsidiaries.

Raising significant questions regarding the reproduction of a kind of colonial dynamic in the tech industry, the substantial disparities in terms of wage and employment benefits inherent to such teams are coupled with a critical linguistic imbalance, exacerbated in either non-English speaking (Brazil) or profoundly multilingual (India) countries.

Based on in-depth interviews with Brazilian tech workers – as part of a global MSCA research project across Brazil, India, Ireland and the US – focusing on personal and professional trajectories in the tech industry, this paper aims at opening up the black box of these transnational teams, looking at the way broader majority vs. minority world dynamics intersect with social and linguistic ones.

Besides the challenges of dealing with remote work or navigating between time zones and management styles, the research reveals how linguistic skills in English turned out to become social distinction criteria: putting workers with comparable technical qualifications at greater risk of discriminatory hiring practices and more vulnerable to lay-offs and direct or indirect humiliation by management or clients – contributing to a pervasive feeling of being “on the edge” and therefore hindering the possibilities to express and collectively discussed more complex social issues going beyond mere technical ones.

Conversely, it also highlights how acknowledging linguistic and cultural backgrounds, often silenced in everyday operation, can open up both spaces of resistance to foreign management and non-hegemonic common grounds to address sensitive questions – revealing how decolonial management practices and sensibilities are critical to making the global tech workplace, and the wider digitalization process, more inclusive.

Alienation Economies: Value Regimes, Astrophysical Precarity, and Cosmic Labour of Astronomers in Central Asia

This paper explores the values and visual work cultures involved in the valuation of cosmic phenomena and the night sky in Kazakhstan, Kyrgyzstan, and other interconnected elsewhere. The study interweaves case studies of institutional astrophysicists and professional astronomical observers, who conduct their work in observatories, with the practices and narratives of precarious “street” astronomers, who engage as entertainers and grassroots educators in the streets and town squares of the cities across Central Asia, such as Bishkek and Almaty. The paper examines the value regimes attributed to the night sky in the context of technoscientific capitalism, post-Soviet indeterminacy, neocolonial resource extraction, and the commercialization of the dark sky commons. Drawing on conceptions of the “alien” in the works of Chingiz Aitmatov, Denise Ferreira da Silva, the narratives of my interlocutors, as well as Nick Land's notion of capital as alien intelligence—a self-constructing force that co-opts human agency to drive its own evolution—the analysis considers how both institutional and street astronomers navigate and appropriate technocapitalist alienation and its forces of un-commoning. The paper argues that both groups play a crucial role in the construction of these emerging alien technocapitalist forces, while also creating opportunities to reframe alienation itself. Building on Moten and Harney's concept of the fugitive “undercommons,” this paper explores how the labour of these astronomers cultivates alternative ways of valuing the darkness of the night sky; how the generative alienation of astrophysical precarity transcends the logic of technoscientific resourcification.

Dismantelling a Gallery of Horrors: Radicalization and Extremism in Europe after October 7th 2023

The paper analyses the impact of Israel-Palestinian conflict on violent radicalisation and extremism in Europe, starting from the attacks of October 7th 2023. After having defined these keywords (radicalisation and violent extremism) and the general background, the paper is focused on the radicalisation of the public sphere and on the mobilisation of sociopolitical movements, included antisystem actors. Starting from a rethinking of

the sociology of Subjects by Alain Touraine, in relation with the theory of radicalisation, the paper utilises a set of different data and sources to support two main conclusions: the first one, the ongoing conflict is catalyst and multiplier of long-term trends of radicalisation within European society; particularly about the re-configuration of antisemitism and islamophobia in the far-right arena. The second one, in order to tackle all this, it is fundamental to give a more important role to a universalistic rationality based on human rights and dignity in the public sphere.

RC08-120.4

ANTONELLI, FRANCESCO* (Roma Tre University, Italy)

War and the Sociological Canon. Dynamics of Exclusion and Possible Pathways of Reinclusion

Discussing the reasons of the marginalisation of sociological analysis on war and peace processes is the main purpose of the paper: such a situation weakens the capacity to understand sociologically macro-social changes. After having analysed in which way war conflicts have been studied during the foundation of sociology in Europe and USA, in the critical discussion it will be hypothesized that such a situation is due to the canonisation of sociology – particularly with the push of functionalism – and the rise of its professional identity, between the 30s and the 60s of the XX century. Eventually, in the final part three proposals will be discussed in order to go beyond this situation: 1. put the “principle of symmetry” at the center in the analysis of war as a social phenomenon. 2. Fully develop all the potential of a cosmopolitan sociology. 3. Dealing with the transformations of the public sphere and institutions in the global world and their connections with different phenomenal levels.

The Critical Value of Time in Humanitarian Cash Transfer Programs : An Analysis of the Essn Program for Refugees in Türkiye

The share of cash transfers (CTs) within international humanitarian assistance has notably increased during the last decade, as they are seen as a « dignified » modality of aid through which beneficiaries can freely define their needs instead of receiving in-kind goods based on exogenous evaluations of needs. Yet the promotion of humanitarian CT also has its roots in the digitalization of humanitarian work and may indirectly relate to the global « funding crisis » faced by the humanitarian sector, allowing CTs to be a more « cost-effective » solution for organizations compared with the higher logistical costs required to deliver in-kind products such as food and medicine.

The case of Türkiye is of particular interest to discuss the social, political and financial implications of humanitarian CT programs. Türkiye has seen the settling of the largest ever humanitarian CT program targeting refugees after the beginning of the Syrian war and the signature of the 2016 Türkiye-EU agreement. Benefitting refugees only, funded by the EU and initially implemented through a consortium of humanitarian agencies, the program has led to mixed outcomes because of its intertwining with EU migration policy concerns and its critical questioning regarding the substitutive role of humanitarian programs to the direct, sustainable provision of welfare.

This contribution will trace the genesis and the evolutions of the Emergency Social Safety Net (ESSN) until its responsibility was transferred to the Turkish Ministry of Family and Social Services in late 2023. It will specifically elaborate on the critical value of time in humanitarian CT, as emergency time is a key variable for intervention, as time is conducive to adjustments due to political and technical concerns, and time is embedded with uncertainty regarding the precarious perpetuation, years after years, of a temporary CT program for (ultimately) undesired refugees.

The Human Rights Paradox: Forced Displacement in a World of Unfulfilled Promises

In a world where human rights are universally acknowledged yet selectively upheld, forced displacement presents a stark challenge to our collective conscience. This study examines the glaring disconnect between proclaimed human rights and the harsh realities millions of forcibly displaced individuals face globally.

In the study, we have explored how the very act of forced displacement systematically strips people of their fundamental rights—rights that are

theoretically inalienable but practically unenforceable in refugee contexts. From the right to life and security to access to education, healthcare and social security, we will dissect how each aspect of human dignity is compromised when individuals are forced to flee their homes.

Our discussion will highlight the paradox of international human rights frameworks that, while well-intentioned, often fail to translate into tangible protections for refugees, based on the case of forced displacement of Nagorno-Kharabakh population in September 2023. Our findings are based on the more than 100 in-depth interviews conducted with the displaced population in two phases (1st phase - during displacement, 2nd phase - six months after displacement). The findings highlight the systemic failures in safeguarding refugee rights, exposing the chasm between political rhetoric and concrete action.

This speech aims to spark a critical dialogue on how we can move beyond mere declarations and towards implementable solutions by confronting these uncomfortable truths. We will present innovative approaches applied to bridge the gap between theory and practice, challenging workshop participants to rethink our collective response to forced displacement.

Ultimately, this presentation seeks to ignite a renewed commitment to upholding human rights in the face of forced displacement – not just in principle but in practice based on the findings of critical analysis.

ANTUNES PADILHA, RAFAEL* (University of Porto, Portugal)

From Words to Worlds: The Interplay of Testimonial Knowledge and Sociological Narratives

In social epistemology, debates between reductionist and anti-reductionist accounts of testimonial knowledge have sparked discussions about the nature of belief and the role of social interactions in knowledge production. A central issue is the concept of social epistemic dependence, which emphasizes individuals' reliance on others and their broader social environment. This tension is particularly evident between the Enlightenment view of the fully autonomous epistemic agent and the anti-individualist perspective, which stresses interdependence. However, I argue that prominent social epistemologists such as Burge (1998), Goldberg (2020), and Greco (2021) inadequately define the "social" in their frameworks and overlook the empirical dynamics between social scientists and the testimonies they gather. While they attempt to reduce individual agency, they neglect the crucial connection between the social and material worlds. Additionally, it must consider how social scientists approach interlocutors in politically sensitive contexts. Moreover, they fail to address how knowledge is shaped through narratives—stories, experiences, and discourses that permeate communities. These narratives, from Kantian "hopes" to everyday gossip, are essential in forming collective identities and shaping shared understanding. This blind spot becomes especially problematic when considering epistemic subjects, such as migrants and refugees, who do not share common belief systems with the host community or the researcher. It raises questions about how epistemic dependence and testimony are addressed in these contexts. Sociological narratives, often built on testimonial knowledge, may even emerge from "Good Liars," further complicating the issue. Thus, I contend that any anti-individualist account relying on a shared ground of belief is vulnerable to critique for neglecting epistemic unbalance, particularly in how marginalized subjects navigate new social contexts. A more robust framework must integrate the role of sociological narratives and recognize the complexity of knowledge production in diverse and unequal environments.

How Does Perceived Justice Affect Urban Environmental Policy Support?

Belief in a Just World (BJW) emphasizes the role of justice in every aspect of life, based on the belief that we, including others, get what we deserve. Globally, including in Thailand, environmental issues have become a major public concern, especially among the young generation. This study investigates how perceived justice among HEI students affects environmental policy support. The applied mixed method was a combination of online surveys and interviews. Of 223 survey participants from 4 HEIs in Bangkok, 21 participated in the interview. The survey affirms the previous study that Personal BJW is the predictor of well-being. The General BJW correlates

negatively with just sustainable policy, especially the 'Polluter Pay for Pollution' policy. The data were analyzed with the reflexive thematic analysis approach. The core theme addressed the factors affecting attitudes towards environmental policy. Three subthemes were identified: (i) Experiences as determinants of problems significance & necessity evaluation, (ii) Knowledge as an unavoidable information in policy process communication, and (iii) Outcome assessment as the result of comparison between self-impact and public-impact. Results illustrated factors causing different attitudes towards environmental policy. These findings suggest that the level of support of any environmental policy is relevant to the social group experiences, that the policy communication process should provide knowledge and information to solve misunderstandings or myths, and that the policy framing as an integrated package could mitigate the individual impact by providing more choices and gain more support.

On the Brink of Cultural Catastrophe: Why Plan for Cultural Heritage in the Context of Disaster Risk?

Cultural heritage holds both tangible and intangible irreplaceable historic value and significance of place attachment, however, with the exacerbating impact of climate change induced and other disasters, culture heritage is under threat. This literature review paper synthesizes key findings on the intersection of cultural heritage preservation and disaster risk reduction (DRR), emphasizing the need for proactive planning. The study identifies critical themes, including vulnerability assessment, policy gaps, and resilience-building strategies. Research reveals that cultural heritage is highly vulnerable to disasters, often overlooked during recovery efforts in favor of essential infrastructure. Preservation efforts are further hampered by institutional and procedural barriers, such as conflicting priorities between local, state, and federal agencies. These challenges are compounded by the limited flexibility for long-term resilience planning, as alterations to heritage sites often compromise the historic value of cultural heritage.

A seminal research question addressed in this literature review paper is: *How can urban planners balance the urgent demands of disaster recovery with the need to preserve the historical and cultural integrity of heritage sites?* Preliminary findings indicate that while technological tools such as GIS are invaluable for mapping vulnerability, their effectiveness is limited by gaps in policy and interagency coordination. Barriers at institutional and procedural levels often overshadowed need for recovery of heritage against critical infrastructure. The research also indicates lack of comprehensive guidelines that cater to the unique requirements of heritage sites, particularly in terms of adapting to long-term climate threats. The literature review also posits that enhancing early warning systems and fostering stronger cross-sector collaboration are essential to safeguard cultural assets. By bridging the current gaps in policy and practice, this paper contributes to a more nuanced understanding of how urban planning can better integrate cultural heritage into disaster resilience frameworks, ultimately to aid preservation of both tangible and intangible heritage.

MEYER, MICHELLE* (Texas A&M University, USA)

Opportunities and Challenges in Emergency Management (EM) Protocols and Volunteer Engagement

The post-disaster Emergency Management (EM) protocol and volunteer management is infused with a complicated relationship, concerns of perception, and issues of integration in disaster response and rescue efforts. Upholding procedural justice in utilizing this human resource and understanding the social capital of volunteer aid can help build resilience against disasters. This research particularly explores the challenges and opportunities for volunteer integration in EM protocols during disaster 'rescue' efforts.

'Volunteerism' in the context of disaster emergency is regarded as direct and indirect service for other people and things with no self-interest. Even though the 'emergent' volunteers can offset several unmet needs, proliferate a sense of community, and bring in resources, they also raise issues in coordination, liability and safety, lack of training, or misconduct in protocols. Integrating volunteers into disaster rescue efforts also experiences external factors such as social media and inter agency interaction.

Therefore, by using grounded theory and performing qualitative analysis on 26 in-depth interviews with emergency managers in areas flooded by Hurricane Harvey in Texas and North Carolina, this study analyzes the challenges and opportunities faced by EM protocols in volunteer rescue efforts. The analysis also looks at the perception of volunteer groups among

emergency managers – 'Cajun Navy' in comparison to other volunteer groups. The preliminary results indicate coordination issues, communication-breakdown, liability issues, lack of training, resource-allocation, and social-media as the main challenges impacting volunteer's rescue efforts. The study also reveals the opportunity in early mobilization, social media and technology, resources brought by volunteers, and empathy of volunteers. Volunteers are also perceived as a resource instead of professionals, by the EMs and this poses issues in the integration of volunteers in EM protocols, however, this perception differs between organized groups such as Cajun Navy and other spontaneous volunteer groups/ individuals, as former is given professional importance.

The Paradox of Remembering Violent Struggle: The Gwangju Uprising and Its Selective Memories in Democratic South Korea

The legacy of activists who resisted authoritarian regimes through violent means presents a significant dilemma for post-democratic societies, as they occupy a dual role as practitioners of both violence and democracy. While their resistance was crucial in overthrowing oppressive regimes, their use of violence presents an uncomfortable reality for societies that emphasize nonviolent political transformation. In constructing a narrative of democratic legitimacy, post-democratic societies may selectively downplay the violent aspects through which democracy was achieved. This raises a question: how can violent struggles, which played a pivotal role in securing democratic outcomes, be remembered as part of the democratic legacy?

This study uncovers the selective processes behind the construction of collective memory surrounding the Gwangju Uprising of May 1980, South Korea's only instance of armed conflict during its democratization, which led to at least 166 deaths. Despite its tragic consequences, the Gwangju Uprising is recognized as a catalyst for subsequent movements, ultimately contributing to the Korean democratic transition in 1987. This study discovers, given the complex features of the uprising, three key actors in Korean society have constructed their own memories of the violent struggles by emphasizing specific aspects selectively.

This study analyzes how three actors have selectively constructed the memory of the uprising: victims' families, in opposition to the official memory that labeled it a riot, developed a "memory of restitution," remembering their actions as necessary for community protection; social movements, focusing on violent struggle, created a "mythologized memory" of activists as fearless figures willing to face death; the democratic state, by erasing the violent aspects, constructed a "domesticated memory" to prevent the uprising's memory from fueling new movements that might challenge state authority. By analyzing the discourses in the media outlets and political campaigns, this study reveals how the three actors have tried to make their memories prevail.

Energy Transitions and Economic Development in Southeast Asia: Energy Infrastructure and the Quality of Life

Based on our field survey in southeast Asia, we discuss an energy transition and people's QOL in this paper. Connections to the national main grid or solar panel electricity supply would not only help people own more or bigger household appliances and access energy-consuming facilities but also improve their QOL. We discuss an energy transition framework for developing countries in relation to improving the quality of life and energy infrastructure. Based on our field research in Thailand, Vietnam and Myanmar, we posit that we should reconsider the ways to improve people's quality of life with more energy intensive household equipment and infrastructure. In our mixed-method research, we interviewed about 30 households (quantitative), and our survey (qualitative) yielded over 1,000 responses in each country with a representative national sample.

The energy transition in Southeast Asia is considered to be a shift from solid fuels such as firewood, rice husks and straw to liquid fuels, and then to electricity. Indeed, electricity has been key to the improvement in people's quality of life in the countries we surveyed. Our research, however, finds significant differences in accessibility to and affordability of electricity between urban and rural households, showing a huge gap of quality of life of people between the two areas. Connections to the main grid and other energy sources greatly affect the quality of life including household appliances ownership. More importantly, connections to solar panel electricity supply in rural areas would assure access to social networks through smartphone ownership. We therefore argue that only by considering these new dimensions of energy poverty, we can find a way for 'just' energy transitions and the improved quality of life.

Être Artiste à Marseille : Une Inscription Dans Le Champ De L'Art Contemporain Par Les Pratiques Participatives En Lien Avec Des Publics

Le point de départ de cette recherche dans le cadre d'un doctorat de sociologie repose sur un constat, celui de la précarité des artistes plasticiens émergents. Ces derniers sont en début de carrière et n'ont pas encore eu le temps, l'occasion ou l'envie d'obtenir des avantages cumulatifs tels que des prix, des concours et d'avoir été repérés par des experts. Pour pallier cette précarité et devenir artiste, le double emploi caractérise leur profession. Depuis les années 1990, des pratiques participatives subventionnées par des acteurs publics et privés les amènent à intervenir dans diverses institutions (associations, centres sociaux, écoles...) et auprès de différents publics (scolaires, détenus, patients au sein d'un hôpital...). Ces interventions sont considérées par la sécurité sociale des artistes auteurs comme des revenus secondaires mais sont, dans les faits, la source principale de revenu en lien avec leur pratique. Afin de les préparer au mieux à ces interventions et proposer un espace pour discuter d'enjeux éthiques (concernant la place du métier d'artiste, la possible instrumentalisation des publics...), une formation professionnalisante se structure dans plusieurs villes en France depuis la fin des années 1990 – début des années 2000 avec comme point commun d'être rattachée à des écoles d'art publiques. Dans quelle mesure ces formations sont-elles un moyen de professionnalisation des artistes plasticiens dans un contexte où la précarisation et la flexibilité de leur emploi s'accroissent ? Cette communication a pour objectif de décrire ce qu'une de ces formations, basée à Marseille, propose et ce qu'elle permet dans la carrière des artistes qui choisissent d'investir ces opportunités pour leur pratique personnelle mais aussi afin de s'ancrer sur le territoire en y développant un réseau professionnel.

Cross-National Variation in "Imagined Meritocracy": Causal Mediation Analysis of Social Origin, Education, Cognitive Skills, and Destination

Recent research argues that we are trapped in "imagined meritocracy", where people misbelieve that our society is meritocratic when, in fact, credentialism operates as a dominant mechanism for socio-economic rewards allocation. Extending this line of studies, the current paper investigates (1) how labor market outcomes are linked to individuals' educational credentials and cognitive skills, alongside parental status, and (2) how these structures differ cross-nationally. Using data from the OECD Programme for the International Assessment of Adult Competencies (PIAAC) for 23 countries, causal mediation analysis first confirms that "imagined meritocracy" operates in all cases in that the magnitude of educational credentials in status attainment outweighs that of skills. However, the effect size of skills, as well as the role of "significant others", substantially varies across societies, ranging from the smallest influence in Sweden to the largest one in the United States. This cross-national variation indicates the existence of several societal types governed by different mechanisms of rewards allocation and intergenerational inequality, such as skill-based meritocracy and education-based credentialism. These empirical findings also suggest that skills development among adults with disadvantaged backgrounds may potentially help mitigate the unequal social structure in some societies, whereas such approaches based on meritocratic beliefs would not work in other cases.

Exploring Protective Factors Against Unhappiness Under the Global Crisis: A Machine Learning Approach

While a vast literature has explained the determinants of happiness, the Covid-19 pandemic has drastically changed the fundamental conditions for human flourishing. Although people have shown their resilience over the few years, evidence indicates that the unhappiness risk surged during the pandemic and has remained high ever since. This paper therefore explores protective factors against unhappiness under the global crisis using data from the General Social Survey (2018-2021, N=4,927). A series of supervised machine learning models with the binary outcome of feeling "not too happy" (against "very happy" and "pretty happy" in the three-point scale) consistently show that satisfactory social relationships/activities are key to preventing unhappiness both in 2018 and 2021. Importantly, its magnitude in terms of the SHapley Additive exPlanations (SHAP) value increased from 0.438 to 0.560 under the pandemic, whereas the contribution of income, occupational prestige, and physical health, among others, declined during the same period (0.277-

>0.107; 0.167->0.143; 0.184->0.130, respectively). Being married mitigates the unhappiness risk as the second most important factor in both years, although its SHAP value decreased from 0.436 to 0.322. In contrast, albeit modestly, the impact of attending religious services intensified from 0.066 to 0.098. These results suggest, under the crisis like the Covid-19 pandemic, connections with other people operate as an essential buffer against unhappiness. Examining their future trends, including effect heterogeneity across individuals and societies, is a crucial agenda to realize human flourishing.

Transformation or Obduracy? Exploring Perceptions, Expectations, and Dilemmas in the Agrifood Sociotechnical Transition of Thessaly

This paper examines the dynamics and politics of agrifood transitions in the region of Thessaly, Greece. Historically, Thessaly has played a central role in shaping national and regional agriculture politics and policies, as it is considered the center of agricultural production and agrarian culture in the country. Under the constraints imposed by the Anthropocene and the pressures of recent critical events, such as severe floods (2021 & 2023) and droughts (2024), exacerbated by climate change, Thessaly has become an arena for competing and combatting visions and societal interpretations of environmental limits and sustainability. Different actors (e.g. farmers, policy makers, agronomy experts, consulting agency and NGOs) are actively involved in shaping both national and regional policies and conceptualizations of just sociotechnical futures. Drawing on the sociology of expectations (Harro Van Lente, 2019; Brown et al., 2010; Borup et al., 2006) and transition politics literature (Stirling 2019; Smith et al., 2005), we argue that the dynamics and politics of expectations configure and empower policies and sociotechnical obduracy in the region's agricultural transition. We posit that obduracy is the result of both the fragmented state water governance, that has configured visions of water abundance empower by the prospects of infrastructure technosolutionism and the path-dependence of modes of industrial crop production. The latter has been legitimized and reinforced by contested certifications and subsidies for large-scale organic farming. Methodologically, the paper is based on an extensive series of interviews and focus groups with farmers, cooperative representatives, researchers, agronomists and civil society actors. Discourse analysis is employed to examine policy documents, technical reports, and records of public deliberation events. The analysis focuses on agrifood sociotechnical systems of specific products: cereals, legumes, industrial tomato, table olives and olive oil

Commodification, Exploitation and Vulnerability: (Un) Documented Afghan Migrant Workers in Istanbul

Turkey has witnessed a tremendous migration wave of Afghan migrants infiltrating from the Eastern political territorial borders of the country in the last decade. Most of these young migrants' only hope is to gain better life conditions either in Turkey or Europe to support themselves and their families. On the way from Afghanistan to Istanbul through agency of human traffickers, they have suffered and coped with many difficulties during which many of their friends lost their lives leaving their dead bodies on the smuggling paths in the mountainous Kurdish region on the Iranian-Turkish border. Based on the data of an ethnographic oral history project, this paper aims to document how these male and female migrants develop survival tactics in the job market as documented and undocumented workers where they have been subjected to diverse forms of exploitation. Their dignity is constantly being violated and their bodies are seen and treated as "docile bodies" that can be consumed any time. The rise of human rights violations and xenophobia has expanded a ground of necropolitics for migrants in Turkey where precarity, fear, despair and waiting become new ways of life. Focusing on the life story Ahmad who lost one of his legs while working in a harsh working place, and narratives of many other male and female workers, this paper tries to analyze and shed light on the violent circumstances of (un)documented migrant workers in Istanbul and their struggle and hope for a possible "future".

Emotion of Fear, Language and Body Politics: Narratives of Syrian Migrants in Istanbul

Turkey is going through a social, cultural, economic and political turmoil due to arrival of millions of migrants from neighbouring countries and other conflict and post-conflict places in the Middle East, Africa and Asia. Istanbul as the leading host city in the country is being challenged by diverse issues and problems in this process. This paper aims to investigate the power dynamics between Syrian migrants and mainstream Turkish society in the context of emotion of fear, politics of language and discourses and how they are stuck on the surface of the bodies of migrants in everyday life in Istanbul. The Turkish politics of exclusion, stigmatization and discriminatory discourses along with exhausting bureaucratic procedures and papers works have led a constant state of felt fear, despair and anxiety in the lives of Syrian migrants. Migrants have tried to cope with violent climate created against them during which they have developed new tactics of survival. Their language as a sign of their existence and their dress codes as visible forms of their existence have been attacked on daily basis. This paper aims to investigate how the circulation of anti-migrant emotions through different mediums in the mainstream Turkish society has contributed insecure life condition for migrants. Based on an ethnographic oral history project, the paper documents emergence of these survival tactics and the discriminatory violent factors that generates them in the light of narratives of ordinary migrants residing in different districts of Istanbul.

ARAT-KOC, SEDEF* (Toronto Metropolitan University, Canada)

Democratic Expression, 'Foreign' Policy and Decolonizing Citizenship

This paper focuses on the responses to pro-Palestinian protests and encampments by the state and civil society in North America in 2023 and 2024 to interrogate and discuss the limitations and distortions of citizenship in North America. The protests and encampments since 2023 have been debated mostly in relation to freedom of expression about foreign policy and international affairs. What are central to recent controversies, however, is not just suppression of some basic civil liberties. As importantly, and often not explicitly debated, are questions raised about national and civilizational identity and about the complexities and contradictions of citizenship and belonging in settler colonial and multicultural societies. Highlighting how some of these complexities and contradictions play out in specific citizenship negotiations and struggles, this paper interrogates what decolonization of citizenship would need to entail. Such interrogation tackles questions about whether decolonization is compatible with separation of foreign policy from internal politics and policies, and with keeping the former outside the realm of democratic politics. Based on critical Indigenous scholarship, the paper suggests that decolonizing citizenship would need to include, but also go beyond a mere extension of existing rights and freedoms to otherwise colonized and racialized groups; and to necessarily incorporate alternative and transformative visions.

ARAT-KOC, SEDEF* (Toronto Metropolitan University, Canada)

White Privilege and/or Contingent and Precarious Whiteness? Ukrainian Refugees in the 'New Cold War'

Since the early phases of the Russian invasion of Ukraine in Winter 2022, several media and academic sources have commented on the highly generous refugee policies towards Ukrainian refugees in an international climate that is otherwise unreceptive and even hostile toward refugees. Comparing the radically different policies and reception of Ukrainians with treatment of refugees coming from the Global South, especially from Syria and Afghanistan, most critical analyses have placed the emphasis on the 'whiteness' of Ukrainians. Finding this interpretation insightful in some ways but insufficient in others, this paper complicates the analysis, arguing that rather than simplistic and general notions of whiteness, references to whiteness of Ukrainians would be analytically accurate, useful and relevant only through contextualized, qualified and contingent interpretations of refugee policies at the intersection of geopolitics and political economy. Historically, the ambiguities of whiteness for Eastern Europeans were

partly transformed and further complicated during the Cold War. While the geopolitics of the post-Cold War and the 'New Cold War' helps to specify and clarify both the privileges and contingent limits of what 'whiteness' would mean for Ukrainians; the political economy of refugee flows reveal how refugee policies are partly informed by economic considerations treating some Ukrainian refugees as potentially highly skilled "talent" to be imported, and others as sources of highly exploitable, precarious care labour.

Towards Future Livespaces: Visions on the Power of AI to Antecipate

Deucalion debuts as a high-performance supercomputer engineered to tackle complex challenges such as numerical modeling, weather forecasting, and logistical optimization. Boasting a processing capacity of 10 million billion calculations per second, Deucalion is set to significantly enhance computational power across academia, industry, and public administration. The high-performance computing narrative is strongly endorsed by scientists and policymakers alike, who emphasize the transformative role of artificial intelligence (AI) in advancing modeling, forecasting, and data-driven computation.

This presentation draws on insights from social studies of science and time studies to critically examine the evolving societal role of AI, particularly its applications in anticipation and prediction. It explores how AI technologies, by enabling new forms of forecasting and anticipation, are reshaping daily social processes and redefining how individuals engage with both human and natural systems. These shifts invite reflection on long-standing questions about how AI is shaping we envision and prepare for future life.

Using key concepts such as promise, future, anticipation, and sociotechnical imaginaries, the presentation explores how these visions are being shaped, how scientists interact with them, and the critical role that social engagement plays in guiding AI's development. It also underscores the importance of debating a "technically and scientifically" driven Anthropocene approach, with an emphasis on how AI is deeply reconfiguring structural models and taken-for-granted expectations about time and temporality across multiple dimensions of social life, from social.

The analysis draws on data from an ongoing research project. This includes netnographic analysis of media sources, semi-structured interviews with AI experts in decision-making roles, and focus groups with citizens discussing the future life landscapes envisioned by AI technologies, particularly in domains in relation to the way people relate to the future (ever more *known* and *anticipated*).

Social Moralities in the Face of Pluralism, Individualization, and High Contingency

This paper addresses the moral dimension of social life, focusing on whether and how the notion of social moralities is still valuable to account for this type of social performance in plural, increasingly individualized societies, with porous institutions (Wuthnow, 2002) and high contingency (Joas, 2020, 2022). That is, if and how morality participates in the orientation of action in the face of social life, at a crossroads that, as several studies have shown, combines an increased relevance of self-orientation; an acute questioning and impulse to pluralize the principles and social logics that guide the relations and interactions among individuals and between them and institutions; and growing tendencies to generate discretionary relations with respect to social normative principles. This discussion is based on the results of empirical research for the case of Chile, which aimed to analyze the sets of normative ideals (values and normative principles) and customary components (coming from moral knowledge derived from social experience) that are part of the ordinary moral work of individuals. The main argument is that in societies such as today's, maintaining the relevance of the notion of social moralities implies moving away from the frameworks of socialization and from the perspective of strategies or interests in the study of actors' behavior. It also implies understanding the normative dimension of morality beyond the restrictive framework of good and evil and the good life, in order to include its plurality and to understand it outside a purely rational-argumentative conception of morality (Joas, 2000). It calls for a broadening of the focus on the moral performances of individuals, emphasizing their capacity for articulation and the fact that their moral achievements can be organized beyond a pre-established grammar. Finally, it implies restoring full weight to the customary dimensions of morality and its dynamics with the normative dimension.

The Relationship between Individuals and Politics behind the Erosion of Democracy

Analyses from various disciplines have increasingly converged for some time now, that democracy is under crossfire. The tensions facing democracy are often associated with a range of phenomena and processes, including post-truth, the weakening of political parties (and with them the mediation structures associated with this model), the influence of plutocracy in shaping political power, and the rise of authoritarianism. These are, among others, the factors perceived as challenges to democracy.

In the context of the question of the crisis of politics and its transformation within the liberal democratic model, this presentation examines one of its edges: the relationship between individuals and politics. This relationship has been key to understanding politics and is often seen as the most important foundation for its functioning. This has occurred by mobilizing concepts such as legitimacy, representation, adhesion, and/or citizen satisfaction. In this paper, we will present an analysis of the relationship between individuals and contemporary politics. We will draw on qualitative empirical research from two cases in South America (Chile and Peru). These cases were selected for their contrasting levels of institutionalization and political institutional strength, capacity for institutional political aggregation, and similarities in the economic model.

Based on our findings, we highlight how political imagination shapes the relationship with institutional politics and, consequently, participates in redefining, challenging, or reinforcing the fundamental principles that sustain liberal democracies. Finally, this presentation will ask about the possible new dynamics that might reconfigure the future of institutional politics in contemporary societies.

Intercultural Knowledge for Páramo Management: Indigenous and Feminist Perspectives on Socio-Ecological Dynamics in Ecuador

The proposed paper delves into how Indigenous perspectives, particularly those of the Kayambi people in Northern Ecuador, offer vital contributions to páramo management—high-altitude grasslands essential for water supply and carbon sequestration—during the Anthropocene. By examining the Kayambi's ecological knowledge and practices, this study challenges the dominant IPCC climate models, advocating for a revision that integrates Indigenous and feminist perspectives. It explores how these perspectives not only address environmental issues but also confront epistemic, social, and ecological inequalities rooted in colonial histories of land dispossession. Through feminist critical discourse analysis and ethnographic work, this study emphasizes the necessity of intercultural dialogue, addressing the marginalization of Indigenous knowledge in global climate models like the IPCC. Hence, this paper will discuss the intersection of Indigenous environmental knowledge, feminist frameworks, climate justice, and self-determination, advocating for the inclusion of Indigenous epistemologies in climate policy. It aims to contribute to a more equitable and inclusive climate justice discourse by rethinking conservation strategies through Indigenous and feminist lenses, amplifying the voices of Indigenous communities as essential actors in global biodiversity, conservation and sustainability.

Affect in Learning Relationships: Unravelling the Taste for Learning Among Young Students at School

Sociology of education has emphasized the significance of school in the construction of young people's subjectivities, educational aspirations and life trajectories (Archer et al., 2010; Reay, 2010; Tarabini, 2023). Indeed, the literature suggests that young people's relationship with learning and school is not neutral in terms of their social and cultural profile (Tarabini, 2021). Hence, a better understanding of this learner-learning relationship remains

imperative to unravel processes of social (re)production, especially in today's meritocratic, individualistic and neoliberal society.

This paper focuses on Bourdieu's (1987) notion of taste as a mediating factor to understand the unequal emotional relationship that young people develop with learning at school. Specifically, it analyses how *taste for learning at school* is constructed across different social and school contexts. As taste is still linked to the ideology of 'natural gifts' (Bourdieu & Passeron, 1977), uncovering the social mechanisms involved in its construction remains an important sociological task.

In this sense, taste is understood as a manifestation of the most personal and emotional experience of young people's relationship with learning. Placing taste as a central element opens up the black box of this concept and brings the affective dimension of learning processes to the centre of analysis. Besides, taste is conceived as a mechanism that allows us to understand the processes of classification and symbolic distinction that place individuals in a hierarchy within the school field (Bourdieu, 1987; Skeggs, 2004).

This paper presents findings from 12 semi-structured interviews with young people from two school contexts with different social and cultural profiles. In doing so, it delves into the emotional experiences of these young people and shows how the (dis)taste for learning varies greatly between school and cultural settings. It also explores how the taste for learning interacts and relates to the construction of young people's identities as learners.

Is Users Rating Becoming Overpowering? the Risks of Inappropriate Use of Digital Feedback

Digital technologies have made it easy to generate feedback on the performance of products and services. They have contributed significantly to reducing the information asymmetries between producers and consumers, between suppliers of public goods and users, and between politicians and citizens. It seems that Web 2.0 has enhanced the effectiveness of the "voice" evoked by Albert Hirschman in the 1970s. Is there a risk that the feedback provided and the connected rating may become too invasive, so much as to constitute a threat to the confidentiality of individual data? We distinguish between three types of feedback: 1) bottom-up feedback, occurring when many individuals evaluate and comment on the performance of organizations; 2) the transversal one, which happens when a series of individuals exchange comments, appreciations and reciprocal evaluations; 3) the top-down one, when organizations assign a rating to individuals. We finally offer some suggestions to moderate the existing risks.

What Next? Nations in the Technological Race through the 2030

This paper investigates the technological trajectories of nations, examining how their current specialization may influence their future technological leadership. By analysing patent data from the United States Patent and Trademark Office, we identify which countries are at the forefront of fast-growing technologies. Nations specializing in these emerging technologies are likely to experience accelerated economic growth, while others may struggle to maintain competitiveness. Additionally, countries tend to stick to areas where they have expertise, making it difficult to shift quickly to new technological fields. However, our findings partly challenge this view. Using predictive models, we project patent trends to 2030, suggesting that countries which were not technologically well-positioned in recent decades may improve their competitiveness, particularly through strategic policy interventions. We also show that future fast-growing technologies may differ significantly from the past.

Bridging the Divide: Tackling Barriers in the Anthropocene for a Healthier, United Future

The Anthropocene era, marked by unprecedented environmental and social challenges, calls for a deeper examination of the spatial nature of our divisions. To cultivate collective action across race, religion, and class, we must understand how to dismantle local barriers that hinder unity. Climate change is testing national social safety nets by driving migration, straining community resources, and prompting xenophobia. However, these crises also present political opportunities for social movements to challenge the status quo and mobilize activists in the fight for justice. What types of institutional arrangements and policy regimes best support this unity?

The pandemic highlighted the significance of the social determinants of health (SDOH), as defined by the World Health Organization (WHO), including access to quality healthcare, education, employment, and safe environments. Over the following decade, increasing data was collected and policies were legislated to address the SDOH. As a scholarly community, we are not lacking data; we now need to collaborate to determine which community services effectively protect health under institutional stress, which support trust in our institutions, and promote civic solidarity.

We provide an analysis of available global SDOH datasets that policymakers can access and introduce a new methodological technique that helps parse complex systems from the local to the national level. This approach aims to answer the critical question: what can be done to support an equitable and peaceful transition for receiving communities into healthier, more diverse forms of themselves, while avoiding the xenophobia and unrest associated with highly segregated societies?

Ethnography-Based Digital Communication for Grassroot Disaster Risk Reduction: A Gamified Mobile Application Design Process on the Prospective Istanbul Earthquake Preparedness and Response

This paper explores how Participatory Action Research (PAR) methodology can be involved in the gamified mobile application design to promote increased user engagement in earthquake preparedness. Our analysis is based on the findings of the state-funded project "Preparing Istanbul for Earthquake with Digital Gamification Design" in process under the current Cost Action Research Project titled the Grassroots of Digital Europe (CA21141). Gamification (Burke, 2016) uses game mechanics to "design experiences" that motivate people to achieve their goals. We aim to design a mobile gamification application for earthquake preparedness, which can be widely used in daily life in countries in the earthquake zone, including pre and post-disaster stages prepared with the Istanbul field study. Our goal is to create an earthquake preparedness mobile application using a community-based gamification design by analyzing the disaster experiences and views of the public in Turkey through social and cultural contexts. For this, we apply ethnographic research to provide an in-depth analysis rather than a pre-design customer journey query based on stereotyping for the pre-design user research. Throughout the paper, we will examine similar disaster communication media (Rasathane, Tatbikat, etc.) grounded on vertical communication structuring and information transfer by scientific or scholarly authorities in Turkey and worldwide. By addressing the impact of digital inequality, we will deduct the significance of the ethnographic approach as a digital communication strategy for user-centric and value-centric media design. Indeed, critical sociology's objective resides in demystifying relations of domination. We contend that both the ethnographic design process and the gamification of earthquake preparedness introduce an act of "democratization in technology" (Feenberg, 2002) that resists the reduction of the livelihood through technical integration of a wide range of life-enhancing values beyond the mere pursuit of the formal bias for the means-ends rationale of sociality, devaluating the sense of social labor.

Race, Gender, Sexuality and Security: The School Resource Officer (SRO) Program in Canada

School shootings and other violent crimes have led parents, policymakers, and other school stakeholders to prioritize safety. The School Resource Officer (SRO) program has gradually become an essential part of the security and disciplinary frameworks integrated into schools. Evidence suggests that the program has become a contentious social issue in Canadian society. It is criticized for classist, gendered, and racialized practices. In particular, students who identify as Black, Brown, and/or LGBTQIA2S+ face major issues vis-à-vis police presence in schools. Given the context, this study explores the experiences of various actors — students, parents, school administrators, teachers, and police officers — with the SRO program. It investigates the bureaucratic underpinnings of and policy directions regarding SRO programs across various jurisdictions in Canada. This is a multisite pan-Canadian qualitative study. The research began with a pilot in Edmonton, Alberta. Over 270 interviews were conducted with six sets of participants connected to the SRO program: (1) current and former students of schools, (2) parents, (3) current and former teachers, (4) school resource officers, (5) school board trustees and administrators, and (6) advocates for and against the SRO program. Three major themes emerged in our pilot study: SROs as trusted and source of security, SROs as ambivalent presence, and SROs as distrusted and a source of insecurity. Some students appreciate the physical presence of a police officer in a school vis-à-vis the threat of violence. Students also emphasize the importance of relationship-building among students, other actors, and SROs. The lack of information about the boundaries and duties of SROs was a constant concern among the students. Students who identify as BIPOC (i.e. Black, Indigenous and People of Colour) shared concerns about being disproportionately affected by police presence and disciplinary action. We also found an empirical need to focus on LGBTQIA2S+ and students with disability.

Challenges in the Social Reintegration of Deported Children and Adolescents to Guatemala from Mexico and the United States: Misalignment between Migration Policy and Local Capacities

This presentation explores the challenges Guatemala faces in reintegrating children and adolescents deported from the United States and Mexico. Using empirical data disaggregated by age, gender, educational level, and accompaniment status, we demonstrate how migration policies implemented in the Global North do not align with local capacities to support these populations. Through seven key indicators—age and gender distribution, educational level at the time of return, accompanied vs. unaccompanied status, access to social and educational services, adolescent employment rates, vulnerability post-return, and access to psychological care—we provide a comprehensive analysis of the reintegration process.

The presentation highlights the gaps between the intended outcomes of migration policies and the local realities in Guatemala, particularly focusing on minors' access to education and mental health services. Data analysis reveals significant challenges in integrating adolescent returnees into formal labor markets and preventing their return to vulnerable situations. Our research emphasizes the need for tailored migration policies that address specific age groups and gendered needs, offering evidence-based recommendations to improve policy coherence.

This study aligns with the objectives of the working group by offering a case study from the Global South, demonstrating the mismatch between policy frameworks developed in the Global North and their implementation in local contexts. Our findings contribute to a more nuanced understanding of migration governance, providing policy recommendations to bridge the gap between migration policy and the reintegration capacities of host countries like Guatemala.

This presentation will explore key combinations of variables, including **age, sex, and country of deportation** to identify demographic trends, **number of returnees by sex and year** to detect patterns over time, and **age and accompaniment status** to assess vulnerabilities among minors. These insights will provide valuable evidence to inform tailored migration policies and improve reintegration efforts for deported children and adolescents in Guatemala.

RC04-54.8

AREVALO, FIDEL* (Universidad de San Carlos de Guatemala, Guatemala)

Evaluating Student Perceptions of Inclusion: Social Equity Policies in Public Universities

This study explores student perceptions of inclusion in public universities, focusing on how institutional policies address the needs of vulnerable groups. The research aims to uncover the alignment between university governance strategies and social equity objectives through five key **qualitative indicators**: (1) **perceptions of inclusion and belonging**, assessing how students feel integrated into the academic community; (2) **satisfaction with financial aid programs**, evaluating the accessibility and sufficiency of scholarships; (3) **student involvement in community outreach programs**, measuring engagement with social projects; (4) **perceptions of faculty support for equity policies**, analyzing how students view the commitment of educators; and (5) **experiences with diversity initiatives**, reflecting efforts to foster intercultural dialogue within the university environment.

To assess the institutional response to vulnerable students, the study uses three **evaluation criteria**: the alignment between policies and students' lived experiences, the accessibility of services for marginalized groups, and the university's proactive communication about equity initiatives. These criteria provide valuable insights into how well the institutions address students' needs.

Since quantitative data on social inclusion is unavailable, **four proxy indicators** are used to strengthen the qualitative findings: (1) **frequency and scope of community outreach programs** led by students and faculty, reflecting the university's commitment to social engagement; (2) **number of student groups focused on diversity and inclusion**, indicating institutional support for these initiatives; (3) **faculty training programs on equity and inclusion**, showing efforts to embed inclusive practices; and (4) **student feedback on access to university services**, collected through surveys or focus groups, providing a proxy for the effectiveness of support mechanisms.

These proxy indicators offer indirect yet meaningful insights into the effectiveness of public universities in promoting inclusion and addressing inequalities. This research contributes to the understanding of governance in higher education, highlighting opportunities for institutions to align strategies with student needs and enhance social equity.

ARFINI, ELIA A.G.* (University of Milan, Italy)

Evolving Language, Persistent Marginalization: Trans Representation in Italian Print Media (2000–2020)

This study examines the evolution of narrative frames and linguistic trends in the portrayal of trans people and issues within mainstream news media over two decades (2000–2020). At the international level, literature on the topic (Capuzza 2019) has highlighted a general under-representation and a tendency towards a merely episodic treatment of the topic (usually linked to the reporting of hate crimes). However, some relevant gaps remain: existing research predominantly focuses on individual trans figures who are newsworthy as celebrities or victims (Amy-Chinn 2011; Barker-Plummer 2013) and is largely situated within Anglo-American contexts, with rare exceptions examining countries considered progressive in terms of LGBTQI+ rights (Åkerlund 2019). Notably, Italy holds the grim distinction of being the European country with the highest number of murders of trans people (TGEU 2020), yet remains underresearched. Addressing these gaps, the study conducts a systematic analysis of trans representation in Italian mainstream media, utilizing a corpus from leading national newspapers. Employing both qualitative and quantitative methods, it explores shifts in narrative frames, language use, and visibility of trans issues over time. Preliminary findings indicate a gradual decline in misgendering, reflecting an adoption of more accurate and respectful language. However, this positive linguistic trend coexists with persistently low visibility of trans issues and a continued prevalence of pathologizing and criminalizing frames that often focus on transphobic violence using sensationalist or gory tones. These findings suggest that despite improvements in language use, mainstream Italian media continues to marginalize trans experiences through limited and problematic coverage.

RC29-472.3

ARGUELLO, LIBERTAD* (Independiente, Mexico)

Urbanización Neoliberal y Control Territorial Criminal En Fraccionamientos De Tlajomulco De Zúñiga (Jalisco)

El trabajo plantea un análisis sobre el significado de la presencia de fosas clandestinas en fraccionamientos de interés social construidos durante los últimos 15 años en una zona de Tlajomulco de Zúñiga recientemente conurbada, debido a la expansión de parques industriales en la Área Metropolitana de Guadalajara.

Entre 2018 y 2022 han sido halladas múltiples fosas clandestinas en fraccionamientos que presentan altos porcentajes de viviendas deshabitadas, que forman parte de un gran proceso de construcción de viviendas de interés social (es decir, de bajo costo) bajo un esquema privatizado que ha resultado ser profundamente lesivo para quienes adquieren estas viviendas, pues una parte importante de estos fraccionamientos construidos a lo largo de todo el territorio nacional se encuentran en condiciones de gran deterioro, ubicados en zonas lejanas a las ciudades, rodeados por múltiples espacios intersticiales, con poca conectividad y escaso acceso a servicios públicos.

El análisis de estos fraccionamientos deriva de una investigación en curso sobre la distribución espacial de la violencia contra mujeres, niñas y adolescentes en municipios de Jalisco, realizada en 2023 a través de una estrategia interdisciplinaria multi-método que combina análisis de fuentes estadísticas abiertas, entrevistas a funcionarios públicos, observación etnográfica, análisis hemerográfico y cartografía feminista.

De este modo, a partir de un marco teórico socio-antropológico y feminista de la violencia se analiza la ubicación de fosas clandestinas en zonas habitadas de dichos fraccionamientos como dispositivos de disciplina y control territorial. Algunos resultados apuntan a diversas problemáticas derivadas del control territorial que ejercen células del CJNG en fraccionamientos como Chulavista, Lomas del Mirador y Villa Fontana Aqua, pero facilitadas por el propio esquema de urbanización neoliberal, que configura espacios de confinamiento para sectores populares considerados "desechables".

Negotiation of Whiteness Under the Orientalist Gaze: Towards Becoming a Middle Eastern Woman

Whiteness, as an ideological construct, takes on different forms across various geographical contexts (Shome, 1999; Arat-Koc, 2012; Razack, 2022). In this paper, I employ an autoethnographic research method to explore my personal negotiation with Whiteness. This negotiation began in my early years in Türkiye, where I grew up, and continues today in Canada, where I now live and work. In Türkiye, I identified as a Turkish woman aspiring to Whiteness. However, my experiences abroad have reshaped my sense of self, and I now identify as a Middle Eastern woman with no aspiration to Whiteness. I argue that the identity of a Middle Eastern Muslim woman was imposed on me through an Orientalist gaze. I am not suggesting that I fell victim to this imposed identity shaped by Eurocentric and Orientalist discourse. On the contrary, I have embraced my Otherness. My identity has become a political site to counter white supremacy, challenge Whiteness, and disrupt oppression (Badruddoja, 2022, p. 622).

To explore my identity transformation, I will frame my discussion within multiple spatial and temporal frameworks. I will start by examining the aspiration toward whiteness in Türkiye. When the Turkish Republic was founded, the elites of the new republic took on the role of "whitening" its citizens to "civilize" them. This pursuit of whiteness persisted into the 1980s, manifesting itself in different ways alongside Turkey's deeper integration into the global capitalist economy. Growing up in the 1990s, with the expansion of neoliberal policies, the concept "white Turk" emerged as a critique of white class culture within the context of a Middle Eastern country (Arat-Koc, 2028, p.391). Later, my migration to Canada has exposed me to the pervasive nature of white colonial violence, which prompted me to deconstruct whiteness and contribute to decolonial knowledge production.

ARIAS VÁSQUEZ, ALEJANDRA JIMENA* (Universidad Nacional Autónoma de México, Mexico)

Prácticas Extorsivas En La Ciudad De México

La extorsión es uno de los delitos que siguen impactando a la Ciudad de México (CDMX), no solo con su incremento anual, sino también con su transformación. A lo largo del siglo XX, las prácticas extorsivas se relacionaron con la policía, sin embargo, en los albores de la siguiente centuria, la extorsión presentó nuevas modalidades, como la extorsión telefónica. Posteriormente, con la mayor presencia de grupos de delincuencia organizada fuera y al interior de la capital, el delito se comenzó a ligar con estas organizaciones bajo la modalidad de cobro de derecho de piso.

La división entre extorsión directa e indirecta ha sido una forma en la que las autoridades identifican las modalidades de las prácticas extorsivas, no obstante, esta clasificación no es suficiente cuando en la Ciudad de México sigue aumentando la aparición de diversos patrones de este delito. Por tanto, para conocer estas modalidades cometidas en la capital es necesario identificar los actores que cometen el ilícito y cómo éstos se relacionan con actores de redes criminales. El contexto de inseguridad e incertidumbre, así como la aparición de nuevos "cárteles" son elementos propicios para hacer efectivo el pago, por temor a la amenaza, o bien, la aparición de un mercado de protección paralelo al proporcionado por el Estado.

Por tanto, el objetivo de esta disertación es:

- Reflexionar sobre la metodología para estudiar la problemática de las rentas ilícitas y extorsión en el plano nacional y local.

Este marco nos acercará a las formas de abordar los siguientes puntos:

- Distinguir y describir las características de los actores que realizan las prácticas extorsivas.
- Realizar un esbozo de tipología sobre las prácticas extorsivas en CDMX.

La presentación de este tema abonaría a la discusión sobre el *estado de la cuestión* de dicha problemática.

Medicalización Del Parto Vs Modelos De Parto Respetado En México. La Restitución De La Equidad En Salud a Poblaciones Vulnerables

Introducción. La salud materna continúa siendo una prioridad para los gobiernos del mundo. En la carrera por disminuir las muertes maternas y mejorar el desempeño de los sistemas de salud, se han implementado dinámicas de atención que lejos de ofrecer mejores resultados, derivan en resultados no deseados y aumentan la inequidad en salud. Procesos como la atención del parto se han vuelto en contra de las mujeres y sus hijos al centrarse en una serie de intervenciones que medicalizan innecesariamente este proceso, un ejemplo de ello es el aumento desproporcionado de cesáreas, que en México alcanzan el 48%. La industria de la salud ha llevado a entender el parto no como un proceso fisiológico natural sino como un proceso que requiere de la intervención e invasión del cuerpo de las mujeres. Ante esta problemática, han surgido movimientos sociales de resistencia que promueven modelos de parto respetado. **Objetivo:** Analizar cinco modelos de parto respetado que operan en zonas rurales y urbanas de México en los que se promueve la equidad en salud materna. **Metodología.** Estudio de casos múltiples. Se analizan las características de cinco modelos de parto respetado a través de testimonios de personal de enfermería que lidera procesos de atención y abogacía. **Resultados.** En los modelos presentados, el parto de bajo riesgo es atendido por personal de enfermería y partería. Para su implementación han generado estrategias como alianzas público-privadas, la búsqueda de subvenciones, atención gratuita o de bajo costo, participación de las mujeres en las decisiones relacionadas con su salud, respeto por los procesos fisiológicos, entre otros. **Conclusión.** Los modelos de parto respetado son una alternativa a la mercantilización y la medicalización del parto. La participación de la sociedad civil en estos procesos reivindica el papel de la mujer y reestablece parte de la justicia que les ha sido arrebatada.

Anticipating Green Hydrogen Futures: Exploring the Sociomaterial Production of a Green Fuel

This paper examines the enactment of green hydrogen futures in Chilean Patagonia. Complementing the literature on socio-technical imaginaries, we explore the role of anticipatory practices as a key operation by which certain energy futures and technological interventions around green hydrogen (GH2) materialize, while other alternatives are discarded. We explore how through these socio-material practices the value of this new fuel is staged and dramatized. Drawing on ethnographic fieldwork, interviews, and secondary material, we empirically study two energy anticipation practices of green hydrogen futures: GH2 technology fairs, and GH2 project prototypes and demonstrations. While the former materialize atmospheres of imminence and business opportunity where technological innovations, economic opportunities and public policies are realized in the present, the latter work as socio-material interventions that enable the value of this new fuel to materialize for different audiences. The article highlights three critical aspects of these anticipatory practices: the socio-material and situated dimension, the spectacle and representation of value, and the type of energy politics they entail for producing hydrogen futures. We conclude by discussing theoretical insights around the central role of materialities and practices for enacting specific forms of techno-optimist energy futures.

ARMEL TIESSOUMA THÉODORE, ZERBO* (University of
Lisala, Burkina Faso)

Youth and the Framing of the 2014 Popular Uprising in Burkina Faso

In mobilizing protesters for anti-government protests, the challenge of framing the socio-political reality arises acutely. In the case of Burkina Faso in 2014, protesters were moreover faced with a particularly long-standing regime—Blaise Compaoré had ruled the country from 1987 to 2014. Such a situation highlights the struggle for meaning via a contentious praxis of politics through the dissemination of frames (Benford and Snow, 2000; Contamin, 2010; Snow, 2011). In Burkina Faso, these frames were based on the distinctive moral logic between “them” and “us” to establish protest as a legitimate means for achieving social and political justice. Driven by civil society actors such as the Balai Citoyen collective, and disseminated especially via Facebook, this created an opposition against the state apparatus that had hitherto failed to materialize, let alone succeed in toppling the government.

The current paper highlights the biographies of certain members of the Balai Citoyen and emphasizes the latter's significance as a youth movement. It reflects an Internet users-focused narrative analysis of the protest on the collective's leaders experience of the protest combined with their biographies by Jaffré (2019).

The Balai Citoyen's activism intervenes in an academic context marked by a scientific debate on the globalization of the concept of youth (Philippis, 2018). Our present study is part of an examination of political protest praxis based on the framing of the concept “youth.” The paper argues that the aspect of age and generation was important to mobilize a population that had largely grown up under the rule of the Compaoré regime. It is based on ethnographic, archival and documentary data and utilizes the theoretical reference to Mannheim's “Problem of Generations” defined on the basis of the sharing of a common horizon within a generational whole under the action of a generational unit (Mannheim *et al.*, 2011).

RC25-409.3

ARMINEN, ILKKA* (University of Helsinki, Finland)
Epistemic Injustice in Institutional Interaction

Epistemic injustice has recently become an increasingly salient topic in humanities and social sciences. It refers to unfair treatment of individuals in their capacity as knowers. Miranda Fricker defined its two main types: *testimonial Injustice* concerns unjust deflation of a speaker's credibility due to prejudice (e.g., gender or ethnic stereotypes). *Hermeneutical Injustice* takes place when a group or category of people is put into a disadvantageous position in trying to make sense of their experiences (e.g., stigmatized groups).

Despite a wide and growing interest in epistemic justice, there are still relatively little detailed empirical studies on institutional practices or interactional behavior. In this presentation, some initial observations on epistemic (in)justice in talk and action in interaction in institutional practices

are offered. The study is based on ethnomethodologically inspired multimodal interaction analysis. Data is mainly video recordings in various institutional environments in Finland. The main institutional spheres are addition treatment and management of research organizations. The areas studied provide an encompassing spectrum of epistemic (in)justices in interaction.

Institutions may be seen as an arena for epistemic injustices, as institutional practices with their power dynamics are selective in enabling voices to be heard or marginalized. In that way institutions can be considered key modalities in purporting epistemic injustice by unfairly discrediting or excluding individuals from knowledge-building processes, reinforcing systemic biases and unequal access to authority. However, the relationship between institutions and epistemic injustices is extremely complex. For instance, in addition therapies confrontational practices bear many resemblances to epistemic injustice. Similarly, management (eventually) narrows down the views of the organization in a manner that may resemble silencing. Through details of recorded interactions, the presentation offers social practices observable amounting to a set of questions concerning justifiability of epistemic asymmetries. The presentation poses many questions but tries also show a direction toward answers.

ARMINEN, ILKKA* (University of Helsinki, Finland)

Is There Epistemic Justice in Imperfect World?

Epistemic injustice, drawing on Miranda Fricker, has become an influential example of injustice. It is composed of several types of unfairnesses. Testimonial injustice occurs when prejudice leads to an unfair assessment of someone's credibility (e.g., women or minorities being disregarded in discussions). Hermeneutical injustice refers to structural gaps in collective understanding, where certain groups are being marginalized and misunderstood (e.g., historically stigmatized groups struggling to convey experiences of discrimination). These concepts shed light on how knowledge and understanding are socially conditioned, reflecting and reinforcing inequalities.

From a sociological point of view, it would be highly relevant to define epistemic justice. Miranda Fricker tried to capture epistemic justice as being the fair treatment of individuals as knowers that would ensure their credibility and respect of their experiences, and countering biases that lead to testimonial injustice as well as addressing hermeneutical gaps that marginalize certain groups' ability to make sense of their experiences. However, in many respects Fricker's notion of epistemic justice is negative, i.e., it stands for the absence of epistemic injustice and sensitivity towards injustice allowing us to stay clear of epistemic injustice.

Fricker's epistemic justice seems to pose a parallel dilemma to that of a rational decision making. Decision making can proceed ideally if, and only if, the participants have shared knowledge, aims, and competence (and unlimited time). Then they can agree on optimal decisions. In the empirical part of the presentation, some examples of epistemic (in)justice in social interaction are presented. Social interaction shares the characteristics of bounded rationality so that the participants do not share the same goals, knowledge and unlimited time. If there were no external limitations, epistemic justice were easily realizable. But the sociological question is, is there epistemic justice in imperfect world? Different theoretical perspectives give different answers to what counts as epistemic justice.

Navigating Ruling Relations: Institutional Dynamics and the Slow Adaptation of Technology in Philippine Rice Farming

This study examines the institutional factors influencing the slow adaptation of technology in rice cultivation in the Philippines, employing Institutional Ethnography (IE) to explore how the family, state, and civil society shape farmers' practices. Approaching the research from the farmers' standpoint, it investigates how their everyday experiences are embedded within institutional power structures that govern technological adoption. While industrial-scale agriculture thrives in other countries, smallholding communities like Barangay Talangka in Sta. Maria, Laguna continue to rely on manual labor. By talking with the people—farmers, local officials, and community leaders—the study captures how technological transfer unfolds within the realities of rural life. Ruling relations, which connect farmers to state policies, market systems, and social expectations, play a key role in shaping these dynamics. Although the state's push for food security aligns with national development goals, agrarian reform laws that limit landholdings and lending policies that restrict capital access complicate mechanization.

Modernization policies promoting efficiency often conflict with the cultural and ecological realities of smallholders. In addition to fieldwork, the study reviews key texts such as agrarian reform laws, environmental regulations, trade policies, and agricultural subsidies to map the institutional landscape. Using IE, this research uncovers hidden connections between institutional policies and farmers' daily practices, revealing how seemingly neutral policies reinforce existing power structures. It highlights how IE's method foregrounds marginalized perspectives and shows the interdependence between institutional actors and local practices, offering insights into sustainable farming arrangements that balance technological change with social and ecological realities.

ARNAL, MAUD* (University California San Diego, USA)

Embodying Childbirth Pain to Fight Sexual and Reproductive Injustices

The recent mobilizations against obstetric violence as a daily routine of care as well as the #MeToo campaign have triggered a new wave of articulations of and conflict over sexual and reproductive injustices. We explore birthing sexual and reproductive injustices through the process by which embodied medical and technological advances in maternity care become accepted, contested or routinized. Used appropriately, they can be life-saving procedures. Routinely used, they are accused of social practices of oppression by transforming the experience of childbirth from a "physiological" process and family life event into a medicalized process with complications or surgical procedure. Based on a sociological comparative research focusing on the restructuring in health care work and its organization as a complement to public health policies in France and Canada, we analyze the development of an embodiment process of re-naturalization of childbirth pain as a way of resisting oppression and epistemic injustices (Cohen Shabot, 2021). Based on the analysis of written sources, as well as seventy-five semi-directed interviews and non-participant observations with health professionals, we argue that the analysis of the management of labor pain highlights how the situated negotiations of bodily knowledge opposing the "natural" to the "artificial" are reshaped by the actor's affects in order to build a shared, embodied "trust" knowledge of pain between birthing people, health professionals and public health policies. These processes open up new spaces of political resistance and negotiation of health and scientific knowledge, but also call into question the growth of the externalization and privatization of public health resulting in intersectional social inequities (e.g. chronic disease, treatment of pain's cancer, screening).

ARNAL, MAUD* (University California San Diego, USA)

Négocier Les Douleurs d'Accouchement, Une Voie De Résistance Aux Injustices Épistémiques ?

Les récentes mobilisations contre les violences obstétricales en tant que routine quotidienne des soins ainsi que la campagne #MeToo ont déclenché une nouvelle vague d'articulations et de conflits sur les asymétries de pouvoir entre les sexes. Nous explorons les asymétries de pouvoir entre les sexes à travers le processus par lequel les avancées médicales et technologiques dans les soins de maternité deviennent acceptées, contestées ou routinisées. Utilisées de manière appropriée, elles peuvent sauver des vies. Employées de manière routinière, elles sont accusées de pratiques sociales d'oppression en transformant l'expérience de l'accouchement d'un processus « physiologique » et d'un événement de la vie familiale en un processus médical avec des complications ou relevant d'une procédure chirurgicale. À partir d'une recherche sociologique comparative portant sur la restructuration du travail médical et des politiques de santé publique en France et au Canada, nous analysons le développement d'un processus de re-naturalisation des douleurs de l'accouchement comme moyen de résistance à l'oppression et aux injustices épistémiques (Cohen Shabot, 2021). Fondée sur l'analyse de sources écrites, ainsi que de soixante-quinze entretiens semi-directifs et d'observations non participantes avec des professionnels de santé, nous soutenons que l'analyse de la prise en charge médicale et sociale des douleurs d'accouchements met en évidence la manière dont des connaissances situées se négocient en opposant le « naturel » à « l'artificiel » par un remodelage des affects des acteurs afin de construire une connaissance expérimentale et partagée des douleurs entre les femmes accouchant, les professionnels de santé et les politiques de santé publique. Ces processus ouvrent de nouveaux espaces de négociation et de consommation des savoirs tout en remettant en question les processus d'externalisation et de privatisation de la santé publique, entraînant des inégalités sociales intersectionnelles.

Mitigating Food Waste: Governing and Integrating a Contested Field

Sustainability challenges give rise to new fields where organizations debate and contest the best ways to tackle specific issues. Food waste, whose reduction and prevention are on the sustainability agenda and the focus of our contribution, is a contested issue that sparks tense field formation. However, a stable and consensual field is crucial for achieving desired sustainability outcomes, bringing the topic of field governance to the forefront.

While field governance refers to a combination of public and private, formal and informal systems that exercise control within a system (Scott, 2008), Fligstein and McAdam (2012) highlight the role of governing units that orient and guide activities within the field by creating a level playing field for its inhabitants. Conceptually building on this, and given the view that sustainability challenges are primarily addressed by private actors and soft law, alongside researchers noting a resurgence of governmental involvement, we ask: What kind of organizations govern the food waste field—public, private, or both? Additionally, considering the heterogeneity of these fields, how do these governing units connect actors and create field stability?

We utilize qualitative data from interviews and quantitative data from a survey to conduct a categorical-descriptive examination of the organizations involved, identifying both private and public governing units. We then investigate how the field is governed and structured through multiple correspondence analysis and a block model of exchange relations among these organizations. Our analysis reveals a tension-filled relationship between an older, industrial-rural block and a younger, urban block, the latter also including the governing units. Notably, our findings indicate that it is primarily public governing units that hold the field together through a process we call sedimentation. This process layers older organizations from the rural side with younger organizations from the urban side, each employing distinct measures to address the food waste issue.

The Swiss Refugee Parliament: Contesting Otherhood to Gain Political Voice

The call for meaningful participation of refugees in democracies and decision-making processes is intensifying. This shift, moving away from the traditional model of refugee support provided by nonprofit organizations to one centered on self-help initiatives led by refugees, has sparked the formation of new organizations that aim to empower refugees by giving them a voice and enabling their participation.

In this context, the Refugee Parliament was established in Switzerland in 2021. In an expressive way, this parliament connects refugees while also seeking to exert influence on politics and public opinion. In doing so, it adheres to principles of refugee autonomy, solidarity, and responsibility, positioning itself as an alternative organization.

The literature on alternative organizations highlights that organizational alterity forms a normatively desired counterpoint to a dominant, conventional model, suggesting that organizations could be constructed differently from what is commonly known and expected. However, neo-institutional theory has revealed the influence of shared expectations and common beliefs that drive organizational homogenization.

Using qualitative data, I examine the role of institutionalized beliefs pertaining to organization in the early formation of the Swiss Refugee Parliament. While the Refugee Parliament initially appears as a counterpoint to conventional parliaments, findings reveal that it mimics traditional parliamentary structures, adopting rationalized and hierarchical organizing methods, which are commonly considered atypical for alternative organizations, as a necessary means to achieve a political voice. Yet, the Refugee Parliament offers an unsettling counterpoint to traditional nonprofits by rejecting the institutionalized and well-esteemed notion of "otherhood"—that is, advocating for the interests of other actors (Meyer 2010).

My contribution sheds light on an alternative organization that constructs its alterity by challenging the prestigious concept of otherhood prevalent in the nonprofit sector. Organizing refugee participation, therefore, can be seen as a contested rejection of the institutionalized belief in advocating for marginalized others.

Social Representations and Discourses Around Domestic Work: Who Remembers the Precarious Migrant Workers?

This study, based on the theory of social representations, analyzes discourses surrounding domestic and care work in Spain, identifying which aspects are acknowledged and which are ignored. Specifically, the research aims to explore how Spanish society includes or excludes immigrant women in its representation of domestic work. Through semantic analysis (IRaMuTeQ, Descending Hierarchical Classification) and a quasi-representative sample (N=1200), the study examines the discursive classes that emerge among the population and the ideological and sociodemographic profiles that reproduce these discourses.

Class 1 describes the work as “exhausting and sacrificial,” highlighting the effort required. Class 2 adopts a critical perspective, emphasizing precariousness, the feminization of labor, and the essential role of immigrant workers; this view is typical among young feminists with egalitarian values. Class 3 focuses on the needs of dependent people (children and the elderly) but overlooks the caregivers’ working conditions. Class 4, more common among older conservative women, sees domestic work as monotonous and does not question its precarious nature or the gender implications involved. Class 5 emphasizes emotional well-being and reinforces traditional gender roles, a view significant among men of higher social status.

The results are discussed within the framework of the Protestant work ethic ideology and discourses that render precariousness invisible. The results indicate that gender, age, and social and ideological values influence perceptions of domestic and care work. Only a specific profile—young feminists—directly addresses the precarious situation of immigrant workers. The study discusses the need to promote critical discourses to foster cultural change toward dignified work and an inclusive approach that integrates the rights of both dependents and their caregivers.

Cultural Diversity and Artificial Intelligence

The speed of disruptive technological innovations, such as advanced robotics, genetic engineering, virtual reality or artificial intelligence, together with the accelerating territorial globalization of these technological changes, raise crucial questions about what will happen to cultural diversity. The technological imaginary seems, at first sight, to leave little space in the future for multiple cultures to reproduce and interact with each other. Is it feasible that the transformations of life in society that technological acceleration is generating, coexist with the diversity of cultures? What degrees of freedom are there for cultures that question this acceleration of artificial intelligence to be heard? From the other side, how are diversities made visible by those who develop artificial intelligence? Sheila Jasanoff speaks of three types of traps that we must think about when approaching this problem: the trap of inevitability, the trap of singularity and the trap of speed. The philosopher, a specialist in the history of science and technology, questions these three traps because, she argues: AI is constructed, not determined and progress is not assured; there are multiple ways of understanding intelligence that AI does not contemplate; and speed is not a sign of the best, but slowness can be a good advisor when it comes to such profound disruptions. This paper will discuss whether or not the advance of AI tends to homogenize the diversity of cultures.

AROCENA, FELIPE* (Universidad de la Republica, Uruguay)

What Does It Means to be Human?

In what ways what it means to be human is being reconfigured as a consequence of recent changes brought about by AI and technological acceleration? In the millennia-long journey of evolution, homo sapiens acquired the physical characteristics that today define them as a species. Although biologically we sapiens are, with minimal genetic differences, all the same, historically and culturally there have been very different ways of understanding what makes us human. In this work we will analyze how advances in artificial intelligence and genetic engineering radically challenge us as to what makes us human. Specialists in neuroscience and in the study of brain-computer interfaces (BCI), think that we are already redefining what it means to be human because every implantation we make transforms our brain, and the notion of humanity is changing radically. From the perspective of Homo sapiens, we are still a species, but we have begun to direct our own evolution. Those who integrate artificial organs, sensors, magnets or multispectral cameras are reconfiguring their sensory system to process new information. This is no longer a typical Homo sapiens brain and we are already on that path. In addition to the potentiality of AI to transform ourselves or render ourselves obsolete in relation to new intelligent systems, there is another lane that is potentially as disruptive as the previous one: genetic engineering enhanced by AI. The advances in this line have been just as extraordinary, and the future possibilities radically unique. With the development of CRISPR the biological limits that for tens of thousands of years defined sapiens are being transcended for the first time in their evolutionary history. Sapiens now has in its hands the ability to create from within itself new species of Homo, or to destroy it completely.

Aging in Sustainable Cities: A Checklist for Integrating Older Adults into Urban and Social Development

The rapid growth of ageing populations globally presents significant challenges for urban environments, social systems, and sustainability strategies. In Italy, where life expectancy is among the highest in the world, addressing these challenges is particularly urgent. While much attention has been given to sustainability, there has been limited focus on how ageing populations interact with rapidly changing social and urban environments. This study seeks to bridge that gap by developing a checklist that local policymakers can use to integrate older adults into urban planning and social development, promoting sustainable and inclusive cities.

Grounded in Bronfenbrenner's ecological model, which examines the interconnected influences on individuals, this research applies a systems-thinking approach to aging. The Delphi method was employed to gather expert input across disciplines, identifying key areas such as reducing inequalities, improving well-being, fostering innovation, and enhancing the active participation of older adults in urban settings. Data collected through two rounds of surveys and interviews were used to refine the checklist, which addresses political priorities and actionable interventions.

By adopting this checklist, local policymakers can create more inclusive and age-friendly urban environments that support the well-being of older adults while promoting social equity and sustainability across generations. This research emphasizes the need for interdisciplinary approaches to address the complex challenges posed by an ageing society in an evolving urban landscape.

ARORA, SHUBHDA* (City, University of London, India)

Decolonising Environmental Health: An Inward-Looking Anti(Caste) Framework

While environmental hazards are considered natural, environmental vulnerabilities are created and reinforced in society through pre-existing structures of power and privilege. I examine South Asian experiences, strategies, and practices related to environmental health. Drawing on decolonial theory, I critique the dominant health paradigm and its first world ‘white focus’ and discuss how creating health equity relies on breaking down

power structures that sustain inequalities. My research discusses how caste disenfranchises marginalised people from participating in decision-making that would directly impact their environmental well-being. Specifically, I will dwell on the experiences of caste-marginalised communities and their acceptance, adoption, assimilation, rejection, and resistance to health decisions within the changing ecology of the area. Through focussing on caste inequalities and other socio-cultural realities that shape the health outcomes of individuals and communities within South Asia, I not only critique the first-world narratives of environmental health but further challenge the dominant narratives within South Asia, which mostly emerge from a privileged caste positionality. Consequently, this research highlights the importance of recognising Indigenous knowledge systems and the agency of marginalised communities in their healthcare decisions. Therefore, I argue for an 'inward-looking' South-Asian perspective to conceptualise environmental health as a response to the disproportionate impact on marginalised populations.

Through adopting a narrative-ethnographic approach, the study delves into the concept of resilience to understand how caste marginalised communities in South Asia adapt and respond to health challenges, highlighting the importance of adaptive capacity and community empowerment. Finally, it considers the multidimensional nature of well-being, emphasising the need for a holistic approach that integrates caste dimensions of health in the South Asian context. Overall, this chapter contributes to a deeper understanding of the complex interplay between environmental health and the social realities in South Asia, offering theoretical and practical insights for understanding environmental health outcomes in the region.

ARORA, VIBHA* (Indian Institute of Technology Delhi, India)
Sikkim's Hydropower Projects As Monuments of Disaster

The global narrative on renewable power has been advocating a shift towards "green" and sustainable hydropower potential of numerous rivers in India's North-east and Himalayan Sikkim is a classic study of how disasters and hydropower are intimately connected. October 2023 marked a turning point for Chungthang Town in North Sikkim, India when GLOF in Lhonak broke the Teesta III dam and wiped the majority of the town and this disaster had followed inhabitants slow-recovery from the 2011 Great Himalayan Earthquake. Both these catastrophic events were not unforeseen or unpredictable and several of my earlier writings had alluded to these disasters while the Government of India, Government of Sikkim and private developers were investing and dreaming of hydro-rupees and ignoring the fragile ecology and hydro-social connections of communities residing here. In this paper with my 25 years long association with the landscape and some discussions with the affected communities, I try and focus on how a prevention of disaster and acknowledging a disaster mitigation perspective is critical to India's ambitious hydropower policy and climate adaptation measures.

Canada's Health Care System: The Promises and Challenges of a Federated System

Canada's universal health care system is often portrayed as a single entity internationally. The reality on the ground is more complex, however, given the constitutional division of powers between the federal government and the 13 provinces and territories. The federal government's leadership is indeed limited to setting priorities through financing and agreements, which has historically left a substantial amount of autonomy for the provinces and territories in determining the breadth of services covered and in implementing delivery models. As in many other jurisdictions, the COVID-19 pandemic exposed weaknesses in Canada's health care system, with some of these arising from historical legacies of this federated health care system. Nevertheless, Canadians have generally fared well compared to similar countries, though this likely owes more to their trust in institutions rather than the system's efficiency. The objective of this case study is to descriptively and analytically present the promises and challenges of a federated health care system, drawing on Canada's health care system. First, we describe the major features of Canada's health care system relating to its historical development, organization, regulation, and financing, with particular emphasis on the federal government's role. Within this backdrop, we then shed light on previous and ongoing policy reforms in Canada. We draw on cases where the federal government initiated policy reforms or where federal leadership was championed, and others where a federated system implied challenges with sub-national entities. In particular, we draw on reforms related to medical assistance in dying, public coverage for pharmaceuticals, long-term

care, intergovernmental collaboration, and the response to the COVID-19 pandemic. This analysis will encourage reflection on the sustainability of a federated system to address future challenges and opportunities on matters related to health care, in Canada and abroad

ARREDONDO, EMANUEL* (University of Valparaiso, Spain)
Teachers and Educational Inclusion in Chile: Resistance and Tensions

Chile is globally recognized as one of the leading countries in implementing large-scale neoliberal reforms. In this context, education was an area that underwent profound transformations, including the introduction of vouchers as a form of financing and the promotion of competition among schools based on their performance in national standardized assessments. As a result of this process, students with special educational needs, learning difficulties, or behavioral issues were systematically excluded from schools with better academic outcomes. In 2015, a series of reforms were initiated, most notably the Inclusion Law, which seeks to break with the neoliberal orientation and the exclusion of students. Through a qualitative inquiry, involving 29 in-depth interviews with school teachers, this study explores the resistance of educators toward students entering schools as a result of the Inclusion Law, who can no longer be excluded. The findings reveal that while inclusion is perceived as an ideal and necessary goal, teachers express strong resistance toward students with learning difficulties and special educational needs, as they are seen as hindering the progress of higher-performing students and impeding the achievement of good results in national standardized assessments. Teachers' discourse reflects the ongoing expectation that students should adapt to the school environment, conforming to the ways in which the school expects them to learn and behave within the classroom. From this perspective, inclusion is a desire, an aspiration, but remains far from becoming part of the school cultures, largely due to the persistent neoliberal culture that prioritizes competition, individualism, and the attainment of results over the well-being and inclusion of all students.

Consecuencias De Las Reformas Educativas En La Educación Superior Multicultural Japonesa, Una Revisión En La Última Década.

Durante 1980, Japón comenzó su inserción en el mercado global impactando en la educación superior. En 1983, el Partido Liberal Demócrata tomó cargo del gobierno y estableció una serie de reformas neoliberales que promovieron la internacionalización de la educación superior. Un 80% del alumnado está en el sector privado, por lo que tales políticas han repercutido en la capacitación sobre las competencias interculturales en un entorno altamente globalizado. El objetivo es examinar las consecuencias de las reformas educativas entre las décadas de 1980 a 1990, y el análisis de su impacto en las políticas de internacionalización educativa comprendido del 2000 al 2022, con base en la observación de las dimensiones de interculturalidad en los programas internacionales en las universidades privadas de Japón. Resultados: La interculturalidad es un proceso y actividad continua. El accionar social favorece dinámicas de intercambio cultural que permitan implementar espacios de diálogo. La interculturalidad en la educación japonesa, es una política consciente, y es imperativo que la sociedad adquiera un conocimiento previo de las dinámicas de sí misma. Conclusiones: La política del mosaico en la educación japonesa promueve el mantenimiento y la preservación de los valores culturales de los inmigrantes y sus descendientes; ésta se ha implementado para reformar al modelo educativo multicultural hacia un enfoque intercultural. Las estrategias educativas que buscan promover la inclusión y la participación, garantizan que las diferencias culturales sean reconocidas y celebradas en el sistema educativo. Esto contribuye a la cohesión social y a la vitalidad de la sociedad civil; las poli-identidades culturales establecen un marco legal y educativo que promueva el pluralismo cultural como un valor central de la sociedad. Así, la educación intercultural es comprendida como la formación en espacios destinados a la enseñanza fomentando dinámicas inclusivas, propiciando una sociedad justa y equitativa en el marco de la diversidad cultural.

RC04-67.1

ARSENDY, SENZA* (The University of Melbourne, Australia)

Mismatch As a Strategy: Working-Class Youth and the Precarious Labour Market in Indonesia

Unemployment is a significant issue faced by Indonesian youth. According to our national data, Indonesia's youth unemployment rate (46 per cent) is substantially higher than the global average (17 per cent) (Badan Pusat Statistik, 2023; World Bank, 2023). Young people living in urban contexts constitute the majority of this unemployed group (Badan Pusat Statistik, 2023). To address the youth unemployment problem, the Indonesian government has placed a significant emphasis on vocational schools. Over the last decades, a number of policies have been introduced by the government to improve both quantity and quality of Indonesian vocational schools. Despite being government's priority, vocational graduates continue to contribute the most to the national unemployment rate (Badan Pusat Statistik, 2020). Previous studies also indicate that graduation from vocational school does not seem to increase the employment opportunity of vocational graduates (ACDP, 2013; Chen, 2009). Focusing on vocational graduates in Indonesia, my research seeks to understand how young people navigate the disconnection between their schooling and employment experiences. I did semi-structure interview with 40 vocational graduates about their transitions from vocational schools to the labour market. Due to the limited number of jobs, I found the significant number of young people who work in the fields that are different from their training in vocational schools, the phenomenon usually refers to as job mismatch. Rather of viewing career mismatch as a passive response to the precarious condition in the labour market, my research highlighted it as an active strategy used by young people to navigate their transitions during uncertain times. This finding contributes to existing debates in sociology regarding the role of agency and structures in youth transitions.

ARSENDY, SENZA* (The University of Melbourne, Australia)

Navigating Precarity in School-to-Work Transitions: The Experiences of Working-Class Youth in Indonesia

Over the last decades, the way young people move from school to work has changed significantly. Education no longer guarantees a pathway to employment. In Indonesia, despite the fact that today the younger generation has a higher education level than their parents, the country's youth unemployment rate is extremely high. By engaging critically with Bourdieusian framework, my research attempts to understand how youth from low-income families navigate their post-school aspirations. My PhD project focuses on vocational graduates in Indonesia. They are not only dominated by youth from low-income family, but they are also the largest unemployed group in Indonesia, making them an appropriate case to study how young people respond to disjuncture between schooling and employment. Fieldwork for this project was done in the first semester of 2024. I conducted semi-structured interviews with 40 vocational graduates, aged between 20-25. Most of my participants work in service-oriented occupations with precarious working conditions (short-term contract, low salary, long working hours), while some of them are unemployed. Not only is my project useful to unpack the struggle and strategies young people use to navigate the rapid change in their transitions, but also to give insights on how they make sense of their experiences within the context of a disconnect between their vocational degree and employment experiences (career mismatch). Furthermore, a case study of vocational graduates in a Global South will allow me to bring Southern perspectives to existing debates in youth sociology about navigating social reproduction in the face of social change.

Two Diverging Trajectories of Critical Theory in Urbanism

The paper interrogates two diverging trajectories of critical theory in urban theory and planning theory. While critical urban theory retains the "emancipatory strike" of first generation Critical Theory and the core idea of "the critique of critique" as integral to emancipatory praxis to change the world, planning theory, following the "communicative turn" in planning, forges "techno-manegerial consensus building machine". Frankfurt School Critical Theory, especially its Marcusean form, was rearticulated with Marxist political economy, Henry Lefebvre's spatial theory and critical realism by critical urban theory. The latter seeks emancipatory and radical transformative alternatives to capitalist urbanisation under the conditions of the intensified capital-imperialism, ongoing onslaught of new forms and multiple expropriations

and enclosures, proliferation of operational geographies, restructuring of state and capital and the deepening of ecological crises at all, from the local to planetary, scales. After the "communicative turn" in planning theory, on the other hand, strong critical and Marxist critiques and debates of the 1970s and early 1980s have been relegated to oblivion and the mainstream has been dominated by "techno-scientism, pragmatism and ecological urbanism". Far from interrogating and problematising the broader structural context of capitalist urbanisation processes and also unevenly distributed socio-spatial and material outcomes of planning practice, which critical and marxist approaches wasted too much effort to explain and struggle against, the mainstream planning quintessentially promoted incrementalist, entrepreneurial or "green" urban practices. Along with techno-scientism and ecological urbanism that found more and more room in planning theory and practice, "communicative planning" came to alliance with a kind of pragmatism, and has been occupying itself with the questions on the (negotiated) role of planners, formal, discursive and processual aspects of planning, participation, governance, and so on. The paper suggests that current contradictory and uneven planetary urbanisation processes entail a re-convergence of urban theory and planning theory.

Intergenerational Housing Inequalities in Europe

This paper presents early findings from the comparative project "Transformations in Housing and Intergenerational Contracts in Europe (THICE)". The overarching aim of the project is to deepen the understanding of how housing wealth is reshaping intergenerational relationships in Europe and to explore socially just solutions. Increasing housing inequalities with growing concentrations of wealth among homeowners, especially older ones, and diminishing access to affordable housing, especially among younger adults have affected European societies in recent decades. At the same time, there has been a revival of family dependencies and intergenerational transfers that sustain welfare and life-course transitions for younger generations. Intergenerational support, both financial and in kind, has increasingly centred on housing with, for example, rising adult co-residence with parents and family assistance for people buying their first property. This marks a profound shift in the intergenerational contract.

With the paper presentation we focus on early descriptive findings from Europe. We draw on existing datasets to map intergenerational housing relations across Europe. While we use existing aggregate indicators such as 'young adults living with their parents' (e.g. Eurostat), we complement these with new aggregate indicators based on the Household Finance and Consumption Survey (HFCS), Gender and Generations Survey (GGS) and Survey of Health, Ageing and Retirement in Europe (SHARE). These datasets will provide further insights into issues like the type of housing transferred (e.g. house/apartment), the housing value, the ratio of inheritance and inter vivo housing transfers, etc. The descriptive mapping of these intergenerational housing transfer patterns will be supported with GIS analytics to visualize spatial disparities and distributions.

Overall, our paper will provide a comprehensive overview of intergeneration transfer patterns around housing. These insights will be critically discussed in light the of welfare and housing regime literature and will facilitate further in-depth comparative case studies.

The Tensions of Trade: Sending States, Brokers, and the Market in Labour Migration

This paper explores the complex relationship between sending states and the market in the context of labor migration. Specifically, it examines how labor-exporting states navigate the dilemma of commercialization and de-commercialization of migrant labor through interactions with market actors such as commercial brokers or intermediaries. The paper uses data from qualitative research conducted in one of the most significant labor-exporting countries in South Asia—Nepal. While sending states depend on these actors to maximize remittance flows and manage unemployment, they also seek to distance themselves from the market as moral hazards emerge from their involvement. Over the decades, state-market relations have evolved to reflect the perpetual dilemma faced by the state in commercializing migrant workers and the potential risk to migrant welfare in the involvement of market actors. Using process tracing, this paper examines one specific policy change in

the Nepal-Japan migration corridor that best captures such a dilemma. It explores how a G2G (government-to-government) agreement signed between the countries to facilitate the migration of SSW (Specified Skilled Workers), originally designed to exclude “morally corrupt” market actors, transformed into a B2B (business-to-business) model. Oscillating between delegation of migration management to the market and exclusion of the market from the facilitation and governance of migration, a longitudinal perspective that this paper adopts helps explain the constant tension between commercialization and de-commercialization experienced by sending states. The paper also assesses the role of the market in influencing state policy and demonstrates the power of market actors in creating, channelling, and maintaining migration corridors. This study sheds light on the moral and political challenges faced by labor-exporting states in their reliance on, and regulation of, commercial brokers and contributes to our understanding of sending state regimes.

'Managing' Welfare in Cross-Border Migration: The Case of Nepal

As migrant workers cross borders, their entitlement to social protection and their ability to mitigate risks pertaining to mobility and employment abroad comes into question. This paper brings together recent scholarly work on the question of social protection of migrant workers and examines how migrant sending states either facilitate or deny access to welfare under the façade of ‘management’. Developing our existing knowledge of TSP (transnational social protection), we argue that the question of social protection needs to be understood in the backdrop of the regime of migration governance of which it is a part of. The post-cold war, neoliberal regime of ‘migration management’ mobilizes non-state actors to produce and sustain ‘desirable’ forms of mobility. In this context, this paper makes the conceptual contribution of ‘welfare management’ as a neoliberal strategy of dealing with the question of social protection and welfare of transnationally mobile workforce. Informed by ethnographically informed qualitative research conducted in Kathmandu, Nepal, I show how under the current regime of migration governance, the traditional state-citizen relationship undergoes reconfiguration. From putting the onus of social protection on the migrants through selective information dissemination, to using the logic of reciprocity and deservingness to provide welfare to specific migrants, the Nepalese state uses a number of strategies to manage welfare instead of granting it unconditionally. This case study, therefore, contributes to our understanding of how migrant welfare services and provisions act as tools of migration control and how ‘management’ of welfare does not eliminate social inequality but merely redistributes it.

Culture Matters: Integrating Cultural Context in African Health Policy for Sustainable Well-Being.

Health policy in Africa cannot be effectively formulated or implemented without acknowledging the significance of cultural context. Across the continent, health practices, beliefs, and behaviours are deeply embedded in local traditions, religious faiths, and indigenous knowledge systems. These cultural frameworks shape how individuals perceive illness, respond to treatment, and engage with healthcare services. However, many modern health policies in Africa still lean heavily on Western biomedical models, often neglecting the socio-cultural realities that influence health outcomes. This gap between policy frameworks and lived experiences contributes to challenges such as poor healthcare utilization, mistrust in public health interventions, and resistance to treatment. This paper argues for a culturally responsive approach to health policymaking, one that recognizes the plurality of African contexts and integrates cultural, religious, and spiritual dimensions into the policy process. It examines case studies from various African regions where collaborative efforts between biomedical and indigenous systems have improved healthcare access, treatment adherence, and health literacy. Particular attention is given to maternal health, mental health, and chronic disease management, where culturally sensitive policies have shown promising results. Ultimately, the paper advocates for a participatory model of policy formulation, involving traditional healers, religious leaders, and local communities alongside medical professionals and policymakers. Such an approach promotes trust, enhances healthcare equity, and ensures that policies resonate with the values and beliefs of the populations they serve. By foregrounding culture in health policy, African nations can design sustainable health interventions that not only address disease but also foster well-being and resilience in diverse cultural contexts.

Intersections of Health, Religion, and Spirituality in Sub-Saharan Africa: An Examination of the Complex Pathways to Well-Being

In Africa, especially in the Sub-Saharan region, health and well-being are deeply intertwined with religious beliefs, spiritual practices, and cultural traditions shaping individual and communal lives. This intersection reflects a complex landscape where biomedical approaches to health often coexist with indigenous, religious, and spiritual healing systems, which ultimately influence health behaviours, care-seeking patterns, and perceptions of healing. Religion, whether in the form of African Indigenous Religions, Christianity, Islam, or other spiritualities, plays a significant role in shaping people's perceptions of illness, wellness, and healing. From faith-based healthcare institutions to traditional healers and community rituals, these diverse frameworks influence not only the treatment of diseases but also preventive care, mental health, and community resilience. This complex relationship is not static, but a reflection of historical dynamics, including the impact of colonization, missionary activities, and globalization, which have altered the traditional health landscape on the African continent. This paper examines the interstices where these domains intersect, focusing on the challenges and opportunities for healthcare delivery and policy. Drawing on case studies from diverse African regions, it examines how religious institutions, and spiritual leaders serve as critical nodes in health promotion, mental health care, and disease prevention, particularly in contexts with limited biomedical infrastructure. Furthermore, it reflects on how spiritual beliefs shape experiences of illness, death, and healing rituals, often complementing or contesting biomedical paradigms. By highlighting both synergies and tensions among these fields, the paper calls for a holistic framework that integrates religious and spiritual perspectives into public health strategies, fostering culturally responsive healthcare systems. Understanding these complex pathways to well-being is essential for designing inclusive health policies and practices that reflect the realities of African societies.

Associations between Academic Performance and Mental Health and Well-Being Among Cambodian University Students

University enrollment in Cambodia is limited to a small number, approximately 14%. However, many university students in Cambodia also suffer from mental health problems. Are there really significant associations between mental health and academic performance among university students in Cambodia? The relationship may differ depending on demographic and psychosocial factors.

We examined these questions using data from 827 students surveyed at five universities in Cambodia. In this study, students assess their own academic performance (rated on a 5-point scale, with higher scores being better). The correlation between K6 (over 9 are suspected mood and anxiety disorders) and self-assessment of academic performance (SAP) was 0.89 (Odds Ratio, OR, 95% CI: 0.82-0.96), indicating that students with poor mental health had lower self-assessment of their grades.

Regarding the relationship between K6 and SAP, the OR of suspected mood and anxiety disorders was 0.93 for male students when normal was used as the reference, which was not significant, but was 0.88 (0.81-0.97) for female students, showing that the relationship differs by gender. Similarly, for students in the economically disadvantaged group, the relationship between the two was OR=0.82 (0.71-0.95), while for students in the average or above group, the relationship was not significant. Looking at whether students skipped meals, no relationship was found between K6 and SAP for students who skipped meals, while for students who did not, a relationship between mental health and academic evaluation was found with OR=0.89 (0.81-0.98). In the first place, the former had lower SAP ratings than the latter. For

students with low levels of general trust, the OR was 0.89 (0.80-0.99) and there was a significant association between K6 and SAP, but this was not significant for students with medium or higher levels of general trust.

What phenomena can be observed in relation to indicators of well-being?

Gender Differences in Mental Health and Well-Being Among Cambodian University Students.

Cambodia experienced civil war from 1970 to 1993. In particular, those who had received higher education during the Khmer Rouge period were massacred and the education system was collapsed. Since then, with the support of many countries, Cambodia is in the process of social reconstruction. However, Cambodia's enrollment rate in higher education is 13.8% for males and 14.0% for females, the lower enrollment rate among ASEAN countries. Therefore, they are valuable human resources for Cambodia's future. However, mental health problems are a common phenomenon among higher education students. Traditional male-centered gender and family norms are particularly prevalent in Cambodia. In rural areas, it is considered pointless to send a daughter to higher education. Such gendered social conditions are expected to result in gender differences in mental health and well-being, and stress on women pursuing higher education. Women who receive higher education are expected to play an important role in building a gender-equal society, and therefore their mental health is important.

We surveyed students at five universities in Cambodia's major cities, Phnom Penh and Battambang, and examined gender differences in mental health and well-being based on data from 827 participants.

In K6, males scored 7.5 and females 8.5, indicating that females had higher mental stress, and the SWEMWBS was 23.5 for males and 22.7 for females, indicating that females had lower mental well-being. Furthermore, females also had poorer conditions in terms of suicidal thought, lonely, worried, thinking too much, college life stress, self-rating mental health, and life satisfaction. However, no differences were found in social relationship items, such as general trust, which are believed to affect health.

We will discuss gender differences in mental health and well-being based on the socio-cultural background of Cambodia, including the effects of the civil war, the collapse of the education system, and traditional gender norms.

Neuroscientific Approach to Emotion and Cognitive Control - Lega Judgement As a Stage -

Our presentation is to show how effective neuroscientific methods are in exploring the roles of emotions in our cognition and decision-making. Among neuroscientific techniques, functional Magnetic Resonance Imaging (fMRI) has significantly contributed to elucidating healthy human function due to its non-invasive nature. The exploration for the correspondence between human brain functions and brain regions is called 'functional brain mapping' and has been accepted widely as an important research paradigm for understanding human brain function. In past decades, understanding of human brain function has deepened not only through reports of active regions but also through their associations with behavioral or psychological indicators. In recent years, DCM (Dynamic Causal Modelling) analysis has revealed 'effective connectivity (with direction)' among brain regions, and it is hoped that DCM analysis will play an important role in understanding human brain function.

In this presentation, we will present the following fMRI study on legal decision-making.: Our study involved legal experts and laypersons (participants) in an MRI scanner, who were asked to judge the sentences

against two defendants, one is remorseful and the other is remorseless, in hypothetical joint murder cases. Through our study, we would like to question the possible contribution of functional brain imaging to the distinction between concepts such as 'emotion,' 'affect,' 'sensitivity,' 'sensation' and 'feeling.'

"Effective connectivity and criminal sentencing decisions: dynamic causal models in laypersons and legal experts", Takeshi Asamizuya, Hiroharu Saito, Ryosuke Higuchi, Go Naruse, Shozo Ota, Junko Kato, Cerebral Cortex, Volume 32, Issue 19, 1 October 2022, Pages 4304-4316, <https://doi.org/10.1093/cercor/bhab484>

What Drives Suicidal Ideation Among Youth in Reflexive Modern Societies?

This presentation examines the key determinants of suicidal ideation among Japanese youth in the context of reflexive modernity. Japan has long struggled with high suicide rates, and since the COVID-19 pandemic, suicide rates among young people have notably increased. Government reports show that young women, particularly, are now more likely to commit suicide than before, raising significant public concern.

The concept of "reflexivity" is central to this analysis. Sociologists such as Giddens, Bauman, and Beck have argued that life in advanced modern societies is increasingly organized around reflexive practices, wherein individuals must constantly navigate choices and risks. In such contexts, even life and death can become matters of personal choice, a phenomenon that may contribute to rising suicidal ideation among youth.

Data for this study were collected from a nationwide sample of respondents aged 16 to 29, with a comparative sample of adults aged 30 to 59. The analysis focuses on four key factors: internet and social media use, friendship dynamics, social skills, and reflexivity, using multivariate analyses.

The findings reveal that: 1) online relationships spilling over into offline life increase the likelihood of suicidal ideation; 2) anxiety within friendships correlates with higher suicidal tendencies; 3) insufficient conflict resolution skills exacerbate suicidal thoughts; and 4) three reflexive factors, which are frequency of self-reflection, thinking of alternative life paths, and worrying about personal competence, are positively associated with suicidal ideation.

These results suggest that reflexive modernity presents a double-edged sword for young people. While it offers autonomy and self-determination, it may also lead them to confront existential choices, including that of life or death, under conditions of heightened uncertainty and social pressure.

ASCENSIO MARTÍNEZ, CHRISTIAN* (Universidad Nacional Autónoma de México, Mexico)

Justicia Cívica y Juventudes: Una Relación Conflictiva

En el año 2019 fue reformada la Ley de Cultura Cívica de la Ciudad de México (LCC-CDMX) y se planteó como objetivo el establecimiento de reglas mínimas de comportamiento cívico, con la finalidad de garantizar una convivencia sana y respetuosa. En la Ley mencionada se enfatiza la necesidad de preservar el orden público por medio de la participación ciudadana, es decir el ejercicio, respeto y cumplimiento de sus derechos y obligaciones. Un marco normativo con tales características genera preocupación respecto de la interacción entre policía y ciudadanía en el marco de la "preservación del orden" ya que sabemos por la literatura especializada que en tales circunstancias pueden presentarse abusos tales como: detenciones arbitrarias, uso excesivo de la fuerza y prácticas discriminatorias hacia individuos e incluso comunidades (Zavaleta, Kessler, Alvarado y Zaverucha, 2016; Tyler y Cheryl, 2004). De tal manera que algunos aspectos señalados en la LCC-CDMX como la noción de orden público y convivencia sana, ameritan un abordaje sociológico orientado a dilucidar ¿quién o quiénes determinan aquello que será definido como orden público y convivencia sana? ¿Cómo se caracteriza dicho "orden", es decir qué normas de comportamiento lo sostienen? ¿Cuáles son los mecanismos de inclusión para que las y los jóvenes opinen o negocien las normas impuestas o la definición de orden?

ASCUI GAC, SEBASTIAN* (Lingnan University, Hong Kong)

Exploring Group Social Mobility Dynamics through Gender and Ethnicity in the UK

Stratification research in the UK has consistently demonstrated that minorities have experienced notable improvements in their socioeconomic status in recent years. This is evidenced by advancements in occupational attainment (Iganski & Payne, 1996) as well as educational achievements (Li & Heath, 2016). Overall, the newer and younger generations of ethnic minorities in the UK are becoming increasingly more 'fluid' compared to their first generation of migrant arrivals (see Li & Heath, 2016; Li, 2018; Platt, 2005, 2007).

This aligns very well with the Melting Pot thesis proposed by Hirschman (1983), predicting that socioeconomic convergence among ethnic minorities and migrants will ensue within their own lifetime or with their subsequent generations. But reviewing specifically income mobility, authors usually warn about life-cycle biases (Hills, 2004), nonetheless, the question still lingers on whether income trajectories for minorities are stable across all groups in society. Thus, the novelty of this research is that the results explore life course income trajectories of cultural minorities and women minorities in the UK, by extending the literature on 'ethnic penalties' in the labor market (Carmichael & Woods, 2000; Li & Heath, 2018; Longhi, 2018; Zuccotti, 2015), the research question delves into discovering if inequalities stemming from ethnic ascription are either persisting or exacerbating with the coming of age.

Another innovation introduced by the study is using the Harmonized British Household Panel Survey-Understanding Society (BHPS-UKHLS), which offers up to 28 waves of repeated measures. Allowing for more robust and comprehensive longitudinal analyses compared to those employed in previous research. In addition, estimations were carried out using multilevel growth models. Results suggest that there are cumulative disadvantages related to the intersectionality of gender and ethnicity, but that only applies to certain groups and their specific life course trajectories, particularly for women of South Asian backgrounds.

ASHOUR, KARIM* (Universität Duisburg-Essen, Germany)

Skills Mobility Partnerships: Investigating Experimentalist Governance Features in Cross-Border Labour Markets

Labour migration across borders is considered a substantial global phenomenon, with many countries facing labour shortages in specific sectors while others have high unemployment rates. Skills Mobility Partnerships (SMPs) have emerged as a proposed approach for facilitating cross-border labour markets between countries of origin and destination through pilot labour migration programs. The SMPs are promoted by different international organisations (IOM, ILO, OECD) as a 'triple win' solution benefiting countries of origin, destination, and migrants. However, in academic literature, SMPs are tackled from a border externalisation perspective to control irregular migration. The EU, in particular, faces challenges with irregular migration and labour shortages, while the neighbouring Global South countries seek regular migration channels. This paper aims to investigate the different conceptual approaches of SMPs and how they are implemented in practice and examine whether there is evidence for experimentalist governance features. Following Sabel and Zeitlin (2012), experimentalist governance involves multi-level architecture and is understood as continuous goal-setting and revision based on learning from implementing various approaches. The methodological approach relies on a multiple case study design targeting 16 identified mobility partnerships between EU member states and non-EU countries. The paper aims to review existing literature on the different SMPs' conceptual approaches and the 16 implemented SMPs combined with utilising primary sources including policy documents and expert interviews in light of the experimentalist governance conceptual framework. The data analysis approach will follow a hybrid qualitative framework and thematic analysis method. Finally, this paper aims to contribute to the literature on labour migration governance by understanding how SMPs could contribute to establishing infrastructure for cross-border labour markets through an experimentalist governance approach.

ASHRAF, SANA* (University of Melbourne, Australia)

Silence behind the Locked Doors: A Qualitative Study on the Domestic Violence Pakistani Married Immigrant Women in Australia

Although domestic violence against women is a widespread problem, but its forms and intensity remain highly variant across contexts. For example, in Australia domestic violence commonly occurs between two intimate partners, while within Pakistani contexts it can be instigated directly or indirectly by any member of the household including the victim's in-laws. Literature on domestic violence also reveals its multifaceted impacts on the lives of immigrant women coping with multiple challenges of integration within a transnational environment. In this study, I utilise an intersectional framework to examine the complex interplay of factors such as arranged marriages, patrilocal extended family system, patriarchal cultural norms, social networking skills, economic dependency and visa status to understand vulnerability of immigrant women towards domestic violence. This study argues that post-migration transition into a nuclear family structure, changes in socio-legal infrastructure, expanded access to economic opportunities and transnational social networking directly impacts women's ability to negotiate and renegotiate patriarchal structures. Unlike their home country, living in a nuclear setting decentralises the collective control of the extended kin providing more space to make patriarchal bargains and assert agency. Reformation of social networks, access to economic opportunities and legal protection services demonstrates how individual agency is continuously evolving and is negotiated distinctively in different cultural environments. Drawing from the case study of Pakistani immigrant women in Australia, my study reveals how these women navigate complex forms of formal and informal strategic interventions to assert their agency in the face of violence after migration to Australia and the subjectivities underpinning it. To collect my data, I utilised in-depth interviews, focus group discussions and online participant observation and employ thematic analysis to interpret diverse experiences of women.

British Muslim Women and Agency: Navigating Religious Identity in Secular Democratic Spaces

This paper explores the intersection of religion, gender, and politics by examining the political activism and agency of British Muslim women in democratic society. While discussions about religious actors in political spheres often focus on prominent religious leaders or male activists, this research sheds light on the experiences of Muslim women and their participation in institutional and grassroots political spaces in the UK.

Using a multigenerational approach, this study highlights how British Muslim women in Newcastle and Glasgow engage in activism both within and outside of their communities, negotiating their religious identity in a secular democratic context. It explores their personal and denominational motivations, as well as the strategies they employ to balance religious principles with participation in public and political life. By investigating how these women assert their agency within local and national political systems, the study contributes to broader debates on religious actors' roles in parliaments, political parties, and public policy advocacy. The findings reveal diverse expressions of political engagement, from direct involvement in political campaigns to more subtle forms of activism through community leadership and advocacy. This paper argues that the political participation of British Muslim women is a crucial, yet underexplored, dimension of the relationship between religion and politics in democratic societies. By focusing on gender and intersectionality, it expands the understanding of how religious actors navigate and influence political spaces in secularized democracies.

Complexity of Ethics and Positionality in Searching for the Multigenerational Identity and Agency of British Muslim Women

This paper explores multiplicity of identity and agency of British Muslim women, offering a comprehensive analysis of how religiosity and identity are shaped and negotiated in a Muslim minority context. The research employs feminist epistemology, and a qualitative method utilised 43 life history interviews with diversity of participants in Newcastle upon Tyne and Glasgow,

with particular attention to the positionality of the researcher. The dynamics of gatekeeper and snowballing methods with researcher positionality. As an outsider/insider navigating shared religious and cultural ties, the researcher's own identity and relationship with diverse participants are critically reflected upon throughout the study, influencing access to communities and the interpretation of data. Additionally, ethical dilemmas around maintaining confidentiality, managing power dynamics, and negotiating participants' concerns about social desirability and prejudice are central to the research process. Ensuring the ethical integrity of the study required a careful balance between building trust with participants while avoiding imposing biases, particularly in light of the heightened sensitivities surrounding Muslim identities in minority contexts.

This paper contributes to ongoing discussions on the complexities of studying identity and religiosity in minority settings, addressing the critical challenges of methodological design, ethical considerations, and researcher positionality. By exploring how British Muslim women across generations express their religious identities and agency, this study sheds light on the diverse and evolving nature of religiosity and identity formation in Muslim minority communities.

Mushrooms, Clay, and Crone: Refiguring Childhood in the Anthropocene

This session explores the entanglements of childhood, geontopower, and the Anthropocene through three figures of early childhood: Mushrooms, Clay, and the Mother-Maiden-Crone. Thinking with Elizabeth Povinelli's geontologies (2016) and Katherine Yusoff's anthropogenesis (2018), we examine how these figures disrupt binary distinctions between life/nonlife, human/more-than-human, and education/world. The destabilization of these boundaries invites a rethinking of childhood as inherently responsive to planetary shifts.

Povinelli's (2016) geontopower breaks with a biopolitical assumption that power works via tactics of making live and letting die and is instead concerned with maintaining the division of life from nonlife. Her figures of the Desert, the Animist, and the Virus illustrate attempts to stabilize or traverse this boundary. These figures, however, are not escapes from power or answers to the Anthropocene but symptoms of late liberal governance in times of climate crisis.

Yusoff's (2016) anthropogenesis reframes human existence as intertwined with geological forces, highlighting endings as much as beginnings. "Definitions of being," Yusoff insists (2016), "must now acknowledge an eternal but shifting mineralogical root" (p. 9). In the shift, the figure of "humanity-as-strata" emerges as intimately linked with geological forces and processes of decay, renewal, and endurance.

We propose three figures that encourage a reimagining of childhood in the Anthropocene: Mushrooms represent the intricate, underground mycelial networks of relationality and interdependence, emphasizing children's entanglements with nonhuman life; Clay as the fusion of human and mineral, highlighting children's material embodiment within strata and their role in sustaining ecological cycles; the Mother-Maiden-Crone invokes processes of care, birth, and pagan wisdom, foregrounding practices of intergenerational care and kinship that extend beyond human boundaries. Engaging with these figures encourages co-speculation about the 'more than social' dimensions of planetary justice, which are highly relevant to eco-attuned scholarship within the sociology of childhood (Kraftl, Taylor & Pacini-Ketchabaw, 2020).

COLLYER, FRAN (Department of Sociology and Criminology, University of Sydney, Australia)

The Sociologists in Pakistan

In Pakistan, sociology has been a recognized academic discipline since 1950, when it was first offered as an elective (Rubab, 2021). Currently, Pakistani degree holders and internationally qualified individuals, primarily from North America and Europe, make up the pool of sociologists at universities. However, there has been little significant sociological writing about Pakistan

or from Pakistan since Alavi (Bushra, 2015). Our study of sociologists in Pakistan is based primarily on secondary sources such as websites, articles and archives. It reveals that most academics are working in two or more fields, such as urban environment, youth, culture, health, and family sociology. There are some areas of sociology that do not have a noticeable presence, including the sociology of science and the sociology of ideas. Of particular note, the sociology of gender is largely absent, with few universities, either in the public or private sectors offering degree programs in it. Sociologists in Pakistan have generally not actively engaged with feminist scholarship, local or even Western, and remain reluctant to deconstruct the androcentrism of many academic disciplines (Aslam, 2024). Few are recognized as experts in the field of gender sociology, although the term is still used in Pakistani sociology. There is also considerable variation in both terminology and practice within country. The feminist sociological point of view is marginal. However, specializations and subfields within our universities' disciplines are not listed on their websites.

The Gender Revolution: Stalled or Still Unfolding? Changes in Gender Role Ideology across Western and Islamic Countries, Cohorts 1942-1995

The gender role revolution is often conceptualized as significant transformations within the gender system. Prior literature suggests that there is an increase toward egalitarian values about gender roles but that this upward trend has stalled among recent generations. This claim is based upon limited evidence from developed Western societies. It is questionable whether this claim can be upheld globally. The literature suggests that in Islamic countries, including the ones that are developed, the trend towards egalitarian gender values is less steep. The aim of this paper is to trace whether the developments in gender role ideology are happening similarly across Western and Islamic societies. Particularly, we are interested to know to what extent the developments have levelled off in both types of countries and, if so, from which generations or period the trend reversal or stagnation has occurred. We also examine the effects of various cultural and structural predictors highlighted in two important studies by Gerling et al. (2019) and Cotter et al. (2011), including changes in religiosity and education, to understand the possible stall and uneven pace of change in gender role ideologies. Our analysis is based on repeated cross-sectional data sets of WVS and EVS [IVS] over the period of the past two decades (2005-2022, five waves). We find a number of variations across western and Islamic countries. The findings show that on average, an upward linear trend over cohorts is found in both Islamic and western societies, which starts leveling off in most recent cohorts. However, the developments in trends towards egalitarian gender ideology are leveling off much steeper in Islamic societies. The cohort effect on gender role ideologies is strongly mediated by religiosity and education, but the effect of religiosity is much stronger in Islamic societies.

L'Étude Des Interventions Mises En Place Pour La Prise En Charge De La Santé Mentale Des Adolescents Et Des Jeunes Scolarisés à La Région De Tanger-Tétouan-Al Hoceima

Objectif de l'étude : Cette étude a pour objectif d'explorer les interventions mises en place pour la prise en charge de la santé mentale des adolescents (es) et des jeunes scolarisés (e) à la région de Tanger-Tétouan-Al Hoceima

Matériels et Méthodes : Il s'agit d'une étude transversale qualitative réalisée sur une période de 03 mois de septembre au décembre 2023, en incluant les intervenants auprès des adolescents (es) et des jeunes scolarisés

(es) à trois niveaux de décision à travers des entretiens et des focus groups réalisés jusqu'à l'obtention de la saturation des données collectées.

Résultats : Sur la base de l'enquête réalisée auprès de 16 personnes, cette étude a trouvé que à l'exception des visites médicales systématiques organisées au niveau des établissements scolaires de toute la région, il existe des intervention sporadiques qui diffèrent d'une province à une autre. Les espaces santé jeune soit sont inexistant soit ils ne sont pas dans les normes. À l'une des provinces, il a été enregistré un manque de structures adaptées à la prise en charge des problèmes de la santé mentale des adolescents (es) et des jeunes et des spécialistes en santé mentale. Au niveau uniquement de 4 écoles les enquêtes ont avancé qu'ils ont mis en place des clubs d'écoute et de médiation pour recevoir les élèves qui ressentent des problèmes pour leur offrir une assistante sociale ou organiser des ateliers à leur profit.

Conclusion : Cette étude a trouvé qu'il existe un grand manque de structures spécialisées dans la prise en charge de la santé des adolescents (es) et des jeunes au niveau de la région de Tanger-Tétouan-Al Hoceïma. Mettant l'accent sur l'importance de proposer des actions susceptibles d'améliorer la santé mentale de cette population au sein de cette région.

Do Young Offenders' Correctional Centers Reform or Harden Them? the Case of Ghana

Whether young offenders' correctional centers reform or harden them is highly debatable since it is complex and varies depending on multiple factors, such as rehabilitation programs, staff engagement, and influences from hardened inmates. Research has shown that correctional centers with vital rehabilitation programs can positively influence young offenders, helping them reintegrate into society. On the other hand, some studies indicate that correctional centers can harden young offenders, especially if the centers lack adequate support systems and prioritize punishment over rehabilitation. Peer influence from more hardened criminals and the stigma associated with incarceration may also reinforce criminal identities. Against this backdrop, this study addressed this fundamental question: Does Ghana's senior correctional center reform or harden its inmates? Using data from semi-structured in-depth interviews with released young offenders in Ghana, the study indicates that the environment at Ghana's senior correctional center has the potential to both reform and harden inmates. However, the study shows that individual inmates' ultimate trajectory, whether towards hardening or reformation, depends mainly on their agency, rehabilitation programs, and correctional officers' support and positive attitude. This study contributes to the empirical and theoretical debates on whether correctional centers reform or harden inmates, especially in the African context. Regardless of their reformation/rehabilitation during incarceration, whether the young offenders refrain from reoffending after their release is dependent primarily on the reintegration support available to them.

ASSAF, LAURE* (New York University Abu Dhabi, United Arab Emirates)

Expatriates and the Gulf's Middle Classes

The term "expatriate" typically depicts a privileged location within intersections of class, nationality, and race/ethnicity. Yet, because this social category is often assumed to be both global and mobile, little attention has been given to how it is inscribed within local hierarchies. This question is especially relevant in societies where expatriates represent a structural part of the population, like in the Arab Gulf region.

Gulf societies have mainly been analyzed through the divide between citizens and non-citizens: while the former would benefit from economic and social privileges, the latter would hold the precarious status of "temporary workers." However, this dichotomy fails to describe the complexity of social hierarchies in the region: neither does it account for the gap separating ruling families from ordinary citizens, nor for the social and spatial boundaries segregating working-class employees housed in labour camps, or domestic workers living in their employer's home, from other city-dwellers. Between these two poles thus exist highly heterogeneous "middle classes" who cross paths and interact in Gulf cities.

Based on the case study of Arab expatriates in Abu Dhabi, capital of the United Arab Emirates, this paper attempts to build an ethnographic definition of these middle classes, looking at their access to urban space; modes of residence; and social and professional mobility. It notably explores how the notion of lifestyle – and its subtle intersections with occupation, class, race/ethnicity, and religion – is often mobilized by residents themselves to portray the internal stratifications of Abu Dhabi's urban society.

Child Well-Being Dashboard Development in Estonia: Social Equality and Equity Perspectives

The aim of the paper is to introduce the first steps of child well-being dashboard development in Estonia. Children are born into this world with differing life chances and unequal opportunities. Public policies aim to reduce those inequalities, but providing equal treatment to children at different starting points does not lead to equitable outcomes. A universal approach to ensuring a good childhood does not consider the needs of all children. Therefore, it is necessary to develop a data-based social investment model for a good childhood that takes into account social equality and equity.

Effective social investment in children requires data that better captures children's well-being and includes all children. The WHO-UNICEF-Lancet Commission has recommended to countries to develop user-friendly dashboards for monitoring child well-being, which would also allow tracking the well-being of children in disadvantaged situations. Iceland has taken considerable steps toward fair, proactive, and early intervention by launching a cross-sectoral child well-being dashboard, which also allows for monitoring well-being of disadvantaged children. In Iceland, child well-being is measured in five dimensions - health and well-being, security and protection, participation and social connection, quality of life, and education.

As a first step of child well-being dashboard development in Estonia, applicability of the Icelandic child well-being model was analysed. In Estonia, data on children are fragmented, with insufficient representation of disadvantaged groups and children under seven years old. Child-related data comes from a range of separate and disconnected international and national surveys and datasets, each with its own focus and sometimes partially overlapping. The concept of a good childhood and data-based social investment that considers equality and equity is still in its early stages in Estonia. However, the importance of the child well-being dashboard is acknowledged and further steps are on the way.

Labor Market Participation for Rejected Asylum Seekers: Navigating Differential Inclusion in Germany

This paper explores the complex realm of labour market participation for individuals with "Duldung" status in Germany, highlighting the paradoxical dynamics of differential inclusion. "Tolerated" persons, mainly rejected asylum seekers who cannot leave the country, find themselves in a precarious legal limbo. With a "non-status" that only temporarily suspends their deportation, they are positioned at a lower level within the civic hierarchy and face significant barriers to accessing the labour market and social services. This paper critically examines how the ambivalent legal framework and institutional barriers underpin a paradoxical state of simultaneous inclusion and exclusion, particularly in the labour market.

The research highlights the critical interplay between labour market and migration policies, which create a dual landscape of economic utilization and migration deterrence strategies that affect the participation pathways of tolerated migrants. It highlights the regulatory environment characterised by restrictive work permit policies and the limited reach of support programmes, which together impede access to stable and skilled employment opportunities. The prevalence of temporary work permissions, although facilitating immediate employment, often culminates in precarious work conditions, undermining long-term job security and career progression.

This paper is based on a three-year study in which 131 experts and tolerated persons in six municipalities in Germany were interviewed. Employing the concept of differential inclusion, alongside the framework of multiple precarity, this study articulates the policy pathways and their implementation in facilitating labour market participation of tolerated individuals in different local contexts. It argues that a comprehensive shift towards inclusive labour market integration requires a holistic reappraisal of not only the legal frameworks governing access to work but also the structural and institutional barriers that perpetuate the precarious existence of these individuals.

Agriculture By Algorithm: Big Data, Digitalization, and Biotechnology Under Climate Change

Based on a textual analysis of publicly available documents from FAO (the Food and Agriculture Organization), Bayer, and Bayer's partner start-ups, this paper provides insight into the data-driven processes and technologies that are transforming agriculture into digitally standardized precision farming under climate change. Digitalization and biotechnology are intertwined within an "agriculture by algorithm" directed toward eliminating site-specific variations on the farm and optimizing efficiency for increasing yield. The paper focuses on commensuration processes which conceptualize agriculture as a measurable, quantified activity tied to algorithmic modelling. It has two goals: 1- to uncover the making of a normative context for change in farming by exploring FAO's promotion of data-intensive technologies; and 2- to clarify, through the example of Bayer and its partner start-ups, the experimental redesign of biological relations and processes, and the entry of these innovations into farming. My analysis explicates how FAO public-policy advocacy and Bayer's biotechnology innovations expand computational processes that support commensuration in agriculture and converts agroecologically and experientially diverse ways of knowing into standard data units within Big Data. Supported by multistakeholder platforms, blended co-financing, and venture capital, "agriculture by algorithm" is expanding the epistemic dominance of quantification into village farming, rendering local farming knowledges and assessments invisible and/or irrelevant.

ATASOY, YILDIZ* (Simon Fraser University, Canada)

Conservation-By-Dispossession: Conservation Policy and Its Consequences for Indigenous Kamba Farmers in the Kibwezi Region of Kenya

Increasingly tied to the UN-REDD+ programme within the general umbrella of the United Nations Framework Convention on Climate Change, wildlife and environmental conservation projects have come to operate within a general policy framework for market-based climate-change mitigation (e.g., carbon credits) and wildlife protection (e.g., ecotourism) to be carried out by private-public partnerships. The question of how these projects are implemented and potential consequences for indigenous farming communities on the frontline of conservation is not well-documented nor well-understood. This paper addresses this challenge with a focus on the wildlife and environmental protection policy implementation at the farm-forest frontier of the Chyulu Hills in the Kibwezi region of the Makueni county in Kenya. The Chyulu Hills Conservation Trust (CHCT) implements these policies in the Kibwezi region, often by employing militarized conservation practices which rely on the use of military and paramilitary personnel, armed rangers, air/land surveillance technologies, and 'shoot-to-kill' anti-poaching activities to protect targeted animals and plants. Based on data collected from interviews with one lead individual from each of the eight CHCT member organizations and the publicly available documents published by these organizations, the paper unpacks the political ecology behind conservation and associated relations of dispossession. It illustrates that these projects alter land use/access relations and foster an enclosure system that displaces people from their customary forestlands and valuable forest resources.

The Turkish Military Schools Graduates' High Transition Rate to Civilian Occupations: A Historical Account

The Turkish PME system stands out for its unique origins, having developed independently from the civilian education system. Originating from the military, the modernization movements during the Ottoman period led to the establishment of military schools before modern civilian educational institutions. By the early 20th century, almost half of the education system was under military control. This historical context is crucial to understanding the current state of the Turkish PME system. Graduates of military schools often transitioned to civilian positions, maintaining a high level of preparedness for civilian life. This trend persists today, with military schools consistently delivering education of superior quality compared to the national average. Additionally, the alignment of military school curricula with the regulations of the Higher Education Council and Ministry of National Education has facilitated soldiers' transition to the civilian job market.

It's also worth noting that soldiers in combat roles face greater challenges in the civilian job market compared to those in technical and support branches. This paper will delve into the characteristics of the Turkish PME system as it relates to civilian job readiness, as well as the disparities in the civilian job market for soldiers in combat and support roles.

Türkiye's Post-2016 Coup Pme Model and Its Challenges: An Insider Account

Since its inception in the early 19th century, the Turkish professional military education system has been subject to the influence of evolving models from the West. The recent overhaul of professional military education has led to establishing a defense university and extensive restructuring. However, despite aiming to serve as an encompassing institution for all officer and NCO schools and staff colleges, the university faces several notable challenges. Firstly, there is a prevailing belief that military education is the exclusive domain of the military, with limited scope for civilian academics, who are often relegated to the role of guest lecturers. This perspective is fervently supported by veteran officers and certain segments of society, necessitating an in-depth examination of the cultural dynamics within the military and broader society. Additionally, the university's progress is impeded by a dearth of civilian professors with specialized knowledge in professional military education. In conclusion, the success of the new professional military education model is contingent upon a significant cultural shift and the broadening of civilians' understanding of military affairs.

ATHAMNY, AMNY* (PhD candidate, Netherlands)

Religious Identity Transmission: The Case of Muslim Families in Canada

I introduce the case of the Arab Muslim families in Canada (Montreal and Toronto). Specifically, I focus on the conflicts they cope with surrounding the religious identity transmission to their children (second-generation Muslim Canadians).

I conducted 30 in-depth interviews with second-generation Muslim Canadians, and 21 front line workers, social workers, teachers, community leaders, activists and community organizers who work with second-generation Muslim Canadians. I asked the participants about their lived religion experience as a religious minority in Canada.

The findings indicate that the second-generation in the sample scrutinize their religious identity. They read about Islam, engage in study groups, and raise points of discussion with their parents such as disentangling the cultural aspect of some practices from the religious aspect. They also cope with questions of whether to wear the hijab or to remove it. In addition, some note the barriers in Sunday School where they are sent to learn Arabic and/or about Islam and voice their difficulty with the language barrier.

Yet, for many participants, the process of religious identity transmission might trigger conflict. The conflict within these families strains the parent-child relationship. Factors such as immigrant religion (i.e. changes in the liturgical and interpretational aspects), contact with other Muslim communities and the multireligious diversity, the in-betweenness position of the second-generation, and the transnational familial ties shape the process of religious identity transmission from one generation to the next.

Utilizing the framework of lived religion helps examine the daily religious life and experience of the participants in their own words and voice. Yet, combination of longitudinal qualitative research might augment the robustness of the findings.

De-Biasing Large Language Models: Fine-Tuning with in-Group Texts for Enhanced Sociocultural Representations

Large language model-based simulation studies are based on the assumption that these models reflect real societal patterns (Argyle, 2023). However, they face significant challenges, such as essentializing groups by attributing uniform decisions to them, erasing in-group minority perspectives, and causing misrepresentation. One potential reason for this issue is the training data: group-related texts are often written by outgroup members, which may reflect

prevalent biases and prejudices (Wang, Morgenstern & Dickerson, 2024). Our previous attempts to address this problem by incorporating ingroup-written texts into the prompts produced limited results (Barkhordar & Atsizelti, 2024). This study aims to reduce bias in LLM-based simulations by fine-tuning the models —using models such as LLaMA 3.2, LLaMA 3.1, Phi 3.5, Gemma 2, Mistral Small, Ollama, Mistral v0.3, Orpo, and DPO Zephyr— with texts written by in-group members. To achieve this, we will use gold-standard annotations of Turkish ideology tweets as ingroup texts. As part of the process, we will develop LLMs fine-tuned for specific ideologies. To evaluate the quality of the outputs generated by these models, we will use three methods: a) simulations based on a survey we designed last year, b) a word pairs axis constructed from antonyms, and c) evaluations of the texts produced by fine-tuned models according to the ideology annotation manual produced by the team.

What Man Can, Woman Can Even Better: Analysis of Gendered Roles in Amisom Military Peace Operations in Somalia

Throughout history, the military as a gendered male-dominated institution is an indisputable fact. The dichotomization of men's and women's roles influences any military operation, including peace operations. The stereotypes of women as weak and unfit for military service have been preserved across time and space, thereby excluding women from most frontline roles to concentrate on support roles. While inclusion is a vital component of gender equality and a bedrock of feminist debates on women's participation in promoting international peace and security, how it happens in the division of military roles in peace operations will form the main discussion in this paper. Using qualitative data collected from a study of a regendered military in the African Union Mission in Somalia (AMISOM), the analysis established that there are shifts in gender roles executed by men and women in a military peace operation mission. This informs the thesis that, once given an opportunity, women have the potential and agency to do all that men can do in military peace operations and peacebuilding.

The Social and Spatial Dimensions of Energy Transitions. an Introduction to the Phase-out Conflict in Sardinia

Recently many sustainability scholars have highlighted the risks of energy transition policies in exacerbating existing social, economic and spatial inequalities. Observing the growing impact of climate change on environments and communities around the world, they also affirm the need of engaging communities for a just and equitable transition. This study, which develops research on sustainable transitions combining the community approach with the spatial analysis, illustrates the case of the Italian region of Sardinia. In this context the implementation of the energy transition politics has encountered strong dissent from local communities. This conflict, which has led to the emergence of numerous organizations and protest movements, has its roots in the lack of active involvement of the communities in the phase-out planning processes. The mobilization can also be traced back to the use of land and soils for renewable installation without clear benefits for the communities and the territory itself. The author, integrating these two research approaches, aims to shed light on different perceptions of the land and the meanings attributed to it by the communities, along with assessments on multiple scales where different actors' perspectives of use, space visions and interests may diverge or openly conflict. Furthermore, the analysis proposes a broader reflection on transition governance, taking into account the multiplicity of actors involved in the process. In advancing the literature on conflicts related to sustainable transitions, this study also proposes to seek forms of dialogue and participation in order to avoid the polarisation of stakeholder positions and the emergence of trade-offs situations, where the energy transition policies, planned for the future of societies are implemented without the engagement of local communities.

Sensory Archives of the Future: From Arms Fairs to Museums

This paper presents a methodological exploration of two ostensibly divergent field sites, arms fairs and the museum, and the curious sensory overlap that exists in these spaces of speculation, future-making and power. Museums and fairs share historical roots in world expositions and their representational logics, what Timothy Mitchell describes as a regime of perceiving the world; "a rendering up of the world as a thing to be viewed," the idea that the world could be represented through objects such that we are convinced that the representations are truthful (Mitchell, 1989). At both sites, practices of collecting, curating, and exhibiting take a sensory turn, using gamefied, tactile multimedia exhibits – in the case of arms fairs in the UK, to showcase the latest policing and military commodities, and in 'Museums of the Future' to present speculative futures of society with technology. While both spaces constitute discrete institutions that hold different positions in public consciousness, this paper resists this division and thinks about these institutions together as 'archives of the future'. At our field sites, the museum and the arms fair, the body is a site for meaning-making. Interactive activities require visitors to touch, listen, and move, often carried by affective first-person storytelling. Domínguez Rubio argues exhibits do not simply display, they make particular ideas legible and therefore meaningful. We argue that if the sensory experience is a core part of what is mobilized in making particular futures legible, then our methods should also take this into account. Exploring the political potentials of emotions and in the activation of senses, this paper explores the limitations when our methods fail to capture such elements from official records and research.

Student Success Stories: How Seas Transform the Academic Trajectories of Vulnerable Students

Educational inequalities persistently affect vulnerable groups, including ethnic minorities, students from low socioeconomic backgrounds, migrants, students with disabilities, girls, and LGBTI+ students. However, scientific research has identified Successful Educational Actions (SEAs) that overcome these disparities (Girbés-Peco et al., 2023). One notable initiative is the INCLUDE-ED project under the 6th Framework Programme, which highlighted effective SEAs like Interactive Groups (an inclusive student organization with additional adult support) (Valero et al., 2018), and Dialogic Literary Gatherings (fostering inclusive environments and co-creation of knowledge through classic literature reading and discussions) (Roca et al., 2024).

At the 2011 Final Conference of INCLUD-ED ("Successful Actions to Overcome Educational Exclusion in Europe"), held at the European Parliament in Brussels, a 10-year-old student, illustrated the impact of these SEAs. Subsequently, sustained academic improvements transformed her school into a model of educational success, culminating in its recognition as the best school in its region in 2018.

Currently, the Horizon Europe project REVERS-ED focuses on studying and adapting SEAs to different contexts, highlighting their long-term impact on reducing inequalities. It analyzes longitudinal data from primary and secondary education to identify trends in educational disparities and learning outcomes, aiming to replicate these achievements across varied settings.

The study employs a communicative methodology to examine the long-term impacts of SEAs among several student cohorts. An exemplary success story is the 10-year-old student mentioned earlier, a girl from a low socioeconomic neighborhood with a migration background, who defied the reproductionist prediction of failure thanks to the implementation of SEAs. She is now completing her degree in Translation and Interpretation, illustrating how evidence-based educational actions can significantly enhance academic paths for disadvantaged students. Many of her peers are also enrolling in university education, pioneering in their neighborhoods. These narratives highlight the enduring impact of SEAs, providing optimism for expanding these achievements across Europe.

"Towards a Multidimensional Conceptualization of Access to Justice on a Global Scale"

Access to justice is a critical factor in evaluating the role of constitutional courts within legal systems, particularly in European models. Historically, distinctions between different forms of constitutional justice have been based on the abstract or concrete nature of judgments, categories closely tied to the ways in which courts are accessed. As constitutional review has shifted towards a more subjective dimension, access mechanisms have evolved, expanding the powers and functions of courts. Constitutional courts, initially established to safeguard the constitutionality of laws, now handle a broader range of cases due to the increasing number of parties entitled to bring claims. However, access goes beyond the mere identification of trigger mechanisms granted by constitutional powers. It also opens the door to exploring, from a *de iure condendo* perspective, the possibility of introducing new judicial powers. This study investigates constitutional justice systems worldwide to analyze two key dimensions: the scope of access (A) and the subsequent expansion of court competences (B). To fully grasp the complexity of these dimensions, the research adopts an interdisciplinary approach, using empirical methods from social sciences, particularly Multiple Correspondence Analysis (MCA). This methodology helps reveal the nuances of dialogue between various constitutional justice systems and provides deeper insight into the dynamic relationships between them. Ultimately, the study seeks to offer a comprehensive understanding of the impact of access to justice on the evolving role of constitutional courts.

AUST, ROBERT* (Institute for Higher Education Research at the the Martin Luther University Halle-Wittenberg, Germany)

Talking about Students with Disabilities. Results from a European Comparative Discourse Analysis

Disability has transcended national boundaries and is now shaped by global discourses (Goodley, 2011). Consequently, inclusive higher education practices are increasingly viewed through a global rather than purely local lens (OECD, 2003). While political attention to disability in higher education gained momentum after the UN CRPD, academic interest has only emerged recently. Despite this, there remains a lack of clarity regarding the conceptualization of disability and its linguistic and cultural construction across Europe. Initiatives like the Bologna process (Crosier & Parveva, 2013) and the European Disability Strategy (European Commission, 2010) emphasize the need for comparative research on disability within higher education. Yet, comprehensive European comparative studies remain scarce (Biermann & Powell, 2016; Powell, 2014), highlighting the necessity for research on the implementation of inclusive practices.

This presentation adopts a comparative European perspective and incorporates insights from disability studies (Berger, 2013; Waldschmidt, 2006, 2017), viewing disability as a socially and culturally constructed phenomenon rather than a fixed ontology. It employs discourse analysis, drawing on Foucault's theories of power, knowledge, and subjectivity (1982, 1997), alongside Butler's concepts of performativity and iterability (1993, 1997), to analyze 51 interviews with university employees across five European universities (Leipzig, Bologna, Krakau, Gothenburg and Aarhus). The aim is to explore how students with disabilities are discussed, and to identify the power dynamics and norms shaping these discourses.

Findings indicate that discussions around students with disabilities fluctuate between regulatory norms and individual recognition. Despite political efforts, the notion of the "normal" student remains centered on non-disabled standards, perpetuating distinctions between ability and disability. Disability continues to be framed as a deviation from desirable normality, influenced by entrenched medical and psychological paradigms. Consequently, legal provisions alone are insufficient for true inclusion; a shift towards viewing disability as part of normality is necessary.

AUST, ROBERT* (Institute for Higher Education Research at the the Martin Luther University Halle-Wittenberg, Germany)

The Evolving Role of Research Management in Higher Education. Analyzing the Strategic Ad-Adaptation of Research Organisations in Dynamic Environments

Since the 1980s, higher education has undergone significant transformation, characterized by global organizational reforms that reconceptualize universities as proactive entities rather than passive responders (Krücken & Meier, 2006). One notable response to these changes has been the establishment of specialized research management (RM) structures, leading to the emergence of research managers (Kerridge & Scott, 2018; Whitchurch, 2009). This presentation examines these developments and their implications for universities in Germany.

The presentation presents two perspectives on RM within higher education. First, analysis of qualitative data from surveys and interviews reveals that while RM is now well-established, there is still limited understanding of task differentiation between university and non-university research institutions. The findings suggest that RM functions as a critical interface in academia, with less separation from traditional administrative roles in universities compared to other research institutions. This positioning of RM enables it to offer new research impulses.

Second, the paper explores the sociological aspects of RM, particularly the discursive constitution and subjectification of research managers in the German research landscape (Bosančić, 2019). Discourse analysis of job advertisements and interviews identifies two main perspectives: one viewing RM as a solution to overburdened administration, and the other questioning its necessity given existing structures. This discussion highlights the ambivalence in power dynamics and recognition practices affecting the professional identity of research managers.

Combining these perspectives, the presentation argues that the evolving nature of universities as proactive entities is closely linked to the strategic development of RM. This relationship underscores the importance of understanding the roles and challenges of RM in shaping higher education's future. The presentation concludes by questioning whether universities should be considered complete organizations or viewed through alternative perspectives (Hüther & Krücken, 2016; Musselin, 2006; Seeber et al., 2015).

RC32-531.2AVAKYAN, YEVA* (Self employed, Armenia)
BYWATER, KRISTA (Save the Children, USA)*30 Years on: Beyond Individual Solutions to Systemic Change for Gender Equality*

As we approach the 30th anniversary of the Beijing UN Women's Conference and the adoption of the Beijing Declaration and Platform for Action, this paper critically evaluates the progress and persistent challenges surrounding the leadership and empowerment of adolescent girls and young women (AGYW) within the global context of gender equality and sustainable development. Despite notable achievements in women's and LGBTQ+ human rights, AGYW remain an overlooked group in global programming and the Sustainable Development Goals (SDGs). A focus on individual-level solutions, at the expense of addressing systemic barriers, undermines meaningful progress in gender equality and women's rights worldwide.

Although individual empowerment strategies have gained traction, they often fail to address deeper structural issues perpetuating gender inequality. These programs, primarily focused on knowledge, confidence, and skill-building, frequently overlook the socio-political contexts that restrict AGYW's leadership and reinforce existing power dynamics. This oversight is significant given the global gender gap, reflecting disparities in access to resources and decision-making power.

In response, this paper advocates for a paradigm shift toward prioritizing systemic change in AGYW leadership and empowerment programming. By employing frameworks such as the socio-ecological model and intersectionality, the paper proposes an integrated approach targeting individual, community, and institutional levels. Through the analysis of successful programmatic examples, key strategies for fostering AGYW leadership are identified, including collective action models and multi-stakeholder engagement.

Utilizing a phased scoping review methodology that synthesizes findings from 72 academic sources and 31 pieces of gray literature, the paper offers actionable recommendations for future programming with a focus on reframing AGYW as inherently vulnerable and shifting the focus to addressing systemic barriers to leadership and empowerment. Ultimately, this research aims to enhance understanding of the challenges outlined in the 2030 Sustainable Development Agenda and align efforts with the transformative goals of the Beijing Platform for Action.

Cross-Legitimation Processes between Traditional and Alternative Medicines

The aim of this communication is to understand the processes of cross-legitimation between Traditional and Alternative medicines. In Latin America, Indigenous traditional medicines (TM) are predominantly understood and regulated in terms of cultural rights for specific ethnic groups and as intangible cultural heritage to be preserved. In contrast, Complementary and Alternative medicines (CAM) are often regulated separately, and conceptualized in terms of prevention or palliative care. Regarding their usage, TM tends to prevail in localized contexts, generally among specific and marginalized ethnic groups, whereas CAM users are typically people from high and upper-middle socioeconomic backgrounds, living in urban environments with medium or higher education levels.

Based on extensive fieldwork that we have been conducting for ten years, we observe an assemblage of different medicines that share a subordinated position in relation to biomedicine. On one hand, TM holds recognition by international organizations and state health legislation, which paves the way for a number of CAM practices—especially those associated with neo-shamanisms—to also be included. On the other hand, the social recognition of CAM among high and upper-middle classes makes other healing perspectives more visible, allowing TM to move beyond community confines and reach a broader audience.

In this process, therapeutic practices tend to detach from the medical systems that give them their meaning and, sometimes, efficacy. Since this also involves taking into account their respective worldviews, that includes spiritualities, the ways in which different therapeutic approaches coexist become a fundamental dimension in understanding medical pluralism. It is therefore significant to recognize the risks of a folklorized multiculturalism, as well as to avoid essentialisms that deny the inherent dynamism of any medical system. Ultimately, conceptualizing pluralism from a sociocultural perspective implies understanding that individuals belong to cultural groups and are embedded in symbolic, social and political universes.

Gentrification, Health, and Well-Being across the Life-Course in Urban and Rural Context in the United States

How is gentrification associated with health and well-being across the life-course in urban and rural neighborhoods in the United States? Long considered an urban phenomenon, gentrification increasingly occurs in rural areas. This process of neighborhood change alters natural, built, and social environments, and can impact social relationships and cohesion as well as health behaviors and health and well-being more broadly. Effects may vary across urban and rural communities for myriad reasons including access to health-promoting material and social resources. More broadly, the relationship between gentrification and physical and mental health is not well developed and extant results are equivocal. Studies that examine gentrification's connection to subjective well-being are rarer. Additional research is needed that examines the relationship across different health outcomes and different individual demographics. This work examines the relationship between gentrification and health with a focus on impacts across the life-course. Theory suggests that a life-course approach matters for understanding urban-rural differences because of varying vulnerability across age with regard to both health and community change.

This research uses 1) restricted data from the 2018 United States General Social Survey and 2-3) the 2006-2010 and 2015-2019 American Community Survey 5-year estimates. Census tract identifiers locate respondents in urban and rural counties. Counties are classed as not gentrifiable (too affluent), gentrifying, and not gentrifying. This work examines subjective well-being as well as physical and mental health outcomes. Predictors are gentrification status of the neighborhood, urban-rural status, and age. Controls nospans theoretically relevant demographic and social variables, including social

relationships, which may be impacted by gentrification, particularly among older adults. Analysis will include ordinal, logistic, and/or multinomial logistic regression as appropriate to each outcome.

Discussion will focus on urban and rural gentrification and health and well-being generally and in neighborhood context with attention to differences across the life-course.

AVIN ILERI, AGNIEŠKA* (Lithuanian Centre of Social Science, Institute of Sociology, Lithuania)

Becoming 'Black' in a 'White' Nation: Roma, Racialization and Lithuanian Law Enforcement

Terms like "white supremacy," "coloniality," and "racialization" are widely used in Western contexts, particularly in the U.S., but remain largely absent from public discourse in Eastern Europe, especially Lithuania (Imre 2016, Christian 2019). The topics of race, racism and white dominance are rarely addressed in Lithuania, where the general belief is that racism exists "elsewhere", not at home. Here whiteness is taken for granted and largely uncontested, with society protected by a double-shield of racism "elsewhere-ness" rhetoric (Goldberg 2006): first, Lithuania's identification as a country without colonial history; second, its legacy as a former Soviet colony, with socialist anti-racism and friendship-of-peoples discourse and recent EU-promoted values of equality and multiculturalism (Kościańska, Petryk 2022). This lack of engagement with racism and 'whiteness' has created minimal space for reflecting on social inequalities in racial or post-colonial terms. Even while preparing this abstract, I feel the weight of the "white gaze," uneasy about addressing such taboo topics and condemning myself for what I dare to talk about. Yet, I ask: How can some persons in a Lithuanian society still feel and be perceived as "black"? In my conference presentation, I will explore how Lithuanian Roma construct, experience, and navigate their "blackness" in relation to the dominant national forms of whiteness through their interactions with the law enforcement. Based on ethnographic research conducted in the Vilnius Roma community between 2022 and 2024, I will highlight how these encounters reveal complex racialization processes, despite the country's self-perception as predominantly "white" or "color-blind." Additionally, I will examine the challenges of developing proper analytical tools to investigate the "racism" and "whiteness" in Lithuania and its impact on local Roma inclusion/exclusion.

AVIRMED, TENUUNJARGAL* (National University of Mongolia, Mongolia)

From Nomads to Urban Citizens: Exploring Place Attachment and Identity in Ulaanbaatar's Ger Districts

This study explores the socio-spatial dynamics of the ger areas in Ulaanbaatar, Mongolia, where half of the city's population resides, facing infrastructural neglect and social marginalization. Over the past 30 years, rural-urban migration has surged, with many internal migrants settling in these districts. Despite the common belief that Mongolians have the freedom to live without restriction in their own land, migrant households often encounter challenges related to livelihoods and a complex sense of belonging in the city. Migrants in ger areas are frequently stereotyped as "orcs" and blamed for environmental pollution, which further marginalizes them and leads to social exclusion, including limited access to social protection schemes.

While much of the existing research has concentrated on the socio-economic conditions in these areas, this study shifts focus to the emotional and psychological dimensions of place-making. Through the concepts of place attachment and place identity, we examine how residents' emotional bonds to their environment shape their interactions with urban space and influence the urbanization process. Utilizing interviews and observations, the research highlights how these affective connections are crucial in understanding the dynamics of ger districts.

The study argues that space is not merely a physical construct but is animated by the emotional relationships and lived experiences of its inhabitants. By examining two ger districts in Ulaanbaatar, the research delves into the "affective dimensions" of place-making, focusing on residents' perceptions of their environment, identity, and belonging. The findings also critique the exclusion of ger residents from the status of "urban citizens" and challenge the socioeconomic and geographic marginalization they face. This research contributes to a deeper understanding of how emotional, psychological, and physical factors intersect in shaping urban spaces and identities in Ulaanbaatar's ger districts.

The Left-behind Voter: The Geography of Discontent between Central and Marginal Areas in Italy

In recent decades, there has been a notable redefinition of geographical inequalities. Contemporary societies appear to be characterized by decreasing inequalities between countries and increasing disparities within countries (Hurley et al., 2019; Chancel, Piketty, 2021). In this scenario, the difference between central and marginal areas is growing at the sub-national level. Central areas are characterized by better job opportunities and life chances (Fielding, 1992), and the attraction of highly qualified human capital (Moretti 2004; Florida, 2005). Conversely, marginal areas are characterized by declining economic and life prospects, a reduction in available social services, and significant demographic shifts including depopulation, ageing, and emigration. These left-behind places (Rodríguez-Pose, 2018; Pike et al., 2023) are experiencing an increasing discontent and anti-establishment position in the population (Dijkstra et al., 2020).

The Italian context offers a privileged setting for examining the relation between spatial marginalization and the ascendance of populism. Alongside the traditional North/South dualism, Italy is experiencing an increasing inequality between central and inner areas, a cleavage that emphasizes the spatial peripherality concerning services of general interest (Modica et al., 2021).

The aim of this study is to analyze the relations between voting behavior and different territorial cleavages in Italy. To this end, it analyses the outcome of recent electoral consultations at the municipal level and by macro-area, controlling for a selection of demographic, social and economic indicators. Initial findings indicate an increase in discontent, evidenced by both a rise in abstentionism and a growth in support for populist parties. Furthermore, if peripheral municipalities demonstrate their discontent through abstentionism, the consensus for populist parties indicates that only Fratelli d'Italia and Lega Nord present a village-oriented profile with roots in the inner areas, whereas the M5S (Five Star Movement) obtains its support primarily from southern voters residing in large municipalities.

AVSATKARINOV, ARSEN* ('El Umiti' Corporate Fund, Kazakhstan)
 AMRIN, ASLANBEK ('El Umiti' Corporate Fund, Kazakhstan)
The Price of Learning: Households' Educational Expenses in Kazakhstan

Educational inequality is a prominent topic in educational research, with numerous studies highlighting the role of financial disparities in shaping access to educational opportunities. A key factor contributing to this inequality is the ability of families to allocate financial resources toward education. Although governments often position themselves as the primary providers of educational funding, families still need to contribute significantly. This study examines the structure and dynamics of household educational expenditures in Kazakhstan, focusing on the factors that influence the magnitude of these expenses. Utilizing data from the Bureau of National Statistics of the Republic of Kazakhstan, the research investigates household spending patterns in relation to socio-demographic characteristics. To address the nested nature of the data and better capture differences across household types, a multilevel regression model is applied. As one of the first studies to explore household spending on education in Kazakhstan, this research provides valuable insights into the economic behaviors that shape educational investment at the family level.

Is Fairs in India Giving Equal Place to Women?-an Unanswered Question

Fair is an event where religious, economic, social, cultural and political activities are taking place together. It provides for merchants, traders, shopkeepers, vendors for business. This event also evolved into a hub of exchange and meeting place for socio-cultural networks.

The majority of the fairs held are either religious fairs or seasonal celebrations. Fairs are generally specific to a location and provide insights into traditional work rural life, beliefs and cultural of the people who live there. Participating in fair is major activity of life of rural people still today. It works as a main source for leisure.

In modern India tools of leisure activities are changing in a very fast. Number of Internet users are increasing very fast. Number of smartphone users are also growing. World of web series gaining more and more popularity. Still importance of fairs exists. More and more people visit that particular place due to the time of fair.

So researcher wants to understand the reasons behind this behaviour one hand and other researcher wants to know post and opportunity available to Women are at par with their counterparts.

This study is based on secondary data and it will focus on Marathwada region in Maharashtra - an one of the progressive state in India

AXEL, FRANZEN* (University of Bern, Switzerland)
The Power of Social Influence: Evidence from the Lab and the Field

Descriptive Norms can have a strong influence on the behavior of individuals. This was already demonstrated in the seminal papers by Solomon Asch (1951, 1955, 1956). Asch placed a naïve subject together with six confederates into a room and instructed them to judge the length of lines. The confederates were instructed to give wrong answers. The experiment showed that on average 36% of the naïve subjects were influenced by the group and provided also wrong answers when the group did so. The findings of Asch did receive a lot of attention and were replicated many times. However, most replication were conducted with university students in the US, leaving the question whether Asch's result are still valid today and whether they can be replicated outside the US. In this paper we replicate and extend the study of Asch. First, we replicate the original Asch experiment using five confederates and one naïve subject in each group (N = 210). Second, in a randomized trial we incentivize the decisions in the line experiment and demonstrate that monetary incentives lower the error rate. Third, we confront subjects with different political statements and show that the power of social influence can be generalized to matters of political opinion. Fourth, we investigate whether intelligence, self-esteem, the need for social approval, and the Big Five are related to providing conforming answers. Finally, we conduct a field experiment and demonstrate that conformity can also be observed outside the lab. We find an error rate of 33% for the standard length-of-line experiment which replicates the original findings by Asch. In the incentivized condition the error rate decreases to 25%. For political opinions we find a conformity rate of 38%. However, besides openness, none of the investigated personality traits are convincingly related to the susceptibility of group pressure.

Indigenous Data in Sápmi - Recent Developments

This paper aims to investigate the applicability of the CARE principles within Sápmi for the management of research data, encompassing its collection, storage, usage, and reusability. Despite the contextual differences between the Nordic national states and the CANZUS states – as well as within Sápmi itself – Sámi alongside other Indigenous peoples are entitled to assert self-determination over data in line with the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP). While this paper will not delve into the legal frameworks governing research data and Indigenous rights, it is important to note that although there is extensive legislation safeguarding individual data, there is a comparative lack of focus on the absence of collective rights for Indigenous peoples to data. This oversight challenges the rights of Indigenous peoples to self-determination and infringes upon their human rights.

Indigenous and Sámi research data encompass a broad spectrum and includes data that is digital, recorded, or yet not digitalized, such as knowledge and information about or related to Sámi individuals, peoples, their lands, waters, natural resources, and ways of living. Indigenous and Sámi data is habitually collected and stored outside the reach of Indigenous societies in infrastructures for research institutions, memorial institutions, governments and public sectors.

CARE principles offer valuable insights into research data management and ethical considerations for researchers in the Nordic countries. The Swedish Research Council updated its "Good research in practice" in 2024 and highlighted the CARE principles (in connection with FAIR) in a chapter addressing research ethics regulations and the actors and resources that researchers can use to get guidance on good research practices.

AYALA, CONSTANZA* (Millennium Nucleus for the Study of the Development of Early Math Skills, Chile)

SUSPERREGUY, MARÍA INÉS (Millennium Nucleus for the Study of the Development of Early Math Skills, Chile)

MIRANDA, CATALINA (Pontificia Universidad Católica de Chile, Chile)

The Role of Teachers on Migrant and Gender Gaps in Math Achievement: A Decomposition Analysis

Studying the math abilities of migrant children is relevant to scientific knowledge, given the substantial increase in migratory movements in recent decades (OECD, 2019). Unfortunately, evidence has shown that migrant students from vulnerable countries often underperform in math compared to their local peers (Harris et al., 2008; Hoffmann, 2018). However, gender-based analyses have yielded mixed results (Dronkers & Kornder, 2014; Escandell et al., 2015).

Different factors explain these results, including teachers' implicit and explicit biases toward students' math abilities (Glock et al., 2015; van Ewijk & Slegers, 2010). Teachers often underestimate the math performance of migrant students (Costa et al., 2021), which may lead to a self-fulfilling prophecy (Jussim, 2012).

In this context, this study analyzed the Latin-American migrant and gender gaps in math achievement of fourth-grade students in Chile. Additionally, we explored the role of teachers in these variations using a standardized Chilean census test (SIMCE), which measures math abilities. The analytical sample comprised 87,086 students, 3,412 classrooms, and 2,100 schools, where Latin-American migrant students represented 10% and 49% were girls.

Using a decomposition analysis, our main findings showed that Latin-American migrant students performed lower than their Chilean peers. The gap was higher for boys than for girls, particularly for Haitian students. When we observed the teacher's role, the within-teacher component accounted for most of the gaps for Haitian students. In contrast, the between-teacher component was more relevant for Bolivian and Venezuelan students.

These results suggest that migrant boys, particularly those from low-income countries, face greater challenges in math. These disadvantages hinder their assimilation processes in host countries, impacting their educational trajectories. Furthermore, teacher biases predominantly affected Haitian students, while for other migrant groups, segregation outside the classroom contributed more significantly to the math gap.

BANJO, OLUFUMILAYO (Obafemi Awolowo University, Nigeria)

Sexual Violence in Nigeria: Men Are Also Victims

Sexual violence is a widespread global problem that has catastrophic effects on survivors. While it has been established that males are the primary perpetrators of sexual violence, men are also victims. This study investigated the experience of sexual violence by men and the public attitude toward it in a small community in Ile-Ife, Nigeria. Data were collected from 163 adults aged 18 and over using a questionnaire. Sexual violence was measured with six indicators, and attitude was measured with three statements. The results show that a large proportion of the male respondents had experienced at least one of the measures of sexual violence. The majority of the respondents believed that men can be sexually abused. The odds were significantly higher among younger respondents aged 18-25, those who had attained tertiary education, and males. The results suggest that a large number of men in Nigeria may be experiencing sexual violence in diverse forms and yet they are hardly heard or given attention. Efforts to address sexual violence in Nigeria should target and incorporate men in the national discourse and programs to eliminate violence against persons.

AYAYDIN, DENİZ* (Boston College, USA)

Affective Communities: Witnessing a Genocide

"It's Bisan from Gaza and I'm Still Alive"

This is Bisan Owda from Gaza, uttering this sentence every day from her social media accounts for the last one year, with occasional interruptions. She tells the stories of struggle, mundane and unimaginable forms of suffering and resilience. Diana Seo Hyung Lee writes "Lately, living has felt defined by the act of witnessing; in particular, witnessing death". As the Israel-Gaza war approaches one year, circulation of images of suffering, death and life amidst war invites us to explore the affective fabric of the digital age of witnessing war and suffering. Bisan's profile, like many other citizen journalists on the ground, serves as temporary meeting points for similarly affected bodies globally.

Affective communities are "welded together, at least temporarily, by shared emotional understandings of tragedy." (Hutchinson, 2016). The notion emphasizes the processes of "producing a temporal solidarization between affected and the affecting social bodies" (Zink, 2019). They refer to ephemeral milieus of communality, to intense and momentary sensorial synchronization and dissolution. Affective communities envision the social as "a net of pulsating spheres of sociability" (Zink, 2019, 298).

Taking Gaza-based war journalist Bisan Owda's social media profiles as a site for digital ethnography, I investigate how a journalist's digital space became the epicenter of affective communities.

The second part of the article is concerned with the ethical and aesthetic grammars of mediatization of war. Using discussions around the most widely circulated AI image "All eyes on Rafah"—an AI-generated image where series of refugee tents spells out the image's title phrase—I investigate the emotional responses to the circulation of a cinematic and sanitized representation of the war instead of the actual images of suffering coming from the ground.

AYAYDIN, DENİZ* (Boston College, USA)

Dark Femininity: Unforgiving Women and Machiavellian Love

The notions of dark and light femininity, an understanding of femininity as a binary, has been circulating on social media in the last few years. The differentiation between the dichotomy between the dark and the light femininity depends on the influencer that uses the term, however it is possible to say that dark femininity refers to confident, assertive, self-interested, mysterious, bold and powerful traits whereas, light femininity indicates soft, nurturing, kind, caring, emphatic traits. Dark femininity draws inspiration from series like Euphoria and aesthetics from celebrities like Kylie Jenner, Beyoncé, Rihanna, Megan Fox, who recently changed her fashion style. It promises women to elevate their lives - romantic or otherwise through control of emotions and through adopting certain aesthetics.

There are multiple Instagram and TikTok accounts with 500k followers, YouTubers and multiple book series (all of them anonymous) giving tips and tricks about activating the dark feminine energy to tap into successful and happy life. There are also related influencers that teach how to walk on heels to master the art seduction. For these influencers, activating the playful, devilish, detached version of femininity that is not concerned about people pleasing and exists any relationship that is unappealing promises the best of femininity or a "femininity premium" (Hamilton et al. 2019).

This paper aims to investigate this new trope of femininity that sees the feminine self as the source of all the problems and a potential paradise if worked on. It investigates how this particular aesthetics and emotional regime means for gendered relations.

AYÇA, YILMAZ* (Turkish-German University, Turkey)

Maternité Et Travail : L'Égalité Entre Les Sexes Au Travail Suffit-Elle Pour La Subjectivation Des Mères Par Le Travail ?

Selon les dernières chiffres d'OECD Better Life Index, la Turquie se trouve dans le quatrième rang parmi les derniers concernant l'équilibre vie-travail. Le pourcentage des femmes ayant un emploi rémunéré entre 16-64 ans est de 30% alors que ce chiffre augmente à 65% pour les hommes dans le même échantillon. Ce taux d'activité féminine place une fois de plus la Turquie en quatrième rang parmi les dernières. En plus de cela, le surtravail est une pratique beaucoup plus rencontrée en Turquie par rapport au moyen des pays OECD. Près de 25% des salariés travaillent de très longues heures.

Même si les données sur la vie de travail s'améliorent depuis le début des années 2000, elles restent toujours alarmantes particulièrement quant à l'emploi des femmes et ses conditions de travail. Le changement de la loi de travail en 2003 qui légalisait le travail à temps partiel avait été propagandé par un discours de l'augmentation de taux d'activité féminine après la maternité. Néanmoins il s'est résulté par le surcharge et le déséquilibre entre vie-travail pour les femmes. D'autre part, la question de savoir dans quelle mesure il est émancipateur pour les femmes d'entrer sur le marché du travail rémunéré a toujours d'actualité.

Cette communication problématise particulièrement la subjectivation des mères dans leurs vies au travail. Autrement dit comment est-il possible pour les mères de s'exprimer leurs subjectivités au travail ? En se basant sur une recherche qualitative menée avec 40 femmes, la recherche se concentre sur les expériences vécues au travail des mères en Turquie et leurs imaginations d'avenirs possible pour leurs vies au travail.

AYDIN, YAHYA* (Assoc. Prof., Turkey)

Empty or Low Use Homes in Istanbul

Housing issues could be defined as a global issue rather than local differences in policies or outcomes. While inequalities in the housing market take different forms, people experience difficulties in accessing affordable housing to buy or rent. In the same environment, a significant number of people leave their property completely empty or use it for a short period of time in a year. In other words, empty and under-used homes such as derelict properties, second or holiday homes and short-term lets have emerged as an alternative market that dominates the housing market but is not actively used in it. This paper will focus on Istanbul as a case study to examine the impact of empty and low use homes on the housing market in the Turkish context, based on official and unofficial data as secondary data. Due to its geographical location and tourist sites, it has always been an attractive place for short or long term visitors. At the same time, the city of Istanbul emerges as an important place for the investors who use their property as a second home or keep it completely empty. Finally, this paper illustrates global level issue in the context of Istanbul and it is generalisable for many of the other both Turkish cities and the same size of cities.

Anomie, Anthropocene and Risk Management: The Gap between Scientific Knowledge, Social Expectations and Regulatory Response

The Anthropocene marks a historical turning point in the relationship between humans and nature. If it was technological capabilities that enabled the human species to have ever greater prospects of survival in the face of natural hazards, now the use of technology can place nature as the one threatened by humans. If technological development was accompanied by the regulatory capacity of states to coordinate the action of citizens in the face of threats, who will now exercise regulatory power to respond to climate change? There is growing scientific evidence of the effects of climate change, a growing social demand to address it, and yet an institutional inability to address the situation through effective regulation. International agreements show limited capacity, which is opening space for responses based on each state's individual defense strategy.

Influence of Forest Governance Approach on Livelihood Capitals: The Sustainable Livelihood Perspectives

Effective forest governance is important for maintaining forest health amidst environmental and economic challenges. This study explores how different forest governance approaches influence livelihood capitals of forest fringe communities in Enugu and Cross River states, Southeast Nigeria. Using a sustainable livelihood approach (SLA) and case study methodology, the

research involved household heads, forest officials, and community elders through a multistage sampling. In Cross River National Park (CRNP), the governance model lacks training and capacity-building opportunities for rural households, except for forest rangers. Educational attainment in CRNP is low, with 33.5% having secondary education. Additionally, weak social networks hinder effective community relationships with park management. In contrast, Enugu forest communities show that a proportion (32.6%) had secondary education qualifications. There is a lack of training or forestry education from the government, and no relationship between government institutions and rural communities to promote sustainable forest management. The study emphasises the importance of community cohesion. It concludes that an effective forest governance method with strong social networks that are inclusive, adaptive, and responsive positively enhances both ecological and human livelihoods. Policymakers should create inclusive governance frameworks to address educational gaps and foster community engagement, improving the socio-economic well-being of forest-dependent populations.

Contested Imaginaries: Representations of Youths in Public Discourse on Insecurity and Social Issues

In this presentation, we reconstruct the processes of problematization, as well as the articulations and tensions surrounding issues of insecurity, social issues, and youth. This analysis is based on discussions and stances taken by workers from various socio-occupational groups during the post-pandemic period in Argentina.

Through focus groups composed of workers from diverse sectors of the labor market, we identified the emergence of youth as a key topic in public debate, particularly in connection with the issue of insecurity. As a result, young people are embedded within imaginaries that position them on different sides of the discourse. While some individuals identify youths as perpetrators, others focus on the situations they experience, framing them instead as victims.

Using a qualitative methodological approach, this paper sheds light on the state of the "post-pandemic" debate regarding the ways in which insecurity, social issues, and youth intersect within the focus groups we conducted.

The Social Life of Phosphate on the Two Shores of the Mediterranean: Labour, Ecology, and Migrations

This presentation focuses on the extraction, travel, and processing of phosphate, tracing the history of the commodity's movements from Khouribga (Morocco) to Porto Marghera (Italy). For decades, these two sites have been silently connected in what historian Simon Jackson calls the Phosphate Archipelago: a network of extractive and industrial spaces on the two shores of the Mediterranean, spaces once managed by the French empire. Over time, deep changes have transformed the global political economy of phosphate. Today, nonetheless, phosphate remains a key ingredient in the global food regime, and the disruption of the phosphorus cycle is a prominent ecological threat. Phosphate thus invisibly links not only mining, industry and agriculture, but also interconnected conflicts around labour, ecology and international relations.

AZAOLA, CRISTINA* (University of Southampton, United Kingdom)
 PELEG, RAN (University of Southampton, United Kingdom)
Investigating Staff and Student Belonging in a Further Education College through Innovative Participatory Game Based Research

In the world of education, belonging has been conceptualised as the affective and emotional dimension of students' experiences at school. However, one aspect that has been overlooked is that of space. How space affords, neglects, or enhances students' belonging is still unexplored. We adopt a sociological lens to explore school belonging that acknowledges its innate relations with power, our bodies and emotions, and the politics of non-belonging. The focus of this paper on space and belonging did not originate from our realisation of the marginal role of space in research but through a Participatory Game Based Research (PGBR). Our PGBR adopted a participatory and innovative methodology in one Further Education College (FEC) in the South of England. It was participatory because staff in the FEC acted as co-researchers who had a say in the creation of research questions, collection, and analysis of data. After receiving workshops on belonging and research skills, the co-researchers chose to focus on space and belonging, i.e. what areas of the school fostered or hindered school belonging. The research revealed some surprising findings, e.g. that students tend to feel that common areas are not theirs and that overall, they feel a stronger sense of belonging when they are in their home subject areas, contrary to what staff was expecting, which is the focus of this paper. These findings were later converted into a game that allows players, in this case staff, to experience the school from the perspective of students.

AZAOLA, CRISTINA* (University of Southampton, United Kingdom)
Teachers' Jury Workshop: An Innovative Vehicle for Fostering Teacher Agency and Eventual School Belonging

This article discusses the development of a teachers jury workshop drawing on the concept of teacher agency with technical professional high school teachers in Mexico. We argue that for school belonging to take place, teachers need to proactively promote it in the classroom, for which teacher agency is key. We depart from understandings of teacher agency that focus on teachers as individuals decontextualised of structural powers. Instead, we explore how teachers manage to be agentic professionals despite their hierarchical working environments willing to explore collaborative ways in which agency can flourish. We adopt an ecological approach of teacher agency. We also employ an innovative methodology of workshop facilitation designed to identify, prioritise, and solve questions related to school belonging collaboratively amongst teachers who acted as juries. With fifty-seven participants, the teachers' jury workshop lasted three days. On day 1, teachers reflected on the evidence from their own professional experiences. On day 2, both authors presented research evidence on school belonging. On day 3, the teachers were invited to evaluate the evidence discussed in the previous two days, reach their verdict on the challenges of school belonging and define concrete actions to be implemented at the classroom and school levels.

AZEREDO, RAFAEL* (University of Queensland, Australia)
 SMITH, KIAH (University of Queensland, Australia)
Horticulture, Justice, and Migrant Labour in Coastal Australia

The growth of Australia's horticultural sector, combined with its seasonal and labour-intensive nature, limited supply of local labour, as well as cost pressures from retailers and global production, has increased the demand for temporary foreign workers in regional and rural Australia. This paper critically examines Australia's use of migration policies to meet this demand, focusing on the Working Holiday Maker (WHM) program and the Pacific Australia Labour Mobility (PALM) scheme. Through policy analysis and interviews with industry and government stakeholders, this paper explores how these programs shape the conditions under which migrant workers are employed. Recent allegations of modern slavery within the PALM program and inquiries into the WHM program underscore systemic issues of underpayment, restrictions on worker freedom, and exploitative practices. This paper addresses the ethical challenges and power imbalances embedded in the design of these migration programs, offering insights into the ongoing struggle for inclusion, justice, workers' rights, and decent work conditions.

AZRRAR, ABDALLAH* (Doctor at Hassan II University of Casablanca, Morocco)

Les Nouvelles Dynamiques Migratoires Au Maroc : Les Réfugiés Syriens Comme Étude De Cas

L'arrivée des réfugiés syriens, ayant fui les persécutions de la guerre, atteste d'une nouvelle dynamique migratoire qui se dessine au Maroc. En tant que pays d'émigration, de transit et de blocage, ces transformations sociales témoignent du nouveau statut du Maroc en tant que pays d'accueil et d'immigration. Cette présence syrienne contribue à la diversification et à la hiérarchisation des profils et statuts de l'étranger au Maroc. Leur installation temporaire et permanente impose de nombreux défis générés par les migrations internationales forcées. Etant donné que le statut des syriens reste ambigu tant que la loi nationale sur l'asile n'est pas encore adoptée, leur visibilité dans l'espace public questionne l'Etat marocain sur sa nouvelle politique migratoire adoptée en 2013, notamment dans sa dimension relative à l'asile et à la protection des réfugiés. En tant qu'agence onusienne internationale, c'est le HCR qui se charge de l'enregistrement des demandeurs d'asile et de l'assistance aux réfugiés. Ainsi, la présence syrienne interroge la société marocaine dans ses capacités d'accueil, d'inclusion et de vivre-ensemble avec l'Autre. Cette communication interroge les enjeux de reconnaissance juridique et les modalités de leur intégration à la société urbaine marocaine. En s'appuyant sur une enquête sociologique qualitative réalisée dans la ville de Casablanca, j'ai analysé les indicateurs d'intégration à travers le logement, l'emploi et la scolarisation. Ces modes d'intégration des réfugiés syriens dans la société marocaine sont influencés par leur origine sociale, leur capital économique et scolaire, leur statut juridique et professionnel, leurs ressources relationnelles, leur solidarité familiale et communautaire, leur rapport avec la société d'accueil et leur durée de séjour au Maroc. Ces multiples facteurs déterminent les lieux de résidence appropriés, les types d'emplois occupés et les établissements scolaires fréquentés.

AZZAMOVÁ, KATARÍNA* (Masaryk University, Czech Republic)

Becoming the Universe: Self-Realization and Meditative Practices in the Sahaja Yoga Community of the Czech Republic

In recent years, meditation has gained significant popularity worldwide, especially with the mainstreaming of mindfulness meditation, which is widely promoted as a tool for self-development. The expansion of meditation research, including the field of contemplative neuroscience, has contributed to the legitimization of meditation, bridging traditional spiritual practices with scientific inquiry.

This paper explores the anthropology of self-realization within the Sahaja Yoga community, as a lower-legitimacy movement, that offers a unique perspective on meditative practices. Based on ethnographic fieldwork in a post-socialist region of the Czech Republic, this study investigates the meditation as a culturally situated practice where bodily experience is shaped by broader discourses of power, capitalism, and biomedical knowledge. The study addresses how Sahaja Yoga practitioners negotiate sensory boundaries and conceptualize the body in contrast to biomedicine's emphasis on the physical body.

The project seeks to address the following questions: What role does the body play in a community focused on self-realization, especially in relation to biomedical understandings of the body? How are sensory boundaries negotiated and performed in the Sahaja Yoga community? And what makes the meditative movement (il)legitimate for the meditation researchers in the Czech Republic? The paper thus contributes to the fields of anthropology of religion, medical anthropology, and sensory anthropology by offering insights into the lived experiences and cultural dynamics of a meditative community navigating the intersection of spirituality, healthcare and science.

AZZARONE, FRANCESCO* (Scuola Normale Superiore, Italy)
The "Charm of Distance": Artistic Experience and Sensory Self-Defense

In my paper, I explore the political potential inherent in social aesthetics. Simmel's social aesthetics is particularly valued for its ability to encompass both meanings of Kant's aesthetics. Indeed, it addresses not only (a) the connection between social forms and expressions of beauty but also (b) the social and historical changes in our modes of perception. In my view, social aesthetics reveals its full potential when examined in its political

implications. Simmel's social aesthetics enables us to investigate the sensory component inherent in issues of a political nature. In particular, I argue that (i) the overabundance of stimuli that threatens modern individuals is the sensory manifestation of the overwhelming power of the social typical of modernity, and (ii) modern subjects' perceptual self-preservation is the sensory consequence of the modern conflict between individuals and society. Defending oneself from modern overstimulation also means protecting oneself from the encroachments of the social sphere and even from other individuals. By integrating both meanings of social aesthetics, in my paper I explore how modern mechanisms of sensory self-defense translate into artistic experience. As Simmel suggests, in the artistic domain, our age is characterized by a widespread «charm of distance», which serves as the counterpart to an endemic «fear of getting into too close contact with objects». As the sensory demands of social life increase and the collective sphere becomes broader and more intrusive, artistic experience tends to become a refuge of disengagement. Social aesthetics offers the opportunity to investigate how the political framework shapes our sensory interaction with the world, both in everyday experience and in art: the quest for distance can thus be used as a paradigm to interpret not only the modern *sensorium* but also contemporary artistic expression.

Good Debt, Solidarity Networks and the Return of the Gift: The Possibility of an Alternative Financial Practice in the Edges of Debt Capitalism

Contemporary debates on financialization reveal a story of individuals, households or corporations becoming increasingly embedded in the debt economy. In critical finance studies or neoclassical economics literature debt is mostly taken for granted as a univocal concept, this paper argues that there is no singular and homogeneous nomenclature of debt and that the meaning of the concepts of debt has contextually different manifestations. It becomes clear in the formation of distinctions between different ethnic, religious, economic classes, and these various dispositions multiply an ambiguous meaning for a universal definition of debt.

This study discusses how an alternative interest-free debt economy is theoretically and empirically constructed by micro-level reproduction of religious life through personal debts. How can debt be considered a new ground for social solidarity in Islamicate societies, specifically through *good debt* (*qard al-hasan*), as part of a Maussian relationship of gift and reciprocity, in contrast to the debt economy of credit within the institutional economic structures and social relations of capitalism?

In Turkey, following the advanced financialization that emerged after the 2001 crisis at the household level, the practices of constructing interest-free debt networks, rooted in Islamic economic imagination and solidarity, have become increasingly widespread. This study primarily focuses such "good debt" communities, which are shaped by groups of 20-30 people whose close relationships are formed through weak ties, as noted by Granovetter, and who lend their regular savings as interest-free, term loans to their friends or relatives in need, in the face of institutionalized economic structures. Then it empirically demonstrates that finance, money and debt as social relations can be rethought through religion and an alternative trust-based financial mechanism to capitalism can be reproduced on micro levels.

Collecting, Sharing and Celebrating Moroccan Migration Stories & Heritage in the Red Star Line Museum (Antwerp)

The Red Star Line Museum in Antwerp is located in the historic buildings of the shipping company where nearly 2 million European emigrants departed between 1873 and 1934, seeking a better life. Third-class passengers were medically examined before departure, making this location a 'lieu de mémoire' where history and memory intersect, connecting with contemporary migration issues as a migration museum.

In times of xenophobia and polarization, the museum aims to be an open house that inspires and challenges visitors. Its relevance lies in bridging past and present and offering a safer space where migrants can share stories and feel recognised. Therefore, the museum invests in projects and partnerships focused on community engagement, co-creation, well-being, and dialogue.

The focus of this contribution is on migration stories from the Moroccan community in Antwerp. By collecting and preserving stories from different generations Moroccan families, the museum strengthens the involvement of the community and provides a more nuanced picture of migration. These stories preserve cultural heritage and are essential for the Moroccan community to better understand their past and their identity, and connect to the future.

Collecting these stories presents challenges, such as lack of representation of Moroccan stories in museums, racism, prejudices, language barriers and ethical issues. Through co-creation and participation, these obstacles can be overcome, and long-term relationships can be built, contributing to a more complete picture of migrants' contributions to society. The Red Star Line Museum's approach combines story collection with participation, co-creation, and well-being, ensuring that people feel safe and recognized, which encourages long-term contributions and cooperations.

An example of this is a project with Moroccan women in Antwerp, captured in a documentary:

<https://www.youtube.com/watch?v=Epx-PQ73z7g>

In our presentation, we want to share our experiences over the last 15 years and the lessons learned.

What Potential Dangers Do Populist Attitudes Harbor? the Link between a Lack of in-Group Recognition and out-Group Derogation.

The elections to the European Parliament at the latest have shown that populist parties are in a position to encourage sections of the population to vote for them on a relevant scale. The literature to date has largely focused on how populist attitudes arise and offers a variety of potential explanations. But what are the consequences of populist attitudes on the other side? And are the effects of populist attitudes and the success of populist parties equally distributed across all population groups? More specifically, do certain social groups within societies have to fear a decline in their freedom and safety due to rising populism? The paper addresses this research question and draws on the theory of threatened social identities to discuss this question. Initial empirical studies have shown that a lack of social recognition can be perceived as threatening to social identities and that populist attitudes can emerge or be reinforced as a result. However, the Social Identity Theory (SIT) goes one step further and postulates that individuals resort to counter-strategies in order to preserve their positive self-worth. One of these counter-strategies is the derogation of relevant out-groups. If one's own social identity is threatened, the devaluation of out-groups helps to ensure that one's own in-group is just as good in comparison as it was before the threat occurred, even if both groups have lost ground in absolute terms. But under what conditions do individuals resort to this strategy? Based on data from the German Longitudinal Election Survey (GLES) cross-sectional study conducted in 2021, I find that the level of social recognition is negatively associated with populist attitudes. Furthermore, those who feel not recognized and state extreme populist attitudes are significantly more likely to derogate migrants.

Asymptomatic Nationalism and Its Woke Symptoms: Nationalists without Nationalism in Postsocialist Montenegro

The main ethno-political antagonism in Montenegro – between Montenegrins and Serbs – differs from the rest of the post-Yugoslav region due to the lack of ethnic distance between the two communities. While intermarriage is considered perfectly normal, ethnicity becomes problematic only when politicized – when it becomes a basis for political power struggles. Until the statehood status became the central political issue in the 2000s, Montenegrin and Serb identities were neither mutually exclusive nor inherently antagonistic; with substantial overlap, they were often interchangeable. However, political polarization around the issue of state independence eventually split families apart, even dividing siblings ethnationally – those favoring independence identified as Montenegrins, while those opposed identified as Serbs – creating two antagonistic ethno-political camps in the process. Since Montenegro's independence in 2006, only Serb nationalists openly embrace the nationalist label, whereas Montenegrin nationalists reject it, instead adopting a position of “civic patriotism” and denying the existence of Montenegrin nationalism altogether. By analyzing population census data over the past three decades of postsocialist transformation in Montenegro, alongside op-ed pieces by self-proclaimed “Montenegrin patriots”, this paper draws on Hall's theory of articulation and Boltanski and Thévenot's theory of justification to account for what I label “asymptomatic nationalism”. First, the paper focuses on the macro-level of ethnonational division in Montenegro, employing process tracing to understand why and how ethnic and other differences were linked into two (ethno)political “chains of equivalence” during the state-building process under the same (semi)authoritarian regime, resulting in two opposing ethnonational identities. Second, it shifts to the micro-level through critical discourse analysis, examining how Montenegrin nationalists use “civic wokeness” to mask nationalist exclusion, justifying the marginalization of Montenegrin Serbs in the name of protecting the country's “civilizational values” and its “European future” from the supposed “Balkan backwardness” they attribute to Montenegrin Serbs and their politics.

RC14-212.4

BACA, BOJAN* (University of Montenegro, Montenegro)

From Conspiracy Theory to Conspiracist Ideology: Rethinking Social Critique in the Conspiracist Zeitgeist

During the COVID-19 pandemic, conspiracism has shifted from the fringes of society to the public mainstream, with many of its proponents willingly adopting the derogatory label of “conspiracy theorists”. Seeing themselves as “conspiracy analysts”, they not only aim to understand the inner workings of social reality but also offer alternative political frameworks and advocate

for change. The condition in which people increasingly feel less shame in articulating political positions through conspiracy theories and where everyone can become a prosumer of these theories has ushered in the *conspiracist zeitgeist*. This transformation of conspiracist *estrangement* from the political mainstream into conspiracist *engagement* within the digital public sphere has been facilitated by the platformization, gamification, and democratization of conspiracy theorizing. Therefore, by shifting the focus from conspiracy theories to the process of conspiracy *theorizing* itself, this paper argues that we can better understand how conspiracism produces social critique that posits *conspiracy* as a fundamental organizing principle of contemporary global society. Using Michael Barkun's three principles of conspiracy theory – “nothing happens by accident”, “nothing is as it seems”, and “everything is connected” – as a starting point, this paper argues that, in the face of a growing sense of unreality in our digitally mediated world, these tenets must be reconceptualized as complexity-reducing analytical tools of conspiracist ideology – which I designate as *epistemic deconstructionism*, *political gnosticism*, and *ideological totalitarianism* – for arriving at a more nuanced sociological understanding of contemporary conspiracism as a non-pathological epistemic-cum-political standpoint.

BACALLAO PINO, LÁZARO MAGDIEL* (Universidad de Salamanca, Spain)

Communicative Imaginaries in Social Movements: The Role of Communication in Mediating Prefigurative Action between Present and the Imagined Future Social Change

The importance of the communicative dimension in contemporary social movements has been widely recognised, given their self-definition from their discursive practices (Castells) and since it becomes a prominent part of their organisational structures (Bennett and Segerberg). Simultaneously, although the importance of a proposal – besides to the denial of protest – of an imagined future of social change for these socio-political agents, synthesised in the slogan “Another world is possible”, has been pointed out, the importance and role of this imaginary of a possible project – opposed to the neoliberal “There is no alternative” –, have not been sufficiently investigated. Based on a qualitative case study of four Latin American social movements – through in-depth interviews with members and critical discursive analysis of their communication spaces –, this study aims to analyse the issue from the intersection of both dimensions: communication – given its dual phenomenological nature (material and symbolical/ideological) (Gramsci) – and imaginaries of social change. Main findings show that, contrary to the absence of a plan in so-called insurgencies noted by previous studies (Arditi), the analysed social movements have a proposal for social change that articulates concrete objectives with more utopian goals of an imagined ideal future, which is articulated with the communicative dimension in two senses. Communication becomes, on the one hand, a tool to share/ socialise the objectives and imaginaries associated with that future among members/sympathisers, and, on the other hand, an end in itself, as a space to put into practice pre(con)figura(c)tive – this is, prefigurative actions in common – dynamics of an imagined scenario of communicative social change characterised by horizontality, democratisation and participation. In conclusion, this dual nature of those communicative imaginaries integrates two parallel/simultaneous processes of articulating visibility and visibilising articulation that become a two-level mediation in both: 1) material processes of mobilisation and organisation; and 2) subjective processes of motivation and creation.

RC42-JS-64.4

BACALLAO PINO, LÁZARO MAGDIEL* (Universidad de Salamanca, Spain)

El Cristal Con Que Se Mira: Peculiaridades De Los Movimientos Sociales y Desafíos Metodológicos Para La Investigación Activista Derivados De Aquellas

Los movimientos sociales contemporáneos que pretenden un cambio del orden hegemónico neoliberal proponen, en sus repertorios de acción colectiva de protesta/propuesta, unas novedosas interrelaciones individuo/colectivo, un singular empoderamiento de sus miembros, basado en la dispersión del poder en sus formas organizativas (por ejemplo, liderazgos colectivos), y la centralidad de una comunicación participativa. Basado en un ejercicio de reflexividad sobre la experiencia de investigación con movimientos sociales latinoamericanos, se analizan las implicaciones que tiene un contexto de conflicto social con tales características para el posicionamiento de investigador-activista, en relación con las tensiones metodológicas del trabajo de campo, su impacto en el enfoque investigativo, los métodos y técnicas, y la relación entre los distintos sujetos involucrados en el proceso investigativo. Los resultados muestran que la investigación-activista con movimientos sociales,

considerando el empoderamiento de sus miembros y su cuestionamiento de los extractivismos académicos, debe superar incluso la investigación militante o la investigación-acción-participativa, transitando hacia una perspectiva de sujetos articulados en procesos de investigación con/desde/para la acción colectiva, evitando diferenciar entre sujeto investigador/investigado. Resulta necesario superar enfoques divisorios entre técnicas centradas en el individuo (entrevistas) y el colectivo (grupos de discusión) para implementar herramientas donde la mediación investigativa-activista asuma toda las complejidades y tensión de las interrelaciones individuo-colectivo, mediante procesos simultáneos de (des)concentración del proceso investigativo. Es pertinente asumir los postulados de la metodología comunicativa crítica, en particular su epistemología intersubjetiva/dialógica de la investigación social, que supondría un enfoque dialéctico de las interacciones entre las subjetividades de los sujetos implicados en el proceso de investigación. En conclusión, estas transiciones metodológicas implican reformular las dimensiones ontológica y epistemológica del rol de investigador-activista, superando la tensión compromiso/distanciamiento y cualquier vestigio que lo considere un ente exógeno con respecto a unos sujetos investigados (pasivos), para transitar hacia la participación de sujetos investigadores en procesos de investigación activista.

Explain Male Sex Workers' Activities with Sexual Scripts Theory. Money, Masculinity, and Love.

Despite the large and growing number of research on the topic, sex work and sex workers can still be labelled as an unresearched area of study; even more under-explored is the male side of this phenomenon. But sex work and sex workers cover many issues that go beyond the questions related to legislation, criminalisation, and feminists' debates.

In this oral presentation, we present two studies carried out in Italy and Sweden about male sex workers who sell sex to other men both online and in public venues (such as porn cinemas and cruising areas).

Since selling sex and sexual services is perceived as a stigmatised activity, especially for those men who self-identify as heterosexuals, men who engage in these behaviours need to find a way to justify their presence in the market. At the same time, as recent research highlighted, it is possible to observe the growing presence of self-identified homosexuals in sex work.

Our theoretical framework is based on the so-called sexual scripts theory of J. H. Gagnon and W. Simon, as presented in their seminal work "Sexual Conduct: The social sources of human sexuality", published in 1973 by Aldine. Indeed, despite the years and criticisms, this theory continues to shape research and researchers in every corner of the planet in describing human sexual behaviours. And even in our two studies, we applied sexual scripts theory to understand how male sex workers behave with their clients around three key concepts: money, masculinity, and love. We will present how the relationship between escorts and clients cannot be simply explained under the rule of money but also how masculinity and love can shape and even better explain the decision behind the choice to start a career in the sex work market.

'the Impossible Choice You Have to Make': A Qualitative Analysis of Low-Resourced Single Parents' Work-Family Practices and Experiences in Dual-Earner-Dual-Carer Sweden

The ability to combine paid work and family life in a gender-equal way has been a longstanding policy aim in Sweden, arguably with gender equality within dual-earner-dual-carer families as the focal point. Despite the well-documented gendered dimension of single parenting, less is known about what this focus on gender equality means for single mothers. This study explores how low-resourced single mothers meet family needs in the Swedish context, using low-resourced coupled parents as a comparison group. A total of 31 single mothers and coupled parents (17 single, 14 coupled), recruited through community organisations in four Swedish cities, participated in seven focus groups during May-July 2023. While scholars have recently suggested that separated parents now drive rather than stall gender equality in Sweden (Eriksson & Kolk, 2024), I suggest that the opposite may be true for low-resourced single mothers. The findings show that the experiences of low-resourced single mothers can be better characterised through gender inequality. This conclusion is supported through three interrelated themes: (1) The policy expectation of co-parenting imposed unique pressures on full-time single mothers, including financial losses stemming from policies that

either assume shared parenting arrangements or do not compensate for their absence, (2) like coupled parents, single mothers did not share family responsibilities gender-equally, but trade-offs were especially pronounced for single mothers who had few opportunities for sharing responsibilities, and (3) single mothers expressed a felt under-recognition of vulnerabilities associated with single parenting from society and the welfare state. Together, these insights further our understanding of the disadvantages faced by single mothers in a dual-earner-dual-carer policy context that favours gender-equal behaviour.

BADAWI, AHMED MOUSA* (Director of the Arab Center for Social and Human Sciences - Egypt, Egypt)

Egyptian Youth's Perception of Political, Social and Cultural Problems: A Sociological Analysis Using Conflicted Rules Theory

Youth studies are a growing area of research in all fields of social sciences. As youth are the largest demographic group in Egypt, political, social, and cultural change affecting this group will be reflected in society and the path of sustainable development in Egypt.

Since the Egyptian society and most Arab countries are going through historical crises, they are unable to develop and face regional and international challenges, due to three types of problems related to state institutions and obstacles to democratic transformation, traditional problems related to local and national social and cultural structures, in addition to the challenges of digital transformation at the individual and group level. It is certain that the level of youth awareness of these crises will be influential in the future of Egyptian development in the medium and long term. Accordingly, the main research question came as follows:

How do Egyptian youth perceive the political, social and cultural problems facing their society?

Theoretically, the study is guided by Conflicted Rules Theory (CRT), which belongs to the Agency/Structure Approach in sociology, and attempts to overcome the epistemological and ontological problems that characterize the Western sociological heritage, by attempting to describe, explain, and predict the change that occurs in social life without focusing on specific societies or phenomena.

At the methodological level, the study adopts a mixed approach, quantitative and qualitative, where the researcher uses national and international databases to describe the youth's state, besides using narrative interviews to reveal the level of awareness. The interview texts are analyzed using a new approach derived from (CRT), which the researcher calls: Four-dimensional Critical Discourse Analyses, which concede a development of Norman Fairclough's critical discourse analysis.

The Religiosity of Modern Mongolians

Thirty years of post-socialist development in Mongolia and Russia of a democratic political system and civil society institutions, the formation of freedom of conscience and the absence of state ideology, and shifts in the socio-economic structure have significantly transformed the institutions of Buddhism in these countries. By now, we can state the completion of the re-institutionalization of Buddhist communities in both countries and the beginning of a new stage of development. At the same time other religions such as Christian enter and become attractive for many Mongolians. According the last Population Census (Mongolian National Statistical Office) from 2020 almost 60 percent of population identified themselves as religious, among them about 3 percent were Christians. Value of religion, religious state of Mongolians, it's changes and reasons will be discussed in the paper based on various survey data, including survey WVS-7, conducted in Mongolia.

Building Peace through Learning: Integrating Educational Reform into Peace Architecture in the Conflict-Affected Pashtun Tribal Region, Pakistan

The Pashtun tribal region lying on the Durand Line has been severely marginalized and radicalized by lethal conflicts over the past four decades that have led to extremism, militancy, terrorism, and deep collective trauma. Governed by the colonially designed Frontier Crimes Regulation for over a century, the region was integrated into Pakistan in 2018 as part of its journey toward peace and post-conflict development. There is an urgent need to address Pashtun society's social and territorial wounds. This paper describes the traditional Pashtun jirga—an inclusive council where all members have equal voice—as a decolonizing method of data collection. Charmaz's grounded theory methodology, as conducted by a Pashtun researcher adhering to Pashtunwali, offers insider insights into the community's educational needs. Culturally sensitive in-depth interviews and jirgas for data collection with Pashtun tribal elders, activists, politicians, and educators identify gaps and prospects within the existing educational system. The current education system largely ignores the local context and fails to acknowledge the memories of violent conflicts, neglecting the pressing need for community healing and reparation. Given the recent extension of Pakistani state laws and the destruction of thousands of schools, there is an urgent need for contextualized educational policies. This research contributes practical suggestions grounded in Pashtun society's realities, addressing unique challenges that the current national curriculum is unable to resolve.

Integrating Pashtun Indigenous knowledge and practices such as jirga into the education model embraces varied knowledge ecologies and multiple ways of knowing and feeling. Schools and colleges can create a new generation and open spaces for empathy and peacebuilding.

Social Theory and Artificial Intelligence: Key Challenges

Straddling a middle ground between apocalyptic and ecstatic accounts of an AI-dominated future, we discuss five possible challenges posed by artificial intelligence for humanity today. These challenges are by no means new, but AI has the potential to intensify them in unprecedented fashion. Firstly, AI possibly compromises notions of human agency and freedom as we have traditionally known them due to its potential to monitor, nudge and guide people's behaviour, thereby enabling various actors (ranging from the state to possibly the AI-model itself) to limit the scope for the individual to deviate from specific norms. Secondly, AI complicates issues around authorship and ownership of intellectual and artistic products, further eroding the erstwhile primacy and fixity of the human subject as creative force. Thirdly, AI poses further challenges for distinguishing what is real and unreal, possibly leading to a state whereby individuals learn to live with and accept the uncertainties of that distinction. Fourthly, AI poses new challenges for the maintenance of our mental and cognitive agility, enabling as it does for us to rely on technologies to fulfil functions that otherwise would have required our own intellectual input. Fifthly, given the uncertainty as to the potential of this technology, especially its destructive potential, questions arise as to how to deal with the AI-research itself, what its current value is, whether to pause that research, and so on.

BAESCH, SOPHIA* (University of Luxembourg, Luxembourg)

(Complex) Health Care Needs at School: Spotlight on Excluding Structures and Practices across German-Speaking Countries

Access to quality health care and inclusive education is guaranteed by two UN-conventions (United Nations Convention on the Rights of Persons with Disabilities, 2006; United Nations Convention on the Rights of the Child, 1989). With the ratification of these conventions there is statutory commitment to establish inclusive education systems across German-speaking countries that can cater towards the rights and needs of students with Complex Health Care Needs (CHCN), too. Whilst there is a lack of data on access to quality care and inclusive education for students with CHCN (Adenstedt, Baesch & Prummer, 2021), existing research reports across the globe suggest extremely marginalising practices (Allard et al., 2015; Ballard & Dymond, 2016, 2018; Lehr, 2020). Local research findings covering partial or neighbouring domains (see Schlüter, 2013; Schwager, 2003; Klauß, Lamers & Janz, 2006; Bernasconi & Böing, 2016; Flieger & Müller, 2016) likewise suggest unmet rights and needs of this population on an astounding scale. The complexity at the intersection of healthcare and education is currently mostly outsourced to the so-called Special Needs Sector in this socio-geographic area, which is still characterised by strong educational segregation based on perceived Disability (Pfahl & Powell, 2011; Buchner & Proyer, 2020). How schools meet Health Care Needs is, however, very relevant beyond the comparatively small population of students with CHCN: they are inherent to the human existence, with students requiring support to meet these throughout the schoolday (Allard et al., 2015; Klauß, 2007). There is, accordingly, a strong need for research at the intersection of health care, education and social justice, identifying relevant stakeholders, policies and local practices, mindsets and (professional) beliefs involved in meeting the rights and needs of students with (Complex) Health Care Needs. Understanding and deconstructing existing exclusionary practices and structures is essential to ensuring students rights and needs are met.

BAEZA CABELLO, CLAUDIA ANDREA* (Universidad Autònoma de Barcelona, Spain)

A Typological Proposal of Self-Employment: Comparative Analysis between Chile and Spain.

The presentation deals with a comparative typological analysis of self-employed workers in Chile and Spain, with the aim of establishing similarities and differences in the configuration patterns of the various profiles of self-employed workers.

It seeks to conceptually, theoretically and methodologically delimit self-employment in its various forms by analysing the data from the active population survey for the years 2019, 2020, 2021 and 2022. Therefore, it is intended to provide elements of analysis based on the construction of the typology of these workers for the understanding of this phenomenon. In summary, provide theoretical and empirical elements for a sociological analysis that sheds light on the social reality of the group studied.

The study design was sequential, composed of a factorial analysis of multiple correspondences together with a cluster analysis with the factors obtained. In both countries, as a result of this first stage, we found three strata: high, medium and low. Subsequently, the sequential design included a second qualitative phase. To obtain the sample for this phase, we applied a typological paragon based on the average profiles of those obtained in the quantitative phase. From these profiles we applied biographical interviews and build a typology of work trajectories. Finally, we report on a typology of work trajectories in both countries composed of four types: linear, moonlighting, discontinuous and informal. This last sector is more evident in Chile with a very high rate of 70% within the group, but it is also present in Spain with a much lower incidence.

Last but not least, it is noted that the phenomenon of self-employment responds to a social structure of occupation clearly detected between independent occupations of high quality and professionalisation, passing through middle sectors dedicated mainly to commerce and services, reaching a low-skilled sector of the primary sector.

Cartografiando Afectos Docentes EN Relación CON La Narcocultura

La siguiente investigación propone cartografiar los afectos que circulan en siete docentes de escuelas públicas de Santiago en relación con la participación de sus estudiantes en la narcocultura. Utiliza un enfoque metodológico cualitativo posthumanista y hace un ensamblaje entre la teoría de afectos, biopoder, biopedagogía y subjetivación, utilizando como técnica de elicitación de datos la narración y la conversación informal. Como resultado se identificaron cinco temas principales emergentes: la narcocultura como concepto de opción rentable que da poder y estatus cuyo final es la muerte, los afectos del odio y el miedo generados por los medios de comunicación y redes sociales, el papel del biopoder y la verdad en la legitimación de roles sociales, el rol formativo de la escuela como alternativa frente a la narcocultura y la importancia de los docentes que marcan y dejan huella. Los hallazgos destacan la complejidad de los afectos que movilizan las representaciones que hacen los y las docentes respecto de la narcocultura, subrayando tanto la resistencia como las limitaciones del sistema educativo en contextos de alta vulnerabilidad social.

The Ways International Students Use Social Media during Their Mobility

This paper focuses on the ways international students coming from East Asia – specifically from China, Japan and Vietnam, - use social media, both to connect with their family and friends in their home country and adjust to their receiving country.

Due to the long distances and high costs, in the past studying abroad was a great challenge, however recently it has become more available, because of different scholarships, internationalisation of higher education, global connectedness and more accessible information sources. Social media not only helps to access this information but also serves as a tool to connect with other people. In the case of international students, on the one hand, it opens the doors to easier and more convenient methods with family members and friends in the home country. On the other hand, it creates ways to connect to other students and find helpful information, which makes it easier to integrate into the host country.

The study employs qualitative research methods, specifically semi-structured interviews with 50 students from China, Japan, and Vietnam enrolled in Hungarian universities. Preliminary data suggest that many of these transnationally mobile students connect daily or weekly with their family or friends in their home country through social media, but it is controlled by them, they are the ones, who initiate calls and send pictures. However, due to technical difficulties, this connection in the families often only with parents, neglecting the older generations.

In terms of the receiving country, students are often part of different group chats that help them in everyday life, especially connected to their university activities, but not limited. Some participants noted, that part-taking in these online groups enabled them to advance in other areas of their lives; such as finding a job or an apartment.

BAGIROVA, ANNA* (Ural Federal University, Russian Federation)

Corporate Citizenship in Demography As a New Element in Regional Models of the Welfare State in Russia

A population decrease and falling birth rates are a critical challenge in Russia. The negative trend persists despite the welfare state support to low-income families with children and a focus on the social sphere and measures to increase birth rate and multi-child parenting. Aggravated by staff shortage, the crisis urges employers across Russia to develop new forms of staff retention and recruitment. One of the new social policy directions in the business sphere is corporate demographic policies for employees and their families. The new context involves the following aspects: (1) By actively supporting families with children and promoting higher birth rates, the state changes the social agenda — it increases the value of the family and parenting among citizens, thus shaping a new agenda for business, which aims to support employees' family responsibilities and provide additional measures

for stimulating births. (2) Experiencing a tremendous staff shortage and competing for employees, businesses have to look for the new ways to retain and recruit staff. (3) Employees and graduates that consider family a priority in life form a certain opinion about the employer and the measures it offers to support family responsibilities. In 2024, we held a comprehensive sociological study (encompassing three federal districts) that allowed us to document this opinion and develop approaches to describing the regional model of the social welfare state, which includes a stance of Russian employees on the corporate citizenship and its role in mitigating pressing social problems that have to do with the negative demographic trends in fertility. The work has been supported by the Russian Science Foundation grant No. 24-18-00854.

Memories of Enslavement and Sexual Violence

Angela Davis stated that "slavery relied as much on routine sexual abuse as it relied on the whip and the lash" (1981: 40) and bell hooks stated that "no scholarly attention has been given to the oppression of black women during slavery" (1982: 22). Forty years later, there has been research on this matter and sexual violence is increasingly recognized as a vital and structural part of the systems of enslavement in the Atlantic World. But taboos and knowledge gaps remain around the issue. Based on empirical research from my fieldwork in Ghana and Brazil for the project "Individual and collective memories of slavery and the slave trade: A contrastive comparison of different communities, generations and groupings in Ghana and Brazil" (funded by the German Research Foundation, 2022-2025), I will discuss references to the topic of rape and sexual violence that I've come across in family and community (hi)stories and in guide narratives at memorial sites.

Placing Memories: Which Histories Are (De-)Thematized at Memory Sites in Ghana and Brazil?

Between Alamo (Texas, USA), Chichen Itzá (Yucatán, Mexico) and the thematization of slavery in (a planned) Disneyland: Michel-Rolph Trouillot often takes a concrete historical site as point of departure for his arguments on "power and the production of history". He concludes that "in order to engage" him, history "could not just be The Past. It had to be someone's past" (2015: 142). And Michael Rothberg has emphasized that "sites of memory do not remember by themselves – they require the active agency of individuals and publics" (2010: 8).

Following these strands of thought – emphasizing that memory sites need people to attribute meaning to them in the present – I will present different memory sites in Ghana and Brazil that address the history of the transatlantic trade in enslaved people. The paper is based on fieldwork and analyses carried out under the project "Individual and collective memories of slavery and the slave trade: A contrastive comparison of different communities, generations and groupings in Ghana and Brazil" (funded by the German Research Foundation, 2022-2025). I will discuss the following questions: Who is addressed by the respective site? Who is in charge of the narrative? And – often related to the former two questions – which parts of the history are (de-)thematized at this site?

Rothberg, Michael. 2010. "Introduction: Between Memory and Memory: From Lieux de Mémoire to Noeuds de Mémoire." *Yale French Studies* (118/119): 3–12.

Accéder à La Scène Politique Locale, Une Pente Raide Pour Les Jeunes Leaders Des Associations Rurales Du Moyen Atlas Marocain

Dès la deuxième moitié des années 90, plusieurs acteurs politiques et de la société civiles marocaine ont multiplié les initiatives en direction des zones rurales dans l'objectif de renforcement des associations de développement local et démocratique et de favoriser l'éclosion d'une jeune génération de militants et de militantes associatifs et politiques. Le lancement en 2005 de l'Initiative National de Développement Humain (INDH) a largement contribué à la naissance d'une nouvelle génération d'associations. Grâce à ce chantier d'envergure, les pouvoirs publics se sont repositionnés en acteur prépondérant d'encadrement de l'action collective instituée.

Capitalisant sur les compétences et la notoriété acquises dans le champs associatif et coopératif, plusieurs leaders d'associations rurales, hommes et femmes, ambitionnent d'accéder à la scène politique locale. Plusieurs contraintes sociales et politiques se dressent devant cette ambition, spécialement quand elle est portée par les plus jeunes.

La présente étude se propose d'identifier les facteurs communs et spécifiques qui habilent les leaders associatifs ruraux (hommes et femmes) du Moyen Atlas à accéder à la scène politique locale, en commençant par identifier leur principales caractéristiques, les compétences qu'ils mobilisent, les contraintes auxquelles ils sont confrontés et les rapports qu'ils entretiennent avec la scène politique locale et nationale.

Pour ce faire, est adoptée une méthodologie mixte quantitative et qualitative au niveau de quatre sites à dominance rurale du Moyen Atlas. Les résultats de ce travail montrent une diversité des profils des leaders de l'action collective instituée différenciée selon les spécificités locales, l'âge et le genre. Certains traits transverses communs ont pu être dégagés à même de cerner le profil du leader associatif qui accède au leadership politique et celui du leader qui n'y parvient pas, permettant ainsi la constitution d'archétypes descriptifs de cette population.

 HASSANE, NEKRACHE (Independent Researcher, Morocco)

Les Organisations Communautaires De Base, Sont-Elles Un Tremplin Vers La Participation Politique ?

Le leadership social et politique dans les zones rurales marocaines a été pour longtemps accaparé par sa forme coutumière ; les notables traditionnels acquis au pouvoir central. Profitant de l'ouverture politique du Royaume dans la deuxième moitié des années 90, plusieurs acteurs politiques et de la société civiles marocaine ont multiplié les initiatives en direction des zones rurales dans l'objectif de favoriser l'éclosion d'une jeune génération de militants et de militantes associatifs et politiques, modernes et démocratiques. Les pouvoirs publics ont réinvesti, avec force, le terrain associatif à travers le lancement en 2005 de l'Initiative National de Développement Humain (INDH).

La présente étude se propose de cerner l'impact de ces deux dynamiques sur le renouvellement des élites rurales et sur l'accès des nouvelles générations à la scène politique locales dans les zones défavorisées du Moyen Atlas marocain. Il est aussi visé d'analyser le positionnement social et politique permettant à ces nouvelles élites de participer à la gestion locale à travers l'investissement du processus électoral au niveau local et national.

Une méthodologie de recherche mixte, quantitative et qualitative, est ainsi mise en œuvre au niveau de quatre sites à dominance rurale du Moyen Atlas. Les résultats de ce travail montrent une diversité des profils des nouvelles élites de l'action collective instituée différenciés selon les spécificités locales, l'âge et le genre. Certains traits transverses communs se dégagent ainsi que des rapports d'instrumentalisation et d'instrumentalisation croisée avec le leadership politique notabilisant permettant la constitution d'archétypes descriptifs des stratégies adoptées par ces nouvelles élites pour accéder au leadership politique.

Humour and Social Transformation: A Multimodal Analysis of Tiktok Comedies in the Anthropocene

This research examines the evolution of humour on TikTok, comparing content from China, the UK, and the USA before, during, and after the Covid-19 pandemic. By analysing 21 content creators' videos across 36 months (January 2020–December 2022), the study investigates shifts in language, themes, and presentation styles, as well as the political, cultural, and social factors driving these changes. Data is drawn from the TikTok Research API, Analisa.io, and digital ethnography, highlighting issues with data quality and reliability.

Key findings reveal that (1) Chinese creators display more demographic diversity and larger fan bases than their Western counterparts, (2) the pandemic's early phase saw a peak in content creation, followed by stability, while Chinese creators deleted content during this time. Thematically, less than 10% of sketches directly referenced Covid-19, with much of the content reflecting everyday experiences and aligned with Maslow's hierarchy of needs.

This research connects digital culture with justice in the Anthropocene by exploring how humour serves as a means of coping with crises. It also interrogates the role of influencers in shaping societal responses and raises questions about whose knowledge and experiences are prioritized in digital platforms. The findings contribute to understanding how sociological knowledge of humour, technology, and culture can inform broader discussions on epistemic and environmental justice in contemporary societies. By considering the socio-technical systems that shape TikTok, this study offers insights into the evolving regimes of knowledge production in the digital age.

Roadmap for Working with Tiktok Research API

TikTok is one of the largest and fastest-growing social media sites in the world, expanding access to Research API from the US to Europe since July 2023. Volume and fidelity of data through official API is the key problem for research understanding trends in social change, human behaviour, and end consequences. This paper displays the experience of working with updating API, including online application, coding scheme, assessment of data quality and viable solutions to address limitations and research gaps. Data analysis includes published content (36 months) by 14 creators from 1 January 2020 to 31 December 2022. Compared third-party analytics platforms with manual calibration, produces low volumes of raw data but precise engagement statistics. Overall, API performance is constantly in flux regarding policies and features, forcing researchers to improvise from dependence on orthodox API routes. This paper will contribute to a better understanding of using the API and its pros and cons for TikTok researchers and suggests supplementary tools and models that produce contextual (textual, visual, and auditory) data and pluralist methodology with API facilitation.

Aspirational Justice and the Capability to Aspire for a Better Future Among Migrant Women in France

This paper questions the conditions for aspirational justice – understood as the provision of fair opportunities for people to imagine desirable futures. Drawing on Sen's idea of justice, we make the capability to aspire key for aspirational justice, which requires taking account of the multi-layered environment people live in and the set of resources and constraints resulting from it. In the case of migrant women with precarious and uncertain administrative status, constraints include the need to cope with the accidents of the past and the trickiness of the present - i.e. working in very precarious conditions; dealing with either limited language or professional skills or with lack of evidence thereof; and yet having to care for their family while navigating their own trajectory. While their daily lives are largely shaped by the constraints imposed by the French Immigration law, migrant women may find support in local initiatives, at the municipal or neighborhood level. We argue that the conditions for aspirational justice depend on the configurations in which public institutions and third sector organisations interact, leading local initiatives to function either as traps or as opportunities for aspirational justice. Our empirical focus is a training programme geared

at acquisition of language and prevocational skills in the Paris region. Our research data consist of public policy documents; 25 life story interviews; and semi-structured fieldnotes at a participatory action research project. First, we present our analytical framework of aspirational justice based on Sen's Capability Approach and Appadurai's capacity to aspire. Second, we discuss how the different institutions involved in shaping migrant trajectories interact and the tensions that arise in the case of the training programme under study. Third, we present a selection of women's trajectories to explore the variety of configurations, either favourable or unfavourable to the flourishing of their capability to aspire.

BAIMURZINA, GUZEL* (Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation)

Platform Work As a Challenge for Decent Employment and Social Protection for Workers (the case of Russia)

A significant portion of labor practices and employment relations have moved to the digital space. In some instances, this has substantially altered the nature of work, introducing new forms of activity and new parties to relationships (platforms as intermediaries in worker-employer or customer-contractor interactions), all of which remain under-regulated by the state. So, traditional issues of social protection for workers employed through digital platforms are becoming more relevant, require rethinking and finding new solutions. These solutions cannot be found without defining the legal status of workers, clarifying their employment status in terms of dependency/independency; understanding the mechanisms of regulating relations between employers, workers and platforms; exploring mechanisms for ensuring social justice, equality of rights and opportunities; developing criteria for quality of workplaces and labour relations.

In the study, we are trying to find answers to these questions. We examined a dataset downloaded from Profi.ru - one of the most popular digital employment platforms in Russia with a wide variety of services. Data collection was conducted during 2023, contains profiles of 935,312 Russian performers registered on the platform. Preliminary analysis showed: the majority (about 90%) of Russian platform workers are employed in the informal economy. Their socio-demographic structure gradually approaches the structure of general employment, although it still has its own characteristics, with more young people and urban residents. At the same time, the share of people without vocational education is noticeably higher in the platform segment due to ample employment opportunities for them (couriers, taxi drivers, domestic staff, etc.). It was revealed that some personal accounts (about 10%) hide groups of workers or intermediaries who redistribute orders among performers (show business services, repairs, cleaning, etc.). Based on results obtained and other studies, the author assesses social risks and positive effects of platforms employment, suggests solutions to the issues noted above.

BALAZS, BALINT* (ESSRG Nonprofit Ltd, Hungary)

"True Bread"

According to the bakers of True Bread, "Bread is born in the field." They actively cooperate with the farmers to decide what kind of bread to grow and how to grow it. They also care about what happens to the wheat in the mill, so they work with the miller. In this way they can produce delicious and healthy baked goods, knowing that the farmer is also protecting nature in the fields.

A new wave of artisan bakers started to develop an informal network of farmers, millers, and bakers in Hungary six years ago. The film shows this cooperation and its importance through some of the network's actors. They show us what happens on the grain table, in the mill, and then in the kiln

So Celebrated Yet Underutilised: Co-Benefits and Trade-Offs in Legume-Based Food Systems

Legumes can improve the sustainability of arable cropping systems and enhance the quality of farmed animals and human diets. Paradoxically, their production and consumption in Europe are low, whereas their demand for feed is high. Current EU policy agendas push for transformative changes and market and infrastructure restructuring towards plant-based diets, which are replete with paradoxes. Policy objectives frequently contradict each other, with ecological objectives often clashing with economic and international trade objectives.

The presentation will look at the different ideas people have about legumes' role in an agroecological transition by using policy case studies from EU projects like TRUE, Radiant, and LegumES. These projects brought together a lot of different stakeholders and decision-makers to come up with better policy and governance frameworks. It will show how ecosystem service (ES) tradeoffs require targeted and integrated policies, strategies, and practices that seek the agroecological transformation of our food systems. The examples of ES trade-offs (how ecological, economic, and trade policies and objectives clash) will demonstrate the need for radical policy transformation to reduce meat consumption and industrial livestock, increase farm incomes, and reduce our import dependency. We can build more resilient food systems by advocating for policy changes that promote the consumption of home-grown legumes.

BALBUGLIO, VIVIANE* (Getulio Varga's Law School, Brazil)

The Production of Memory in the Judicial Archives of Prison Massacres in Brazil – Manaus (2017) and Altamira (2019)

This work is part of a PhD research agenda in law and state violence, focusing on investigating the phenomenon of prison lethality and memorialization in Brazil. It is a study that employs qualitative research methods and a documentary collection composed of judicial archives concerning two prison massacre contexts in the Brazilian Amazon region, in the states of Amazonas and Pará, referring to the years 2017 and 2019, when more than one hundred people died, were injured, or suffered trauma while in state custody. The legal and sociological dimensions surrounding these prison massacre contexts also reveal a space of contradictions when observed from the perspective of state violence. On the one hand, legal norms, institutions, and judicial processes reproduce state violence. On the other hand, these components represent possibilities for recognition, accountability, and reparation concerning the state and other institutions and individuals connected to these massacre contexts. This study will be developed considering the coexistence of intrinsic contradictions, aiming to reconstruct the narrative of the massacres by utilizing judicial archives as a memory collection in these contexts. Interpreting and understanding judicial archives as memory collections will investigate these prison massacre contexts from a short, medium, and long-term perspective. The study will detail the tensions leading up to the deaths, the roles of state institutions in the face of extreme violence, and the aftermath of these events, including practices of memorialization and community traumas within the Brazilian prison system and in these cities in the Amazon region. Finally, ongoing research findings will be presented, including the concept of "uncomfortable memory" in prison massacre contexts and the role of law in addressing state violence.

BALDASSAR, LORETTA* (Edith Cowan University (ECU), Australia)

Applied Sociology: Bringing Theory into Practice and Practice into Theory II

Sociology is at core a science of the social. From the earliest formation of the discipline, sociologists have sought to make sense of complex social realities and to find solutions to injustices, problems, and inequities encountered in the worlds that they study. Ours is therefore a practical academic pursuit, one that creates new knowledge in the pursuit of better ways of living together in ever more complex societies.

Yet there remains a tendency both within and beyond the discipline to understand applied sociology or social 'practice' as inherently outcomes oriented and lacking theoretical rigour. At the same time, social theory is often imagined as esoteric and arcane, untethered from practical solutions to 'real world' problems.

This professional development session disputes both assumptions. Our presenters demonstrate the value of applied sociologies that draw on theoretical concepts to creatively address wicked problems, while also exploring the generative potential of engaged intersectoral research to generate new insights that enrich social theory.

Professor Loretta Baldassar's current work brings sociological methods and theories into conversation with health research and proposes new approaches that support social connection and wellbeing across the life course. She draws on her influential theorisation of transnational families and care circulation to inform interdisciplinary and applied projects that aim to improve health and care services in multicultural contexts. She currently leads the Social Ageing (SAGE) Futures Living Lab at Edith Cowan University, with a range of research projects that emphasises the role and value of the socio-cultural relationships in an individual's support network (formal and informal), including in particular the use of technologies to mediate local, virtual and distant support networks. Health research is still largely dominated by medical and more positivist theoretical frameworks, and Loretta will discuss some of the challenges in "translating" social science methods and concepts in this context.

Beyond Skills: Building Work Environments That Foster Social Love

Our paper explores the intersection of well-being, emotional intelligence, and social love within organizations through empirical research findings, with the aim of integrating theoretical and empirical perspectives from management and organizational studies investigating emotions and love (Pirson, ed. 2022) with social love research (Iorio, Cataldi 2023). Building on the recognized importance of professional purpose and social connectedness in work, we propose a new approach to foster a thriving work environment. Our research focuses on the five essential competencies, established by the EU, for organizational success (Self Management Skill, Innovation Skill, Cooperation Skill, Social Engagement Skill, and Emotional Resilience) (Soto, Napolitano, Sewell, Yoon & Roberts, 2022), but introduces a crucial preliminary step: emotion-based team formation. Traditionally, team training focuses solely on skills; here the hypothesis is that grouping individuals according to levels of happiness, empathy and emotional contagion can create a more positive and productive work environment. The approach used is experimental and the research process was carried out in 3 stages. 1) the sampling procedure was initiated and applied research was conducted. Non-probabilistic reasoned choice sampling was used.

2) work was done in working environments without distinction of mode. 3) all participants were subjected to the implicit association test, which allows the strength of the association between an item A and B to be objectively investigated through so-called implicit associations. Finally, a focus group was conducted using Grounded Theory.

This research explores the positive side of the "work-vocation" theme as provided by the social love framework, characterized by non-utilitarian care and collective well-being.

The research examines how certain mechanisms improve the balance between individual outcomes and collective benefits in different work environments. This research reveals the actual dynamics of social love in work environments and possible practices to foster it.

Contested Property: Housing Rights, Land Monetization, and Institutional Histories of Slum Rehabilitation in Mumbai

This paper traces the three-decade history of Mumbai's Slum Rehabilitation Scheme since its inception in the early 1990s to reveal the contested character of property rights and development politics in contemporary Mumbai. Pushing back against a presentist tendency that puts disproportionate weight on emergent processes of neoliberalization and financialization, our analysis reveals the path dependent forms and institutional legacies of earlier political-economic arrangements and political contestations also shaping contemporary property rights and land policies. The case material draws from interviews, policy analysis, property market assessments, and newspaper and other media discourse on property rights and land monetization in Mumbai to trace the evolution of the Slum Rehabilitation Authority (SRA), the state agency responsible for managing slum redevelopment in Mumbai. In contrast to assessments that emphasize a singular shift toward neoliberalization and financialization, our findings reveal three broad period in which shifts in slum land regulation and redevelopment outcomes in Mumbai have occurred. These shifts are closely linked to broader economic and political transformations occurring at national and global levels. However, by centering the contestations between developers, residents facing displacement, political leaders, civil society organizations, and the SRA, we find that the agency of key actors and contestations between them have had as much influence on these shifts as overly structural accounts would suggest. These contestations have shaped the incremental tweaks that help explain the longevity and popularity of the scheme, even when similar initiatives have failed to take off in other Indian cities. By focusing on institutional change and the contested politics that have shaped efforts at slum rehabilitation and property rights claims in Mumbai, this research contributes both to understanding the historical evolution of slum redevelopment in Mumbai and the historicization of property rights, governance, and urban transformations in the Global South and more broadly.

BALLANTYNE, GLENDA* (Swinburne University, Australia)

Interpreting Interculturalism: Comparative Insights from Spain, Canada, and Australia

Over the past decade, the idea of the 'intercultural city' has garnered global traction as a novel municipal-level diversity policy approach. Various understood as an alternative or essential complement to multicultural policy frameworks, it has been established in Europe for more than two decades, and is now adopted in cities in Asia, the Middle East, North America and Australia. To date, the adoption of the approach in increasingly diverse regions of the world has received little scholarly attention. This paper draws on preliminary findings from an international comparative study to help to address this gap in the literature. Using findings from four cities in Spain, Canada, and Australia, the paper investigates differences and similarities in how interculturalism has been interpreted and implemented in these national contexts. The paper argues that while these nations' distinct socio-historical and policy-political diversity contexts have shaped the meanings attributed to and policy expressions of the approach, they share elements of a common discursive and practical project: a bi-directional conception of immigrant integration; a transversal methodology; and a mobilising logic. The paper concludes with a brief reflection on implications which can be drawn regarding theoretical "multiculturalism and /interculturalism" debates.

Plural Cosmopolitanism after WW1: Herbert Adolphus Miller and the Beginnings of Tomorrow

This paper addresses the future-oriented arguments of the 'forgotten' US pragmatist sociologist, Herbert Adolphus Miller (1875-1951). He was committed to science as the basis of action, and he considered his political activities to be continuous with that science. He was directly involved with social reform and the progressive movement in US politics, a movement that was in retreat after WW1. The political climate may not have been

propitious, but 'science' would provide for a different politics to come, and, in an unfavourable present, a politics engaged with the issues of tomorrow remained necessary. Unusually, even for progressives, Miller was committed to race equality in the US and globally. He was one of the few white sociologists to address issues of colonialism and empire, drawing out the interconnections between domestic race relations, immigration and international relations. In two important books, *Races, Nations and Classes* (1924) and *The Beginnings of Tomorrow* (1933). He argued against European (and Japanese) overseas colonialism and supported anti-colonial revolutions (including in central Europe). He warned against the pathologies of nationalism and new forms of oppression of minorities. In this context, the future that Miller described as both possible and necessary, was at odds with the future conceived in the mainstream politics of his time. The dominant view (including progressives) was of a future global order organised through the 'benevolent hegemony' of an American, British and French domination. It is this order that has now broken down and whose divisions Miller addressed. His future is our present and his diagnosis remains prescient, as the problems he described continue to divide peoples both nationally and internationally.

BALTARU, ROXANA-DIANA* (University of Bergen, Norway)

(How) Do Formal Organizational Commitments Work? the Case of Inclusion Organization in the UK Higher Education System

In the UK, virtually all universities have formally committed themselves to inclusion, despite little empirical evidence of whether (and if so, how) equality and diversity can be achieved through purposive organizational action (Author 2019, 2020, 2023). This research project explores the role of universities' formal commitments in the process of inclusion organisation. Drawing on new institutionalist theory elaborated by DiMaggio and Powell and advanced by John W. Meyer, and on earlier sociological analyses of institutions à la M Weber and P Selznick, I reconsider formal organization in the pursuit of inclusion as merely one type of (culturally validated) social action. I argue that by formalising organisational commitments to inclusion universities do not only pursue the inclusion of people in higher education, but also their own inclusion into the organisational field in which they operate. This argument is explored empirically with organizational indicators and textual data collected and refined from 2017 to 2020, from the websites of app. 100 UK universities and other governmental and non-governmental organisations, such as the Equalities Office and the Equality Challenge Unit (UK). Using big data analytical techniques such as Latent Dirichlet Allocation, and descriptive analyses of keyword-frequencies on a sub-set of data, I map discursive similarities between how different universities talk about inclusion, and how inclusion is being framed by governments, charities, and other third-party organisations. The results show how organisationally embedded universities have become by virtue of their formal commitments to inclusion. This raises important questions about the role of organizational commitments in strengthening institutional legitimacy as opposed to delivering meaningful change at the structural level in relation to their formally articulated goals (in this case, making universities more inclusive). The findings are discussed in relation to early and new sociological institutionalist perspectives and in relation to equality and higher education policies.

Social and Spatial Factors behind Societal Resilience in Times of Complex Risks: Towards Integrative Model in Survey Research

Societal resilience becomes increasingly important in the face of turbulent times of increasing planetary pressures, social and geopolitical tensions and risks. Societal resilience is the ability of society to resist and recover from major shocks or adapt to crises and unexpected events.

This presentation proposes an integration of different levels of factors for the research of societal resilience using survey research

The societal resilience, as the dependent variable, is measured using societal resilience index (8 items, Bodas, 2022). The explanatory model includes (1) external factors, like risk perception (open questions on the highest risk in the country and a list of 21 risks); trust in institutions and their abilities to efficiently react in a case of crisis (international, national, municipal, non-governmental, local); perception of preparedness (national, municipal and individual); information sources, (2) community level factors, like place attachment, social trust and social networks; and (3) individual factors, like personal preparedness level; individual knowledge, socio-demographic characteristics, subjective health evaluation.

The survey questionnaire for the measurement of societal resilience was constructed for the representative survey in Lithuania, and the data was

collected in 2024. The questionnaire includes more than 100 items, and allows the validation of different indexes measuring the factors influencing societal resilience and investigating their explanatory power.

This presentation is based on the project „Socio-spatial determinants of societal vulnerability and resilience to crises and strengthening the crisis response potential of communities“ (SERENITY), funded by the Research Council of Lithuania, no. S-VIS-23-21

BAMOHAMMI, ABDEZHAR* (Université de Montréal, Canada)

Les Inégalités D'accès à L'IA : Un Défi Pour L'éducation Et L'inclusion

Les inégalités d'accès et de compétences sont une préoccupation majeure. L'IA pourrait accentuer les inégalités, notamment en matière d'accès à l'éducation et aux compétences numériques. Les personnes moins scolarisées risquent de subir davantage les effets négatifs de l'automatisation sur le marché du travail.

Les biais algorithmiques représentent un autre défi. Les bases de données utilisées pour entraîner les IA manquent souvent de diversité, ce qui peut entraîner des discriminations. Par exemple, les IA pourraient moins bien fonctionner pour des personnes d'origine non-européenne ou pour des données dans des langues autres que l'anglais.

Il est également important de ne pas aggraver la fracture numérique avec le développement de l'IA en éducation. Il est crucial que ces technologies soient inclusives et qu'elles ne discriminent pas les minorités ou les groupes vulnérables.

L'écart entre les genres dans la maîtrise des compétences en IA est également un point d'inquiétude. Le manque de représentation des femmes dans ce domaine pourrait aggraver les inégalités existantes.

Pour répondre à ces défis, il est essentiel de mettre en place des politiques et des pratiques favorisant l'équité et l'inclusion. Cela inclut la formation des enseignants et des élèves à l'utilisation éthique et responsable de l'IA, ainsi que la sensibilisation aux biais algorithmiques. Les gouvernements et les institutions éducatives doivent travailler ensemble pour créer des environnements d'apprentissage qui exploitent les avantages de l'IA tout en minimisant ses risques.

En conclusion, bien que l'IA offre de nombreuses opportunités pour améliorer l'éducation, il est impératif de prendre des mesures proactives pour prévenir les inégalités et garantir que ces technologies sont utilisées de manière équitable et inclusive. Cela nécessite une collaboration étroite entre les éducateurs, les développeurs de technologies, les décideurs politiques et la société civile.

BAMYEY, MOHAMMED* (University of Pittsburgh, USA)

Historical Memory: Its Role in Revolutions

Building on my ongoing research into the two waves of the Arab Spring, this paper explores how the memory of earlier revolutions influenced patterns of mobilization in 2011 and 2019. My own ethnographic notes and subsequent data collection show an attentiveness by participants to an almost a whole century of mass mobilization, including imagined successes, failure, and emotional relations to those past events. The paper suggests that this kind of historical memory was responsible in part for the emergence of new styles of movements in the recent uprisings, as well as new forms of knowledge and expressive culture that sought to respond to perceived shortcomings of earlier revolutions. The paper argues that the style of remembering past uprisings is also a form of judgment on them, a judgment that is always conditioned by a perspective on the present sociopolitical order.

Toward a Decolonial Lexicon

This presentation introduces to ISA constituents a collective project that is currently underway, bringing together scholars from the Arab region along with Berlin-based scholars. Designed to investigate the historical genealogies of 60 essential sociological concepts in Arabic, English and French, the presentation outlines how the project emerged out of a felt need to provide an infrastructure for decolonizing sociology at the root level, namely the level of its basic concepts. The focus on one world region, the Arab World, allows us to see how the sociological knowledge was implicated in colonial processes that also affect how ideas like "society" or "religion," for example, acquire meanings that cannot be easily disentangled from relations of power although, once in use, what they signify seems to evolve in relation to various sociopolitical dynamics and perspectives of the communities of knowledge formed around them.

Corporate Logics of Contemporary Communication for Social Change: A View from the Global South

Social change and communication are irrevocably linked. Historically, ideas of equality, freedom, justice, and inclusion – the central tenets of social change – are articulated in citizen engagements, social movements, state welfare policies and even in corporate governance through communicative processes and technologies. Amidst evolving media landscapes, including the rise of digital technologies, communication for social change (CSC) has become pivotal in addressing social inequities, especially during crises like the COVID-19 pandemic. However, there is little scrutiny on how discourses of empowerment and justice are shaped by the corporate social responsibility initiatives of powerful stakeholders such as the multinational corporations (MNCs). Using case studies of selected CSR initiatives of Nike and the Gates Foundations, especially so-called digital empowerment programs targeting vulnerable girls of the global South, the paper demonstrates that neoliberal matrices of impact and outcomes dominate contemporary social change and justice narratives. By anchoring the analysis in feminist media, social justice and CSR theories, the paper unravels the complex dynamics of power and knowledge in CSR strategies. Ultimately, it advocates for more equitable and inclusive frameworks that transcend profit-driven motives, ensuring that communication for social change remains genuinely transformative for marginalized communities.

Millet Revival through Odisha Millet Mission Among the Tribal Farming Communities of Rayagada, India

The Green Revolution in India focused on rice and wheat, neglecting the traditional crops like millet. A rice-based diet replaced millet, the traditional food of Odisha's tribal farming community during this transition. Diet changes over the years have resulted in micronutrient deficiencies in the Odisha tribal farming community. Additionally, the impact of climate change, like the irregularity of monsoons in the rain-fed regions in the state, created food security issues. Thus, there has been an effort by the State Government and Non-Governmental Organizations (NGOs) in Odisha to integrate millet into agricultural policies through the launch of the Odisha Millet Mission (OMM) in 2017. The study's primary objective is to examine the practices of the OMM and its impact on the revival of millet. Additionally, the study will understand the implication of OMM toward reviving traditional foodways. The fieldwork was conducted in Kalyansingpur block, located in the tribal district of Rayagada, with support from an NGO, NIRMAN, the local facilitating partner of the OMM, which played a crucial role in implementing the program at the grassroots level. Ethnographic methods were used to meet the objectives, including in-depth interviews and focus group discussions. The findings reveal that millet, once central to the tribal community's foodway, sharply declined with the rise of commercial farming and was grown on a limited scale only for family consumption and socio-cultural practices. However, with OMM, millet cultivation has revived to some extent in areas where OMM is implemented, especially in the tribal regions, with the introduction of agronomic methods, providing farmers with direct economic incentives and creating market spaces. Here, replication of the traditional foodways is limited with the implementation of OMM. Rather, a re-engagement with the food and the community's foodway is taking place through newer transformations in the economic and environmental aspects.

BANEGAS, JUSTINE* (Sciences Po School of Research, France)

Réclamer Justice, Réparer Le Péyi. Mobilisations Antillaises Et Usages Militants Du Droit Face Au Scandale Du Chlordécone De La Martinique à l'Île-De-France.

Officiellement utilisé de 1972 à 1993, le chlordécone, un pesticide organochloré employé contre le charançon du bananier dont la toxicité était connue de l'État français depuis le début des années 1970 et déclarée par l'OMS depuis 1979, est aujourd'hui responsable de la contamination de 92% des Martiniquais et 95% des Guadeloupéens. Si plusieurs recherches épidémiologiques et toxicologiques sont déjà parues, la littérature en sciences sociales est encore peu développée sur cette question, par ailleurs encore jamais étudiée sous l'angle des usages du droit. À partir d'un double terrain en Martinique et en Île-de-France, alliant des observations participantes en français ou en créole et des entretiens semi-directifs avec des membres de collectifs anti-chlordécone et les avocats de ces collectifs, cette recherche met en lumière la façon dont la saisie du droit reconfigure l'espace des mobilisations antillaises, et, à travers les demandes de réparations qu'il met en jeu, le rapport aux institutions françaises censées répondre au scandale.

Les données récoltées ont permis de dresser une première cartographie d'une mobilisation de victimes d'un scandale environnemental et sanitaire à la temporalité politique et judiciaire unique, et inscrit dans un espace politique spécifique, celui d'une ancienne colonie départementalisée. Elles ont notamment rendu possible l'identification de plusieurs modèles de *cause lawyering* dans la mobilisation en retraçant la trajectoire des avocats et leurs stratégies judiciaires respectives. Elles révèlent par ailleurs un ensemble de pratiques de fabrique de la preuve par les collectifs anti-chlordécone, mettant au jour un cas singulier de contre-expertise et d'épidémiologie populaire permettant d'investir des dispositifs judiciaires destinés à l'indemnisation. À travers ceux-ci, elles permettent enfin d'interroger de manière élargie de nouvelles attentes en matière de réparation, tant sur le plan symbolique que matériel, pour « réparer les corps et le péyi », depuis un espace politique ultramarin en crise.

BANKI, SUSAN* (University of Sydney, Australia)

Ocean Swimmers and the Body Image Gap: A Study of Sydney, Australia, and Jeju, South Korea

For anyone who has developed a taste for ocean swimming in groups, the health and mental health benefits are obvious – camaraderie, physical exertion without the stress of weight-bearing, connections with the natural world, and the therapeutic value of 'blue space' not only above one's head, but all around. A small literature supports these intuitive findings (Gould, McLachlan et al. 2021, Olive and Wheaton 2021, Moles and Bates 2023, Olive 2023, Butler-Eldridge 2024, Olive 2024, Wright, Eden et al. 2024). Like other sports, ocean swimmers have a 'uniform' of sorts – a swim cap, goggles that (temporarily) imprint on the skin, and either a tight wetsuit or a bathing suit. None of these elements may be considered particularly flattering. Yet the literature is silent on any issues associated with body image. Is this because ocean swimmers (who are a breed of all shapes and sizes) are a self-selected group that reject hegemonic views of what a body 'should' resemble? Is it because the power in the act of swimming trumps the disempowerment present in the act of (partially) disrobing? This paper analyses the images projected by two sets of ocean swimmers – the *haenyeo* (female divers) of Jeju in South Korea and the 'salty' ocean swimmers of Sydney's eastern suburbs. Semiotic analysis is conducted on films, literature and videos that represent these two groups to determine where, if at all, body image is obscured, elevated, or outright rejected.

Transformative Teaching in Online Spaces: Results from a 3-Year Australia-Korea Teaching Project

Various literatures that examine transformative learning in the tertiary sector point to disruptive approaches – ones that take students out of the classroom to alter their perceptions, assumptions, and knowledge paradigms (Mezirow 2012). For example, land-based learning argues that a shift in the physical environment allows for reciprocity and community exchange (Simpson et al 2014). Cross-cultural exchange programs facilitate exposure to

students from different backgrounds (Himelfarb and Idriss 2011). Experiential learning that disorients students can transform the learning experience (Lam et al 2005). These disruptions to routine ways of learning are part of social and psychological transformation, and they are the kinds of strategies that are embraced by those who want to teach transformatively.

However not all teaching institutions have the means to offer physical disruptions to the tertiary classroom. As the Virtual Exchange literature demonstrates, there are now online platforms that offer a way to provide some of these experiences (Turula, Kurek and Lewis 2019). Yet significant pedagogical, logistical, and administrative challenges remain.

This paper delves into this question about the viability of online platforms as legitimate disruptors of the traditional tertiary classroom. The paper begins by reviewing theories that speak to tertiary transformative learning, then summarizes the literature on online educational platforms. A gap in the literature is identified: do online platforms truly facilitate disruptive transformational learning? The paper then turns to the empirics of a three-year project that sought to offer transformative learning to tertiary students from Australia and South Korea. Both online and in-person teaching was offered to students studying theories of social justice. The paper details the challenges of the program, along with its successes. It concludes that transformative learning is possible through online platforms, but that some elements go missing. A corrective to these missing elements is suggested.

Transformation of Communication between Young Citizens and Local Self-Government in Social Networks: Case of Russia

The digitalization of public administration and the transition to good governance have naturally transformed the relationship between people and power. Modern youth as digital aborigines, most involved in daily life in digital communication on social networks, however, do not see the authorities as the real addressee of such communication. The purpose of the article: to study the communication of young people with local self-government in social networks in regions of the Russian Federation.

Methods of research: analysis of the indicators collected by parsing official pages of local self-government in the social network Vkontakte, in-depth interviews with young people.

Research results. Local government with the adoption of a separate federal law, were forced to establish official pages in social networks and enter into digital communication with the population. However, there was no communication in the format of "dialogue". Even the most active and innovative part of the population - youth - is not involved in digital communication with local authorities. Young people do not see this type of communication as "dialogue" and prospective. Involvement in communication with local self-government is determined by the personal attitudes and active citizenship of students rather than by the life situation. Previous experience of communication leads to interaction on a regular basis if it was positive, or forms the attitude that such communication is useless if it was negative, did not lead to a solution. Meaning the global trend of activation of state youth policy, detailed study of "mechanism" of activation of youth through communication with local self-government expands opportunities for setting priorities of the Youth-oriented policy.

BANO, SAMIA* (SOAS University of London, United Kingdom)

Muslim Legal Consciousness, Family Law and Everyday Lived Experience

In this paper I reflect on legal alienation and the everyday lived experience of British Muslims using civil and plural/ privatized systems of law to resolve matrimonial disputes. There is now a growing body of literature documenting the ways in which English and European family law systems accommodate diverse family arrangements with the settlement of migrant ethnic and religious communities across European countries. Migration from the global south has led to important insights into the ways in which family law systems have adapted to what is now described as the emergence of the 'multicultural family.' At the heart of this work lie important questions over debates on rights, choice, agency, autonomy, welfare, duties, and responsibilities. There is however an absence on insights on legal alienation of formal and personal systems law and the ways in which everyday experience of law produces ordinary legal consciousness. Drawing upon empirical research and feminist literature I raise critical questions of legal alienation, self, power, voice, authority and the production of knowledge in social and legal realities raising questions over the ways in which social, political and legal practices may marginalize minority voices, knowledge and lived legal experience. At the heart of this paper lie critical questions on the operative and constitutive effects of modern law, belonging and identity, conceptualization of the 'centre and periphery' and the ways in which discourses on diversity in law continue to reflect unequal power relations. What do we understand as Muslim legal consciousness? In what ways do these diverse practices in legal experience be understood as legal alienation of practices that may disrupt, transform and resist traditional conceptions of legal consciousness? The interplay of diverse, social and lived legal knowledges and plural experiences produce new insights into the experience of legal alienation in ordinary legal consciousness for British Muslims.

Improving Maternal Health: Using Indigenous Methodologies to Unveil the Root Causes of Poor Maternal Health in Ghana.

Background: Most maternal deaths are recorded in Sub-Saharan African (SSA) countries including Ghana. Global policy initiatives like the Sustainable Development Goals (SDGs), aim to decrease maternal mortality by 2030. Research shows a snail-like progress due to pandemics, climate change, financial crises, and insecurities. Hence, its more crucial for studies on maternal mortality in SSA countries which experience the highest rate of maternal deaths globally. However, there is a dearth of literature in SSA countries on the topic, as most related studies have either been conducted elsewhere or used Western methodologies which are unapplicable in most SSA countries. Other studies were conducted by outsiders who had little understanding of the context.

Methods: the study therefore used Afrocentric methodologies that are consistent with the sanctity of motherhood and African communal values to examine maternal health in the Upper West Region, Ghana. Thus, via African feminism, the study used indigenous research tools, particularly, songs and storytelling to collect data in local Ghanaian languages. Interviews and focus group discussions were also conducted, which were audio-recorded and transcribed verbatim with participants' permission. The researcher being a native with a deeper understanding of the topic and context facilitated all sessions and manoeuvred the dual positionality of an insider and outsider. A total of sixty-three people were purposefully recruited to participate in the study, consisting of community health workers, supervisors and service users. All data was analysed using thematic analysis.

Results: Findings from the study reveal the use of educative songs and stories centred on maternal health which have an emancipatory benefit for marginalised women, aside facilitating greater interaction among participants to generate richer data on maternal health.

Conclusion: The study concludes that, to guarantee better maternal health outcomes, there is need for more studies using indigenous methods to generate relevant data to design evidence-based interventions.

AI Chatbots As Sites of Gendered Erotic Fantasy and Commodified Algorithmic Intimacy

With the proliferation of large language models, a number of companies have released AI companion chatbots that simulate romantic partners, typically girlfriends. Platforms like Replika and Muah allow users to tailor their companion's appearance, personality traits, affect, and expressions of gender identity. This study critically examines the relationship between the chatbots as an evolving expression of erotic desire and the commodification of algorithmic intimacy. We situate these developments within the international history of feminized erotic labor and its technological mediation, drawing on theories of gender performativity, affective labor, and transhumanism. We qualitatively analyze transcripts of conversations with AI companions to interrogate how constructions of femininity and erotic fantasies are produced, negotiated, and consumed. Our findings show how these technologies extend and contest traditional paradigms of the female erotic, highlighting the sociotechnical imaginaries that reconfigure users' relationships to femininity, eroticism, and the gendered dimensions of intimate labor.

How Nation Broke the Movement: Affective Dissonance between Turkish Climate Activists and Global Youth Movement

Social movement researchers suggest that individuals would take part in movements because of their emotional and affective identification with the movement, despite the associated risks (Polletta & Jasper, 2001). However, within transnational connective action networks, characterized by weak ties (Bennett & Segerberg, 2013), affective identification may be weaker than commonly assumed for collective action networks. Moreover, affect is seen as a vital force in shaping national belonging. The consequences, then, can be profound when sense of belonging to a movement confronts with affective identification with the nation, leading to affective dissonance and potential fragmentation within the movement. I scrutinize these affective dynamics by investigating the Turkish youth climate movement's dissociation from the global movement, Fridays for Future (FFF), asking what were the impacts and causes of the dissociation. The dissociation was announced on November 23, 2021. The activists mentioned criticisms from activists from other national branches concerning a post commemorating the country's founder, Atatürk, as the cause. I utilize a mixed-method approach to scrutinized the impact of dissociation on the movement. Through temporal analysis of the group's Instagram account, I show that the group's overall activity dramatically decreased and the remaining activities focused on the national agenda. Dynamics of affective dissonance surfaced during the in-depth interviews with Turkish activists (N=16). The interviews highlight that the activists experienced a sense of alienation and exclusion within the broader global movement, which was amplified with the critique towards their post, leading their decision to leave.

BARAN MANDERBACH, ZOAN* (Freie Universität Berlin, Germany)

Location Matters? How Activists Navigate between Space, Scale and Digital Media

Contemporary scholarship on digital activism posits that the advent of digital media has substantially reduced the cost of connectivity for movements. Lately, scholars advocate for a unified consideration of the online and offline facets of activism (Treré, 2018). This body of work highlights the persistence of mobilization dynamics and underscores the importance of integrating offline data to comprehensively understand digital activism. Drawing upon prior research, this paper proposes an interdisciplinary framework that employs hybrid data to uncover the offline underpinnings of digital activism. By synthesizing the geography of communication, spatial sociology, and social movements literature, this study poses two central questions:

1. How do activists leverage social media to bridge contentious issues and places?
2. What are the individual, societal, and spatial determinants that affect the scope of connectivity on social media platforms?

To address these inquiries, this research examines a cohort of Twitter/X users engaged in co-hashtagging contentious places as a method of scaling up their activism. This analysis delineates the scale of individual engagement—local, national, or transnational—based on such co-hashtagging practices. Subsequent in-depth interviews with a subset of these users (N=16) were conducted to delve into the personal, political, and spatial mechanisms underpinning these phenomena. Preliminary findings indicate that while the scope of engagement is predominantly dictated by the users' political/ideological stances, their social media use is shaped by their spatial positions and the role they attribute to themselves in mobilization. Therefore, by combining online and offline data and investigating the offline dimensions, this study critically scrutinizes innovations of social media in facilitating activism. It posits that broader dynamics, including ideological commitments and spatial positioning, influence the manifestations of activism on social media, as much as the architecture and affordances of digital platforms.

Green Divides: Findings from Large-Scale Comparative Surveys on the Impact of Individual- and Country-Level Factors on Public Attitudes Toward Energy Transition in Europe

The aim of this presentation is to examine the factors influencing public opinion regarding the transformation of Europe's energy systems in order to achieve the European Green Deal's objective of becoming the first climate-neutral continent by 2050. Notwithstanding the potential advantages of renewable energy, public opinion demonstrates obstacles at both the individual and national levels. These obstacles can be attributed to discrepancies in national economics and anxieties regarding the ramifications of the energy transition on labour markets, energy prices, and security concerns.

To facilitate a comparative analysis, a cumulative data set with variables associated with attitudes towards energy transition was produced by integrating data from over 1,700 national surveys encompassing 57 waves of the Standard, Special, and Flash Barometers (2001–2023). Furthermore, a country-level data set was constructed to ascertain whether public opinion is dependent on contextual factors. This data set comprised variables on energy mix, energy consumption, access to energy, and economic indicators.

The findings of our analysis indicate that public attitudes towards a just energy transition are shaped by a combination of individual-level and country-level factors. Individuals with progressive left-wing political orientations, higher household incomes, and greater educational attainment are more likely to demonstrate support for energy transformation. However, significant regional disparities emerge across Europe, largely as a consequence of divergences in the energy mix. In regions that are heavily reliant on fossil fuels, such as parts of Central and Eastern Europe, the impact of political orientation, income, and education on support is less pronounced, and country-level energy-related factors gains in power. Conversely, in regions with a higher proportion of renewable energy sources, such as Northern and Western Europe, the greater proportion of energy from renewables amplifies the supportive effect of individual factors on public attitudes.

BARAT, ERZSEBET* (University of Szeged, Hungary)

Shifting the Critical Gaze – Challenging the Binary Distinctions Informing Dominant (Feminist) Discourses of Marginalization in the US Debate on the 'protection of Human Life'

I examine the relationship between reproductive justice and democracy with a focus on the debate around 'the constitutional right to abortion'. I study the logic of the US Supreme Court's official argumentation in favour of overturning *Roe vs. Wade* (1973) in 2022. I carry out a critical analysis of discourse and explore the intersection of multiple relations of power

shaping the decision. My aim is to point out the overlap across the harms the various groups of women suffer in the wake of the Court's limitation of their access to reproductive health care. My ideology critique is focused on the conceptualization of 'beginning/end of human life' and the US citizens' constitutional rights provided they are 'deeply rooted in history.' I argue that in the wake of the decision, a vast range of US population has been rendered – directly and indirectly – in the status of the living dead (Mbembe 2019). I argue that the multiple distinctions underpinning the court's decision is integral to the white supremacist discourse of contemporary US political communication. It reiterates the particularly loud voice of 'patriotic manhood' since the Trump administration which is articulated from the perspective of the aggrieved entitlements by hegemonic (white hetero Christian) masculinity (Kimmel 2013). I uphold the importance of organizing collectively against the escalation of the hate rhetoric of right-wing populism that has caught various groups of women in a spectatorial fight of the relatively harmed collectives against one another (Berlant 1998). Instead of this competitive struggle for relative gains against one another, I propose to focus on the overlaps across trans* and heterosexual middle-class womanhood, a position that hinges on their will of to accept that we all have the figure of patriotic manhood in the way – albeit in different ways – of reproductive justice.

The Persistence of Marginality and Poverty Among Refugees in Italy: Insights from a New Survey

This paper examines the persistence of marginality and poverty among refugees in Italy, drawing on a recent UNHCR-promoted study that incorporates an unprecedentedly large survey (N=1200) and rich qualitative data, including focus groups with refugees and interviews with key stakeholders. Within this rich fieldwork, our analysis focuses in particular on three categories of protection beneficiaries in Italy and their potential civic stratification: (a) refugees, (b) recipients of subsidiary protection, and (c) Ukrainian war refugees with temporary protection status.

We argue that legal status interacts with a range of individual and social conditions in shaping economic well-being. Crucially, our findings reveal alarmingly high levels of both relative and absolute poverty, as well as significant material and social deprivation, across all three groups. By comparing these categories, we explore the mechanisms behind protracted exclusion despite the presence of a regular legal status.

A central finding is that legal regularity alone is insufficient to guarantee decent living conditions or socio-economic integration, a conclusion supported by previous research (Finotelli & Ponzo 2018; Hinger & Schweitzer 2020). The misalignment between legal status and the implementation of effective integration measures, particularly in the areas of employment and housing, is evident. Most subgroups of protection holders face precarious living conditions, underscoring a state of "protracted displacement," a phenomenon described in the literature as occurring independently of legal status (Cingolani et al. 2022; Papatzani et al. 2022).

In sum, our data point to troubling patterns of persistent marginalization and differential inclusion for forced migrants with international protection status.

Fandom and Political Leaders on Social Media Platforms: A Comparative Study of Italy, France, and Spain

The decline of traditional party loyalties has prompted critical questions about the formation of political identities, including new forms of political belonging, the nature and intensity of affective connections with political entities, and the influence of digital politics on participation. Recent research has begun linking the concept of fandom to politics, exploring whether the fan-like attachment to political leaders represents a new form of political engagement (Hinck and Davisson 2020; Sandvoss 2013; Dean 2017). Our study contributes to this emerging field by mapping the phenomenon of political fandom in Italy, France, and Spain and offering insights into its defining characteristics.

This research specifically examines Instagram fandom pages dedicated to the main political leaders in these three countries. We analyze the number of active pages, the levels of engagement they generate, and the content they share. Furthermore, we categorize the content (both fandom and anti-fandom) into three types of fan attachment: *political*, where admiration centers on the leader's political skills; *personal*, where fans are drawn to the leader on a physical or emotional level, with little focus on political content; and *communitarian*, where support is based on the leader's representation of a particular group or community.

Our findings will offer a preliminary evaluation of the role of political fandom in shaping political discourse in Italy, France, and Spain. Additionally, we will highlight key similarities and differences across these countries and explore the potential political implications of this form of engagement.

Avances y Retrocesos En Los Procesos De Transformación De La Justicia Brasileña Analógica En Digital y La Apuesta En La Participación Social Para Una Jurisdicción Efectiva

El proceso de transformación de la justicia analógica en justicia digital en Brasil no tiene paralelo en el mundo. En menos de 20 años, el Poder Judicial más grande del mundo en términos de volumen de papel se ha vuelto 100% digital, un movimiento que ha implicado cambios en el ejercicio profesional de millones de abogados y agentes públicos que trabajan en el ámbito de la justicia. Bajo la coordinación del Consejo Nacional de Justicia, órgano creado por enmienda constitucional en diciembre de 2004 y encargado de la planificación estratégica del Poder Judicial, están importantes iniciativas destinadas a la transformación digital de la justicia brasileña. En esta investigación teórica apoyada en miradas críticas de los derechos humanos, en la sociología de la administración de justicia y en teorías de la gestión pública, se busca, a partir del análisis de datos del poder judicial brasileño, relacionar el camino digital de la justicia con los avances, desafíos y retrocesos provocados en el proceso de inclusión, en la promoción de la igualdad, en el aumento de la eficiencia y eficacia de los derechos y. Los desafíos para una jurisdicción efectiva se relacionan sobre todo con la construcción de la equidad judicial y con la mejora de la *accountability* de la justicia. La hipótesis, confirmada por los resultados, es que el uso de la tecnología ha permitido avances, pero también retrocesos en la protección de los derechos humanos, y el mejoramiento de la jurisdicción debe estar guiado por una mayor participación social en el establecimiento de las políticas judiciales.

Affordances-Driven Ethics for Research on and with Chat Apps: Notes from the Global South

Chat apps have received increasing attention from social science researchers lately. Despite the high frequency of its use for multiple purposes, research in such environments entails specific ethical challenges, more familiar for researchers from the Global South, where chat apps have become an important part of everyday life for a decade or so. This article discusses the ethical conundrums that emerged in two distinct cases in Chile and Brazil, concluding that current frameworks fall short in the sociotechnical dimension. To address this, the article inaugurates the casuistic-heuristic model with an affordances-driven approach, which contemplates the agency of the group members within the interactive processes. The discussion takes place in chat apps digital environments, while it reveals the possibilities and constraints that platforms' features offer during the research design.

BARBOSA, SÉRGIO* (University of Brasilia, Brazil)

From the Hate Cabinet to the Love Cabinet: The Case of Brazil

Scholarly attention has already recognized the centrality of social media platforms for elections, including the spread of dis/misinformation and how this can be recently amplified by AI technology. However, little research has investigated the way progressive campaigns are appropriating platforms to foster social change. This paper investigates digital activism for social and political mobilization. Chat apps such as WhatsApp are more than a digital space for "hanging out" with like-minded people: they have gradually become a key platform for social and political mobilization, particularly in Global South countries. They create new possibilities of communication with impact on the political sphere, digital activism, and elections. This paper investigates how WhatsApp as a platform has been appropriated by local communities in Florianópolis, Brazil. Aware of the importance of highlighting the Global South context beyond a Western-centered perspective, the paper looks at #Campeche and South of the Island Popular Struggle Committee WhatsApp group. The analysis is structured via three research levels: communication repertoires (whether WhatsApp is a levelling communication tool that elevates the profile of marginalized players in the political system and how many affordances influence what happens through and because of them); context (Brazilian context matters beyond the Global North); local level (the consequences for local democracy). In doing so, the article poses the research question is: *How does the Love Cabinet foster an emerging strategy to collect votes?* It has three main contributions: i) the methodology comprehends of triangulation of qualitative methods, by combining content analysis, and digital ethnography of chat apps groups; ii) it encourages and has its main motivation to investigate the so-called "love cabinet" to successfully implement the values of plural participation, social inclusion, and bottom-up innovation in today's platform society; iii) little research has privileged to investigate the love cabinet from the Global South(s).

Is Artificial Intelligence the Future of Long-Term Care? Ageing and Sociotechnical Scripts of AI Companies

Ageing and healthcare policies are increasingly shaped by technological advancements, influencing care institutions and practices. The implementation of Artificial Intelligence (AI) in long-term care settings, from companion robots to chatbots, has gained attention, especially as the COVID-19 pandemic exposed systemic issues such as staffing shortages. In Australia, a Royal Commission into the sector urged investment in emerging technologies to address care deficiencies for older people (aged 65+) living in nursing homes ('institutionalised ageing') or independently in the community ('ageing in place').

Long-term care has attracted significant interest from technologists due to its market potential. However, technologies developed for older people often reinforce stereotypes, portraying them as passive and digitally unskilled. It is thus crucial to examine how AI might perpetuate these views, undermining efforts to ensure dignified later-life care.

This study draws on sociologist Madeleine Akrich's concept of 'user representations' to explore sociotechnical narratives of AI-based care for later life. For Akrich, the imaginary of the user is inscribed into the technology, originating 'scripts' or 'scenarios' of use. This can, in turn, reveal how ageing and care discourses unfold and become scripted.

To explore such discourses, we analysed 35 companies developing and commercialising AI technologies for the long-term care sector – for both institutionalised ageing and ageing-in-place. Through a visual and textual thematic analysis of their websites, combined with a semiotic perspective, we found four key themes: the carefication of ageing, public inefficiencies, AI solutionism, and the datafication of care. Older people were usually depicted as passive data sources, while care staff were portrayed as inefficient. AI was positioned as the solution to all care challenges, from medical diagnoses to healthcare management. We conclude by reflecting on how these narratives shape perceptions of ageing and care, raising critical questions about AI's role and the future of human-centred care.

Encrucijadas. Los Campos Magnéticos En Las Metodologías Nómadas

El objetivo de la presentación es hacer un recorrido por las metodologías nómadas en las ciencias sociales y ver cómo en estas se plantea la relación con el otro, o los otros, que surgen en el camino, como una relación de encuentro. Se trata de cruces de caminos, que muchas veces llevan a transformaciones o a una completa desintegración del sujeto nómada. ¿Qué tipo de emociones tienen aquí protagonismo? ¿Una postura completamente empática ante lo que se cruza en el camino? ¿Una postura nostálgica, de saber que el camino nunca llegará a un fin? ¿O una actitud destructiva, como si se tratase de una pulsión de muerte?

En la presentación quiero reflexionar sobre algunos de los protagonistas de la sociología nómada que nos llevan a reflexionar sobre estas emociones que surgen en el camino:

Walter Benjamin: flaneur, pasajes y embriaguez
André Breton: campos magnéticos y encuentros
Siegfried Kracauer: Interacción y transformación
Marc Fischer: Interacción y desintegración

Para Una Metodología Del Intercambio: Construir Identidades y Empleos

Las ciudades son lugares donde se cruzan biografías, especialmente biografías de migraciones, lugares donde los recién llegados encuentran rápidamente conexiones, sobre todo en el marco laboral. ¿Cómo se puede diseñar una investigación que no sólo documente estos cruces, sino que también permita ampliar los intercambios de una forma activa y creativa? En actuales investigaciones sobre la inmigración en la ciudad me he propuesto experimentar con métodos artísticos para investigar dinámicamente esta diversidad y las intersecciones posibles. En Brasilien am Main (transcript 2019) realicé una investigación sobre los brasileños y brasileñas en Frankfurt, para ver cómo hay diferentes formas de modelar la nación Brasil desde la inmigración. Después, a través de un viaje a Brasil, me propuse realizar intercambios (parcerías) entre las diferentes biografías, entrelazando diferentes medios de la cultura (desde la música hasta la comida). En esta presentación me gustaría discutir sobre estas metodologías relacionales y el uso de métodos de investigación artística. ¿De qué forma sería posible que las investigaciones vayan más allá de una documentación de los „caminos de investigación visual colaborativa" (Pathways of Collaborative Visual Research)? ¿Qué posibilidades tenemos que, a partir de la investigación, surjan nuevas relaciones sociales o se generen nuevos puestos de trabajo? Una propuesta que hago en otra investigación (City Atlas, Verlag für moderne Kunst 2024) es ir más allá de la investigación y crear una "agencia de empleo relacional" (relationale Arbeitsvermittlung).

La Resignificación Del Sentido Religioso En La Protesta Feminista y De La Disidencia Sexual En México Durante La Década 2011-2020

La protesta en el espacio público constituye una práctica corporizada que revela distintas formas de experimentar el mundo y de representarlo. En esta ponencia se analiza de qué manera la matriz de sentido religioso es resignificada en la protesta feminista y de la disidencia sexual para reivindicar identidades, derechos y libertades, pero también creencias y emociones, como el orgullo y la vergüenza. Dicha resignificación toma forma por medio de un poder de representación observable en las consignas, los símbolos religiosos, los performances y diversas materialidades empleadas para dicho fin. Los anclajes metodológicos remiten a la etnografía de marchas y protestas a lo largo de una década que se caracteriza por el avance de algunos derechos para las mujeres y disidencias sexuales, pero también por un conjunto de disputas en torno a ellos, como las que han representado los movimientos antigénero o contra la "ideología de género". Me refiero a los años que transcurren de 2011 a 2020. Dicha etnografía se desarrolló en el tránsito por distintas investigaciones y ciudades como Guadalajara y la Ciudad de México. Durante ese tiempo se conformó un archivo fotográfico que, en este caso, se posiciona como un campo para la investigación. Desde esta perspectiva, la imagen no constituye un recurso meramente ilustrativo, sino una fuente testimonial a partir de la cual se interroga una temporalidad.

Prejudice and Discrimination Against Children: Evidence from a Factorial Survey Experiment

Research in the fields of childhood studies and intergenerational relations has long been theorising and evidencing that children are a social group that is systematically put at disadvantage compared to adults. This paper makes a new contribution to the field by developing a conceptual framework of discrimination and prejudice against children informed by economic, sociological and social psychological scholarship on race and gender discrimination, prejudice and stereotypes. The framework produces testable assumptions on the causal effect of an individual being a child as opposed to adult on how adults behave towards the individual (discrimination). This effect is explained through extended and refined ideas around adult-centrism, adultism, ageism and childism (prejudice).

Assumptions derived from the framework are tested using an online factorial survey experiment conducted with a representative sample of 500 adults in the UK, including parents and non-parents. This design (sometimes called vignette experiment) is a method common in discrimination research allowing to identify a direct causal effect of one condition (child) versus another condition (adult) on a respondent's rating of a scenario (vignette). This factorial survey experiment captures discrimination against children by asking respondents to indicate how appropriate a behaviour is towards an individual. The condition that varies within each scenario is whether the individual is a child or an adult. The scenarios cover life domains that overlap for children and adults such as within-family interactions, interactions in public spheres and access to public goods. To shed light on the drivers of discriminatory behaviour we examine relationships between ratings of the child/adult scenarios and respondents' scores on an adjusted adult-centrism scale. Implications of the results are discussed in relation to policy, parenting and practice in child-centred institutions such as schools.

BARGHOUTI, VILITCIA* (Michigan State University, USA)

The Agony of Crossing to Work: Palestinian Labor in Israel and Alienation.

Building on Marx's theory of Alienation and deriving from an indigenous framework, my paper argues that Israel's modern and settler colonial state managed to create alienated laborers in the West Bank and Gaza Strip through various mechanisms of its racial capitalist and settlers' power. The Palestinian laborers' feelings of Alienation appear clearly in their daily discourses and narratives, expressing the unjust, thus harrowing work conditions they experience daily when crossing to their workplaces in Israel. But more than that, the workers become emotionally exhausted by realizing their labor benefits and empowering their oppressors, and subsequently, that power is used against Palestinians in many ways. Some of the expressions that the Palestinian workers frequently echo are:

"I hate this work In Israel; it fills me with shame."

"I know that people in my village have this idea about me as if I am a traitor."

"I do not have other choices; if the Palestinian Authority offers us good wages, I will never think of work in the Israeli settlements."

Historically, the Palestinians have been deprived of working in their lands as peasants through a systematic process by the colonial power(s), which started with land "transfer" and "grabbing" before 1948. It developed into a territorial "closure" and active building of settlements after 1967. Then, the land and the body control evolved through a severe security apparatus after the first Intifadah of 1987. The Israel surveillance system was used to not only control people's mobility but also humiliate them and degrade their dignity. Those control processes have evolved in the last 76 years to become increasingly entangled with "a security apparatus" that incorporates key features of Foucault's idea of "surveillance" to discipline society and subject people to their power to ensure their humiliated life and obedience to the colonial capital system of Israel.

Stigmatisation and Loss of Income As Causes of Social Isolation in Young Adults with Precarious Employment Trajectories

Gallie and Paugam's social exclusion theory argues -based on previous studies such as those of Jahoda et al. on the effects of unemployment in the city of Marienthal in Austria- that the loss of employment leads to a situation of loss of personal connections which results in the social isolation of the unemployed people. According to Gallie and Paugam, this loss of personal connections has two main causes: 1) stigmatisation and distress, and 2) loss of income. The empirical analyses developed by Gallie and Paugam (2003, 2004, 2013) and following analyses have focused primarily on the direct relationships between stigma/distress, loss of income and social isolation, neglecting more complex causal relationships such as the effect of loss of income on stigma, which in turn can further reinforce social isolation. This paper analyses these different effects using qualitative data from hybrid narrative interviews. Specifically, it studies the labour market trajectories of a sample of 100 young adults between 25 and 39 living in the city of Barcelona with a strong presence of unemployment in their trajectories. Although the bulk of the data analysed is qualitative in nature, quantitative data obtained in the hybrid interviews are also analysed, which allows us to develop a more comprehensive and integrated analysis of the trajectories analysed. In this way, the feedback and reinforcing effects of the factors above mentioned could be more easily identified.

Negotiating the Care Act 2014: Experiences of Mental Health Social Workers in English Social Care Services

This paper will present the findings of a research project that explored mental health social worker experiences of the Care Act 2014, the primary social care legislation in England. The ways in which social workers experience their role and professional identity in this mental health social care context will be considered in relation to interprofessional and organisational factors, as well as the statutory and policy influences on mental health social work in England. The ways in which mental health social workers understand and negotiate the demands of the Care Act 2014 on their practice will be placed within a wider context of national and international conceptions of the social work profession.

What Are the Experiences of Fulfilling Care Act 2014 Duties for Social Workers in English Mental Health Settings?

This presentation will present the findings of a PhD study into the experiences of mental health social workers in England when working within the frameworks of the Care Act 2014, the primary social care legislation in England. Findings from semi-structured interviews with social workers will be presented to show a complex negotiation of social work identity and values alongside statutory responsibilities and frameworks. From this, these findings will be placed within current policy trends to offer perspectives on the ways in which mental health social work is utilised within English social care services.

BARMAN, DHRITIMAN* (Virginia Polytechnic Institute and State University, USA)

The Architecture of Grey Markets: A Field-Theoretic Analysis of the Making of Quasi-Legal Cannabis Market in Southwest Virginia

Field theory has its roots in classical electromagnetism in Physics and was later adopted by the Gestalt psychologists in Europe in the early 20th century. Then, in his hugely influential contribution to sociology, French sociologist Pierre Bourdieu put forward his theory of fields to explain patterns of social hierarchy and power in different cultural arenas, including science. Yet, the theory of social fields received surprisingly little engagement so far in science and technology studies (STS). In my Ph.D work, I will use Bourdieu's theory of social fields and American sociologists Neil Fligstein's and Doug McAdam's concept of strategic action field (SAF) to study the dynamics of social action around the recently-emerged quasi-legal cannabis market in Southwest Virginia. So far, the literature on cannabis legalization has taken place in places like Colorado, California, or Washington, where there is a relatively liberal culture or social movement-type situations, which made those places more interesting to study in the first place and a relatively conservative region like Southwest Virginia has so far been neglected. My proposed project hypothesizes that the Southwest Virginia region is unique in terms of its political structure, the actions of social actors, and even the greyness of the market itself. The hypothesis is that it will take different types of stakes, approaches, and actions from the actors in this region, and how those actions are being shaped is the centrality of this work. Using a field-theoretic analysis, I examine how different actors, including hemp growers, store owners, politicians, law enforcement, and activists/researchers, situate themselves in a field of contention in which the norms and rules of governance are still unclear. Bourdieu's field theory helps analyze the process of social action, including the know-how of technologies and how actors orient their actions defined by the structure of the field.

BARMAN, DAISY* (Assistant Professor of Sociology, Gandhi Institute of Technology and Management, Bengaluru Campus, India)

Divine (Un)Forgiveness: Death Rites for the "Sinner" Among Vaishnavas of North-East India

Death is not solely a personal loss for the bereaved, but also a deeply social phenomenon, encompassing collective rituals, practices, and symbolisms that embody the cultural, religious, and social structures of a given society. It transcends the individual experience of loss into a communal event where societal norms dictate mourning behaviours, funeral rites, and memorialization practices. Studying death sociologically is crucial as it provides insights into how societies structure their responses to morality, and mortality negotiating the meanings of death and life. This paper investigates what happens to deaths that fall outside society's moral compass. What at all is a moral death and an immoral one? How are suicidal deaths mourned in society? This article explores the complex interplay between notions of sin accorded to suicide, divine forgiveness and denial of it, and prescription and prohibition of death rites within the Vaishnava community of Assam which is located in North-East India. Using an auto-ethnographic approach, this paper analyses the ritual practices (and the absence of them) in socially unacceptable deaths among the Vaishnavas. By focusing on the liminal status of the "sinners," the article contributes to broader discussions on the sociology of religion, death, and morality offering insights into how religious beliefs shape death practices and the moral categorization of individuals at the end of life. And consequently, how this socially constructed mourning reshapes the experience of loss and the process of grieving of the bereaved.

BARMAN, EMILY* (Loyola University of Chicago, USA)

A Healthy Bottom Line: Health Enterprises and the Challenge of Multiple Regimes of Value

Central to the project of global health (e.g. the United Nation's SDG goal of "good health and well-being for all") is the identification and diffusion of effective health equity interventions across multiple communities and locales. Crucial to this endeavor is the work of health enterprises: organizations that sell affordable products and services that improve access to healthcare for disadvantaged populations. Drawing from qualitative data and using abductive analysis, this paper examines the challenges faced by a sample of health enterprises as they seek to establish the health benefits and the economic sustainability of a new health intervention in their development of a new business model. Importantly, these organizations must negotiate varied and changing criteria for and practices of valuation as they move promising models of health care from the Global South (where they typically originate) to the Global North for their financialization and marketization. Thus, one key determinant of success for health enterprises is their capacity to capture and communicate multiple regimes of value as they move health interventions across geographical locales.

Childhood and Environmental Challenges: An Exploration of Children's Experiences of Everyday Life in Kashmir, India

There is growing sociological literature on the intersections of childhood experiences and environmental issues. Yet, we lack an understanding of how children negotiate environmental challenges in their everyday lives in conflict zones around the world. By drawing upon a qualitative empirical study which focused on children's subjectivities in Kashmir, we explore Kashmiri (Muslim, Sikh, and Hindu) children's perspectives on how they navigate space and place in a context of conflict and quotidian violence. This paper offers an original analysis of children's understanding of their environmental context, and their engagement with spatial localities within a framework of child well-being. The study includes narratives of 52 children, aged 14-16 in two locations in Kashmir. A thematic analysis of interview narratives, in combination with children's mapping of their journey from home to school, illustrates the challenging environmental context and how spatiality intersects with structural violence and environmental justice.

Findings document the direct and sustained everyday impact of living in a conflict zone and how this governs children's lives. Children's accounts demonstrate the constraints on their own agency as a result of macro and micro level power structures. The impact of increased Indian tourism to 'safe spots', and the environmental harms emanating from this are also included from children's perspectives, including concerns about their ecology. Implications for policy and practice are sketched out within a framework of Indian army's ongoing presence in Kashmir. The paper should be of interest to educationalists, health policy makers, and scholars of environmental harm and social justice.

Palestinian Childhoods: The Role of Music in Young Palestinian Lives in a Context of Quotidian Violence and Resistance

Aims: There is a dearth of literature on the significance of music in the lives of Palestinian children living under occupation. This paper seeks to make a conceptual and empirical contribution in understanding the role of music in children's lives in a conflict zone. Working within a conceptual framework of space and place (Tuan 1979, Shalhoub-Kevorkian 2006), the paper helps

advance the notions of homeland, identity, and belonging within a context of conflict.

Context: In 1948, as a consequence of the Israeli-Arab conflict, hundreds of thousands of Palestinians found themselves displaced and dispossessed. Many were forced to migrate to other places to re-establish their homes. Those living in Occupied Palestinian Territories (OPTs) including Gaza and the West Bank continue to experience direct and everyday violence. Given this context of displacement and dispossession, we focus on music as a vehicle of influence in the lives of these children.

Methods: By drawing on the most recent and bloody conflict which began on 7 October 2023, this paper examines a total of ten YouTube videos and associated comments to demonstrate how the sounds of music help subdue the sounds of conflict and thereby reflect and shape young Palestinian identities. Through a content analysis of the lyrics of songs and interviews with child musicians, teachers, and audiences, we identify the meaning-making attached to the realm of music.

Findings/Conclusion: Key findings highlight the impact of music on young lives along the lines of resilience and resistance. We illustrate how the sounds of music displace the sounds of air strikes, the sounds of crying, and the sounds of despair. The themes of solace, hope, homeland, and the heterotopia of imagined spaces are also highlighted. This paper carries a broader significance for global childhoods in promoting the role of music in the context of childhood and adversity.

BARNES, BRENDON* (University of Johannesburg, South Africa)

(Mis)Recognition, (De)Coloniality and Climate Justice: Implications for Marginalized and Indigenous Youth Climate Activism

The world is experiencing unprecedented global heating with negative impacts on mental health, physical health, ecosystems, infrastructure and economic systems. This presentation focuses on strengthening the role of the decolonial movement and its intersections with climate justice particularly in the global South. I draw on work on marginalized including indigenous youth activism as examples. Young people are increasingly active in climate activism. However, youth from marginalized and indigenous groups have reported feelings of exclusion and misrepresentation in white and Western dominated youth climate activist spaces. Colonization, coloniality and decolonization are often drawn on in climate justice scholarship and praxis. What do we mean by these concepts and how can they strengthen climate justice? Using a narrative review of recent writings on climate and environmental justice, I attempt to make three arguments. I argue that it is important to identify the misrecognition of structural, epistemic and subjective dimensions of climate injustices. While conventional notions of justice (for example, distributive and procedural) take us so far, understanding (mis)recognition can strengthen our understanding of climate injustices, particularly in the global South. Second, it is particularly important to reveal the misrecognition of coloniality, particularly those colonial assemblages that underpin climate injustices. I demonstrate how climate coloniality is co-constituted at the structural, discursive and psychological levels. Lastly, it is important to describe examples of decolonial work from the global South that attempt to address climate coloniality and strengthen climate justice. I use examples from marginalized and indigenous youth climate activism in the global South to demonstrate decolonial work. Lastly, I discuss recommendations for future research, youth activism and praxis.

BARON, DANIEL* (Martin-Luther-University Halle-Wittenberg, Germany)

How to Model Dual Processes within Couple Dyads. Theoretical Implications and Empirical Applications

Several studies in family sociology suggest using dual-process theories, i.e., the model of frame selection (Esser/Kroneberg 2020), to explain important partnership outcomes, i.e., fertility (Arránz Becker/Lois 2017) or separation and divorce (Esser 2002a, 2002b). In most of these cases, the concept of sociological explanation (Esser 1993) is used as a framework for deriving empirically testable hypotheses. A closer look, however, reveals that these approaches take only limited account of the dyadic nature of the underlying research question. For example, Esser's (2002a, 2002b) classic studies on divorce conceptualize couples' decisions to separate as the result of a joint reframing of their (unsuccessful) marriage in light of a mismatch between individual demands. Sometimes, as in the case of Esser's studies, data limitations do not allow for a more rigorous modeling of dyadic processes, such as social exchange or couples' bargaining over relationship decisions. In

other cases, research questions may be unspecific as to whether the object of study is the couple as an entity (between-dyad perspective) or the couple as a dyadic complement of two autonomous but interdependent acting individuals (within-dyad perspective). However, with the increasing availability of dyadic data, e.g., GSOEP, FReDA, LISS, HILDA, sophisticated considerations of dual processes within couple dyads are becoming feasible.

This paper extends current dual process approaches in family sociology by implementing theories of social relations and interdependence (Back/Kenny 2010, Lange/Baliet 2015) and accompanying methodological approaches, i.e., actor-partner-interdependence modeling (Kenny et al. 2006), into the model of frame selection. This allows for sociological explanations of effects of couples' actor-partner interdependence on relationship outcomes. Conceptual and theoretical considerations will be empirically illustrated by ongoing research on the dyadic effects of job insecurity on relationship decisions, i.e. fertility, among couples in Germany.

RC06-95.1

BARON, DANIEL* (Martin-Luther-University Halle-Wittenberg, Germany)

Resilient Couples in Times of Changing Labor Markets in Germany

Flexibilized labor markets and deregulated employment relations make families more vulnerable to work-related stressors and intrafamilial planning uncertainties. In particular, social psychological research has shown that reduced job security due to flexible employment (i.e., fixed-term employment, temporary employment) is associated with reduced subjective well-being and increased subjective economic hardship. Against this background, this paper asks to what extent each partner's resources increase couples' resilience to the negative consequences of flexible employment.

Therefore, a dyadic research approach based on social exchange theory is used to examine whether the secure employment (i.e., full-time, permanent contract) of German actors decreases the partner's perception of work-related or economic insecurity. It is expected that these actor-partner effects will be most pronounced among couples with a traditional division of labor (i.e., male-breadwinner model), which, in Germany, is particularly prevalent among (married) couples with children. Thus, the gendered effects of employment constellations in couple dyads are considered.

The German case is of particular interest because of the long-lasting flexibilization processes that characterize the labor market in the context of the conservative German welfare regime. For the empirical analyses, longitudinal dyadic data of German couples (based on the German Socio-Economic Panel, GSOEP) will be used. In particular, longitudinal actor-partner interdependence models will be used, a novel methodological approach that allows for the investigation of associations between perceptions of job and economic insecurity of both actors and partners in the context of couples' (atypical) employment constellations.

Underground Music Scenes and the Politics of Heritage: Notes from Iran and Tunisia

The paper explores how "underground" music scenes embrace cultural heritage, looking at the cases of Tunisia after its 2010/2011 Revolution, and of Iran since the "Woman, Life, Freedom" movement (2022/2023). In these two contexts heritage is used as a resource and a frame of reference, providing musicians a tool for aesthetic experimentation and a source of cultural capital. However, heritage is always socially constructed and contested: by adopting and reworking cultural repertoires as "heritage", musicians position themselves in broader societal controversies, and music scenes become loci of conflict. Iranian music scenes, for instance, have recently witnessed a rediscovery of imaginaries linked to pre-Islamic Persia, together with a resurgence of nostalgia towards the years of Reza Shah Pahlavi. Some musicians are embracing these imaginaries in opposition to the Islamic Republic, evoking a romanticized past that is simultaneously exalted and mourned. Such musical politics of heritage ultimately remarginalize the gendered and ethnically connoted dimensions of the "Woman, Life, Freedom" movement, recalibrating Iranian cultural conflicts as a war between conservative masculinities. The Revolution of 2010/2011 cast Tunisia as a cultural battlefield: the country's history and collective identity have been mobilized by different actors struggling to define Tunisia's future. In this situation, musicians play with various forms of heritage, including local "folk"

music styles; elements from Amazigh, Arab, Islamic, and African cultural repertoires; and the collective memory of Revolution itself. Heritage is used as a move of "cultural reappropriation" and as a creative way to reflect on the country's current turmoil, but also as a way to position Tunisian underground music within global scenes and markets. Through these case studies, we reflect on music scenes as conflictual sites for the production of collective identities, and investigate how scenes participate in the political struggle for heritage, at the local and the global level.

Current Debates from a Comparative Perspective on the Measurement of Multidimensional Poverty As a Composite Indicator

We analyze the composite indicator of multidimensional poverty from a comparative perspective. This presentation is based on the ongoing work of the Presidential Commission for the Updating of the Measurement of Poverty in Chile, of which the author is a member. We assess the conceptual, methodological and empirical contributions of one of the indicators that generate the most technical and political debate at the international level.

Since 2015, Chile has adopted a multidimensional measure of poverty, which is currently being re-evaluated due to the post-pandemic social and economic situation. It uses the *Encuesta de Caracterización Socioeconómica Nacional*, Chile's largest household survey. Fostered by debates in economics, sociology and public policy, civil society organizations also boost this discussion.

The presentation focuses on two axes. First, from a theoretical point of view, the paper refers to international debates in the framework of the rights-based approach and Sen's capabilities theory. It also refers to the contributions of The Oxford Poverty and Human Development Initiative (OPHI), based on the Alkire-Foster Method. This, applied to 110 countries, shows that 1.1 billion people live in multiple poverty. Second, we discuss from a technical point of view the use of relative unidimensional indicators, such as the OECD's (half the median household income), which facilitate international comparisons, versus composite indicators. These enable comparing and harmonizing quantitative data sources. However, they cease to be comparable when different variables are used. Data availability is a very important question in southern countries. In this last debate, it is strategic to decide which dimensions and indicators of deprivation to include. Three dimensions are central (health, education, and living standards). Some countries, though, have added other dimensions, for example, in Chile, work and social protection, as well as social networks and social cohesion, to design more effective strategies to address multiple inequalities.

Social Movements, Public Policy and Informal Institutions: The Role of Patronage in Chile (2006-2022)

This presentation analyzes how mobilization and public policy shape one another in Chile over two decades, during an intensive cycle of collective action (2006-2022). By examining the interrelationship between mobilization and public policy, we argue that patronage is the glue that binds the two. Patronage is an informal institution, specifically a mechanism of non-professional recruitment in bureaucracies, in which political parties and agents appoint their supporters to government positions.

Using descriptive data from the Conflict Observatory of the Center for Social Cohesion and Conflict Studies, as well as secondary information produced by state agencies, and primary information comprising fieldwork conducted in six regions between 2003 and 2024, we study how bureaucracies fuel, block, or limit the effectiveness of policies. We show that until 2019, patronage channelled and attenuated social conflict in specific areas, enabling the rapid delivery of social benefits and jobs that public policies should transparently manage but do not. We assess through which mechanisms bureaucracies limit the reach of social justice reforms, focusing on research from the South. We examine sectors where patronage has no impact, particularly education and pensions, and areas where public employment mitigates social conflicts. We also analyze the limits of this mediation in the context of the 2019 social outburst.

Our contribution is twofold. First, we assess the evolution of the mediation between social movements and public policies. We analyze the specific mechanisms by which implementers shift reform efforts away from the demands of social movements through patronage, which operates as a shock

absorber of mobilizations in some sectors. Second, we develop a framework for triangulating mobilizations, public policies and informal institutions. This helps to understand how and why efforts to challenge systems of domination fall short during the design and implementation stage of policies by state and social actors.

The Political Socialization of Activism. the Case of the Housing Movement in Spain.

The few existing empirical studies on the personal cultural effects of participation in contentious social movements have mostly focused on the long-term consequences in the activists' lives and rarely on the short-term impacts and the socialising effects. Therefore, recently authors such as Fillieule and Neveu (2019) or Passy and Monsch (2019) have called for the need to address these issues. This communication addresses these areas by studying the case of participation in the Platform for People Affected by Mortgages (PAH) in Spain. Data obtained from three local groups of the movement in three cities (Barcelona, Sabadell, and Terrassa) are analysed. The data were gathered through ethnographic fieldwork carried out from the beginning of 2014 until the beginning of 2019, which used the following methods: three months of observation in each local group, analysis of institutional documents, five informative interviews with leaders, and fourteen biographical-episodic qualitative interviews with activists. These interviews were analysed through discourse analysis focused on detecting changes in political identities, interest in politics, and issues related to the movement's ideas and frames. The conclusion is that regular and active participation between one and two years in the PAH generates personal cultural changes, but in unequal intensities depending on the degree of cultural-ideological proximity previously held with the movement's ideas and the comfort or discomfort experienced with participation. People who had political ideas and housing lifestyles close to those defended by the PAH and who experienced a comfortable participation, undergo some changes and reinforce and refine their previous ideas. People who had distant ideas and an uncomfortable experience of participation undergo fewer changes. Finally, people who were culturally distant from the PAH but who had a comfortable experience of participation are the ones who change the most profoundly.

BARRAZA, JAVIERA* (Pontificia Universidad Católica de Chile, Chile)

Ciudadanía y Justicia Climática En Un Campamento De Migrantes En Santiago

El aumento de los flujos migratorios en Chile ha transformado el modo en que los migrantes habitan en las ciudades del país. En efecto, cerca del 40% de los hogares que viven en "campamentos" (asentamientos autoconstruidos) a nivel nacional son de origen extranjeros. En esos espacios, los migrantes comúnmente carecen de condiciones mínimas de habitabilidad al acceder de manera precaria a servicios básicos como el agua y la luz. En un contexto en el que amplias zonas del país se han visto afectadas por sequías prolongadas, olas de calor y eventos climáticos extremos, se explora cómo los migrantes que residen en campamentos lidian colectivamente con la precariedad habitacional. Basado en un estudio etnográfico conducido durante doce meses en un asentamiento autoconstruido en Santiago, se analiza de qué manera la demanda de los migrantes por acceder a servicios básicos es una práctica colectiva de ciudadanía anclada en una reivindicación mayor por justicia climática. De este modo, se busca demostrar que los fenómenos derivados de la crisis climática se vuelven catalizadores de demandas políticas para los migrantes. Al mismo tiempo, busca entender de qué manera los reclamos por justicia ambiental permiten la emergencia de nuevas ciudadanías para los grupos migrantes residentes en Chile.

Nous. Exploring Border Violence through a Panafrican Feminist Research Perspective

On 21st February 2023, the Anti-Black, anti-migrant speech of Tunisian President Kais Saïed heralded a cruel persecution of Black migrants. Deadly police violence, deportations and social unrest escalated into a racist crisis in the weeks that followed which continues to this day. The anti-migrant and gendered dimension of the crisis points to the interconnection of race, patriarchy, and borders arising against the backdrop of EU border externalization. In my constructivist Grounded Theory on border violence in the *Eurafrican border zone* I explore these dimensions while taking the Black Panafrican migrant critique as a starting point that helps me to subvert the hegemony of Western categories of knowledge and critique.

The analysis of interviews with Black African no border activists and migration workers in Dakar, Niamey and Berlin shows that if we are to understand racial border violence in African contexts, we must take into account the multiplicity of entangled histories of race and thereby provincialize European colonialism and whiteness. However, to talk about racism among Africans reveals to be delicate. The reflexive interpretation of the data shows that the topic of racism in Africa is imbued with contradiction, irritation, and silence. Similar tensions arise in the face of other concepts I use when I enter the stage as an African Diasporic "postcolonial-feminist" from Berlin, i.e. colonialism, decolonization, and, especially, feminism.

What are the risks of racism in the postcolony? Why does the topic of feminism disturb the panafricanist talks I undertake with my interlocutors? My contribution discusses these conversational crises against the background of the postcolonial constructions of African identity, the *Nous Africain-e-s* (Us Africans), and the dominance of Eurocentric categories of critical knowledge which silences pathways of decolonization proposed by panafrican feminists and no border activists.

BARTELMESS, TINA* (University of Bayreuth, Germany)

Framing Food Poverty in Germany: Media Portrayals, Social Inclusion, and the Impact on Public Perception (2018-2024)

Food poverty and insecurity are growing concerns across many high-income countries, including Germany, where 3.5% of the population was affected in 2022, according to FAO estimates. This study examines how German media portrays food poverty and its implications for social inclusion and exclusion. Using a corpus of 406 articles from 2018 to 2024, this framing analysis identifies the dominant frames in media discourse and explores the rhetorical strategies used to depict those affected.

Drawing on Foucault's discourse theory and Entman's framing theory, the research addresses two key questions: How is food poverty framed in German media, and how do these frames express social inclusion or exclusion? A qualitative and quantitative frame analysis was conducted using MaxQDA Analytics Pro software, identifying three key frames: (1) food poverty as a result of material poverty, (2) food poverty as a political issue, and (3) food poverty as a multifaceted challenge. These frames highlight a range of causes, from inflation and low income to political inaction and structural inequalities, with varying proposed solutions.

A subsequent linguistic analysis reveals how these frames shape public perceptions of those affected by food poverty. While some media portray individuals as resilient and part of the broader society, others reinforce stereotypes of helplessness, creating social divides. Notably, the inclusion of direct quotes from affected individuals humanizes their experiences, fostering solidarity and reducing stigma.

The findings underscore the importance of inclusive media representations in shaping public and political responses to food poverty. By critically engaging with media discourse, this study highlights the role of journalism in promoting social cohesion and equitable policy solutions to address the complexities of food poverty in Germany.

BARTHOUE, EVELYNE* (LIRE Université de Nouvelle-Calédonie, France)

«Jeunesse Kanak Lève-Toi !». Analyse Des Mobilisations Et Émeutes Juvéniles De Mai 2024 En Nouvelle-Calédonie.

La Nouvelle-Calédonie connaît actuellement une crise économique, sociale et politique sans précédent. Elle fait suite aux violentes émeutes qui ont débuté le 13 mai 2024 lors de l'annonce présidentielle de la révision constitutionnelle du dégel du corps électoral hérité des accords de Nouméa de 1998. Ces émeutes ont particulièrement mis en visibilité une partie de la jeunesse kanak qui cumule des inégalités face au reste de la population et qui exprime un fort sentiment d'injustice sociale et une défiance politique face à l'ensemble des représentants politiques (Barthou, 2024). Selon l'ISEE (Institut de la statistique et des études économiques de Nouvelle-Calédonie), en 2022, la population kanak reste globalement moins qualifiée : 49 % des 15-64 ans n'ont aucun diplôme qualifiant, contre 33 % pour les non-Kanak. À l'opposé, 6 % des Kanak ont un diplôme de l'enseignement supérieur, contre 28 % dans le reste de la population, et, même à qualification équivalente, des écarts persistent. Nous verrons dans cette communication que les émeutes ont surtout eu lieu dans les quartiers nord de la ville de Nouméa, ville marquée par des inégalités socio-spatiales importantes et qui accueille une population jeune, souvent venue de brousse (espaces ruraux de la Grande Terre de Nouvelle-Calédonie) et des Iles Loyautés. Celle-ci qui vit souvent dans des conditions très précaires et très différentes des modes de vie en tribu. Ces émeutes ont aussi souligné une colère juvénile, jusqu'ici invisibilisée et étroitement liée à la situation néocoloniale que connaît le territoire, les inégalités socio-économiques que subissent une grande partie des jeunes kanaks et un fort sentiment d'injustice et de discrimination, même chez les plus diplômés. Enfin, nous verrons que la jeunesse kanak est aussi plurielle sur le territoire et une partie d'entre elle est fortement mobilisée sur les enjeux de transformation socio-politique et climatique.

Differences in COVID-19 Vaccination Among Migrants and Non-Migrants in Germany: The Mediating Role of Psychological Factors of Vaccine Behavior

Understanding the underlying mechanisms for differences in COVID-19 vaccination between migrants and non-migrants in Germany is crucial in order to design targeted interventions encouraging vaccination. Hence, this study examined to what degree these disparities were mediated by psychological factors using the established 5C model of vaccine behavior (*Confidence, Complacency, Constraints, Calculation, Collective Responsibility*). Data were obtained from the German seroepidemiological study "Corona Monitoring Nationwide" (11/21-02/22). The association between vaccination and migration history considering the psychological factors was investigated using logistic regressions, while controlling for various sociodemographic and health-related characteristics. Lastly, a decomposition was conducted to uncover how much of the disparities in vaccine uptake could be explained by the 5C framework using the Karlson-Breen-Holm (KHB) method. People who immigrated themselves, were less likely to be vaccinated against COVID-19 compared to non-migrants, especially participants from the MENA region. The results of the mediation analysis showed that a substantial proportion of differences in vaccine uptake was mediated by the psychological factors (first generation: 61.2%, second generation: 64.2%). Confidence in safety of the COVID-19 vaccine and collective responsibility were the most relevant explanatory factors in the 5C framework. Furthermore, the results highlighted the importance of a differentiated consideration regarding the country of origin: While 19.4% of the effect for the MENA region is explained by the 5C model, the proportion for Eastern Europe is 73.5%. However, the indirect effect for the MENA region is not significant suggesting that the underlying mechanisms for the lower uptake need to be identified. Therefore, we investigated the effect of migration-specific characteristics on vaccination differences within the migrant population in an additional model. The study concluded with a discussion of possible explanations for the different attitudes towards vaccination (e.g. experiences of discrimination) and recommendations for targeted interventions to overcome potential barriers and to ensure equal access to healthcare.

Intended and Emergent Academic Knowledge Transfer: A Review of Reviews

Knowledge transfer has become an almost universal expectation directed at universities and research institutes alike. It is not an end in itself, policies trying to foster transfer activities aim for responses to societal challenges or contributions to innovation. For universities, this expectation comes on top of their traditional missions: research and teaching. While a focus on the intended transfer activities of academic actors is highly compatible with a governance perspective, it tends to turn a blind eye on actual processes of knowledge transfer that are more complex and emergent. Innovation processes, for example, typically involve not only intended but also unintended elements that might be connected to the traditional missions of universities. Intermediary actors, for instance, translate "basic research" publications for their target groups. Graduates from university enter the labor market and sometimes transform their field of practice by the cognitive categories they acquired at university. The proposed paper will review a total number of 44 reviews on knowledge transfer, analyzing to which extent such less obvious processes of knowledge transfer have been reflected and evaluated.

BARTL, WALTER* (Institute for Higher Education Research at the Martin Luther University Halle-Wittenberg, Germany)

The Coal Phase-out in Germany and Its Regional Impact on Economic Worries

Market-driven closures of coal mines have typically been associated with negative economic consequences for the affected regions. In Germany, structural policy directed towards ameliorating the negative effects of hard coal decline in the Ruhr area lagged behind the onset of decline, caused major political conflicts, and has been variously criticized for its reactive character that failed to generate a positive image of the future. The phase-out of lignite coal in Germany, in contrast, is state-driven and accompanied from the outset by compensatory and investment policies that strive to facilitate regional structural change proactively. Against this backdrop, the proposed paper investigates how the policies of lignite coal phase-out initiated in 2018 and the accompanying public discourse affect the economic worries of individuals in the remaining three lignite coal mining areas in Germany. Focussing on the period 2016–2021, the paper uses a longitudinal multilevel design based on regional and individual data from the German Socio-Economic Panel (GSOEP). Overall, probabilities of strong economic worries decrease throughout the observed period. Results show that subjective economic worries do not significantly differ between residents of lignite mining regions and those in the rest of the country. Further robustness analyses confirm that the coal phase-out policy has not increased economic worries in German lignite mining regions. However, in all regions, persons under 40 have a higher probability of strong economic worries while the probability declines above age 65. To conclude, possible limitations of the study and possible connections of economic worries to the electoral turnout of the neo-nationalist Alternative for Germany will be discussed.

Does Inequality Undermine Life Satisfaction? Effective Identification of Country-Level Controls for a Longitudinal Investigation

Does increased economic inequality undermine people's subjective well-being (SWB)? Longitudinal analyses generally offer a good foundation for results that can be interpreted in causal terms, because the analytical design controls for time-constant differences between countries. But researchers must still consider what controls to include for time-varying variables. Researchers engaged with this topic generally focus their attention on controls for individual-level determinants of SWB. I argue (in part by pointing to results in previous research) that individual-level controls are not important for this question. Instead, what is needed is more careful attention to the identification of time-varying country-level controls. A more plausible set of decisions leads to a more extensive set of country-level controls.

Applying that perspective to an analysis of relatively wealthy countries during the period 1990 to 2019 (using data from the World Values Survey), one key finding is that the overall negative impact of economic inequality on life satisfaction is much smaller than what is evident in previous research.

But there are important differences for income groups. The negative impact on lower earners is larger than the overall result. But for higher earners rising income inequality leads to *increased* life satisfaction. This is a striking result that contrasts with most previous research. Rising income inequality in effect contributes to rising inequality in life satisfaction as well.

BARTŁOMIEJSKI, ROBERT* (University of Szczecin, Poland)

Reconfiguring Ocean-City Relations: The Blue Economy's Impact on Performativity in Port Cities

This paper explores the transformative impact of the Blue Economy on the performativity of port cities, with a focus on the evolving relationship between urban environments and the Global Ocean. By comparing different stages of port city interactions with the ocean, I highlight key performative features of economy, technology, politics, and culture that emerge through these shifts. Using Actor-Network Theory as a framework, I analyze how the Global Ocean, treated as a non-human actant, translates across the global market (economy), port infrastructure (technology), city governance (politics), and urban users (culture).

Drawing on findings from a Short-Scientific Mission Grant COST Action CA22122 - *Rethinking the Blue Economy: Socio-Ecological Impacts and Opportunities (RethinkBlue)*, conducted at PortCityFutures in Delft and Rotterdam, I focus on Rotterdam as a case study for understanding the Blue Economy's performativity. Through content analysis of publications, promotional materials, and performative walks within the maritime spaces of Rotterdam, I construct a performative frame of the city's role within the Blue Economy. This analysis aims to reveal the ways in which human relations with the ocean—shaped by economic interests, heritage traditions, cultural values, and emotional action nets—have transformed the symbolic and functional roles of both the ocean and port cities.

By revealing the ongoing reconfiguration of ocean-city relations, this research highlights the ways in which economic transformation and technological innovation drive the evolving role of port cities within global politics and maritime networks. The paper provides a sociological perspective on how urban infrastructures, maritime technologies, and political governance mediate relations with the ocean, while reshaping the performativity of both port cities and the Global Ocean.

BARZAGHI, ALESSANDRA* (Università Cattolica Del Sacro Cuore di Milano, Italy)

Borders in the Learning Processes of Unaccompanied Minors: A Research in the Italian Context

Unaccompanied Minors (UAMs) in Italy face many visible and invisible borders (Khosravi, 2010). They are marked by key sources of inequality and seen as young adult males, therefore as subjects to be controlled in emergency rather than as minors to be protected (Santagati, Barzaghi, 2021). This also occurs in the educational contexts dedicated to them, including school-training institutions and the reception system, which employ standard approaches failing to enhance their skills and cultural capital. This is an emblematic case of migrant students in the Italian context that leads to reflect on the lack of valorization of the cultural capital that these subjects can bring to the whole society.

The author's research raises the following questions: how do UAMs perceive and define borders? What are the learning processes activated by UAMs crossing and experiencing borders?

The research aims to observe the trajectories of UAMs, with a focus on the intersection of *learning and migration*, recognizing that learning must be contextualized and cannot be understood without considering movement through social space (Morrice, 2014). Furthermore, the author proposes to view *borders* (Mezzadra, Neilson, 2014) from the perspective of minors, offering new insights for reflection (Kaisto, Wells, 2020), and to consider borders as a social space for learning.

To answer the research questions and seriously consider the UAMs' perspective, challenging the adult and colonial narrative (Freire, 2022), former UAMs involved in their own contexts as activists are engaged in the co-construction of qualitative investigative tools (creative participatory methods such as drawing, body maps, life maps), which are then used to collect biographical narratives from the UAMs. The research is developed in different Italian local areas paying attention to national, urban and rural borders.

BAS, MUHAMMED FAZIL* (Yildiz Technical University, Turkey)

Is There a Need for a Non-Academic Sociology? Cohabitation of Non-Academic and Institutionalised Sociological Thought in Turkey

Sociology has, like other academic disciplines, become increasingly institutionalised over time and has accepted the limits of the academic "field". With this natural history of academic disciplines in mind, an important question is whether the transdisciplinary synthetic, theorizing and thought provoking character of sociology requires the discipline to operate outside the academic field in ways that can push its boundaries. On the one hand, it can be said that the debates around the term "public sociology" point to a need in this direction, but public sociology seems to express an orientation from the academy to the public outside of it. On the other hand, it is a useful area of research to ask what the potential of non-academic debates, social movements or public spaces is to encourage and support the production of such theories and methodologies within the academy, and whether this potential is still valid under changing social conditions.

This study aims to discuss the contribution of non-academic circles to the production of sociological thought in the history of the development of sociology in Turkey, and the effects of academic institutionalization in retrospect. Although a chair of sociology was established within the university in Turkey as early as the 1910s, its institutional continuity was soon interrupted and had to be re-established in the late 1930s. For a long time before and after this date, sociological studies within the academy as well as sociological analyses outside of it determined the shaping of sociology in Turkey. On the other hand, the impact of institutionalized academic studies has become more decisive than non-academic ones after the 1990s. Through the mutual contributions and discrepancies between academic and non-academic studies, the study aims to catch a clue about the path that sociological studies can follow today.

BASHFORD-SQUIRES, SALLY* (Nottingham Trent University, United Kingdom)

How Social Enterprise Projects Can Support the Development of Relational Ethics Towards Improving Indigenous Women's Health in the Anthropocene. a Case Study from North-Eastern Uganda.

This presentation explores the health and wellbeing of women living in the Teso sub-region, Uganda, a rural area in the north-east of the country experiencing high levels of poverty. It examines the impact of social enterprise projects (SEP) on women's health through a lens of intersectionality. The social enterprises researched include tailoring schools, agricultural initiatives, and a football project.

Various evidence suggests that increasing women's income intensifies their work burden leading to greater health issues. Other studies propose that economic empowerment is necessary to autonomy. However, this research seeks to understand how SEP impact on Iteso women's health through supporting relational values rather than encouraging individuality.

The study draws on a qualitative approach using bricolage, rapid-ethnography, and autoethnography as methodologies due to their adherence with the Afrocentric values which guided the research. The research presents narratives from 63 semi-structured interviews, autoethnographic extracts, photographs, and artwork. Analysis of the findings was conducted through a conceptual framework combining elements of intersectionality, new materialism and Indigenous Knowledge.

The results of this research demonstrate that women in Teso are subjugated to anthropocentric issues relating to climate change such as malaria, along with non-communicable illnesses concerning mental health. Alongside increasing poverty, the climate emergency has fractured masculinities resulting in increased gender-based violence in its many forms.

The enterprise projects provide resources which lessen violence and improve health. The values of the participants reflect an ethics of care encouraging relationality; within the SEP participants plant trees, harvest water, share resources and engage in music, dance, and drama. However, this research also demonstrates the need involve men in enterprise projects. This research contributes to existing knowledge on issues of gender and development within majority world settings. It reveals the propensity for SEP, based on relational values, to improve community health in marginalised areas.

Film-1017.1

BASHFORD-SQUIRES, SALLY* (The University of Greenwich, United Kingdom)

"Eitai"

The documentary, entitled 'Eitai' which is an Ateso word for community togetherness, is filmed in Teso sub-region, Uganda. Teso is a marginalised rural area of North-Eastern Uganda. The documentary is based on my doctoral research which was conducted in this area.

Eitai explores issues of climate change and the resultant poverty, alcoholism, and various forms of gender-based violence (GBV). It explores how the social enterprise projects provide economic wellbeing as well as a safe space for the community to share knowledge, combat climate issues through the planting of trees, and sensitise communities through music, drama, and dance.

The documentary demonstrates the importance of Indigenous Knowledge, particularly communitarianism and the need to develop stronger relationships with each other, the land, and non-humans to prevent further damage to our planet. Eitai captures many unique stories concerning the fight against HIV and GBV which are relayed through the participants' stories, music, and dance.

BASHONGA, RAGI* (University of Johannesburg, South Africa)

"My Mother Was My First Country": Identity and Belonging of Second Generation Congolese Immigrants in South Africa

How do we make sense of Africanity and Pan-Africanism in the face of Afrophobia in South Africa? I consider this question through the exploration of second-generation Congolese immigrant experiences of identity and belonging in South African cities. This is important because of what the journey of migration means in the personal and social imaginary, particularly in a global context of ever-increasing obsession with borders and exclusion.

For this contribution, I present a portrait of Nabarungu Bacumi which is centered on the role of her mother – a powerful yet destructive force throughout Nabarungu's childhood through to adulthood. It tells a story of how Nabarungu's mother influences and mirrors her experiences at the level of personal and national identity. Themes in Nabarungu's poetic-portrait are around the implications of beauty and aesthetic in the personal world and also in public, and the ways that physical appearance are tied to particular localities. It speaks to her experiences of masculinity, experienced with her father and with men, white men. This introduces race as an important theme, a longing to be seen and validated by whiteness. Her story shows that experiences of othering and xenophobia made it difficult to belong to the broader world as a child and as a young woman. Finding internal peace has been a process of finding things more abstract and tangible to hold on to, music and values have become a space in which to find home. This contribution proposes the need for a deeper interrogation of the experiences of intra-continental immigrants and argues for the recognition of an African diasporic experience in Africa.

Child Well-Being and Right to Education in Sicily. the Legacy of the Covid-19 Pandemic and Current Educational Challenges

The COVID-19 pandemic has highlighted and intensified socioeconomic inequalities and disclosed the fragility of public policies related to education and child well-being. In Sicily, a region significantly affected by poverty and high school dropout rates, the transition to remote learning revealed critical gaps in upholding the right to education, as mandated by Article 34 of the Italian Constitution and international frameworks such as the Convention on the Rights of the Child.

This study seeks to analyse the pandemic's impact on the Sicilian educational system by evaluating how effectively the right to education has been protected and assessing the policies enacted to address the challenges posed by the health crisis.

Hence, the main research objective is to investigate how the pandemic influenced the right to education and child well-being in Sicily, focusing on inequalities in educational access and the effectiveness of institutional strategies designed to support children and adolescents during and after the emergency.

The research questions address the management of education in Italy throughout the pandemic, the impact on vulnerable children, and the measures taken to reduce educational disparities.

Using a qualitative approach, this study relies on secondary data analysis from official sources and semi-structured interviews with teachers, school administrators, and social workers from various Sicilian provinces. The sample is balanced to represent different territorial contexts, providing a comprehensive view of educational challenges in urban, suburban, and rural settings.

Ultimately, the study aims to offer a critical reflection on current educational challenges and propose strategies to ensure inclusive and quality education for all children.

Responsibility and Professional Accountability in Juvenile Criminal Proceedings to Ensure the Child's Best Interests. an Exploratory Investigation between Italy and Northern Ireland

The professionals' role in the juvenile justice system, including judges, lawyers, social workers, and other practitioners, is crucial in ensuring that the "best interest of the child" remains central in decision-making processes. This research adopts a comparative perspective to examine the professional responsibilities and accountability of these key actors in Italy and Northern Ireland. Through interviews with legal practitioners and social workers, the study explores how different perceptions, practices, and principles impact decisions involving minors and how these roles contribute to shaping interventions within the justice system.

By comparing these two national contexts, the study identifies key similarities and differences in how professionals navigate their responsibilities, emphasizing their role in balancing public safety, rehabilitation, and children's rights protection. The analysis also explores the challenges professionals face in safeguarding minors' rights and well-being amid evolving legal frameworks, resource limitations, and societal expectations.

This research provides valuable insights into how a *child-centred approach* can transform the quality of interventions in the juvenile justice system. It also offers critical reflections on best practices and areas for improvement, contributing to a better understanding of *how* strategies for supporting vulnerable youth are implemented effectively, proportionately, and with a rights-based approach.

This exploratory study aims to offer critical insights into how a child-centred approach can enhance the quality of decision-making and interventions in the juvenile justice system. It intends to contribute to the development of best practices and identify areas for improvement, supporting a more effective and rights-based approach to juvenile justice.

BASU, CHANDNI* (Sister Nivedita University, India)

Relational Well-Being of Youth in India and South Africa: Digitalized Realities

This study examines the relational well-being of youth in India and South Africa within the context of rapidly expanding digitalized realities. With the proliferation of smartphones and social media, young people in both countries are navigating complex digital ecosystems that significantly influence their social interactions, sense of belonging, and identity formation. Drawing on qualitative and quantitative data from youth aged 15-24, the research explores how digital engagement impacts relational dynamics such as family cohesion, peer relationships, and community connectivity. The findings highlight both positive and negative outcomes, revealing that while digital platforms can foster support networks and global connections, they also present risks of social isolation, cyberbullying, and fragmented communication patterns. By focusing on how youth negotiate relational well-being in digitalized environments shaped by socio-economic disparities and cultural contexts, this study provides a nuanced understanding of digital inclusion and its implications for youth development. It advocates for youth-centered digital policies and relational frameworks to ensure that technology enhances rather than hinders the relational well-being of young people in these diverse settings.

BATISAI, KEZIA* (University of Johannesburg, South Africa)

Navigating Role-Overload: 'tales of a Scared/Wounded Yet Productive Female Academic'

In my chapter, Batisai (2017), titled "Mothering beyond National Borders" analyses the trajectories of Zimbabwean migrant women in South Africa. The chapter exposes the narrative of fear rooted in the 'perceived strain of mothering' on one's career. Such fear takes us to the question, "So how do these two identities [a mother and a career woman], inhabit a being and how are they played out in daily life, at home and work?" posed by Mesthrie (127) in her review of Venitha Pillay's *Academic Mothers*. Although the review challenges the way Pillay renders the pursuit of a balance between motherhood and an academic career futile (128), Mesthrie acknowledges that the book "opens debate over motherhood in academia" (129). In 2017, these debates were beyond those raised in my chapter, but I acknowledged that they warranted further exploration. Writing from a biographical standpoint, I revisit these debates in 2024 to map and interrogate my intersecting identities – as a Black academic mother – core to personal trajectories of how I have confronted the post-pandemic burnout, fatigue, and role-overload as I navigated the aftermath of the COVID-19 pandemic. To avoid mourning over the past, this article focuses on role-overload to expose how the pandemic, beyond blurring work-family-life lines, taught me to progressively set boundaries and prioritise self-care – attributes that I further embraced during the University of Johannesburg 2023 Women's Leadership Development Programme. This biographical piece is a powerful theoretical and methodological tool for interpreting the realities of being a Black academic mother, which I summarise by the phrase 'Tales of a Scared/Wounded yet Productive Female Academic'. The self-reflective article brings to the fore the intersections of my academic and (re)productive being, which, although private, affect the public (aspects of life), including my realities as a female academic, especially after the pandemic.

BATTISTI, FABIANA* (University of Rome Tor Vergata, Italy)

Co-Design to Deconstruct Digital Accessibility. a Participatory Journey at the Finger Tips of an App.

The aim of this paper is to reflect on the complexity of social vulnerability from an intersectional point of view in relation to co-design processes involving participatory methods capable of bringing individuals and private companies into dialogue. The reflection starts from a specific case study related to the construction of an app for online and on-site use of cultural itineraries in partnership with a private organisation. We ask ourselves the following questions: How does the corporate system guide operational decisions? What are the challenges and opportunities in creating more equitable and inclusive access, particularly in relation to disability?

Recovering the matrix of systemic domination proposed by Adams and Zuniga (2016) and systematised with the application proposed by Antonucci, Sorce and Volterrani (2022), we reconstruct the decision-making process in the different aspects of the work carried out over a period of six months (April-October 2024), focusing in particular on the identity and epistemic dimension of disability. Following the growing scholarly debate in the field of digital accessibility and artificial intelligence, supported by a bottom-up social justice perspective, and understood as present and future public spaces that are increasingly central to the negotiation of independence and power for disabled people (among others Goggin and Soldatic, 2022; Newman-Griffis et al., 2023; Zhang and Goggin, 2024), we rely on ongoing participant observation work, including participation in specific resources such as the creative method of the world café, as well as in-depth interviews with an extended team of 20 people (Jorgensen, 2011; Pink, 2015). Broad operational and theoretical limits, virtues and risks emerge, laying the foundations for looking at the potential of a guided co-construction of the de facto deconstruction of the very concept of accessibility, better expressed as plural and therefore real usability.

MATANCEVIC, JELENA (Faculty of Law, University of Zagreb, Croatia)

Contemporary Challenges and Prospects of Older People's Care in Croatia and Possibilities for Transformations

Care for dependent older people is conceived as a new social risk and a rising issue for contemporary welfare states (Bonoli, 2006; Greve, 2017). Long-term care (Pavolini & Ranci, 2013) is one of the most rapidly developing policy areas in Europe. Croatian older people care is characterized by a welfare

mix model: widespread informal care, a growing and today dominant role of private, for-profit and non-for-profit providers and general diversification of services (Matancevic & Baturina, 2024). Reluctance to policy reforms, limited state's capacities for service provision and contested processes of decentralizations have resulted in strong trends of privatization of services, territorial disparities and inequalities in access to formal care as well as a growing burden on the informal sector of family care (Matancevic & Baturina, 2024).

The aim of the paper: (1) to present the recent trends shaping Croatian older people care system, relating to privatization, diversification of services and their accessibility and affordability, and (2) to analyse the transformative capacities of the Croatian care system to Europeanise and follow the EU relevant agenda

The methodology includes secondary data (official statistical data and reports) to analyse the abovementioned trends and semi-structured expert interviews (N=9, from different sectors) on key challenges of the Croatian welfare system and its prospects in the context of the European pillar of social rights.

The research results show that care needs and the future supply of services are recognized as a pressing social issue. The problems of poor capacities of the government and other stakeholders in delivering social services and developing innovations in the field of care, as well as the lack of capacities for the Europeanisation of welfare systems are highlighted. Results will be discussed in the context of prerequisites for the transformation of care in Croatia to meet the future needs of older people.

Where Do We Go Now? Missed Opportunities and Uncertain Future- Evaluation of the Foundations for the Development of the Social Entrepreneurship Ecosystem in Croatia

Social entrepreneurship and social enterprises represent umbrella terms for various innovative and dynamic practices. The key difference between entrepreneurship in the business sector and social entrepreneurship is that the latter prioritises welfare and social goals (Baturina and Babić, 2021). Social entrepreneurship has become an autonomous area of practice and research in Europe (Borzaga et al., 2020.). The social entrepreneurship sector is relatively new in Croatia, still in the phase of progressive development (Vidović, 2019). A new sector with different development issues such as a lack of an appropriate legal and financial framework, or policy support (Vidović, 2019, Baturina and Babić, 2021).

The goal of this paper is to evaluate the current state and potential of developing an enabling social entrepreneurship ecosystem in Croatia. The paper will rely on a) a literature review (previous research, public policy documentation, official statistical data) b) recent empirical research (quantitative research based on a survey conducted within the Croatian Social Enterprise Monitor research (Vidović et al, 2023) and 2024 iteration (to be published) and two qualitative researches based on the case studies of innovative initiatives in the sector (Baturina and Matančević, 2023.; Baturina and Mardeža Bajš, 2023). The analysis will reflect several key dimensions of the ecosystem (policy, financial framework, skills and education and networking capacities and visibility) already recognized as important in the EU context (Borzaga et al., 2020).

The discussion will assess social enterprise sector ecosystem development in Croatia from the perspective of sector status in the Central and Eastern European context (Defourny, J., Nyssens, 2021) and the broader European context (Dupain et al., 2022). The conclusion will give some recommendations for the future development of sector and try to reflect on social entrepreneurship in Croatia as a new forms of entrepreneurship orientated towards advancing normative goals of justice, equity, and sustainability.

BAUDENS, PAULINE* (Taltech University - Public Administration, Estonia)

The Food Delivery Apps, a Blessing for Women?

Technology could hold the promise of empowering women in reshaping daily practices and traditional gender roles. Digital technologies, such as food delivery apps, can assist women in managing their traditional cooking responsibilities, potentially relieving them from this daily duty, either partly or entirely. This paper examines the effects of food delivery apps on women's daily practices and perceptions, exploring the interconnection between digital technology and female empowerment within patriarchal norms.

India, while generally a traditional society with strong gender role distinctions, is also one of the largest and fastest-growing digital markets globally, including for food delivery services. Thus, an in-depth study in Pune, India, involving twenty-two women, was conducted to observe the dynamic shift in societal norms.

The findings suggest that in a traditional society like India, food delivery apps initially offered a sense of liberation for the women as they artificially relieved them from the daily burden of cooking, sensibly freeing their minds. But cooking responsibilities predominantly remain a female duty. Additionally, these apps tend to originate compulsive behaviors, compromising a certain degree of self-control, and raising questions about the true extent of empowerment promised by digitalization.

Exploring Climate Emotions and Public Support for Climate Interventions across 30 Countries

Emotions are central to human experiences of climate change. Empirical research demonstrates their importance for climate perceptions and climate-related behaviors. The intensifying severity of climate change prompts consideration of emerging, potentially controversial technologies. Alongside mitigation and adaptation, climate intervention proposes to remove carbon dioxide from ambient air (carbon dioxide removal, CDR) or reflect sunlight away from the Earth (solar radiation modification, SRM). Although such options arouse emotional reactions of diverse kinds, the intersection between climate emotions and climate intervention has received limited attention. This article employed a unique, global dataset with 30,284 participants across 30 countries (in 19 languages) to provide insights on three questions. We first leveraged the global dataset to map incidence of fear, hope, anger, sadness and worry across countries. This is the first time climate emotions of adults are investigated on such a scale. We also identified significant differences in climate emotions by level of development, with those in advanced economies reporting weaker levels of climate emotions. Second, using multiple linear regression analyses, we assessed the relationship between climate emotions and support for climate-intervention technologies. We determined that hopeful and worried were the most consistently (positively) correlated. Third, we explored if reading about technology categories differentially affected climate emotions. Individuals randomly assigned to read about ecosystems-based CDR were significantly more hopeful and worried about climate change, though such differences were minor in size. Together, our results provide the first global-level evidence of the relationship between discrete climate emotions and perceptions and support of climate intervention.

AI Usage in Companies: Does Gender Matter?

In light of the ongoing discourse surrounding the recent advancements in artificial intelligence (AI), and the debates surrounding the opportunities and risks of AI, this contribution aims to identify the prevalence of AI usage within German companies, as well as company characteristics that facilitate the usage of AI. As, the call emphasises, gender is a significant factor to consider when analysing AI usage at the labour market or in organisations. Additionally, the usage of AI in German companies, along with the proportion of women in the labour force, is above the international average, a particular focus is placed on the role of the gender composition of companies for the usage of AI. The analysis is based on empirical quantitative data from the BIBB Training Panel, a representative panel for companies in Germany. The companies are classified as follows: companies with a 1) predominantly female workforce, 2) mixed workforce, 3) predominantly male workforce. The data indicate that the usage of AI in Germany has been gradually increasing since 2020. The preliminary results of the logistic regression, which considers various other impacts on the usage of AI (size, sector, digitalisation level, innovative culture), indicate that in comparison to male-dominated companies, mixed-companies utilise significantly more AI in 2023. However, no significant difference was observed in the use of AI between female-dominated and mixed-companies. These findings suggest that a diverse workplace may foster a conducive environment for AI adoption. Nevertheless, the data does not identify which employees are using AI. Further investigation is necessary to ascertain what is driving this trend and who is using AI in mixed-companies. Nevertheless, the findings may be generalizable to other countries, as they indicate that more mixed or gender-diverse workplaces may be better equipped to utilize new technologies such as AI.

BAUTISTA-LEON, ANDREA* (Universidad La Salle, Mexico)

An Unfinished Social Revolution: Challenges in the Integration of Professional Women into the Mexican Labor Market

This research analyzes the gaps and disparities in the labor market for women professionals in Mexico, in the context of an accelerated increase in their participation in higher education between 2017 and 2022. Through a quantitative and descriptive approach, the study uses data from ANUIES and the National Occupation and Employment Survey to show the situation of women in this period. The results highlight that, although the gender gap in access to higher education has decreased, challenges persist in the labor market, such as the low economic participation of women with bachelor's degrees, the segmentation of fields of study, and wage gaps. In addition, women are still concentrated in traditional careers such as education and health, with an underrepresentation in engineering and technology. This progress, although significant, faces persistent gender segmentation in the labor market and wage inequality, reflecting an unfinished social revolution.

BAVBEK, YASEMIN* (Harvard University, USA)

From Soldiers of the Faith to Experts in Development

This paper seeks to explain the transformation of American humanitarianism in the early 20th century from religiously motivated charity and educational work to developmental and aid projects in the Middle East. It traces the response of American missionaries and other humanitarian actors in the American empire to the three events of violence against Armenians in the Ottoman Empire. Building on Elisabeth Clemens' work and Bourdieusian field theory, I argue that the humanitarian responses to the 1894-1896 and 1909 massacres took the form of "iterated problem-solving" and "intentionless invention." These moments of crisis also highlighted a tension within the American Protestant field: the humanitarian logic of neutrality clashed with the logic of conversion and religious solidarity. In these instances, a developing humanitarian field remained subordinated to the Protestant one. The Armenian Genocide of 1915 created a crisis on an unprecedented scale, leading to the development of an autonomous global humanitarian field building on previous American structures but transcending them. The Near East Relief replaced the ABCFM as the central actor in the region after 1919. Contrary to previous practice, this now autonomous field of humanitarianism redefined what 'neutrality' means and transformed the vision of aid from a return to the status quo ante to addressing the root causes of violence and building institutions for future development. The transformation of overseas American humanitarianism in this process further redefined the way how international humanitarianism is understood and practiced during the interwar period. The paper ends with discussing the legacies of this moment and its consequences for how INGOs engage with populations in the Global South.

BAVBEK, YASEMIN* (Harvard University, USA)

What Exactly Do We Reflect on When We Use "(Self)Reflexivity" in Sociology

In recent decades, sociological techniques such as self-reflexivity and self-reflection have become buzzwords, especially in critical sociological research, as a means of accounting for and theorizing on the position of the sociologist vis-à-vis their research topic, their ontological approach to the world, and/or identities of their 'subjects.' The aim is commonly understood as laying bare relations of domination, or acknowledging the limitations and shortcomings of research. Even though there has been increasing focus on self-reflexivity as an integral part of the research process, sociologists frequently use the word in radically different and ambiguous ways, with meanings ranging from an offhand acknowledgement of one's own identity(ies), to a thorough account of the context and ontological paradigms the author uses to think through the world. There is rarely any explicit discussion on what we mean by self-reflexivity and how others have chosen to apply it as a "technique" for accounting for power relations encountered in many stages of doing research.

To start conceptualizing the various ways self-reflexivity as a technique works and is related to relationships of domination, I identify the various ways in which sociologists have approached the concept. In these categorizations, the meaning of "self" also changes; for example, some forms of self-reflexivity position the 'self' as individual, other forms position the 'self' as researcher, as discipline of sociology. The aim is to lay the foundations of a terminology of self-reflexivity as a technique that would not only bring together social relations of domination based on gender, race, sexuality and coloniality together, but outlines forms of self-reflexivity that would bring together the

position of the researcher with the identities of domination and concerns of epistemological and methodological de-colonization. This project contributes to building a critical social theory that unpacks the false dichotomy between theory and practice.

BAWIDAMANN, LOÏC* (University of Zurich, Switzerland)

Back to Community: Connecting Conspiracy Theorists Beyond the Screen

The Organic Christ Generation (OCG), originally an evangelical religious community based in Switzerland, has evolved into a multifaceted organisation with a diverse set of counter-knowledge platforms. What began as conferences and newspapers promoting various conspiracy theories has expanded into the digital realm with their video platform Kla.TV gaining significant viewership, particularly in German-speaking countries. However, driven by concerns over increasing online censorship and a desire for closer connections in anticipation of a perceived inevitable crackdown on alternative media providers, the OCG is actively seeking to strengthen physical connections among its members. This paper examines the complex relationship between the OCG's sophisticated digital infrastructure and its community-building efforts. Through qualitative interviews with OCG members, participant observation at OCG events, and in-depth analysis of OCG-published content, I explore how digital technologies both enhance the reach of their message and potentially hinder the religious community's growth. This paper investigates the tension between the community's online expansion and the desire for tangible, in-person connections with like-minded individuals sharing their heterogeneous beliefs. This conflict leads to far-reaching debates within the community about identity and their position towards society at large, offering insights into the challenges faced by a digital-age religious community seeking to balance virtual and physical presence.

BAYA-LAFFITE, NICOLAS* (Institute of Sociological Research / Environmental Governance and Territorial Development Institute, Switzerland)

Constructing Narratives of the Twin Transition: Digitalization and Sustainability in EU Foresight

The European Union's strategy for achieving climate neutrality by 2050 places the twin transition—digitalization and sustainability—at the core of its policy frameworks, as reflected in the European Green Deal. These transitions have been framed as both technological and societal, requiring not only innovation but also governance capable of anticipating and shaping future transformations. This context sets the stage for examining how the EU's foresight processes construct and disseminate narratives that guide public understanding and policy development related to the twin transition. The construction of these future narratives raises questions about how societal and environmental changes are framed. To shed light on how narratives about the twin transition are constructed, this paper analyzes key EU policy documents, as well as larger frameworks such as those developed by the IPCC Working Group III. Using narrative analysis, the paper identifies how digital technologies and sustainability strategies are framed within broader social, economic, and political contexts. This approach allows for an examination of how these narratives position digitalization as essential to achieving sustainability while embedding these developments within sectoral and societal transformations. The findings show that while the narratives are predominantly technocratic, there is an increasing emphasis on contextualizing digital and green transitions within a wider set of social and political dynamics. The narratives analyzed reflect both the potential and limitations of how digitalization is seen as a driver of sustainable futures, revealing the performative nature of foresight in shaping expectations and policy directions. This paper thereby contributes to understanding how current anticipatory knowledge practices, such as those embedded in EU foresight, influence societal agency and the construction of future imaginaries. The paper highlights the role of digitalization within broader sustainability strategies and reflects on the implications of these narratives for envisioning transformative futures.

Between Politics and Profits: Private Sociology Classes in Iran

This paper examines privatization of Iranian sociology in the 21st century by studying changes that have happened in teaching in the past two decades. The teaching of sociology in Iran has for a long time been constrained by political considerations and censorship as well as hiring policies that prioritize ideological over academic qualifications. Yet, beginning in the early twenty-first century, student associations began to react to the diminishing quality of their classroom education through collective protests and by organizing reading groups and book clubs that went above and beyond the official curriculum. Over time, these extra-curricular classes morphed into private classes outside the university run by academic sociologists and intellectual figures who charge students for membership and participation. Thus, private, for-profit reading groups emerge, where sociology texts and methods are taught and discussed. This paper presents the results of a multi-methods study of this phenomenon, focusing on how the politicization of sociology has made university teaching contentious and whether these classes provide an alternative outlet. We also discuss the wider global trends of Neo-liberalism and micro-credentialism which introduce private profit motivations into sociological teaching.

BAYON, MARIA CRISTINA* (Universidad Nacional Autónoma de México (UNAM), Mexico)

Trans Youth: Urban Portraits, Narratives, and Journeys in Mexico City. Doing Visual-Participatory Research

Transgender people are subject to a permanent moral and normalizing scrutiny that pathologizes and fetishizes their bodies, trying to subsume them in the cis-normative gender ideals. The "cispassing", hostile practices in the medical and psychological fields, insecurity and fear in public transport, difficulties of access to safe toilets, and even the rejection - in various spaces - to be named according to their chosen pronouns and names, account for the multiple violences trans people experience and face daily.

This paper is based on a visual-participatory research on urban experiences carried out with diverse subaltern groups (trans youth, high-school students from disadvantaged neighborhoods, street vendors) in Mexico City. The visual and participatory character consisted of visual narrative workshops, where, using compact video-blog cameras distributed on a rotating basis among the participants, it was the young people themselves who decided what to say, what to show, where, and when. Our role as researchers was the support and follow-up for the construction of a visual narrative: what do I want to say and show (make visible) and to whom do I want to question.

Here I focus on the group of trans youth with whom we conducted a workshop of audiovisual narratives of 14 rounds during a year, in the context of which they gave an account of their experiences, spaces, and journeys through the city where they feel accepted/respected/recognized, and those that are hostile/discriminatory/ risky/dangerous. Schools and universities, access to health services, public transportation, recreational spaces, pride parades, trans-activism, fear in public toilets, were some of the topics chosen to account for spaces of exclusion and belonging. Videos, photos, poems, and animations produced and narrated by the young people themselves show the diversity of transgender experiences with their own bodies, in their daily interactions and journeys across the city.

Residential Mobility in the Metropolitan Dispersion of the Immigrant Population in Spain, 2001-2022.

The intense growth of international immigration in the case of Spain, from barely 1.4 million and 3.6% of the population to over 8.2 million and 17.1% in only two decades, has led to important changes in the territorial settlement patterns of the different immigrant groups. From an initial insertion where the large urban centres such as Madrid, Barcelona or Valencia have acted as a gateway to Spain, to a continuous growth of the immigrant population in the metropolitan peripheries. This process has taken place with high intensity,

even exceeding in some municipalities on the periphery the immigrant population of the large central cities. In addition to direct arrivals from abroad, a large part of this growth has taken place via residential mobility, in a process of suburbanisation that does not necessarily coincide in its characteristics with that experienced by the autochthonous population. In the case of Spain, this mobility has been collected annually by the Residential Variation Statistics, and by the recent Statistics on Migrations and Changes of Residence. This communication analyses these patterns for the eight largest metropolitan areas in Spain and for the main immigrant groups, focusing on: 1) the evolution of the flows in relation to the different economic periods (2000-2008; 2019-2014; 2014-2019; 2020 and 2021-2022); 2) the impact of the flows on the concentration and dispersion of the different groups in the territory; and 3) the disruptive effect of Covid-19, especially on movements towards the densest areas and for Asians.

PROKHOSHIN, ALEKSEI (Charles University, Czech Republic)

Residential Segregation By Origin, Nationality and Migratory Origin in Spain: The Case of Barcelona

Residential segregation, understood as the distance in the place of residence between population groups, is usually analysed by calculating different segregation indicators, which inform us of the residential proximity or distance of two populations groups. In these studies, the categorisation used to define the population under study is not a neutral choice, since it affects both the group analysed and what is considered to be the reference population. There are three different types of approaches in the scientific literature. On the one hand, those that use ethnic or 'racial' categories, as in the case of the UK and the US, which do not take into account the migration phenomenon. In countries without ethnic categorisation, as in the case of Spain, segregation is calculated either by considering migratory origin and therefore focusing on the country of birth (from which children born in the place of destination disappear), or by analysing nationality (in which some origins disappear from observation in a differential way, especially Latin American origins in the case of Spain). In this paper, we propose to use the latter two perspectives, analysing segregation based on the dissimilarity index by country of birth and nationality between 2002 and 2022, and adding a new calculation that considers the descendants of migrants, based on their identification at census section level with the last census of 2021. This is calculated for the city of Barcelona and some of the cities in its metropolitan region, which should allow us to analyse segregation dynamics in greater depth and to understand the weight of categorisation in the calculation and interpretation of segregation. While the effect of the scale or indicator used has been the subject of intense academic debate, less attention has been paid to the definition of population groups and its effect on the results.

Black Feminism and Transnational Solidarity: Mobilization Against State Violence in France

Based on three years of ethnographic research, including interviews with activists, I discuss the role of black feminist activism and transnational solidarity in the movement against police violence. I focus on how Black and Maghrebin origin men are predominately killed at the hands of police and how Black and Maghrebin origin women, including Assa Traore and Ramata Dieng, are leading this burgeoning movement. It is telling that despite the preponderance of men as victims of state-sponsored violence, it is women - as sisters, mothers, etc. - who are doing much of the mobilization against this issue, rather than their brothers or uncles or fathers. Black women activists navigate how to respond to police violence that disproportionately targets particular ethnoracial minority populations in a context that does not acknowledge the relationship between state violence and racism. They do so by locating the specificity of their identities as both Black and women. The activism of Black women is not only motivated by their particular positionality, but it is also shaped by it. Gender is just as present as and is inextricably intertwined with racial identity, and both shape the possibilities and modes of mobilization. Their unique standpoint (Collins 1986) as Black women, sisters, mothers and daughters also characterizes the transnational solidarity these women activists make with Black Feminist activists around the world, including Angela Davis and the late Marielle Franco. I argue that such a Black Feminist perspective is essential to understand contemporary racism in postcolonial societies.

BEATA, NESSEL-ŁUKASIK* (The Maria Grzegorzewska University, Poland)

(No) Connection. the Social Responsibility of Museums in an Era of Growing Social Inequality.

The emergence of new external factors such as Covid19 and escalation of war in Ukraine led to social polarization and deepening social inequalities in Central and Eastern Europe. In result, cultural institutions (museums) - the products of human civilization and symbolic power, have not only begun to deepen the discourse on their social responsibility. At the same time going beyond concepts of participatory or relational museum they expanded the scope of their social practices to new dimension of their impact on language and interactions in public space between dominant environments and minority groups.

My presentation leads to discussing what effect has had this overcoming by museums in Poland of lack of lasting and continuous relations with their own social environment with people with migrant experience? Has the attempt by such institutions to undermine certain stereotypes that make it difficult for them to effectively resonate with the deepening inequalities between Polish public and people speaking other languages actually translated into an increased role of this type of institution in process of including disadvantaged groups in the circulation of interactions generated by symbolic power in museums? And if so, what methods were used to achieve this?

The basis for showing intricacies of such relations taking place in public space between institutions often perceived primarily as tools for strengthening impact of symbolic power on the general public and groups representing marginalized groups will be results of my research from 2023, devoted to migration crises. Based on this material I will first show variety of forms of assistance from various museums in Poland to over two million refugees from Ukraine and then I will present what interactions took place between these institutions and new groups of recipients as a result and how this translated into changes in the area of communication with potential audience

Responsive Social Services. Citizen-Led Actions and Voices on Changes Needed in Helping Systems.

This paper analyses original data from six European countries (Austria, Denmark, France, Poland, Portugal and Romania) about citizens' actions to bring about changes in social services working in the fields of mental health, disability, child protection and youth at risk of exclusion. Data was gathered in 2024 as part of the Horizon Europe project: "Increasing the responsiveness of social services to citizen voice across Europe".

We used a qualitative approach to explore the perspectives and actions of citizens who want to contest inadequate practices, lack of government systems reactions, or slowly changing social policies. Based on selected interviews as examples (out of 120 gathered in total), we show evidence of diverse approaches used by citizens to organise collective or individual actions aiming at changes in these policies, systems and practices. From protests, and petitions to social media campaigns and private initiatives they advocate and educate and challenge how the systems should work. We draw on Amitai Etzioni's concepts of active societies and their transformation towards responsive societies and flexible systems (1968) and Manuel Castells' networks of outrage and hope (2012) to show how the democratisation of social services is both a long-term process and a contemporary dynamic of citizen emancipation (Wojciechowska, 2019). The paper also explores the emerging use of technology, particularly social media, for public calls to action. Our findings highlight the increasing importance of open, honest communication between citizens and services, emphasizing the need for a shift towards more trust-oriented attitudes, with reduced fear of judgment on both sides. The discussion section will focus on the trends and factors that either hinder or facilitate this change.

BECKER, JOHANNES* (Leibniz-Zentrum Moderner Orient, Berlin, Germany)

Power Relations in Migrant Communities in Light of Long-Term Socio-Historical Processes in Contexts of Origin

The sociology of migration has again started to take into account the situation of migrants before they embark on their journey. However, as I argue, power relations in migrant communities can be traced to long-term socio-historical processes in contexts of origin that are often overlooked. Therefore, it is important to relate not only to the immediate surrounding of migrants before departure, but to take into account the social histories in the contexts of origin, ideally through careful contextualization of migrants' biographies and family histories. In our research on a local community of Syriac-Orthodox Christians in Germany, this socio-historical outlook has proved essential for understanding the present. While most Syriac-Orthodox migrants have arrived in Germany from Eastern Turkey, a smaller number stems from Northern Syria. Despite the geographical proximity of these areas, living conditions there started to diverge after the definition of the border between Turkey and Syria following the First World War. Becoming established in the local context and in the state tended to be easier in Syria than for Syriac Christians in Turkey who were subject to ongoing discrimination. In my presentation, I particularly focus on politics of citizenship, land and social mobility in Syria and Turkey. These differences between the two countries influence the Syriac-Orthodox community to this day, for example in latent inner-community boundary-making processes and political orientations. My presentation is based on the first results of research for the project "Migrant arrival contexts in transregional comparison", funded by the German Research Foundation (DFG).

Subjects of God? Rethinking Religious Agency, Biography and Masculinity from the Global South

Religious specialists inhabit ambivalent institutional positions. On the one hand, as professionals working for organizations, their scope of autonomy is constrained and subject to organizational rules, religious dogmas and religiously sanctioned restrictions on their own lives in the form of celibacy, choice of residence etc. On the other hand, because of their charisma and their epistemic authority with regard to, for example, the interpretation of everyday events, personal crises, religious scriptures and moral judgments, they may also have considerable autonomy and power. In this article, we compare the lives of Greek Catholic monks in the Middle East and Pentecostals pastors in South Africa. We focus on the question of how the subjective understandings and objective realities of personal autonomy relate to one another and change in the course of religious specialists' careers. Scrutinizing religious agency in a gendered environment allows us to analyze how dominant constructions of connections to God, religious charisma and ecclesiastical careers reproduce the masculine structure of church institutions. While Eastern Catholic monks are often portrayed as extremely constrained by institutional rules, Pentecostal pastors appear as largely autonomous, organizing the religious affairs of their congregations in a highly independent fashion. Our analysis demonstrates that such images often mirror idealized portrayals that are produced by dominant religious discourses. As our analysis also shows, however, these discourses obfuscate both the agency of monks and the institutional constraints of pastors.

BECUCCI, STEFANO* (University of Florence, Department of Political and Social Sciences, Italy)

Lights and Shadows of the English University System

This presentation examines the English university system. The first section outlines the major university reforms that took place during the 1990s, initially implemented by Conservative governments and later by Labour governments. The second section focuses on the governance system at both national and local levels, as well as the relationships between the center and the periphery, highlighting how the historical autonomy of English universities has evolved over time. The third section discusses the current evaluation criteria for teaching and research in England. Finally, the conclusion addresses the key challenges that emerged from the analysis. The aim of this presentation is to illustrate the changes that have occurred in higher education in England. These changes are largely driven by two main trends: the increasing market-oriented approach of universities and the adoption of evaluation systems and criteria inspired by New Public Management.

BEDARD, JEAN-LUC* (Université TÉLUQ, Canada)

Opening up Regulation: The Curious Case of Medical Doctors' Regulating Body Opening to Share Formerly Reserved Acts with Other Health Professions in Quebec (Canada).

As elsewhere in advanced Western economies, professions in Canada are undergoing important transformations, spurred by technological innovation, change in the relation between citizens and experts, and transformations of the link between professions and the State. This is especially true of regulated professions, where the relations between professions and the State are currently subject to profound reformulations. This is most relevant among Quebec's ecologies of regulated professions, its regulatory framework being under scrutiny, aiming in recent years at simplifying its processes, showing more flexibility and being more adaptable to ongoing challenges. This communication will look at the medical profession in Quebec as a case study in these processes. Relying mostly on Abbott's notion of linked ecologies (Abbott, 2005) and the neo-institutionalist approach (Powell and DiMaggio, 1985), I will use documentary evidence from 2017 to 2024, to analyse its evolution. One of the major trends in these years has been an increase in interprofessional collaboration, translating into more elements from the medical doctors' scope of practice being shared with other professions. This is particularly salient with various actors' positions surrounding the proposed Bill 67 to amend the Professional Code, currently under consideration by National Assembly. Beside pure virtue, how can such a trend be explained? My contextual analysis will look at how a dominant profession opens its borders and accepts other professions into its (former) exclusive acts. Considering the social, political and economic context, this analysis intends to propose a few conclusions regarding these trends towards collaboration between professions. First, it seems that this collaboration trend is well received by other professions, who could benefit from such opportunities. Second, this further opening of its borders is better understood when put in the larger context of the profession of medical doctors profession's larger history.

Processual Analysis of Foreign-Trained Professionals Admission into Regulated Professions in Quebec: What Role Has the Pandemic Crisis Played in Implementing Long Awaited Transformations?

This paper proposes an analysis of professional regulation during the covid period, looking particularly at admission of foreign-trained professionals (FTPs) in the province of Quebec (Canada). Through web-scraping techniques, we collected data on media presence of Quebec's professional regulators during the first 18 months of the pandemic crisis period (March 2020 to November 2021). Preliminary data analysis shows a total of 3795 occurrences. Further analysis will discriminate between covid-related publications or all other themes. Admission of foreign-trained professionals (FTPs) being a recurrent theme among regulated professions' ecologies (Abbott, 2005) in Quebec, the analysis will show how these ecologies reacted on that matter during the pandemic crisis. One of its main objectives is to show how the crisis context helped in treating some long-lasting issues. With hindsight, other related events show that this theme (FTP admission) is sometimes treated through other, related measures. For example, echoing similar experiences in other Canadian provinces, creation of an assistant-doctor position seems to answer some of the issues raised during the crisis context. Current propositions to change the Professional Code, Quebec's overarching law on regulated professions, aim to answer long-lasting issues (lighter regulatory activity, being more responsive to ongoing challenges) with important input from the pandemic crisis. With a neo-institutionalist approach (Powell & Bromley, 2015) we will first focus on results from the health professions during the pandemic crisis and enrich this analysis with more recent developments on relevant issues regarding admission of FTPs. This latter, related analysis draws from documentary analysis from 2017 up to Spring 2025.

Beyond Margins: Unveiling the Struggles of the Transgender Community

This study draws attention to the marginalization of transgender individuals in Haryana, focusing on three distinct groups: cultural practitioners, sexworkers, and beggars. To gain a thorough understanding of their circumstances, 13 in-depth interviews were conducted, yielding three primary themes. Firstly, the study highlighted the scarcity of societal awareness regarding gender identity and gender expression. Gender is a social construct influenced by cultural factors like norms, attitudes, and behaviors, while gender identity refers to an individual's unique, deeply felt sense of gender, which may or may not align with their birth sex. Sexuality encompasses gender, sex, sexual orientation, pleasure, and reproduction. Second, the study found that social constraints stemming from stigmatized identities significantly impact transgender individuals. Both school dropouts and those with educational qualifications face difficulties in securing employment, leading them to engage in cultural activities or resort to prostitution. Incomplete documents and government identities prevent them from getting facilities provided by the government. Third, the study revealed a lack of acceptance in both family and society due to heteronormativity. Transgender individuals often face abuse, violence, and discrimination in their own families and society. The findings of the study shed light on the issues faced by transgenders even after getting rights they are still struggling to be the part of mainstream society and live a respected and dignified life. It highlights the importance of extensive awareness campaigns and legal amendments due to the insufficient societal acceptance and weak organizational framework.

Collective Memory & Organizational Remembering: Reimagining Archives in the South of Morocco

The emergence of memory studies in organizations reflects the recognition of the past's ability to influence strategic and organizational actions in the present. In this paper, we empirically investigate how ancestral knowledge and practices constitute a strategic and organizational resource to adapt to climate change and its ecological and socioeconomic effects, namely migration and rural exodus. Based on a single case study in the south of Morocco, we show how collective memory, through a restoration strategy supported by ancestral practices and knowledge, enables a community to update its collective goals and how, in turn, emergent mnemonic devices generate organizational forgetting. We try to explain how different stakeholders deploy the past to identify within the organization's values to implement change strategies, reduce intergenerational conflicts, or constrain the change strategy to protect its glory and legacy. Our data demonstrate how the restoration of collective memory, through the revitalization of ancestral practices, facilitates change paradoxically. Given their inherently non-neutral nature, archives are not merely passive repositories of historical facts. Rather, they are shaped by those in power, reflecting their biases and interests. The decisions about what to preserve and what to omit in archives play a key role in shaping dominant narratives and silencing the marginalized voices. The identification and the renewal of the collective past enable the emergent structures and instances to implement technical projects better accepted by the population. The young reconcile with their past by restoring the collective memory. This action minimizes the intergenerational gap and allows young people to integrate into an authentic environment managed by ancestor customs and traditions. As a result, a rhetorical history has emerged to persuade the traditional organizational structure to forget and to facilitate strategic change. Eventually, it strengthens communities' abilities to deal with climate change's effects, including drought, desertification, and exodus.

Citizenship Otherwise: Migrants' Infrastructuring Work As Propositional Politics for a Decolonized Urban Belonging

Tying in with Lemaski's 'infrastructural citizenship' (2017), this paper explores how state and citizens negotiate their relationship through infrastructure. We do this by focusing on the 'infrastructuring work' of people with precarious residency status in Brussels. In the Belgian capital of 1.2 million, a large and

variegated group of nearly 100.000 people - particularly migrants - navigate, contest and reimagine conventional notions of citizenship tied to territorial boundaries and state-sanctioned frameworks of political membership, access to rights, and belonging, through everyday practices of accessing, making and using infrastructure. Hence, through 'infrastructuring work', citizenship as an individual and collective subjectivity is performed, enacted and brought into being (Isin & Nielsen, 2008), even when formal citizenship is lacking. At the same time dominant, state-centered paradigms of citizenship are challenged, particularly their entrenched conceptions of legality and legitimacy, and inherent racialized categorizations.

As the building, provisioning and regulating of (access to) infrastructure is one of the tactics of governmentality, we argue that a better understanding of this 'infrastructuring work' is central to rethinking and decolonising dominant notions of citizenship. Moreover, we contend that this 'infrastructuring work' of migrants in collaboration with a myriad of other formal and informal urban actors, represents a form of 'propositional politics' (Lancione 2019), prefiguring other forms of citizenship and urban belonging that challenge dominant, (neo-)colonial paradigms of belonging.

At the intersection of architecture and ethnography, we utilize critical mapping methods to both unravel the migration regime's governmentality, as well as the contesting performance of citizenship through rights making or taking. By mapping the embodied encounters of people with precarious (national) citizenship with, in and through infrastructure, we shed light on the diverse and overlapping geographies of citizenship-making in Brussels, offer a decolonial critique of established notions of citizenship and belonging, and start imagine a citizenship otherwise.

A Cross-Country Qualitative Exploration of Caregivers' Needs and Preferences for Social Care and Support Services

With the global aging population, the number of older, care-dependent adults is on the rise, leading to a substantial demand for care. While European countries have adopted diverse approaches to meet this demand, the overarching tendency in policy practices or reforms revolves around a notable shift from state-provided professional long-term care to informal care, delivered by family members or friends. In Southern European countries like Italy, extensive informal care results from fragmented and limited formal care provision, with health and social care systems to rely heavily on informal caregivers. Other countries including the UK employ a more mixed-care model with increased state-provided formal support for caregivers. However, this in practice still entails a significant shift of responsibility for care from the state to caregivers. Due to the negative consequences experienced by caregivers, including caregiver burden and adverse mental and physical health outcomes, research on social policies across Europe to directly or indirectly support the caregiving role is crucial. To date, qualitative studies exploring caregiving needs, challenges, and preferences regarding formal support in countries with diverse social care systems and policies, are scarce. This cross-country qualitative study aims to address this gap by exploring the experiences of receiving various forms of support and services among caregivers in both Italy and the UK. By conducting semi-structured interviews with 6-10 caregivers in each country and employing Interpretive Phenomenological Analysis, the study is expected to provide a comprehensive cross-country qualitative comparison of caregivers' formal support needs, exploring nuances within diverse social policy landscapes.

Inclusive Teaching in Elementary School: Spatial and Temporal Structures in Classroom Interaction

The fact that successful inclusion also requires new spatial concepts has already been emphasized by some authors (cf. Reich 2014). However, many concepts relate in particular to new school buildings or renovations (see Kricke et al., 2018). The LLR-Transfer design research project, on the other hand, focuses on the conversion of existing classrooms into multifunctional classrooms. The project is funded by the Saxon Ministry of Education and Cultural Affairs and is being implemented at an elementary school in Dresden in close cooperation with teachers and school management. The project draws on pedagogical and didactic concepts developed as part of the Teaching-Learning-Room Inclusion project (cf. Czaja & Beier, 2023, Czaja 2023) on the one hand and on concrete empirical surveys of the initial conditions

on the other. The presentation will present results from a study with 360° videos (Windscheid & Gold, 2022) of the arrival phase of an inclusive school class. This phase is intended "in the sense of an individual flexitime" for independent learning, in which "tasks can be practiced, deepened and solved independently" (Reich 2014: p. 187); from a practice-theoretical perspective (Rabenstein & Drope, 2021), specific case structures are illustrated that illustrate spatial appropriation practices and identify barriers.

BEIER, FRANK* (Technical University Dresden, Afghanistan)

The Classroom from the Perspective of Primary School Children. an Empirical Study with Narrative Maps.

Even today, classrooms often still follow basic principles that largely "date back to the late 19th or early 20th century" (Hubeli et. al., 2019, 27). A transformation of the premises towards modern learning environments does not seem to be taking place in the area, even though educators are encountering an increasingly heterogeneous learner population that requires flexible and adaptive learning environments (cf. Kricke et. al., 2018, 20; Hubeli et. al., 2019, 27). In order to develop practicable and innovative concepts for classrooms, practical research projects therefore seem particularly useful (cf. e.g. Schreiner et al., 2019, 15). In the "Teaching-Learning-Room Inclusion Transfer" project, basic ideas for a smart "classroom of the future" (cf. Czaja, 2023) are implemented in cooperation with teachers and school management for an inclusive primary school class and the redesign of the classroom is accompanied as part of a design-based research approach. A central role is played here by how the pupils in the classroom community themselves perceive the classroom as a space and figure it in their actions (Löw & Sturm, 2022). With the help of narrative maps (cf. Behnken & Zinnecker, 2010), different perspectives of pupils could be reconstructed:

Primary school children describe movement, learning, retreat and stage spaces that are systematically taken into account as part of the design process of a new classroom, which is appropriate to student needs.

BEIER, RAFFAEL* (TU Dortmund University, Germany)

Displaced, Resettled, and then? Lived Experiences of Non-Occupancy and Secondary Residential Mobility

In the context of global campaigns like 'cities without slums', large-scale, state-subsidized housing and resettlement programmes have experienced a renaissance. While proclaiming the provision of new, formal homes that would enable so-called beneficiaries to lead a life in dignity, among scholars these programmes provoke justified concerns whether they miss their target groups. Unaffordability and a lack of choice, peripheral locations, and under-serviced sites are commonly cited concerns.

Eventually, many subsidized units – sometimes up to 70% – are not occupied by intended recipients. Most authors see this as a form of gentrification or downward-raiding, whereby higher income groups again displace intended recipients towards poor-quality housing elsewhere. However, most research misses to include perspectives of those who do not occupy their units – mainly because of methodical challenges to follow people to disperse locations. Consequently, little information exists about the reasons, directions, and experiences of secondary residential mobility of 'the missing people' of state-subsidized housing and resettlement programmes. Where do they move, why do they leave? How can we conceive the effects of housing provision on the lives of displaced dwellers who do not or no longer inhabit their units? Might secondary mobility be a step towards a dignified life elsewhere or rather the undesired result of undignified resettlement spaces?

This comparative study on three of the most significant housing programmes in Africa analysed 101 housing pathways of people who rent out or sold their housing units in the capital regions of Ethiopia, Morocco, and South Africa. Rejecting a unilateral notion of downward-raiding, I suggest a renewed conceptual perspective that sees people, who do not occupy their received housing units, as active subjects that reconfigure supply-driven, shelter-centric housing policy according to their own demands, while at the same time being affected by (severe) financial constraints and social pressures.

 SHI, SHIH-JIUNN (National Taiwan University, Taiwan)

Handling Ageing with Care in Authoritarian and in the Democratic Regimes: Ideas, Institutions, and Explaining Long-Term Care Policy Development in Three Chinese Societies

The Chinese societies are ageing rapidly that generates pressure for long-term care (LTC) provision. Despite their ethnic similarities, three models stand out: LTC in Hong Kong is a universal tax-funded model with a publicly subsidised but privately-operated delivery system. China is moving from a means-tested model to a contributory model, with policy experimentation on its long-term care insurance scheme, which is now implemented in 49 cities. Taiwan initially followed the footsteps of Japan and Korea for a social insurance model till 2016, but eventually implemented a partially tax-funded one that might further evolve to a hybrid system combining tax and social insurance. Drawing on historical institutionalism and ideational analysis, this paper stresses the institutional logics underpinning policy evolution in light of policy learning and feedback effects as they related to the changing nature of the political regime at hand (i.e. authoritarianism, democracy and their evolution over time). We argue that both existing policy legacies and political institutions tied to the evolution of authoritarianism and democracy have shaped the ways in which various policy ideas about care provision have risen to prominence – or declined in importance – that led to diverse policymaking outcomes.

RC19-285.3

BELAND, DANIEL* (McGill University, Canada)
Ideas, Transfer, and Diffusion in Health Care Policy

Much has been written in recent decades about the role of ideas in politics and public policy, a trend that is also present in the more specific field of health care research. This is the case because the assumptions of policy actors and the ways in which they frame the issues at hand have a direct impact on patterns of policy stability and change in health care. This paper connects the scholarship on the impact of domestic ideas with the literature on transnational processes in health care. The result is a critical review of the key concepts and claims associated with the study of ideas it relates to both domestic and transnational processes. Although literatures reviewed in this paper are not necessarily centred on the role of ideas, the analysis suggests they contribute to the study of ideational processes at the transnational level. The paper concludes with an agenda for future research about the role of ideas in both domestic and transnational health policy processes.

BELFAKIR, FATIMA-EZZAHRA* (Faculty of Social Sciences and Humanities of Tunis-Tunisia, Tunisia)
Sociology Meets Other Disciplines : Gender and Politics in Morocco

Due to the socio-political movement of "Arab Spring" in 2011 and some measures adopted by Moroccan kingdom to reinforce human rights, women's representation in the parliament raise to 16.7% in the 2011 legislative elections, to 20.5% in 2016, and 24.00% in the last elections by the year 2021. Despite these gains, significant challenges are still occurred. To analyse this, this research examines how the social roots and political career affect their parliamentary participation including the women MPs characteristics ? as well as their proximity to power within the main and temporary parliamentary bodies ? my research also asks the place of women's issues in the political agenda of women parliamentarians and what they have contributed to the women's cause in order to create a certain social dynamic on gender issues in Morocco?

In order to answer all the research questions and collect the necessary empirical data, we have already built database as a methodological tool concerning academic qualifications, professions, party affiliations, previous local and legislative political experience, associative and syndical work, age, marital status of Moroccan women MPs. Adopting both quantitative and qualitative analysis leads to investigate their visibility in leadership roles (membership of the political bureau, and as chairs of standing committees, parallel diplomacy organs, and other parliamentary committees). Some findings show that factors of scientific qualification and specialization and professional career influence positively the leadership roles and parliamentary functions. To sum up, the findings of this research would contribute to political knowledge because they might have policy implications, informing decision-makers and providing new insights into political analysis.

This research project relates directly to the impact of sociology on Gender-studies, and which is correspond to opportunities exciting for women in order to mobilize for social and political change through their role in parliament for example in MENA.

BELKEBIR, OTHMAN* (Geneva Graduate Institute, Switzerland)

Colonial Infrastructures and Disrupted Mobilities: Unsilencing Itinerant Peoples in Moroccan Colonial History

As the question of controlling mobility and territory is central to any colonial enterprise, Infrastructures, understood both in their material (ports, railways, etc.) and bureaucratic iterations, played a crucial role in reshaping the circulation in the colonies and beyond. Morocco, as a joint French and Spanish Protectorate, was no stranger to these processes of concomitant disrupted mobilities and rampant domination. Based on Archival work conducted in France and Morocco, this presentation answers Trouillot's radical call to « unsilence the past » by tracing the colonial entanglements between a diverse array of itinerant peoples, underrepresented in the Moroccan colonial historiography. By doing so, it aims to participate in discussions on archives, enduring repertoires of domination, and the « reverberations of the past » (J. Go).

Language Assistance for Migrants in US Healthcare: The Impact of Interpreters in Hospital Outpatient Clinics

This paper explores the role of interpreters in healthcare for migrants in two outpatient clinics at one hospital in Maine, USA. The paper is part of a larger project that contributes to understanding the complex and urgent global health issue of how to care for increasingly diverse and mobile patient populations. The analysis is based on a hospital ethnography. The patients are "New Mainers," people who migrated to Maine since the mid-1970s from East and Southeast Asia, Latin America, Sub-Saharan Africa, and the Middle East. I observed interactions between clinicians (physicians, nurses, and physical therapists) and adult patients. Most clinicians were white and English speaking. Three quarters of the interactions were interpreted in-person or remotely (by telephone interpreters). In the US, federal civil rights law and regulations require recipients of federal aid, including hospitals, to provide language access for people who do not speak, read, write, or understand English at all or very well. How does adding an interpreter change the clinician-patient dynamic, introduce further complexity to scheduling, and situate participants in treatment rooms that were not originally designed or configured for this triad? In addition to adding a third person, how do structural factors shape healthcare for New Mainers, such as immigration patterns, national and international politics, health care policy, and the organization of work as well as participants' racial, ethnic, and immigration histories? The paper introduces the concept of "interpreting assemblage" – a configuration, ensemble, or arrangement of heterogeneous elements that work together for a period of time and then disperse – to describe and explain the dynamics of interpreting in clinical environments that are fluctuating and highly diverse, with patients drawn from communities characterized by a complex interaction among race, ethnicity, immigration, culture, and geographical mobility.

The Imaginary of 4.0 Technologies: An Empirical Analysis of the Narrative System on Industry 4.0, Digital Twin and High Performance Computing.

The present research adopts a mixed methods approach that aims to investigate the system of narratives about Industry 4.0, the emerging technologies of high-performance computing and digital twins and how these are impacting socially. Specifically, the reflection started from a broader perspective that explored all the possible 'visions' of the future that digital transformation and technological innovation processes are leading to, taking into account the conflicts that arise in their implementation and in the widespread socio-technical configurations. With critical optimism, the implications and repercussions that these technologies have on society were analysed, but not only that, the academic and entrepreneurial narratives

of Industry 4.0 were also explored through an integrated perspective that produced a matrix of entrepreneurial types in the terminal phase. In the initial phase, a contextual investigation and reconstruction of the existing social literature on the examined technologies and Industry 4.0 was carried out. In the second, more operational phase, an automated extraction of the contents present in the social media Facebook was carried out, with regard to the three different macro-themes, at the same time the qualitative survey instrument was developed, i.e. a semi-structured interview outline, which allowed for an in-depth exploration of the narrative system concerning 4.0 enabling technologies in general and in particular with regard to high-performance automatic computing and digital twins in the various contexts examined, trying to understand the perceptions of users but also the social repercussions given by their use. Interviews were carried out with entrepreneurs and experienced personnel who have or have proven knowledge of the technologies under study. The results were read and interpreted from a convergent integration perspective attentive to social impacts and future perspectives in a critical key.

Correlaciones Entre Las Actitudes Frente a Los Discursos De Odio En Las Relaciones Online y Offline.

La presente comunicación se asienta sobre datos obtenidos a partir del proyecto de investigación PID-2021-1271130D-I00 durante el año académico 2023/24. El estudio trata de observar las diferencias y similitudes en los comportamientos que se generan por parte de la población adolescente frente a los discursos de odio, cuando se producen en el espacio virtual y cuando se producen cara a cara.

La muestra se compone de 571 alumnos y alumnas de cuatro centros de secundaria, formación profesional y bachillerato pertenecientes a la localidad de Almería, en una franja de edad entre los 12 y los 19 años. La diversidad cultural y étnica de la muestra elegida aporta datos de interés para la investigación, ya que nos permite conocer si estos factores son significativos a la hora de emitir o recibir discursos de odio y las diferencias que se presentan en contextos online y offline. El estudio trata de comprender cómo actúan los jóvenes frente a los discursos de odio tanto dentro como fuera de las redes sociales, debido a que se han detectado diferencias considerables en el modo en que se interactúa y se comparte cierto contenido relacionado con los discursos de odio en ambos contextos.

Se ha usado la metodología cuantitativa, utilizando una encuesta elaborada para tal fin como técnica para recabar la información. Para el análisis de datos, se ha utilizado el software estadístico SPSS.

Decolonising Place in Aotearoa

The ongoing capitalist settler colonisation of Aotearoa has wrought immense violence upon this place and its inhabitants. The centrality of the dispossession of Indigenous land by settlers in Aotearoa has brought the issue of place and its contestation—how it is understood and conceptualised, and ultimately, how it is related to—to the fore. Contributing to the discourse around place in Aotearoa are a rich diversity of Indigenous and non-Indigenous thinkers, often writing outside of academic discourse. Whilst there may be a renewed interest in place within academic discourse, some of the most important place-based thought that seeks to address colonising relations to place is not exclusively located within academic discourse, but instead draws from the Indigenous epistemic traditions of Aotearoa. Informed by these traditions, and these Indigenous and non-Indigenous thinkers of place, my aim is to develop a conception of place that emerges from place and draws from *mātauranga Māori* (customary Māori knowledge) and *whakapapa kōrero* (Māori thought). In the context of the ongoing settler colonisation of Aotearoa, I will present two opposed ways of relating to place pertaining, but not limited to, settler colonialism; anapopism (being out of place) and belonging (being in good-relation to place). By speaking to the particularities of place, belonging and anapopism within settler colonialism in Aotearoa, I will discuss several examples of the practical politics of decolonising place in Aotearoa.

BELLINI, ANDREA* (Sapienza University of Rome, Italy)

Professionalism and Social Change: Processes of Differentiation within, between, and Beyond Professions (Palgrave Macmillan, 2023), Edited By Lara Maestripieri and Andrea Bellini

The volume *Professionalism and Social Change: Processes of Differentiation Within, Between, and Beyond Professions* (Palgrave Macmillan, 2023), edited by Lara Maestripieri (Universitat Autònoma de Barcelona, Spain) and Andrea Bellini (Sapienza University of Rome, Italy), investigates the profound transformations reshaping the world of professions in the context of critical change processes such as the post-industrial transition, globalization, and digitalization. Applying the analytical framework labelled WBB (Within-Between-Beyond), this book offers a multidimensional approach to the dynamics of professional differentiation and the evolving relationship between professions and society.

This session invites the commentators to discuss with the authors three main debates along three dimensions: the 'within' dimension, which addresses fragmentation processes within professions as an expression of growing differentiation in working conditions and status among professionals; the 'between' dimension, which explores the tensions between various professions and their potential for competition or collaboration within changing professional systems; and the 'beyond' dimension, which examines how social change influences professionalism and, conversely, how professional change impacts society.

Critics will evaluate the applicability of the WBB model in various national and professional contexts, with particular attention to the evolving dynamics across a range of established and emerging professions. The discussion will explore how professionals are redefining the boundaries of their expertise in response to these transformations, highlighting the growing role of professionals in shaping and negotiating their positions within both institutional and market-driven environments.

The panel will include distinguished discussants Diego Coletto (University of Milan-Bicocca, Italy), Juan Pedro Blois (Universidad Nacional de General Sarmiento, Argentina), and Corinne Delmas (Université Gustave Eiffel, France), alongside the editors and several contributing chapter authors. Together, they will give rise to a lively and thought-provoking debate on the future of professionalism in the face of global and local challenges.

BELLINI, ANDREA* (Sapienza University of Rome, Italy)

BETTI, MARCO (Università di Teramo, Italy)

The Incessant Professionalization of Social Work: Institutional Change As a Catalyst for Strengthening a Professional Project – the Leps Experience in Italy

The introduction of "Essential Levels of Social Services" (LEPS) in Italy opened a road to the further professionalization of social workers. The LEPS are designed to ensure minimum standards of social services throughout the country. They define the basic service levels that all local authorities are obliged to provide, focusing on reducing inequalities and enhancing the quality of services. The government ensures funds and guidelines to help local authorities meet these standards.

In this respect, the establishment of the "LEPS Supervision" has raised critical questions regarding how this measure will support the professionalization of social workers. Supervision is targeted at assisting social workers and other professionals in social services. It does so by providing emotional support, developing relational skills, and guiding professionals in resolving workplace challenges. Drawing on the "boundary work" framework (Gieryn, 1983; Abbott, 1988; Llewellyn, 1998; Carlile, 2002; Lamont & Molnár, 2002; Hernes, 2004; Kellogg et al., 2006; Langley et al., 2019), this presentation analyzes the contribution of the LEPS Supervision to the redefinition of the boundaries among professional autonomy, institutional expectations, and inter-professional collaboration.

The study concentrates on two regions in Central Italy, belonging to the same macro-area but showing different characteristics with respect to the institutional and organizational structures. A comparative approach can serve this purpose, looking at how the organizational dynamics interact with the professionalization process of social workers. The interplay between organizational structures and professional identity construction shows how the LEPS Supervision supports social work as a distinct profession while generating shifts in the boundaries defining social work, healthcare, and administrative roles. These findings extend beyond the actual implications of professionalization and the broader development of social services at the regional and national levels. It is around the management of evolving boundaries that the core of empowering social workers and ensuring service integration lies.

RC31-JS-116.4

BELLINIA, TINDARO* (University of Messina, Italy)

"Transplanted" Lives: Stories of Sub-Saharan Migrants Working in a Sicilian Horticultural District - Subalternity and Processes of Subjectivation

In recent years, the debate regarding human mobility from the Global south to the Global north has been characterized, on the one hand, by the idea of forced migration, since it is "almost always" linked to a 'necessary choice', a non-choice, determined by structural factors that model, condition and, in turn, determine individual decisions and trajectories" (Della Puppa, Sanò, 2020), and on the other hand, by the idea that migrations and secondary movements are new forms of the Underground Railroad, motivated by the right to escape to freedom (Queirolo Palmas, Rahola, 2020).

How can we overcome these contrasts? Perhaps the themes developed by global slavery (Zeuske, Conermann, 2020) can serve to better understand the contemporary world, where freedom and slavery no longer have a clear demarcation and embrace infinite nuances. "We must ask ourselves questions about who extracts labour, what is the nature of the relationship between production and labour, how property relations are maintained, and who profits from these circumstances. If these questions are not addressed, non-freedom will not vanish. (Rossi, 2017)". The plantation system, with its "constitutionally racial and colonial" capitalist accumulation logic does not only concern the distant past, but remains an inescapable node of contemporary capitalism while maintaining the centrality of the "racialization" issue in any analysis of extraction and exploitation (Corrado, De Castro, Perrotta, 2017; Ippolito, Perrotta, 2021). What forms of racialization and exploitation therefore accompany current human mobility? How are the vulnerabilities produced by the security of migration and contractual precariousness in the labour market intertwined? To answer these and other questions, this research is based on intense ethnographic activity, conducted since 2021, particularly among young sub-Saharan workers in the horticultural sector of the Barcellona-Milazzo area, in the province of Messina, and looks into forms of discrimination and attempts at emancipation.

BELMONTE, ROSALBA* (Tuscia University, Italy)

Victims and Perpetrators of Gender-Based Violence in the Italian Press

Newspapers' representation of gender-based violence contributes to create and reinforce stereotypes and prejudices about the role of women and men in society, thus favoring the persistence of those relations of material and symbolic domination, that still too often lead to gender-based violence.

This is what emerges from the research project *STEP - Stereotypes and prejudice. Toward a cultural change in gender representation in judicial, law enforcement and media narrative*, that analyzed a corpus containing more than 16,000 articles published in Italian newspapers in the period between the 1st of January 2017 and the 31st December 2019, dealing with the crimes connected to gender-based violence: domestic violence, rape, femicide, stalking, women trafficking.

From the research three main aspects characterizing the journalistic representation of gender-based violence emerged: the centrality of women in the journalistic narrative of the gender-based violence and the parallel marginality of the men who perpetrated it; a de-responsibilization of the violence's perpetrator; a re-victimization of women, who are often considered co-responsible of the violence they suffered.

This paper presents the preliminary results of a follow-up of the research project "STEP", titled "STEPSISTER. Stereotypes and prejudices in press representation of gender-based violence", and focuses in particular on the journalistic representation of the women and men involved in cases of gender-based violence in public spaces and non-intimate relationships perpetrated in 2024.

The aims of the work are to two: a) to find out if, over the time, Italian journalists have changed their way to represent gender-based violence or if they continue to reproduce the stereotypes and prejudices emerged from STEP research; b) to understand if the journalistic representation of gender-based violence perpetrated in public spaces and non-intimate relationships present the same characteristics of the representation of the other forms of gender-based violence.

RC26-430.2

BELMONTE, ROSALBA* (Tuscia University, Italy)

Without a State. the Internal and External Obstacles to the Palestinian Nation-State Project

Nowadays, the exercise of sovereignty by a power pursuing public interests on a territory and its inhabitants is no longer a sole prerogative of nation-states. Indeed, states coexist with a plurality of new orders such as non-state public authorities. An example of non-state public authority is the Palestinian National Authority (PNA), namely the self-government body established by the Oslo Agreements (1993) to administer the Palestinian Territory for an interim period of five years, with the aim of forming an autonomous Palestinian state that has never been achieved.

Although since its establishment PNA has embarked on an institution-building process aimed at gradually achieving the independence in terms of territorial control, economy, people flows management and transnational relations, after thirty-one years an effective and fully functional Palestinian state was not established, and the current and increasing exacerbation of the conflict in the Gaza Strip suggests that it is not destined to be born in the short/medium term. The obstacles that have prevented the establishment of a Palestinian state are both endogenous – deriving from the Palestinian actors' behavior and choices – and exogenous – arising from the choices, the behavior, and the omissions of external actors. The aim of this work is to present and analyze in depth the abovementioned obstacles and then to discuss the opportunities that the creation of an effective and fully functional Palestinian state could guarantee to local populations in terms of justice, rights, and protection, and to the political stability and security of the whole region.

The Impact of Binge-Watching on Academic Achievement: A Study of College Students' Viewing Habits and Perceptions

The advent of subscription video-on-demand (SVOD) services like Netflix and Amazon Prime Video has significantly altered the way people consume television, giving them greater control over where, when, and how they watch their favorite programs. This shift has led to new viewing behaviors, notably binge-watching, where individuals consume entire series in a single sitting. Among college students, who often fall into high binge-watching categories, this behavior can lead to reduced academic focus, increased stress, and, potentially, academic underperformance. This study investigates the relationship between binge-watching and academic achievement by examining the viewing habits, motivations, and perceptions of 103 students from a liberal arts university in the Northeast of the United States. Using a questionnaire and statistical analysis through SPSS, the research explores students' reasons for binge-watching, such as using it as an escape from reality, and their understanding of how this habit may impact their academic obligations. Despite the potential risks associated with binge-watching, results indicate that students hold varying perceptions regarding its influence on their academic performance, with many not believing it to negatively affect their studies. These findings suggest a complex relationship between media consumption and academic success, highlighting the need for further research and institutional strategies that can support students in managing their media habits while maintaining academic engagement.

Christian Parliamentarians x Human Rights Activists: Disputes about Gender in the Brazilian National Education Plan

The National Education Plan is a legal document, drawn up every ten years, that defines goals and guides public educational policies in Brazil.

In its last elaboration, the Plan foreseen for the 2014 – 2024 decade, after much dispute between religious parliamentarians and social movements, ended up excluding any mention of the word gender in its guidelines.

The religious' argument was that gender equity and sexual education policies would end up introducing an evil ideology to students and putting the traditional family and good customs at risk. The work analyzes, in the Brazilian political scenario, the process of preparing the National Education Plan for the decade 2025 - 2035, especially on issues that promote clashes between social and educational movements, on the one hand, and religious segments on the other. The research analyses the legal instruments: decrees, bills, conferences and public hearings that deal with the National

Educational Plan for the period of 2025 to 2035 and the concerns and demands of politicians and religious jurists in relation to the National Education Plan.

The gender theme once again gains prominence in the political debates for the preparation of the aforementioned Plan. Social movements in defense of human rights argue that the school environment needs to welcome and include students from the LGBTQIAPN+ community and provide guidance on sexual education as a form of ending gender-based violence inside and outside school. On the other side, there are Christian parliamentarians, with the argument of defending religious freedom and the defense of the traditional family.

Chaplaincy As a Moral Enterprise: Insights from Local Government Chaplains in the Philippines

In a local government unit in the Philippines, a ministerial organization composed of trinitarian churches partnered with local officials for the creation of a chaplaincy program for government employees and residents. Such partnership allowed church leaders to lead activities like prayers, bible reading sessions, and values formation seminars as part of the local implementation of the Moral Recovery Program—the national campaign for moral transformation.

Following Becker (1963), this paper offers to understand chaplaincy work as constitutive of a moral enterprise seeking to transform the locality for divine purposes. Drawing from a study involving the leaders and members of the ministerial organization, I unpack the contents of their moral claims informed by localized interpretations of legal documents and biblical passages. Based on the interviews, what underpins their continuous involvement in public affairs is the collective vision for their locality to be the “place of God” (Bayan ng Diyos). This imaginary, as claimed, incrementally manifests as they maximize the space and time afforded to them for “non-doctrinal” but biblically-based teaching sessions during office hours and official government functions. Bolstering their claims to legitimacy are references to observed everyday moral transformations among government employees commended by the local chief executive.

By focusing on the work of chaplains, my study contributes to understanding the role of religion in public life in the Philippines beyond traditional indicators such as the electoral participation of religious actors and their lobbying on morality policies. Framing the chaplaincy program as part of a moral enterprise sheds light on the everyday consequences of the localized interpretations of the constitutional provisions on the separation of church and state and the participation of civil society organizations in Philippine democratic politics.

Discretionary Collaboration in Work-Oriented Rehabilitation: Approaches Among Coordinating Caseworkers in Sweden

This presentation addresses tensions between discretion and entitlement to work-focused rehabilitation for sick-listed unemployed individuals, highlighting how caseworkers' decisions on collaboration are influenced by factors that also affect access to resources and realization of entitlements. Collaboration is a priority in the Swedish welfare state, particularly for work-focused rehabilitation, reflecting how the work-first approach has become a norm for such networked service. This study examines how caseworkers with coordinating roles at the Swedish Social Insurance Agency (SSIA) navigate complex expectations during the planning phase. The group has diverse educational and professional backgrounds, often holding a university degree. A vignette-based survey, answered by 853 respondents (with a 45% response rate), explored discretionary initiatives to collaborate in the context of social entitlements for work-focused rehabilitation.

The findings identify three approaches to collaboration: boundary nospanners (33%), boundary keepers (10%), and boundary users (57%). Boundary nospanners, typically with shorter SSIA tenures and working in specific contexts, engage external actors such as healthcare providers and the Public Employment Service, actively seeking information and consensus. However, requests for medical documentation correlate with client ethnicity, indicating potential bias. No other significant correlations were found concerning ethnicity, gender, or caseworkers' educational background.

In contrast, boundary keepers—often with longer SSIA tenures—exhibit limited collaboration, focusing primarily on SSIA's framework. Boundary users employ flexible strategies, adapting collaboration to cases while relying

on internal resources. The analysis shows how geographic area and tenure influence collaborative practices and strategies. The study raises questions about discretion in coordinating collaborative services and how policy is translated within organizational contexts and continues into collaborative practices, potentially affecting access to resources and realization of social entitlements. The findings can inform future policy development to address inclusion of diverse professional roles at the planning stage of this networked welfare service, as well as responses to complex needs.

BENÍTEZ PEREIRA, FRANCISCA* (Universidad Adolfo Ibáñez, Chile)

Valuing Life in the Emergency Room: Inequalities and Social Interactions in a Chilean Public Hospital

The central aim of this presentation is to explore how life valuations emerge from the social interactions that occur in the emergency waiting room of Chile's Public Emergency Assistance Hospital (formerly known as “Posta Central”). This research posits that inequality is not merely an abstract construct tied to social, cultural, and political conditions; rather, it is a category actively produced, reproduced, and legitimized in everyday interactions (Auyero, 2016; Das, 2015; Han, 2012).

The setting for this ethnographic investigation is the waiting room of the former “Posta Central,” Chile's oldest and most iconic emergency service, located in central Santiago. This location provides a unique opportunity to examine how social inequalities—manifesting through gender violence, homophobia, racism, xenophobia, and other forms of discrimination—are made visible in real-time. The population served here is diverse, often reflecting the multiple axes of marginalization present in contemporary Chilean society.

This presentation shares preliminary findings on how life valuations emerge from the interactions within this space. First, it will describe the everyday interactions among key participants: security and admissions staff, patients and their families, and medical personnel. The research highlights that the functioning of the emergency room relies on the active engagement of all these actors. Second, it will analyze how these interactions are shaped by social categories such as gender, socioeconomic status, ethnicity, and migration. These categories not only intersect but are actively mobilized in the dynamics of healthcare access and delivery. Lastly, this presentation illuminates the ways in which power structures and social hierarchies influence health outcomes, offering a nuanced understanding of the inequalities embedded in medical care.

BENJAMIN, ORLY* (Bar Ilan University, Israel)

Intimacy at Work? Non-Formal in-Work Forms of Resistance Underlining Human Dignity and Recognition

One of the persistent forms of resistance to the low quality of jobs in the new economy is the Anti-Work movement. As Kathy Weeks explains in hers “The problem with work”, it became impossible for young adults to accept their position as instrumental in someone else's endless appetite for more profit. Next to the anti-work movement, other in-work forms of resistance emerged following the Covid “Great resignation” including organizational communication in the sense of intimate gestures between employees indicating recognition of out of work sources of sorrow and uncertainty. However, up until recently scholarship on job quality has not updated its understanding of intrinsic dimensions of job quality leaving the increased need for inter-personal intimate connection at work, outside its accounts. Without a more thorough systematic understanding of the inter-personal form of resistance to workplace alienation and exploitation, employers' responsibility for enabling this expression of human dignity, remains unexplored. Thus, I propose the need to extend the emphasis on intrinsic dimensions and begin shed light on employees' longing for a sense of meaning in their work raising, already since long, the question of whether the search of intimacy at work. I ask, how can the discussion of the ‘great resignation’ be connected then to a revision of existing conceptualizations of job quality? As a first step towards an exploration of this issue I chose to focus on employees of ideological workplaces in which market principles of employment, primarily skill evaluation, are allegedly marginalized. Analyzing 20 semi-structured interviews I elicited a longing for intimacy at work that I propose to conceptualize in three ways: as an update on intrinsic dimensions of job quality; as a form of in-work resistance to existing over-emphasis on skills and productivity; and, as a response to the current poly-crises and the persistently increasing levels of uncertainty.

BENJUMEA, DIANA* (Singapore University of Social Sciences, Singapore)

Repairing Health and Well-Being in Both More-Than-Human and Human Ecosystems: A Multi-Species Paradigm in Singapore and Medellin

The growing interest in repairing the broken relationships between urban environments and nature has brought scrutiny to the old dominative paradigms often embedded in urban agendas. Multi-species approaches offer transformative frameworks to reimagine healthy urban ecosystems beyond the human-centric narratives, emphasising the interdependence between human and more-than-human life. However, the practical implementation of such frameworks is not without its challenges, particularly within the constraints of Nature-based solutions, which often prioritise human benefits. This study adopts a comparative lens to analyse the potential of multi-species agendas in two distinct urban contexts: Singapore and Medellin. Singapore, renowned for its "City in Nature" vision, exemplifies a high-tech approach by integrating biodiversity into buildings and infrastructure. Meanwhile, Medellin has gained international recognition for its socially and inclusive urban greening initiatives, blending ecological restoration with community development. Despite their differences, both cities demonstrate efforts to enhance environmental integrity. Yet, these strategies fall short of dismantling entrenched dominative relationships with nature. Based on field observations and qualitative and quantitative analyses in both contexts, this paper presents a conceptual framework for fostering symbiotic urbanism. This approach seeks to cultivate mutualistic relationships between humans and more-than-human agents by shifting away from control-based models towards methods that repair and enhance both ecological health and human well-being.

BENYA, ASANDA-JONAS* (University of Cape Town, South Africa)

"Patchwork Quilt of Patriarchies": Women Mineworker's Experiences of Violence Underground

Labour feminists have long criticised trade unions for embracing and reproducing a culture that valorises androcentric norms and logics, functioning as boys' clubs with 'brotherhood' solidarities that exclude or marginalise women. Like their global counterparts, South African trade unions and federations, especially those organising in male-dominated workplaces, have also faced similar criticisms. While much has been said about transforming unions and taking seriously women's struggles in workplaces, the recalcitrant masculine culture of unions remains. Women's experiences are still coloured by marginalisation, and they continue to be seen as 'outsiders inside' and as invaders.

Using data from participant observation where I worked full shifts underground for almost a year while living with mineworkers in their residences, and interviews conducted between 2008 and 2019 at a platinum mine in South Africa, I outline women's experiences in three mining unions: the United Association of South Africa (UASA), the Association of Mineworkers and Construction Union (Amcu) and the National Union of Mineworkers (NUM). I reflect on their responses to violence and sexual harassment targeted at underground women miners. I argue that unions as boys' clubs with brotherhood solidarities are not only complicit in the production of unequal power relations and gender inequity at work, but also perpetuate violence against women by reinforcing hetero-patriarchal norms and by reproducing a culture that disempowers women. To serve women, to serve women there needs to be a rupture from androcentricity, and unions have to appreciate the connection between pocketbook issues and women's day-to-day workplace struggles, or what some scholars have called the 'sex of class'. This reckoning is critical for the future of the labour movement, as women are a permanent feature of work.

Unpacking the Concept of Sunsum Yaree (Spiritual Illness) in Mental Health Research in Ghana

Previous studies investigating traditional healing and faith-based approaches to mental illness and other diseases in Ghana have consistently classified mental illness as sunsum yaree, attributing it to *bayie* (witchcraft), curses, the actions of individuals, and ancestral spirits. While these studies have relied on the accounts of their participants and should not be critiqued for any inaccuracies or for potentially failing to critically examine the broader significance of sunsum within Akan illness narratives—given that this was

not a primary objective—this paper contends that such neglect, whether conscious or unconscious, has implications for how the term is utilised in broader analyses of mental illness among the Akan and within the general healthcare of individuals affected by mental illness. This paper argues that the notion of sunsum yaree among the Akan is considerably more complex, nuanced, and broader in perspective than represented in previous studies. To address some of the earlier conceptualisations of sunsum yaree, this paper employs Akan Indigenous knowledge frameworks to elucidate the cultural understanding and interpretation of the term. The paper posits that a crucial factor in the interpretation of illness is the philosophical foundation that underpins theories of causation and the approaches to addressing them. Significantly, this highlights the role of Indigenous knowledge systems in the interpretation of illness and mental health in particular.

Comparing AI-Based Flood Risk Estimation and Risk Perception Among the Community: A Study from a Floodplain Region of India

The methods of flood risk estimation are undergoing a paradigm shift due to the emergence of Geospatial Artificial Intelligence (Geo AI). Undoubtedly, it is capable of estimating flood hazards more precisely than previous methods, and it has the potential to serve as a significant tool for spatial planning. However, the execution of such planning is very difficult without community acceptance. Therefore, integrating AI-based flood risk estimation with community perception can be a pragmatic approach to building a disaster-resilient society. Apart from this importance, existing literature is rarely focused on AI and community perception in flood risk studies. This research develops a framework to compare flood risk estimation and community risk preconception. The framework is applied through a case study of villages of North Bihar, located at floodplain region of India. The region is affected by severe floods almost every year due to the rapid onset of rainwater from the Himalayas. The study follows three steps: First, it develops a flood hazard model using GIS and Remote Sensing derived geohydrological parameters, along with Google Earth Engine (GEE) based Random Forest Techniques. The cluster of building footprints within severe flood hazard is identified as high flood risk. The study is validated through past damage data and media reports. In the second step, risk perception is evaluated, with data collected through a field survey of 200 households in the region. In the third step, the AI-based estimated risk and the community's risk perception are compared using spatial matrix analysis. The findings indicate a coexistence of agreement and disagreement between AI-based flood risk estimates and the community's risk perception. Finally, the study suggests enhancing disaster communication to bridge the gap between estimated risk and community perception.

BERA, SOMNATH* (Central University of South Bihar, India)

Exploring the Gap between AI-Derived Landslide Risk, Risk Preparedness, and Risk Communication: A Comparative Study from the Indian Himalayas

The Geospatial Artificial Intelligence (Geo AI) drastically enhances the capacity to estimate landslide risk. Within the Geo AI platform, numerous machine learning algorithms are being developed to achieve optimal prediction accuracy. These techniques allow for a top-to-bottom approach, wherein scientific perspectives are reflected in risk mapping. However, existing studies rarely explore how community preparedness aligns with this scientific risk mapping. Therefore, this study aims to compare AI-derived risk estimation with community preparedness. Additionally, it investigates the gaps in disaster risk communication. The study is conducted through a case study in the Eastern Himalaya of India, which is one of the most landslide-prone regions in the world. Climate change, earthquakes, rapid population growth, and unplanned infrastructure development are cumulatively generating the risk of fatal disasters in the region. Overall, the methodological framework consists of three steps. First, we develop a landslide risk model using GIS and machine learning algorithms such as deep learning. In the second step, community preparedness is assessed. Risk preparedness data is collected through a GPS-based field survey involving 200 households. The next step compares risk estimation with risk preparedness. Furthermore, the study analyzes the effectiveness of disaster risk communication in addressing the identified gaps. The findings of the study indicate that risk preparedness is complex among communities and varies at the local level, even though the degree of risk is almost the same. The study recommends improving risk communication to bridge the gap between AI-defined predicted risk and community preparedness.

BERALDO, ANA* (Center for Studies on Criminality and Public Safety, Federal University of Minas Gerais (CRISP/UFMG), Argentina)

Lived Religion and the Multiple Governance of Ordinary Life in Latin American Urban Margins

Latin American territories of poverty are often perceived as lawless and chaotic. However, the literature increasingly suggests that, rather than being ungoverned, these areas are regulated by multiple authorities, logics, and norms. This paper explores the central role of religion and religious practices in shaping daily life within these complex dynamics. Drawing on findings from two ethnographic studies conducted over the past eight years—one in a favela in Belo Horizonte, Brazil (2016–2020), and the other in a villa in Buenos Aires, Argentina (2021–2023)—the paper moves beyond the distinction between the otherworldly and the worldly, highlighting how religion functions as a key factor in producing social order in conflictive urban margins.

In the favela in Belo Horizonte, while Catholicism remains influential, the rapid and deep expansion of various evangelical denominations, particularly Pentecostalism, is striking. In the villa in Buenos Aires, although a similar religious shift is noticeable, with evangelicalism gaining legitimacy over recent decades, Catholicism maintains a dominant presence through institutions, projects, and key actors. However, religious affiliation is not the only factor distinguishing these two settings. Focusing on lived religion, this comparative research demonstrates how the role of religion in producing social order is shaped by its interactions with other societal actors and institutions governing these spaces.

Special attention is given to the relationships between lived religion and: (i) State apparatuses, logics, and actors; (ii) local criminal networks; and (iii) social movements and political organizations. By examining these interactions—ranging from conflict and confrontation to intersection, overlap, or cross-fertilization—this paper offers a broader understanding of how religion, as lived in each community, generates diverse forms of governance and order in marginalized urban spaces in Latin America.

BERALDO, ANA* (Center for Studies on Criminality and Public Safety, Federal University of Minas Gerais (CRISP/UFMG), Argentina)

Violence, Governance and Politics in a Brazilian Favela and an Argentinean Slum

This paper aims to examine the production of violence and order by State and non-State actors in marginalised Latin American urban spaces in two contexts of rising far-right movements and parties. It draws on findings from two ethnographic studies conducted over the past eight years: one in a favela in Belo Horizonte, Brazil (2016–2020), and the other in a slum in Buenos Aires, Argentina (2021–2023). In these spaces, I analysed the coexistence of different normative regimes that simultaneously govern these territories. These included the State (in its multiple facets, from social assistance to police repression); ii) the “world of crime” (the moral universe established around certain illegal activities); and iii) religion (including both the Catholic Church and the multiple evangelical strands). My previous works propose that violence and life/death dynamics in many territories of urban poverty in Latin America are shaped by the State’s complex and often ambiguous relationships with criminal and religious actors. Additionally, I argued that violence arising from the conflict between State, crime, and religion produces specific forms of order and predictability (or unpredictability) that guide behaviour within these communities. Although this was never my intention, in carrying out these two fieldworks, I also ended up observing, from the margins, the periods leading up to the rise of far-right leaders to senior executive positions in both countries (Jair Bolsonaro in Brazil and Javier Milei in Argentina). Recognizing that macro-level politics cannot be fully understood in isolation from micro-level aspects of daily life, this paper explores the connections between local realities in these neighbourhoods, how violence is produced and governed (by State and non-State actors), how it generates order, and the broader context of far-right political ascendancy in both Brazil and Argentina.

BÉRANGER, ARTHUR* (Géolab, Université de Limoges / LAP, EHESS, France)

De La « Lutte » à La Dépossession Environnementale, Analyse Critique d'Une Communauté Écologique De Fuite

S’inspirant d’un cadre d’analyse issue de la pensée néo-léniniste libertaire contemporaine, cette contribution propose une lecture des enjeux entourant les « communautés de fuite » en termes de lutte et d’inégalités environnementales locales. Ainsi, en se réemparant d’une nomenclature prédéfinie portant sur les communautés écologiques, nous nous attarderons sur les « communautés de fuite » qui s’éloignent de toute conflictualité vis-à-vis des institutions. Cette contribution repose sur une analyse menée depuis deux ans au sein d’une communauté de l’Ouest de la France, partagée entre enquête ethnographique durant les assemblées mensuelles et des visioconférences hebdomadaires, ainsi que de multiples entretiens individuels et collectifs avec les habitants de cette initiative néo-rurale, regroupant des individus uniquement blancs, hétérosexuels, et avec un capital économique et culturel conséquent. Dès lors, il s’agit d’interroger de manière critique la complexité qui s’articule autour des communautés de fuite, entre production d’un imaginaire de lutte et génération d’inégalités environnementales locales.

Ainsi, bien que non subversive dans son approche directe, la communauté de fuite est tout de même productrice d’idées et d’influence à son échelle, qui s’inscrivent dans un processus politique plus vaste, et considérée comme une forme de laboratoire préfiguratif. Cela se décline sous l’approche “politique” qu’implique un tel projet, et la création d’imaginaires comme – unique ? – pouvoir de lutte et d’influence sur le monde social.

Considérant toutefois que, dans son approche macroscopique, le collectif ne propose que très marginalement un projet alternatif au système socio-économique dominant par le caractère autocentré de l’initiative et l’absence d’inscription dans des projets de lutte plus globales et intersectionnelles ; il sera également pertinent de proposer l’analyse des dynamiques locales qu’incarnent ces communautés de fuite, dès lors elles-mêmes génératrices d’inégalité environnementale par le procédé de dépossession mis en place par ce type d’initiative communautaire, au détriment des habitants initialement installés.

Information Styles and Political Engagement: Navigating Misinformation in Hybrid Media Environments during German Populist Mobilizations

Research on misinformation in hybrid media environments lacks a nuanced understanding of how users evaluate, encounter, and act upon content. Concepts like the “echo chamber,” “filter bubble,” and “online radicalization” have recently come under scrutiny. We still know surprisingly little about media users’ responses to misinformation.

Recent advances in STS-affine Cultural Sociology research suggests treating misinformation uptake as “alternative epistemologies,” proposing that different groups operate with distinct, often conflicting, understandings of truth, knowledge, and evidence. While acknowledging variation in media users’ sense-making is certainly valuable, this approach also faces challenges. First, research tends to take alternative media users’ claims at face value, equating political mobilizations’ use of scientific language with actual knowledge production. Second, like studies within the “misinformation paradigm,” the “alternative epistemologies” approach often views media rather instrumentally, treating digital communication’s permeability as central mechanism for fringe beliefs to enter mainstream discourse.

In this paper, I argue for an approach to misinformation that focusses on media experience. I analyze data from repeated interviews with users with 54 alternative media users/activists and fieldwork conducted between 2019 and 2022, during the German mobilizations for German far-right populist party AfD and Querdenken (anti-lockdown protests). In the analysis, I note significant differences in how these media users/activists navigate the hybrid information environment. Drawing from the conceptual toolkit of media anthropology, I theorize these differences as “information styles” and argue that these distinct understandings and practices of information also imply different conceptions of the political and of (possible) political engagement. Building on this, I show how the adoption of a particular information style – I identify four – influences how users/activists move in and out of a sequence of populist mobilizations, why they participate in protests, but also how, in some cases, they depoliticize themselves again.

BERG, METTE LOUISE* (University College London, United Kingdom)

DICKSON, EVE (University College London, United Kingdom)

Waiting, Entrapment and Slow Violence in the UK Asylum System

In the UK, the asylum dispersal and support system is privatised and separate from the mainstream welfare system. Low levels of support and a system designed to yield profit for private contractors leave those seeking asylum housed in deprived areas and reliant on support from the third sector, often for protracted periods. In this context of limbo and entrapment, state / non-state boundaries are opaque and blurred (Giudici 2021), and third sector advocates are increasingly drawn in to 'fill the gaps' (Mayblin and James 2019).

Drawing on participatory ethnographic fieldwork conducted in Yorkshire in the North of England during the COVID-19 pandemic, this paper examines 'welfare micropublic' (Berg et al. 2019) encounters between people seeking asylum, the state and its private contractors, and third sector advocates. Using asylum housing as a lens, we focus on how the complex asylum dispersal system subjects those caught in its web to slow violence and exhaustion (Darling 2022) while they wait for an outcome on their asylum claim.

We examine how solidarities are formed and fractured at the micro level, arguing that (inter)mediation and contingency are key to understanding everyday asylum governance and its myopic (Whyte 2011) and dehumanising bureaucratic logic. Focusing especially on dynamics of un/seeing and un/hearing, we foreground lived experiences of slow violence (Nixon 2013), and ask what they tell us about the nation as an imagined 'community of value' (Anderson 2013) in hostile times. We conclude with reflections on hope and how to change the narrative.

Gender Mainstreaming in Teaching: The Case of Catalan Universities

The introduction of a gender perspective into the university curricula is one of the main priorities of the European Research Area (ERA) and it is related to the excellence in teaching and research content, stimulating critical thinking and the capacity of performing without gender bias in academic and professional fields. In Catalonia, since the adoption of the Equality Act in 2015, is mandatory that the gender perspective is incorporated in all qualifications offered by universities requiring accreditation by the Catalan University Quality Assurance Agency. Since then, and with the advice of the Women in Science Committee (WSC), universities started to do the work. The WSC is a collegiate body that includes all Catalan universities, the Catalan government responsible for science and universities and the University Quality Assurance Agency, among others, with the role of ensuring compliance with the legal objectives of equality in higher education and research. Several actions have been promoted during these years, as driving, coordinating and monitoring Gender Equality Plans (GEPs) in universities and research centres or agreeing on a system of indicators to assess the situation of women in academia. In this research we focus on one recent action, recognised as a best practice by EIGE (European Institute of Gender Equality), which is the promotion of gender mainstreaming in Catalan universities curricula. We analyze the incorporation of this measure through a qualitative approach based on documentary analysis of the GEPs of all Catalan universities from 2015-2022. The results show how the gender perspective, with an intersectional approach, is starting to be introduced in the curricula and is becoming central to the notion of quality in teaching, as also the implementation of the gender perspective in teaching content has to be further developed to have effective results in knowledge processes of the students.

Trauma-Integrating Narratives As Opportunity to Transform Polarization in Collectives

Background: Biographical narratives are constructs of our perception of the world, shaped by the interaction between the self and the environment. We can create various narrative constructs unable to distinguish symptoms of individual from collective traumatic experiences. This discussion is quite

closed related to the question of agency as the capacity of individuals to act independently and to make their own free choices. The structure versus agency debate understood as an issue of socialization against autonomy in determining whether an individual acts as a free agent or in a manner dictated by social structure might be twinned with the question of differentiation between individual and collective drama symptoms. **Research Question:** Is it possible to overcome the polarization between winners and losers through the creation of trauma-transformative narratives, using individual unconsciousness emotional material to get in contact to individual and bridging in this way to the collective trauma as well? **Methodology:** In a single-case study, subjective experiences are constructed as both victim and perpetrator narratives. These narratives are then transformed into an integrative narrative through confrontation with unconscious, unresolved traumatic elements and their integration. **Results:** The identification of agency related aspects of traumatization versus collective traumatization was helpful for differentiation between individual and collective trauma symptoms. The trauma integrative narrative opens up access to new narratives and perception spaces and seems to help overcome the victim-perpetrator polarization.

Agency is the capacity of individuals to act independently and to make their own free choices. The structure versus agency debate may be understood as an issue of socialization against autonomy in determining whether an individual acts as a free agent or in a manner dictated by social structure.

Reconfiguring Inequalities and Tolerating Democratization: Understanding Political Elite Strategies in Rajasthan

This paper aims to describe the processes of social change in the elite structures and how traditional political elites, with princely family background, tend to reconfigure themselves in the changing social and political contexts of Bikaner city in Rajasthan state of India. The traditional system of feudal power organized around princely families has been challenged by the rise of new political elites from non-princely backgrounds in the postcolonial contexts in 19th century India. This marked a shift in political field (to use Bourdieu's concept), and created a rupture in the structures of power and domination. Drawing upon the empirical study of Bikaner town in Rajasthan, this paper maps the elite strategies to reproduce their monopoly over a particular field. It also explains the renewal in the process of reconfiguring power and inequalities vis-à-vis the challenges posed by democratic politics. With the entry of new elites and intermediate caste groups into urban politics and business, Bikaner city's elite structure has become highly competitive and yet maintains its exclusivist nature. It concludes with the discussion of how this change has produced new problems of legitimation and of acceptability for traditional political elites.

Small States, Big Goals: Why Alliance 8.7 Is Established?

The study explores the establishment and significance of Alliance 8.7, a global coalition aimed at eradicating forced labour, child labour, modern slavery, and human trafficking, with a focus on the role of small states in shaping and benefiting from international alliances. The literature review examines existing scholarship on small states, transnational cooperation, and global governance, emphasizing the constructivist framework. It also discusses the increasing importance of international alliances for small states in a world marked by multiple crises. It uses the Green Deal, the European Union Corporate Sustainability and Due Diligence Directive (EUCSD), and the climate crisis as key examples. The establishment of Alliance 8.7 is examined as a case study to illustrate how small states engage in international cooperation to address social and economic challenges, focusing on the Alliance's objectives, structure, and impact on global efforts to eradicate forced labour, child labour and modern slavery. Every Alliance member country must prepare and comply with policy roadmap documents. Within this study, a comparative content analysis of roadmap documents produced by Alliance 8.7 has been conducted via the MaxQda coding programme to identify patterns and strategies that reflect the policy goals of all 31 member states within the Alliance. The coding shows how patterns differ according to the country being at the global south or global north. In conclusion, the study reflects on the importance of international alliances like Alliance 8.7 for small states in the context of global crises, arguing that these alliances not only offer states a platform for transnational engagement and contribute to more equitable and sustainable global governance but also works as a device for the survival of small states in the global economy.

Meta-Organizing Polycentric Governance

Polycentric governance (PG) has been first defined by Ostrom et al (1961) as characterized by a multiplicity of decision-making units that overlap in the governance of a public good or natural resource; and as an efficient and adaptive way to govern resources in a context of environmental and climate change (Shawoo and McDermott, 2020; Patali et al., 2022). Polycentric governance requires a forum of discussion and deliberation (Carlisle and Gruby 2019, Heikkilä et al. 2011). The literature overemphasizes the role of decentralization, institutions and norms in governance, but underestimates the notion of organization. Yet, organizing matters for grand challenges (Gümüsay et al 2022). We know little about the organizational forms this forum can take and their effects on polycentric governance of resources. In this paper, we precisely do this and examine the various organizational forms the PG forum or regulatory intermediary can take. We argue that the theory of meta-organizations, organizations whose members are themselves organizations (Ahrne and Brunsson, 2008) might help understand how to create the necessary arenas to enable cross-scale, cross-level linkage, or linkage between geographically distant unit, and to find an adequate balance between competition and cooperation to achieve efficient polycentric governance. We conduct a comparative case study of various polycentric arrangements and look at the outcomes of different organizational forms. We analyze several dimensions, such as type of resource, type of territory, stakeholder representation and involvement, membership composition (voluntary or not), form (e.g. network, meta-organization, etc), formation of the forum (at whose initiative), authority and decision (are there organized devices for decision-making), production of rules (what type, they binding or not), and effects on resource sustainability. We contribute to the literature by showing how organization and meta-organization matter for polycentric governance. We also show the variety of meta-organizational forms and origins (with public mission or not).

BERKOWITZ, HELOISE* (CNRS, LEST, Aix Marseille Univ, France)

Why You Need to Know about Meta-Organizations

We live in a world fraught with not only organizations, but also meta-organizations. Meta-organizations are organizations with other organizations as members, rather than directly individuals. From international organizations like FIFA or the WTO, to national industry or business associations like the Groupement des Exportateurs Cacao & Café du Cameroun and the American Petroleum Institute, or transnational peasant movements like la Via Campesina, meta-organizations are everywhere around us and play important roles in creating decided orders among organizations. Yet we rarely think of them in those terms, and we rarely examine their distinctiveness. Being an organization and having organizations as members has significant theoretical implications that I will discuss in this presentation.

BERLOVITZ, GABRIEL* (Georg-August-Universität Gottingen, Germany)

A Power Resource Approach for the 21st Century

This article conceptualizes an adapted form of the power resources approach that's based on recent literature on strike effectiveness, and social movement unionism (see McAlevey, 2016; Nowak, 2018; Kallas, 2023; Kallas, 2024; and Schmalz et al., 2018; Gallas, 2018). It argues that while the Power Resource Approach theory was originally intended to be a relational approach, recent empirical work demonstrates a need to recenter the relationship between firm and union power within it (Kallas, 2024). Empirical analysis of strikes and social movements justifies an adapted Power Resource Approach that focuses more heavily on the role of union leadership, transformational movement demands, broad socio-economic influence, and whether labor's strategy reflects both union and employer power resources, when it comes to analyzing the efficacy of labor movements. This article discusses the shape of an adapted power resource approach with socio-economic conditions as the separate but necessary building blocks of firm and union power (Isaac et al., 2022; Kimeldorf, 2013; Nowak, 2018). Union and firm power is related

to this foundation and largely exercised through leadership or decision making structures within a firm or union (McAlevey, 2016; Johnston, 2004). The outcomes of labor struggle are then a product of union leadership's and workers' accurate assessment and utilization of their power, in relation to the employer's power. By focusing more heavily on the agency of actors involved and their relationships, an adapted power resource approach can be more inclusive and sober about the true capabilities of labor's ability to fight for broader segments of the working class. New conceptual forms of labor struggle are crucial to build broader solidarity and ensure labor has the power to confront climate change, ever declining public goods, increasing prejudice and xenophobia, and the many challenges of the 21st century.

RC44-JS-165.5

BERLOVITZ, GABRIEL* (Georg-August-Universität Gottingen, Germany)

Striking Outcomes: Analyzing the Conditions and Strategies Related to Effective Strikes

This dissertation examines why socio-economic conditions, the power resources of employers and unions, and strategies employed by these parties, lead to a variety of strike outcomes. Not only are strike outcomes since 2008 understudied in the literature, but the dynamics of strikes could hold the keys to addressing some of the fundamental challenges presented by climate change, and capitalism. The dissertation conceives of new models to evaluate how workers can achieve success in the strike context and then compares strikes, through descriptive statistics and interview informed case studies, across the healthcare and automotive sectors, within the USA in the last 4 years. It compares unemployment rates, inflation rate, and public opinion about unions (macro socio-economic conditions); the share of the firm affected by the strike, experience of firm leadership with strikes, susceptibility of the firm to public opinion (firm power); the structural, associational, institutional, and societal power of unions, and their leadership's ability to utilize these resources (union power); and the concrete strategies used by firms and unions to utilize these power resources, to evaluate why some strike have varying outcomes (See Schmalz et al., 2018; Kallas, 2024; McAlevey, 2016; Nowak, 2018; and Kimeldorf, 2013 for authors related to my theoretical model). Preliminary results suggest that macro conditions have a significant relationship with the power resources of either side. It also confirms that power resources of firms and unions are deeply related to one another and their successful employment by either side's leadership structures or union membership, drastically shapes the outcomes of a strike. Descriptive statistics will also show that open ended economic strikes are increasingly resulting in transformational outcomes, while comparative analysis provides lessons on how these outcomes could be more broadly achieved.

BERNAL MONTERO, DAVID* (El Colegio de México, Mexico)

La Nación En Miniatura: El Souvenir Como Generador De Representaciones Nacionales En El Mercado De Artesanías La Ciudadela

México, como uno de los países que recibe mayor afluencia de visitantes al año, tiene al turismo como un pilar económico fundamental. Esto tiene su origen a partir de los planes de desarrollo turístico en los años sesenta con el gobierno posrevolucionario que construyó narrativas identitarias de lo "mexicano" (Montfort, 2001). Esto, para el consumo turístico de un público masivo que visitó el país para los JJ.OO de 1968 y el mundial de fútbol de 1970. De ahí, nace el mercado de La Ciudadela que actualmente sigue funcionando como un espacio para la difusión y comercialización de lo artesanal en la Ciudad de México.

El presente estudio propone desde una exploración etnográfica realizada durante dos años en el mercado mediante entrevistas tanto a turistas como comerciantes y observación no participante, analizar cómo el consumo de souvenirs estructura una representación de "lo mexicano". Esto, generando una mirada socialmente establecida por parte de los primeros desde distintos medios que construyen su mirada, en particular medios masivos (Urry, 2002) y la creación de nuevas formas de mercantilización identitaria de los segundos (Comaroff & Comaroff, 2001) mediante los objetos comercializados en el mercado.

Argumento, que además de la estandarización del destino derivado de distintos medios de comunicación y la mercantilización cultural que genera, el souvenir como objeto no solo es una representación de la nación estática. Por el contrario, este construye y reproduce activamente la significación de lo nacional mediante su compra y posterior socialización en espacios distintos al mercado (Zubrzycki, 2017). Este abordaje busca explicar la selección y explicación de los productos expuestos, la construcción de su autenticidad, las narrativas en las que están inmersas y el significado que le da tanto el vendedor como el comprador, exponiendo una versión de lo que significa México para ellos y los demás.

Discourse on Urban Biodiversity in Climate Change Transitions: Insights from Five Italian Cities

As urban areas confront the pressing challenges of climate change, effective communication of biodiversity is crucial in shaping resilient socio-ecological systems. The research, conducted as part of the Italian National Biodiversity Future Center, examines how five major Italian cities (Milan, Genoa, Florence, Naples, Palermo) are integrating biodiversity into their climate change transitions through public discourse and citizen engagement.

Using advanced web and social media analytics provided by a strategic communication agency (Words), the researchers have analysed over 77,000 media clips from various digital platforms over a three-month period in 2024. The focus is on key themes derived from five conceptual frameworks – Planet, Prosperity, People Engagement, Biodiversity Governance, and Climate Justice – which together operationalize the concept of urban biodiversity by addressing environmental health, sustainable economic practices, citizen involvement, regulatory frameworks, and social equity. Semi-structured interviews with municipal officials and thematic experts complement the data, providing insights into the general strengths and weaknesses of cities communication efforts. Findings indicate that cities successfully framing biodiversity within broader narratives of climate resilience achieve higher public engagement. For example, Milan and Florence emphasize green infrastructure and community-driven initiatives, while Naples and Palermo struggle with limited biodiversity discourse amidst pressing local issues like waste management.

By exploring how various discourses on climate change transitions shape public perceptions and actions, initial insights for policymakers emerge regarding the integration of biodiversity into urban climate action plans, promotion of environmental stewardship, and enhancement of citizen involvement. This approach enhances understanding of how effective communication can drive socio-ecological change, ensuring that biodiversity remains a central focus of urban sustainability efforts. The insights from this research also contribute to the development of an Urban Biodiversity Communication Compass, a kind of framework that guides cities in refining their communication strategies, engaging citizens more effectively, and supporting urban biodiversity conservation.

Overtourism and the Transformation of Urban Spaces: Governance, Social Inequality, and Environmental Challenges

Overtourism is reshaping urban spaces globally, highlighting the contradictions of tourism in a rapidly changing world. While tourism offers opportunities for economic growth and cultural exchange, its unregulated expansion generates profound issues, such as the commodification of urban culture, the displacement of local residents through gentrification, and the environmental degradation of cities struggling to balance visitor influx with the communities' well-being.

In cities like Venice, Amsterdam, Barcelona, and even Bangkok and Kyoto, overtourism pressures transform local identities and economies. The rise of short-term rentals and tourism-focused businesses distorts economies and pushes residents out of city centers, exacerbating housing shortages and deepening social inequalities. Public infrastructure, transportation, and cultural sites are overwhelmed, resulting in increased waste, pollution, and deteriorating urban environments. These developments contribute to what scholars term "urbanicide," where cities lose their essence and become tourist attractions prioritizing profit over sustainability, fuelling protests and the emergence of "tourists go home" movements.

This presentation explores the governance challenges posed by overtourism and the strategies cities are using to address these issues while rethinking urban tourism. By examining case studies from Europe and Asia, it highlights governance responses and policy innovations, such as limiting tourist accommodations, increasing regulations on short-term rentals, encouraging community participation in urban planning, and promoting sustainable tourism models. The goal is to examine whether existing strategies are sufficient or whether a more radical approach is needed to address the inequalities and environmental impacts of tourism in cities.

The research finds that while some policies provide temporary relief, most fail to address the deeper socio-environmental impacts of overtourism. It concludes by proposing pathways for more sustainable urban tourism models that balance economic growth with cultural preservation and environmental resilience. Bold governance and greater community involvement emerge as critical factors in safeguarding urban spaces for both residents and visitors.

Social Policy Towards Transnational Families: Non-Formal Education of Children

The spread of families with members across state borders presents challenges for social policies regarding transnational family members. One less explored area is how the state ensures the non-formal education of children from transnational families. Accordingly, the aim of this presentation is to discuss the issues related to the non-formal education of children from transnational families as part of state social policy. Non-formal education here is defined as children's development in sports, arts, science, and other activities, typically organized outside regular school hours and settings.

To achieve the research aim, a qualitative survey was conducted between the end of 2024 and the beginning of 2025. The research method involved focus groups with experts. Three focus groups were organized with non-formal education teachers working with children, including those from transnational families residing in Lithuania. Preliminary research results reveal a positive attitude and the state's efforts in organizing formal education for children from transnational families. However, there is a lack of attention to non-formal education. This gap creates an additional burden on non-formal education teachers, particularly in terms of understanding different cultures and addressing psychological aspects.

Post-Socialist Gentrifications

The paper aims at advancing research on post-socialist gentrifications beyond comparison to the West by providing a comparative study of gentrification in two inner-city neighbourhoods in East Germany and Poland. We address two research gaps: First, we analyse the differences between two post-socialist gentrifications on the basis of a common framework that centres on the institutional environment for reinvestment, displacement and gentrification. Second, we pay particular emphasis to the different roles of the state and analyse how gentrification is embedded into different institutional environments. On this basis, we argue that gentrifications in post-socialist countries are "similar" because they are based on the common denominator of privatization and market reforms. At the same time, they are also "different" because their operation is embedded into dissimilar trajectories of transition. We argue that this calls for more East-East comparison and a clearer focus on the differences in which the transition of property rights, the introduction of new tenure structures and the construction of new markets has been achieved.

Effects of the Eco-Social Crisis, Housing, Touristification and Gentrification in Two Southern Mediterranean Cities: Porto and Barcelona

This communication is framed in research-funded project ECOSOCITIES (2022-2025), which studies eco-social resilient discourses and practices in southern European cities (PID2021-123912NA-I00). Our research highlights Porto's trajectory as it parallels Barcelona in experiencing a housing crisis (characterized by gentrification), a tourism crisis (evidenced by touristification), and socio-economic challenges—albeit with a two-decade lag (Meerow 2016, Putnam 2000). These cities have many similarities, both of Southern European heritage, having become a tourism magnet and economic epicentres for entrepreneurship. They have, however, faced significant setbacks due to the COVID-19 pandemic deepening preexisting eco-social repercussions. How have these challenges shaped the response to the eco-social crisis in both

cities? Which tensions have arisen in the housing, economy and eco-social spheres? What are the bottom-up responses to this multidimensional crisis?

We seek to elucidate these tensions and challenges in both Barcelona and Porto, and through a comparative study, explore a route that may enable them to avoid some effects of the eco-social crisis by focusing on the bottom-up and collective actions that arise when social community organisations.

Employing a mixed methods approach, we analyse quantitative secondary data such as OECD, EUROSTAT, National Institute of Statistics of Portugal and Spain, municipal reports with statistical data to gain a deeper understanding of both local contexts. Besides we undertake semi-structured interviews and focus group discussions. We specifically analyse the role of associative networks, bottom-up solutions and the result current urban space distribution (green spaces, spaces for the elderly or young children.), as well as housing distribution play in mitigating the impact of the eco-social crisis that has been aggravated by the pandemic.

We conclude by advocating to foster a grassroots community engagement and social resilience as vital strategies to alleviate the adverse effects of touristification and gentrification dynamics on urban space social configuration and changes in Porto.

Perceptions of Personal Branding Among Education Students: A Cross-Cultural Study of Morocco and the U.S.

In a rapidly changing and increasingly digitalized world, **personal branding** has emerged as a critical strategy for **career advancement** across various fields. This research aims at examining how students in both countries view personal branding, their attitudes toward its importance, and the extent of **institutional support** available to help them build a professional identity. Additionally, it investigates students' intentions to leverage personal branding strategies, such as social media presence, to enhance their employability. A **comparative** analysis will offer **cross-cultural** insights into how education students from different academic and socio-cultural backgrounds approach personal branding.

This study explores the perceptions, attitudes, and behaviors of education major students in Morocco and the U.S. regarding personal branding, with a focus on how these future educators view self-promotion in the professional realm. It studies the role of institutional support in shaping students' personal branding strategies and the ways in which these strategies influence their career aspirations. Drawing on survey data from education students in both countries, the study plans to probe key factors such as students' use of social media for professional visibility, their awareness of personal branding as a tool for employability, and the institutional mechanisms that foster personal brand development. Additionally, the research highlights cross-cultural differences in how personal branding is perceived and deployed within the education sector, considering the distinct academic, cultural, and socio-economic environments of Morocco and the U.S.

This research will contribute to the growing body of literature on personal branding by providing a nuanced understanding of how education students navigate the professional landscape and leverage personal branding to position themselves for future success in the field of education. It will offer valuable insights for educators, institutions, and policymakers seeking to support students in building strong professional identities in an increasingly competitive and interconnected world.

BERRIH, CAROLE* (CERDAP2 (Univ. Grenoble Alpes, Sciences Po Grenoble), France)

Widening the Gap. the Role of National Power Dynamics in the Disconnect between Penitentiary Law Reform and Practices in Niger

Using Niger's penitentiary system as a case study, this paper illustrates how reformers' emphasis on legal texts, viewed as a prerequisite to implementation but disconnected from institutional dynamics and power relations, has widened the gap between norms and practices. Since the 1990s, several reforms have taken place, culminating in a major overhaul of penitentiary laws in the 2010s led by the Ministry of Justice, with support from the EU-funded Program for Justice and the Rule of Law. While prison regulations were previously governed by decrees, this reform introduced the first law on the prison system, supplemented by decrees and regulations. These new texts, which retained many provisions from the earlier decree, expanded detainees' rights, such as increasing the number of meals provided or clarifying disciplinary rules – reflecting a stacking of norms (Darbon 2003, Bierschen 2014) common in the development sector in Africa.

These reforms were adopted in a context marked by strong military influence over institutional dynamics, marginalizing the Ministry of Justice in terms of influence, capacity, and resources. This (im)balance is evident in the prison system: while the Ministry is theoretically responsible for detainees, budgets, and administration, the National Guard of Niger (GNN), a military body, is the sole actor deployed in prison.

Since legal texts only have value based on the importance assigned to them (Le Roy 2005), prison realities remain unaffected. The adopted texts, supported by 'external reformers' (Olivier de Sardan 2021), blinded by a situated, positivist view and by predetermined power relations, and committed but powerless internal reformers, had no influence on the prison system. The GNN disregarded the texts, leading to a deeper disconnect between written norms and on-the-ground realities. This paper is based on data collected during doctoral research from 2018 to 2023 (defended in 2024).

Caring for Salmon: Epistemic Justice for Equitable Climate Futures

The uncertainty surrounding climate futures challenges existing scientific approaches while presenting opportunities for rethinking the role of knowledge in environmental governance. This talk critically examines the historic centralization of genetics as a dominant framework for defining human-salmon relationships, particularly in fisheries management and conservation. Drawing on a five-year ethnographic study of Pacific salmon in Canada and the United States, I explore how the reliance on genetic science has shaped salmon management practices and limited more relational, place-based approaches and Indigenous knowledge and governance systems. Through the lens of salmon hatcheries, I discuss the transformations needed in scientific institutions and governance platforms to advance epistemic justice as a critical fourth dimension of environmental justice. Overall, I call for models that better account for historical exclusions and support more inclusive frameworks for co-management and environmental decision-making.

Global Eco-Social Policy: The Integration of the Ecological, the Economic and the Social in International Organisations' Policy Proposals

Discussions of how to integrate ecological and social policies have mushroomed in recent years. Globally, policies fall short in balancing natural and social systems. Wealthy welfare states often overshoot planetary boundaries, while some low-income countries have trouble meeting basic needs but stay within ecological limits. Most eco-social policy research revolves around national challenges rather than their global dimensions, which is surprising given the transnational character of ecological crises. The paper outlines how to approach eco-social policy from a global perspective by focusing on international organisations (IOs), which are crucial actors in a just transition to a more sustainable future, since they provide policy recommendations to both groups of countries and could thus balance natural and social requirements. Some IOs increasingly acknowledge tensions between environmental policies and social policies, and some offer integrated policy perspectives that aim to render these tensions into synergies. This paper concentrates on key global social policy IOs, namely the ILO, the OECD, and the World Bank. To provide an evaluation of their eco-social policy practices, the paper assesses IO policy proposals in their degree of policy integration, using a conceptual framework that differentiates between eco-social problems, goals and instruments. It then examines levels of incumbency and transformation associated with their approaches. Incumbency refers to staying within established practices that broadly reproduce the prevailing global political economy, while transformation signifies the capacity to promote changes to incumbent policy notions that challenge this economic order, which is often blamed for the current economic, ecological, and social crises. By offering a nuanced exploration of eco-social policy integration within different IOs, the paper provides insights into the evolving landscape of global eco-social policy, which is expected to become a key concern in global social policy – both for the journal and for the eponymous field of research and practice.

BERTEN, JOHN* (Bielefeld University, Germany)

How the Anticipation of Crises Shapes Social Security Policy and the Welfare State

The welfare state is exposed to increasing pressures from multiple, multidimensional and global crises. This requires not only immediate crisis management through social policy, but also challenges the future sustainability and functioning of welfare institutions, leading policy actors to try to identify (im-)possible and (im-)probable, desirable and undesirable futures, and act in response to them. The paper explores how crisis anticipation influences social policy institutions and processes. It focuses on social security as a key institution of the welfare state in which futures play an intrinsic role, as social security transforms vague uncertainties into specified risks. Theoretically, it develops a conceptual framework that builds on the interdisciplinary literature on futures and anticipation. Drawing on first preliminary results from a new three-year project on 'Social Security in Crisis Mode', the paper shows that the anticipation of crises is able to shape both the policymaking process at large and the availability of specific policy alternatives in particular. First, futures are part of the epistemic framework that actors in the initial phases of the policy cycle – problem construction, agenda setting, and policy formulation – draw on and that mold the options they see and deem appropriate. Second, crisis anticipation shapes temporalities of policymaking towards an increased urgency to act. Third, it influences and potentially transforms core logics of social security policymaking: from a focus on compensation and provision to more forward-looking principles such as precaution and preparation. Fourth, anticipation shapes the design of policy models, strengthening resilience and investive elements.

BERTHELET, CHARLES* (École des hautes études en sciences sociales (EHESS) / Université du Québec à Montréal (UQAM), Canada)

The Cultural Performance of Econationalism: The Identity-Building Process and Iconic Power of Les Cowboys Fringants on the Quebec Popular Music Scene from 2000 to 2025

Depuis l'orée des années 2000, le nationalisme québécois a connu différentes évolutions dont le développement d'un éconationalisme qui conjugue les préoccupations de l'époque relatives aux enjeux environnementaux et les questions identitaires qui traversent la société québécoise dans la plus longue durée. Si ce «nationalisme vert» a surtout pénétré le discours institutionnel et partisan québécois à partir de l'élection d'un gouvernement fédéral canadien conservateur et ouvertement climatosceptique en 2006, force est cependant de constater que ce développement majeur a été précédé par des productions et performances culturelles qui ont, dès le début de la même décennie, fait la promotion de plusieurs idées constitutives propres à cette nouvelle orientation soi-disant «pro-environnementale» au sein du nationalisme québécois.

Cette présentation mobilisera les outils conceptuels et analytiques offerts par le «programme fort» en sociologie culturelle (voir not. Alexander, 2003, 2011) afin de rendre compte de l'importance qu'ont prises certaines pièces du groupe de chanson Les Cowboys Fringants dans le développement culturel de cet éconationalisme proprement québécois. D'une part, il s'agira d'envisager le contenu notamment textuel de la production musicale du groupe au travers d'une herméneutique structurale propre à mettre au jour les évaluations normatives que des chansons promeuvent et transmettent sous la forme d'une série d'oppositions binaires à consonance à la fois environnementaliste et nationaliste. D'autre part, il s'agira de procéder à une étude de la performance culturelle du groupe en combinant une attention portée à la représentation scénique et médiatique de ce dernier à un examen de sa montée en «iconicité», laquelle a fini par lui conférer un pouvoir performatif et culturel hors norme dans la société québécoise. Toutefois, l'analyse ne pourra faire l'économie des dynamiques sociétales comme des récits environnementaux ou identitaires dans lesquels le groupe a inscrit sa contribution, et qui ont contribué en retour à en permettre ou en produire l'iconicité.

RC40-JS-237.1BERTI, FABIO* (University of Siena, Italy)
VALZANIA, ANDREA (University of Siena, Italy)*The Exploitation of Seasonal Foreign Workers in Agriculture: The Case of Tuscany (Italy)*

The exploitation of seasonal foreign workers is a widespread phenomenon in many Italian regions, both in the North and in the South, as emerged by many investigations and field research.

In particular, main agriculture sectors, from viticulture to olive growing and the fruit and vegetable and horticultural production, are interested by a strong use of seasonal work, especially carried out by foreign migrants. In this framework, beyond illegal recruitment practices and illicit control of workers, the labour exploitation manifests itself through not totally illicit practices as well. These are unfair employment relationships in which the employer takes advantage of the socio-economic and linguistic weakness that characterizes foreign workers. The Italian case is a sort of clear example of how the absence of policies on seasonal workers – especially for the foreign workers – leads to their exploitation in work, with a particular exploitation of asylum seekers.

The speech aims to present the results of a qualitative research carried out in Tuscany (Italy) between 2021 and 2022. Research was carried out through 40 in-depth interviews, three focus groups with privileged stakeholders (e.g. international organizations, institutional and trade union representatives, entrepreneurs, academics and activists) and 85 interviews to migrant agricultural workers. In particular, the research focuses on the working and living conditions of seasonal foreign workers, the exploitation practices and the awareness level of the phenomenon, both in the workers and in the various stakeholders interviewed.

RC40-657.2BERTI, FABIO* (University of Siena, Italy)
VALZANIA, ANDREA* (University of Siena, Italy)*The Food Poverty in Italy: A Qualitative Focus on the Caritas Centres in Tuscany*

Despite the reduction of hunger on an international scale, particularly in areas traditionally characterized by malnutrition, recent years have seen an increase in problems relating to food access precisely in those countries which considered themselves immune from such problems.

During and after the pandemic, Italy recorded a considerable increase in people and families who requested food aid. The "point of view" of Caritas (people who use food aid services provided by the territorial Catholic Church structures) highlights this increase well, remarking a 13% growth in food aid interventions. This speech presents reflections on the theme of malnutrition based on studies conducted in Tuscany, aiming to produce a new cognitive framework that would give voice to the users of Caritas food support services and focusing on three areas of analysis: the main characteristics of food poverty; the impact of the pandemic emergency and the consequences on families with children; the role of the food support services system of Caritas.

BERTUCELLI, FRANCESCO* (University of Pisa, Italy)

Relational Infrastructures: Turning Habitus from (dis)Positions in Symbolic Space to Transcalar Sociocognitive Prostheses

According to Bourdieu-Wacquant's generative structuralism, physical spaces – in the form of built environment, dwellings, workshops and street furniture – as they are divided and hierarchized as a set of oppositional sites, can be envisioned as symbolizing established positions in social space. For, through the inertia of urban infrastructures, a naturalization of social divisions occurs, which gives material strength to historically determined and arbitrary power relations. These are distributed according to a social topology empirically observable and organizable in fields, intended as schematic images displayed by sociological inquiry. That is, as fields represent the objectivated form, of autonomous – but relational – positioning of agents, the "ontological complicity" of practical agency – catalyzed through the incorporation of social disposition in form of habitus/habitat – with the institutionalized set of positions thus hinders a mechanical causation between a "context" and a "consciousness". Nonetheless, despite the refusal of any essentialism, with this framework dualisms are not completely overcome, since uncertainty remains between autonomy and heteronomy of agents, which is ultimately traced back as a content belonging to a cultural global container. Which is intelligible in symbolic terms only. If, following Latour-Callon perspective, instead to deduce the habitus in this way it was considered as something that must be explained, a risky assembly, adherent and made of material components – the same infrastructures, which are not considered as an inert manifestation of social relations, but literally the mediators which formats these latter – its formation would be subtracted from the determinism of "contextualization", and flattened on its "associated milieu" in a trans-scalar vision. In this way, the formation of habitus as framed subjectivities would not be subjected to all-encompassing abstract social fields, but it would be negotiated with non-human materiality and related agency as sociocognitive prostheses.

BERTUCCELLI, FRANCESCO* (University of Pisa, Italy)

The Smooth and the Striated Sea: Shipyards Industry Affecting Marine Environment

This paper draws on the distinction between smooth and striated spaces by Deleuze and Guattari to illustrate how ship manufacturing affects marine environment and viceversa. Indeed, as the sea is mostly unexplored and relatively unreachable by human activity, it is taken as an example of “plan of immanence” by the two philosophers, offering the image of an unorganized and un-appropriated territory – reflecting its smoothness –, and thus it stands as a reserve for potential becoming of the world, surrounding in a tangent manner modern society achievements. However, on the other hand, conversely the sea has also been progressively enveloped and manipulated – and thus striated – by development of navigation and expansion of shipbuilding as the “associated milieu” of ships and their routes. Accordingly, it can be said that the design and the affordances of vessels, along with the state of seamanship, could be read as a way to fold, dominate and exploit the sea. Including the transfiguration of coastal areas by harbour ports construction, without which the ships would not exist. Adopting the STS “transcalar” framework to the study of the “heterogeneous engineering” of ship construction then, it could be observed how humans, material components, marine flora and fauna, waves, currents and seabed are associated together to form a durable ensemble, which lastly manifest itself in the adapt maritime mean of transport. And how evolutions in these “naturalcultural” assemblages “enroll” and “translate” such individual components in new networked arrangements, turning virtual potentialities of smooth sea into actual elements of striated marine environment. In particular, the example of luxury yachts is introduced, as they are being built in form of sophisticated customized prototypes, enriched with fancy features and devices which significantly influence navigation, and by this they represent essential propellers for technological advancement in broader “blue economy”.

Manufacturing Consent, Gaza and the Anthropocene

In a world that where numerous countries perpetrating genocide have signed the Gevena convention projecting to the world, they value human life, how can said countries get away with such crimes against humanity? Through an analysis of manufacturing consent this paper hopes bring to the forefront its contribution to the ongoing genocide in Gaza and wider Palestine. More specifically, this paper is interested in the way social media has interrupted the framework of western propaganda and manufacturing consent, garnering widespread support across the western world. Support which could perhaps be considered the largest support for Palestine the western world has seen since the Nakba 76 years ago.

Whilst we bear witness to genocide in real time, the American propaganda machine continues to manufacture the consent of the slaughter of Palestinian people in the name of human rights, self-defence and assumed Israeli sovereignty. However, simultaneously Palestinian journalists have been producing a counter narrative through social media. A narrative that has evoked powerful solidarity for the Palestinian cause.

Given this, this paper hopes to stand in solidarity with the people of Palestine, by highlighting the way in the which the American propaganda machine has been interrupted by Palestinian voices. Ultimately, highlighting how the wider world has come to know about the injustice perpetuated by Israel, which in turn has helped affect a more urgent want for justice for Palestinian people by the wider world. Inspiring love and solidarity for Palestinian people. In the Anthropocene, where information flows rapidly and narratives collide, the power of local movements and social media can disrupt entrenched systems of propaganda, fostering a greater global awareness and solidarity for the rights and dignity of the Palestinian people, inshallah resulting in a free Palestine in our lifetime.

Regional Resilience and Innovation in Post-Socialist Central and Eastern Europe: Opportunity for Clinical Sociology?

Regional resilience has emerged as a critical study area, particularly in post-socialist Central and Eastern Europe, where societal, political, and economic transformations have shaped regional responses to external pressures. This paper explores the role of sociological research in understanding how these regions adapt to disruptive changes. Using a case study of High-Performance Computing (HPC) technology diffusion, this research examines the role of institutions, networks, and cognitive frames in shaping regional resilience across

14 regions of the Danube area. Framing this within Cultural Political Economy (CPE), we investigate how different social forces—institutions, networks, and cognitive frames—interact to produce regional imaginaries that guide adaptation strategies. Our findings suggest that resilience mechanisms, including persistence, transition, and transformation, are deeply influenced by these social forces, which operate in varied ways in core and peripheral regions. Furthermore, we argue that a uniform approach to building resilience, such as technology transfer, can lead to divergence in outcomes, particularly as new technologies like Artificial Intelligence (AI) and Quantum Computing (QC) are widely used.

Our research highlights the impact of sociological analysis in shaping national development strategies and examines how intellectual forces redefine regional imaginaries to influence resilience. By integrating CPE, we provide a nuanced understanding of how regions in post-socialist contexts navigate complex societal transformations, offering insights into how sociology informs and shapes emergent discourses around resilience, technology, and development.

A Post Anthropocentric Imaginary and Policies for Young People.

We live in the Anthropocene, a geological era marked by the catastrophic impact of humans on the planet. We have already transgressed seven of the nine planetary boundaries needed for a healthy planet. Governments across the globe are failing to exercise a duty of care to children and young people by not urgently reducing greenhouse gas emissions thereby putting at risk the planetary systems on which all life, relies. Government policies are also contributing to failing schooling systems, rising education debt, mounting mental health issues, broken child protection and juvenile justice systems, increasing employment precarity and income and housing insecurity. Significant institutional changes are needed if anything like a just and viable future for young people is to be possible.

In this paper we consider how a post-anthropocentric socio-political imaginary might inform new youth policies. Such an approach, we argue would help address current gaps between governments' claims to promote young people's well-being and the reality of what many state policies are actually doing. In this paper, we also recognise a shift is underway in how new materialist philosophers and sociologists are understanding the world (Delanda 2011, Latour 2013, Fox and Aldred 2021, Bessant and Watts 2024).

Our aim is to consider the implications of this shift for state policy and young people. In doing so we also use findings from an Australia Research Council funded project exploring student climate action and democratic transformation. Drawing on young people's actions and insights and post-anthropocentric principles, we ask what would a holistic approach to government policy look like if it were designed to secure opportunities for young people to live flourishing lives. Our analysis is relevant for considering not only how trust in democracy might be rebuilt, but how all life might survive in a time of climate crisis.

 College London, UK, United Kingdom)
 WATTS, ROB (Global Urban and Social studies, RMIT
 University, Australia)

*Action for Intergenerational Climate Justice in the
 Anthropocene: Assemblies, Carbon Budgets and Legal Options*

One striking feature of young people's contemporary climate politics is how it highlights the question of intergenerational justice that encompasses the interests of young people alive today and those yet to be born. Acknowledging a tradition including Fanon, Friere, Ranciere and Touraine which point to the inter-connections between theory, research practices and aspirations for social change, raises questions for people researching climate politics and young people about what role they might play in promoting climate justice.

In this paper we identify and assess some promising policy and legal strategies for social change that promote intergenerational climate justice. We begin by exploring *what* intergenerational justice looks like, and *why* intergenerational justice matters in the context of climate change if we are to come close to realising justice in the Anthropocene. We then provide an account of how some scholars have defined the subjects of intergenerational climate justice, and we attempt to develop these accounts. In doing this we also draw on theories of intersectionality and recognition.

Finally, we identify and assess the policy instruments and legal strategies that can be, and in some cases are already being used to advance intergenerational climate justice. This involves focusing on three interventions: multigenerational and generation-specific climate assemblies, models of carbon budget taxation, and climate litigation based on the principle that governments have a 'duty of care' to children and young people.

We argue that together, these policy and legal interventions can help specify and realise the promise of intergenerational climate justice.

*Between a Rock and a Hard Place: The Complexities Around
 Formalising Artisanal and Small-Scale Mining (ASM)*

Over 225 million people are directly and indirectly involved in the artisanal and small-scale mining (ASM) sector's labour value chain across Latin America, South America, Africa, and Asia (World Bank 2024). According to the World Bank, the total workforce in the ASM sector was estimated at 44 million in 2020 (World Bank 2020). This number of workers exceeds the total number of employees in the formal mining industry, which amounts to 7 million (ILO 2019).

Most often, ASM activities that occur without a mining permit are considered illegal and criminalised. Additionally, ASM is associated with several social ills, such as issues related to miners' health and safety, environmental degradation, child labour, and the occurrence of violence and conflict within the sector. For this reason, formalising the sector is often proposed as a solution to these issues. However, the practical implementation of formalisation policies frequently encounters significant obstacles, leading to recurrent failures of formalisation.

The Department of Mineral Resources and Energy (DMRE) in South Africa recently released the draft Artisanal and Small-Scale Mining policy for implementation in March 2022. The announcement of this policy is the first step in formalising the artisanal mining sector in South Africa. Yet, formalisation strategies often fail in sub-Saharan Africa and other parts of Africa.

This presentation, which draws on a chapter in my book, delves into the concept of formalisation within the ASM sector, providing an overview and analysis of South Africa's government-led formalisation process. The presentation also examines the formalisation efforts in Ghana and the Democratic Republic of the Congo (DRC) to draw valuable lessons. Finally, the presentation puts forward the implications of formalisation for women in artisanal mining, a topic often overlooked in broader discussions on formalisation.

*Health Community Lab: Redefining Public Health Innovation in
 the Post-COVID Era*

The Health Community Lab (HCL) project introduces an innovative model for public health policy and intervention design. Funded by Italy's National Recovery and Resilience Plan (PNRR) and part of the broader Tuscany Health Ecosystem (THE) initiative, this European-backed project aims to drive technological and institutional change in the post-COVID-19 era. HCL is pivotal in regional renewal efforts, with a core focus on enhancing citizen engagement in shaping healthcare policies and services.

Drawing on the Living Lab methodology, HCL promotes co-creation among stakeholders to address local health challenges. This collaborative approach has led to the development of prototypes that are tested experimentally, with the potential for system-wide scaling. Adapted to the Tuscan healthcare context, the project facilitates targeted micro-interventions that require coordination among institutional actors, civil society, private actors and researchers.

HCL has proven particularly effective in improving public health communication and prevention strategies, such as vaccination campaigns and screening programs, as well as enhancing access to patient care and primary healthcare services. The method fosters stakeholder consensus, even as participants negotiate their diverse needs and interests.

By integrating diverse perspectives and fostering collaboration, HCL aims to build a more sustainable and responsive healthcare system. This participatory model represents a significant shift in public health, addressing evolving societal needs and improving healthcare delivery through community-driven innovation. HCL's work serves as a blueprint for transforming regional healthcare strategies in Tuscany and offers a model for similar initiatives across Europe.

 PEDACI, MARCELLO* (Università di Teramo, Italy)

*Representation of "Marginalised" Migrant Workers: Unions,
 Social Movements and Other Actors*

The paper analyses the dynamics of representation within "niches" of "marginalised" workers, primarily migrants, who often face poor working conditions, precarious employment, or even overt exploitation. The objective is to reconstruct the processes behind representation by examining the role, strategies, resources and results of traditional unions and emerging actors, including grassroots unions, the constraints within which they operate and the attempts to overcome them.

From one hand, these new actors operate as "political entrepreneurs" and actively collaborate with social movements to advocate for decent work, social justice, and democracy. From the other hand, representing these new social groups – often invisible yet highly cohesive – demands significant organizational investment. Traditional unions, therefore, often concentrate on the most prominent groups, inadvertently fostering marginalization, as well as creating opportunities for grassroots representation.

New actors have thus emerged as political entrepreneurs themselves, frequently adopting confrontational strategies that challenge and reshape traditional representation practices. Recognizing the significance of local contexts, we also consider the roles of other influential actors, including local and regional governments, political parties, trade associations, and professionals.

The research is based on a case study on migrant workers in the Prato textile supply chain, focusing on their recent mobilizations and protests, which were organized by a grassroots union. This case is particularly relevant as Prato represents an archetype of an industrial district – the largest in Europe – characterized by a pro-labour governance environment, institutionalized industrial relations, and a cooperative, pragmatic approach to addressing labour market tensions.

Simultaneously, the district has undergone substantial transformation with the rise of new forms of ethnic entrepreneurship, particularly Chinese businesses. These entrepreneurs, initially positioned themselves in distinct segments of the supply chain, later expanding into traditional textile production, thus extending the district's supply chain and embedding it within a broader global value chain.

ECKSTEIN, JOHANNES (Berlin School of Economics and Law (HWR Berlin), Germany)

Standards Versus Needs? Professional Conflicts in the Overburdened Field of ECEC

Within the last two decades, the field of Early Education and Care (ECEC) has not only been largely expanded in many Western European societies in staff and childcare places due to rising needs of families, but also has to meet an enlarged agenda of divergent (and partly incompatible) tasks to fulfill beyond mere care work: early education to prepare for school; social inclusion of children with special needs; co-parenting; networking with local institutions, among other tasks. Concomitantly, the service providers are struggling with a permanent lack of resources. Both trends have severe implications for the related professions (and „semi-professions“), with repercussions also for the quality of services. Drawing on both an extensive scoping review and own in-depth case studies in four different regions of Germany, the paper discusses such implications and the coping strategies of organizations and staff. Our findings suggest an intensified conflict between two opposing institutional logics and knowledge-bases in ECEC: On the one hand, the dominant public discourse, following the logic of human capital production, calls for a stronger standardized early education in kindergartens to better prepare for school. On the other hand, actors in the field strive hard to defend the professional logic of a needs-based approach in ECEC. This conflict infiltrates daily practices in the sector, producing severe tensions that raise uncertainty about how to act „properly“ – thus potentially undermining professional ethos and motivation, with negative implications for the quality of services. The strategies of staff to deal with these strains are diverse, between a daily muddling through and (rather hidden) resistance practices. Management seems to apply hybrid strategies between empathetic communication and disciplining. Especially in socioeconomically disadvantaged regions, the professional logic risks to be overturned by the economic logic. This, however, may further undermine the motivation of staff working under particularly difficult conditions.

BHAMBRA, GURMINDER* (University of Sussex, United Kingdom)

Colonial Histories, Famine, and Lessons for Addressing Climate Change

Sociology has increasingly acknowledged the continuing legacies of colonialism and empire within contemporary societies and examined the significance of colonialism to the structure of the social sciences. In this paper, I develop such understandings in relation to thinking about how the histories of famine within colonial empires can shed light on the difficulties of addressing issues related to climate change in the present. Famine is of fundamental importance precisely because it is what climate change threatens for a significant proportion of the world's population. The connection I want to draw out is how understanding famines in the past will help us to understand those to come and, in particular, the obstacles to addressing the challenges of impending famines that derive from the legacies of colonialism, including of Western democracy itself. The standard view is that famines occur because of climatic conditions and have particular consequences due to endemic poverty understood in endogenous terms. I draw attention to the serious limitations of such a view through a focus on the colonial political economy of the British empire in India and of how its democracy at home was implicated in the production of famine deaths within empire. While Amartya Sen has argued that democracy is central of the solution to famine, I suggest something different. Colonial political economy structures the mal-distribution of resources, including the consequences of climate change, rendering (Western) democracy in these contexts a problem. Specifically, it remains an obstacle to forms of reparation that would be necessary to effectively address the increasingly urgent challenges posed by climate change. A reparative historical sociology, cognisant of colonial histories, would be part of the process of reconstructing such understandings and, in the process, could facilitate the development of a more just world.

RC35-JS-83.2

BHAMBRA, GURMINDER* (University of Sussex, United Kingdom)

Critical Theory, Implicit Nationalism, and the Political Economy of Colonialism

Frankfurt School critical theory is grounded in a theory of capitalist modernity which, in common with wider sociological approaches, elides histories of colonialism. This results in a misdiagnosis of current problems of inequality and inadequate solutions for their address. Many critical theorists, for example, focus primarily on issues of redistribution associated with a capital-labour relation organised nationally and now seen to be threatened by globalisation and migration. Such an understanding fails to account for how the decommmodification of labour through the development of national welfare arrangements in the West – an explicit issue for critical theory from Habermas's *Legitimation Crisis* onward – has been bound to wider colonial histories and, specifically, colonial patrimonies. A proper address of these issues requires a more expansive approach to distributive justice conducted in a reparative frame that recognises the ways in which the legacies of our shared, but asymmetrically experienced, colonial pasts continue to configure the present and its possibilities. It involves making colonial histories central to understandings of capitalist modernity and to the normative address of inequalities that otherwise risk being legitimated by the standard accounts of critical theory. In this paper, I take issue with the central conceptualisation of modern society as *capitalist* at its core, and the way in which capitalism is understood *separately from colonialism*. I further question the implicit nationalism of critical theory and argue that what is missing from it is a political economy of colonialism.

BHARGAVA, RASHI* (North-Eastern Hill University, India)

Celebrating or Consuming: Social and Ecological Implications of Public Cultural Festivals in North-East India

North-East India, a region comprising federal states of Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland, Sikkim and Tripura, has a rich tapestry of visual, material and performative cultures along with abundant biodiversity. The region is often positioned as a 'periphery' because of its distinct topographical, geographical, ecological, social, political and economic situation. Often seen as lacking in 'development,' North-East India has been the recipient of various development policies of the central and state governments; Look-East Policy being a case in point. With limited opportunities for the consolidation of manufacturing and service industries, the last decade and a half saw numerous attempts to make the region a haven of cultural (read: indigenous) tourism. Thus, one can see the emergence of many public cultural festivals mainly organised between September and December every year attracting performers, participants and tourists from across the world. Although the festivals are portrayed as a window into the rich cultural heritage of the region, they have had a huge social and ecological impact including increased social inequalities and irreversible biodiversity loss.

Set in this context, this paper interrogates the numerous social and ecological issues and challenges resulting from increased tourist activities in the region by focusing on three popular festivals - *Hornbill Festival* (Nagaland), *Ziro Festival* (Arunachal Pradesh) and *Cherry Blossom Festival* (Meghalaya). The findings reveal the complex re-negotiation of the broader terrains of identity, culture, commodification, consumption, development and ecology. They further highlight the need for sustainable tourism practices underscoring the importance of integrating local cultural knowledge and practices with conservation efforts by including community stakeholders to preserve the ecology and biodiversity of the region. Through this, the paper intends to add to the existing body of knowledge on the contentious relationship between development and ecology especially in the context of global south.

BHATIA, SHRIYA* (Ashank Desai Centre for Policy Studies, Indian Institute of Technology, Bombay, India)

Global North Policy Paradigms Delegitimizes Circular Practices of the Global South: Case of End of Life Vehicles

Emerging waste management solutions through circular economy policies, digital and processing technologies, and knowledge products transferred from the global north to the global south create new contestations over access to waste.

Studying waste management and circular economy policies in India reveal the engagement of international actors in the policy process. This is facilitated through joint declaration between governments, memorandum

of understandings and consortiums between international multilateral development agencies and local agencies. Technical assistance is provided through funded research, policy reports, manuals and tools. They advocate for a shift from public waste management paradigm to private sector driven circular economy.

Based on extensive field based research since last three years on the End of Life Vehicle management process in Mumbai this paper explores the policy process adopted for the Vehicle Scrappage Policy. I critic the pre and post policy processes that create new institutional models jeopardizing existing informal sector practices. The complex regulatory requirements, administrative protocols, fiscal instruments and monitoring tools, create barriers for the informal sector. The exploratory approach identifies the policy bias supporting material recovery and recycling rather than practices of repair, reuse, remanufacturing, refurbishment that contribute towards higher circularity goals.

The paper postulates that Global North policy paradigms are increasingly influencing the policy processes in the Global South. It ignores the existing contextual and complex dynamics, and socio-political relationships of actors with the waste valorization process. Doing so, is threatening to delegitimize ingenious circular networks and practices. The paper proposes that the existing circular networks and practices are valid institutions that are codified in space, have a collective manifestation of communication power, that resolve environmental problems by providing an integrated, stable, cooperative model through spontaneous patterns of self-coordination, that economizes transaction costs, thus contributing to not only a circular economy but building a 'circular society.'

BHATTACHARJEE, NANDANA* (Just Transition Research Centre, Indian Institute of Technology Kanpur, India)
ACHARYYA, MAYURAKSHI* (Indian Institute of Technology Kanpur, India)

Gender and Public Sphere: Participation of Women Heads of Local Government As Decision-Makers in the Coal Districts of India

Historically, decision-making in Indian society was regulated by men till the 73rd Amendment Act of the Indian constitution was legislated. This Act reserves seats for women in the local governments. The past three decades have witnessed the impact of this constitutional provision varying widely across regions. In this research, we explored a few coal regions where the situation gets amplified because of the national net-zero agenda of the government of India.

Against this backdrop, the paper investigates the participatory parity of women heads of local governments in decision-making processes in environmental, economic and social sectors. To analyse the sociological implications, the paper uses the Habermasian framework of the public sphere to unravel the executive authority among the women-elected heads of the local governments. In addition, it engages with the discourse of parity of participation by Nancy Fraser.

The result shows that authority becomes the point of contestation in conjunction with gender and the public sphere. Aligned with Fraser's model which recognises how historically institutional mechanisms have systematically denied resources to excluded groups leading to violation of justice, local governments in the coal districts of India become sites which devalue the authority of women heads.

Drawing from interviews of women heads of local governments this paper foregrounds how historically sanctioned authority of men in the public sphere acts as a hindrance at two levels, one is the lack of real participation of women in the decision-making processes of the local governments and the second, the institutional structures holding on to age-old exclusionary practices even after adoption of inclusive regulatory frameworks.

BHATTACHARJEE, SOHINI* (Jawaharlal Nehru University, India)

Is It Really Organic?: The Organic Claim and Trust Among Middle-Class Urban Organic Food Consumers of the Delhi National Capital Region

The contemporary food system with its productivist paradigm often compromises quality for quantity. Consequently, consumer doubt and scepticism in the food system have raised the perception of risk associated with food consumption. In the face of growing concerns, food categories

making quality claims, such as organic food, have emerged. In value-based food chains, like the organic food system, trust in the credence claim of the 'quality' product can be critical in affecting consumption. This paper explores how trust is navigated in the organic credence claim from the perspective of middle-class urban residents of the major urban centres of the Delhi National Capital Region (Delhi NCR), comprising the National Capital Territory of Delhi (NCT of Delhi) and major urban areas of the Central National Capital Region (CNCR). Since the turn of the millennium, a niche market for organic food products has emerged within major urban cosmopolitan centres of India such as the aforementioned region. With the introduction of organic food regulations in 2017, the domestic organic food sector has been brought under the purview of an organic standards-backed certification system to regulate the sector. Oriented towards domestic consumers, the organic logo was meant to generate consumer awareness, identification and trust in the organic claim. Against the backdrop of this recent development, the paper analyses how trust in organic food is navigated by middle-class urban consumers of the Global South and if and how it affects their decision-making process regarding purchasing practices within value-based short food supply chains. Consumer trust in organic food is explored by engaging with respondents' trust in organic farmers, retail intermediaries and organic certification. Drawing on the concepts of interpersonal and institutional trust, the paper presents an argument for the co-existence of both in the context of the organic food economy.

BHATTACHARJEE, SOHINI* (Jawaharlal Nehru University, India)

"Farmers Are Scientists": How Experimentation and Knowledge Transmission Is Shaping the Organic Farming Landscape in the Delhi National Capital Region

Modern productivist agriculture and neoliberal policies have reshaped the agricultural landscape in the Indian subcontinent. The conventional farmer is dependent on a market-based package of practices, an institutional ecosystem where 'expert' authority is held in high esteem and places precedence on quantity over quality parameters. A largely one-size-fits-all approach has emerged within conventional agriculture that is being challenged by alternative agricultural systems such as organic farming. These sustainable agriculture systems are knowledge-intensive and require on-farm experimentations to tailor practices to the requirements of the specific farm in the absence of 'quick fixes'. This paper draws on the experiences of organic food producers in the Delhi National Capital Region (Delhi NCR) to understand the processes of learning, unlearning and re-learning they engage in within a knowledge-intensive farm management system. The farmers in this study consciously decided to convert to organic farming from conventional agriculture. They actively experiment with alternative practices, methods, and even crop varieties to observe what works for their farm. However, it is not simply an individual endeavour. Organic farmers engage with networks that comprise a host of other actors (including but not limited to peer groups, the scientific community, and organisations) within which knowledge regarding organic farming is shared, shaped and transmitted. Non-human actors and material aspects, too, play a critical role in the process of experimentation and knowledge creation for organic farmers. Together, these significantly shape organic farming practices. However, the ability to conduct on-farm experimentation is limited by considerations, such as livelihood issues, access to knowledge networks and family structures that will be explored in terms of who can and cannot participate in organic farming. Ultimately, the paper attempts to highlight that organic farmers are scientists in their own right whose agricultural practices are shaped by experimentation and learning through participation in knowledge networks.

BHATTACHARYA, ANWESHA* (Tata Institute of Social Sciences, Mumbai, India)

Exploring Love through Loss: Illustrating the 'Lived Experiences' of Hijras in Retrospective

The hijras are an indigenous group of sexually marginalized transwomen who are engaged in traditional occupations. My paper will be focusing on love, love relationships, emotional instability, betrayal, partly crossing paths with mental health. I want to bring to light the pain caused during and after heartbreak and rejection not once but several times by lovers. This incidents of being physically or mentally mistreated in relationships, exploited, violated, and deceived in love happens because the hijras belong to sexually marginalised section. Men take advantage of them by manipulating them, enjoy benefits through the pretence of love, have sidekicks, and many more. The commitment is a distant dream because marriage with a third gender is not legal in India and it is not fullfledgedly approved by society. The incapability to bear children pushes hijras to surrender and sacrifice to humiliation and

defeat in the hands of the lover. Research does not talk about the emotion of these transwomen who yearn for love all through their lives. Simmel had argued that love is not motivation, it is different, it cannot be explained psychologically. Therefore in my paper, through the experiences of my subjects (hijras), I will attempt to reflect on how the hijras get marginalized in relationships by dint of them inhabiting a transsexual body. In addition to this, while exploring the experiences of the hijras I will engage theoretically with the concept/ experience/emotion of love. Secondly, I will also try to explore the nature and complexity of these non-heterosexual relationships. I will be writing this paper in the context of the hijras in West Bengal, India.

RC09-JS-164.2

BHATTACHARYA, ANWESHA* (Tata Institute of Social Sciences, Mumbai, India)

The Dominance of the 'Superstructure': Delineating the Socially and Culturally Embedded Occupations of the Hijra Community

The kinship system of the hijra community has established strong network through which the traditional community of transwomen has been able to maintain its control in almost every part of India with prudence and firmness. The kinship system of the hijra community represents a social, hierarchical structure with relationships based on inequality. The interesting fact is that the power dynamics of the community centres on the kinship rules and regulations. The core values are premised on the asymmetric relationships and interactions of the community, more so the occupation rather the economic ideals of the community are governed by the kinship order. The structure of the kinship hierarchy dictates and dominates the relationships and interactions not only within a particular hijra house but all throughout the community. Nonetheless, the kinship structure represents the social system of the hijra community which is interlaced with the normative order of the community and together they govern the economic system of the community. The occupations of the hijra community are traditional and are founded on beliefs and practices in Hinduism. Therefore, I argue in this paper that contrary to Marx's proposition suggesting the concept of 'base' (economy) dominating the superstructure which comprises the cultural, societal ideals etc.; the hijra community contradicts this Marxian idea and proves how the economy is embedded in the social and the cultural. In my paper I further argue that in the hijra community it is not always economy that supersedes, religious or the societal order and ideas, but on the flip side it is culture and social structure that dominates economic arrangement. Moreover, this kinship order is intertwined with an autonomous cultural system which is intrinsic to the hijra community. I discuss the phenomenon in the context of hijras in West Bengal.

BHATTACHARYA, IPSITA* (Department of English, India)

Women's Participation in Tourism Consumption and Its Barriers in the Context of North East India

Globally, women face unequal access to tourism consumption compared to men, largely due to the uneven distribution of household responsibilities such as childcare and homemaking, which limits their leisure time, especially in developing countries. In many societies, cultural norms further restrict women's mobility and leisure choices. In the context of North East India, women encounter multiple barriers to tourism consumption, including safety concerns, financial limitations, and societal constraints. This paper highlights women's participation in tourism consumption and its barriers with reference to the North East India.

Women tend to prefer family-friendly or culturally familiar destinations, often avoiding places they perceive as unsafe or unfamiliar. This is particularly relevant in North East India, where issues of security, political unrest, difficult terrains, and inadequate infrastructure can deter women from traveling. While matrilineal societies, such as those in Meghalaya, exist in the region, patriarchal norms still prevail, limiting women's freedom in public life, including tourism.

A significant barrier is the perception of safety for both solo women travelers and groups, compounded by the lack of reliable transportation and political unrest in certain regions. Cultural differences and unfamiliarity with the region's social customs can also make women feel uncomfortable discouraging them from indulging in travel and tourism.

Despite these challenges, women in North East India are increasingly participating in the tourism sector. They are becoming key providers of tourism-related services such as handicraft production, guiding, managing homestays, and running small-scale businesses. Women's involvement in community-based tourism, particularly in rural areas, can help break down barriers and foster inclusive tourism, ultimately empowering women economically and socially. Equal social justice between men and women of the region is required to encourage more women for participating in tourism activities.

BHATTACHARYA, SATADRU* (University of Connecticut, USA)

Seeds of Change: South Asian Ecology and Vandana Shiva's Legacy

As a variety of ecological/environmental human crises engulf the world, discussions of climate crises, sustainability, food and water justice are moving towards the center of social science theorization in the Global North. The growing recognition of indigenous knowledge traditions are also contributing to some of the shifts in thinking about environment and sustainability (see Abhayawickrama, Mayes and Villafana 2024). However, as a new stream of publications seek to capture "new" thinking, the long existing critiques and insights in other parts of the world are only sporadically included. My paper tries to present the approach of a globally known activist scholar from India, Vandana Shiva whose work offers a holistic approach to thinking about environment beyond its colonial structures. Her efforts to decolonize South Asian agriculture and agriculture in the Global South by challenging Western Hegemony in knowledge systems makes her one of the biggest proponents of decolonization in South Asia. However, her corpus of writings and speeches including on neoliberal globalization, environment, facets of earth democracy, colonial control of knowledge, indigenous knowledge and practices remains mostly at the margins of the canon in the Global North.

In the academic scholarship of the Global South, particularly South Asia, the name Shiva is also synonymous with ecofeminism, decolonization, biodiversity, self-reliance. Additionally, her life is an embodiment of her decolonization perspective as she challenges the activism and scholarship dichotomy. This is because her activism (though much talked about) is deeply rooted in her academic scholarship, and her activism in turn nurtures and gives direction to her academic scholarship (in Western academia, you can either be a scholar or an activist but not both). Hence, my paper tries to study decolonization of knowledge systems in South Asia, particularly in the arena of environmental conservation through Shiva's works using her theorisation and case studies of her activism.

From Increased Workloads to Health Risks Amongst Women and the Elderly: A Case Study of the Impact of Ecological Breakdown through an Intersectional Lens in Baltistan, Pakistan

This study traces the ways in which climate breakdown affects women and elderly men in a village, Barah Valley in Pakistan administered Gilgit-Baltistan. The essay draws on intersectional perspectives, arguing that women and elderly men are disproportionately affected as they continue to engage in subsistence farming since in many sections of Pakistan it is the women who do the bulk of agricultural activities while younger men work in sectors other than agriculture in towns and urban areas of Pakistan. More specifically, the paper illustrates the ways in which water scarcity due to disrupted weather patterns and shrinking glaciers has led to food insecurities amongst the poor, increased women's work responsibilities and affected the health of the elderly. The study additionally illustrates the women's desires to improve their quality of life in the farming villages as well as their attitude towards interventions of international NGOs. The paper shows that while women desire improved infrastructure, elderly men reminisce about days of organic farming methods.

Much scholarship on climate crisis within Gilgit-Baltistan have examined its' socio-economic impact and the ways in which the people adapt to their local realities. However, there have been less studies which focus on how the most vulnerable such as the poor, elderly, and women who have less power to be mobile and engage in decision making processes in the village experience climate breakdown. Data is based on focus group interviews in a village, a semi-structured interview with the directing manager of Agha Khan Rural Support Programme, informal conversations with farmers, people in the hospitality sector in Skardu, Shigar and Ghanche district of Gilgit-Baltistan, participant observation, and WhatsApp conversations.

The Impact of Exclusionary Legislation on the Housing Experiences of Blacks and People of Colour in Berlin from Ukraine

Drawing on 26 interviews and ethnography among third-country nationals from Ukraine in Berlin, this study demonstrates how exclusionary social policies in Germany have impacted on the everyday realities of black and people of colour, that is, third-country nationals fleeing the war in Ukraine. While there has been much discussion of exclusionary social policies, border regimes and discriminatory actions in scholarship regarding refugees and asylum-seekers from working-class backgrounds, there has been only limited discussion of the impact of discriminatory policies on skilled and middle-class refugees and migrants who have been displaced and who have come to settle in metropolitan regions in the Global North. This study examines that the experiences of formally educated third-country nationals who were denied temporary protection and encountered several challenges and obstacles regarding housing and accommodation in Berlin. In this study, I show that, although third-country nationals from the Global South who entered Europe from Ukraine were not illegalized or made deportable, but because they were denied temporary protection, they ended up in precarious situations in Berlin, as they were barred from finding housing in the formal sector, and several of them were rendered homeless. Consequently, as this study will also show, several blacks and people of colour from Ukraine ended up in a similarly precarious position as deportable and illegalized refugees and thus needed to network within civil society in order to find accommodation that racialized refugees in Berlin had been using for almost a decade. Data is drawn in two phases. I first interviewed 14 refugees during April and May 2022 at the Tubman network. A year later, in May 2023, I contacted some of the refugees and interviewed them in order to gain further insights into their situations. Accordingly, I interviewed twelve more individuals, six of whom were women, the remaining six men.

Cast(ed) Emotional Transactions and Self-Harm: Unpacking Caste-Embedded Narratives in Indian Higher Education

This study investigates the intricate relationship between caste-based discrimination and emotional distress, particularly focusing on self-harm among marginalised students, especially Dalits, within Indian higher education. It delves into the emotional consequences of systemic inequality, highlighting how feelings of isolation, shame, and internalised stigma shape the mental health of these students. Through the lens of caste-embedded academic narratives, the study examines how caste-based emotional transactions exacerbate psychological vulnerability.

Employing a mixed-methods approach, the research draws from a survey of 250 individuals from marginalised caste groups, alongside 20 detailed case studies and 10 focus group discussions conducted across five Indian universities. The aim is to explore the emotional and psychological harm inflicted by caste-based social hierarchies and exclusionary practices in academic settings, with particular emphasis on Dalit students' experiences. The study reveals how systemic inequalities manifest through caste narratives, social exclusion, micro-aggressions, and biased institutional practices, which collectively undermine students' self-worth and sense of belonging.

Dalit students frequently encounter stereotyping and isolation, leading to profound emotional distress characterised by feelings of shame, inferiority, and helplessness. In some cases, these psychological burdens trigger self-harming behaviours as a coping mechanism against the overwhelming weight of caste-based discrimination. The findings call for urgent mental health interventions that address both structural inequalities and the emotional toll of caste discrimination, contributing to broader discussions on social justice, mental health, and the well-being of marginalised students in higher education.

Mental Health and Well-Being in Higher Education: Aspirations and Experiences of Racial Minority Students in UK

This study investigates the effects of racial and ethnic experiences on mental health and well-being in higher education through a mixed-methods approach. Using a quantitative survey of 350 participants and 30 in-depth qualitative case studies, the research examines how discrimination, cultural identity, and socio-economic inequalities shape mental health. It also addresses how these factors influence access to education, participation, academic performance, and the overall well-being of racial minority students in higher education. The quantitative analysis reveals a strong correlation between racial and ethnic discrimination and increased levels of anxiety, depression, and stress. In contrast, a strong cultural identity appeared to mitigate these effects, fostering resilience. The qualitative case studies offer deeper insights into personal experiences of micro-aggressions, exclusion, and coping mechanisms across various racial and ethnic groups. Thematic analysis highlights the emotional distress caused by structural inequalities, while also emphasising the role of cultural support systems in promoting mental well-being. By integrating statistical data with qualitative accounts, this study provides a comprehensive understanding of how racial and ethnic experiences influence mental health outcomes and educational experiences. The findings underline the need for culturally sensitive mental health interventions and contribute to policy discussions aimed at improving mental health services for racially and ethnically diverse student populations in higher education.

The Efficacy of South Africa's National School Nutrition Program in the King Cetshwayo District, Kwazulu-Natal.

KwaZulu-Natal has recorded the highest number of malnourished children in South Africa. This qualitative study seeks to determine the prevalence of malnutrition, child hunger and child neglect within the King Cetshwayo District in KwaZulu-Natal. To combat this national and provincial challenge, South Africa's National School Nutrition Program (NSNP), which is administered by the Department of Basic Education, targets nutrition in children by providing meals for children at impoverished schools. The aim of the National School Nutrition Program is to provide nutritious meals for school-going children, but media reports indicate that this program has been ineffective in achieving this goal. Therefore, this qualitative study investigates the efficiency and effectiveness of these programs at 3 selected schools in the King Cetshwayo District in KwaZulu-Natal. Data has been retrieved from fifteen teachers employed within this school, 20 parents that live within this area and 50 children over the course of 2024. Particular focus is paid to quality-of-service delivery by the selected meal suppliers and the nutritional content, quality and freshness of the meals prepared for the children. The study aims to accurately identify the ills in the implementation of this program, so that there can be appropriate corrective measures applied. The relevance of this research collectively contributes towards the curbing of the prevalence of malnourished children in KwaZulu-Natal, South Africa and aims to identify and understand the various ways in which children experience neglect and malnutrition.

Academics of Colour Accessing the Professoriate in Elite Universities in the UK and USA

Academics of colour in the US and UK are less likely than their white peers to be professors (Advance HE, 2024; NCES, 2024). There is little research that has explored their experiences in accessing the professoriate, particularly in elite universities (Nowogrodzki, 2022). Research has focussed on job satisfaction of faculty of colour (Niemann and Dovidio 2005), tokenism (Jackson 2008) and issues of marginalisation and isolation that faculty of colour experience in higher education (Griffin, et al 2014). There is evidence to suggest that discriminatory practices restrict the recruitment and retention of faculty of colour (Villalpando and Bernal 2002) which results in them experiencing micro aggressions in interactions with White colleagues (Chang 2002; Patton et al. 2014). This paper will explore the experiences of academics

of colour in elite universities in the UK and the USA. Drawing on interviews with 34 respondents and using a critical race theory perspective, the paper will examine their experiences of accessing the professoriate. The findings indicate that academics of colour experience racism in the White space of an elite university. This is heightened when they seek promotion to the rank of professor in elite institutions. To counter the racism they experience, they develop 'safe spaces' in which they find empathy and support from other academics of colour. A key finding from the study suggests that despite having negative experiences in elite universities, academics of colour have contradictory feelings about their positions. They disassociate themselves from the racism by recognising the status and prestige associated with working at an elite university, and ultimately gaining a senior role as a professor within it. The paper suggests that in order for academics of colour to be fully included in elite universities, institutions must acknowledge racism and their own Whiteness to work towards cultural change.

BIALAKOWSKY, ALEJANDRO* (Universidad de Buenos Aires, Argentina)

Reclassificatory Tensions between Contemporary Democracy and Capitalism

The tensions between democracy and the different forms of accumulation, distribution and organization of modern capitalism are not new. These tensions have appeared, on the one hand, with the challenges to the "formal character" of the type of democracy linked to capitalism and colonial expansion. These critiques have sought greater democratization, even putting capitalist relations in crisis. On the other hand, these tensions have also arisen in moments of epochal transformations of capitalism. There, the democratic framework has seemed to present itself as an "obstacle" to the expansion of capitalist relations, both over other spheres defined as "non-economic", and in order to promote mutations in the forms of production, consumption and distribution.

Nowadays, several perspectives have been arguing that we are at a crossroads defined by both tensions: the search for emancipatory democratization, and the emergence of new oppressive forms of exploitation—for example, through the digitalization of the economy. For this reason, the relations between capitalism and democracy are undergoing a double crisis. How to deal with such complex and distressing crises? This paper will dwell on them through a proposal that focuses on the reclassificatory processes of contemporaneity, that is, their incessant transformations in the ways of dividing, qualifying and hierarchizing the social and natural world. These transformations pose a sophisticated interweaving between social reclassifications in general—of different social realms—and sociological ones—that seek to analyze and intervene in them. Both social and sociological reclassifications mold the very concepts of "democracy" and "capitalism".

BIALAKOWSKY, ALEJANDRO* (Universidad de Buenos Aires, Argentina)

Social Classes, Reclassificatory Processes and De/Renaturalizing Critiques

By reflecting on reclassificatory processes, this paper analyzes the relationships between "social classes" and de/renaturalizing critiques. Reclassifying processes refer to persistent transformations and disputes over the ways of dividing, qualifying and hierarchizing the social and natural world. We are always modifying past, present and imagined future reclassifications, since there is no original ahistorical "classification" from which all others begin. The modern category of class, conceived as "social", refers both to the intrinsically collective character of socio-economic stratification, and to the historical transformations that crosscut its members with their practices, beliefs, bodies, etc. It implies a critique that denaturalizes non-modern and modern relations of domination, fissuring the naturalized and individualistic definition of *homo economicus* of liberalism and neoliberalism.

However, acute analyses of the concept of "social classes" have highlighted its interconnections with other categories. The hierarchies and attributes of those other categories are legitimized through their supposed "nature": i.e., gender relations understood as "natural divisions between sexes"; or "racial" and "colonial" segmentations of ethnicity based on physiognomic traits. The groups related to these degrading categories have deployed critiques that denaturalize themselves seeking justice against exploitation and subalternization. Such critiques have ruptured the reclassificatory boundaries between the natural and the social. Then, more complex and—even blurred links between the human and the non-human—objects, animals and artifacts, such as algorithms—emerge. How do these reclassificatory processes mold and tense the relations between social classes and other collective categories? Are we facing processes of de- or re-naturalization of the ways of dividing, qualifying and hierarchizing the social? The paper will address these questions.

Gender, Social Class and Educational Achievement. Explaining Gender Gaps in Primary School from an Intersectional Approach

PISA reports show that gender gaps in mathematics and reading performance persist (OECD, 2023), even despite trends towards the reversal of most gender gaps in educational attainment. Gender gaps in educational performance have long-term effects, with impacts on educational choices, gender segregation in labour markets and gender pay gaps (Kriesi & Imdorf, 2019). The *gender stratification hypothesis* posits that gender equality in society establishes an opportunity structure for girls to perform better and follow traditionally 'masculine' educational trajectories (Baker & Jones, 1993). The *gender-equality paradox* points, however, in a quite different direction (Stoet & Geary, 2018). We advocate an intersectional approach seeking to understand the interplay between gender and social class in the formation of gender gaps in different socio-cultural contexts.

We use an aggregated database of nearly 700,000 4th-grade students from 65 countries between 2011 and 2019 (plus soon to be released 2023 data), taken from the latest TIMSS assessments. Through multilevel structural equation modelling we address how socioeconomic status (SES)—as a composite proxy variable for social class—moderates the gender effect on achievement at the student level, and how socioeconomic development mediates the relationship between societal gender equality and gender gaps in mathematics.

Gender interacts with SES at different levels, with higher-SES boys increasing their advantage over girls, while lower-SES girls tend to match or outperform their male peers. At the country level, globally, the apparent inverse relationship between societal gender equality and girls' performance in mathematics vanishes, and in more developed countries becomes strongly positive, when we control for the average SES of the country. But there are still large variations in the magnitude of gender gaps in different contexts. We argue for the need to develop explanations that can be tailored to specific socio-cultural contexts by accounting for the intersection of different axes of inequality.

School Segregation As a Driver of Increasing Educational Inequalities: A Global Perspective

School segregation is an emerging problem in education systems in developed countries (Bonal & Bellei, 2022). Segregation of socioeconomically disadvantaged and immigrant students is aggravated by educational policies promoting free choice (Boterman, 2019) and family strategies seeking social 'homogeneity', all together with—and beyond—urban segregation (Cordini, 2019), tending to intensify in the most differentiated education systems and in those with the highest degree of privatisation (Sciffer et al., 2022).

In an increasingly globalised world, education systems that receive a larger influx of immigrant students are expected to experiment a reaction among middle-class families, who would move towards more affluent (socially 'homogeneous') schools, while students from families with less power of choice would tend to be concentrated in highly segregated schools. The resulting school segregation is a potential factor in increasing educational inequalities, as the most disadvantaged students tend to be concentrated in some schools and not in others, placing greater demands on teachers' workloads and conditioning the educational process.

Using data from the TIMSS and PIRLS assessments over the last two decades (2001-2021), totalling more than 2 million 4th grade students, we analyse patterns of school segregation of both low-SES and first-generation immigrant students. Through multilevel structural equation models, we aim to explore both these segregation patterns over time and across countries, and their relationship with an expected increase in educational inequalities.

Our results show that school segregation of immigrant students has increased over the last two decades in most developed countries, and that the educational outcomes of the most disadvantaged—both low-SES and immigrant—students are falling behind as segregation increases. These two processes have serious implications for the quality and equity of our education systems, implying the need for policy makers to develop policies aimed at both reducing school segregation and containing its effects on educational inequalities.

Thinking Back and Forth: Uncovering Mechanisms of Advice-Seeking Network Formation through Empirical Agent-Based Models

Advice-seeking networks are frequently sampled and studied within competitive environments, such as law firms or financial institutions. In these contexts, social exchange theories provide valuable insights into the network formation mechanisms that underlie observed structural patterns. By fitting simulated network data generated from mechanisms inspired by social exchange theories to empirical networks, researchers can typically isolate the effects of attractiveness toward specific advisors who possess relevant resources, such as skills and expertise, while also controlling for the negative status costs associated with seeking advice. However, these theories offer limited guidance in understanding the emergence of advice networks in non-competitive, supportive contexts, where different dynamics, such as reciprocity and transitive closure, become more prominent. In this study, we propose an agent-based modeling (ABM) framework to explore advice-seeking in non-competitive settings. We define various underlying mechanisms that contribute to network formation by unpacking different reciprocity-based theories. Our aim is to test whether mechanisms that assume the existence of a reciprocity norm are more effective in explaining emergent advice network patterns than those that view agents as more calculative. These calculative agents decide to seek advice either from a given advisor, expecting future benefits from the same individual (direct reciprocity), or from another advisor of their current advisor (generalized reciprocity). To quantify the effects of these different causal mechanisms, we employ Approximate Bayesian Computation (ABC). We then perform Bayesian model selection on an empirically observed advice-seeking network within a coworking space to identify the most plausible drivers of network formation.

Narrating Social Class in Polish Media: Discursive Strategies and Thematic Trends (2004-2024)

The aim of this paper is to explore how social classes have been discussed and represented in the media in Poland. We argue that the media plays a strategic role in the discursive construction of everyday understanding of social classes and the symbolic boundaries between them. Taking into account the potential changes in language and images of social inequalities over the years, the paper employs diachronic analysis.

Our primary research question is: *What is the media discourse on social classes in Poland, and how has it evolved over time?* To address this question, we analyzed articles published in selected print media between 2004 (the year of Poland's accession to the European Union) and 2024, focusing on topics related to social class. The diachronic analysis concentrated on thematic trends and in-depth discursive strategies used to represent social classes in popular weekly newspapers. Four media outlets were chosen to represent different target groups throughout the political spectrum. We employed Critical Discourse Analysis (van Dijk, 2009) to examine not only how social structures are narrated but also the potential influence of these narratives on shaping individuals' experiences and beliefs about social inequalities.

This presentation will address the main thematic trends and discursive strategies in the representation of social classes in the press. In addition to answering our central research question, we will also explore: (a) the main topics associated with social class representation in the media and how they have (or have not) changed over time, (b) which social classes are most frequently discussed, and (c) the primary discursive strategies used to represent these classes in the selected media.

This presentation forms part of a broader project on upward mobility and social reproduction in Poland, titled "RaM-CLASS. Class reproduction and mobility – biographical experiences in academic, artistic, and business fields" (2023-ongoing).

BIELER, ANDREAS* (University of Nottingham, United Kingdom)

Rethinking Labour Movements in Times of Polycrisis

We are living in times of multiple, overlapping crises, also referred to as polycrisis, including a crisis of global political economy, a crisis of global labour relations, a crisis of global gender relations, a crisis of global race relations and a global ecological crisis. Underpinning these internally related crises, as I will argue in this paper, is the relentless expansionary dynamic driving the capitalist mode of production and extending exploitation and expropriation into ever further areas of life. And yet, where there is exploitation, there is also resistance. Labour movements have played and will play a crucial role in efforts of defending life and finding alternative ways out of crises.

The purpose of this paper is to reflect critically on how to conceptualise labour movements best in times of multiple crises. I will argue that considering that capitalist exploitation is not only focused on exploitation of wage labour in the workplace but also on the expropriation of unpaid labour and cheap natures in the spheres of social reproduction, resistance to expropriation in social reproduction has also to be understood as a form of class struggle. Hence, labour movements do not only comprise trade unions and other workplace-based organisations, but equally social movements, citizens' committees and environmental groups. It is such an expanded and broadened understanding of class struggle and labour movements, which provides a basis for constructive reflections on progressive ways out of crises.

Aging in a Changing Climate: Sensory Experiences of Older Adults

Climate change, much like aging, is an inevitable reality that affects us all. Both processes require reflection on how old age unfolds in the context of a changing climate.

My presentation will explore how shifting weather patterns impact the everyday lives of older adults, highlighting how climate change is experienced at a sensory level in fleeting and often difficult-to-verbalize "here-and-now" moments of daily life. Weather fluctuations, such as heatwaves, represent a material dimension of this change, directly felt through the senses.

For decades, sociology and anthropology have sought to describe social life beyond Cartesian dualisms like nature and human, body and mind, or cognition and sensation. Drawing on Paul Vannini and Tim Ingold theories, I will show how integrating attention to weather as a practice and being-in-the-weather as a social phenomenon can reshape research. My presentation will emphasize the inseparability of the material and the sensual, offering new ways to understand the experience of living in a changing climate.

I will present findings from a two-year ethnographic field study on the sensory experience of climate change among individuals over 65 in Warsaw. Using creative methodologies like sensory walks and participatory photography, I transcended participants' verbal accounts to understand multi-sensory dimensions and layers of their experience.

I will reveal everyday weather moments where the interplay between aging and climate change subtly unfolds. By focusing on how older adults uniquely "sense" the weather—through heat, cold, and shifting air—my presentation will offer a fresh, sensory-driven perspective on the aging experience in an anthropocene world.

Organizations, Geopolitics, and Transnational Capital: The Creation of the Bahía De Banderas Trust (FIBBA) in Mexico

Considering the context of the global economic integration of world systems and the (inter)dependence of peripheral countries in relation to the accelerated productive processes of central economies, we analyze the role of the Bahía de Banderas Trust (FIBBA) as an organizational and legal mechanism driving a major socioeconomic change in Mexico between 1970 and 1990, from agriculture to tourism. A *trialectic* morphogenetic analysis was employed, using *organizational sociology, geopolitics, and transnational capital*, to argue that FIBBA was an organizational mechanism deliberately created

by the State, acting in a geopolitical level, through the facilitation of sale of communal lands to private companies—initially domestic, but later foreign—as a means of promoting economic and productive “modernization”, resulting in a transnational economic field.

New Institutionalism perspective, particularly focused on the institutional work, allied to the *Critical Realist Evaluation*, were used to demonstrate how the creation of the trust catalyzed institutional change by the State, enabling the privatization of communal lands, thus fostering the country's integration into the global economy. Methodologically, the research adopts a historical-documentary approach, combining the analysis of historical, legal, statistical and qualitative data (interviews and direct observation) from both the municipality and FIBBA, to assess its impact on urbanization and land control.

The findings indicate that FIBBA significantly transformed Bahía de Banderas by shifting economic activity from agriculture to tourism, which attracted foreign capital and established tourism as a key economic driver. In conclusion, while FIBBA played a strategic role in modernizing the region and attracting investment, successfully integrating Mexico into the global economic system, through the tourism sector, it did so in a subordinate role, at the expense of increasing dependence on transnational capital and people disempowerment. This transformation also resulted in the dispossession of *ejidatarios* and disproportionately benefited large international corporations.

Music Worlds Exchanged: Relationalities and the Curricular Value of Performing Bolivian Music

In international encounters, Bolivian musicians' performances often are marketed and consumed as folklore and as stagings of cultural difference, even as performers resist this cultural cornering. This paper explores an alternative form of exchanging music worlds, not based on the idea of touring Bolivians who perform for foreign audiences, but rather on a model of musicians who, in an intensive course, teach US college students how to play Andean panpipes. The course “Performing Bolivian Music,” is unique in its aperture to any student—not just music students—and in its bilingual teaching, even though the course carries no Spanish language requirement. Throughout the course, students learn what it means to work in inextricable interdependence with others—an ethos that contrasts with what one finds in many US college classrooms. I team-teach this course with Bolivian musicians and our social contract rests on multi-decade relationalities between an anthropologist/musician and the founder/director of a Bolivian music ensemble. Taking cues from Native American and Indigenous Studies' and feminist scholars' focus on the concept of relationality (Cattelino and Simpson 2022), I suggest that such a course moves out of a consumptionist model of cultural exchange and towards a model that emphasizes multilevel relationalities—among the instructors and among the students who become involved in playing Bolivian music. I also consider the relational values assigned to the knowledge of performing Bolivian music, as these practices assume a place within a credit-bearing course of the university's curriculum, not in the disciplines, but rather in interdisciplinary spaces.

Caribbean Reparations Calls As Decolonising Accountability Tools for Inclusive Social Justice Frameworks

Caribbean reparations calls are a response to the lasting devastating legacies of colonialism and transatlantic slave trade, and the resultant global inequities that affect particularly the Global South, and thus, profound demands for accountability. However, they hardly find a footing in international human rights frameworks, debilitating various social justice demands.

This paper builds on Third World Approaches to International Law (TWAIL) to critique international human rights-based justice frameworks and expose engrained structures of subordination and exclusion these frameworks have legitimated and reproduced. This paper is concerned with unearthing the epistemological injustices supported through international (human rights) law. In the TWAIL tradition, the paper asserts the Global South as a site for knowledge production and practice of human rights with specific understandings of and calls for justice that so far have not been reflected in and addressed by international human rights mechanisms for accountability and protection. Arguing that through calls for reparations, the Caribbean “speaks from a subaltern epistemic location” (Gathii 2020) that challenges the “universal” quality of Western worldviews reflected in international legal knowledge, this paper urges for a re-examination of the established perimeters of human rights-based justice, including standards, structures, mechanisms and methods.

Thus, the paper argues that reparations are decolonising calls demanding a critical re-imagining of the international (human rights) justice frameworks as systems that reflect and are inclusive of alternate standpoints on justice. It puts forward a theorisation of justice and reparations, in which both backward looking (reparation) and forward looking (compensation) responsibilities are taken by former coloniser States and the international community as duty bearers to respond to Caribbean reparations. The paper thus proposes and discusses in detail the necessary multifaceted effort, involving undertaking institutional, structural, legal and policy action by a wide range of actors operating at various international and national levels.

Building Brighten Futures: Knowledge and Communication on Socio-Environmental Topics in Two Macaronesian Regions

The global changes – out of which climate change is the most visible aspect – have conveyed dilemmas that challenge our ability to reflect on them and engender effective solutions. Thus, the world is imbued with what Timothy Morton (2013) called hyperobjects, including the Anthropocene. Notwithstanding, the term ‘Anthropocene’ has generated controversy, with some authors suggesting that the correct term is ‘Anthropocenes’, due to the plurality of approaches and the fragmentation of the discourses involved, which entail a transdisciplinary epistemological positioning (Kelly, 2014; Wright, 2016). Bruno Latour's (2014) reflection on the Anthropocene builds on the idea that Geology and Earth Sciences draw near Anthropology, raising the question of human agency not only in construction of scientific facts, but in the very existence of the phenomena that these facts document. In other words, how is it that humans end up exerting such a significant influence on the planet, yet find it hard to understand the consequent profound changes, and feel powerless to respond to them (individuals, society, organisations, institutional and political power, economic agents)? Additionally, which discourses, knowledge, practices and ways of dealing with socio-environmental challenges and climate change are established at regional and local levels in insular contexts, specifically in the Autonomous Region of Madeira and the Autonomous Community of the Canary Islands? The study we have conducted as part of a doctoral research, revealed that the mainstream perspective is still prevalent, and that regarding knowledge, policies, communication and participation, lay rationalities and territorial communities' perspectives remain virtually absent, although they have proven to be crucial throughout time, in providing answers to the main challenges experienced in these concrete territories and in forging adaptive skills. They must, therefore, be contemplated when tackling complex and multidimensional issues and considering alternative, brighten futures.

Fátima Alves (Open University and CFE) is a co-author.

Powering Communication and Societal Engagement with Climate Research and Policies in Insular Territories

The discourses that condition knowledge, research and public policies concerning climate change are based on assumptions that work as starting points for analysis, debates and consensus to be carried out, yet they also emphasise controversies that contribute to opening *black boxes* (Latour, 1987, 1992, 2005) regarding the phenomenon, and which emerge from perceptions and conceptions that are occasionally divergent and incompatible. In fact, the different discourses highlight differentiated knowledge/power relationships and conflicting interests emanating from science, politics, economics, environmental NGOs..., often culminating in disparate and extreme positions, which generate confusion and instability. They are, therefore, a stimulus to public apathy and immobility, instead of fostering active and committed citizenship and the impulse to action.

Even though the relevance of participatory citizenship is cited by supranational, national and regional actors, and it is acknowledged that the involvement of all stakeholders is crucial in addressing socio-environmental challenges and promote the success of climate policies, resistance from knowledge- institutionalized powers endure, even when they refer to the need for change.

As concluded within the scope of a case study carried out in the Autonomous Region of Madeira and the Autonomous Community of the Canary Islands, also at regional level, the construction and dissemination of knowledge about climate change and the policies continue to favor a top-down approach. Lay rationalities and non-formal and territorial constructs have not found echo in scientific communication, nor in the mass media, and remain absent in the conception, design and implementation of policies, despite some local articulation initiatives with communities, associations, activist groups, together with economic agents, which hinders successful communicative processes and may balk timely, integrated and effective responses.

Unveiling the EU Digital Policy Pathways: A Compass without True North?

Digital transformation is a widely used concept in policies and academic discourse (Heeks et al., 2023), especially in the EU (European Commission 2021; 2022). Consolidated digital monopolies (Bilić et al., 2021; Rikap, 2021) and public pressure impose the need for protective industrial policy and stronger democratic governance. Geopolitical relations lead to trade conflicts in which the open global Internet and open markets falter in the face of the controlled global flow of technology, data and capital (Bradford, 2023).

The Digital Compass, designed to bolster the European international standing and create a sustainable digital transformation, focuses on creating efficient markets and public administration, better connectivity, improved digital skills and democracy. However, predominantly technocratic solutions often overlook the need for a comprehensive approach to social development. It is crucial to consider power and unequal social relations, rather than just individual skills and freedoms.

In this paper, we analyse (a) the underlying pathways in digital policy (strategies, acts, communications) (N=38) and (b) the regulatory expertise and experience of European Commission digital policy experts gathered through semi-structured interviews (N=10). Combining quantitative and qualitative analysis, we present the main characteristics and relations between explicit and implicit development paradigms (neoliberal, structuralist, sustainable, human development, and public wealth production).

Empirical data shows the lack of a single development direction of the EU digital policy. Relationships between individuals, social groups, public authorities, European institutions, and corporations are evolving. Infrastructures are insufficiently considered a shared resource through the

lens of universal accessibility, non-discrimination, and social welfare. Private and public investments are reshaping the boundaries and responsibilities of actors in complex and unpredictable ways. Targeting too many policy goals creates the risk of missing the policy goals and steering digital transformation in undesirable directions.

BILON, XAVIER JAVINES* (University of the Philippines Diliman, Philippines)

Pride, Politics, and Pageantry: Uncovering the on-Line News Coverage of LGBT Issues in the Philippines through LDA Topic Modelling

Recent trends in news consumption foreground the growing importance of on-line news as a primary source of information for many people. In the Philippines, while television and radio remain the primary sources of news, around half of Filipinos now turn to the Internet for their news. Given the media's gatekeeping function in shaping public discourse, it is crucial to uncover how media cover LGBT issues by examining which topics are being focused on and which are left out, and to surface opportunities for LGBTQI movements to engage with media outlets in bringing attention to issues that affect LGBTQI people. In this work, I utilized latent Dirichlet allocation (LDA) to model central topics across headlines of LGBT-related on-line news in the Philippines from 2017 to 2022 ($n = 1,314$). News articles were obtained using Google Alerts, a tool that monitors web content. Using various optimisation metrics, 15 topics were obtained. These include topics across three general themes: pride (news about pride celebration and Pride Month), politics (news about LGBT-related pronouncements of key government officials such as the Philippine president and proposed laws on anti-discrimination law and marriage equality), and pageantry (news about cultural events such as drag competitions and beauty contests). News coverage of LGBT-related issues was also observed to peak during events surrounding these themes: pride marches, official government discussions on LGBTQI matters, and cultural events involving LGBTQI folks and allies. The findings reveal opportunities for LGBTQI movements to leverage these social, political, and cultural contexts to engage with news media outlets and address significant gaps in coverage of other issues affecting LGBTQI people, such as health, education, and employment.

Interprofessional Dynamics in Mental Health and Disability Services: The Tuscan Model

Mental health social workers often face challenges in being recognized for their expertise within interprofessional teams, especially in systems dominated by biomedical approaches. This study examines the Tuscan model of disability assessment and care, which prioritizes user participation and empowerment. It aims to analyze power dynamics influencing interactions between SW and other professionals, and how they affect the quality of care and the involvement of service users with disabilities and their families.

The study utilized a qualitative design, involving 150 professionals from 10 multidisciplinary assessment units across Tuscany. Data were collected through focus groups and role-play sessions, which were recorded and analyzed using the theoretical lens of Anti-Oppressive Practice (Burke, Harrison, 2002; Dominelli, 1996). The participants included social workers, healthcare professionals, and other stakeholders involved in the care of people with disabilities. The analysis focused on identifying themes related to interprofessional collaboration, power relations, and user participation.

The results revealed that despite the Tuscan model's focus on user empowerment, significant power imbalances persist within interprofessional teams. Social workers often found their roles marginalized, limiting their ability to advocate for user-centered approaches. However, the model's emphasis on participation led to some positive outcomes in terms of user engagement and the promotion of autonomy. Key strengths of the model include its structured approach to multidisciplinary collaboration, but challenges remain in ensuring equal recognition of social work expertise.

The study emphasizes the need to address power imbalances in mental health and disability services for effective participatory care. Social workers should advocate for better recognition within interprofessional teams. Policy revisions are necessary to reinforce the value of social work in mental health and ensure that care models align with empowerment and social justice principles. Future research should focus on strategies to improve interprofessional equity and the long-term impact of participatory models on service outcomes.

Promoting Human Rights in Social Work Education: The Fridas Project

Background and Purpose: Social work plays a crucial role in upholding human rights, but the inclusion of human rights principles in academic training is limited. The FRIDAS (Fundamental Rights in Daily Actions of Social Workers) project, a collaborative effort between universities and the REDU (Human Rights Education Network) association, aims to bridge this gap by promoting a human rights-centered approach in social work education. The project aims to empower future social workers to identify and prevent human rights violations and discrimination, while promoting inclusive practices in vulnerable settings.

Methods: FRIDAS is a partnership between four universities (Roma Tre University, NTNU, Università di Shkodër, and Universidad de Granada) and REDU. Key activities include gathering case studies of human rights violations in social work, creating a competency framework on human rights for students, and developing educational modules for training. A virtual community of practice will be established to allow students and practitioners to exchange best practices and advocate for human rights in social work.

Findings: Initial results indicate that integrating human rights principles into social work education increases students' awareness of their role in promoting social justice and safeguarding vulnerable populations. Students develop essential skills such as empathy, critical thinking, and lateral problem-solving, which are vital for addressing complex human rights issues in practice.

Conclusions and Implications: FRIDAS underscores the importance of interdisciplinary collaboration between academic institutions and human rights organizations in shaping the next generation of social workers. The project's outcomes will have long-term implications for higher education, policy, and practice by establishing a human rights-based curriculum that prepares social workers to advocate for marginalized communities. Future research will examine the impact of this approach on professional development and service delivery.

RC28-443.3

BINDER, BARBARA* (GESIS Leibniz Institute for the social sciences, Germany)

Socioeconomic Status and Patterns of Online Behavior in Germany

Do individuals from different socioeconomic status (SES) groups use the internet differently? The digital divide extends beyond disparities in access to adequate internet access. Being online offers potential benefits, but people may differ in their knowledge, opportunities, and capabilities to take full advantage of these benefits.

Using a linked dataset from the German General Social Survey (a large, probability-based survey) and respondents' web surfing behavior (GESIS Web Tracking), this study explores whether online behavior varies by SES background. Respondents participated in a web tracking study, which collected data on every individual website visit over two months following the installation of a browser plug-in. This pilot study includes more than 4 million website visits from 500 participants, with the linked data providing around 340,000 website visits from 106 respondents. The websites visited were classified into content-based categories, such as "education," "job search," "healthy living," "personal finance," alongside categories like "shopping," "sports," and "video gaming." Through regression analysis, I examine whether SES is associated with particular types of website visits and whether this relationship is moderated by first- and second-level digital divide factors, such as access to fast internet connections and digital literacy.

Differing online behavior may ultimately contribute to inequalities in education, the labor market, or financial well-being, potentially mitigating or reinforcing existing social inequalities. Thus, understanding these behavioral differences is crucial for reducing structures that exacerbate inequality.

BINDER, PIOTR (Polish Academy of Sciences, Poland)
KOTNAROWSKI, MICHAŁ* (Institute of Philosophy and Sociology Polish Academy of Sciences, Poland)

Social Implications of Digitalization of Professional and Private Life in Poland: Between Convenience and Trust

Digitalization, defined as the increased utilization of digital technologies, is included in the European Union's development strategy. It is one of the top priorities on the list of development goals, which were gradually implemented before the COVID-19 pandemic. The outbreak of the global epidemic crisis in 2020 and its long-term course strengthened this process. It concerned the professional environment, including remote work and various types of hybrid solutions, as well as personal context. Video and text communication, email, and messaging apps began to play a more significant role. The proposed paper will aim to analyze the social consequences of the intensification of such digital practices in work and private life based on two types of empirical evidence: the ESS Round 10 rotating module "Digital Social Contacts in Work and Family Life" (2020-2022) and the interview-based qualitative longitudinal study "The social implications of the COVID-19 pandemic in Poland" (n=356) conducted in three waves over the same period. Attention will be focused on the Polish context, where, in the light of ESS data, digital social contacts were very positively viewed among respondents as solutions facilitating the management of activities and simultaneously had the lowest level of perceived risk that professional work and private life would interfere with each other. The juxtaposition of quantitative results with a qualitative longitudinal dataset allowed us to (1) reconstruct the spectrum of meanings behind the trust in progressive digitization, (2) uncover the range of consequences of digitization on job satisfaction and relationship quality, and (3) highlight the importance of the stage of the dynamic process, such as the pandemic, on the perception of the analyzed phenomena.

TELEGDI-CSETRI, ARON (Babeş-Bolyai University, Romania)

Empirical Perspectives on Social Inclusion Policies of Returned Moldovans

Since the post-Soviet era, the Republic of Moldova has gained recognition for the significant emigration of its citizens seeking employment opportunities across various European countries. The national dynamic migration phenomenon has inevitably prompted institutional engagement through a range of policies aimed at either supporting migrants and preserving national identity abroad, as well as initiatives encouraging Moldovan emigrants to return home, many of whom leave behind families.

While return migration has been addressed in research to some extent, the family relationships behind it- migration structure, relational dynamics, generational differences- have not. Departing from the perspective of transnational family members on migration, on transnational life as well as on opportunities abroad and at home, their needs and adequate policies for a prospective return need to be researched and created.

This paper aims to deeply explore both the perspectives of Moldovan families and national authorities in terms of their relationships, communication and the evaluation of the effectiveness of inclusion and reintegration programs and policies. Drawing on a series of interviews conducted as part of the ReMiReM (Exploring Returned Migration Dynamics in the Republic of Moldovan: A Qualitative Analysis) project, the research analyses the collected data to formulate recommendations for enhancing the public and institutional intervention framework concerning returned Moldovan.

Commuting to Job (Dis)Satisfaction? Examining the Mediating Roles of Strain and Job Conditions Using German Panel Data

Job satisfaction is a crucial dimension of quality of life, significantly impacting individuals' wellbeing and making it a key concern for individuals, employers, and policymakers. While factors such as workload, income, and job security are known to affect job satisfaction, the relevance of daily commuting remains less explored. This paper examines how commuting duration influences job satisfaction and explores the mediating roles of strain and job conditions.

Utilizing panel data from the German BAuA-Working Time Survey (2015-2023), we apply Pooled OLS and Fixed Effects Models to analyze this relationship and account for unobserved heterogeneity. Our findings show that longer commuting duration significantly reduces job satisfaction. Strain factors—such as emotional exhaustion, poor social support, and work pressure—mediate this negative association, while job conditions (e.g., overqualification, wages, leadership position) do not mediate the effect once unobserved heterogeneity is considered.

These results suggest that commuting is more than lost time; it adds stress and mental fatigue, which carry over into the work environment and reduce job satisfaction. Improving job conditions alone may not offset the negative implications of long commutes. Even with higher wages or job security, the strain from commuting continues to diminish satisfaction.

Reducing commuting times can lead to a healthier, more satisfied workforce. Individuals with long commutes should be mindful of the toll it takes on their wellbeing. Reducing commute times—through remote work or relocation—may be key to improving job satisfaction and quality of life. Policymakers should also recognize the burden of long commutes. Promoting remote work and improving public transportation could help alleviate commuting stress. Additionally, stress reduction programs for long-distance commuters should be prioritized as part of public health strategies, ultimately enhancing individual wellbeing and quality of life.

BISCHOF, STEPHAN* (Federal Institute for Population Research, Germany)

Overestimation Unveiled: Men's Skill Overrating and the Power of Question Phrasing to Counteract It

Overestimation bias is a critical issue in subjective assessments in survey research, with certain sociodemographic groups, such as men, being more prone to overestimate their schooling, earnings, or skills. This paper investigates how overestimation bias arises in self-assessments of whether individuals' skills match their job requirements and explores the conditions under which this bias manifests. I conducted an online survey with a split-half design, enabling a comparative analysis of two instruments for measuring subjective skill mismatches. Both instruments require a self-assessment of whether an individual's skills exceed, match, or fall short of job requirements, with version 1 slightly emphasizing individual skills and version 2 emphasizing job requirements.

The study reveals statistically significant differences between the two versions. Version 1 shows roughly twice the incidence of overskilling, lower rates of skill matching, and half the incidence of underskilling compared to version 2. The skill mismatch distributions in version 2 are more balanced, with predictive analyses indicating higher construct validity for this version.

These discrepancies also vary across sociodemographic groups. Notably, the differences between versions are more pronounced for men than for women. While women show similar overskilling rates across both versions, men assess themselves as overskilled more than twice as often in version 1. This suggests that men are more likely to be affected by overestimation bias, particularly when the assessment emphasizes their own skills.

My findings enhance the understanding of biases in self-reports, demonstrating how question phrasing influences overestimation bias and how slight adjustments can mitigate this issue. Additionally, our research shows that overestimation of skills is predominantly driven by men. The implications of this research are crucial for understanding, interpreting, and addressing gender inequalities in the labour market. By revealing how emphasis in self-assessment affects biases, this study underscores the need for precise survey design.

Appauvrissement ET Inversion DES Rapports De Pouvoir : UNE Analyse DU Rapport AU « Travail De La Terre » ET De La « Location DU Travail » ENTRE Autochtones ET NON Autochtones Dans LE Département De GRAND-Lahou

Le secteur agricole en Côte d'Ivoire demeure un pilier majeur de son économie dont les non nationaux ont contribué au rayonnement régional et international. Source d'enrichissement national et individuel, l'on constate cependant, une certaine distance entre les autochtones et les « travail de la terre ». Partant d'études menées dans le département de Grand-Lahou, principalement sur les productrices d'attiéké, un mets très prisé en Côte d'Ivoire et hors du pays, la communication a pour objectif de montrer comment les populations participent à construire leur propre dépossession et leur appauvrissement à travers la « location du travail » de production et leur rapport de plus en plus distant au « travail de la terre ». L'étude montre, en effet, que dans des rapports de travail où les autochtones cherchent à se positionner comme les « employeurs », les « supérieurs hiérarchiques » des allogènes et des allochtones, il s'opère au fil du temps, une inversion des rapports de pouvoir avec un déplacement des compétences dans le travail de production et dans le processus de commercialisation. Les analyses se basent à la fois sur des données secondaires et sur des données primaires. Ces dernières ont été collectées à partir d'un ensemble d'entretiens menés avec une trentaine de participants sélectionnés par effet boule de neige.

The Unique and Shared Challenges Faced By Men and Women in a Lower-Income Country Refugee Camp

This research explores the unique and similar challenges that men and women face in refugee camps located in a lower-income country. By focusing on gender-specific experiences of refugees, the study aims to highlight how men and women navigate the hardships of camp life, including access to basic needs, psychological well-being, and coping mechanisms. Drawing on Viktor Frankl's notion that "those who have a why, find a how", the research seeks to understand the "why" behind refugee resilience, and how it shapes their survival and adaptation strategies.

The research employs a qualitative methodology, relying on semi-structured interviews with male and female refugees in Mahama Refugee Camp in Rwanda. Participants will be selected to provide a range of perspectives, with data being collected through digital interviews. The inductive approach will allow themes to emerge naturally from the interviews, rather than being driven by predefined hypotheses.

Data sources include primary interviews with refugees and secondary data from existing literature on gender and migration. Analytical tools will involve thematic analysis to identify patterns in participants' experiences and narratives, focusing on how gender influences their well-being and survival strategies.

The findings aim to provide a deeper understanding of refugee experiences in camps by offering insights into how men and women navigate the hardships of refugee life, revealing the role of cultural, social, and psychological factors in shaping their experiences. The findings aim to inform gender-sensitive policy interventions and humanitarian efforts in refugee camps in lower-income countries.

Trusting the Green Transition: Public Attitudes Towards Just Transition in the European Context

The concept of Just Transition (JT) highlights the importance of implementing climate policies that are both fair and inclusive, ensuring that all groups are supported during the transition to greener economies. While JT policies are increasingly recognized as essential components of climate action, international differences in public support for these policies remain

almost entirely unexplored. JT policies often require providing assistance to vulnerable groups, which depends on public institutions' ability to fairly and efficiently distribute these benefits. As a result, variations in institutional trust across countries could significantly shape public support for such programs. Using a merged dataset from the European Social Survey Cronos-2 (2023) and ESS Round 10, we analyze public attitudes towards JT policy across twelve European countries, controlling for cross-national differences through country fixed effects. Our regression models indicate that political trust and institutional trust are positively associated with support for JT policies. Additionally, we find that the trust-as-heuristics thesis, which posits that trust is particularly crucial for policies involving risk or sacrifice, does not hold true when examining political or institutional trust in the context of JT policies. We conclude that trust is a more stable factor in determining support for JT policies, whether they involve general support or entail clear personal costs that benefit others rather than oneself.

RC17-JS-89.3

BJORKHAUG, HILDE* (Norwegian University of Science and Technology, Norway)

Food System Liability

The first United Nations Conference on Food and Agriculture was held in 1943 and 44 participating nations "declares its belief that the goal of freedom from want of food, suitable and adequate for the health and strength of all peoples, can be achieved." [1] In 1945 FAO the permanent organization in food and agriculture was established. Liability to ensure food security is a goal for the UN while providing enough food for its population has allowed nations and states to develop sophisticated and exceptional agricultural and food policies. Climate uncertainty and severe weather events challenge food production in different ways, and unrest and conflict between nations expand the interest in food security from the agricultural sector to foreign affairs and defense. At the same time, we observe the concentration of power to large private actors accelerate in the same crisis scenario.

This paper discusses global food security liability in a food system where rights, power, and agency are increasingly skewed. Norway is used as a case of a country that repeatedly implements exceptional policies to strengthen self-sufficiency through 'sustainable national food production' for its domestic market. These policies enable the exploitation of people and resources internationally to gain access to inputs such as feed, or cheap precarious labor for seasonal work and allow for the extreme concentration of power in domestic supply chains and food trade.

Representational Perceptions of Future University Students in Rural Areas. the Analyses of Two Ethno-Methodological Dimensions

The present study aims to contribute to the development of scientific knowledge about the representational perceptions of future university students in rural areas regarding their interest in university studies. The representational perceptions of these prospective university students relate to two ethno-methodological dimensions: the private dimension and the academic dimension. Perceptions of the private dimension are represented in members' stories about family and friends, whereas perceptions of the academic dimension are represented in narratives of the academic environment and the importance of research to the academic environment as a whole. The ethno-methodological private dimension is asserted in narratives about the importance of members' social context, social world, and world of study. The verbal tensions in the representations depict an uncertain and dependent relationship in relation to members' family and friends in the rural area where they all live. The social context, social world, and study world of the members also are reported as significant in the ethno-methodological academic dimension. In the representational perceptions in the study, a series of chains of perceptions is created and reproduced, all interconnected in the ethno-methodological sense and consisting of verbal tensions in narratives. They suggest an ethno-methodological balancing related to interactions between representational perceptions about verbal conflicting interests and verbal downplays of those conflicts; representational perceptions of members' fear related to choice of study programs and university; orientation points in narratives that seem to facilitate self-positioning in the current social context, social world, and world of study; and a battlefield of various conflicting interests that seem to influence the members' representational perceptions. In the last case, the conflict seems to relate mostly to the representational perceptions of the common aspects in the social context, social world, and world of study that members find difficult to relate to, oppose, or manage.

BLACHA, LUIS* (IESCT-UNQ/CONICET, Argentina)
THOMAS, HERNÁN (IESCT-UNQ/CONICET-CIC-PBA, Argentina)

Edible Technologies: Food, Humans and Artifacts in the Anthropocene

The aim of this presentation is to analyze the processes of co-construction of food and social actors in the context of the Anthropocene. Food is not only a product but also a process and an organizational form that exercises agency over social actors, just as these actors produce, distribute, modify, consume, or reject these artifacts.

From the perspective of Socio-Technical Studies (STS), technologies are socially shaped, and societies are technologically built. This approach allows us to overcome several a priori determinisms: biological, artifactual, supply-side, sociocultural, and nutritional.

The functioning of food as a technological artifact can only be understood within the framework of socio-technical alliances, historically situated, where heterogeneous elements are aligned and coordinated. Deterministic and monocausal explanations fail. Thus, changes in consumption patterns can only be explained within the socio-technical alliances in which they are embedded. It is a system of food functioning that includes some actors while excluding others.

Therefore, it is impossible to transform our food without also questioning the actors who produce, distribute, and consume it, along with their social identities, cultural patterns, and geopolitical roles. Food as *edible technologies* seeks to overcome the non-working that characterize the 21st-century food system through alternative proposals.

The analysis of the Argentine case is particularly relevant to understanding this dynamic of inclusion/exclusion. The country produces enough calories to sustain ten times its population, yet hunger continues to increase its social impact even when the macroeconomic context improves. New forms of social inequality and malnutrition emerge, related to access to nutrients, posing new challenges for the social sciences in a context of increasing intervention in life itself.

Socio-Technical Solutions: Food, Recycling, and Housing in the Anthropocene

The objective of this presentation is to address the construction of social problems and the way in which solutions are conceived and implemented. Socio-Technical Studies (STS) explain how societies are technological constructions, while technologies are socially shaped. There are no neutral technologies.

By questioning the supposed neutrality of technologies, it is possible to identify the influence of power relations in shaping the political and technological agenda for social development. This perspective is relevant for critically addressing the design, planning, and implementation processes of product, process, and organizational technologies aimed at generating dynamics of social inclusion in Argentina. In this presentation, we examine case studies related to initiatives in food management, recycling, and housing in Argentina. Based on these, we ask:

Why is it necessary to redefine the analytical criteria for addressing social problems? Because constructing problems in a deterministically linear way (technological or social) often leads to inadequate solutions and unintended effects: a reproduction of the original conditions of exclusion by other means.

The meaning of the concept of Social Innovation takes on new implications when characterizing the Anthropocene from the Global South. Not only do geopolitical relations limit the capacity of actors; the available infrastructures also exert agency. By operationalizing STS, it is possible to approach problem-solution relations as part of an integrated approach (both theoretically and

methodologically). It is not possible to implement “solutions” that are truly inclusive without incorporating users into the design of the problem. Their sustainability is not only environmental but also demands consideration of the social ties that different actors have with their material surroundings, which include everything from the available artifacts to the organizational forms and the economic, geopolitical, and cultural processes that enable their functioning from a socio-historically situated perspective.

Scrolling the War Feed: Social Media, Affect and the Ukrainian Diaspora's Responses Towards the Russian Invasion of Ukraine

The emergence of social media has changed how war is experienced, even for those observing it from a distance. Endless war feeds offer unprecedented access to real-time warfare and civilians exposed to violence. By consuming these images, users not only gain first-hand access to the war zones but also actively become part of war narratives and possibly even digital „producers” of war (Hoskins, 2021).

In our presentation, we will explore the role of social media in mediating the Ukrainian diaspora's reactions to the Russian invasion, focusing particularly on the less-explored affective dimensions of digital engagement in the war. Social media has been a useful tool for staying in touch with family, friends, and familiar places in Ukraine, learning about the situation of troops and civilians on the ground, and raising awareness, support, and donations. However, the overwhelming presence of war feeds in the diaspora's daily lives also brings a multitude of negative emotions, including heightened anxiety, feelings of numbness, powerlessness, and a sense of disconnection.

Based on interviews with over 40 Ukrainians living abroad in Poland, Israel, and the USA at the time of the invasion, we explore how people have ‘felt’ their digital participation in the war effort across time and space. We also examine how they strive to shape, influence, or limit the amount of war-related content integrated into their daily social media use. These emerging findings are part of an ongoing multimodal research project with the Ukrainian diasporas in Poland, Israel, and the USA, titled “*Engagement from Afar: A Multi-sited Ethnography of the Ukrainian Diaspora's Responses to War.*”

BLACK, SIMON* (Brock University, Canada)

Domestic Work and the Dual Crisis of Care: The Case of Jamaica

Domestic workers play a largely unacknowledged but nevertheless vital role in Jamaica's care economy, providing both direct and indirect care services to thousands of households. With a dearth of formal care services, and in the context of a rapidly ageing population, high levels of emigration, and rising female labour force participation, demand for paid domestic work in Jamaica will continue to grow. Yet domestic workers experience decent work deficits, including low wages and inadequate social protections, and lack access to care rights and services for themselves and their families. Drawing on qualitative and quantitative case study data in the form of focus groups with domestic workers and a survey of 210 women employed as domestic workers in the greater Kingston area, this paper argues that domestic workers experience Jamaica's care crisis as a crisis of social reproduction: while their work helps middle- and upper-income households meet care needs, domestic workers lack access to key resources (including money, time, rights, and services) squeezes social-reproductive capacities and undermines their ability to provide for and maintain their own households. The paper employs a feminist political economy lens to situate this crisis within a broader political economic context of demographic shifts, austerity measures, and the privatization of costs and responsibilities for social reproduction under neoliberalism in Jamaica. In conclusion, the paper examines the role of the Jamaica Household Workers' Union (JHWU) in organizing, promoting, and protecting domestic workers' rights, including access to social protection, and to training and skills development. As the case of the JHWU suggests, strengthening domestic workers' collective representation is not only key to achieving decent work for domestic workers and addressing their care needs, but to strengthening Jamaica's care economy overall.

Adolescent Substance Use and Self-Efficacy: The Role of Risk-Taking in Aspirations for Their Future Roles

Among the many challenges faced by adolescents is the consideration of their future goals, as they must formulate decisions concerning their educational, occupational, and familial goals. Understandably, adolescents need to have confidence in their abilities to function within these future adult statuses. However, adolescence is also a time when many young people begin to experiment with a wide variety of substances (e.g., alcohol, marijuana). Substance use has the potential to affect adolescents' behaviors, but may also be associated with their perceptions of self-efficacy. Using data from a nationally representative sample of high school seniors, this study examines the linkages between adolescent substance use and their perceived self-efficacy concerning their future roles as workers, spouses, and parents. The analyses demonstrate that, contrary to previous studies of substance use patterns during adolescence, males and females report quite similar patterns of usage, with alcohol being the most commonly used substance. Adolescent females report significantly higher self-efficacy in regard to spousal and parental roles, while adolescent males report higher self-efficacy in worker roles. Among females, factors associated with peers, such as their substance use, are significantly associated with perceptions of self-efficacy. Interestingly, self-efficacy among adolescent males is shown to be significantly influenced by family and parental factors. Higher levels of substance use (including alcohol, marijuana use, and vaping) are shown to detract substantially from adolescent males' self-efficacy. Among females, alcohol use is similarly shown to be associated with lower self-efficacy, yet the same pattern is not evident in terms of marijuana use and vaping. The patterns of associations between adolescent substance use and self-efficacy are shown to be quite distinct, depending upon the particular substance, as well as the contextual factors linked to peers and families. The findings and implications thereof are discussed within the framework of ecological theory.

Marriage and Fertility Aspirations in Post-Pandemic China: Changes in the Preferences of Young Adults

Young adults in China, like their counterparts from around the world, eventually begin to seek out intimate partners. However, the global pandemic of recent years has impacted virtually every aspect of our social lives and, understandably, has greatly affected the normal dating and mate selection patterns among young people. In this study, we use data from two samples of college students in China; one sample was collected in the years prior to the beginning of the pandemic (2017-2019), while the second sample was conducted immediately following the end of the pandemic (2022-2024). The analyses reveal several distinct changes in the mate selection preferences on young adults. Following the pandemic, both females and males express a greater desire for partners who are caring and sensitive to their emotional needs, and express a lower preference for partners with more pragmatic qualities (e.g., earnings potential). Further, the relative effect of parental control and filial piety are shown to be lower among young people, following the pandemic. Daughters, as compared to sons, appear to be more substantially affected by parental influence. However, in the post-pandemic sample, both females and males express a lower desire for traditional marriage, the desire for a higher age at first marriage, and a greater openness to alternative forms of relationships (e.g., cohabitation). Overall, the analyses suggest that contemporary Chinese dating patterns have changed, and dramatically so, over the course of the pandemic. The results suggest that a significant shift in the mate selection preferences of both young females and males has occurred. The results are discussed within the modernization framework, and the implications for future patterns of mate selection and marriage are addressed.

Show Us What You Are Looking at. Visual Participatory Research As a Way to Collect and to Exhibit Social Interpretations

Working on social justice with people having different literacy levels, how can we present their interpretations in the way we interviewed them, i.e. without relying solely on words?

On a theoretical level, this contribution proposes a way of disrupting conventional representation, to sustain deterritorialisation as Deleuze and Guattari (1972) conceptualized it.

In concrete terms, people are first asked to show what attracts them in a picture by tracing lines or masking parts of it.

This presentation will focus on 2 case studies with 2 digital dispositifs conceived to organise and exhibit visual interpretation based on still and motion pictures.

Discriminating Seasonalities. How Greenhouse Farms (are) Shape(d) by Seasonal Work in Japan.

The seasonality of agri-food products is not a matter of chance but of social organization. In horticultural greenhouses, environmental factors can be artificially altered - e.g. with heating systems - to allow producers to enter markets earlier and with greater consistency. Seasonal agricultural work is needed longer, and is more intense and costly, thus subject to forms of rationalization - along biases and preconceptions. This paper focuses on Japan, in a context of agricultural population decline - due to aging and the lack of incentive for younger generations - and growing demand for out-of-season food, which domestic agriculture hardly meets. Recruitment and employment of foreign labor is a necessity, yet widely overlooked. This paper shows how the social organization of (counter-)seasonality in (artificialized) greenhouses, in order to stabilize their productions and outlets, is based on discriminating non-national workers: first, within the administrative institution sourcing them from overseas, securing labor under the guise of trainees - mandatorily committed to workplaces, rather than workers, channeling marginalized, non-national groups to out-of-season greenhouse farmers; then, within these farms, management is then planned according to the trainees they are assigned. We concentrate on tomatoes and strawberries, two highly artificialized and emblematic greenhouse products. Over fifteen operations and cooperatives were visited, and 13 semi-structured interviews were conducted with recruiters, trainees, and their employers in the Kumamoto region and its vicinity, ranking first in greenhouse production, Japan-wide. We underline how the cost and prospects generated by artificializing food seasonality in greenhouses operates in tandem with foreign workers' discrimination, in a country rarely investigated. Our conclusions suggest that the use of a seasonal workforce may discriminate against populations based on conformity to imperatives arising from the artificialization of seasonal production and consumption rhythms.

BLANCARTE, ROBERTO* (El Colegio de México, Mexico)

The Strange Disappearance of the Catholic Church in Mexican Politics

The Catholic Church, either by means of the hierarchy (mainly bishops) intervention and social and political movements of catholic origin, used to get involved in Mexican Politics, particularly, but not only, in times of elections or in the quest for democracy. The arrival of a populist left leaning government headed by a charismatic and religiously inspired and oriented leader changed the political landscape and the rules of engagement. The result of this changes, after a brief period of uncertainty, has been a retreat in participation and an almost complete silence regarding social changes. This paper will explore the reasons of that retreat and silence, related to secularization, populism regarding religion, or new forms of spiritual politics.

Advancing Children's Rights through Law and Policy

This presentation focuses on the experiences of involving children and young people in law and policy work drawing on the case studies of the International and Canadian Child Rights and Partnership Project (ICCRP). We discuss the ways children participate in the development of child-related laws and policies and the different leverage points for navigating across the power dynamics at play for children given a legacy of children's exclusion from the political realms. We consider the various socio-political landscapes, the importance of structures and mechanisms for supporting children's participation in the development of law and policy, and the significance of advocacy and strategic work at the local and broader levels. In examining the many ways groups of children across the globe are engaging and informing policies and laws, we reflect on the relational component of these examples of children's participation with families, communities, the different interest groups and civil society.

Disabled Pathways? Labour Market Entry Trajectories of Persons with Disabilities across Europe

Almost a fifth of the population in OECD countries report having a disability, and the proportion of students classified as having special educational needs has steadily increased over recent decades. For the study of social inequality, this group is of great interest due to their marginalization and the long-term effects of classification on their life chances. Yet, *comparative* research on the labour market inclusion of persons with disabilities is scarce, including knowledge on school-to-work transitions (STWT), and particularly studies that address STWT as processes rather than singular events. Comparative perspectives on the impact of institutional contexts in shaping these STWT of persons with disabilities are rare, hindering policy learning.

We address these research gaps by using longitudinal data from the European Statistics on Income and Living Conditions (EU-SILC). We first provide thick description of labour market entry trajectories of persons with disabilities in 25 European countries. Applying sequence and cluster analysis, we classify individual trajectories, estimating their linearity and volatility. Second, we analyze these processes in relation to key institutional characteristics. We argue that the focus of social stratification research on 'classical' institutional variables should be extended to fully understand the labour market entry pathways of persons with disabilities: thus, we include institutional indicators for support structures and segregation.

Estudio De La Gobernanza Organizacional En El Sector Turístico Extremeño

El concepto de gobernanza en los estudios de gestión se introduce principalmente en el análisis de la participación. Los estudios destacan la importancia de la participación de residentes y grupos de interés público, como ONGs y asociaciones comunitarias, en contextos como: a. Desarrollo del turismo patrimonial; b. Planificación turística; c. Alianzas público-privadas.

Aunque existen diferentes grados de participación entre las partes interesadas, algunas de ellas, a pesar de ser relevantes, no pueden influir en el proceso de toma de decisiones. El poder es una variable clave en la discusión sobre la participación, ya que quien lo tiene establece reglas que limitan la participación de algunos actores, mientras que delega el poder en otros.

La literatura sobre gobernanza en destinos turísticos ha abordado temas como la "buena gobernanza" y las "mejores prácticas", basándose en estudios de casos de lugares y eventos de interés turístico, tales como parques naturales, eventos, áreas costeras y ciudades.

Estos estudios analizan temas como: turismo sostenible y gestión integrada; la participación de las partes interesadas en procesos colaborativos; la gestión de alianzas; los desafíos y oportunidades de este ideal teórico y práctico; la interacción entre poder y política en el desarrollo turístico; y cómo los diferentes niveles de administración pública facilitan (o no) la mediación de problemas de sostenibilidad. Con base en estos temas, se establecieron dimensiones para evaluar la gobernanza turística en Extremadura mediante cuestionarios y escalas de evaluación. De los 16 indicadores analizados, la mitad obtuvo puntuaciones bajas, lo que refleja la necesidad de mejorar la gobernanza turística en nuestras localidades. Esto puede estar relacionado con que un 60% de los territorios carecen de un órgano de coordinación turística y un 63% de los que sí lo tienen no cuentan con estatutos que lo regulen.

Communicating News in Wartime Ukraine

The Russian invasion of Ukraine in February 2022 marked the first time industrial countries had fought a major war since 1945. This offers a unique opportunity to observe how news and communication change under the impact of a war. The Ukraine UNESCO Portulans study asked a representative sample of 2,014 Ukrainian mobile phone users about their news, information, and communication patterns in August 2024. The preliminary findings indicate that the war has fuelled a dramatic increase in the importance of news and information. Individuals have reconfigured their news consumption, 86% indicate they consume less Russian content. The most trusted sources are friends and family, followed by online search, Ukrainian President Zelenskyy, and internet media including social media. Traditional media like TV and print media are less trusted than internet media. When respondents want to check information they say they first ask friends and family, followed by using online search. Media literacy is high with 49% rating their ability to accomplish online tasks as good or excellent. Around 90% say they pay attention to the source of news and they check other sources to help judge the trustworthiness of news. The centrality of online search and willingness to check other sources underlines the general pattern of sourcing information across multiple information and communication channels. People are cautious in part because most understand communication as a national security issue. There is no evidence of a 'spiral of silence' in Ukraine, as arguably there appears to be in Russia (Nolle-Neumann, 1984). Friends and family are among the most trusted sources of information. Sourcing information on- and offline and sharing with friends and family seem to be at the core of this smart nation. These are preliminary themes that we will expand and put in a theoretical context for the full paper.

BLASKO, ANDREW* (IPHS-BAS, Bulgaria)

Alienation and the Emergence of Objectivity

People at times believe that they know something true, which does not change, about something that exists independently of them. But why is this the case? The present discussion addresses how this belief has come to dominate both everyday life and scholarly attitudes. A common view is that it is simply the way of the world that things seem to be separated from us by an insurmountable barrier, and even appear strange. I contend, however, that we experience such strangeness because we treat each other as alien beings—our words and deeds conceal that we live in a shared world of our own making, and a world of ostensibly independent objects mirrors us very much more than we mirror it. Reality for us is a social process, and the path on which we walk is dependent upon what we and all who have come before us have done—and perhaps only even considered doing. We nonetheless treat each other as isolated individuals in an essentially objective world because our actions have transformed things held in common into putatively pure objects that lurk in a myriad of private worlds. This fundamental form of alienation, which reflects that human creations have acquired power over their creators, both reveals and expresses the nature of hierarchies of power in society. Specific societal relations are thus a primary source of the domination of objective reason today—along with the accompanying belief in the possibility of objective knowledge and truth—insofar as reputedly pure

objects that do not manifest our creative activity are constituted through the individual appropriation of things produced in common. It is as if the latter are indifferent to us and independent of us, and our actions appear to have little effect upon what they are.

RC36-593.1

BLASKO, ANDREW* (IPHS-BAS, Bulgaria)

The Powerless and the Elites

The manner in which European colonialism generated neurotic and psychotic states in both colonizers and those colonized, coupled with the concept of double consciousness, casts important light on how power is exercised in developed countries such that citizens are inclined to submit willingly to those in power over them. The relations that previously obtained between the colonial metropole and those whom they colonized are somewhat analogous to relations in advanced societies between elites and those whom they control. There are masters and servants, and the wealth of elites is constructed through the power they exercise over those who serve them. The substantial difference between classical colonialism and today's democracy consists of how colonized slaves recognized that others exercised power over them, and eventually came to struggle against them, while citizens of modern societies believe they are sovereign individuals, even as the power, wealth, and exclusiveness of elites continues to expand. European-style colonialism was exercised in the international arena by nations who regarded themselves as superior to the other nations they controlled as their own property. In contrast, the elites in today's advanced societies exercise similar forms of domination in the domestic arena over those who regard themselves not only as free, but also as essentially equal with those who dominate them in all but their measure of wealth. This challenges current conceptions of liberal democracy, but has not yet been adequately studied. The present discussion seeks to help fill this gap by investigating these questions on a theoretical level against the background of studies of power, domination, hegemony, and governmentality in order to illuminate how power exercised by another may result in those who are dominated both desiring and approving of their submission.

BLASKO, IOANNA* (Uppsala University, Sweden)

The Figure of the Alienated Migrant "Integrating" into (European) Society

In recent years migration scholars have become increasingly reflexive and critical of otherwise commonly used concepts in migration studies. "Integration" has, for example, been argued to reproduce assimilationist ideas of alienated outsiders incorporating into an insider group – a critique which, although less frequently discussed, also applies to the concept of "inclusion". This presentation grapples with some of the historical and theoretical underpinnings of the related terms "integration" and "inclusion" with regards to migrants' experiences of alienation on the labour market and at the workplace. In addition to a theoretical discussion, empirical examples are also given from an interview study and observations conducted in Sweden with Syrian refugee engineers, in which their personal experiences are highlighted.

The paper adopts a theoretical perspective not found in previous discussions concerning these concepts by using a critical realist framework of structure and agency. This perspective helps us uncover how the discourse of "integration" and "inclusion" has led to the creation of social structures and norm circles which reproduce alienating labour market and workplace structures. These operate under the assumption that (outsider) migrants need to "integrate" into the (insider) "host society". These structures have real life effects on how practitioners, as well as migrants themselves, view integration and alienation.

BLOIS, JUAN PEDRO* (National Scientific and Technical Research Council (CONICET), Argentina)

For a History of Sociologists in the Wild

The history of sociology has traditionally examined sociology as an academic discipline and/or intellectual discourse. In effect, specialists, regardless of their preferred approach (intellectual, institutional, etc.), have largely focused on sociologists working within universities and/or scientific institutions. While academia plays a fundamental role in the making of sociology in any society, non-academic postgraduate practices—such as those within government agencies, private corporations, or NGOs—can also be seen as playing an important role. Building on studies aimed at unraveling the development of sociology "in the wild" and on my own research on the trajectory of sociology in Latin America, this paper will argue for the importance of exploring the

professional activities of sociologists beyond academia. First, it will draw attention to how this intellectual agenda can serve to explore the ways in which sociological expertise has been legitimized, demanded, and used by different social actors and non-academic institutions in different contexts—a line of inquiry that may pave the way for a systematic understanding of the social effects (or performativity) of the discipline. Second, it will contend that the study of sociology outside academia can help to stimulate scholarship that focus on “ordinary” sociologists rather than just the “big names” of the discipline. This, in turn, may shed light on how some of the perennial intellectual controversies of the discipline—e.g., involvement vs. detachment—have been embodied in the daily routines of sociologists working for a client or employer. Last but not least, it will show that this broader approach can be instrumental in furthering the interrogation of academic sociology itself as it may encourage a more relational gaze—an individual's waver in academia may be influenced, for example, by the (other) professional options outside universities.

RC52-809.2

BLOIS, JUAN PEDRO* (National Scientific and Technical Research Council (CONICET), Argentina)

From the Office to the Screen. the Digital Transformation of Psychotherapy in Buenos Aires

In recent decades, social life has become increasingly digitalized. Professional practice was no exception and a growing share of services like legal advice, design, or even religious guidance are now delivered through digital media. By taking the face-to-face interaction between experts and their clients to screens, digitalization has paved the way for the rapid disembedding of professional work from its traditional workplaces. This is not without consequences: as various studies within the sociology of knowledge have emphasized, places are not merely a setting or backdrop, but an agentic player in the production and legitimization of expert practices. In effect, places are endowed with cultural meanings that lend credibility to certain beliefs that are instrumental in the relationship between a professional and their clientele. To address this issue, this paper examines the growing incursion of psychotherapists in Buenos Aires (Argentina) into the digital environment and how these professionals navigate the challenges of working as cloud-based consultants outside the traditional place of therapy, i.e. the office. How do they establish authority or deploy empathy in the digital environment? How do they defend their autonomy and build trust? Based on in-depth interviews with practitioners—including individuals who work in different modalities (only online or combining both online and in person) and who work via video-calling software (Zoom, WhatsApp, etc.) or mental health platforms—the paper explores the challenges of shifting to online work, the practitioners' thoughts on virtual psychotherapy, and the differences in working conditions associated with using video-calling software versus specific mental health platforms. Buenos Aires offers itself as a compelling case study for exploring this issue: not only is it the city with the highest proportion of psychologists per capita in the world, but it has also traditionally been considered a hotspot for psychotherapy and psychoanalysis in the Spanish-speaking world.

BLOM LUSSI, ELLINOR* (Lund University, Sweden)

Who Is the Problem Represented to be? Subjectification and the Social Division of Automated Welfare Surveillance

Automated welfare surveillance has become increasingly more popular in public sectors. Sweden is no exception; on the 1st of January 2024, a new Swedish welfare state was launched. The UBM, short for Utbetalningsmyndigheten, is a public agency that will utilize system wide data analysis in order to detect, forestall and prevent inaccurate welfare payments. Meaning that the authority will screen welfare recipients for fraud using algorithms and data analysis. Previous cases of algorithmic welfare fraud schemes indicates that there are significant risks of harm when states utilize automation when conducting welfare surveillance.

Sweden is commonly recognised as a social democratic welfare model, meaning that the state provides welfare benefits to all citizens. The Swedish welfare state makes a difference between allowances, deductions and subsidies. While this division formally takes shape as an organisational difference, the division also has moral and social implications. It is argued that tax reductions and tax reliefs tend to require far less documentation and control than social welfare, a notion that very closely can be connected to the idea of the criminalisation of poverty.

This paper seeks to engage with the issue of who is considered to be the problem when the Swedish state establishes an automated welfare surveillance scheme. With the WPR framework (short for what's the problem represented to be?), this paper will answer the research questions: Who is the target population in the establishment of the UBM? And how has this problem representation come about? By making use of public reports and official documents, this paper highlights who the presumed welfare fraudster is, and how the idea of who is presumed as the “problem” has changed over time.

BLOMQVIST, PAULA* (Uppsala University, Sweden)
WINBLAD, ULRICA (Uppsala University, Sweden)

Ideas, Interests and Institutions in the Swedish Health Care System

The modern Swedish health care system was constructed around the idea of a universalistic, tax-based system where public authorities take responsibility to ensure that all citizens have access to high-quality health services on equal conditions. Solidarity was built in to the system through its financing—progressive income-taxation—as well as the overriding principles of equal access and medical need as the only acceptable principle of resource allocation and prioritization. To insure these values, public ownership of health care institutions, also in primary care, became the preferred political option. The values underpinning the system, many of which were inspired by the UK Beveridge report, also aligned with the political visions of the Swedish social democratic party which governed the country during most of the period the system was constructed (1932–1976). After 1980, the system became the target of increased criticism from the right-wing political opposition which led to a series of reforms in the 1990s and 2000s. Values associated with neoliberalism such as efficiency, private entrepreneurship, choice and consumer rights gained impact, leading to an abandonment of the previous public monopoly on care provision and a stronger attention to the patients' satisfaction with the system. At the same time, a broad political consensus on the values of universalism and social equality has prevailed in Swedish social politics, moderating reform ambitions.

BOATCA, MANUELA* (University of Freiburg, Germany)

Romani Europeans and the Challenge of Unthinkable Histories

Present in Europe for centuries, but still not considered of Europe or addressed as Europeans, the Roma are not part of Europe's reckoning with either racism or enslavement. Such reckoning routinely restricts

European racism temporally to the Holocaust, conflating racism with antisemitism; and relegates enslavement spatially to Africa and the Americas, equating enslavement with the transatlantic trade. The Roma

fall through these temporal and spatial cracks in Europe's current politics of memory. I trace this structural oblivion to an Occidentalist imaginary that equates Europeaness with whiteness and that has historically produced unequal Europeans in the South and East of the continent to which non-white and other non-conforming populations, histories, and events can routinely be relegated. Drawing on Michel Rolph Trouillot's analysis of the Haitian Revolution as an “unthinkable history” made by enslaved Black people, I argue that European politics of memory will remain incomplete as long as the history and the present of anti-Roma racism, the legacies of Romani enslavement, and the implications of such histories for the (im)possibility of constructing an identity as Romani Europeans are deemed unthinkable in an Occidentalist white Europe.

BOCCAGNI, PAOLO* (University of Trento, Italy)

Undoing Nothing: From an Ethnography with Young Asylum Seekers to a Sociological Research Agenda

What does “doing nothing” mean for young people like asylum seekers in “waithood”? And what lies behind “nothing”, aside from the obvious fact that “something” is happening nonetheless? In order to address these questions I draw on a four-year ethnography in an asylum centre in Northern Italy. I was a frequent guest in the temporary and segregated dwelling spaces of several young men from West Africa, waiting for their asylum claims to be assessed. “Nothing”, to them, is more than a negative or residual label. Rather, it articulates distinct meanings and plays out different functions. For one thing, it expresses a lack of meaningful things to do, while public authorities divest them from any support other than basic livelihood, in a liminal space where only those with more capitals and good luck will find a meaningful way ahead. “Nothing” vents out frustration for the distance between what migrants have achieved and the new and dignified life they had been aspiring to; one that should afford autonomy, adulthood, success. Sometimes nothing is also used in a more assertive tone, to clear out from conversation, and ideally from one's thoughts, all haunting memories from the past—people left behind, violence encountered or witnessed, literal proximity to death. Nothing, therefore, has much to do with absence—another category of increasing, if elusive relevance. In sum, my ethnography elucidates the promise of a more systematic and critical analysis of what nothing does, regardless of what it is, as a category in use, especially among young people in protracted transition toward their next life stages. “Undoing nothing”, through the lived experience of those dispossessed of meaningful life horizons, is a fruitful exercise for social scholars of youth, forced migration, and beyond.

Ageing over Generations - Labour Migrants from North Africa in the Context of the Recruitment Agreements of the 1960s in the Federal Republic of Germany

Sociodemographic change in Germany poses major challenges, especially for the ageing immigration society of the 1960s. Labour migrants from North Africa occupy a special position but are underrepresented in political and academic discourse. Against this background, my PhD project focuses on how this aspect of social inequality shapes the view of age(s) of subsequent generations of labour migrants and how gender becomes relevant in this context. The focus here is specifically on labour migrants who immigrated to Germany from Morocco as part of the recruitment agreements from 1963 and from Tunisia from 1965. In order to trace the specific challenges faced by this group, it is important to examine the second and third generations and to draw comparisons with their parents and grandparents in order to gain insights into the ageing of the first generation of labour migrants.

The aim is to find out how the subsequent generations perceive their own age(s) and to draw comparisons with their parents and grandparents. In addition to a migration- and gender-specific perspective, a set of qualitative-empirical methods will be used to collect subjective interpretations of how the descendants of North African labour migrants themselves imagine ageing and what perspectives they see in this regard. Specific life situations and life courses become visible in the field of tension between the different categories of migration, age(s) and gender. At the same time, the interdependence of these dimensions is constantly emphasised in order to reflect on them with a view to an ageing society in Germany. Building on this, I would like to present the initial results of my research in Rabat and obtain feedback.

Diversity Colliding with Uniformization: The Hidden Paradox in the Organisation of Inclusive Childcare in Contemporary Germany

Worldwide, childcare services have seen strong policy commitments to both develop their professional mission and respond to diverse educational needs. In Germany, this comprises a social inclusion mandate targeting disabled children and those with language problems. Regulatory frameworks seek to introduce specialised services into early childhood education and care (ECEC) settings which are expected to offer special assistance and training tailored to individual circumstances. Concomitantly, ECEC settings are pushed to find ways conducive to the building of better 'human capital' in order to ensure that all children leave them with a 'standardized' repertoire of skills (especially those expected by primary schools). Hence the institutional environment of the involved organizations contains two parallel agendas, that is, proactively accounting for diversity among their clientele and making key operations more 'uniform'. Drawing on results from a – largely interview-based – qualitative research project involving four German childcare organizations, our paper illustrates how the latter struggle and cope with induced pressures, considering, among other things, the role of quality management systems and professional self-inspection. We show that, internally, the social inclusion mandate entails mixed feelings as related programmes are decoupled from the day-to-day and external stakeholders (e.g. parents) call for 'results' in terms of acquired skills. With scarce and scattered human resources, but also due to a 'mission overload' of contemporary ECEC settings, exclusionary dynamics emerge as a side-product of a 'diversity-sensitive' reorganization of the sector. As care workers are torn between incompatible missions, differentiated educational outcomes seem unavoidable, emanating from the hidden paradox of a the deliberate arrangement of specialized assistance coinciding with a movement of organizational streamlining. Solutions to this imbroglio may come from efforts to put the various institutional expectations in harmony with each other and rethink the complex goal structure imposed on the sector.

BODUR, MUHAMMED YASIR* (Sakarya University, Turkey)

KILIÇ, MUSTAFA AMMAR (Tekirdağ Namık Kemal University, Turkey)

Migration, Labor, and Tea Harvesting in Turkey: Sub-Saharan Africans amid Post-Pandemic Transitions

The COVID-19 pandemic significantly disrupted Turkey's labor market, particularly in informal sectors. Seasonal labor markets experienced increased volatility, prompting shifts in workforce dynamics. This research examines the role of Sub-Saharan African migrants in seasonal tea harvesting in Turkey's Eastern Black Sea region, focusing on the pandemic's effects and aftermath.

Fieldwork conducted in 2020, 2021, and follow-up research in 2024 explores how economic challenges and stricter enforcement against undocumented migrants, particularly in Istanbul, led many Sub-Saharan Africans to seek agricultural employment. Observations and interviews with migrants, garden owners, intermediaries, and local authorities reveal that labor dynamics established during the pandemic persisted.

A rotational labor system emerged, with Sub-Saharan African migrants increasingly filling labor shortages traditionally met by Georgian workers. Pandemic-related border restrictions sharply reduced the influx of Georgian laborers, creating opportunities for Sub-Saharan African migrants. Tea harvesting became a more stable income source compared to precarious informal jobs in Istanbul. For many, this shift represented a strategic alternative despite poor working conditions and low wage. Employment was often secured through social networks and intermediaries. Solidarity networks helped migrants navigate challenges and ensure economic survival.

In the post-pandemic period, rising inflation and labor migration agreements between Georgia and EU countries decreased Georgian workers' interest in Turkey's agricultural sector. Meanwhile, evolving migration policies and stricter enforcement against undocumented migrants in Istanbul further pushed Sub-Saharan Africans toward agricultural work. Since 2020, these migrants have gained significant experience, with seasonal agricultural work offering more stability. They have emerged as key players in Turkey's tea-harvesting labor market.

This research analyzes how Sub-Saharan African migrants adapted to and reshaped Turkey's agricultural labor landscape, emphasizing their role in tea harvesting while linking broader trends to Turkey's migration policies.

Mothers Who Use Opioids: An International Comparative Analysis of Policy and Practice in the UK and US Socioeconomic Landscape

This is a presentation of an analysis of data collected in the *Relations Study* in the UK and the *Mothers Study* in the US with the goal to provide international perspectives on policy and practice for future guidance in clinical sociology. Both studies collected ethnographic observation data in community and clinical settings, and qualitative interviews from mothers who used opioids, including prescription pain medications, heroin, and opioid medication treatment. The number of parents using opioids has been increasing, exposing a critical lack of treatment facilities for mothers and pregnant women with opioid use dependence. Mothers of young children who use drugs may be met with judgmental attitudes and discriminatory treatment in their encounters with social services and health providers. Parents who use drugs are an intensely governed population and subject to competing policy agendas and coercive practices. There is a gap in understanding how increased surveillance affects utilization of required healthcare and desired outcomes. To understand and respond to parental opioid use, research must account for the wider social ecology within which families are embedded. The *Relations Study* was guided by an analytic framework drawing attention to an underlying question of how people are governed and how governing shapes peoples' lives. The *Mothers Study* was guided by a syndemics framework to focus on the socio-ecological aspects of the women's everyday reality. This combined analysis will provide comparative findings on the extent to which different governing systems affect mothers who use opioids and the outcomes for their families. The UK study was funded by the Economic and Social Research Council (ESRC); the US study was funded by the National Institute on Drug Abuse (NIDA). The analytical collaboration was funded by the Fulbright-Scotland Distinguished Scholar Award at the University of Edinburgh, hosted at the Institute for Advanced Studies in the Humanities.

Generative AI and Challenges of Social Perception in Healthcare

The research utilized empirical data from a CATI survey conducted in 2023-2024 (N = 1600) and included experiments with textual and visual generative neural networks.

Findings indicate that generative AI is primarily used by younger individuals, who tend to understand the technology better, while older generations remain cautious. One in three respondents reported experience with generative AI, a figure that has remained stable over the past year, signaling a plateau after initial growth. Notably, only 9% have used generative AI for health-related inquiries, and only a third believe it could replace a doctor. A significant barrier to wider adoption is the poor and negative image of AI, which is more common among older Muscovites. Respondents express concerns about medical errors and treatment quality.

Not only do social perceptions influence AI usage, but there is also a reverse influence. The study highlights that neural networks reinforce visual (appearance) and fictional (texts) stereotypes about medical professions. For instance, nurses are often portrayed as young, white women in a uniform, while doctors are middle-aged men. Functional stereotypes limit the perceived roles of nurses, who are often seen merely as "doctor's assistants". There is a vicious circle when neural networks are being trained on stereotypical data, generating stereotypical output, and being trained on more stereotypical data. To disrupt this cycle, it is important to analyze the output from neural networks with a socio-humanistic lens, aiming for an evidence-based perspective free from specific ideological biases. This approach, which we termed "prompt experiment," has been partially adopted by major AI companies, though concerns about their objectivity persist. Also, our research reveals that many medical stereotypes are deeply ingrained and require specialized skills for identification.

Engaging with social perception is vital because literature reveals its connection with current challenges within the healthcare system.

BJORKHAUG, HILDE (Norwegian University of Science and Technology, Norway)

Swimming Downstream: Global Issues, Local Conflict

Producing more than half of the farmed Atlantic salmon in the world, Norway is by far the world's largest producer of farmed salmon (FAO 2023). In addition to its contribution to marine value creation in Norway, international organisations like FAO have represented salmon as a more sustainable source of protein than red meat that can be used to feed the world's growing population (FAO 2023; Ministry of Foreign Affairs 2017; Reinertsen and Asdal 2018; SINTEF 2012). However, the many environmental challenges of the industry have made salmon farming a site of enduring conflict in Norway (Bjørkan and Eilertsen 2020; Osmundsen and Olsen 2017; Tiller, Brekken, and Bailey 2012). This reveals negative interactions between SDGs as food security clashes with environmental sustainability (Hickel 2019).

In 2024 the Norwegian Environment Agency closed salmon fishing in 33 rivers during the salmon fishing season due to the status of wild salmon stock, which is at a historically low level (Miljødirektoratet 2024). Referring to a report from the Norwegian Scientific Advisory Committee for Atlantic Salmon [1], they identified salmon farming and climate change as the largest threat to wild salmon (Miljødirektoratet 2024). This led to a heated public debate, which is the subject of our investigation. As most farmed salmon produced

in Norway is exported (Ministry of Trade, Industry and Fisheries 2021), the case raises questions about downstream impact of global food production. In this paper we use situational analysis to map actors, issues, and discourses to critically examine the construction of policy issues and how knowledge is used in the situation, focusing on the relations between the salmon farming industry, known as a powerful lobbyist, and less organised local resistance, as the foundation of global sustainability is local sustainability.

BOINO, CAMILLE* (Université Lumière Lyon 2, France)

Des Dispositifs Au Prisme Des Expériences Des Adolescents : Étude D'un Dispositif De Santé En Éducation Prioritaire.

Cette proposition de communication s'inscrit dans le cadre du panel «The Rise of Devices in Secondary Education». Elle vise à interroger les dispositifs éducatifs (Barrère, 2013) à travers le prisme de leur public, en se concentrant plus particulièrement sur les récits d'adolescents scolarisés dans des établissements relevant de l'éducation prioritaire. Le dispositif étudié ici est porté par l'établissement scolaire et ses enseignants, en partenariat avec des structures extérieures (médico-sociales et de jeunesse). Il a pour vocation de répondre à des problématiques sanitaires, adoptant ainsi une approche plus sociale que scolaire (Frangji, 2017) des difficultés rencontrées par les élèves de l'éducation prioritaire. Ce dispositif vise à éduquer et sensibiliser les adolescents de cinquième à la santé mentale et physique en abordant des thèmes tels que la puberté, la nutrition, l'usage des écrans, et l'activité physique en plein air, avec des ateliers organisés tout au long de l'année scolaire. Des entretiens semi-directifs ont été menés avec des adolescents participant à ce dispositif, au cours desquels ils ont décrit les activités réalisées et proposé une réflexion sur leur expérience. L'intérêt de cette étude est d'explorer les dimensions subjectives à travers les perceptions et les appropriations du dispositif par les adolescents. Les entretiens révèlent ainsi des perceptions variées : certains considèrent ce dispositif comme une pause nécessaire dans leur parcours scolaire, tandis que d'autres remettent en question la pertinence de certains thèmes, comme la puberté, influencés par les opinions de leurs familles. D'autres encore voient dans ce dispositif un espace d'apprentissage. Cette diversité de points de vue souligne les tensions entre les objectifs institutionnels affichés et les expériences vécues par les adolescents mais aussi sur la prise en charge de ce qui fait problème.

Exploring Lived Temporalities: Narratives of Adolescents in Urban Poverty Contexts

This communication is situated within the framework of the panel "Contested Everyday Temporalities. Children and Youth in Contemporary Changing Worlds". It examines how young individuals, aged 11 to 15, all enrolled in programs for disadvantaged youth, perceive what constitutes their daily lives and activities through their narratives. The study delves into the daily temporalities experienced by adolescents in low-income neighborhoods. It analyzes how they organize and narrate their week, uncovering variations and commonalities in their experiences. Through semi-structured interviews with adolescents, detailed accounts of their current week were gathered. This approach enables the collection of specific narratives, highlighting significant (marked) and less emphasized (unmarked) social aspects (Brekhus, 1998), thus revealing the diverse daily experiences despite a shared disadvantaged youth context. The narratives illustrate the diversity of adolescents' priorities. While some structure their week around family responsibilities, emphasizing familial obligations, others prioritize unstructured activities, focusing on time spent outdoors and leisure without adults. Still others highlight activities structured by adults, such as schooling and organized leisure, like clubs and extracurriculars. This diversity underscores how adolescents experience daily life, balancing the search for autonomy, family commitments, and institutional expectations. To deepen this analysis, the concept of budget-time has been mobilized and reinterpreted as "experiential time-budget." Unlike traditional time-budget (Sorokin and Berger, 1939), which focuses on precise measurement of activities, experiential budget-time relies on adolescents' narratives. This subjective approach allows for a better understanding of how young people navigate their daily lives in urban poverty, considering the elements they find worthy of recounting and those they omit. In conclusion, this communication offers an exploration of the lived temporalities of adolescents in urban poverty contexts. By examining their narratives and applying the concept of experiential budget-time, the study sheds light on the complexities and variations in their temporalities, considering their experiences in vulnerable situations.

The Social Crisis of Water in Aconcagua, Chile: Privatised Rights Management and Collaborative Usage Strategies in a Context of Mega-Drought

This article addresses the ongoing drought situation in the Aconcagua basin in central Chile, framing it as a social crisis caused by the 1981 water management model. The model prioritised the privatisation and commercialisation of water for large-scale agriculture, forestry and energy, leading to intensive usage and unequal access. For over 15 years the basin has been experiencing a prolonged mega-drought, leading to escalating conflict between social movements and actors from various sectors and social strata. In an attempt to address the situation, a reform passed in 2022 prioritises human consumption of water and seeks to mitigate inequalities in water access and distribution. We examine how the 2022 water reform and the water governance model proposed by the regional government of Valparaíso have addressed growing water conflict. Using frameworks derived from political ecology and the commons paradigm, our study investigates conflicts between key actors involved in water management and the search for collaborative solutions in Aconcagua. We applied cartographic methodologies, conducted 19 in-depth interviews with key actors, and engaged in participant observation in five regional water meetings between May 2023 and June 2024. Our findings reveal that new actors and collaborations have emerged within water debates. Municipal authorities are increasingly tasked with providing potable water in waterless sectors; Rural Drinking Water Associations seek recognition for their historical role as community water managers; and the General Water Directorate has increasingly intervened to redistribute the existing supply. Our findings highlight the importance of strengthening cooperation in support of collaborative water models that recognise the diversity of uses and actors within the basin and their ways of relating to the territory. Our results raise the question of a water model that accounts for social and geographical heterogeneities and promotes the development of collaborative water experiences at the local, provincial and regional levels.

Women Lawyers, Judges, and Law Professors and the Mobilization of Moral Agency to Reconfigure Professional Forces

The paper examines the role of women judges, lawyers, and law professors in mobilizing moral agency to reshape professional forces. It addresses moral disputes within the professional space, viewed as interactions within the professional ecology. It departs from the legal-liberal political order and its challenges and contestations. It focuses on the moral disputes surrounding these women's perceptions of their professional practice, institutional policies for reserving career positions for Blacks and women, political polarization, and democratic backsliding. These disputes seek to draw symbolic boundaries among women and between female and male colleagues, highlighting persistent tensions. The blurring of boundaries between legal expertise and politics illuminates professional cooperation and the identification between women and men in this regard. The paper also approaches how professional regulatory bodies use ethical codes to address political conduct producing professional impurity. The qualitative empirical data is drawn from 10 semi-structured interviews and online research on professional associations' websites and social networks. The fieldwork reveals how moral agency intertwines with the genderization and racialization of professional relations.

BONEMER CURY, CAROLINA* (University of Sao Paulo, Brazil)

Risk Monetisation: A Service or a Disservice to Effective Risk Management Practices in the Workplace?

In risk management, risk monetisation is a process by which the loss associated with a particular risk can be estimated in monetary terms. In the context of industrial relations, the term may also be used when employers or governments adopt policies whereby workers are paid a premium to compensate for hazardous work. Although some theories suggest that such compensation would lead to safer workplaces, as employers would invest in occupational health and safety to avoid the additional labour costs, other studies have shown this to be false.

In Brazil, occupational risk is monetised through various forms of hazard pay received by workers, and the rate of occupational accidents and diseases remains high. Moreover, although the value of most types of hazard pay is not high, it is an important source of income for many low-paid workers. It may therefore discourage workers and workers' organisations from demanding safer workplaces, as with reduced risks would come reduced wages.

To assess whether such discouragement occurs, quantitative empirical research is being used to determine whether workers' organisations in Brazil have engaged in collective bargaining and collective action aimed at reducing workplace hazards or, conversely, whether their actions are focused on obtaining hazard pay for workers.

By identifying the behaviour of workers' organisations, this research attempts to determine whether the existing risk monetisation policies in Brazil present a disservice to the improvement of occupational safety and health.

Social Movements, Constitutional Change and Transitional Justice in Chile (2019-2023)

In South America, with the end of the civic-military dictatorships that ruled almost all the countries of the Southern Cone in the frame of Operation Condor (Paraguay, Brazil, Uruguay, Argentina, Chile) between the '60s and the '80s, we can see the start of different legal responses to the State Crimes committed, reestablishing democracy and rule of law in the region. Since the mid-1980s, Latin America has seen an intense period of constitutional change, as almost all countries either adopted new constitutions. After the worldwide known Chilean Uprisings in 2019 ("estallido"), Chile started a political and legal process to substitute the 1980 Constitution, a strong political symbol of Pinochet's dictatorship era (1973-1990). On the 27th of October 2020, Chileans massively voted in favor of the beginning of this new constitutional process that could play an important role in the unfinished Chilean transition to democracy. On the 4th of September 2022, the First Draft of the Constitution presented by the elected Constitutional Convention was overwhelmingly rejected by Chilean citizens. In 2023 a "Committee of Experts" wrote a new draft that had to be discussed by a "Constitutional Council" and then voted through a new Referendum on the 17th of December 2023. This second draft was also rejected, through different arguments and positions by social movements and parties of the Chilean political spectrum. Here we seek to investigate the post-"estallido" constitutional process in Chile, to understand its relationship with the transitional period and its unresolved issues. The preliminary results of a 2 months fieldwork in Chile will be presented, in order to share some insights on the processes of political and social change from the point of view of different actors interviewed in Santiago.

BONHOMME, MACARENA* (Universidad Autonoma de Chile, Chile)

Social Media As a Tool of Resistance for Migrant Platform Workers

In Chile, protests and strikes led by migrant food delivery workers since 2020 have challenged the literature that suggests that migrants are less likely to appeal for better conditions or to unionize for fear of losing their jobs and/or deportation. Through social media platforms, migrant workers have organized and gathered to demand better conditions. Drawing on multi-sited and digital ethnography and 30 interviews with workers in food delivery apps in Santiago and Valparaíso, this article delves into the different forms of resistance migrant riders have pursued through social media. This study shows that virtual communities have been built to organize and support each other collectively. Virtual communities also serve as countermeasures to fight racist representations from society and media. Riders' social media accounts and virtual communities have been vital to migrant workers' resistance. First, to resist the precarious working conditions in the platform economy by organizing protests and strikes; second, to build community and solidarity among workers; and third, to resist racialized representations of Latin American and Caribbean migrants. Through Instagram and X/Twitter, migrant workers endeavour to build a positive image, self-portraying themselves as both allies in the control of street crime and as "good migrants" who are contributors to society by doing social services. Sharing content becomes a way to humanize themselves against the anti-immigrant discourse and racism that they face. Therefore, using social media has been key for political action and solidarity amid an unequal society that is increasingly excluding them from citizenship.

Legal Status in Limbo: Insights into Italy's Labour Migration Regime

The structural features of the Italian immigration regime and labor market have historically led to high levels of irregularity and precariousness in both labor relations and migrants' legal status. The unresolved tension between the declared fight against irregular migration and unwanted migrants, and the need to secure flexible, low-cost labor for positions that natives no longer wish to occupy, has resulted in repeated, often sudden measures for mass employment-based regularizations and in the cyclical admission of selected foreign workers through the annual quota system known as the *Decreto Flussi*. In 2020, in the wake of the pandemic crisis, and twelve years after the previous amnesty, the Italian government launched its latest mass regularization, targeting workers in the domestic and agricultural sectors. In 2023, a new three-year plan was introduced for the admission of over 450,000 workers.

Based on an analysis of the 2020 amnesty and the 2023-2025 annual quota mechanism, this paper shows that such measures have created extensive conditions of protracted liminality and legal limbo for migrants. It examines, first, the factors producing administrative limbo during the implementation of these two policies - illustrating the role played by key actors, most notably public administrations, employers, and intermediaries. Second, it explores the implications of this often-protracted legal limbo on the lives of migrants through a discussion of illustrative case studies. The research draws on qualitative interviews conducted within the framework of two Horizon projects, with experts, public officials, employers' organizations, trade unions, private assistance centers responsible for managing the administrative procedures of the amnesty or *Decreto Flussi*, and migrants who participated in these processes.

Disrupting Professional Academic Identities? the Effect of AI Technologies on South African Academics

This paper investigates the evolving professional identities of South African academics in light of emerging AI technologies, particularly those utilising Natural Language Processing and Machine Learning. It tackles two key questions:

Firstly, how do South African academics construct their professional academic identities? This includes their understanding of their roles, the demands of the organisations as well as the key values and experiences that shape their academic identities, and how they understand the signifiers of professionalism within their fields. Additionally, it examines how race/gender/age/language contribute to their academic identity?

Secondly, the paper investigates whether South African academics perceive, or have experienced, new AI technologies as disruptive of their academic identities. If so, it seeks to understand the nature of this disruption and how they understand its effect on their professional identities.

To explore these questions, this study uses a qualitative methodology based on in-depth-interviews with twenty academics across various disciplines and of different ages, genders and racial/ethnic backgrounds. By examining their experiences and views, the paper aims to provide insights into the intersection of AI technology and academic professional identity in South Africa.

Climate Change Movements and Online Youth Radicalization: Visions, Symbols and Emotions of Dissent

The study aims to explore the relationship between radicalization, youth collective actions, and environmental online activism and its consequences offline. Starting from the concepts of creativity and radical imagination, this paper analyzes the opportunities that they offer to young people to reflect on their self-representation in the social environments, emphasizing the role of emotions as drivers of collective actions. Younger generations want to be protagonists of social change, as it might be understood by examining the online discourse of climate activism. Social networks should not be conceived as a separate space but in continuity with the offline world, directly influencing their way of thinking and acting.

Using the sentiment analysis, along with lexical correspondence analysis, an evaluation and categorization of opinions and emotions conveyed in some official press releases will be done. In particular, this paper focuses on some radical climate movements such as *Ultima Generazione*, *Letzte Generation*, *Just Stop Oil*, and *Extinction Rebellion*. Using natural language processing, this methodological approach points to underline the connection between radical non-violent militancy in real life (roadblocks, targeting masterpieces, chaining themselves to public places) and radical discourse on the Internet. The empirical data obtained will be compared, for an in-depth understanding, with an explorative analysis through the visual meaning approach of some relevant figurative posts on the social pages of the previous movements.

According to the obtained results, this work addresses the following questions: How do young radical climate activists represent themselves in online communication practices? Can the online environment play a role in orienting collective objectives and actions? How creativity and radical imagination contribute, as tools, to the raising awareness on the issue of climate change? Can they foster concrete actions aimed at social change?

Framing Social Policies for Aspirational Justice: A Perspective Oriented Towards the Enhancement of Capability to Aspire and Capability for Voice

Social policies are meant to tackle vulnerability processes, but they do not always reach their target. This (partial) failure can be explained by a multiplicity of reasons, e.g. the inadequacy of available resources, inappropriate expectations placed on beneficiaries, etc. This contribution claims that an important reason for explaining the limitations of social policies lies in their inability to take beneficiaries' aspirations and voices seriously, often resulting for the most disadvantaged among them in exclusionary processes or non-take-up of benefits and services. The paper investigates this issue, mobilizing a perspective based on the notions of capability to aspire and capability for voice.

In a first step, the sense of these notions is theoretically explored, based on the receiver-doer-judge framework that proposes a multidimensional notion of vulnerability encompassing material well-being, capacity to act and political participation. In a second step, it identifies what such notions entail for the conception of public action and public services in the field of welfare. This is then confronted with the findings of empirical studies in the field of youth policies, with a view to assessing their impact on their beneficiaries' capability to aspire and capability for voice. A multilevel perspective is used to investigate to what extent there is a gap between vulnerability a) as it is experienced at micro level (a multidimensional and complex fact), b) as it is framed by social policies at macro level (vulnerability as a social problem to be solved, in a normative perspective detailing the expectations that beneficiaries ought to comply with) and c) as it is implemented by public agents (at the crossroad between fact and norm). The contribution offers some concrete suggestions how social policies might more efficiently reach their goals and promote aspirational justice.

RC20-294.3

BORDANOBA GALLEGO, LIDIA* (Department of Sociology, University of Barcelona, Spain)
 FLECHA, RAMON (Department of Sociology, University of Barcelona, Spain)

Validated Artificial Intelligence: Sociological Contribution to Positive Impact of Artificial Intelligence

In scientific and social forums, there is significant debate about the social impacts, both positive and negative, of Artificial Intelligence (AI) and Generative Artificial Intelligence (GAI). However, so far, no scientific research has been conducted to provide clear guidelines for mitigating the negative effects without compromising the benefits of AI. Sociology is making the key contribution to this endeavour.

Through the communicative methodology, focus groups have been conducted in which participants analyzed and discussed documentation showing the effects of AI application. These analyses were linked to the monitoring of the Sustainable Development Goals (SDGs), with particular emphasis on SDG 8. This goal proved to be especially significant during the discussions, as it generates the highest number of both positive and negative effects in the reviewed documentation.

The results indicate that the negative effects can be offset by the positive effects, which can be enhanced when based on scientific evidence that helps

avoid bias and ensures that the generated information is accurate and reliable. For this, it is essential to use Validated Artificial Intelligence (VAI) and Validated Generative Artificial Intelligence (VGAI) (Pulido et al., 2023), as these tools can scientifically verify and validate both the provided and produced data, ensuring they are free from bias and aligned with accuracy and reliability standards. Thus, the research proposes an approach aimed at maximizing the benefits of AI application. This implies focusing on the positive and normative aspects of its implementation, avoiding "Luddite" arguments that, by opposing technological progress, may slow development and limit the positive effects AI can generate.

BORGARELLO, FRANCESCA* (Centre for Social Studies, University of Coimbra, Portugal- University of Bologna, Italy)

Rethinking the Concept of Left-behind Places. a Dialogue with Partha Chatterjee's Notion of 'Political Society'

In this paper I intend to discuss what I understand as a particular declination of the concept of 'left-behind places', from the postcolony: the concept of political society elaborated by Partha Chatterjee (Chatterjee 2004, 2011, 2020)

With this concept, Chatterjee attempts to rethink spaces normally perceived from a Eurocentric and nationalist point of view as 'left-behind by progress' and populated by 'surplus population' as instead **1)** 'productive' spaces of: new processes of subjectivation, specific political forms and grammars, new forms of capitalist subsumption, resistance to the dynamics of subsumption, unforeseen urban forms; **2)** structurally produced by capitalist logics and State dynamics, as 'necessary spaces'; **3)** permanently reincluded 'in differential ways' in the space of capital and the State

He observes these dynamics in the specific context of Calcutta. In particular, he examines the reorganisation of the 'urban cartography' in the postcolonial city along a fundamental division: between a space that 'follows' the Eurocentric 'norms' of urbanity and one that transgresses and exceeds them, giving rise to different norms. It is this second space that he calls 'political society'.

In this paper I intend to retrace the construction of the concept of political society in Chatterjee - also in articulation with other authors of the 'Global South' (Samaddar, Sanyal, Gago, Simone) - in an attempt to exercise a different gaze on what in the social sciences is often perceived as a 'place left behind'. I will do this by giving particular centrality to **a.** the urban/geographical reconfiguration from which the space of political society emerges, in Chatterjee's reading; **b.** and the political forms that emerge from this space. Among these forms, I will particularly examine populism, which is conceptualised by Chatterjee (Chatterjee 2020) as one of the fundamental political logics of 'political society space' and, more generally, of the postcolonial space.

RC02-30.2

BORGARELLO, FRANCESCA* (Centre for Social Studies, University of Coimbra, Portugal- University of Bologna, Italy)

Translating Marx in the Postcolony. the Case of Subaltern Studies' Re-Conceptualisation of 'Labour Under Capital'

Marx has been central to 'think the Postcolony', at different latitudes. At the same time, post- and decolonial perspectives have offered among the most interesting re-readings of Marx in recent decades. Marx's thought has emerged transformed and displaced from the postcolony, acquiring a new and often unexpected life. The notion of 'translation' in an expanded sense (political, conceptual) is among the most interesting concepts to account for this transformation process. Among the central experiences in this global operation of re-reading is certainly that of Indian Subaltern Studies, which here I consider as a collective and creative operation of Marxist translation (e.g. of Marx himself, Gramsci, History from Below).

In this paper I intend to consider the specific operation of Marxian translation put into practice by Subaltern Studies, focusing in particular on their reconceptualisation of 'labour under capital' in an expanded sense. The reconceptualisation of labour has always been central to the Subaltern Studies: rooted in specific case studies, it has involved a broader conceptual/theoretical reflection on the meaning of labour under capital in the postcolony. Some of the most interesting conceptualisations have concerned: **a.** the transformation of peasant labour (Guha 1983, 1998), and feminised peasant labour specifically (Spivak 1993, 1999, 2003) **b.** the transformation of labour in factories (Chakrabarty 1989, 2000); **c.** and informal labour (Chatterjee 2004, 2011, 2020). In this paper I want to explore this debate and collective theoretical operation as an interesting example of reconceptualisation / translation of Marx in the postcolony.

The paper is also the opportunity to present some 'new' reflections emerging from the in-person dialogue with some of the members of Subaltern Studies developed during a stay in India (January/February 2025), where I will dialogue with Chatterjee and Amin, and in the US (May/June 2025), where I will converse with Chakrabarty and Spivak.

BORGHI VENCO, SELMA* (Universidade Estadual de Campinas, Brazil)

What Is Justice in Education with Temporary Teachers? the Situation in Brazil and France

This paper discusses the relationships and working conditions of Brazilian and French teachers. The hypothesis is that both countries are moving towards flexible hiring measures, especially in more socially vulnerable areas. Labour relations are understood as the legal device responsible for regulating the contract to be signed between employer and worker, including rights, working hours and salary. It is therefore distinct from the concept of working conditions (Gollac and Volkoff, 2007), since these are alluded to both the environmental character of the workplace, such as lighting, temperature, ventilation, the presence of toxic substances, among other aspects, as well as those associated with work management, evidenced by forms of pressure, the establishment of the pace of work and the adoption of strategies that end up being configured as moral harassment and, therefore, conceived as agents that cause psychosocial damage, especially since the recent configurations of work management lead to: 'excessive pressure, career insecurity, lack of autonomy, isolation, ethical conflicts... jeopardise the well-being and social integration of many workers' (CINGOLANI, 2012, p. 114)

Despite the construction of equality since the French Revolution and the Welfare State, precarious contracts among teachers are growing and are more abundant in the poorest areas of the Paris region; in Brazil, on the other hand, precarious labour relations reach high levels in poorer states, as well as reaching 100% in schools on the outskirts of Campinas, a municipality located in the state of São Paulo, Brazil. Poor working conditions are invariably linked to labour management, which is aggravated by temporary work. Equality in the provision of education is problematised in the absence of stable contracts that make it possible to select qualified professionals with job stability.

RC02-40.2

BORGHINI, ANDREA* (UNIVERSITY OF PISA, Italy)

Infrastructure, Power and the Resilience of the State

The Nation State played a very prominent role in the formation, dissemination, and stabilization of the modern infrastructural ideal, especially from a material perspective.

Infact the amount of investment required, together with the geographic scale of intervention, made the state the essential point of reference for the realization of infrastructure, which was considered the concrete proof of material progress.

Since the '70, this mode has been in crisis and the public role of the state has been questioned, even and especially concerning the governance of infrastructure.

The proposal aims to problematize this prophecy. Although it is certainly possible to read the changes that have taken place over the past fifty years in terms of a gradual decline in the role of the state in the creation and control of many infrastructures, the most recent challenges demand that to abandon the linear logic that the idea of decline seems to suggest. Not only because a still substantial part of access to infrastructure is based on the mechanism of citizenship, but also because the goal is rather to understand what are the new forms through which state, supra-state, and extra-state governance processes interact in the management and implementation of infrastructure.

BORJ MAROC, FOUZIA* (Université Hassan II, Morocco)

Le Local Et La Crise Des Politiques Écologiques : Eaux Souterraines, Transformations Des Pratiques Agricoles

Au Maroc, les politiques écologiques et les progrès techniques ont créé une nouvelle dynamique agricole, entraînant l'ouverture et l'intégration des oasis dans de nouveaux marchés. Se basant sur une étude ethnographique de terrain, réalisée auprès d'acteurs locaux et d'agriculteurs à l'Oasis d'El-Jorf, cet article a pour objectif d'analyser comment les nouvelles conditions d'utilisation des ressources conduisent à la concurrence et aux conflits autour de la légitimité de l'accès aux eaux souterraines. Cette analyse permet de

comprendre les tensions entre la dynamique agricole et la politique publique de gestion de l'eau et la manière dont cette dynamique contribue à ouvrir une nouvelle piste de débat sur les modèles de développement locaux. Nos résultats montrent des inégalités d'accès aux eaux souterraines entre les différents types d'agriculteurs, ainsi que les politiques écologiques binaires participent à la construction des nouvelles réalités agricoles sahariennes. La surexploitation des nappes témoigne les limites des politiques écologique et remis en question la durabilité sociale, économique et environnementale.

WG01-JS-57.1

BORJ MAROC, FOUZIA* (Université Hassan II, Morocco)

The Common, Political Marginalization and Water Conflicts for Survival in a Moroccan Oasis

Studies on oases worldwide reveal that the natural resources in these areas are decreasing sharply. In Morocco, ecology policies and technological evolution have led to the emergence of agriculture dynamics, which, in turn, have resulted in the spread of modern, elite owned farming lands that are encroaching on traditional oasis space.

This article explains how the shift in resource use practices has led to the depletion of the waters of the traditional irrigation systems "Khattaras", but also to legitimate pluralism of access to water, and -most of all- infringed upon the survival needs of marginalized small farmers and sapped their negotiation capacity. The changes in forms of agriculture and the tough competition over resources have triggered water conflicts and stimulated the emergence of many ecology protest movements by local actors. The latter are due to the undermining of the traditional water rights governed by common property customary laws on access to water within oasis communities. This reality has had a great impact on access to water and has even led to ethnic conflicts.

The results of this study first show the importance of conflicts over upstream and downstream water resources depending on the hierarchy in the space of the oasis-Aljorf (vertical conflicts), which has led to breakdowns in social ties between beneficiaries who sometimes belong to the same tribe (horizontal conflicts). However, this also reveals that the drilling techniques have become a resource 'ownership' instrument for elites that contribute to the creation of a new space.

Bias Induced By a Researcher's Political Ideology in the Production of Research Findings

The political ideology of a researcher may introduce bias at various stages of the research process. When researching policy-relevant topics, researchers' priors and policy preferences may shape the design, execution, analysis, and interpretation of results. Detection of such bias is challenging because research itself is not normally part of a controlled experiment. Our analysis exploits a rare opportunity where 161 researchers working independently in 71 research teams took part in an experiment. They were surveyed about their position regarding immigration policy prior to learning that their task was to test an immigration-policy-related hypothesis: that immigration reduces public support for social welfare policies. We measure the impact of prior ideological positions on empirical estimates and peer rating of each other's model specifications. We found that research teams composed of pro-immigration researchers estimated a more positive impact of immigration on public support for social programs. For example, pro-immigration teams were 11.4 percentage points less likely to find large, statistically significant positive effects of immigration, while anti-immigration teams were 14.6 percentage points less likely to find large, statistically significant positive effects. Moreover, the methods used by teams with strong pro- or anti-immigration priors received lower peer ratings. Their lower-rated models are the mechanism causing observably biased outcomes. These results expand our understanding about the myriad sources of bias that enter the research process at different stages. The analysis makes a case for including political ideology as an important factor in the debate over making science more reliable and reproducible.

From Research to Comic: Drawing the Hidden Injuries of Social Mobility

How can a research-based comic book help us better understand the emotional complexities of social mobility in marginalised urban areas? And how can visual storytelling reveal the tensions and challenges of upward mobility? This paper reflects on the process of creating a research-based comic, developed from over 80 interviews with upwardly mobile individuals, family members and long-term residents from stigmatised neighbourhoods in Germany. In particular, it explores how translating social mobility research into a visual medium encourages intersectional perspectives, challenges conventional understandings and offers a more accessible way of engaging with the hidden injuries of social mobility.

Challenges of Implementing Digital Technologies in Long-Term Elderly Care: The Case of Russia

One of the key areas of social policy concerning the elderly is the development of a long-term care system. Currently, the elderly population in Russia constitutes 24%. A crucial component of this system is the digitalization of long-term care organizations and the implementation of digital technologies in the care process for elderly people and people with disabilities. A study was conducted using the methods of expert interviews with technological and social entrepreneurs, managers of social agencies as well as survey of social service employees. The research results demonstrate that the elderly care sector is transforming due to the development and implementation of digital technologies. This contributes to the formation of an ecosystem that includes social and technological entrepreneurs, social and medical institutions. The creation of such an ecosystem enables the attraction of investment, which in turn enhances the socio-technological impact of care and rehabilitation. Digital technologies, utilizing artificial intelligence (AI) tools – particularly computer vision and voice assistants – contribute to the processes of deinstitutionalization of medical and social care, rehabilitation, and the prevention of adverse conditions in the elderly. It is noted that the use of such digital technologies requires supervision by professionals in the fields of social work and medicine, as well as the enhancement of the digital capital of certain vulnerable groups and the overall elimination of digital inequality. In turn, the active dissemination of AI practices among employees in care institutions allows them to perform many tasks. However, additional training for social organization staff in the use of digital technologies is required.

Acknowledgments. The research was carried out with support of the Russian Science Foundation (RSF) according to the project № 24-18-00542, implemented at St Petersburg University.

Eco-Social Strategies for the Inclusion of Persons with Disabilities: Regional Practices in Russia

Disability is a significant socio-economic issue in contemporary society, requiring focused attention and in-depth analysis. As of January 1, there were 2023, 10,933,000 people with disabilities residing in the Russian Federation. In this context, improving the quality of life for people with disabilities and facilitating their full inclusion into society presents an ongoing challenge for the state social support system. To address this, the eco-social model is increasingly being adopted, with the aim of fostering an inclusive environment and ensuring that people with disabilities have access to their rights—such as education, employment, quality medical and social assistance, and participation in social networks. The eco-social strategies promote the development of interconnected structural changes that aim to mobilize individual resources and help people overcome both internal and external barriers. The approach also involves creating accessible social spaces by adapting public areas and transportation systems to the needs of people with disabilities and enhancing the accessibility of information resources. Medical-social assistance within the eco-social framework aims at comprehensive rehabilitation and habilitation.

This encompasses not only medical interventions but also psychological support, social adaptation, and the fostering of self-care skills. The paper investigates regional practices in Russia concerning the application of the eco-social strategies to integrating individuals with disabilities. The main methods were expert interviews and focus groups with clients. In conclusion, while recognizing the eco-social model as an optimal service model, it emphasizes that its effective implementation necessitates substantial structural and institutional transformations. The implementation of eco-social strategies demands substantial human, environmental, financial resources, along with strong administrative support.

Acknowledgments. The research was carried out with support of the Russian Science Foundation (RSF) according to the project № 24-18-00542, implemented at St Petersburg University.

Challenging Harmful Practices: The Role of Film in Addressing Bride Kidnapping in Central Asia

Following Kyrgyzstan's independence from the Soviet Union in 1991, the practice of bride kidnapping became more common, despite its roots in cultural traditions. The lack of Soviet-era protections for women's rights contributed to its persistence. Today, it is increasingly recognized as a crime that violates women's rights and hinders gender equality.

This study evaluates the impact of the film "Bride Kidnapping," which was honored at the 2023 Alternativa Film Awards for its role in raising social awareness. The film follows a 19-year-old girl who becomes a victim of bride kidnapping in Kyrgyzstan. Through screenings, both offline and online, the project aimed to educate and engage audiences about this issue.

The research involved interviews with the general population in a Central location test in Bishkek and surveys of screenings participants including those in Almaty, additional screenings in Bishkek, and special projects online and offline. Findings reveal a widespread rejection of bride kidnapping, with exceptions among older viewers (over 46 years), where support is notably higher.

Most participants viewed bride kidnapping as a criminal act that should be legally condemned, holding perpetrators accountable rather than the victims. The film increased viewers' willingness to report planned kidnappings and shifted perceptions, particularly regarding the victim's choice to stay after being abducted.

The results suggest a significant attitude shift and increased readiness to engage in local actions to combat the issue, including advocacy, learning, donating, and volunteering. To build on these findings, fostering intergenerational dialogue and expanding participation mechanisms could support the drive toward gender equality.

Cinematic Influence: How Films Shape Social Attitudes and Drive Change in Central Asia

Modernity is characterized by both technological and social advancements, yet inequality remains a persistent issue. Social problems can be addressed at various levels, including through shaping human attitudes, dismantling stereotypes, and raising awareness. In this context, art—specifically cinema—can play a significant role in societal change.

This research investigates how films influence individual behavior and societal attitudes by emotionally and intellectually engaging viewers. The study utilizes key theoretical frameworks such as Agenda Setting Theory, Social Learning Theory and Educational Theory to explore cinema's impact on audiences. These frameworks provide a foundation for examining both behavioral and societal effects.

Various impact measurement methods are employed, including, pre- and post-viewing surveys, and follow-up surveys, to assess how attitudes and behaviors change over time. The research focuses on several key indicators that measure whether the desired impact occurs, such as increased donations or heightened awareness of social issues. The geographical focus is primarily Central Asia (Kazakhstan and Kyrgyzstan), where films address region-specific problems.

Preliminary results indicate that the willingness to act on social issues increased by 3-8 times following film screenings. Additionally, the desire to

participate manifests in different ways, from sharing information to actively contributing to solutions. Films either emphasize the relevance of the problem or evoke emotional responses, both influencing how viewers perceive and act on the issues.

These findings contribute to a deeper understanding of cinema's capacity to drive both individual and societal transformation, highlighting its potential as a tool for social change.

BORTUN, VLADIMIR* (University of Oxford, St. John's College, United Kingdom)

"Men of the People", but Which People? Unpacking the Social Bloc of Right-Wing Populism

While capitalists are relatively united in their struggle with other classes, they are also divided along different axes: small and medium vs big business; industrial vs finance capital; domestically embedded vs transnational companies. The competition between these different fractions of capital has intensified in recent years and, while critical political economists have mapped some of this intra-class conflict, there is still limited research and discussion on how that might have been translated into the arena of party politics. I argue that the ongoing rise of 'right-wing populist parties' across Europe has to be understood in this wider context. While the current research overwhelmingly approaches these parties in terms of either their discourse or their voting base, I make the case for a 'material turn' that shifts our gaze to the class forces and material interests they represent. I argue that these parties tend to represent insurgent social blocs led by fractions of capital who do not feel represented (any longer) by mainstream parties and are therefore aiming for control over state power. It is a struggle for hegemony within the capitalist class. I substantiate this line of argument with the exploratory case study of the Reform UK party in Britain, which appears to represent - at both descriptive and substantive levels - a social bloc based on the petty bourgeoisie and led by sections of finance capital and the fossil fuel industry.

The Association between Unhealthy Food Environments and Outcomes of Type 2 Diabetes Care in Flanders, Belgium

Introduction

Although research increasingly highlights the impact of food environments on health, studies linking environmental characteristics to outcomes of type 2 diabetes (T2D) care remain scarce. This study examines the association between the retail food environment and HbA1c levels in a cohort of T2D patients in Flanders, Belgium.

Data & methods

We used a unique longitudinal database covering a three-year retrospective follow-up of 4,189 T2D patients aged 40+ treated in primary care practices across three regions in Flanders. The dataset combines (a) health insurance data, (b) medical lab data on HbA1c test results, and (c) information on the socioeconomic and food environment at the level of the census tract of patients' place of residence. Food environments were mapped using the Locatus database, providing addresses of all food retailers in Flanders. For each census tract, we counted the total number of unhealthy food outlets within a 500m walking distance from each address and, subsequently, averaged it across the number of addresses within the tract.

Using linear mixed models with repeated measurements nested within patients, in turn, nested within census tracts, we assessed the association between the average number of unhealthy food options within walking distance of T2D patients' place of residence and their HbA1c levels.

Preliminary results

Controlling for individual covariates, patients living in areas with more unhealthy food options within walking distance had, on average, higher HbA1c levels. This relationship, however, depended on the urbanization level and median household income of the census tract. Two- and three-way interactions showed that the association between unhealthy food environment and HbA1c levels held only for those living in the poorest 20% neighbourhoods of urban cities.

Preliminary conclusion

Our preliminary results suggest a clustering of the adverse impact of an unhealthy food environment on blood glucose levels in the poorest neighbourhoods of urban cities.

Is an Individual's Life Pace Adapted to Their Perceptions of the Future?

The passage and pace of time shape human lives. Individuals' behavior is adapted to their temporal horizons and their temporal horizons are adjusted to their expectations about the time they have left to live. Extrinsic mortality rates are believed to influence whether individuals adopt a slower life pace by postponing maturity to acquire knowledge or a faster life pace, characterized by an early transition to parenthood. Exposure to deadly shocks leads to a perceived shortening of life expectancy and shifts in individuals' temporal preferences, resulting in a present-focused mindset, higher impatience and increasing sense of urgency. This paper explores how the 2004 Indonesian tsunami, a large-scale, random mortality shock, altered individuals' perceptions of their futures and accelerated the pace of their transition into adulthood. Specifically, it tests whether the tsunami had an impact in marriage timing, and reduced the age of initiation of parenthood as well as the intervals between births.

Although fertility rates have been observed to rise following natural disasters, the underlying mechanisms remain only partially understood. Using data from the Study of the Tsunami Aftermath and Recovery (STAR), a representative longitudinal survey of 28,372 Indonesian individuals living in areas vulnerable to the 2004 tsunami inundation, this study introduces and tests a new explanatory mechanism: the Acceleration Model. This model explores how a post-disaster shortened temporal outlook and heightened sense of urgency influence variation in life pace, reflected in both psychological outcomes -higher impatience- and behavioral changes - earlier marriages, earlier onset of parenthood and reduced timing between births-. By examining the interplay between perceived life expectancy, temporal horizons and fertility timing, this paper contributes to the understanding of how perceptions of the future influence present behavior.

Gendered Forms of Intergenerational Solidarity in the COVID-19-Pandemic – a Critical Perspective on a Moral Resource in Future Health Crises

The COVID-19 pandemic can serve as a blueprint for the potentials and pitfalls of intergenerational solidarity as a moral and political resource in health crises. It provoked controversial debates about the solidaristic responsibilities between generations. However, while many of these appeals to intergenerational solidarity involved at least implicit references to other social categories, such as age and gender, the consequences of such an entanglement of social categories have been rather neglected so far in ethical and social research.

Against this backdrop, we provide an intersectional perspective on intergenerational solidarity in Germany during the COVID-19 pandemic to identify lessons learned for future health crises. After a short clarification of the concepts of generation and solidarity, we provide a critical analysis of the public media debate in Germany. Applying qualitative content analysis of two major German newspapers (DIE ZEIT and Welt am Sonntag) during February 2020 and June 2022, we explore how intergenerational solidarity was framed in the media, especially at the intersection with the social categories of gender and age. On this basis, we carve out a matrix of gendered and queer forms of intergenerational solidarity and respective underlying narratives. Our findings reveal a gendered and heteronormative generational divide that include pertinent gender and age stereotypes during the pandemic: while older women were largely depicted within traditional caregiving roles, queer forms of intergenerational care were marginalized or omitted in media narratives, neglecting their potential as resource in this acute health crisis.

We discuss our findings within feminist theories on care, affection, and queer healthcare. Based on this, we draw conclusions how a more diversity-sensitive approach towards intergenerational solidarity can unfold its potential as a moral resource and for policy action in impending health crises, e.g. the post-antibiotic era and the nursing crisis, to develop sustainable healthcare in the future.

BOSSI, LUCA* (University of Turin, Italy)

Public Policies, Family Capital and Social Stratification in the Civic Engagement of Young Muslims in Italy

Since at least the 1980s and more concretely since the 1990s, Islamic organisations in Italy have sprung up mainly thanks to the commitment of the first generations of immigrants, especially from the Maghreb, the Middle East and Bangladesh. Over time, their activities have diversified: integration of newcomers, spiritual assistance, care of community relations and places of worship, interreligious and inter-institutional dialogue. However, with the transition of second generations to adolescence and adulthood, the needs have changed. Religious, cultural and linguistic transmission in the diaspora is now a widespread concern among Islamic communities born of migration.

Local case studies suggest that an open associative climate and public policies of recognition and inclusion can facilitate a virtuous process of youth civic and religious engagement, thereby generating social capital for the benefit of the wider community. However, this new cohort of engaged youth seems to involve above all the more affluent and established segments of the population, those who could rely on family cultural, social, and economic capitals. They represent a religiously and civically aware élite, raised in a cosmopolitan, tolerant and plural context and today fully integrated into the professional world, from arts to entrepreneurship and politics.

Besides this generational leadership, and despite their efforts and investments, Islamic FBOs in Italy do not seem to succeed in involving young people from the most marginalised neighbourhoods or social strata, who are among the most exposed to the effects of social disintegration and to the risks of religious or political radicalisation, and therefore most in need of intervention.

BOSSUYT, EVA* (The Paris Institute for Political Studies (Sciences Po Paris), France)

Connecting Value Regimes: The Role of Brokers in the Transnational Used Clothing Economy

The ways organizations create and assign value have long been studied through the lens of global value chains. Drawing on this legacy, this paper examines the transnational circulation of used clothing in France, Chile, and Bolivia to analyze local-to-global processes of valuation and commodification. Ethnographic research in these three contexts provides the basis for analyzing the classification activities of brokers, with a particular emphasis on exporters in France and importers of used clothing in Chile and Bolivia. The materiality and value of this object are explored in various settings, from French collection bins and sorting warehouses to Chilean landfills and Bolivian street markets. This reconstitution of the social life of clothing enables the identification of intersections, frictions, and nodes of valuation across the Global North and South.

The paper demonstrates that brokers in the used clothing value chain translate and connect different value regimes – through sorting and grading – to seize trade opportunities. I argue that this entrepreneurial strategy for capital accumulation coexists with a new grammar of worth under the Anthropocene, wherein the concept of circular economy serves as an industrial imperative for value extension and extraction.

This contribution highlights the importance of considering the mobility and diversity of used clothing – from unsold items to gifts and waste – in understanding the coexistence of value regimes, the peripheries of valuation processes, the boundaries of capitalist value, and the standardization and disputes over value regimes in transnational contexts.

BOSTAN, CANSU* (Lund University, Sweden)

Diasporic Justice: Yazidi Mobilization and Memory in Sweden after the Genocide

August 2024 marked the tenth anniversary of the Yazidi Genocide, the 73rd Decree as referred to and historicized by the Yazidis themselves. However, not only are reparation mechanisms and transitional justice options yet to be developed and impunity overcome, but also the thousands of Yazidis who are still missing, mass graves that are not excavated, along with the hundreds of thousands displaced in refugee camps characterize the genocide as continuing. This paper is a part of a broader project focusing on the diasporization of Yazidis in Sweden and Germany to generate ethnographically deep knowledge on the Yazidis' justice aspirations, the socio-spatial dynamics of their mobilization to trigger change, and the creative, strategic use of international law in their justice pursuits.

By understanding diasporization as a form of mobilization, this paper ethnographically focuses on the socio-spatial dynamics of community-building among Yazidis in Sweden as they seek justice in the aftermath of the Yazidi Genocide. It examines not only mass protests, which reveal diaspora alliances among different groups and lead to the emergence of alternative juridico-political networks, but also the diasporic justice mechanisms developed to institutionalize remembrance and sustain memory while navigating the challenges of strict migration regimes.

Drawing on Foucauldian nominalist intervention, I analyze various meanings assigned to justice throughout the process of diasporization, as diaspora actors' subjectivities shift across different regimes, positioning them as genocide survivors or unwanted migrants. I explore how these differing formulations of justice either align with or conflict with the framings of international law and the narrative construction of the Yazidi Genocide in ongoing prosecutions of IS members for genocide in Sweden. In this broader context, courtrooms are understood not merely as mechanisms of subjection for the victim-survivors but as mediums for subjectification, forming one of many avenues of diasporization/mobilization that assign meanings to 'justice.'

BOTOKOU, LANDRY* (Linköping University, Sweden)

Exploring the Effect of Unemployment on Attitude Towards the Future for the European Aging Workforce

The main challenge with the extant literature on the relationship between unemployment and attitudinal outcomes, such as welfare attitudes, is that most studies use a cross-sectional design, which does not allow for the estimation of causal effects. Although there are few longitudinal studies, most are country-specific and do not allow for an understanding of the role of institutional settings in mitigating the impact of unemployment on attitudinal outcomes. To fill this gap in the literature, we investigated whether unemployment affects older workers' attitudes toward the future. And how does this association vary across European welfare regimes?

In a longitudinal research design, we used six waves (4,5,6,7,8,9) of the Survey of Health, Ageing, and Retirement in Europe with 27 European countries plus Israel gathered in five welfare regimes. In the total sample of 36533 observations, 4% has been treated or experienced the transition from employment to unemployment. To handle heterogeneity between older people, we use propensity score matching and, specifically, the method of the nearest neighbour to find a match for the treated with respect to gender, age, education level and health status in order to estimate the average treatment effect of the treated.

The results suggest that experience of unemployment decreases optimistic view of the future by 0.10 on average in the total sample. However the effect of unemployment on attitudes differs across welfare regimes with no significant impact in social democratic regimes. Meanwhile, the most substantial effect is found in the Southern-Mediterranean regime. The comparison across welfare regimes sheds light on the dynamic relationship between individuals' view of the future and institutional context in Europe. However, dividing the sample into five sub-samples for stratified analysis by welfare regimes raised some challenges related to the sample size.

BOTTALICO, ANDREA* (University of Naples "Federico II", Italy)

Logistics Made in Italy. a History of Mobilizations from the "Economic Miracle" to the Pandemic.

What have been the main stages in the history of logistics in Italy, and what has been the role of autonomous trade union organisations? By mirroring the country's socio-economic model and the growing structuring of firms into 'networks', logistics has established itself over time as a tool for managing the flow of goods to the point of becoming strategic for the modern economy and its synchronisation needs. Nevertheless, its history has not yet been written. This contribution attempts to trace the boundaries and narrate the socio-historical evolution of the logistics supply chain in Italy, in a time nospan that starts from the economic boom and arrives at the present day marked by globalisation and the health emergency. By retracing some key stages of the last seventy years, the aim is to provide an instrument of knowledge on the economic and trade union history of the country through the analysis of the development of an ancillary dimension of production that, over time, has acquired an increasingly relevant function with respect to production regimes. The hypothesis guiding this contribution is that phenomena such as the outsourcing of logistics functions, the repression of union rights, and structural illegality, have been the preconditions for the development of the freight transport logistics chain in Italy as a dynamic economic sector. These phenomena were not an effect but a cause of the developmental trajectory

of the Italian logistics model. Against this model, the autonomous forms of conflict have effectively opposed. Starting from its origins, passing through epochal transformations such as the advent of intermodality, and arriving at logistics districts, transport infrastructures and digital and material platforms, the focus of this contribution is the history of conflict in a key dimension of the global economy and its impact on the economic organisation of the Italian society.

Football Supportérisme As Political Expression in the Age of Youth's Political Disinterest

At the same time as Moroccan youth show a declining interest in politics, political expression in the form of tifos (choreographed visual displays), chants and singing has been expanding in football stadiums over the past several years. Through case studies of Moroccan ultras groups (passionate and organised groups of young football supporters) from South, Center, and North regions, this paper seeks to show what political issues football fans chant about. With thematic analysis we find that the Moroccan "ultras groups" express demands that political parties should take into account for each geographic area of the country.

Leisure Promotion for University Students: Trends and Marketing Strategy

Several studies show the harmful effects of hyper-connection and cyber addition of students on their mental health and academic performance. Therefore, we focus on understanding the impact of leisure in the educational sector on the academic performance of students. In this context, we discuss the alternatives that allow students to free themselves from this dependence through the promotion of leisure. Hence, based on the theory of planned behavior we will examine students' attitudes, subjective norms, perceived behavioral control and students' intention towards participating in the educational events promoted in their universities or outside of their universities.

The aim of our research is to evaluate the new trends in educational leisure activities for university students and to examine leisure marketing and promotional activities that influence on students' behaviour typically the new generation. Hence, based on the theory of planned behavior we will examine students' attitudes, subjective norms, perceived behavioral control and students' intention towards participating in the educational events promoted in their universities or outside of their universities. The purpose of our research paper is to examine students' behavior towards participating in educational leisure activities, through the promotional events and social influence among university students.

Adding to that, some managerial implications will result due to the possible influence of investors in this sector to target a potentially profitable niche.

The Personal Branding Strategy of Professor-Researchers in the Era of Marketing 5.0

In a word that is constantly changing, increasingly digitalized and connected, the professor researchers faces several challenges. Among which we cite:

- Adapting to the new digital revolution (e-learning, virtual reality, artificial intelligence, etc.)
- The need to be productive in publishing quality articles and in indexed journals to maintain one's career ;
- Present their research work at conferences and symposia and know how to convince;
- Ensure visibility as a researcher at the national and international level and have an impact ;
- Respect academic standards and researcher ethics, particularly with the emergence of artificial intelligence ;
- Meeting the expectations of a new generation of learners (ultra demanding and ultra connected) ;
- Seek collaborations and funding for research projects ;
- Work on their brand image, their notoriety and their reputation on social networks ;
- Etc.

So many points to be taken into consideration by a professor researcher in the era of this digital revolution. Which requires the implementation of an effective personal marketing strategy, especially since we are already talking about marketing 5.0.

The question we ask ourselves is how can the professor researcher develop his personal brand strategy in the era of marketing 5.0?

The aim of this study is to explore the factors that enable the professor researcher to promote his or her reputation in the academic sphere as a professor and in the scientific community as a researcher.

The interest of this present research work is to provide the professor researcher with the means which will allow him to establish an effective strategy to improve his visibility and his notoriety in the scientific community.

Diversified Socio-Technical Systems Involving Farmers to Meet the Challenges of Water Scarcity: A Case in Middle Atlas, Morocco

In Morocco, irrigation based on groundwater use has seen a rapid rise over the past thirty years, generally in connection the adoption of drip irrigation. However, this change in irrigation practices, while promising on paper in terms of water use efficiency, has been driven more by economic factors—such as reduced labor and increased yields—than by concerns over the sustainable management of water resources. Water use efficiency of drip irrigation systems were generally low in a time of easy access to water resources.

In the Ain Timguenai-Ouled Mkoudou-Ighezrae aquifer in the Middle Atlas mountains, fruit and vegetable farmers are facing a critical shortage of water that they can get from their boreholes. These farmers, who initially developed socio-technical systems during a time of plentiful water resources, now find themselves needing to adapt their systems to cope with increasing water scarcity.

An analysis of local practices reveals two main categories of socio-technical systems. The first, prevalent among small-scale, often family farms, involves gradual and informal adjustments. These farmers reduce the size of drippers and modify their irrigation methods, relying on local knowledge and exchange. The second category is more technologically advanced, incorporating tools like sensors or weather stations to anticipate water needs often with assistance from external experts. Some farmers combine elements of both approaches. The solutions that farmers wish to implement to address the water crisis or actually implement is heavily dependent on the type of socio-technical system they are inserted in.

Encouraging more rational and sustainable water management practices is essential to building farmers' resilience in the face of growing water scarcity. To do so, understanding socio-technical systems in which farmers are involved is critical for shaping policies that provide targeted support for different types of agriculture.

BOUCHAARA BOUCHAARA, SAWCEN* (univeristé mohamed 5 de Rabat, Morocco)

Prévenir Plutôt Que Guérir : Le Rôle Crucial Des Parents Dans La Prévention Des Comportements Addictifs

Ce papier explore l'importance d'une approche préventive et participative dans la lutte contre des problèmes de comportement tels que la violence, le décrochage scolaire et, notamment, les comportements addictifs incluant non seulement la consommation de substances psychoactives, mais aussi des addictions comportementales comme l'addiction aux écrans ou aux jeux vidéo.

Cette approche implique La prévention universelle qui vise tous les élèves à travers des programmes de sensibilisation favorisant un environnement scolaire sain, la prévention ciblée qui s'adresse spécifiquement aux groupes à risque avec des ateliers et un soutien psychologique et enfin, la prévention sélective qui se concentre sur les élèves étant déjà en difficulté, nécessitant des interventions personnalisées.

L'aspect fondamental de cette approche participative est celui de l'implication active des parents. Leur participation renforce l'efficacité des initiatives éducatives et permet un suivi régulier des élèves à côté de la collaboration entre enseignants, éducateurs, psychologues et travailleurs sociaux qui est essentielle pour créer un réseau de soutien solide autour des élèves.

Des programmes comme le Child-Parent Center (CPC) ont démontré leur efficacité en montrant que l'implication parentale est liée à une diminution des problèmes de comportement chez les enfants, ce qui peut prévenir des comportements addictifs à l'avenir. En participant au CPC, les parents sont davantage impliqués et ont des attentes plus élevées, ce qui a un impact positif sur les compétences et le comportement des adolescents (Hayakawa et al., 2016).

Nous examinerons plusieurs questions dont : Comment une intervention socio-éducative participative peut sensibiliser les jeunes aux dangers des addictions? Comment convaincre les parents de s'engager activement dans ces initiatives ? Et comment intervenir auprès des élèves vulnérables, qui sont confrontés à des défis liés à leurs profil de personnalités ou à leurs environnements difficiles par rapport au comportement addictif ?

Être Enseignant Avec Un Handicap Au Maroc : Une Compréhension Des Expériences Vécues

Si la littérature scientifique sur les thématiques de l'inclusion et de l'éducation inclusive regorge de recherches sur les enfants avec handicap et leur scolarisation, peu de travaux s'intéressent aux vécus des enseignants en situation de handicap. En effet, acteur important dans la mise en œuvre des systèmes éducatifs inclusifs, ces enseignants font face à des inégalités significatives souvent invisibles mais profondément enracinées.

Afin d'approcher le vécu, le ressenti, le parcours et l'histoire des enseignants en situation de handicap, nous avons choisi une démarche biographique de

réécits de vie. Le but est d'analyser le sens que ces enseignants donnent à leurs expériences vécues.

A travers la mise en intrigue des récits, nous pouvons appréhender les trajectoires, les besoins et les défis de ces enseignants. Nous pouvons analyser les stratégies de réponse qu'ils adoptent pour préserver non seulement une relation pédagogique stable, mais aussi favoriser leur épanouissement social et psychologique.

Division Sexuelle Du Travail Au Maroc: Intersections Entre Le Genre, Le Religieux, Et La Mobilité.

la division sexuelle du travail est un enjeu fondamental des rapports sociaux de sexe, qui sont des rapports inégalitaires, hiérarchisés, asymétriques, (D.Kergoat). Au Maroc la division sexuelle du travail reste fortement influencée par des normes traditionnelles et religieuses, bien que des résistances et des changements soient en cours. En effet, l'accès limité des femmes au marché du travail, leur faible taux d'activité et leur surreprésentation dans les secteurs informels, ainsi que des inégalités face au chômage, aux rémunérations, à la formation professionnelle, aux promotions, configurent cette division sexuelle du travail, du savoir et du pouvoir asymétriques selon les sexes.

Historiquement, les femmes marocaines se voient reléguées au second plan à l'intérieur du système patriarcal qui régit de manière hiérarchique les rapports sociaux entre les hommes et les femmes. Cette hiérarchie transparaît dans les modes de socialisation qui établissent une hiérarchie entre les deux sexes et assignent à chacun un rôle social (Rahma Bourquia). Les femmes, en vertu de leur statut et de leur rôle et responsabilités de ménagères, se retrouvent minoritaires dans les sphères de pouvoir économique et politique, subalternes dans les lieux de travail et sous-payées et pauvres, tandis que les hommes par leur statut principal et / ou rôle du chef de ménage, ont un accès prioritaire aux activités génératrices de revenus, ou aux revenus tirés de la production familiale et aux bénéfices de la solidarité sociale. L'une des notions clé qui renforce cette division et celle de la «Qiwamah» issue des interprétations religieuses, qui attribue aux hommes une position de protecteur et pourvoyeur de la famille, tandis que la femme est perçue comme responsable des tâches domestiques et de l'éducation des enfants.

Ainsi, cette communication présente un aperçu global de la division sexuelle du travail, en explorant les dimensions historiques, culturelles, et religieuses au Maroc.

Guarding the Sacred: Muslim Custodians of Judaism in an Inter-Religious Strife?

Simon Lévy, one of Morocco's foremost Jewish anti-Zionist leftists, told me in an interview in 2004 that Moroccan Muslims are the saviors of Judaism. Lévy expressed his confidence that the physical absence of Jews from Jewish quarters and sanctuaries will not threaten their future existence or significance as long as they are in the hands of his Muslim co-citizens. Through this line of thinking, Lévy underlined the imbrication of Judaism and Islam in Morocco, alluding to the fact that the threat to Moroccan Judaism is not internal. Based on two decades of ethnographic research, this talk argues that the organic relationship between Moroccan Muslims and Jewish spaces—despite the existence of a long tradition of anti-Zionist discourse within Moroccan society—is rooted in a local understanding that respects the sacred as a trans-religious value. Moroccan Muslims have shown deference, if not reverence, to Jewish religious sites, symbols, and sacred spaces regardless of the volatile political situation that has pitted Jews against Muslims in Israel/Palestine. I contend that Moroccan Muslims' care for Jewish sacred spaces is grounded in the Islamic concept of *'imārat al-'arḍ* (the cultivation or stewardship of Earth), which stands in opposition to *al-ifsād fī al-'arḍ* (spread corruption on Earth). *'imārat al-'arḍ* is the Muslim equivalent of the Jewish notion of Tikkun (repairing the world). Thus understood, *'imārat al-'arḍ* requires being an agent of justice and construction, which has allowed Moroccans to handle both the criticism of Zionism and the care for Jewish Morocco without any contradiction or dissonance. Therefore, in an age of political violence and human destruction, the lived experience of ordinary Moroccans vis-à-vis Judaism underscores that the protection of Jewish spaces is a vital aspect of *'imārat al-'arḍ*.

Artists and Cultural Professionals As Environmental Activists? Developing Strategies and Actions Addressing Environmental Issues in the MENA Region

In a world characterised by increasing global flows, mobility is closely related to citizenship considering that freedom of movement is viewed as a condition to promote citizens' full participation in public life (Le Breton, 2021). As any social fact, mobility is heavily impacted by a number of social and geo-political constraints. This is especially true in the MENA region, where access to mobility is among the most restricted ones at the global level (UNESCO, 2019).

In this context, adding environmental considerations to mobility adds an extra layer to the burdensome reality of the region's citizens: if mobility is considered a major contributor to CO2 emissions, how to go about reconciling mobility with environmental citizenship? Restricting the debate to the carbon footprint of travel leads to a dead-end when infrastructures offer no alternative to planes. At another level, the injunction to renounce (Monnin, 2023) mobility highlights the power of those who can decide who should renounce to what. This debate is particularly sensitive for artists and cultural operators based in the MENA region, whose capacity to move internationally is instrumental to pursue their career.

Sheller's perspective (2018) offers a robust framework to rethink this debate, mobilising climate justice to craft a new mobility paradigm based on human rights, fairness and equity, and calling for a collective work to define the rules and norms that should govern access to it. Inspired by this theoretical framework, as well as post-colonial literature challenging Western "green" approaches (Hamouchène & al, 2023), our empirical research analyses artists' and cultural operators' strategies to address mobility and climate change in the MENA region using EU and other donors' resources through cooperation projects and participatory processes to reinforce cultural ecosystems, as well as new narratives stemming from their artistic work, in a bid to contribute to environmental citizenship.

Work, Financial Independence, and Quest for Meaning: The Case of 'financial Independence, Retire Early' in Quebec (Canada) in the Post-Pandemic Era

In a context where workers are driven by quests for meaning and coherence, this communication focuses on a marginal movement whose popularity has increased with the pandemic crisis, both in Quebec (Canada) and elsewhere in the West: frugalism (often referred to as FIRE, Financial Independence, Retire Early). Born in the United States in the 1990s, this movement proposes a lifestyle model based on savings, investment and responsible consumption, with the aim of accumulating the assets needed for financial independence and, if desired, early retirement, from the job market. By examining the most influential personal finance books within the Quebec frugalist community, this communication demonstrates that frugalist discourse highlights both the economic issues and the meaning of work, which are united by a programmed change in the work ethos. Far from questioning the value of work, the study shows that frugalists, once financial independence is achieved, aspire to a lifestyle aligned with their values. In this context, work - freed from its economic constraints - can become an integral part of their life, according to chosen modalities. More broadly, the media and literary success of the books analyzed testifies to workers' interest in alternative lifestyles and their desire to reevaluate the meaning and place of work in their lives, through modalities in line with their personal values. The study of this community is therefore relevant to understanding the changing relationship to work in a changing society.

Ultras, Les Nouveaux Protagonistes Du Répertoire De l'Action Politique

Le Maroc contemporain a vu naître des formes de mobilisation qui n'empruntent pas les voies classiques. Il n'y a pas, dans ces formes de mobilisation, de coloration politique ou associative bien déclarée, il y a juste un agrégat d'individus et de groupes poursuivant un objectif commun. Les supporters et les Ultras ont battu le pavé par des manifestations de rue ou devant les locaux des clubs, et se sont également exprimés au travers

des tags dans les quartiers et les coins visibles des grandes villes. Ils ont pu prendre position, dans le débat public, sur des sujets les concernant mais aussi touchant toute la société. Les groupes de supporters et les Ultras se sont distingués par des grèves des stades lors des matchs à domicile, par des encouragements sélectifs et des grèves de déplacement lors des matchs hors domicile. Ils ont également emprunté au répertoire classique de l'action publique les instruments pour créer, mener et développer des activités collectives. Un tel enthousiasme militant laisse à penser qu'ils défendent non seulement leurs intérêts en tant que supporters mais également ceux d'autres personnes. Il faut toutefois souligner que le supporterisme ultra a accentué, ces dernières années, la cadence de la contestation sociale et politique en relation relative avec le contexte socio-économique du pays. Ma communication tend à explorer les pistes pour encadrer davantage les actions collectives des groupes de supporters et des ultras et qui sont d'ailleurs des nouveaux enjeux pour les pouvoirs publics. Quelles sont les mesures à entreprendre pour gérer en amont les logiques d'interactions entre les protagonistes qui perturbent l'ordre public? Comment faire face à ses nouvelles formes de mobilisation et de contestations qui donnent du fil à retordre aux chercheurs et aux Médias?

BOURKIA, ABDERRAHIM* (Hassan 1 University Sport Sciences Institut, Morocco)

Women Riders in the Moroccan Fantasia

Horses have long held a special place in the hearts of Moroccans, and a position of honor in the history and culture of Morocco. Tbourida or fantasia, a display of horsemanship which imitates a cavalry charge, is a tribal, rural and religious tradition which has been an integral part of Moroccan culture for centuries, and is still synonymous with popular celebrations. The skills are taught from early childhood, following the Prophet Mohamed's instruction to "teach your children swimming, archery and horse riding." Tbourida is particularly characteristic of moussem, annual celebrations marking sowing or harvest or in honor of particular saints, as for instance in the localities of El Jadida, Azzemour Moulay Abdellah Amghar, Meknes and in the past at Sidi Abderahman in Casablanca, and is also practiced at family occasions such as births and wedding ceremonies. According to Barbié de Preaudeau and Faucet, horses are used extensively during family ceremonies, and the tbourida, the most distinctive example of this, is most often associated with feast days [Ikhiar 1996, page 132]. Tbourida consists of groups of riders galloping together, gathering speed before firing their rifles simultaneously and bringing their horses to a halt in a single line. A team of riders is called a sorba. The number of riders ranges between five and twenty five, though most often nine or eleven; their number is always odd. The mokedem, or leader, was at one time also a cavalry leader, e.g. at the time of Sultan Hassan I [El Merini 2000, page 586]. An experienced, respected and recognized rider, he oversees every aspect of preparations for a performance: clothing, harness, horses and rehearsals. During the performance he coordinates the movements of both riders and horses.

A Transnational Financial Elite? Evidence from the Mergers and Acquisitions (M&A) Professionals

A common representation of financiers as a transnational elite is widely spread. Following the transnational elite literature, financial elites involved in globalized financial markets can be depicted by their transnational mobility, their participation to transnational corporate elite networks and their participation to a borderless global economy. This communication aims to tackle this hypothesis by questioning the transnationality of a specific financial elite, those dealing with M&A. M&A deals are most of the times transnational, operated by transnational firms, matching buyers, sellers, investors and debt issuers from different countries. M&A service firms have developed a transnational professional jurisdiction (Boussard, 2018). However, to what extent are the careers of the M&A professionals transnational?

The issue raised is the kind of circulations, moves and mobilities on which rests the transnationality of the professionals involved in such deals. The mapping of "geographies of transnational professional practices" (Harrington and Seabrooke, 2020:411) is a question that remains to be addressed. The spaces created by cross-border practitioners do not necessarily rely on extensive physical mobility (Araujo and Davoine, 2023). The communication examines this question of transnational mobility with an inquiry into the M&A professional services in France, through an analysis of a data basis of 664 M&A operations in France in 2010, involving 842 individuals for whom detailed CV have been found on LinkedIn (2022). A sequence analysis shows that a very few of them (6%) have transnational careers, while 4 other clusters are constituted of professionals locally anchored. The communication questions

this paradox of a transnational profession constituted by locally anchored professionals and presents evidence that this globalized financial market is locally embedded in national elites rather than organized by transnational elites. However, these national elites do possess a cosmopolitan capital (Buhlman et al., 2013), although this capital is not necessarily derived from long-lasting transnational careers.

Cultural Interaction between Sub-Saharan Migrants and the Local Population in the Period of Liminality

Moroccan migration policy has been configured as a result of national and international changes and development, moving from being a country of emigration to a country of immigration, receiving a migratory flow from Sub-Saharan Africa. Morocco has to resort to security borders reinforcement and to holding talks with the European countries. Stranded in Morocco, and experiencing multiple hardships in a situation of liminality, Sub-Saharan migrants find themselves in a state of tension between difficult integration tentative in the host society and the impossibility to return to the country of origin.

The situation of liminality leads migrants to position themselves between two identities, one local and the other from their land of origin. In other words, they are "neither here nor there". Liminality encourages sub-Saharan migrants to work towards a social organization in which forms and dynamics of interaction and in particular cultural interaction with the local population get woven on a daily basis. Migrants adopt strategies and mechanisms through identity negotiations to confront or alleviate the constraints and challenges of liminality, through a process of both producing and constructing a hybrid identity.

Migrants internalize the Moroccan local culture by appropriating its values and norms. The interference of two different cultures triggers acculturation, which refers to the reconstruction of an identity, resulting from this liminal cultural interaction. Liminality is inseparable from a negotiable stability, linked to a transitional phase, in which the migrant strives to seize the opportunity to cross over the European shore, a corollary phase with a negotiable change of identity.

Political Economy Paradigms, Politics, and Subsidy Designs. the Unique Case of Lebanon Managing Subsidy Implementation and Subsidy Lift during the Crisis

The Lebanese subsidy system constitutes a unique case in the MENA region since it was historically aligned with, and to some extent shaped by, the political construction of a liberal economic model, with minimal state intervention in market allocation and anti-protectionist commercial regulations intended to accelerate trade liberalization. Therefore, since the independence and until the Lebanese civil war (1975-1990), subsidies in the "merchant republic" were negotiated, legitimized, or contested on the grounds of liberal commercial orientations, unlike its neighboring Arab countries where subsidies were mainly linked to "import substitutes" and protectionist mercantilist (anti-liberal) measures. Today, they are still at the core of contemporary political and social divides, especially after the financial collapse in 2019 and the consequent multilayered Lebanese crisis (ranked among the top 10, "and probably the top 3" according to the World Bank). Especially between 2020 and 2022, both the introduction and the lifting of new subsidies schemes unleashed a heated political controversy in Lebanon, that one might call a "subsidy war", echoing the (highly charged) public and scientific debates on subsidies costs and benefits in the MENA region.

This study intends to assess to what extent the neo political turn in the last decades (especially 1990-today), has shaped subsidies' structuring, design, and politics behind it, exacerbating, not only the unfair redistribution of the Lebanese liberal subsidy system, but also the political elite capture over public money. It will showcase the management and mismanagement of subsidies and subsidy lift during the last economic crisis with particular focus on the wheat and health sectors, highlighting the risks behind a discretionary design of monetary subsidies in a context of extreme fiscal constraints, and de facto contributing to institutionalize a tendency towards an exclusionary approach to social protection.

Making Visible the Daily Lives of Women Farm Workers in the Maghreb: Their Constraints, Their Initiatives, and Ways for Improving Their Living Conditions

The feminization of the agricultural workforce has grown substantially in the Maghreb over the past decades. However, the activity of women farm workers is often not visible, socially recognized and accepted, or taken into account by public policies. The absence of a clear legal framework for seasonal work exposes them to precariousness, various forms of violence and deprivation of basic social rights (social protection, pensions, health insurance, support in the event of accidents, etc.). Rural development policies and programs having a gender focus often prefer to support the development of new income-generating activities and tend to leave aside the issue of the living conditions of women farm workers. Research on rural women in the Maghreb has also often focused on women as members of family farms but till now has paid limited attention to the situation of women farm workers.

A special issue of the *Alternatives Rurales* journal gathers a series of articles which aim to unveil the daily lives of women farm workers in Morocco and Tunisia. These articles analyze not only the constraints women farm workers face but also the initiatives they take to adapt to these constraints. The presentation takes stock of the main findings of these articles and their main lessons, especially in terms of the identified opportunities for improving the living conditions of women farm workers.

Ce Que La Maladie Chronique Peut Nous Apprendre Sur Notre Système Social.

Le suivi de patientes et de patients diabétiques et/ou hypertendus constitue l'une des principales activités du médecin généraliste dans un établissement de soins de santé primaires. L'interaction avec les patients est souvent l'occasion pour le médecin de prendre connaissance de problématiques sociales auxquelles ses patients se voient confrontés. Ils lui parlent de leur solitude, de l'impossibilité à avoir une couverture sociale, de la démission de leur famille... Cette rencontre avec les patients devient parfois une source de tensions mutuelles lorsque les médicaments essentiels à leur santé viennent à manquer, la confiance dans le médecin et le système de soins s'en voit alors sérieusement menacée.

Delving into Gender Narratives in the International Migration and Climate Change Literature and Policy: The Case of Small Island Developing States (SIDS) and Slow-Onset Events

This paper provides a scoping and policy review of the relationship among gender, international migration and slow onset events in Small Islands Developing States (SIDS). The vulnerability of these places stems from their unique geographical and socioeconomic profiles as well as their limited capacity to mitigate and adapt to the impacts of climate change, which is expected to have disproportionate effects on the most vulnerable groups of the society. The work particularly focuses on women and gender minorities experiences by avoiding generalisations or deterministic conclusions, while mapping the main relevant themes associated to the analysis of the topic from a vulnerability perspective. The results show large literature gaps in embedding multiple gender approaches into the analysis of migration patterns in the context of climate change and into ensuring inclusive and participatory gender-responsive solutions. Topics such as food security,

unemployment and gender-based violence are central in the discussions of the literature and they also stress the multiple implications with adaptation and disaster risk management policies. The lack of a comprehensive and extensive literature on the topic highlights the importance to investigate these phenomena both from academic and policy perspectives. We implemented a machine learning approach on a large corpus of policy documents with the aim to map, monitor, and analyse to what extent human mobility (migration, displacement, and planned relocation) and gender related implications are integrated into national policies, strategies and legal frameworks in SIDS. This exercise was aimed to find potential synergies and discords among the topics discussed by the scientific community as well as to detect some potential gaps, needs and implications for the policy community.

Beyond the Backlash: Campaigns Against the Istanbul Convention in Türkiye and the Discursive Dynamics of an Anti-Gender Movement

This study analyzes the dissemination and the nature of the discursive claims of the anti-gender movement in Türkiye with specific reference to the conservative social and political forces targeting the Istanbul Convention (IC) and the feminist actors. The Turkish case has been characterized by a powerful women's and feminist movement united across the ideological spectrum marked by crucial turning points in anti-violence policies. As the paper contextualizes the anti-gender dynamics in the Turkish case, it shifts the analytical lenses from the gender politics of right-wing populism to highlight the significance of the societal actors. The qualitative research is based on the conceptual terrain of the social movement literature and scholarship on the global anti-gender movements. The critical discourse analysis technique is employed in analyzing the news in the conservative media outlets about the IC over three years (2020-2023) when the campaign targeting the Convention had gained visibility. The study contends that the anti-IC campaigns in Türkiye positioned themselves in an ideological contestation with the progressive, pro-feminist, and rights-based discourses of an already weakened civil society. The study problematizes the discursive strategies of anti-gender politics by inquiring into how it has structured itself as an ideological countermovement and underlines the consequences of the post-IC process on the anti-violence and gender equality policies. By analyzing the news opposing the IC published in four selected conservative newspapers, the study concludes that the political discourses of the actors in these new outlets have been oriented towards justifying Türkiye's withdrawal from the IC as they were produced, circulated, and disseminated as a bastion of the countermovement, thereby strategically engaging with the gender policies and politics of a right-wing populist government.

Conflicting Family Values and Employment Arrangements: The Role of Gender Ideology

Despite declining traditional gender orientations, the erosion of the male-breadwinner model, and the implementation of policies to foster the compatibility of family and work for men and women, gendered spheres of care and providing still exist: Women are less integrated into the labor market, and men are less integrated into private spheres. These inequalities are accompanied by competing gender ideologies around family orientations, like gendered employment arrangements and child-centering. Multidimensional ambivalent gender ideologies occur, which, for example, mix egalitarian positions of joint spheres of labor with essentialist beliefs of parenting responsibilities. In this study, we address whether and how gender ideologies influence gendered employment arrangements and who can realize an arrangement matching their gender ideology. Our study combines several strands of literature, such as second demographic transition, gender ideology, and social integration, to explain gender differences in employment arrangements.

We use the German Social Cohesion Panel (SCP) for 2022/23 and focus on both partners in heterosexual unions aged 18 to 67. We employ latent class analyses to identify multidimensional gender ideology classes. In the second step, we use gendered employment arrangements as a dependent variable and estimate multinomial logistic regression models with the predicted gender ideology classes as the primary explanatory variable while controlling for socio-demographics.

Preliminary results show that next to egalitarian and (moderate) traditional gender ideologies, ambivalent gender orientations exist. Dual-earner arrangements are more likely for egalitarian persons, an effect mainly driven

by women, and single-earner arrangements are more likely for child-centered men and women. Gendered employment arrangements depend on gender ideologies. Further, we will investigate how mismatches in family orientations between partners influence gendered employment arrangements. We discuss how these findings contribute to differences in the social integration of men and women and how ambivalent gender ideologies can be understood as drivers of persistent gender inequality.

Balancing Cultural Resistance and Political Accommodation: Urban Mapuche Organisations in Post-Democratic Chile

This presentation examines the narratives of interculturality within urban Mapuche communities in post-democratic Chile, focusing on the challenges and resistance they face under the state's neoliberal multicultural framework. Drawing on sustained ethnographic research conducted with urban Mapuche associations in Santiago—most of which are led by women—the paper explores the strategies these communities employ, such as ethno-bureaucracy and strategic essentialism, to engage with state institutions while simultaneously negotiating their identity and cultural practices in urban Chile today. The study highlights how neoliberal multiculturalism, while offering limited recognition of Indigenous rights, creates asymmetric power dynamics that result in both inclusion and exclusion, fragmenting the collective experience of urban Mapuche. Informed by critical multicultural and intercultural studies, the sociology of race and ethnicity, and an intersectional lens, this research contributes to discussions on how structural dispositions within the state shape Indigenous urban identities and the challenges of achieving truly symmetric intercultural exchanges.

BRAGA, RUY* (University of Sao Paulo, Brazil)

Neoliberalism, Authoritarianism, Evangelism: Hegemonic Politics and Elective Affinities in Bolsonaro's Brazil

In 2018, the election of Jair Bolsonaro as president of Brazil by a wide margin of votes—a radical defender of the civil-military dictatorship—defeating Fernando Haddad, the candidate of the Workers' Party (PT), reversed the progressive expectations that the successful administrations of Luiz Inácio Lula da Silva had left in the country's politics. The aim of this chapter is to analyze this surprising political shift in light of the transformations in Brazilian society that progressively distanced it from the pact established by the New Republic, that is, the period that followed the end of the dictatorship in the country and the promulgation of the 1988 Constitution. To this end, we argue that Jair Bolsonaro's election in 2018 and his notable electoral performance in 2022 indicate the emergence of a new hegemonic project in Brazilian politics and society. This is a hegemonic project based on social foundations very different from those that supported the New Republic. Instead of civil government, an increasingly prominent political activism by the armed forces; instead of investments in health, education, social protection, and labor rights, a raw version of neoliberalism; instead of trade unions and other progressive social movements as a dynamic source of popular mobilization for the expansion of citizenship rights, evangelical churches advocating a conservative agenda. In this context, we argue that Bolsonaro's election in 2018 represented a provisional response to the challenge of reconciling accumulation and legitimation, and Lula's election in 2022 by a very narrow margin of votes indicates that social and political disputes in the current interregnum defined by the crisis of neoliberal globalization are still open.

Projectification of Work: Do Project Skills Question Professional Configurations and Boundaries?

Among models on management and organisation of work and labour relations, project work increasingly stands out, affecting the role, status and powers of professionals. One trend observed in project work contexts pertains to the rise of new skills related to project management and organisation, framed and pushed by a growing set of programmes for training and certification of project skills. With this paper we propose to discuss how changing, projectified, organisational conditions, and particularly the rise of project skills and how they may overlap with professional expertise, can affect professionals' work and standing in different contexts.

This discussion stems from a research project 'PROWORK - Projectifying work: network organisation models in contemporary capitalist societies', devoted to the analysis of modes of projectification, understood as processes that raise the "project" in its own right as the central tenet of work organisation. The data for this discussion comes from case studies in four different sectors: Research & Development, Consulting & Management, Social Economy, and the Arts. The research methodology draws on ethnographic work, including direct observation, document analysis, and interviews.

Project work occurs within contexts where forms of expertise are shaped by mixed models of regulation, where claims to the public good may be in competition or combined with claims of market value, and multiple forms of legitimacy and authoritative knowledge claims can clash. Projects are thus a ground where notions of expertise can be challenged, prevailing dichotomies between formal education and on-the-job training overpassed, and prevailing modes of professional regulation undermined. As such, it is a model of work organisation that can introduce significant changes in professional boundaries, at its core, as project skills and management can encroach on professional expertise and autonomy, which calls for specific analysis on how those concepts still hold their explanatory power under conditions of projectification.

Projectifying Research and Development Work: Academy- and Industry- Driven Projects

This paper addresses the impacts of projectification on ST&I work, based on the results of two case studies analysing Research and Development (R&D) projects carried out in partnership between companies and research institutions. These case studies are part of a research project - 'PROWORK

- Projectifying work: network organisation models in contemporary capitalist societies' - analyzing modes and processes of projectification in different contexts, where the "project" is becoming the central tenet of work organisation, with specific impacts on work relationships, performance, goals and rationales.

While R&D has long been configured as a largely project-based endeavour, the impacts of the projectification of R&D work are not uniform and unchanging, making it important to analyse how that projectification is empirically enacted, in different contexts, by different social actors, and what specific impacts it bears. For that purpose, we will analyze both academy- and industry-driven R&D projects: one about preventing groundwater contamination, publicly funded and anchored in academic institutions that partner with local water companies in various geographies; the other focused on the development of a new product based on composite materials, privately funded by the company that produces them, and developed in partnership with academia.

These R&D projects will thus be analyzed as socio-technical networks, focusing not only on the individual and organizational levels, but the interorganizational level. The fact that these projects have different institutional anchors, are based on different funding sources, and compose diverse networks with distinct actors, is what makes them interesting to analyse various dynamics and dimensions of projectification, the role played by different stakeholders in them, and its outcomes.

Serving that in-depth and layered look, the case studies methodology draws on ethnographic work, to capture the subtler phenomenological dynamics of the projectification of R&D work, including data from direct observation, document analysis, and interviews.

Post-Institutional Spirituality in the Anthropocene

The now-common adage, "we look where the light is," captures well the reasons scholars of religion tend to privilege institutional, governmental, or civil society organizations' responses to the multiple crises of the Anthropocene. But some of the most interesting, and sometimes rather counter-intuitive, responses to the polycrisis or syndemic we face come from individuals and groups that operate outside of the existing religious, and also civil society arenas. In this presentation, I describe three responses to the perilous effects of the Anthropocene that are markedly spiritual but not aligned with large institutional forms of human organization. These three case studies or sources of response include a) a broad meta-narrative of "reverential naturalism" that has become more evident in the Pacific Northwest region of North America as conventional religious phenomena wane; b) the rapid growth of postural yoga forms we see in western societies; and c) the so-called "animal turn" in intellectual, artistic, and activist contexts. What lessons do these three examples have to teach scholars of religion, both about new religion-adjacent phenomena, or new post-religious spiritual communities, both of which seek to respond creatively and effectively to the dark future often associated with the Anthropocene? What methods and theories in the sociology of religion might be most, and least, well equipped to enable scholars to see, collect data about, and interpret the rapid changes occurring in our shared world?

Intergenerational Relations and the Dynamics of Active Retirement: Insights from Senior Workers

As populations age, significant challenges arise, including the reorganization of the labor market, the coexistence of multiple generations in the workplace, and the redefinition of retirement. This study examines the complexities of intergenerational relationships at work, focusing on the factors influencing the extension of working life beyond traditional retirement age and how these dynamics shape the transition to active retirement. It investigates how senior workers balance professional and personal life, perceive retirement, and envision their post-retirement activities.

Drawing on eight focus groups with workers over 60 from diverse professional backgrounds, the research explores: 1) current working and family conditions; 2) the impact of technology on work and relationships; 3) the quality of workplace interactions and work-life balance; 4) the personal and social meanings attached to work; and 5) the motivations behind early or postponed retirement and future plans for leisure and social engagement.

The findings emphasize the importance of family, social, and professional relationships in retirement decisions, underscoring the critical role of

intergenerational dynamics. This research enhances our understanding of retirement transitions and offers valuable insights for developing policies and workplace strategies that support active and fulfilling aging in both personal and professional spheres.

The Relevance of Social Capital for Care Providers: A Qualitative Study Using the Dyadic Interview to Examine the Role of Informal Relationships in Supporting Italian Caregivers

Increases in life expectancy also mean increases in the size of the elderly population requiring care. This has significant implications for family members, often referred to as the "sandwich generation" as they are tasked with addressing the needs and caring for individuals across the age spectrum. This research is part of a national mixed-methods study being conducted in Italy (from 2024 to 2025) investigating the role of informal social relationships in supporting family carers.

The presentation will focus on the qualitative aspect of the study, which aims to investigate the role of the social capital of individuals who provide care to relatives aged 65 and above. We adopted a more expansive definition of the term "sandwich generation," with particular reference to the Italian context. A purposive sample of 20 caregivers, aged from 50 to 65, were interviewed online using the dyadic interview method: the dyads were composed of caregivers and their supporters, such as spouses, other relatives, or friends. The interviews collected in depth information on the caregivers' experiences, including their perceptions of the caregiver role, their well-being, and the impact of the caregiver role on their work. The data collected was analysed by qualitative thematic analysis using template analysis.

The preliminary findings suggest that caregivers frequently encounter significant challenges in their daily lives. Social capital is regarded as a crucial component of their support, but maintaining it can be challenging. Furthermore, the results highlight how being a care-provider may also lead to conflicts in the family dynamic. This study emphasizes the value of informal social networks for caregivers and the kinds of support they provide. Furthermore, the research underscores the importance of examining the formal assistance that caregivers require in order to enhance their quality of life.

Arts and Community-Based Approaches to Conflict Transformation, Social Cohesion and International Collaboration within the Scope of Foreign Cultural Policies. a Case Study on the 'Donko Ni Maaya' Project in Mali.

In the context of international collaboration, there is a growing recognition of the importance of integrating cultural knowledge and community-based approaches when addressing social cohesion, conflict and crises. Traditions such as 'Maaya' ('humanity' in Bambara) illustrate that conflict resolution, reconciliation, and resilience are deeply embedded in the cultures of Mali, West Africa. However, the impact of community-based approaches, local cultural knowledge and the cultural sector as a whole are often underrepresented in discussions on conflict transformation, peacebuilding and the strengthening of social cohesion. This paper explores how the promotion of art and culture can contribute to conflict transformation, crisis prevention, and social cohesion, using the example of the 'Donko ni Maaya' ('Culture and Humanity') project, implemented by the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ) in Mali. The project focuses on empowering young cultural actors and the Malian youth, positioning them as 'agents of change.'

The paper addresses three key research questions:

1. How does the 'Donko ni Maaya' project strengthen the role of young Malians through cultural activities?
2. To what extent can the promotion of the cultural sector contribute to the creation of 'Platforms for Transformation' (Lederach 2013) in fragile states?
3. How can arts and community-based approaches to conflict transformation, social cohesion and peace be incorporated into foreign cultural policy approaches?

The research draws on both quantitative and qualitative surveys, resulting in a set of qualitative indicators that demonstrate the impact of art and culture in alignment with existing theories of arts-based peacebuilding (cf. Shank and Schirch 2008). The analysis focuses on three key areas: the creation of safe spaces in response to violence, securing the basic needs of youth as agents of change, and the necessity of artistic practice in establishing platforms for transformation.

BRANDON, VINAY* (University of Minnesota, Twin-Cities, India)

Re-Enchanting Disintermediation: Exploring Techno-Spirituality, Hindu Cybernetics and the Fetish Character of Blockchain Imaginaries in Digital India

The speculative frenzy among cryptocurrency promoters and investors is commonly associated with the financialized worldview of neoliberal realities, economic anxiety, and market positionality. Broadly considered as a social movement and an epistemic shift, a cultural analysis of Cryptocurrencies or Crypto-Assets is usually confined to macro-questions of monetary trust imbricating the micro-politics of non-state digital currencies/alternative financial futures. The polysemic locus of financialization thus seems to come always already attached with the spatiality of limited (banks) or radical disintermediation (state) in Crypto, considered archetypically as Bitcoin. Mainstream cultural critiques of the design ideals of cryptographic disintermediation thus reproduce Bitcoin's monetary pragmatics, or the countervailing tendencies (utopia vs dystopia) of its anti-state realist politics. Thus, existing literature applying relational approaches to Crypto-finance usually offers a disenchanted critique of the fetish character of *all* Crypto tokens – critiquing its techno-economic imaginaries and Manichaean tendencies in light of its *this worldly effects*.

This paper utilizes the extended case method and grounded theory to illustrate that magic, spirituality and techno-religious iconography are ever-present in blockchain's cybernetic ideal of disintermediation – assuming distinct historico-cultural forms. Utilizing William Pietz's problematization of fetishism in the interplay of religious and economic orders of social trust, along with David Graeber's thesis on the social creativity of the fetish, the paper will illustrate how religious, mythological and hierarchical ideals shape and vivify the imaginaries of distinct blockchain dreams, in both its cypherpunk design ideologies and specific (Hindu) cultural practices.

By comparing the techno-evangelist slant of Crypto's originary network cosmologies with the spiritual force of Hinduism, Digital Hindutva and technopopulism driving NFT adoption in contemporary urban India, I will illustrate how relationality and social metaphysics get deeply embedded within culturally specific notions of disintermediation – thereby re-enchanting cyberlibertarian ideals of anonymity, privacy and digital integrity that undergird Crypto's social and cultural reproduction.

BRANDT, FREDERIKE* (Technical University Berlin, Germany)

Global and Local Knowledge, Societal Processes and Conflicts of Materiality: Lithium Extraction in Argentina

This contribution focuses on the conflicts arising from lithium extraction in the so-called lithium triangle, particularly in Argentina – a region with the largest lithium deposits in the world. With a surge in demand driven by electric mobility and renewable energy storage, unconventional lithium mining methods, such as extraction from saline waters, have become prevalent. However, this has triggered widespread protests in Jujuy and Catamarca, where local and indigenous populations resist land expropriation and anticipate severe water scarcity in the arid environment.

The tensions escalate with repressive measures from local and national authorities, prompting a constitutional reform in Jujuy to criminalize social protests and streamline lithium extraction by transnational corporations. A cross-sector resistance movement emerges, uniting indigenous communities, public service employees, miners, and bank staff against the encroachment on their land and resources.

It is a complex arrangement of diverse actors who refer to different knowledge, which is exacerbated by the rapidly changing conditions of the lithium market and the local politics of an unstable country. This research examines the different actors and scales of these conflicts, addressing the negotiation and local implementation of 'universal' norms such as human right.

In conclusion, this research delves into the heart of the conflicts surrounding lithium extraction in Argentina, shedding light on the global and local tensions,

the impact on human rights, and the challenges posed by the materiality of the research object and the global market which it is linked to from a sociology of knowledge perspective.

Therefore, it is an empirical exemplary case of tensions and inequalities in the knowledge regimes of different actors on different scales intersecting with global and local tensions.

BRANDT, FREDERIKE* (Technical University Berlin, Germany)

Sexual Violence: Ethnophenomenological Analysis of the Experience of Affected Persons

Sexual violence is part of the lifeworld of many people and by no means a marginal phenomenon. It takes place in different forms in public and private spaces. Which phenomena are identified as sexual violence (e.g. in public or legal discourse) evolves dynamically and in social embedded processes. Apart from the partly dynamic limits of the phenomenon, there is another methodological challenge: Sexual violence is a bodily experience. It is always corporeal, both on the part of the perpetrators and on the part of the targeted person. Interactions without physical contact can be also important here, such as insults or exhibitionism. The specific type of sensuality and spatiality must be addressed in a differentiated manner. Since sexual violence is always bodily and sensual, special methods and methodological concepts are needed to understand the primarily bodily sense of the experience and to make it available in verbal language for research. Thereby researchers must also fight against the fact that sexual violence is still strongly tabooed in society and therefore often remains veiled. In view of these challenges, I decided to conduct open interviews with affected persons, in which the interviewees themselves discuss their experiences. In this context, I will use the data collected in interviews to discuss how to methodically deal with bodily phenomena that partly elude visibility, comprehensibility, and verbalization. A qualitative and inductive approach is necessary to gain a better understanding of the experiences sexual violence. Based on the methodological challenges mentioned above, the approach of ethnophenomenology is used, which sheds light on subjective sensual experiences. The reflexive attention is enacted by the interviewees themselves. In this way, the bodily experience can be analyzed. The analysis resulted in differentiating the narrated experiences by their specific corporeality, their reciprocity and their temporality.

BRANDT, ULRICH* (German Federal Pension Insurance, Germany)

CZAPLICKI, CHRISTIN* (German Federal Pension Insurance, Germany)

HEIEN, THORSTEN* (Deutsche Rentenversicherung Bund, Germany)

Increasing Numbers of Self-Employed, Increasing Risk of Poverty in Old Age?

For a long time, self-employed people were not the focus of research on old-age poverty in Germany. On the one hand, a large proportion of them were compulsorily included in various pension schemes, namely the pension scheme for the liberal professions (i.e., doctors, architects, lawyers, notaries), the pension scheme for farmers and the statutory pension insurance. On the other hand, it was assumed that the vast majority of the remaining self-employed were able to make sufficient private provision for their old age. However, the significant change in employment activities and forms of employment in recent decades has led to an increasing number of self-employed not compulsorily insured in a pension scheme. Many of them are so called "solo self-employed" who do not employ any staff. Furthermore, these self-employed very often have not sufficient funds for private pension provision resp. general accumulation of wealth or are not prepared to use them accordingly. One of the consequences of this is that according to the government's pension report in 2020 – new figures will be available at the end of 2024 – the proportion of former self-employed persons who received means-tested old-age benefits, i.e., are considered poor according to the legal definition, was higher than for former employees.

Against this background, the article uses data from the study on "Life courses and old-age provision" to examine the current old-age provision and the (non-) employment biographies to date, as well as other objective and subjective determinants of the old-age provision of self-employed people aged between 40 and under 60 in Germany. The results can be used to estimate how the old-age provision of the self-employed and their specific risk of poverty will develop in the near future. Based on these analyses, suitable measures to combat old-age poverty among the self-employed can be discussed and evaluated.

The Ideologized Field of Cultural Production? Art Versus Commerce Versus Politics, or: The Artistic World Reversed

Scholars have redeveloped Bourdieusian field theory, originally developed on the basis of 19th century and late 20th century societies, to account for globalization and transnationalization (cf Buchholz, 2016), in arts and culture but also in other fields. Yet Bourdieusian field theory has not been updated for another major transformation: the climate crisis. Touching all spheres of society and threatening the survival of our ecological and social systems, the climate crisis draws political attention to fields, like the cultural field and challenges these fields' relative autonomy. Both in Bourdieusian and post-Bourdieusian analyses of the cultural field, the focus is on culture as the negation of the economy (Bourdieu, 1993). However, the climate crisis foregrounds another negation: of the political-ideological.

Our paper takes the case of the cultural field of fashion to demonstrate how the climate crisis enforces political engagement and makes ideology salient into relatively autonomous cultural fields. Our analysis of fashion legislation, magazines, journalists, and digital intermediaries shows how political actors, from activists to lawmakers, enter the field to form coalitions and spread ideologies that challenge or defend the status quo of a cultural field predicated on ecologically destructive practices. This 'ideologization' ultimately leads to the introduction of a second heteronomous pole, next to the heteronomous pole of the market, changing the logic of the field from a bipolar opposition of (high status) aesthetics versus (low status) commerce, to a threefold logic opposing aesthetics vs politics vs commerce. This threefold logic reshapes the doxa of the field, leading to new op/positions in the field, and causing the players in the field to develop new strategies to (not) deal with the climate crisis. We thus offer a redevelopment of field theory for the unique of the climate crisis to not only cultural fields, but more broadly to the contemporary fielded societies.

BRATHWAITE, BEVERLEY* (University of Roehampton, United Kingdom)
 GODBOLD, ROSEMARY (University of Hertfordshire, United Kingdom)

Racism and Clinical Decision Making- a Sociological Perspective in a Nursing Curriculum.

Making clinical decisions is vital in assuring safe and competent delivery of care. It has no place for racism. Nurse education spend a lot of time teaching nursing students the importance of clinical decision and how to make clinical decision, which is to be expected. Implicit and other forms of biases are understood as the central reason for decision making that clearly have an impact on all nurses thinking in relation to clinical decisions. However, racism work in a very specific way and is imbedded in society so effectively that the transmission of racism is regularly not acknowledged by these systems and institutions and those that work within them in positions of power. Nurse education and the NHS are systems and institutions that perpetuate racism even when explicitly wanting to do the opposite.

The evidence clearly identifies that Black and Brown patients have inferior healthcare outcomes than White patients. There are multiple factors for this but one of them is inappropriate clinical decision making based on racism. An exploration of the evidence and the need for nurse education to acknowledge this and make real changes will be presented. How racism both individual and institutionally functions in a way that impact on the lived experiences of Black and Brown patients in the NHS. Nurse's clinical decisions can ultimately lead to inadequate care delivery. The complexities and theories of clinical decision-making and how clinical decisions are made will be considered, and how Whiteness as a social construct plays a significant role in British nursing education, evidence base and the function of racism. Finally, what can nurse education actually do to make changes that will transform this current reality.

RC15-227.4

BRATHWAITE, BEVERLEY* (University of Roehampton, United Kingdom)

The Disparities and Risk of COVID-19 in Black and Brown Nurses in the United Kingdom- a Public Health Issue in England

COVID-19 does not discriminate, but people do, and evidence clearly identifies that in society, Black and Brown (B&B) communities are disproportionately negatively affected in education, work, housing, criminal justice system, and health. B&B healthcare workers in the National health service (NHS), the public

service that provides free health care at the point of access to all in the UK, were affected in unprecedented numbers by COVID-19 deaths compared to their White counterparts. The way that the British government used the NHS and through public health initiatives when responding to the pandemic has shed light on the racially based inequalities and social determinants of health that exist in society and for female B&B nurses.

Using postcolonial feminist theory, the reasons for these higher numbers of deaths is based on the colonial history of B&B women's gender being constructed in a way that is racialised and disadvantaged. B&B women have been made invisible, powerless, and used only when necessary to provide a service to White colonial masters both male and female and that these power relations are still in place today. British colonial power laid the foundations for the institutional racism that today is perpetuated and sustained within public health at the height of the pandemic and persistently influences public health decision making.

BRAUN CARRASCO, FABIO* (Humboldt University, Berlin, Germany)

Affective Landscapes in Far-Right Memes

Emergent far-right mobilization has relied heavily on internet communication in many countries. Especially social media has played an outsized role in fostering and maintaining affective allegiance among supporters. The platforms are partly segmented in accordance with age, with Facebook corresponding with older users and Instagram and Tiktok targeting younger users. Many far-right movements recognized the power of online mobilization long before established political parties started building up a social media presence. One early and widely effective strategy was the use of memes, which were established as a means of political communication in the run up to the 2016 U.S. presidential election. The far-right pioneered memes as a simple and concise instrument, which combined political messaging with the activation of emotive responses, hence drawing in viewers on an affective rather than a policy-oriented basis. The initial motifs centered around "Pepe the Frog" and the imaginary country of "Kekistan" have over time faded from the far-right meme repertoire and other, often country specific formats have emerged. By inserting their own discourses into general internet culture, far-right movements have managed to create strong ties to sections of frequent internet users. In many countries this is reflected in the share of young voters that vote far-right.

This contribution seeks to trace the emotional landscapes that are conjured in online far-right spaces. These often include a rebellion against a status quo that is portrayed as dishonest and self-interested and a return to traditional social and gender roles, which includes the re-valuation of supposedly masculine character traits by emphasizing meritocratic regimes and "honest" work. What is present in much of the far-right's meme practice is hence both the affective glee of the attempted destruction and denigration of those considered (political) enemies and deep feelings of validation and recognition within the own political-ideological realm.

BRAUN CARRASCO, FABIO* (Humboldt University, Berlin, Germany)

The Far-Right As Focal Point of the Reemerging Capitalism- Democracy Tension in a Multipolar World

The end of the Cold War that culminated in the collapse of the Soviet Union seemed to have proven one thing in particular: that the twin system of liberal democracy and capitalism was functionally and morally superior, ensuring both political freedom and elevated standards of living. Yet this supposed truth, albeit never unquestioned, today seems almost preposterous. That "the end of history" would not usher in a global expansion of Western modernity seemed to become evident first through 9/11 and the subsequent "War on Terror". A "free world" led by a Western alliance seemed impossibly far away. With the 2008 financial crisis and the economic changes that predated and followed it, also the internal tensions of the "superior" system became clear. The second and third decade of the 2000s further complicate the picture, as former mass parties struggle for political relevance, mechanisms of democratic representation seem fraught and strong(women), ethno-nationalists, and religiously guided market-libertarians have marched unto the political stage. The backdrop against which these transformations are taking place is the diminished economic and political importance of parts of the Global North, especially Europe, and the reemergence of a multicentric, at times fractured world order.

The tectonic shifts in global power structures bring to light both the contradictions within the former "core" and the challenges to it from the newly emerging centers, creating mutually reinforcing instabilities. The far-right, which despite its degree of internal homogeneity is an umbrella term for

diverse viewpoints and actors, has come out as one of the main beneficiaries of this process, as it quickly positioned itself as an expert entrepreneur of instability. This contribution seeks to explore these various, interrelated processes by contextualizing the ongoing far-right breakthrough in the light of an intensifying capitalism-democracy tension set against the global process of de- and multi-centralization.

Extortion of Public Transportation and Organized Crime in Estado De México

The concentration of illicit crimes does not happen randomly. That is, there are factors that favor or inhibit criminal dynamics. In the Mexican case, extortion of public transportation in certain areas of Estado de México stands out. In this work, we seek to relate this crime with the strengthening of criminal organizations, which will be done through analysis of both crimes and their connection in the context of this state. The objective is to connect the incidence of these phenomena, characterize the way in which it happens and its social effects. The above will be done through the analysis of crime figures, the monitoring of criminal processes and the understanding of the development of criminal groups. At the end, some general reflections are made and routes are proposed to contribute to the knowledge of criminal organizations and their effects in current Mexican times.

BRAVO GOVEA, LUIS* (Universidad Nacional Autónoma de México, Mexico)

Las Fuerzas Armadas En Gobiernos De Izquierda: El Caso De México y Colombia

La izquierda política es un espectro ideológico en el cual se ha valorado de distinta manera a las fuerzas armadas. En el caso de las transiciones democráticas, ha habido varios países latinoamericanos que han virado a esta tendencia política, y con ello ha habido cambios y continuidades en las relaciones cívico-militares. Lo anterior cobra importancia debido al pasado autoritario en la región y a la necesidad de entender estas reconfiguraciones con respecto a los regímenes democráticos. De este modo, se propone analizar a la relación de los nuevos gobiernos de izquierda con las fuerzas armadas en el caso de Colombia (Gustavo Petro 2022-2026) y México (Andrés Manuel López Obrador 2018-2024). El objetivo es comprender este proceso político con respecto a la militarización de estos países e identificar procesos de ruptura y cambio. Al final, se realizan una serie de conclusiones y sugerencias para el entendimiento de esta línea de investigación en América Latina.

TG07-982.2

BRAZIOLI, CECILIA* (University of Milan, Italy)

Legitimising Graffiti Writing in Contemporary Urban Aesthetic Governance

Originated as external to, if not in contrast to, the field of urban planning, informal creative practices, such as graffiti writing, are now central in the discourses of urban planners and their *modus operandi* (Vivant, 2020). Thus, cultural governmentality, "endogenizing" spaces of critique (Boltanski and Chiapello, 1999), seems to compel actors with a critical view of urban planning to adapt. Nonetheless, by occupying ordinary or unused spaces, artists offer a singular experience outside of the predetermined, routine frameworks of an increasingly standardized and domesticated city (Chatterton, 2002).

Theorists of aesthetic capitalism (Bohme, 2010, 2017; Murphy and de la Fuente, 2014) highlight the relevance of the visual and the aesthetics for value extraction, stressing the neoliberal nature of current Western cities management of urban order. However, more generally, spatial aesthetics refers to an analysis that focuses on the sensory aspects of our experience as users of a specific space (Carmo et al., 2014).

Graffiti occupies "in-between" places, and rhymes with an aesthetic of "infestation". The "in place/out of place" dialectic is thus central for claims to legitimacy, legality, and intrinsic quality of a given instance of graffiti. Who are the subjects allowed to legitimately assess graffiti, which are the rules and the logics they deploy, and which are the power relations that come into play in this process? To tackle this question, I look at how graffiti concretely relates to the environments in which it features, activating a repertoire of valorisation strategies (including defacement, unsafety, subversion, authenticity, originality, creativity, fame etc.) and engaging a dialectic co-construction of the legal framework of urban surfaces, shedding light on the "lawscape" of cities.

RC37-JS-206.1

BRAZIOLI, CECILIA* (University of Milan, Italy)

Negotiating Urban Aesthetic Order: Processes of Space Valorisation through Graffiti and Street Art

In the framework of contemporary "creative" urban strategies, at the same time as various official projects exploit street artists for urban regeneration purposes, graffiti writers are still prosecuted for their actions on walls, on trains, in the streets. Thus, the value attributed to these practices makes them visible in opposing yet simultaneous directions. Following Brighenti (2016a), who relies on a Deleuzian concept (1968/1975), I refer to this tension as *divergent synthesis*. I consider it relevant to pay attention to these tendencies in the discursive repertoires, representations, negotiations and resistances implied when dealing with graffiti and street art to inquire about the role they have in changing, visibilizing and shaping urban space aesthetics, and the social relations that take place there.

I plan to focus on the discourses, narratives and negotiations that represent the underlying linguistic systems of measure of the complex dynamics of value attribution, keeping in mind that measures are never neutral: through any measurement act, ascribing meanings, both epistemic models and power tools can be identified (Brighenti, 2016b). Moreover, I consider valorization processes as inherently unstable and multifaceted, capable of condensing scattered discursive repertoires and representations that affect the perception of the aesthetic (dis)order of the cities (Brighenti, 2018; Vaslin, 2021). For this purpose, I consider aesthetic capitalism (Bohme, 2003, 2010, 2017; Murphy & de la Fuente, 2014) a particularly helpful theoretical attempt to explain the current manifestation of neoliberalism, since it allows us to observe how value is extracted from aesthetics.

STRÜVER, ANKE* (University of Graz, Austria)

Embodied Climate Activism As a Planetary Ethics of Care

Departing from the urban as site where the climate crisis is produced, experienced, and antagonised, this paper will focus on body mapping as a research method to advance a care-ethical approach towards planetary thinking and the climate crisis.

The density and diversity of a city's population, public spaces allowing strangers to meet and assemble, or the spatial proximity of political decision makers are just a few reasons why the urban functions as a preferred site for tackling the climate crisis. Considering the lack of political will to implement life-saving counter-measures to this crisis while the remaining window of opportunity is rapidly decreasing and the consequences of inaction are becoming more and more tangible, climate protests have become an inherent part of everyday life.

Fighting the climate crisis is thus tied to a relational understanding of care and extending care for the people, the planet, and their interrelated futures by *caring-with* in Joan Tronto's sense: Caring is then not only a specific activity but a bundle of practices that respond to emotional and physical needs—of oneself, other people, and/or the planet as more-than-human being—and that rest on the radical respect for interdependencies. To secure the survival of human civilisation as we know it, structural changes towards a climate-friendly everyday life are therefore crucial. We understand care as one condition for pushing these structural changes.

Activists—particularly those participating in actions of civil disobedience—are embodying climate activism by putting themselves at the frontline of the fight for climate justice. The mental and physical implications of this fight—which can be viewed as an act of (planetary) care—will be further investigated through the method of body mapping, focussing not only on the experiences made on the immediate protest sites, but also on those made in prisons and courts thereafter.

Aging and Hyperaging in Different Institutional Skill Formation and Firm Organization Contexts: Older Workers' Vocational Changing and Training in Germany and Japan

Societies in Germany and Japan are aging and hyperaging respectively because of longer lifespans and fewer children. This can motivate, or force, workers to stay in the labor market longer than in the past, this can collide with firms pushing older workers out or into other areas. Successful transitions for both individuals and society more generally, requires acquisition of new skills to perform this work. In this study we investigate the learning and training activities, desires and potential barriers of adults in these two societies working in medium to large firms who are shortly before retirement. We hypothesize that the vertical organization of firms in Germany (where firms tend to operate in a single industry, as in Europe more generally) may lead to greater incidence of forced unemployment or retirement, whereas the horizontal organization of firms in Japan (where firms operate across industries, as in East Asia more generally) may keep workers employed in the same company but shift them to completely new jobs and/or industries. Using institutional skill formation regime perspectives and literature on firms in both countries, we hypothesize that society is better equipped in Germany to provide training for individuals outside of firms, but the highly embedded institutional structures in Germany may be slower to adapt to changing demographics and workers' needs; at least when compared with a liberal market setting as in Japan. We have work-in-progress with PIAAC data to uncover if perceived barriers to training such as lack of time, opportunity or financial support differ in ways that reflect the different organizational forms and availability of training in these two societies. Finally, we aim to identify what types of change are observed among such workers based on their previous job tasks and industry, compared to their current ones as evidence of differential impact of firms.

Looking at Milan As an Alpha City: Framing and Updating a Research Agenda

The paper contributes to the debate on elites' spaces in European cities in specific relation to phenomena of alpha territorialisation. It tries to apply this international figure to Milan, that is the main financial and economic hub in Italy. This case can be considered as an original intersection between the articulation of urbanisation and socio-spatial polarisation processes in the Italian context and the dynamics of global cities, integrating international trends with site-specific characteristics. Based on comparison with London, the article updates the recent evolution of spatial processes, policy, and planning in the Milan urban core. On the one hand, it recognises different local strategies, phases, and possible meanings of phenomena of alpha territorialisation, which vary according to different places of development (near the city centre or in external areas of the urban core) and to different times of implementation (before and after the 2008 crisis; before and after the approval of new general urban plans in 2012 and 2019). On the other hand, it identifies open challenges and knowledge gaps to develop further research and policy-making in a city that, since the 2011 political turn, has been investing in a radically new urban agenda, that is very articulated: from new statutory urban plans, to multiple sectoral urban policies; from large redevelopment projects, to new experimental planning tools specifically targeted to the regeneration of multiple neighbourhoods. Within goals and rhetorics of economic innovation, social inclusion, and environmental regeneration, the experimental approach promoted by the Milan urban governance is multifaceted, but the implementation mechanisms are still unclear, and the risks of further gentrification and disparities cannot be excluded. For all these reasons, the effects of this new phase of spatial policy and planning in Milan demand for further investigation, considering local specificities in relation with global processes of other alpha cities

Fighting Back Gender-Based Violence and (re)Finding Body Autonomy through the Practice of Women's Self-Defense.

A lot of work has been done about the vulnerability of women, the different types of violence they face as well as its impacts on their body. However, very little research has taken the approach of an agency of women through the appropriation of violence, as a tool to fight back from patriarchal violence. This presentation discusses the subject of women's self-defense, and the different ways of learning how to become violent allows them to inhabit their bodies, their social interactions and urban environments, through changed practices and emotions.

This presentation is based on ongoing PhD research in geography about women's self-defense in Paris and London, and draws on participatory observations in self-defense classes, interviews with teachers and students, and surveys distributed during these lessons.

Studying women's self-defense allows us to understand the different body techniques implemented by women before, during and after studying self-defense. Furthermore, gender norms surrounding women's posture, body autonomy and the use of their muscles are intensely reshaped through the learning of this defensive violence. This topic also provides us with an opportunity to rethink women's status as eternal victims, as preys or as passive: in the case of feminist self-defense, women actively fight for their autonomy with techniques designed by and for women (Dorlin, 2020). Feminine violence also tackles our perception of the "perfect victim", from a sociological, legal, and moral perspective, and what fighting "like a girl" means (Young, 1980).

Highlighting the *continuum* of violence faced by women, as well as its impact on their bodies remain a subject of utmost importance. However, learning how women actively fight their vulnerabilities using defensive violence may also allow us to rethink the interactions between gender, violence and space, from the scale of the body to the scale of the city.

Administrative Performance in the Service of Female Entrepreneurship in Cameroon: Role of Gender Policies in Decentralization and Local Development Reforms

This communication analyzes the impact of gender policies in decentralization and local development reforms, specifically examining their influence on the performance of the Cameroonian administration in terms of female entrepreneurship. The issue raised for this purpose is the following: How do gender policies contribute to strengthening the effectiveness of decentralization and local development reforms to promote female entrepreneurship in Cameroon? The context of decentralization and local development reforms in Cameroon has seen the establishment of legal and institutional provisions to promote gender equality and women's empowerment, as well as specific programs to support female entrepreneurship. According to Kamdem (2011)¹, few studies have looked at the specific case of Cameroon and the impact of gender policies on administrative performance in terms of female entrepreneurship. Drawing on feminist theories according to Falquet J. (2005)², the capabilities approach of Amartya Sen according to Monnet E. (2007)³ and the institutional theory of Max Weber according to Belley (1988), we will see along this article how by acquiring the necessary skills to assimilate the issues and challenges linked to the understanding of gender policies, the Cameroonian administration will be able to better legally and socially supervise female entrepreneurship, from a local development perspective. This analysis being carried out in a context of decentralization, the article specifically examines the impact of gender policies in the performance of the administration of the municipality of Yaoundé 1 to support women entrepreneurs in the district. The methodology is based on a qualitative approach, based on semi-structured interviews with key stakeholders and statistical data. The results of the study indicate that gender policies in the reforms have had positive effects on female entrepreneurship in Cameroon specifically within the commune of Yaoundé 1, in terms of access to financing, training and participation in local decision-making bodies.⁴ Drawing on feminist theories according to Falquet J. Post-Anthropocentric Movements: Rethinking Agency, Justice and Social Change Beyond the Human

Social movements are and have been key actors producing knowledge about the negative human impact on the planet – locally, transregionally and globally. Our presentation employs the idea that political-sociological thought must begin to expand beyond anthropocentric frameworks to engage with broader, more-than-human relations of justice and conceptions of social change. In real life, we can see already various forms of post-anthropocentric movements, which remain largely overseen and/ underconceptualized. We suggest we need novel ways of conceptualizing justice, agency, and knowledge that decenter human exceptionalism and recognize the entanglements between human and non-human actors. Using examples of diverse forms of environmental, interspecies, and relational justice, the paper explores how a post-anthropocentric lens can reframe debates on the distribution of harm, responsibility, and rights across species and ecosystems. Drawing on feminist, Indigenous, and decolonial epistemologies, we seek to challenge dominant knowledge systems that prioritize human interests while marginalizing non-human entities. Central to this inquiry is the question of whose knowledge counts in understanding justice in the Anthropocene, particularly in a world shaped by interconnected ecological crises. We suggest that looking at what we call 'eco-democratic knowledge practices' forged by social movements in one way of recognizing the agency of non-human entities (rivers, animals, forests), we consider it as essential to envisioning a more equitable and sustainable future. Bridging and building on existing research on social movements including prefigurative politics, and intersectional alliances with the literature on political ecology, including socio-ecological transformations, nature-society relations, and community-based modes of living could help rethinking sociological approaches to post-anthropocentric justice and social change - compelling us to engage with complex, multi-species relationships and to support the construction of real-life laboratories of socio-ecological, democratic change.

The Iftar in the Street. the Spatial Configuration of a Food-Based Communitarian Ritual in Spanish Cities.

This presentation explores the spatial configuration of *iftar*, the ritual that breaks the fast during Ramadan, in Spanish cities. Like in other European countries, Spanish cities have experienced a significant pluralization of their religious landscapes. Islam, spread widely through the global diaspora and fueled by international migration and globalization, is one of the most rapidly growing religions. Its expansion is also marked by a strong sense of community through the concept of the *umma*, a transnational network of believers that unites followers across diverse cultures and regions. This sense of community translates into material traces that manifest in public spaces through places of worship, specialized shops, and symbolic elements. It is also evident in public celebrations, such as the *iftars* during Ramadan, which take place in various cities. A food-based ritual, *iftars* have acquired an important public dimension, promoted by local Islamic communities and supported by public authorities. This presentation draws on an ongoing collective research project that analyses the public celebration of iftars in three medium-size Spanish cities: El Ejido, Melilla, and Vic. By analyzing the spatial dimension of

these celebrations, we aim to advance critical knowledge on the role of food in the public visibility of religious minorities. Moreover, we want to shift the gaze from big cities and "cosmopolitan" neighborhoods by focusing on other urban and territorial configurations.

BROCCATELLI, CHIARA* (Univestitat Autònoma de Barcelona, Spain)

Integrating Mental Health Services: A Multilevel Network Methodological Approach

Mental healthcare services must be seen through a social lens, where coordinated actions are crucial for developing holistic care plans that consider patients' broader social and environmental contexts. The mental health system operates across interdependent levels—clinical, community, organisational, and policy—each contributing to overall mental wellness. However, fostering synergies across these layers presents challenges, as healthcare professionals from diverse settings (community centres, hospitals, NGOs, and private foundations) often have different capabilities, priorities, and needs. These actors form a complex network of relationships, creating intricate governance structures within the sector. Understanding how these relationships operate and how to nurture partnerships between mental health services is essential for building an integrated care system.

Despite the clear social nature of the mental health system, the factors and best practices that sustain collaboration across different service providers and health professionals remain underexplored. Research on the multilevel collaborative processes—such as community initiatives, interventions, and resource sharing—between public and private entities has been sparse. Using past and current case studies, the present presentation discusses the theoretical and practical implications of applying a multilevel network perspective, rooted in social networks research, for analysing the multi-level patterns of interpersonal relationships within and across different healthcare professionals and their networking performance, with a view to also map patient's larger social system to understand how comprehensively support people's mental health.

BROOKS, RACHEL* (University of Oxford, United Kingdom)

Mediatization of Student Protests Against Israeli Action in Gaza: A Cross-European Analysis

Research into student political activity, across Europe, has shown how the media can play a key role in shaping how such activity is framed. For example, emphasis within the Spanish press on the violent nature of student protest has tended to divert attention away from the specific concerns of students and present students, rather than the issues that they were protesting about, as a threat to society (Brooks et al., 2022). Moreover, press coverage of student political activity in the UK has also frequently constructed students as a threat. In this case, however, it is longstanding traditions of intellectual debate that are presented as threatened – from students' desire for 'safe spaces' (spaces for discussion without the threat of violence, harassment or hate speech) and implementation of 'no platforming' (not providing a platform to a speaker representing ideas deemed to be harmful) (Brooks et al., 2022; Finn et al., 2021). The current paper will develop this analysis, of the role of national newspapers in mediating student protests, by focusing on coverage of protests, against Israeli action in Gaza, which took place in many European countries in the summer of 2024. It will explore how the protests were covered in two national newspapers in each of Denmark, France, Ireland, Spain and the UK, and the extent to which such coverage positioned student political activity as a threat. Moreover, given some national difference in response (e.g. in Ireland, one university responded by agreeing to divest from Israeli companies) and in policy positioning (e.g. Spain has historically been more supportive of Palestinian causes than some of its European neighbours), the paper will examine whether this heterogeneity is also played out in media reports. It concludes by assessing the likely impact of the coverage on societal understandings of students as political actors.

*Widening Participation to Higher Education Work Placements:
Temporal Challenges*

Within the UK, sandwich courses, i.e. degree programmes that include a year spent on a work placement, usually during the third year of a four-year course, are increasingly offered by higher education institutions to maximise the proportion of their graduates moving into employment and, particularly, jobs that are deemed 'graduate-level'. Indeed, there is evidence of a strong positive correlation between participation in sandwich courses and employment. Although this positive impact is particularly marked for students from non-traditional backgrounds, such students are also significantly less likely to undertake a sandwich course. The article draws on 50 interviews with higher education staff and students to argue that many of the most significant barriers experienced by non-traditional students are related to various temporal challenges. In doing so, it expands the body of work on the frequent mis-match between hegemonic university time and the time of students from under-represented backgrounds. In addition, it argues that non-traditional students are less able than their more privileged peers to take advantage of the 'slow time' necessary to undertake a work placement, and that the rhythms of external actors are also relevant when explaining the challenges faced by non-traditional students.

BROWN, PATRICK* (University of Amsterdam, Netherlands)

Towards a Theory of Magical Phenomena and Their (un) Questionability

Recent theoretical work in the sociology of risk and uncertainty has engaged with concepts of enchantment and re-enchantment. This work develops Weberian concerns which initially considered the disenchantment or de-magicalisation of society as a key feature modernisation. Connecting work on magical thinking and cultural dynamics, to dis-/re-enchantment and lifeworld rationalisation, this paper seeks to synthesise and extend our understanding of the magical and its role within different modernities. Drawing initially on work by Habermas on limits to communicative action as a basis of rationalisation, we explore the power of magic as an inhibitor of questioning and an obstacle to mutual understanding, listening and discussion. The paper then moves to consider some of the organisational and power dynamics which drive the emergence of objects, people and phenomena as magical and unquestionable. I will draw upon Mary Douglas's work on organisational conflict and anomalous objects, alongside Sarah Ahmed's work on emotional 'resonances' around objects, as a basis towards understanding the emergence of feedback loops which result in the gradual shifting of particular phenomena or objects away from discursive spaces of rational debate and questioning. As these phenomena, people or objects move towards discursive spaces where deep-seated assumptions, meanings, imaginaries and emotions accumulate around them in particular formats, this can start to preclude open discussion and to render misunderstandings and miscommunication more likely when attempts at discussion do take place. As objects, people or phenomena move beyond question (at least among some groups in society), so does their power potentially increase and thus their usefulness in everyday processes of handling uncertain futures and vulnerability, partly by limiting other discussions and critical thinking. The paper will refer to a number of examples – drawn from medicine and politics – in order to examine the longer-term gradual processes and mechanisms of (de)magicalisation in more detail.

BROWN, STEFAN* (Royal Holloway University, United Kingdom)

A Scoping Review of Critical and Diverse Perspectives of Mental Distress and How They Might be Useful for Mental Health Social Work.

While the biomedical model of mental health remains dominant in healthcare provision, there is increasing recognition of the diversity of understandings of mental distress within society. This range of perspectives is shaped by lived experiences, social positions and identities including those related to gender, 'race', ethnicity, culture, religion, sexuality, disability, neurodiversity, social class, as well as their interactions and intersections.

This proposal outlines the first stage of a plan to develop learning resources to support practitioners in learning about diverse and critical perspectives on mental distress and how to explore ways in which these perspectives can be used in practice.

The presentation will present findings from the first stage of the project, which consists of a detailed scoping review of critical and diverse perspectives on mental distress. The presentation will detail the key messages drawn from the literature on diverse and critical perspectives on mental distress. As part of the presentation, there will be a discussion of sociological concepts evident in the literature and their relevance to mental health social work.

The presentation will also include the initial feedback on the second stage of the project which involves a roundtable discussion with a panel of experts, who will be asked to appraise and select specific critical and diverse perspectives to be included in learning resources for practitioners and students. The round table discussion will include People with Lived Experience of mental distress, experienced social worker practitioners and those involved in the academic study of mental distress.

The presentation aims to contribute to the overall conference theme of 'Justice in the Anthropocene', by recognising the salience of critical and diverse perspectives on mental distress, informed by sociological thought. These perspectives can offer social work and other professions vital tools for promoting social justice within a biomedically dominated world of mental health.

Social Work Perspectives on Mental Capacity Act Decision Making

This thesis is based on a study that examined the perspectives of 17 social workers based in adult social care settings, carrying out MCA assessments and Best Interests decision making with people who have YOD. The findings from the research study reveal how social workers use the MCA to make decisions. Highlighted in the findings is a typology of the approaches social workers use in their MCA decision making, consisting of procedural, medicalised, creative, shared, positive risk and rights-based approaches. The findings also reveal the processes that social workers engage in as part of their MCA decision making, the contextual factors which shape social worker decision making and the nature of collaborative practice between social workers and other professionals, family members, carers and community organisations. The conclusions of this thesis highlight the complex nature of MCA decision making for social workers in their practice with people with YOD as well as recognising the importance of social worker cognisance with risk issues and promoting the rights of people as part of their MCA work.

BROWNE, CRAIG* (The University of Sydney, Australia)

Between Practice and Imaginaries: Class and Classification

Despite the revival of interest in class and class analysis, my paper suggests that this renewal has yet to fully incorporate some important developments in contemporary social theory. It will make two main suggestions concerning how the dilemmas of the relationship between class and classification can be addressed in ways that build on current theoretical initiatives. First, it will contend that class, both as a category and a 'reality' of lived group experience, whether defined subjectively or objectively, has been considerably shaped by the two dominant modern social and political imaginaries. These are, in Cornelius Castoraidis' opinion, the imaginaries of the project of autonomy and the capitalist imaginary of rational domination. It is from these imaginaries that the interpretation of class as constitutive of society originated and this horizon of understanding was integral to the formation of class as a collective subjectivity in modernity. The tension between the two modern social imaginaries and their intermingling would have a range of implications, including those contributed to notions of the transcendence of class and class conflict. The exploration of these social and political imaginaries institution is salient to comprehending the variations in class formation from the perspective of global modernities. Second, it will be suggested that the broadly defined contemporary strands of the sociology of practice have illuminated significant dimensions of classification struggles and their contemporary implications for social classes. There is, nevertheless, a need to assess and systematise these insights in order to capture the dynamics of class relations and their layering, as well as the nexus between class and other dimensions of inequality and injustice.

BROWNE, CRAIG* (The University of Sydney, Australia)

Beyond the Dialectic of Enlightenment: Renewing the Program of a Critical Theory of Society

Adorno and Horkheimer's sketch *The Dialectic of Enlightenment* adumbrated the reorientation of critical social theory away from its founding research programme and explicated the antithetical character of the modern project of emancipation. Adorno subsequently contended that the critique of systematic domination should be undertaken as a negative dialectics, due to the inversions of the ideals of reason and autonomy into their opposites, the violence of the logic of identity that underpins conceptualisation, and the implications of the total integration of administered capitalist society. Adorno detailed persisting tensions and contradictions, but the alleged aporias of his critique and its distance from the practical agency of social struggles motivated later changes in critical social theory. Despite the profound implications of Habermas' introduction of the intersubjective paradigm of communication, including its reconstruction of the connections between rationality and democratization, the limitations of Habermas' perspective and analyses with respect to power, conflict, social struggles, material reproduction and divergent trajectories of modernity precipitated various reformulations and alternative proposals. Given these failings and the later proposals' deficiencies, my argument is that critical social theory needs to develop a new synthesis, which nevertheless incorporates elements of later intersubjective critical social theories and Adorno's critique of capitalist modernity. My analysis will suggest that the notion of the dialectic of control contains the nucleus for a genuine synthesis and that its insights can be used to underpin an interdisciplinary research programme concerned with the metamorphoses of ideology, the dynamics of social conflict, the experience of reification, the transformation of the capitalist production, and aspects of subjectivity. The theory of the dialectic of control aims to explain in a single framework both social-historical progression and regression, present a diagnosis of the times, and restore the linkages between theory and practice.

BRUG, MIENKE* (University of Humanistic Studies, Netherlands)

VAN DER VAART, WANDER (University of Humanistic Studies, Netherlands)

Using Visual Data Methods in Research with Orphaned Children in Namibia

Parental loss is considered of the most stressful events in the lives of children. Understanding how children experience parental bereavement is therefore considered an important public health issue. However, qualitative research on how children experience the loss of their parent is scarce, especially among children in non-western countries. Besides, studies that explored this theme, describe that responses often remained limited when young orphans were interviewed on their feelings about their parent's death.

Research on hard-to-study populations, such as parentally bereaved children, and sensitive topics, such as parental loss, may require a broader palette of research methods than verbal interviews only.

On the basis of a study in Namibia, the use of visual methods was examined to understand the experiences of these children. Twenty-one children who lost one or both their parents, participated in the research.

Two types of visual methods were used: drawings and paintings, and taking photographs.

This study shows that the use of these methods yields several benefits:

1. a) It provided new information that other methods did not reveal.
2. b) It encouraged some children to express experiences that they did not express through verbal methods. For example, a child who did not previously talk about the death of the mother, made a drawing about it.
3. c) In addition, children enjoyed working with these techniques, providing they are appropriate to their age. This contributed to the enjoyment of participating in research.
4. d) Finally, these visual methods offered various opportunities for children to participate in the research.

Thus, this study showed the relevance of the use of visual methods in data gathering of a sensitive topic among a hard to study population. By thinking through the structuring of visual methods, this method could be used among larger groups

BRULE, ELIZABETH* (Queen's University, Canada)

From Performative to Transformative: An Institutional Ethnography of Decolonizing Pedagogical Practices in Post-Secondary Educational Institutions in Ontario, Canada

The Truth and Reconciliation Commission (TRC) of Canada's report, released in May 2015, calls upon post-secondary institutions to play a major role in redressing the educational needs of Indigenous peoples. Emphasizing the need for Indigenous autonomy, self-determination, and community participation in all curriculum and program developments, the report urges "post-secondary institutions to educate teachers on how to integrate Indigenous knowledge and teaching methods into the classroom" (2015, 7). Since then, universities across Canada have responded, instituting culturally appropriate programs and policy initiatives, including mandatory courses for all students, language classes, and Indigenous strategic plans. While many of these initiatives are exemplary, involving the extensive participation of Indigenous communities, there is no consensus on what decolonization means or how it will be achieved. Several Indigenous scholars have called into question the feasibility of doing so, drawing our attention to the deficit model that has so often been used when incorporating Indigenous content and practices into the academy (Simpson 2014; Archibald et al. 2016). Although recent surveys and narratives address Indigenous scholars, students and staff experiences within post-secondary institutions (Brulé & Kolezar-Green, 2018; Debassige & Brunette, 2018; Gaudry & Lorenz, 2018, 2019), there is little empirical research on the social organization of decolonial pedagogical practices and policies. This presentation is based on the empirical research findings of an institutional ethnography (Smith, 1990, 1999, 2005) carried out from 2020 to 2024 that addressed this knowledge gap and examined the social organization of Indigenous and non-Indigenous faculty, students and staff efforts to decolonize academic teaching practices and the challenges and successes that they encountered at three universities in the province of Ontario. The results of this study reveal how a Eurocentric understanding of inclusion and knowledge formation largely influences university policies, programs and curriculum development, limiting the possibility of transformative practices.

RC21-333.1BRUNORI, FRANCESCA* (University of Rome Sapienza, Italy)
MUSSO, VIRGINIA* (University of Milan Bicocca, Italy)*Feminist Practices of Urban Care: The Rooting of Care Ethics in Montevideo*

This work is part of a broader reflection on the relationship between the city, gender, production, reproduction, social justice and the tensions that cross these interconnected spheres. By adopting a feminist perspective and considering urban space as a projection of social, economic and political power dynamics, our analysis overexposes the historical concealment of social reproduction and the increasingly violent erosion of the right to the city.

Starting from these critical assumptions, the study explores how a place-based ethics of care can stimulate a renewed reflection on the urban and become the cornerstone of an alternative paradigm, capable of rethinking public policies and planning urban space according to a relational logic that privileges everyday life. Following a brief genealogy of the concept of Care, the contribution will question how this perspective can be integrated into urban planning and public policy-making processes. In this regard, the case of Montevideo emerges as particularly significant. Indeed, in the Uruguayan capital, the public administration - in close dialogue with feminist collectives - has defined and implemented a strategy to territorialise care, embracing this ethical perspective within its public policies. The analysis of this experience, which is also relevant for its feasibility and replicability, makes it possible to outline imaginaries and practices for creating more liveable and equitable cities, able to recognise the centrality of social reproduction and respond to everyday needs. The study wishes to contribute to the contemporary debate on care, weaving a new narrative on the urban, in which the city is understood first and foremost as a complex organism and a shared platform, where social relations, sedimented in space, are constitutive.

BRUNSSON, NILS* (Stockholm Centre for Organizational Research (Score), Sweden)

GROTHER-HAMMER, MICHAEL* (Norwegian University of Science and Technology (NTNU), Trondheim, Norway)

The Necessity of Hypocrisy

Hypocrisy is usually perceived as being problematic for society and its moral order. This also applies to organizations, which are broadly expected to behave well and do what they say they do. However, drawing on decades of research we will show that organizational hypocrisy is a normal and often unavoidable occurrence. What is more, hypocrisy often contributes to the maintenance of existing norms and values, and it can sometimes be a facilitator for real social change. We argue that it is important for sociological research to acknowledge hypocrisy and understand why it is common and what effects it has.

Trying to Reassemble the Russian Empire: The Impact of Russian Aggression in Ukraine on Its Own Future

Since the collapse of the Soviet Union, under the presidency of Boris Yeltsin, Russia attempted to build a functioning model of a federative state, because even in its current borders, Russia remains largely a de facto imperial state with "national outskirts" constituting a significant part of its territory and population.

After Vladimir Putin came to power in 2000, all sprouts of democracy and federalism were gradually phased out, and neo-imperialist and nationalist sentiments grew, which found their current form in the ideology of the "Russian World." This ideological concept combines the imperial idea of "gathering" the former Soviet republics under Moscow's rule with the chauvinistic idea of the "missionary and civilizing" role of the Russian people. However, in the long term, Moscow's appeal to Russian nationalism is more likely to alienate not only neighboring states, but may also provoke centrifugal forces within Russia itself.

The curtailment of the rights of ethnic minorities and national republics has led to the strengthening of assimilation processes among peoples primarily dispersed in the body of the Russian Federation (Finno-Ugric peoples, peoples of the Volga region). But, in the frontier Russian republics (in the North Caucasus and Siberia), the opposite ethno-demographic processes – the mass exodus of ethnically Russian population and growth of indigenous peoples – have been taking place in recent decades. According to census data, in the 2010s, of the 21 republics within the Russian Federation, the share of indigenous peoples grew in 13, and in 11 indigenous peoples constitute the majority of the population.

The full-scale war against Ukraine launched by Russia in 2022 only intensified the internal contradictions between the Russian ethnic majority and ethnic minorities, which we could see for example during the partial mobilization in the autumn of 2022, when the pockets of resistance were precisely the national regions.

ANTONOVA, VICTORIA* (Higher School of Economics - HSE Moscow, School of Sociology, HSE ILSIR Laboratory, Russian Federation)

Providing a Bare Minimum or Building a Unique Team? a Comprehensive Participatory Study of Social Inclusion and Diversity Management in Russian Public Career Centers

The participatory research is dedicated to a complex investigation of employees' with disabilities (EwDs) labor conditions in the Russian public sector and focuses on the public career centers by investigating social inclusion for EwDs, EwDs' career paths, talent management models, and other related concepts. Despite being a significant contributor to national welfare, the Russian public sector currently provides little information on EwDs' labor conditions. The authors claim that the social inclusion of EwDs in contemporary Russia may be seen not only as a field of future theoretical elaborations but also as a potential area of essential social work and targeted policymaking.

The research utilizes the strategy of multiple case study, semi-structured interviews, and qualitative questionnaires within the framework of a complex

institutional ethnographic study to reach several Russian public career centers as examples of public institutions for an in-depth EwDs' labor conditions analysis. Using the results of the previous pilot study and Weick's sense-making optics together with inclusive leadership conception as theoretical frameworks, the authors introduce an adopted research technique that overcomes the observed pilot study difficulties and tailors the methods to the specifics of the field. The initial context for the research proposal was explored with the help of disability rights activists and study participants, as well as study results were presented as media awareness-raising projects.

Cultural practices, models of disability, and the compliance between the claims of legislative institutions of inclusive policymaking and their actual practices will be particularly highlighted. Based on a literature review and empirical data, the authors discuss a range of interrelated phenomena for future investigation to achieve intersectional analysis and participation and practical implications, including precarity, corporate image, and cooperation of the state, scholars, and NGOs.

The results of the long-term research project are aimed at developing the guidebooks and workplace inclusion assessment tools.

Understanding the Post-Agrarianism of Rural Areas: Post-Agrarianism As a Theoretical Concept and a Research Framework

The paper is devoted to the understanding of the rural post-agrarianism concept as a theoretical framework and applied research scheme for the Russian villages' development potential and their contemporary social problems. Based on the discussion of the in-depth literature review of postagrarian studies from several regions (USA, Poland, South Africa, Russia), the authors outline the range of possible research questions and potential practical applications of post-agrarian optics. Primarily, the research perspectives for Russian rural landscapes in the study focus on the human capital, economic utility, and development policies and on the potential research methods that may be applied. On the basis of the conducted evaluation, the authors come to understand post-agrarian optics as an innovative and agile theoretical concept that has a significant potential for the study of the social aspect of rural life and its economic structure due to its flexible conceptual scheme and diverse methodological framework (in particular, in combination with the analysis of natural factors with the modern Russia socio-economic conditions).

According to the authors, research in the logic of post-agrarianism can significantly contribute to a scientifically proven solution to a number of key problems of the Russian village by identifying its development potential in various spheres of activity, determining economic prospects, developing social technologies for the growth of the Russian villagers' welfare, and the development of human capital of Russian rural settlements. These problems include lack of sustainability of local communities, local entrepreneurship stagnation, low effectiveness of local institutions, and many others. Relying on the complex pilot study results in the Gorodetsky area (Nizhny Novgorod Region of Russia) based on the complex matrix analysis tool developed by the team, the authors propose further vectors for the progress of post-agrarian research specifically in Russia and assess the possibilities of further research in postagrarian optics in Russia.

Alienated Human Rights? Comparative Insights from a Study of Abortion Debates in Poland and Argentina

Are human rights a part of everyday experience? Have they found a way into ordinary legal consciousness? And, if so, have they remained a vital part of it? In our study of abortion debates in Poland and Argentina, we have analyzed the attitudes towards human rights of social activists active in abortion debates based on individual and focus group interviews conducted in both countries the years 2023 and 2024. My talk presents initial findings on the alienation of human rights as reflected in the data, and discusses the explanatory hypothesis connecting legal alienation to the mode of constructing what is perceived as a viable argument in political debates concerning abortion.

ML-Based Annotation Outperforms Human Coder for Annotation Tasks: Not so Fast. an Analysis of Race Annotation for Youtube Using ML-Based, Standardized Human Coded and Qualitative Data

The advent of AI-based tools offers new opportunities and challenges to sociological methods. Recent studies have pointed to the capacities of these machine learning (ML) models to take over repetitive tasks such as the classification of data (Belal et al. 2023; Whang et al. 2023). Comparing different AI applications and human annotators against a gold standard corpus (GSC) (Wissler et al., 2024), some studies have found that AI can surpass humans in various annotation tasks (Aldeen et al., 2023, Gilardi et al., 2023), although, this is not the case when it comes to more complex tasks (Labruna et al. 2023).

This contribution is based in a larger case study on algorithmically introduced racial inequalities among German content creators on YouTube and has the goal to critically examine the use of GSC in the comparisons between machine and human annotations. We ask the following question: What challenges does the use of GSC pose when comparing different annotation methods with regards to sensitive categories such as race? We proceeded in three steps: (1) We created our own GSC with the help of human annotators using a standardized classification survey (Liang et al. 2022). (2) We then invited the annotators to a focus groups discussion on the challenges and possibilities of classifying race for online profiles. (3) We used the GSC to compare three ML-based annotation applications (Skybiometry, Kairos, ChatGPT) to a different group of human annotators.

First results show that the creation of a GSC for race annotations contains significant ambiguities resulting in critical ethical challenges for its use. When compared to the GSC ML-based tools are unable to meet the quality of the GSC, posing further questions with regards to the reproduction of racial biases in automated annotation.

"the Algorithm Is like a Mercurial God" – Exploring Content Creators' Perception of Algorithmic Agency on Youtube

Algorithmic systems wield substantial influence in contemporary society, particularly in the context of digital platforms (Bunz, 2012; Burrell & Fourcade, 2021; Zuboff, 2023). Since it is mostly unknown how algorithms specifically work, content creators (CCs) as a new professional group who rely on their functionality for economic reasons, are in a constant state of sensemaking regarding the characteristics and perceived preferences of the algorithm (Duffy, 2020; Bishop 2019a; DeVito, 2021).

While studies suggest that users in general and CCs in specific do indeed perceive the algorithmic structures as agentic (Shin, 2022; Singler, 2020; Wu, Pedersen, & Salehi, 2019; Cotter 2024), we still know very little about the variations within these assessments and in which ways different social dispositions and industry factors play a role in that regard. This is a matter of concern as negotiating with algorithmic systems is a fundamental part of this profession. We therefore examine the following question: In what ways do content creators perceive the YouTube algorithm as possessing agency, attributing qualities such as autonomy, intentionality, foresight, and goal pursuit to it?

We do this by conducting a thematic analysis (Braun & Clarke, 2012) of 30 interviews with German-speaking CCs on YouTube. We find that CCs perceive agentic qualities of the YouTube algorithm and that their assessment does depend on their experience and exposure to it. Four key themes were identified: The algorithm is seen as an entity that is non-transparent and largely unpredictable (1); as dynamic, intentional, and human-like (2); it exerts a great deal of power (3) and is described as communicating through metrics

thus constantly creating hierarchies and reinforcing inequalities (4). Thus, our study contributes to a more in-depth understanding of the challenges of emergent professions on digital platforms as well as shine new light on human-machine-interactions from a social inequality perspective.

BUDGINAITE MACKINE, IRMA* (Vilnius University, Lithuania)

Discursive Configurations of Whiteness in Lithuanian Media: Peripheral Whiteness and the Reproduction of Global Racial Hierarchies

This paper investigates the discursive expressions of whiteness in media narratives about Lithuanian migrants. For nearly two decades, emigration has been a central concern in the public discourse, initially driven by fears of losing the 'best and brightest'. Over time, media depictions have gradually acknowledged the diversity of migration trajectories, trends of return migration and increasing attractiveness of Lithuania as a country of immigration. Yet these depictions remain largely structured by class and gender hierarchies. The Covid-19 pandemic and related travel restrictions highlighted this further, with some returning Lithuanian nationals being portrayed as 'vile migrants' in the context of the pandemic.

Drawing on a postdoctoral research project funded by the Lithuanian Research Council (2021–2023), this paper analyses portrayals of various groups of Lithuanian migrants in leading internet news media between 2013 and 2022. It focuses on how both embodied and disembodied markers of whiteness are invoked in media narratives, particularly in the context of East-West European migration.

The findings reveal that Lithuanian migrants are represented as both beneficiaries of EU mobility and as subjects of marginalisation, often categorised as 'not quite White' in Western contexts. Although some individual migration stories resist stereotypical portrayals, they also occasionally engage in the racialization of other groups to assert Lithuanian migrants' claims to hegemonic whiteness.

The paper argues that these shifting representations are shaped by intersecting markers of difference and complex geographies, histories, and socio-cultural contexts that reflect broader global racial dynamics. The media portrayals underscore Lithuania's peripheral position within European hierarchies of difference, where certain groups are discursively excluded from dominant forms of whiteness. Simultaneously, Lithuanian media often reproduces these exclusionary dynamic rather than challenging them. By failing to question the (subtle) ways in which whiteness is discursively maintained, media discourse ultimately contributes to the reproduction of global racial hierarchies.

BUEHLER-NIEDERBERGER, DORIS* (University of Wuppertal, Germany)

Palestinian Childhoods - Growing up in a Heterotopic World

Questions: How does being Palestinian structure the childhood and youth of people who grow up as Palestinians in different constellations and regions? What are the experiences of violence, and under what circumstances do they become particularly relevant? Are there common experiences that are significant even if childhood was spent at least partly in Western countries? How are these experiences transmitted across generations?

Method: The paper is based on life-history interviews with 15 Palestinian people (8 men, 7 women; between 30 and 60 years old) who grew up in Israel, Gaza, the occupied territories, refugee camps in neighbouring countries, in other countries in the Middle East, or for part of their childhood in Western countries. The interviews focused on childhood and adolescent experiences and are used to uncover important social structural features, following Bertaux' life-history approach (1981).

Results: By comparing these very different life stories, we sought to identify what structures all these stories in the same way. The fundamentally 'heterotopic character of the world' for these people was identified as a particularly relevant structuring factor. The term is taken from an essay by Foucault (2004) and is used here to capture the following: the restricted access to space everywhere, the expulsion from spaces, the surveillance of movements in space (even if they already have citizenship of a Western country), the application of different rules to this group than to other people. This creates a context in which experiences of violence and traumatization become particularly threatening, as there is neither escape nor safety; it can be characterized as a form of violence per se. As with other forms of violence, the experience of a heterotopic world can be passed on intergenerationally, and in the case of some of our interviewees, still to their children, even if that generation was born abroad.

BUENO, ARTHUR* (University of Frankfurt, Germany)

The End of Psychology, Again: Revisiting Adorno in the Age of Digital Capitalism

This paper explores the enduring relevance of Adorno's thesis on the "end of psychology," originally developed in response to the post-liberal capitalism of the 1940s and 1950s, as a framework for analyzing contemporary societies and emerging forms of authoritarianism. Contrary to common interpretations, I argue that for Adorno, the abolition of psychology under authoritarian conditions is not a completed process but an ongoing tendency within a dialectical reality shaped by counter-tendencies. Rather than being a pessimistic diagnosis, this perspective reveals a continuous struggle between forces driving both the dissolution and the persistence of psychology—in other words, between tendencies toward heteronomy and autonomy. The central argument of this paper is that, despite the profound transformations modern societies have undergone, the dynamics that Adorno identified continue in new forms. The rise and crisis of neoliberalism, along with new modes of domination shaped by digital capitalism, can be understood as specific manifestations of the ongoing conflict between the end and persistence of psychology. As I contend, understanding these developments from an Adornian perspective is crucial for grasping both the continuities and distinctive features of contemporary authoritarianism.

The New Authoritarian Personality: A Comparative Study of Germany and Brazil

The rise of far-right populisms around the world has sparked debates about the emergence of a "new authoritarian personality" (Gandesha 2018, King 2021, Amlinger/Nachtwey 2022). While these movements share common traits, they exhibit notable variations, especially between the Global North and Global South (Pinheiro-Machado/Vargas-Maia 2023). These variations challenge the assumption that a uniform set of socio-psychological structures underpins their emergence across different contexts. Building on our quantitative and qualitative studies of Germany and Brazil (Bueno 2021, Jäger 2022), this paper compares authoritarian tendencies in both contexts, exploring their similarities and differences. In both countries, we observe the intertwining of neoliberal concepts of freedom with new authoritarian attitudes. However, the form this phenomenon takes and its position within the political spectrum differ significantly. In Germany, two distinct groups emerge: one characterized by explicitly reactionary forms of authority, and another by a novel libertarian authoritarianism that opposes reactionary elements. In contrast, Bolsonaro's election in Brazil saw the combination of reactionary and libertarian conceptions into a single movement. Although Bolsonaroism is a heterogeneous coalition of political groups (Rocha 2019, Nunes 2020), these factions found enough common ground to unite. To account for the similarities and differences between Germany and Brazil, we propose a modular and dynamic concept of the new authoritarian personality. In dialogue with Critical Theory's classical arguments (Jäger 2020, Bueno 2024), we define it through core socio-psychological structures—distinct from the 'old' authoritarian personality—that manifest differently across contexts.

BUENO, MARILIA* (Universidade de São Paulo, Brazil)

Fantasy-Laden Thinking in the Brazilian Decivilising Process

Norbert Elias demonstrated that decivilising processes can be accompanied by an increase in the degree of fantasy-laden thinking, which may or may not be associated with a less realistic orientation of actions (and consequently an increase in threats posed by nature and by humans). In Brazil, the rise of the far-right was marked by an increase in various types of anti-science discourse. This research investigates the conception of knowledge proposed by one of the main figures of anti-science discourses — the far-right guru with strong traditionalist and esoteric tendencies, Olavo de Carvalho — and how his followers have incorporated this view.

Having been the leader of a Sufi sect and imminent astrology teacher, Carvalho has achieved unprecedented influence on Brazilian public opinion during the far-right rise through his best-selling books, his close relation to President Bolsonaro, the use of social media and, most importantly for this research, his "Online Philosophy Course" that had more than ten thousand students, most of whom became his loyal followers.

The research to be presented (that is still in progress) has two levels: first, understanding of his discourse towards science, which was shown to be

deeply grounded in a magical-mythical conception of reality. The second level aims to investigate, through interviews with his former students, how they incorporated these principles. The presentation will focus on the results and analysis of these interviews, whose main objective is to investigate how this fantasy-laden discourse was appropriated by them and whether it changed the behavior and the orientation of these individuals' actions over time towards a less reality-congruent manner - aiming to contribute to a broader understanding of the recent rise in science rejection in Brazil.

BUENO PATIN, ANAËLLE* (Tilburg University, Netherlands)

Workers, Communities and the Environment: The Struggles for Decarbonisation Around a Steel Plant in IJmond (Netherlands)

The concept of a Just Transition has gained traction in policy circles as a framework to reconcile workers' material needs with the environmental transition. However, despite originating from trade unions, workers' roles as active ecological subjects remain under-theorized. Workers and their communities seen primarily as beneficiaries of just transition policies, rather than key actors in the transition. However, in the Dutch region of IJmond, workers of a steel plant led a strike to force the owners of the factory to take decarbonization seriously. This shows that workers not only have an history of resisting exploitation but they also embody the struggles of decarbonization. They are situated at the heart of industrial production. Much of the transition literature focuses on technocratic or normative approaches, with limited attention given to workers' agency and how their work shapes their relationship to the environment.

In this paper, I propose through a working-class ecology lens. I attach particular attention to understanding how these processes, relations, and positionalities are materially embedded. I draw upon more than 20 interviews with trade unions, workers, residents, and environmental groups involved in the decarbonization of a steel plant in IJmond (Netherlands). The critical position of the steel plant as a key economic actor, despite its known detrimental impacts on the environment and public health, has become the focus of regional debates. This has generated tensions and conflicts among groups, but it also offers a space for envisioning and implementing alternative solutions.

BUENO RAMOS, MARIA LUCIA* (Universidade Federal de Juiz de Fora, Minas Gerais, Brazil, Brazil)

Between the Global and the Local. the Imaginary Project of Brazil Idealized By São Paulo Modernists in the 1920s.

Cornelius Castoriadis (1975), reflecting on the symbolic dimension of socio-historical processes, highlights "the creative power of the collective imaginary and its changes over the years". In this paper, we present as an exemplary case an imaginary project for Brazil, conceived in the realm of the arts, along the lines of Mario de Andrade and Oswald de Andrade and the brushstrokes of Tarsila do Amaral, in São Paulo in the 1920s, but which was reinvigorated in other periods, inspiring innovative aesthetic expressions such as Tropicalismo, in the late 1960s, and the curatorship of the XXIV São Paulo Biennial in 1998. The São Paulo modernists in the 1920s, like their European avant-garde friends, proposed an articulation between art and life, as the foundation of a revolution in art that would extend to other spheres of social life. However, they did so in a distinct and singular way, which gains relevance when studied from a comparative perspective, with other avant-garde expressions, highlighting how the scope of the aesthetic movement of the avant-gardes is much broader than the restricted sphere of the European circuit, which confined most of the analyses until then. The goal of this presentation is to consider the proposal of the São Paulo modernists, their repercussions and interlocations, taking as references the works of the three artists mentioned, which will be discussed from the global context of the historical avant-gardes, from which they are inseparable. In other words, the approach to modernism from a global perspective can contribute not only to a deeper understanding of this trend, but also to redimension much of the current readings around the avant-gardes, which certainly tend to increase their importance with the expansion of the universe of interlocations in which they were constituted.

Migrant Voices : A Web-Based Respondent-Driven Sampling Approach for the Study of Health and Health Care Use Among Newly Arrived Migrants in Belgium

Research on health inequalities and migration has expanded in recent decades, with most studies comparing migrant and non-migrant populations. While valuable, these studies often fail to capture differences within migrant groups or to explore how other social dimensions of health may play a different role among migrant groups.

A major challenge is the lack of health data on people with a migration background, particularly the newly arrived. Migrants are underrepresented in health surveys due to language barriers, legal status, and mistrust of institutions, while administrative data, such as health insurance records, often lack detailed information on migrant backgrounds, especially for undocumented and newly arrived migrants.

Web-based Respondent-driven sampling (WEB-RDS) is a promising method for reaching migrant populations. It is a peer chain-recruitment method for populations without a sampling frame or that are hard-to-reach.

This formative study evaluates the acceptability and feasibility of a WEB-RDS for newly arrived migrants from various countries of birth in Belgium. Focus groups with representatives of different migrant groups will assess the assumptions of a WEB-RDS by delving into social network properties of the target population and exploring how to adapt the WEB-RDS to specific migrant groups (in terms of type of incentive system, network size question, seeds recruitment, coupon system, etc.).

First analyses of the WEB-RDS data will be conducted, using Census data from Statbel as an external benchmark. We look forward to presenting and discussing these findings at the ISA conference.

RC12-193.2

BUGNON, GÉRALDINE* (University of Fribourg, Switzerland)
(De)Judicializing Gender Violence? Hybrid Regulation in Juvenile Victim-Offender Mediation

Regulating gender violence is one of the major contemporary challenges for justice systems. On one hand, social movements denounce the structural dimension of this violence presented as the result of patriarchy (Cavalin et al. 2022) ; on the other hand, scientific literature highlights the ineffectiveness of criminal justice in identifying gender violence, condemning offenders, and protecting victims (Koss et al. 2003; Lieber 2023).

Responses take two different directions: on one hand, reforming criminal law to make it more "effective," as evidenced by the recent revision of sexual criminal law in Switzerland; on the other hand, inventing new ways of "doing justice" by relying on so-called alternative justice models, such as mediation and restorative justice. Both types of responses are subject to controversies (Cossins 2008; Casas Vila 2016; Burns et Sinko 2023), which denounce in the former case a "carceral feminism" and point out in the latter case the risks of secondary victimization.

This paper aims to critically interrogate an alternative response to gender violence among juveniles in Switzerland: how is the use of victim-offender mediation justified by the courts? How are categories such as "violence," "offender," "victim," or "justice" employed? How does this contribute to (re) distributing agency, responsibility, and vulnerability in gender violence situations? to what extent is the "social problem" of gender violence (de) judicialized by these alternative forms of justice?

This paper is based on 18 months qualitative research conducted in Switzerland among mediators and juvenile judges, from a perspective of analyzing law in action. I conceptualized these alternative justice mechanisms as hybrid systems, operating at the fringes of the judicial power (Daly 2002; Zernova 2007), and relying on plural and competing norms from legal realms as well as from psychology or social work (Tränkle 2007).

RC40-663.2

BÜKE, ATAKAN* (Leipzig University, Turkey)
 RIBEIRO, JOSÉ (Universidade de Lisboa, Portugal)
 GUNDUZ HOSGOR, AYSE (Middle East Technical University, Turkey)

A Meta-Analysis of Rural Collective Action and Grassroots Mobilisation in Turkey in the 21st Century

The paper conducts a meta-analysis of grassroots mobilisations and collective action in Turkey over the past two decades, exploring the dynamic intersection of citizen agency and sociopolitical struggle. Through categorisation by thematic concerns such as environmental justice, land and food rights, urban transformation, and resistance to extractivism, the analysis sheds light on the evolution of rural and urban protests, cooperative initiatives, and social movements that have emerged in response to ecological and social crises.

Drawing on case studies from significant protests and grassroots efforts, environmental protests against mining projects, agrarian struggles over land ownership and its dispossession by extractivism, this paper explores the self-organising nature of these initiatives, their interaction with formal political institutions, and their wider sociopolitical implications. Following, the paper evaluates the duration, effectiveness, and transformative potential of these movements, identifying key factors that influence their success and longevity.

The paper also critically engages with the intersectionality of these movements, examining how gender, ethnicity, and socio-economic backgrounds have shaped the nature of protests and their outcomes. We argue that these mobilisations demonstrate a hybrid and pluralistic approach to grassroots citizenship, where localised struggles become platforms for broader claims of justice and sustainability, transcending geographic and political boundaries. By doing so, these initiatives contribute not only to ecological resilience but also to the reconfiguration of civic agency in the rural Turkish context.

Ultimately, this meta-analysis highlights the enduring impact of organised collective action in Turkey, offering insights into how rural localized struggles can transform into sustained movements for ecological and social change.

Reflections on the Past and Future Trajectories of the Sociology of Agriculture and Food

The International Journal of Sociology of Agriculture and Food (IJSAF) has been published by the ISA Research Committee on Sociology of Agriculture and Food since 1991. Supported by the rise of critical social sciences and humanities approaches, IJSAF has made significant contributions to analysing agrifood systems through various frameworks, concepts, and methodologies. Content analysis will be used to review past issues of IJSAF between 1991 and 2024.

This paper will focus on the thematic, geographical, theoretical, and methodological priorities reflected in IJSAF. The results of a questionnaire among the members of RC 40 will also support this assessment. A mixed-method approach will be used to evaluate the results of the membership surveys. The paper will examine changes in dominant themes in critical agrifood scholarship over the years and identify regional and thematic gaps according to past and current members of RC40.

BULANKULAME, INDIKA* (Centre for Poverty Analysis, Sri Lanka)

Voices of Hope, Visions of Youth: An Exploratory Study

This project combines a qualitative study with a reflective film exploring the aspirations, challenges, and identity of Sri Lankan youth aged 15-29, that comprises nearly a quarter of the population. Conducted through focus group discussions in diverse locations, the study examines perspectives on education, economic challenges, employment, and broader aspirations. Findings, analyzed using thematic and narrative approaches, provide rich insights into the complexities of youth experiences in modern Sri Lanka.

The film, produced, researched, script developed by Sociologist Dr. Indika Bulankulame and Directed by Dr. Sameera Tilakawardana, integrates interviews, cinematic visuals, and research data to create a compelling narrative. Premiered on International Youth Day 2024, it amplifies authentic youth voices, serving as a dynamic advocacy tool to inform policies and inspire action. This innovative project highlights evolving identities of Sri Lankan youth, offering pathways toward a more inclusive, brighter society.

RC14-207.5

BUONCOMPAGNI, GIACOMO* (University of Macerata, Italy)

Flood News from Italy to Europe. Narrating Local Crises in the Global Journalism Ecosystem.

For some time now, the field of journalism has been multifaceted, thanks to the digitalisation of its content and its distribution on digital platforms, which have profoundly changed not only the nature of reporting, but also the journalistic profession itself, production routines, the way news is processed and thematised, and the relationship with sources and audiences. Processes that have affected both national and community media, for example in terms of their agendas and news values.

Indeed, local journalism is also evolving in response to the many challenges posed by the ecological changes that have taken place in the digital media sector, as well as more recent health and environmental emergencies.

In this respect, it is precisely in the production of emergency information that the main efforts of the local media have been concentrated, a publishing sector that is even more in crisis after the pandemic event.

Despite the fact that local newsrooms, like all information agencies, now operate with reduced margins and are forced to deal with changing news consumption habits, it is in these situations that the centrality of territorial journalism is revealed.

Based on this scenario, the study presented here analyses the behaviour of the local, national and international media during the floods that hit Emilia Romagna (Italy) in May 2023.

There are three main research questions: How does the media agenda change during the emergency? How does editorial work reorganise in local and national newsrooms? How do local newspapers relate to digital space, national and international community and media institutions?

To answer these questions, a qualitative methodology was used: the semi-structured interview. Specifically, twenty-five interviews were conducted between July and November 2023, including in the sample journalists (professional and non-professional) with different roles in Italian, local-national, digital and physical newsrooms.

BURCHARDT, MARIAN* (Leipzig University, Germany)

The Sociology of Digital Dreams: Getting a Job in a Ghanaian Start-up, and Keeping It

In the recent past, sociological theory has been obsessed with the concept of the future, of imagining and designing possible ways of being that are yet to come. Such imaginations are closely tied to digital technologies and the promises associated with them. In my contribution, I explore how fantasies, ideas and understandings around digital work shape employment trajectories and work in Ghana. I zoom in on such forms of becoming through the analysis of the employment biographies of people working in a digital enterprise in Ghana. My argument is that the sociology of the future needs to be more firmly embedded in the analysis of digital capitalism and interrogate the ways in which digital capitalism stimulates its own forms of futuring that leave their marks on the nature of work and careers. My contribution is based on a mix-method project on the dynamics of job change in Ghana, involving a survey and 200 qualitative interviews. In this contribution, I focus on interviews carried out with employees and management in a tech start-up in Western Ghana.

Strengthening Social Impact Assessment in Corporate ESG Reporting

In 2022, the European Parliament and the Council introduced a new regulatory framework, the Corporate Sustainability Reporting Directive (CSRD), to enhance the transparency and integrity of Environmental, Social, and Governance (ESG) reports. While previous legislation mainly focused on environmental impact, the new directive and the European Sustainability Reporting Standards associated with it elevate social impact to the same level of importance. Of the 12 Standards, two are General, five are Environmental, four are Social, and one is devoted to governance. This shift represents a significant change in how companies report their social contributions and responsibilities. A key requirement of this new framework is that ESG reports must undergo independent assessment by an external agency, ensuring the objectivity and credibility of the reports.

The effort of the European Securities and Market Authority (ESMA) to regulate third-party providers of ESG ratings and scores presents both an opportunity and a challenge. In response to demand, many consulting firms are rushing to offer ESG reporting services without proper training in social impact measurement. This study emphasises sociology's crucial role in providing the necessary tools for assessing social impact, focusing on co-creation and genuine societal improvement, distinguishing this from dissemination or transference. Companies not only influence society through their operations but also have the potential to transform it by embedding social impact within their strategies.

Our findings aim to contribute to developing a more robust and informed approach to ESG reporting, particularly in understanding social impact as improvement aligned with societal goals like the SDG and better aligned with the European Union's vision for corporate transparency and responsibility. By fostering co-creation with all stakeholders, companies can amplify the social benefits of their actions, creating a multiplier effect that reinforces the positive transformation of society through responsible corporate practices.

Decommodifying Public Space in Italian Cities. the Temporal Embeddedness of Modest Collective Action.

The problem of urban public spaces is fundamentally concerned with their public dimension. The public nature and accessibility of these spaces can often be perceived as intimidating, with historical issues of violence, exclusion, and the "tragedy of the commons" persisting in their wake. Occasionally, there is even an attitude of repulsion or avoidance towards public spaces. What strategies can cities and community-based organizations employ to enhance the quality of public spaces and improve their accessibility, safety, and inclusivity? Cities are frequently seduced by the enclosure of spaces and the commodification of public space, or alternatively, by the dystopian prospect

of camera surveillance to maintain public order. Implementing these policies has resulted in notable consequences, including the exclusion of specific groups and perpetuating social injustice. As a result, these policies have effectively led to the appropriation of public space by specific groups to the detriment of the broader local community.

In order to gain further insight into the phenomenon of decommodification in urban contexts, we revisited the Neo-Weberian and Polanyan traditions in urban sociology. Our research focused on seven Italian cities where forms of decommodification have emerged and taken root over time. 168 interviews were conducted, and 35 participant observation sessions were completed. In contrast to existing literature that focuses on policy design and legal theory in the analysis of commoning, this study aims to empirically examine how the interaction between associations and local governments has shaped the management of everyday practices. The findings reveal the emergence of governance traits that are not primarily strategic but rather adaptive and incremental: participatory management modalities, where community contractual instruments (Collaboration Pacts and Local Community-based Enterprises) support mid-range innovations & complex forms of social exchange in collective action, modest and incremental reciprocity which in turn reinforce their embeddedness over time.

Futuring Smart Cities and Smart Petroleum Futures: The Melding Digital Smartness of Extraction and Urbanization

Little research to date has drawn out the connections between digitalizing extractive industries and digital urbanism. In this paper, we argue that these are complementary, mutually reinforcing processes: digital urbanism enables the digitalization of extraction, and digitalization centralizes extractive labor in urban centers. "Smart" digitalization as a political-economic strategy works on both the extractive and urban levels, as seen in smart cities as well as extraction's intensifying use of automation, sensors, digital twins, artificial intelligence, and robotics. More precisely, we argue that these processes mutually articulate through future world-building. The Calgary smart city promises a future economic diversification from the oil & gas industry toward high technology, and the digitalizing oil & gas industry promises a low-carbon future.

In this talk, we draw on a 3-year ongoing case study of the digitalizing oil & gas industry in the city of Calgary and the province of Alberta, Canada, to situate the dual smartness strategy within the same process of future world-building. In tension with smartness's promises, what seems to be happening empirically is that digitalization in Calgary is deepening extraction's centrality to Alberta's economy. Moreover, whereas literature on futuring has focused on crisis as a primary instigator of futuring, our research shows more banal, more hopeful futures in digitalizing energy and cities. Our evidence suggests that while the production and unrolling of futures is quotidian in practice, potential revolutionary futures create the conditions for everyday futuring.

BURR, THOMAS* (Illinois State University, Afghanistan)

Secondary Historical Sources: Problems and Issues

In the 1980s and 1990s, sociologists called for guidelines on the use of secondary historical sources in the social sciences. Over the next few years, several comparative-historical social scientists offered scattered advice on using secondary sources appropriately, but since 2000 or so, few have devoted attention to the problem. Some argue that current practices in the field are acceptable, and nobody has offered a coherent and thorough set of guidelines for the use of secondary sources. In contrast, historians themselves are generally skeptical of the secondary sources that their own field produces.

Two issues arise from the various bodies of advice written by historians and social scientists. First, secondary historical sources seem to contain at least five different kinds of facts: reported facts, empirical inferences, summarized facts, empirical generalizations, and arguments-as-facts. Second, social scientists seem not to have grappled with the problem that historians produce idiographic interpretations, in which single facts are deeply woven into webs of other facts, while social scientists very often seek to extract such facts to use as "data" for nomothetic purposes.

In the first stage of a project of developing comprehensive guidelines and standards for using secondary historical sources in social science, I will analyze how comparative-historical scholars in sociology and political science use secondary sources in their published works. I will sample several recent works in this field and will analyze them to learn how many of which kinds of facts are prevalent, how social scientists use them as data, and how they make theoretical inferences from these bodies of facts. I will report on the progress of this research.

BURTE, HIMANSHU* (Indian Institute of Technology Bombay, India)

A New Architecture of Socialities

Can architecture and sociology exchange their 'objects' meaningfully? I explore one side of this dual possibility by focusing on the Indian architectural non-profit, Hunnarshala Foundation, through a mix of oral history, participant observation and qualitative interviews. Hunnarshala's work shows how the central 'building task' (Norberg Schulz 1961) of architecture may be reconfigured as one of building a participatory and collaborative *sociality* in and through the process of design and construction. Carrithers (2017) sees sociality as 'the propensity of beings to associate with one another' which he relates to the human world's 'overflowing inventiveness in institutions'. Incubated around the 2001 earthquake in Bhuj, India, Hunnarshala is now well known for, among other things, participatory post-disaster reconstruction in diverse contexts across India, Nepal, Iran and Indonesia. Its work demonstrates advances on many fronts: conserving and updating traditional building practices for disaster readiness; technical innovations for building sustainably; policy impact; artisan training; and, a remarkable new aesthetic of profoundly habitable spaces. However, I argue that the production of new equitable, nurturing *socialities* - marked also by mutual accountability - in different spheres of spatial production is the prime object of Hunnarshala's architectural practice. I will explore the architecture of new socialities in three arenas of relationality within the process of spatial production: a) Hunnarshala's organisational sociality, arguably modelled on a 'fluid social collective' (Roth Smith 2022, 1818), b) relationships with disempowered 'end users' (cast as 'owners'), artisans and labourers (makers), and c) with collaborating organisations. A key analytical focus is the tension between the pursuit of more nurturing and empowering socialities on the one hand, and the institutionalised power and status relations (for instance, those related to authorship or expertise) in each arena, seen in the context of diverse cultures of self-making by all actors involved.

BUSCHER, KAREN* (Ghent University, Belgium)

African Great Lakes Region Diaspora in Brussels (Belgium) and the Transnational Urban Translation of Violent Conflict and Ethnic Tension

Situating itself at the intersection of migration studies, urban studies and conflict studies, this paper investigates the everyday spatial translations of the ongoing civil war and ethnic violence in Eastern Congo through processes of conflict-induced migration to (Belgium).

To understand the ways in which the ongoing civil war in Eastern DRC shapes the everyday urbanity amongst Congolese diaspora in Brussels, we put forward the concept of 'transnational urban war-scaping'. The paper is based on data gathered in collaboration with Congolese (diaspora) informants and researchers through transnational fieldwork across Brussels (Belgium) and Goma (DR Congo) on spatial manifestations of conflict narratives (and discourses as well as everyday urban practices of inter-communal fear, suspicion, othering and boundary making). This transnational focus on everyday city-making through migration deliberately aims to go beyond the narrow analytical frameworks of 'spill over' effects of ethnic violence through African migration and diaspora, and looks into spatial translations of ethnic war experiences across (post)colonial geographies.

Tracing Constellations of Conflict and Competition in German Higher Education – a Temporal Approach

Present organizational research considers competition as one of the major transformative forces of the 20th and 21st century (Porter 1985). In sociological theory, competition is thereby considered as a social form that avoids direct conflicts (Simmel 1903). While competition is a triadic relationship in which Ego and Alter court for the favour of a third party in the absence of direct conflict, a conflict is a situation characterized by direct interaction between two or more actors with opposed interests in the absence of a third party (Dahrendorf 1972).

The panel raises the question if the focus on competition in organizational studies leads to overseeing situations in which conflict and not competition is

still the form of social action that determines organizational developments. In our empirical data, conducted to explore multiple competitions in and between organisations in the German higher education system, we recognize relations and actions in the context of competition, which are outside the triadic scheme. Based on these observations, we trace different constellations of conflict and competition. We thereby argue that it is common that many situations into which an organization manoeuvres are not characterized either by competition or conflict but involve both. To analyze such situations allows us to create a heuristic of constellations.

To take first steps to create such a heuristic we conduct a temporal approach and focus on three time periods: The time in which actors prepare for competitions, the time in which competitions take place, and the time after the competition. First empirical insights point to different constellations regarding the relation between competition and conflict. The first constellation are conflicts provoked by preparatory activities. The second constellation is when actors who are actually competing cause conflicts at the same time and the third constellation is conflict as an (un-)intended consequence of competition.

The Doing Masculinity of Older Men

In recent years, research on masculinities, in particular the question of hegemonic masculinity and alternatives to it, has mostly focussed on fathers and men of working age. In our qualitative research project "Comparing three generations of fathers in Poland and Germany: continuity and change in practices of fatherhood", we interviewed (young) fathers as well as grandfathers and great-grandfathers. The presentation will explore how men who have already retired from working life and are between 70 and 90 years old create masculinity in the sense of Doing Masculinity and present it in the interview. The men were mainly asked about their memories as fathers, i.e. about topics and practices that in some cases date back 50 years or more. However, they also talk about themselves as (great)grandfathers and about their own sons as fathers, sometimes distancing themselves from them or regretting that they themselves were not particularly active as fathers. In all of these interview passages, they always present themselves as men and do masculinity. The reference to paid work, which has formed the centre of their lives for many decades, proves to be central for some of them. For this presentation, we are therefore pursuing the following research questions: Are hegemonic ideas of masculinity, which are usually based on physical activity, professional success and fatherhood, still the relevant criteria for presenting oneself as a man/masculine at this age or are other standards applied here? How important is care, for example, both for oneself and one's own body, but also for others, such as one's partner, children and grandchildren? On the other hand, what significance does professional life/paid work still have for the production of masculinity? We would like to explore these questions in our presentation on the basis of empirical material and theoretical-critical considerations.

Ubu-Ntu's Power to Shape Futures: A Journey of Praxis and Connection

Colonialism, while ubiquitous in reach and impact, wasn't a totalising force. Decolonial futures have always been a fact of life for many. Posited as "alternatives", decolonial praxis is juxtaposed with colonial sensibilities that are individualising, fragmenting, rigid, materialist and linear in character; the latter offers a different proposition.

Rooted in epistemologies of the land, decolonial futures are based on a regenerative ethos. This is evident in languages of indigenous people, and philosophies of *being-be-coming* and world-sense. This paper explores *ubu-ntu* (the onto-philosophy of the bantu-speaking people of Africa) as ontology, epistemology and axiology as a heralding and realisation of decolonial futures.

Ubu-ntu is the main reason why indigenous people survived the genocidal impulse of coloniality. While *ubu-ntu* is a southern African iteration of a humanising ethos, it shares foundational principles with other land-based philosophies. This paper explores possibilities offered by these epistemologies in relation to contemporary poly-crises.

The authors apply the ethos, philosophies and approaches of *ubu-ntu* epistemology in examination of contemporary social movements. We provide

several case studies of formations grounded in what is often described as a "solidarity economy". Some projects are rooted in decommodifying land and food sovereignty initiatives; others are organized as worker, owner and/or consumer cooperatives, timebanks, land trusts and other community-owned and run initiatives. This global movement is Described by different names this global movement seeks to reclaim ways of living, being and knowing that allowed peoples to survive and thrive historically.

Ubu-ntu is a living ethos deeply embedded in the commonsense of those who practice it. What vistas of theorization are possible when we tease out this deeply-embedded ethos of be-ing? How is *ubu-ntu* lived and purveyed in everyday life? To what extent does the solidarity economy movement exemplify *ubu-ntu* in practice and are they a "decolonizing" form of contemporary resistance?

Mentoring Latinx Students in a Primarily White Institution: A Lasting and Empowering Partnership

In recent years the role of mentorship has been given increasing attention, particularly in Primarily White Institutions where underrepresented minority students require mentors with whom they can identify for their professional growth. As Latin American professors/mentors in the United States for more than two decades, we have engaged in a mentorship practice that develops a partnership with students that persists long after college graduation. As minoritized scholars, we have privileged our mentoring work with Latin American and Latinx students following a collaborative approach that is in contrast with the traditional top-down mentorship model. This approach involves building a student-teacher partnership that starts in college and continues after graduation. In the process, students become *peer mentors* and feel empowered as individuals and as part of their respective communities. This collaborative mentorship approach also allows for teacher/student partners to continue contributing and strengthening our communities. In this presentation, we will reflect on this collaborative mentorship approach and share some experiences to show its relevance.

Local Governance: Exploring Participatory Mechanisms in Tlajomulco De Zúñiga, Jalisco, México

Despite the ongoing democratic changes that have developed since 2000, and that continues until now, the process of consolidating democracy in Mexico remains indefinable. This leads us to analyze the actions that the government has carried out and to examine the challenges it confronts. Mexican history offers valuable insights into areas requiring improvement across all three government levels. Nevertheless, the post-transition landscape has introduced intensified complexities, encompassing a spectrum of struggles within Mexican territory. My project uses ethnographic methodology to understand the challenges faced by local governments and citizens. By doing so, it seeks to contribute not only to the comprehension of local-level democracy in Mexico but also to a broader understanding of the struggles that face urban areas within Latin American cities.

My main aim is to analyze Mexico's post-2000 democratic transition through the perspective of municipal urban conditions. My research has two specific aims. Firstly, it aims to assess the effectiveness of citizen participation tools in empowering individuals living in the Jalisco municipality. By classifying the reach of these tools, it will provide insight into the extent to which they enhance citizens' engagement and decision-making. Secondly, this study aims to identify citizens who actively access these democratic mechanisms and investigate how they perceive, negotiate, and engage with them. It will shed light, therefore, on the intersection of participatory mechanisms with citizens' values, goals, and experiences as a resident of Jalisco municipality. By highlighting these alternative approaches, this study aims to provide a more comprehensive understanding of the diverse ways in which citizens unite, respond, and employ strategies to address the challenges within their communities.

Understanding Ecuador's Higher Education Admission System: Student Representations and Their Influence on Shaping Study Choices

In 2010, Ecuador established a unified university admissions system based on a standardized test, including bonus points for vulnerable students as a key affirmative action measure. However, merit-based systems can reproduce access barriers due to the impact of inequality on admission scores (Jackson et al., 2007) and students' career choices (Reay et al., 2001). A crucial factor influencing study choices is not only the information students have about the system (Ball & Vincent, 1998) but also their perceptions of merit, risk, and their chances of accessing higher education (Clycq et al., 2014). Therefore, choices are shaped not only by rational considerations but also by culturally defined horizons of possibilities (Glaesser & Cooper, 2014).

This study analyzes how students benefiting from affirmative action perceive the admission system in Ecuador and how these perceptions influence their career choices with varying selectivity levels. The study draws on 26 semi-structured interviews with students from Universidad Central del Ecuador, one of the largest and most prestigious public universities.

Results show that both high- and low-selectivity career choices are influenced by perceptions of the admission system. There is confusion about the criteria for affirmative action allocation, coupled with a denial of the structural inequalities that justify these policies. As a result, students don't see their access as a right, linked to equal opportunities. Furthermore, perceptions of an unfair system with unclear rules lead students, even those with high admission scores, to opt for less selective programs to minimize risk, despite these not being their preferred choices. Lastly, the perception of systemic unfairness is linked to viewing admission to highly selective programs as a matter of luck rather than merit. These findings highlight the need for public education policy measures beyond affirmative action bonus scores, particularly focusing on information and guidance in the career selection process.

Social Justice in the Anthropocene: From Predatory Consumption to a Politics of Humanism

The issue of social justice in the Anthropocene, when human activity has led to a serious ecological crisis, takes us to the very heart of the contemporary socio-economic system.

The neoliberal reforms of recent decades, aimed at maximising the profits of the owners of capital at the expense of labour and based on the ideology of irresponsible consumption, have led humanity to unprecedented levels of inequality, increased conflict and radicalisation, and environmental depletion.

Contrary to some predictions, the global pandemic COVID-19 has not become a 'great equaliser'; it has only exacerbated the already existing disparities in socio-economic development both within and across countries. Developed digital technologies, including AI, which has become popular in recent years, are also unable to lift humanity out of the crisis of inequality. In the current context, these technologies reinforce existing inequalities and create new ones, favouring the accumulation of capital in the hands of a limited number of people.

At the same time that a small group at the top of the wealth pyramid has concentrated incredible power in their hands, the majority of the world's people have found themselves virtually unarmed in the face of ever-worsening living conditions and looming challenges. The depletion of social institutions (especially trade unions) as a result of neoliberal predation has significantly reduced people's capacity both to fight against the violation of their economic rights and to confront life-threatening challenges (such as pandemic or climate change).

The solution to these problems requires a systemic approach and is possible through a transition to a fundamentally different social system, the criterion of effectiveness of which will not be the profit of the owners of corporations, but the quality of life of people and the preservation of ecosystems and biodiversity on planet Earth.

Client Selection As a Site of Resistance: Corporate Lawyers' Ethics through a Moral Economy Lens

Do all clients and causes merit representation? This question is at the heart of currents debates on lawyers' ethics in the academic, the professional and the public domain. Amongst other developments, the climate crisis and the Russian invasion in Ukraine brought this topic to a head.

By using a moral economy lens (Webb forthcoming), this paper explores client selection and existing controversies about large law firms' social license to operate as a 'site of resistance'. These controversies can be seen as indicative of the 'double movement' a moral economy lens provides us with. That is, the engagement in counter-moves that resist the processes of marketisation and commodification within corporate practice. This exploration sheds light on the interaction between macro- (developments in society) meso- (logics and dynamics at the level of firm) and microlevels (how individuals view and respond to this matter) which can help to identify and comprehend corporate lawyers' ethics in response to changing societal demands.

The Ripple Effect of Separation: How Parental and Adult Child Relationships Influence Relationship Stability

We examine the ripple effect of separation between parents and adult children, exploring how these familial transitions influence relationship stability. Using HRS data from 1998 to 2020, we investigate: (i) whether parental separation in adulthood increases an individual's risk of separation and (ii) whether an adult child's separation heightens the risk for parents. Our findings show that both parental and adult child separations significantly increase relational instability, with a stronger effect on adult children. Additionally, we assess gene-environment interactions by incorporating polygenic indices (PGI) for depressive symptoms, categorized into three groups. Individuals with higher PGI exhibit a greater likelihood of separation following familial separations, underscoring the role of shared genetic factors in relational dynamics. This study contributes to the literature by highlighting the interconnections within family systems and the continued influence of parental relationships into adulthood, as well as the moderating effects of genetic predispositions on these dynamics.

Unemployment and Parent-Adult Child Relationships: How Parental Support Evolve Following Job Loss

Using 14 waves of longitudinal data from the German Family Panel and employing individual-level fixed effects models, this study investigated how parent-adult child relationships change following the job loss of the adult children. We focused on contact frequency, emotional closeness, and three dimensions of functional solidarity: emotional, instrumental, and material support from parents to their adult children.

The findings revealed that parent-child relationships intensified after job loss across all examined domains, underscoring the crucial role of families as safety nets during challenging times. Analyses of father- and mother-child relationships showed that while mother-child relationships strengthened in all areas, only functional solidarity between fathers and children increased significantly.

These results emphasize the importance of family support not only in childhood but also in adulthood, especially during crises. Additionally, the differences between mothers and fathers highlight the gendered nature of parent-child relationships following job loss.

BUZEA, CARMEN* (Transilvania University of Brasov, Romania)

Equity Sensitivity in the Romanian Cultural Context

This paper focuses on the issue of fairness in the work context and presents a study conducted in Romania that aimed to measure equity sensitivity based on Huseman et al. (1985, 1987) conceptualization, which suggests that employees experience inequity in different ways along a continuum with three states: Benevolent, Equity Sensitive, and Entitled.

Participants were 319 full-time employees, 43.9% male and 56.1% female, with at least three years of work experience ($M=16.77$, $SD=10.66$), ranging in age from 20 to 64 ($M=38.02$, $SD=10.87$), working in different organizations across Romania. Participants were recruited through a convenience sampling approach within the personal network of social science students. Three measures were used for data collection: the 16-item Equity Preference Questionnaire ($\alpha=.81$) to assess equity sensitivity, 9 verbal portraits to identify the comparison person or group, and 11 verbal portraits to measure the preferred strategy to reduce inequity when it occurs.

The results indicate that Romanian employees tend to have a benevolent approach to equity, i.e. they show greater tolerance for under-reward situations. When assessing the fairness of the exchange with the organization, the respondents preferred to compare themselves with their colleagues or not to compare at all. In under-reward situations, the preferred strategies for reducing inequity were: (1) requesting additional rewards and (2) cognitively distorting outcomes by maximizing the perceived value of benefits. In over-reward situations, the main strategy was to increase work effort. Based on these findings, we proposed an exploration of issues of culture, power, and social structure, which provide the backdrop against which workers' measured perceptions of justice can be understood from a sociological perspective. Furthermore, along with limitations and future research directions, practical implications for Romanian organizations were suggested with the aim of achieving better equity at work.

BUZINKIC BUZINKIC, EMINA* (Institute for Development and International Relations, Croatia)

Anti-Muslim Racism at the European Periphery: Race in the Balkans

My proposal discusses critical underpinnings of anti-Muslim and anti-migrant violence reflective of race politics in the Balkans, particularly nowadays when the prolonged refugee crisis and the Covid-19 pandemic call for a closer examination of the politics and methodologies of social distancing and bordering against targeted populations and their flattening. Through the methods of critical discourse analysis and political ethnography, I look into the politics of race and racialization in the Balkans while tracing localized genealogies of ethno-racial hierarchies, and the impact of the global, more specifically, European racial discourse inscribed in its border politics.

I situate my analysis within the entanglement of the continual anti-Muslim politics in the Balkans, accounting for visceral, cultural, and epistemic erasures, and the recent migration politics enforcing restriction of movement and keeping away Muslims and populations of color outside of European borders. I examine the entangled deployment of the domestic anti-Muslim violence as the politics of racialization where second-hand whiteness inconveniently fit Christian and civilized Europe, and the violence against brown and Black, Muslim, and looking-like Muslim populations, refugees and migrants arriving from the so-called Muslim countries within the recent migratory flows - deployed for preservation of white, Christian, and civilized Europe. I argue that the convergence between anti-Muslim violence and anti-migrant violence is a complex representation and manifestation of ethnic tensions and the pervasive logic of racial formation in the Balkans, layered with the racialized designations traveling along with migrants and refugees, pronounced explicitly during and after the so-called refugee crisis.

BUZINKIC BUZINKIC, EMINA* (Institute for Development and International Relations, Croatia)

Storying Social Distancing with Swana Refugee Youth

Storying social distancing grapples with the experiences of refugee youth at the intersections of multiple societal pandemics—Islamophobia, anti-Muslim violence, anti-migrant politics—and the recent Covid-19 pandemic, all amidst the devastating earthquakes in central Croatia. Although the Covid-19 pandemic introduced "social distancing" into our global lexicon, social distancing has long been reverberating through historico-political

violence globally and in the Balkans, including genocide and ethnic cleansing of Muslims and the detention, deportation, and public outcasting of migrants, refugees, and Black and Brown bodies.

This presentation discusses collective memory writing amongst seven young refugees from Syria and a Croatian activist-researcher. The story-telling flows took place in the summer of 2021, in a Croatian village by the Croatian-Serbian border as the terrain of police violence against refugees, and the site of autonomous crossings and free movement. Rooted in the politics of reclamation of one's identities and entitlements, the collective memory writing session sought hope and solidarity. The experience of sharing, writing, documenting, and strategizing on publicizing the refugee youth journeys prior to and amid their everyday living and schooling experiences in Croatia revealed multiple societal pandemics, all operating through racialized surveillance and disciplining of refugee youth. These nuanced accounts move us towards the mobilization of the new ways of knowledge production that unsettle and combat permeating work of racialized criminalization and cultural exclusions.

African Women's Understandings, Experiences and Beliefs of Menopause in Rural South Africa: A Qualitative Study

There is a paucity of research on menopause, menopausal women's lived realities and beliefs in the Southern African context. It is necessary to explore the ways that menopause is conceptualised in differing contexts as the experience for many is individualised, confusing and erased. Menopause in this paper refers to the phase leading up to, and after a woman's last menstrual period. Existing research suggests that menopause is not openly discussed among sub-Saharan women due to intense privacy and taboos regarding menstruation and reproduction. Existing findings show that many Southern African women are not aware of the physical mechanisms of menopause, its duration and symptoms.

Further, existing research in the African context shows division in the ways that menopause is conceptualised and experienced by African women. Some report a positive mindset relating to the freedom from the constraints of menstruation, a perception of cleanliness with the lack of menstrual bleeding, as well as economic benefit as sanitary products are no longer an expense. Menstruation is seen as consequence of the natural aging process (although some report that this is caused by a supernatural intervention). Negative descriptions of menopause relate to the fear that the loss of menstruation creates poison in the body as the women's cleansing mechanism is no longer functional. This can be transmitted to sexual partners. Women describe a loss of sexuality and sexual attractiveness as a result. Some women report feeling invisible and irrelevant as part of the menopausal process.

Using an in-depth qualitative approach the research referred to here sets out explore the ways in which a small sample of South African women of average menopausal age, living in a rural area of KwaZulu Natal, South Africa represent their experiences of menopause and their needs in this context.

Pet Ownership: Support or Burden? Exploring the Perceptions and Experiences of Pet Ownership for South Africans Living in Poverty.

Domestic pets include animal companions in the home environment. Whilst pets such as dogs may have working roles in that they serve as security for the household in which they reside, and cats and dogs alike may have a role in rodent control, pets are otherwise non-working or income generating. Domestic animals potentially provide invaluable companionship, emotional and social support to their human counterparts. Just under half of South Africans households include pets, however the ways that obligations and relationships between humans and pets are constructed differ socioeconomically and culturally. This presentation explores the social norms of pet ownership for South Africans living in poverty through a small qualitative study conducted in a semi-rural settlement.

Sustentabilidad Descolonial, Solidaridad e Interculturalidad. Aportes y Límites De Una Cooperativa De Mujeres "Indígenas" En México.

El objetivo de este trabajo es analizar los aportes y límites de la cooperativa "Mujeres reunidas" en México, para proponer alternativas emancipadoras y solidarias frente a la crisis social y ecológica-ambiental que enfrentamos. Es una cooperativa de mujeres "indígenas" artesanas que elaboran, comercializan y exportan productos de ixtle (fibra natural de maguey), a partir de la organización colectiva del trabajo, la producción agroecológica y la recuperación de sus saberes y prácticas ancestrales en la relación de cuidado y respeto que establecen con la Madre tierra.

Asimismo, van impulsando procesos que se orientan, de manera contradictoria, a la socialización del poder revalorando el trabajo y la participación de las mujeres en la toma de decisiones; a promover la interculturalidad crítica, mediante un diálogo de saberes (científico y popular) y, a plantear una ruptura con la racionalidad instrumental que cosifica y mercantiliza las relaciones entre los humanos y con la Madre tierra. Esto mediante la restitución de relaciones de solidaridad y reciprocidad, orientadas a la reproducción conjunta y equilibrada de la Madre tierra y la vida humana, proponiendo otras formas de sentipensar y practicar la sustentabilidad ecológica-ambiental e intercultural que tiende hacia una "sustentabilidad descolonial", con impacto a escala global.

Se desarrolla un análisis cualitativo, desde la perspectiva crítica de la Colonialidad del poder, para identificar el entramado de relaciones de poder que disputan el control de los diversos ámbitos de la existencia social (trabajo, autoridad colectiva, subjetividad, sexo-género, "naturaleza"), y que históricamente han estructurado a la comunidad (racismo, clasismo patriarcal y eurocentrismo). Se utiliza una metodología de coinvestigación, que establece un diálogo de ida, vuelta y regreso con diversas integrantes de la cooperativa, de manera individual y colectiva.

Are Young People Lazy and Waste Time Online?: Content Creation and the Politics of Creativity Among Gen Z Creators in the Philippines

One of the common concerns that people post on social media nowadays is that young people are getting lazy because of longer social media use including scrolling online and posting memes and videos. In the Philippines, social media personalities and creators are getting younger and younger as many are getting viral online at a young age. This paper provides an alternative perspective by examining young social media creators engaging in what I will call the politics of creativity. Building from the lens of creativity (Gauntlett 2010) as an affective labor and informed by digital culture studies, I explore how young people creators use social media to their advantage as conduits of knowledge, specifically on social media vernacular and social media logics. This paper is part of a larger PhD project on influencer cultures in the Philippines, and empirical data is culled from digital ethnography, and semi-structured interviews with 30 influencers and 30 audiences. Findings include how many young creators get more viral on platforms like TikTok (Abidin 2020). Because of their understanding on moving "around" platforms, young people creators are becoming more skilled in working around platform governance, earning the status and prestige as content creators. I argue that experience This paper also offers policy recommendations on how platforms can protect young people as they become more popular as creators.

'I Have to be More Careful': Social Media Influencers in the Philippines and the Proficiency of Politics on Online Spaces

Scholars and activists have established that social media platforms are viable spaces for political discourse and activism. This paper examines the ways in which people navigate 'being politically aware' in online spaces by examining social media influencers in the Philippines as empirical entry points and building on studies on influencer studies and online social movements studies. This paper is part of a larger PhD project on influencer cultures in the Philippines, culling data from digital ethnography and semi-structured interviews with 30 social media influencers and 30 audiences. Informed by the concept of *proficiency* which looks at personas as profiles that are packaged online (Moeller and D'Ambrosio 2018), this paper explores how influencers balance their work as influencers and the ethics of being socially and politically aware on social media, particularly on TikTok and Facebook. The paper argues that while audiences expect social media influencers to become more vocal in social and political issues, they understand they are bound by limits from brands and their endeavors. This balancing act maintains their status as influencers and thus allows people to trust them as public figures. Ultimately, social media influencers are nuanced beings with varying degrees of openness which impacts discourses online in that while social media affords political awareness, it is ultimately the negotiation between the personal, social, and economic aspects, that affects how influencers become more vocal on social issues online.

Narratives of (In-)Justice in Sex Trafficking: the Case of Nigerian Women in Italy

Representation practices play a crucial role in understanding the historical, cultural and political specificities of the category of 'victim'. In this regard, the expression 'sexual humanitarianism' refers to processes where specific migrant groups are more than others represented as vulnerable in relation to their involvement in the prostitution market (cf. Andrijasevic and Mai 2016). Those who belong to these groups become 'iconic victims' (Jones 2010) and are therefore entitled to claim protection rights on the basis of a supposed higher vulnerability attributed to women (and minors, especially girls) involved in sex trafficking. These women are often called upon to demonstrate their fragility in order to obtain institutional protection, thus modelling their biographies and traumatic experiences according to narratives that adhere to the stereotypical notions promoted by humanitarian discourse.

This paper presents the results of a fieldwork research carried out between 2018 and 2022 on the phenomenon of Nigerian sex trafficking in Italy. It addresses forms of gender (in)justice as reflected in the biographical experiences and narrative representations of Nigerian migrant women involved in the prostitution sector. Through the adoption of a biographical approach, the research focuses on the narrative strategies adopted by these women who often face the difficulty of translating (not only linguistically) what they experienced within the rigid parameters of the institutional and bureaucratic vocabulary that tends to make them performing as 'perfect trafficking victims'. Therefore, in addition to the well known forms of injustice suffered by these women within trafficking circuits, due to the extreme conditions of the journey, multiple forms of violence and sexual exploitation experienced in Italy, the research highlights more invisible forms of bureaucratic and institutional violence linked to different fields of experience of the women involved, from reception to healthcare management, up to the often obstacle-ridden experience of motherhood in diasporic contexts.

CABRERA FEBLES, CRISTINA* (University of La Laguna, Spain)

The Way to the Agri-Food Transition: Holistic Livestock Management of Sheep and Goats in Canary Islands

How the "holistic management" (Savory and Butterfield, 2018) of small ruminants, particularly sheep and goats, can drive agrobiodiversity and regenerative agricultural practices in the Canary Islands? Through an agroecological framework, this research addresses the essential role that traditional pastoralism and transhumance practices play in fostering sustainable agri-food systems, highlighting the socio-economic importance of the pastoral culture of the Canary Islands through the lenses of holistic livestock management.

Pastoralism in the Canary Islands has long been a vital component of cultural heritage, with shepherds and goat herders using transhumance to move livestock across different ecological zones. This practice reveals many benefits, among which we can find dispersion and diversification of the livestock load, use of endemic species perfectly adapted to local ecosystems, the resilience of grazing lands by preventing overgrazing and maintaining soil health but also enhances agrobiodiversity through the interaction of livestock with diverse plant species that are going to be dispersed through fecal organic matter. In this manner, holistic management of ovine and caprine livestock serves as a regenerative approach to livestock farming, not only promoting biodiversity conservation, soil regeneration, and carbon sequestration while contributing to the local food system but also revealing the value of livestock farming as a basis for maintaining historical social, environmental and economic ties.

The local knowledge embedded in transhumance and herding traditions offers valuable insights for the agroecological transition in the archipelago. However, this process also requires the development of governance tools and grassroots interventions that support the multi-actor collaboration necessary for an effective agroecological transition. By aligning the traditional practices of pastoralists with modern sustainability goals, this paper suggests that a holistic livestock management approach not only benefits biodiversity but also strengthens the agri-food value chain. This approach is crucial for building a more resilient and diverse agricultural system in Europe.

The Role of Women's NGOs in Addressing Domestic Violence Against Women: Evaluating Challenges and Institutional Barriers in Turkey

This presentation focuses on the role of women's NGOs in combating domestic violence against women in Turkey. The research evaluates how NGOs contribute to the implementation of domestic violence prevention policies and addresses the systemic challenges they face.

Key findings highlight the critical role that women's NGOs play in supporting victims and advocating for stronger legal protections. However, the study also reveals significant barriers, including limited collaboration with government institutions, inadequate funding, and exclusion from policy-making processes. These challenges are exacerbated by regional disparities and cultural resistance, particularly in rural areas.

Focus group discussions were held with **34 women's NGOs**, including regions like **Gaziantep, Van, Trabzon, Izmir, Antalya, and Erzurum**, where service delivery challenges were most prominent. This presentation will explore the institutional barriers that hinder the effectiveness of NGOs and provide policy recommendations to improve collaboration between NGOs and government bodies, enhance support services, and address the structural challenges limiting their influence.

From Contestation to Collaboration: Exploring Social Movements and Civil Society Dynamics

Social movements and civil society organizations are often seen as vital indicators of a robust democracy, strengthening social cohesion through voluntary participation aimed at the common good. However, existing literature has predominantly addressed these dynamics in isolation (Della Porta, 2020), with one stream focusing on conflict and contestation while the other emphasizes cooperation and social capital.

This paper empirically examines the relationship between social movements and civil society participation, focusing on the Chilean case characterized by low social cohesion and a recent social outburst that has unprecedentedly elevated the prominence of social movements. By leveraging individual-level data from the Chilean Longitudinal Social Survey (ELSOC) from 2016 to 2021, alongside contextual data on the frequency of mobilizations (Observatorio de Conflictos database) and the number of civil society organizations (Centro de Políticas Públicas UC database) both at municipal level, the study explores the individual-level relationship between attitudes toward social movements and prosocial behaviors such as monetary donations and participation in civil society organizations, utilizing multilevel modeling approach.

The findings illuminate critical areas of intersection between civil society and social movements, particularly in a society with significant challenges related to social cohesion (low social and political trust; low participation in civil society). This research contributes to a more nuanced understanding of these dynamics by integrating conflict and cooperation perspectives. It highlights the potential for social movements to foster greater civic engagement and solidarity within a complex sociopolitical landscape.

CACERES, IGNACIO* (Pontificia Universidad Católica de Chile, Chile)

GONZALEZ, ANDRÉS (COES, Chile)

The Effect of Social Movements on Religious Identity

This article proposes an examination of the relationship between support for progressive social movements and religious disaffiliation in Chile, contributing to the growing literature on how political dynamics shape religious identification. Chile's religious landscape has experienced significant changes in recent years, with a sharp decline in Catholic identification and a rise in religiously unaffiliated individuals ("nones"). At the same time, the country has been involved in a prominent and historically unprecedented protest cycle led by several progressive social movements.

Drawing on data from the Chilean Longitudinal Social Survey (ELSOC) from 2016 to 2021, this study investigates whether support for liberal movements—such as those advocating for student, feminist, environmental, and indigenous rights—correlates with higher probabilities of religious disaffiliation. Using autoregressive models, the results show that individuals who express positive evaluations of these movements are more likely to identify as non-religious and demonstrate lower participation in religious services, regardless of their previous religious affiliations. These effects are evident for Catholics and Evangelicals, indicating that political support for progressive causes can influence religious identity. The findings suggest that religious identification in Chile is more contingent and that political values, even without direct church involvement, play a role in shaping religious affiliations. The study extends the discussion on secularization beyond the North American context, offering new insights into the interaction between politics and religion in Latin America. Also, the results emphasize the relevance of a wide perspective to analyze the effects of social movements on domains surpassing the movement's immediate thematic scope.

CADAA, RAUL* (UNLP, Argentina)

CADAA LALINDE, LOLA (Humanidades UNLP, Argentina)

"from the Dark Night, to the Bright Light..." Sport and Human Rights in Argentina

The dictatorial period that Argentina went through in 1976-1983 is internationally known. Once democracy was restored, those responsible for atrocious crimes were tried and imprisoned based on the collection of data carried out by a commission created for this purpose; the "CONADEP". In recent years, investigations into athletes who "disappeared" in the same period came to light. Many of them were born, studied or lived in the city of La Plata; converting it, along with other indicators, into the national capital of "Sports and Human Rights" of Argentina. That is why the UNESCO Chair of "Economic Systems and Human Rights" belonging to the National University of La Plata, has created a Sports and Human Rights Observatory. The purpose of this is to deepen investigations into the recent past, but fundamentally to ensure that the rights to access and practice sports of citizens as a whole and, in particular, of vulnerable sectors, are not violated in the future.

The central objective of this work is to share with other colleagues the strategies to be developed and the design of policies to be carried out to guarantee access and sports practice that dignifies the general well-being of the community. The purpose of the Observatory's actions is directed towards women, people with disabilities, aboriginal peoples and other vulnerable groups.

The theoretical referential framework of our research, and the design of policies to carry out the aforementioned actions, is based on the UN/UNESCO objectives for the subject; and works by Peter Donnelly, Bruce Kidd, Richard Giulianotti and others.

CAETANO GRAU, FEDERICO* (Facultad de Ciencias Sociales, Universidad de la república, Uruguay)

Confinement, Risk and Uncertainty: The Psychosocial Impacts of Prison Work

This presentation addresses the representations of risk and its psychosocial effects on workers at the National Institute of Adolescent Social Inclusion (INISA), the institution responsible for managing adolescent detention centers in Uruguay. Within carceral environments, there is an omnipresent sense of risk that is experienced not only as a constant physical threat but also as a symbolic dimension that permeates all labor practices, creating an atmosphere of uncertainty, constant alertness, and emotional fatigue.

The theoretical framework guiding this presentation is situated within contemporary debates on risk and uncertainty, proposing an interpretation that links large-scale theoretical systems of risk with the microdynamics of intersubjective labor practices in confinement contexts. From this perspective, risk in carceral settings should not be understood solely in terms of objective threats but as a discursive construction that reinforces social and institutional inequalities, exacerbating workers' vulnerability.

This presentation is an intermediate stage of an ongoing doctoral research project (FCS, Udelar), which constitutes an ideographic and qualitative case study on the configuration of order in carceral settings. Through an analysis of 50 interviews, the ongoing study reveals how INISA workers not only manage the constant threat of crises in their daily work but also develop subjective coping strategies that, while effective in the short term, come at a high psychological cost, as they tend to generate emotional exhaustion over time. This exhaustion, fueled by a culture of immediacy and a lack of institutional reflexivity, affects workers not only within the prison environment but also in their personal relationships and overall well-being outside of the workplace.

CAETANO GRAU, FEDERICO* (Facultad de Ciencias Sociales, Universidad de la república, Uruguay)

Del Diagnóstico Del Riesgo a Una Ética Del Encuentro: Hacia Una Inflexión De Las Prácticas Psicosociales En El Inisa

En el contexto de la penalidad juvenil uruguaya, las prácticas psicosociales en el Instituto Nacional de Inclusión Social Adolescente (INISA) se insertan dentro de un entramado burocrático altamente protocolizado, donde los adolescentes son reducidos a un conjunto de diagnósticos y pronósticos centrados exclusivamente en la gestión del riesgo. Desde una perspectiva psicodiagnóstica positivista, se intenta encuadrar a los jóvenes dentro de marcos teóricos preconcebidos que anulan su capacidad reflexiva y su agenciamiento en la construcción de su propia narratividad existencial.

El uso de técnicas invasivas, que van desde los extensos formularios que aplican los profesionales basados en el modelo RNR (Riesgo, Necesidad y Responsividad), hasta el cúmulo de pruebas psicométricas y proyectivas, operan desde un ritualismo burocrático vacío, que se desliza como una práctica fabril, desprovista de una heurística socioeducativa. De esta manera, los adolescentes emergen frente a la visibilidad del sistema como un "sujeto delincuente", negando la posibilidad de abordarlos como "sujetos enigmáticos," con una singularidad irreductible y una subjetividad compleja.

Esta ponencia se propone problematizar críticamente las prácticas psicosociales instituidas dentro del INISA, buscando introducir una nueva hermenéutica psicosocial, centrada en un oficio artesanal, vincular y éticamente comprometido con una subjetivación emancipatoria que desafíe las lógicas punitivas dominantes.

Ética, Cuidado y Género: Aproximaciones Etnográficas En La Llamada Educación Especial En España

La presente comunicación responde a cuestiones metodológicas y éticas sobre trabajo de campo etnográfico en contextos escolares de la llamada "Educación Especial", contextos donde la cuestión de género toma protagonismo. Se trata de un acercamiento a los dispositivos de diagnóstico (cómo y quienes diagnostican, etiquetan y desde dónde), a las lógicas escolares en las que se traducen estos "etiquetajes" (y que focalizamos en centros de educación especial y aulas específicas), así como a las visiones e interpretaciones que se realizan de estas situaciones por parte de las familias

de las personas involucradas y por parte de la comunidad (entendida en sentido amplio y ligada al movimiento asociativo, Administraciones públicas, redes informales de apoyo, etc.). Desde aquí, nos proponemos dialogar sobre cuestiones éticas y políticas que atraviesan nuestra labor etnográfica en este contexto concreto. Principalmente pondremos el foco de atención sobre cuestiones vinculadas con la feminización del sector profesional relacionado con la EE; con el sesgo androcéntrico de los diagnósticos de la población etiquetada como Necesidades Educativas Especiales (NEE) y con la búsqueda de posibles espacios de diálogo y debate con las/os protagonistas de la investigación: jóvenes escolarizadas/os identificados como alumnado de EE. Al mismo tiempo, hay que considerar que la cuestión de género está muy presente y cómo podemos abordarla partiendo de este contexto a través de la etnografía.

CALABRETTA, ANDREA* (University of Padova, Italy)

ALLIEVI, STEFANO (University of Padova, Italy)

Lived Religion, Lived Citizenship. the Everyday Experiences of Young Muslims in Italy between Religion, Morality and Civic Engagement

In recent years, the study of religion and the study of citizenship seem to have proceeded on parallel tracks. Indeed, both strands of study have challenged institutional and formal conceptions with a view to developing research approaches grounded in the everyday experience of social actors. These trends have led to the concepts of lived religion (Ammerman, 2015) and lived citizenship (Kallio et al., 2020). These parallel developments have already produced fertile intersections that explored the relationships between the lived experience of citizenship and faith (Rubin et al., 2022), particularly among migrants and their descendants (Nyhagen, 2015; Calabretta, 2023).

The present study aims to engage and deepen this research stream with new data and analysis. The aim of the paper is to explore how the everyday experience of religiosity overlaps with and fuels that of citizenship. The paper is based on 80 biographical interviews and 8 focus groups with young Muslims with migratory backgrounds living in Italy. The research is part of the project 'Growing old, feeling like citizens?' (Universities of Padua and Milan-Bicocca) which focuses on the biographical trajectories of young Muslim adults in Italy.

Based on the data collected and analysed in the project, the paper provides some interesting insights. First, in the interviewees' narratives, the daily experience of belonging to Islam – which intensifies with the transition to adulthood – is linked to the rediscovery and practice of religious and moral values contiguous to the idea of being 'good citizens'. This convergence between citizenship and lived religion is even more interesting since it occurs in a minority context and where Islam is the subject of negative representation (Allievi, 2012). Thus, by associating Islam with civic engagement, the interviewees seek to claim their legitimacy in participating as Muslims in the Italian citizenry.

RC32-524.4

CALCAGNI, MARIANA* (Freie Universität Berlin, Germany)

From Peasant Women to Social Change: The Politicization of Identities and Materialities Towards Socio-Ecological Transitions

Peasant movements are key actors for thinking and acting creatively in processes of food and socio-ecological transition. Drawing bridges between feminist political ecology and critical ecofeminisms, this article analyzes the National Association of Rural and Indigenous Women (ANAMURI) in Chile as key agents of social change. The study follows a qualitative methodology based on an analysis of ANAMURI's working papers, in-depth interviews, and ethnographic observations of the organization's women leaders (data collected from 2021 – 2023). There are various ways in which ANAMURI mobilizes political and identity categories (such as women, feminisms, care, and earthcare) as strategies in search of the food systems transformation in the context of a civilizational crisis. ANAMURI's case also contributes to understand the politicization processes of materialities for food production (land, seeds, water, among others), resulting in key factors for the political formation of rural women as agents of social change. Thus, care and earthcare become political tools used in the daily life of ANAMURI's women to foster food transitions.

CALCAGNI, MARIANA* (Freie Universität Berlin, Germany)

Rural Youth in Germany: The Convergence of Feminist, Agrarian and Environmental Agendas in the "Jabl"

Who will produce the food of the future and under what conditions? In an uncertain context in which climate change threatens biodiversity and the agri-food industry has tended to become a global market, new generations of farmers are organising themselves to make political demands for alternative models of agrarian development. The aim of this research is to analyse the political demands and imaginaries of young farmers in Germany. Feminist political ecology is used as a theoretical lens, as it challenges hierarchical dualisms and proposes to pay attention to relations of care between humans and within nature, seeking to find insights to traverse the possible multiple crises we are inhabiting. The methodology is based on an in-depth case study of the food movement Arbeitsgemeinschaft bäuerliche Landwirtschaft e.V. (AbL) in Germany, with a special focus on the youth faction of the movement (jAbL). The study is based on in-depth interviews with members of the movement, participant observation and content analysis of documents, data collected in 2022 and 2023. The results show that young farmers are setting a new agrarian agenda for overcoming food inequalities, based on key socio-environmental challenges. Traditional agrarian struggles such as access to land, fair working conditions and food sovereignty remain at the heart of their demands; however, struggles for gender equality, including queer identities, social inclusion and concerns about the impact of climate crises are now at the centre of young farmers' struggles in Germany, thus broadening the agenda of fighting intersectional inequalities. The construction of these new agrarian imaginaries is interpreted through the lenses of care and earthcare, which allow us to delineate an emerging ethic in the agrarian struggle, led by young people. This points out the relevance of the convergence of feminist, agrarian and climate change agendas, and the urgent need to build broad alliances.

RC22-354.4

CALDER, RYAN* (Johns Hopkins University, USA)

The Paradox of Islamic Finance: How Shariah Scholars Reconcile Religion and Capitalism

In just fifty years, Islamic finance has grown from a tiny experiment operated from a Volkswagen van to a thriving global industry worth more than the entire financial sector of India, South America, or Eastern Europe. You can now shop with an Islamic credit card, invest in Islamic bonds, and buy Islamic derivatives. But how has this spectacular growth been possible, given Islam's strictures against interest? In *The Paradox of Islamic Finance*, Ryan Calder examines the Islamic finance boom, arguing that shariah scholars—experts in Islamic law who certify financial products as truly Islamic—have made the industry a profitable, if controversial, hybrid of religion and markets.

Critics say Islamic finance merely reproduces conventional interest-based finance, with the shariah scholars' blessing. From an economic perspective, they are right: the most popular Islamic products act like conventional interest-bearing ones, earning healthy profits for Islamic banks and financial heavyweights like Deutsche Bank and Goldman Sachs. Yet as Calder shows by delving into the shariah scholars' day-to-day work, what seem like high-tech work-arounds to outsiders carry deep and nuanced meaning to the scholars—and to the hundreds of millions of Muslims who respect their expertise. He shows that the shariah scholars' conception of Islamic finance is perfectly suited to the age of financialization and the global efflorescence of shariah-minded Islam.

The Paradox of Islamic Finance draws on 15 years of fieldwork and 291 interviews conducted with interviewees in 20 countries—especially Pakistan, Saudi Arabia, Malaysia, the UAE, and the United Kingdom. Interviewees included shariah scholars, Islamic bankers, lawyers, shariah auditors, securities regulators, and central bankers. Calder's research assistants also interviewed 130 members of the general banking public in Pakistan and Saudi Arabia. He attended weeks of training seminars, interned at an Islamic-finance law firm, and even shopped at Islamic banks around the world.

RC02-44.2

CALDER, RYAN* (Johns Hopkins University, USA)

Why Does Islamic Finance Succeed in Some Countries More Than Others? the Politics of Shariah Authority in "Cool" Saudi Arabia and "Hot" Pakistan

Why has Islamic finance succeeded commercially in some countries and not others? Some states, particularly Malaysia, have received wide international recognition for thoughtful regulatory and tax policies that foster Islamic banking and Islamic capital markets. As of 2023, Islamic banking penetration

in Malaysia sits at an impressive 42% of total national banking assets. However, that figure is 85% in Saudi Arabia—even though the Saudi central bank refused to acknowledge the very existence of Islamic finance until the 2010s. In Pakistan, where activists have agitated for Islamic finance since the 1970s and the state banned interest-based banking in the 1980s, the figure is just 20%. Drawing on 210 interviews, years of fieldwork, and analysis of primary and secondary school textbooks, this article compares Saudi Arabia and Pakistan while taking Malaysia as a reference point. It attributes their difference to the contentiousness of the field of public discourse about the meaning, authority structure, and implementation of Islamic law within the economy. This field has long been stable in Saudi Arabia but contentious in Pakistan. In Saudi Arabia, usury (ribā) appears in public as primarily a matter of individual piety. In Pakistan, by contrast, usury (ribā or sood) appears everywhere from school textbooks to popular opinion to the central bank as a vehicle for utopian macrosocial engineering, implicating domestic and global structures of inequality and subjugation. In Saudi Arabia, the implementation of Islamic finance therefore becomes a “cool” techno-juridical process that can merge smoothly into pre-existing national and international financial-market infrastructures. In contrast, the implementation of Islamic finance in Pakistan has invoked “hot” political passions that destabilize implementation efforts and obstruct easy integration into capitalist financial markets. The paper thus integrates a social-movements perspective and a political sociology of legal authority into the question of how national markets form and grow.

CALDERÓN ROJAS SANDOVAL, AROMA* (PUCP, Peru)
CAVAGNOUD, ROBIN* (PUCP, Peru)

Challenging Borders and Roles: The “Sandwich Generation” in Venezuelan Migration to Peru

This paper presents preliminary results from a comparative study on transnational care in contexts of protracted humanitarian crises, focusing on Venezuelan migrants in Peru. Based on 60 narrative interviews with migrants in Peru and 40 semi-structured interviews with their elderly parents in Venezuela, we analyze the trajectories of the transnational “sandwich generation”: women who simultaneously provide long-distance care to their parents in Venezuela and their children in Peru.

Our findings reveal how these women negotiate and organize their care roles in a context of precariousness. Transnational care strategies are affected by interconnected factors: the multidimensional crisis in Venezuela intensifies the need for remittances and emotional support, forcing these women to maintain constant connections through digital technologies. Difficulties in labor market integration in Peru, exacerbated by discrimination and lack of credential recognition, hinder the generation of income necessary to sustain both ends of the care chain. The family situation, especially in single-parent households, adds layers of complexity, requiring emotional and logistical juggling. Furthermore, restrictive migration policies in Peru limit mobility and family reunification, forcing creative adaptations in transnational care practices.

We argue that these dynamics not only reconfigure family relationships but also enrich and challenge existing theoretical frameworks on migration and care. This study contributes to decentering migration studies by focusing on South-South care experiences, offering a critical perspective on how protracted humanitarian crises shape and transform transnational care practices, highlighting the resilience and adaptability of migrant women in the face of multiple adversities.

Healing with Friends? Twin Survey Experiments on Vaccines and Geopolitics in Front of Global Pandemics.

While the Covid-19 pandemic took the world by surprise and affected every country on the planet, the global response was marked by clear geopolitical fractures. While pandemics represent punctuated instances of intense and symmetric crisis, these can be compounded by long-term structural shifts which alter the global balance of power and force ‘friend or foe’ lenses

onto otherwise nonpartisan issues. Such a wicked problem has plagued international public health for decades, impacting things like the rollout of the malaria and smallpox vaccines, and it reflects the inherent tensions between global problem-solving, on the one hand, and immediate national self-interest on the other. From a national standpoint this often leads to tensions between functional problem-solving and value-based cooperation choices, and with possible feedback effects on domestic governance arrangements.

To understand the extent to which this affects not only political leaders but the population at large, we conduct a pair of survey experiments in a survey fielded in early 2025 in Japan, the US, the UK, Brazil, Nigeria, Italy and Germany, collecting about 1500 observations in each country.

In the first experiment, we ask the respondents’ willingness to receive a vaccine, randomizing the country of origin from a list of potentially friendly or unfriendly countries. In the second experiment, we ask the respondents to decide whether to support or not the allocation of extra vaccine doses to third countries, drawn from a list of potentially friendly or unfriendly countries. Together, these experiments allow us to reveal how much global health cooperation is conditioned by geopolitics and the intricacies of global solidarity. We expect respondents to prefer vaccine cooperation with friendly countries on average, but with significant heterogeneous treatment effects for gender, concern with pandemics, left-right placement on the political spectrum, and the degree of supranational identity.

Intersectional Gender Futures the Stemma Project: A Transdisciplinary Approach for Transformative Justice

There is no doubt how gender bias affects all women, with a notable impact on those whose gender intersects with other categories, including, but not limited to, ethnic origin, socioeconomic status, religion, sexual orientation, and/or disability (Armstrong, Jovanovic, 2015). The intersection of categories such as gender and different abilities increases greater exposure to situations of risks, stigmatization, and discrimination, in a social system that tends to reproduce and amplify social inequalities (Bourdieu P., Passeron J. C., 1970). The focus of the proposed abstract is an “intersectional and transdisciplinary approach for Transformative Justice” with a critical approach to power structures and sociocultural processes that perpetuate the social exclusion of some groups from STEAM (Science, Technology, Engineering, and Mathematics) disciplines. The proposal will share the results of STEMM[A1] research project, funded by Next Generation Europe, to contribute to reducing the gap in STEAM. The research will be carried out at multiple levels, with the aim of better positioning the role of the Universities in the panorama of opportunities to promote social inclusion and empowerment, and the role of communities and movements to attribute meanings to STEAM. The proposal will highlight the inclusive value of the intersectional approach (Corbisiero, Nocenzi, 2022) and the importance of transdisciplinarity as a device and paradigm to promote Transformative Justice, the keystone for a cohesive and sustainable society.

Generational Shifts in Subjective Well-Being: Do Younger Cohorts Experience Lower Levels of Life Satisfaction?

Research suggests that the advent of social media has had a significant negative impact on the subjective well-being of younger generations, particularly those born between 1995 and 2010. Key drivers of this decline include social comparison, fear of missing out (FOMO), sleep disturbances linked to constant exposure to social media platforms and smartphone usage. These factors contribute to feelings of inadequacy, reduced self-esteem, heightened anxiety and depression, potentially leading to a notable decline in life satisfaction among younger cohorts compared to older generations.

However, understanding time in human societies is complex, as three interrelated dimensions operate simultaneously: birth cohort (generation),

historical period (trend) and age (life cycle). Age effects represent developmental changes throughout the life cycle. Period and cohort effects refer to exogenous contextual changes in broader social conditions. Period effects arise from cultural or economic shifts unique to specific time periods (e.g., economic recessions, health crises like the COVID-19 pandemic) and affect all individuals, regardless of age. Cohort effects are the essence of social change, not just determined by the time of birth as such, but also by cumulatively going through the same historical and social factors.

This paper formally tests the cohort-effect hypothesis related to life satisfaction by comparing younger generations (1995–2005) with older cohorts (1895–1995). We control for both period (trend) and age (life course) effects using repeated cross-sectional Eurobarometer data (1972–2022) from eight European countries. The analysis employs Hierarchical Age-Period-Cohort (HAPC) regression to disentangle the unique effects of cohort, period and age effects.

CALMELET, LAURE* (Faculté d'éducation et de formation de l'Institut Catholique de Paris, France)

Facteurs Explicatifs De La Croyance En La Justice De L'école Des Professionnels De L'éducation.

Paul Ricoeur définit la visée éthique comme : « la visée de la vie bonne, avec et pour autrui, dans des institutions justes » (1990, p.202). Confrontant cette définition à l'idée de la coexistence de logiques de justice plurielles (Sen, 2012), pouvant mener à des « conflits éthiques », nous arrivons à un questionnement portant sur le lien entre la croyance en la justice des professionnels de l'éducation et leur implication dans la création d'espaces pédagogiques « capabilisants » (Sen, 2012 ; Nussbaum, 2012). Ces environnements, reposent sur l'idée de l'accessibilité pédagogique à visée universelle (Bergeron, Rousseau & Leclerc, 2011) et visent la maximisation du pouvoir d'agir des élèves. Dans le cadre de notre travail doctoral, nous faisons l'hypothèse que la croyance en la justice des professionnels peut avoir un impact sur leur visée éthique et leur implication dans la dynamique inclusive de l'école (Booth, Ainscow & Kingston, 2006). Afin de caractériser ce lien, nous cherchons à quantifier et qualifier ces croyances. Pour ce faire, nous avons déployé une large enquête à destination des professionnels de l'éducation pour laquelle nous avons recueilli 516 réponses complètes.

Nous souhaitons proposer ici des résultats inédits qui en sont issus afin de répondre à la problématique suivante :

Quels sont les éléments qui conditionnent la croyance en la justice de l'école (CJE) des professionnels de l'éducation ?

Afin de tenter d'apporter des éléments de réponse à cette question, nous présenterons notre méthodologie de mesure de la CJE des professionnels, basée sur l'adaptation d'un test de croyance en la justice du monde (Lipkus, 1996), puis nous détaillerons les résultats de tests de corrélation entre le CJE et différents éléments tels que l'âge, le sexe, la profession exercée, le milieu d'exercice ou encore la présence de dispositifs spécifiques au sein de l'établissement dont dépend le professionnel.

CALMELET, LAURE* (Faculté d'éducation et de formation de l'Institut Catholique de Paris, France)

The Liminal Situation of Students with Disabilities in the French School System.

I would like to propose an oral communication about the difficulties encountered in implementing an inclusive dynamic in the French school system.

The 2005 law "for equal rights, full participation, and citizenship of people with disabilities" grants every child with a disability the right to attend their local school. Accordingly, the number of children with disabilities increased from 155,351 in 2006 to 436,085 in 2021 (DEPP, 2021).

However, the school system and education professionals are struggling to face the challenges of the inclusion of children with disabilities. Some teachers acknowledge that they feel unprepared for the pedagogical demands necessary to embrace student diversity (Chaix, 2014). This is linked to a deep feeling of uneasiness for teachers (Ployé, 2018; Barrère, 2017) and to very uncomfortable schooling conditions for some students. Indeed, even though they are present in the classroom, the lack of pedagogical accessibility keeps them in a liminal situation, in which they are neither fully part of the system nor fully excluded (Murphy, 1987).

In a comprehensive approach, we ask the following question:

- How do teachers' beliefs about inclusion and students with

disabilities impact schooling conditions for students with disabilities?

To discuss this point, we will first define the concept of liminality (Saint Martin, 2019 ; Ployé, 2018). Then, we will cross-analyze institutional documents such as the educational code and the teacher competence framework, along with results from a large survey addressed to education professionals during our doctoral research, which provides insights into education professionals' beliefs about the education of children with disabilities.

We will demonstrate how the lack of operationalization of the instructions given to professionals, combined with their personal values and views on disability, are contributing factors to the failure to enable the full participation of children with disabilities in French schools.

A Radical Legacy or a Radical Future? a Cultural Political Economy of the Environmental Crisis in the Post-ETA Politics in Basque Country

The end of ETA's violence and the legalisation of Batasuna's successor parties, Bildu and Sortu, in Spain have put the spotlight on Bildu's institutional adaptation and organisational evolution, while the mainstream media associate it with ETA's legacy and, therefore, with focus on it as a radical party. This presentation moves away from purely identitarian and political conceptualisations of Bildu, focusing on its potential role in fostering an alternative vision of capitalism in the Basque Country. This vision questions the current neoliberal hegemony of the PNV and rearticulates new socio-economic alliances to achieve it. Specifically, this article aims to explore how Bildu's policy towards a climate transition renews discourses on the role of the 'state' in the economy, and emphasises the importance of the public and social economy to define new horizons of social justice. The climate transition can be said to form the basis of a new economic imaginary that promotes shared socio-semiotic systems around which to share similar conceptions of climate, as well as a new political model. Based on this concept, the presentation explores the struggles between representatives of Bildu, local authorities, businesses, citizen groups and the current government to adopt or resist such an approach around a case study linked to the Norway energy company Statkraft. In this context, it is argued that, at least three paths can be detected. These are first, a 'techno-market' solution led by global private initiative, second, a state led climate sustainability, and third, energy sufficiency for a post-capitalist context. The paper draws on cultural political economy to explore the discursive and extra-discursive practices that contribute to the selection and retention of certain discourses and their potential transformation in durable institutional and policy solutions to shed light on the vision of capitalist restructuring of Bildu in Basque Country, and its transformative potential.

CAMARA, MOHAMED LAMINE* (Universidad de Zaragoza | Máster Sociología de la políticas públicas y sociales, Spain)

Critical Reading of Citizen Science: Second-Order Observation of the "Incluscience-Me" Project in Córdoba, Spain.

This work addresses the application of citizen science to children's environmental education in the case of the "Incluscience-Me" project developed from October 15, 2023, to October 15, 2024.

The "Incluscience-Me" project is organized and coordinated by the University of Córdoba and the Biodiversity Management Research Group (GESBIO) with the collaboration of other entities.

It consists of promoting ecological awareness in children under 12 years of age, through children's participation in environmental research with school activities (teaching, workshops) and extracurricular activities (exploration of the wildlife of Córdoba).

The project includes students from early childhood and primary education, teachers from selected educational centers (9 Primary early childhood education center), and special education students.

We propose to link this project with the process of environmental socialization of children, not only as participants, but also as protagonists of the research carried out.

The questions from sociocybernetics are:

How does the "Incluscience-Me" project influence the understanding of biodiversity conservation and the pro-environmental attitude of children under 12 years of age? And above all, how does the project promote a reflexivity in the concept of citizenship in the participants?

The paper proposes to analyse the foundations of the project, the experience in a learning and practice context, its execution records and the perspective of the participants in order to analyse, with a second-order observation, the degree of satisfaction of the children in participating in the project, the meaning they give to this participation and the way in which this broadens their vision of citizenship.

CAMARENA-CORDOVA, ROSA MARIA* (UNIVERSIDAD NACIONAL AUTONOMA DE MEXICO UNAM, Mexico)

Children Family Trajectories and Demographic Change

Since the second half of the twentieth century Mexico has experienced a series of major political, social, economic, cultural and demographic transformations. At the demographic level, there was an impressive mortality reduction that raised life expectancy from 49 years in 1950 to 75 years at the end of the century. Fertility had a precipitous decline from an average of 6.1 children per woman in 1975 to 1.9 today. Migration, especially international migration, accentuated over time and diversified its forms of occurrence; while nuptiality, after remained relatively stable for a long time, has shown significant changes in recent decades.

All these, along with important changes at cultural and social levels, as those related to women status, education, employment, among others, has had a considerable impact on families, whose transformations have been documented by several studies. However, few specific research attention has been paid to the effects those changes have had on Mexican children's family lives, particularly in relation to the people with whom they grow up.

From a life course perspective and keeping in mind the importance that family composition and stability has shown to have for children's well-being, this paper analyzes and compares residential trajectories from birth to 17 years of age, of three cohorts of men and women born between 1962-1997. Residential trajectories are built using Sequence Analysis Techniques considering the kinship composition of households in which children lived at each single age.

Interest is focused on aspects such as co-residence family structure and its variations with age, the duration of that co-residence, the stability of family environment along childhood, the timing, type and sequence of changes, as well as the relationship of all these with demographic and social contexts over time. The longitudinal and retrospective data come from the Mexican Retrospective Demographic Survey carried out in 2017.

Germany Bans the Red Triangle: Nomadic Semiotics in Digital Image Analysis

In July 2024, Germany's House of Representatives voted to ban the symbolic use of red triangles in connection to the Al-Qassam Brigades (*ASB Zeitung*) and their use in pro-Palestinian media. Recently META (Facebook) and Instagram have also been censoring the use of the symbol online.

Often, "pictures provide insights into the practices through which people construct themselves as social beings within specific locales and enable us to link personal life worlds to wider societal contexts" (Hodgetts et al., 2007, p. 267). How does digitality manifest these contexts and how can it be analyzed?

This paper examines some characteristics of nomadic semiotics grounding an analysis of the deep complexities associated with using digital visual images, without ignoring affective and aesthetic levels. Taking a cue from Du Bois' work over 100 years ago, I will present a practical example by examining the current sociological implications of the use of red equilateral triangles in social media.

Image interpretation is grounded in practices of examining experiences of creating/perceiving without treating sets of relations between symbols and their potential meanings as closed systems. Because images are not subject to the confines of written or formal verbal communication (Schratz & Steiner-Löffler, 2003), they create space for complex ideas to be presented more directly than spoken or written forms of communication. Prosser (2003) notes that "Images are, by their nature, ambiguous and do not in themselves convey meanings which are supplied serendipitally by those who perceive them" (p. 98). As such, it is useful to operate within a theoretical understanding of images that contemplates them as social interfaces, by "intentionally engaging thinking by and on as well as through the image" while keeping in mind that "shifting terminology and expanding theoretical and methodological repertoires are symptomatic of the image's refusal to be disciplined" (Cambre 2021, 748).

LAVRENCE, CHRISTINE* (King's University College at Western University, Canada)

Speaking in Tongues: Networked Aesthetics and the Everyday in Selfie Practices

Between art and everyday life, there is no difference.... (Brecht 1965: 71)

Despite increasing scholarly attention to everyday aesthetics and relational aesthetics, sociology remains suspicious of incorporating aesthetics and aesthetic approaches, a gap that Georg Simmel's foundational work on sociological aesthetics once sought to bridge. In *Art and Agency*, British Anthropologist Alfred Gell (1998) argues that most "literature about 'art' is actually about representation," (25) and thus sidelines the performative and agentic aspects of objects. Yet Nicolas Bourriaud in *Relational Art*, claims some art it takes 'as its starting point human relations and their social context' (Bourriaud 1998: 117) and thus relational aesthetics focuses on 'the inter-human relations which they [artworks] show, produce, or give rise to' (Bourriaud 1998: 117).

In light of Bourriaud's positioning of art as a 'social interstice', this talk examines the self-aestheticization that social media platforms afford and encourages in reference to the anxieties of faciality manifesting in online phenomena like the trends of "mask-fishing" and "tongue selfie".

Drawing on a three-year study involving over 100 participants about their selfie practices, we explore how the prolonged engagement with digital images of faces produces new aesthetic practices, preoccupations and anxieties. As Smith, Byrne and Harries (2020) describe in their discussion of Martin's social aesthetics" (2011), it is our "shared capacity for feeling" that allows us to apprehend and respond to our everyday social worlds and their objects in ways that can exceed simple predetermined social categories (91). A social aesthetics arising from the heightened role of photography within digital sociality provokes an intense visuality within everyday social relations so that new theorizations of the relationships between aesthetics and social life might be proposed.

CAMERON, LORNA* (Unuiversity of Lincoln, United Kingdom)

Courts in a Time of Permacrisis: Knowing Justice (Digitally) in the Anthropocene

As we navigate the *Anthropocene*, we find ourselves in an era of *permacrisis* - a time of continuous and overlapping crises which have a global as well as national impact.

As the ecological event horizon approaches the societal imperative is to reshape and redirect our activities, but this puts us into conflict with our boundaries of sovereignty and culture, challenging our understandings of justice, and our confidence in the rule of law.

The ways in which we access justice must evolve and advances in digital technologies promise greater accessibility to justice at less cost. However, the recent pandemic has shown that less engagement diminishes the rule of law and our confidence in it.

We know justice and the rule of law through the social and cultural life of law; through the court as the place of law with its aesthetics, architecture and artefacts, and the rituals and performative traditions of the trial. As our courts become digitised, we do not yet understand the impact of digitisation on this 'knowing'.

Matthews[1] argues that through an attention to obligations, rather than rights, a sensitivity to the forces and relations that define the Anthropocene might be fostered. This implies a shift of emphasis from the *aesthetics* to the *aesthesis* of the human experience. This paper argues that aesthesis is a key element of *knowing* justice and extends the argument to propose that the integrity of the criminal trial therefore relies on the physical presence of the people at its centre. It follows that an anthropological analysis of the architectural phenomenology of the trial courts can help us to *know* justice (digitally).

CAMMISS, STEVEN* (University of Birmingham, United Kingdom)

HAYES, GRAEME (Aston University, United Kingdom)

Silence and Climate Disobedience in the English Courts

In this paper, we discuss the criminal trials of environmental (and other) activists, prosecuted in England for their participation in non-violent direct action and disobedience. Drawing on recent cases, interviews, and observations of trials, we outline how the British government and the higher courts have responded to the ongoing protest wave of direct action by systematically removing the defences available to these activists in court. As a result, these activists typically accept that they have committed the actions they are accused of, but plead not guilty (to charges of criminal damage or public nuisance), without now having recourse to any defence in law. We discuss how judges then seek to manage activists in the courtroom, by surveilling and curtailing their capacity to explain their motives and their actions, and imposing various forms of silencing. We argue that this process is designed to create an artificial and arbitrary separation of politics from the law. But it also creates opportunities that can be seized by defendants to develop resistant voice and agency.

Engaging Emotions through Art: Young People Tackling Different Learning Environments

In recent decades, the arts have gained great relevance in the social sciences as a tool for exploring social complexity, cultural diversity and social inclusion, including their affective implications (Bourdieu; Di Maggio; Inglis). In the field of education, too, there is a renewed interest in the arts and arts-based education because they challenge traditional ways of teaching and learning in formal and informal educational settings. In particular, art is seen as a valuable means of promoting social inclusion in multicultural contexts (Martiniello; Clover).

Our paper aims to explore the relationship between young people, emotions and arts education in formal and informal educational settings by presenting qualitative and visual data collected as part of the European research project "The Cultural Literacies' Value in Europe" (Clivie), which aims to improve our understanding of the value of cultural literacy through arts education for social inclusion. The target group of this project are young people (10-18 years old) who experience overlapping disadvantages in different areas and to different degrees (migrant background, low socio-economic status, disability). In particular, adopting the cultural theory approach to emotions (Hochschild, Illouz), which examines how different social contexts influence young people's emotional experiences, we analyse the results of four Italian case studies - two formal educational settings, i.e. two schools in the periphery of Milan and two informal educational settings, i.e. two third sector institutions dealing with ethnic and disability issues - in which emotional cartography is used as a creative methodological tool to promote the emergence of feelings, values and emotions that foster cultural literacy and awareness of difference. We are comparing experiences in these two types of educational settings in order to better understand how different learning environments, using art as a participatory technique, can shape young people's emotional expression and promote cultural understanding and inclusion.

Corporate Investors and the Housing Affordability Crisis in the U.S.: Having Wall Street As Your Landlord

Given the importance of housing affordability to one's social class standing, one's ability to afford decent, secure housing is not only important on an individual level, but impacts intergenerational im/mobility as well. The purpose of this research is fourfold: it examines the recent trend in bulk housing purchases by Wall Street corporate investors who turned those purchases into single family rental (SFRs) properties, post the Great Recession. The phrase 'buy low, rent high' is common parlance in today's SFR investor market. Second, in so doing, this research discusses the implications for the population in general, but for marginalized populations in particular, that is, persons of color and those in the lower socioeconomic strata of American society. Third, this research examines a closely related housing phenomenon, condominium deconversion, where corporate investors purchase privately

owned condominiums in bulk, who turn them into rental units. Fourth, summary analysis and suggestions for future research as well as legislative and policy proposals to offset the housing affordability crisis in the U.S. conclude this research. While this research focuses on the U.S. context, the global implications of the financialization of the housing industry by corporate investors across the globe, post the Great Recession, will be referenced and contextualized, as well.

Letterloop y La Amistad En La Era Digital. Un Estudio Sociológico Sobre Los Vínculos Virtuales De La Juventud Española.

El amor, como vínculo afectivo esencial, ha sido un objeto de estudio predominante en la sociología, explorándose en sus múltiples formas, desde el amor romántico hasta el amor familiar, pasando por las relaciones de amistad entre semejantes. Sin embargo, la amistad, pese a su gran relevancia en la socialización secundaria y en la construcción del capital social (Bourdieu, 1998), apenas ha recibido atención académica. Su lateralización es particularmente remarcable considerando el papel central que la amistad desempeña en el tejido social. Ésta tiene un peso sociológico indiscutible al contribuir a la cohesión social y al ofrecer un campo de interacción que trasciende el ámbito formal de las instituciones (Simmel, 1986). En este sentido, los lazos de amistad permiten a los individuos construir redes de apoyo y, al mismo tiempo, fomentar su sentido de identidad y pertenencia. Dada la evolución de las interacciones sociales en la era digital, resulta crucial analizar cómo estas relaciones se configuran y sostienen en un entorno mediado por las nuevas tecnologías. Por consiguiente, este estudio presenta como objetivo principal explorar cómo se desarrollan y mantienen las amistades en el entorno digital. Asimismo, como objetivos secundarios, se analiza la influencia de las subculturas juveniles en estos procesos y las posibles diferencias en las relaciones de amistad atendiendo al género. Para abordar estos objetivos e indagar en las dinámicas que estructuran las amistades en el contexto digital contemporáneo, se utiliza una triangulación metodológica que combina entrevistas en profundidad, grupos triangulares y etnografía digital en la plataforma *Letterloop*, un espacio emergente para la construcción de vínculos digitales.

CAMPDEPADROS, ROGER* (University of Girona, Spain)

DE BOTTON, LENA (University of Barcelona, Spain)

Online Interreligious Dialogue Community Building to Stand Against Online Hate Speech

When educational and social policies addressed to end with segregation problems are not scientific evidence-based, they may easily increase xenophobia and racism. Previous research (authors) showed that forced redistribution of immigrant students, considered as a load that had to be shared within a Spanish municipality, was strongly associated with a xenophobic vote to an extreme-right party that launched Islamophobic and anti-immigration rants. In those few years of redistribution implementation, this party went from nothing to the second most voted in that municipality. Multiethnic and multireligious societies pose the challenge of both confronting such kinds attacks and achieving social cohesion, now increasingly taking place online.

In this communication, we present results of two European researches on hate speech "Alreco" and "Real Up", that identified both the online upstander discourse in front of attacks to minority religions and religious practices -such as islamophobia and antisemitism- and elements that foster and strengthen it. These researches were about how to widen the visibility of online upstanders who stands in front of populism, hate speech, disinformation, and fake news, and how they pose alternative narratives.

The analysis found that citizenship provides dozens of online daily actions to stop or counteract hate speech. One essential action is strengthening

interreligious dialogue community building so that it can provide, from diversity, upstander responses jointly with scientific evidence, acting as a shield and preventing the normalisation of hate speech and isolating violence. These actions help build an online community that provides victims and bystanders with a proper context to report and the certainty that there will be no retaliation. Another research output stemming from applying Social Media Analytics to upstander discourse is that the most impactful posts (those with more likes and retweets) are not violent, are linked to the language of desire, and are based on evidence.

TG12-JS-74.2

CAMPIONE, FRANCESCA* (Sapienza University of Rome, Italy)

Care Ethics and the Dynamics of Recognition

The paper examines Care Ethics as a vital ethical framework that promotes meaningful human relationships, as an alternative to traditional impartialist models like deontology and consequentialism. At its core, Care Ethics recognizes the inherent vulnerability of human beings and their relational and care needs, emphasizing the importance of responsibility towards others.

The discussion delineates two interpretations of the individual: the view of an isolated,

competitive entity and the alternative perspective that acknowledges the individual's uniqueness and need for recognition. This latter viewpoint supports a vision of social cohesion grounded in interconnectedness and mutual support.

A key focus of the paper is the examination of potential barriers and facilitators to recognition. In particular, an interpretative dimension represented by language, narratives and social categories, as well as cultural values, thought paradigms and subjective interpretations, and a purely experiential dimension, consisting of personal experiences and emotions.

Additionally, the paper proposes a rethinking of social violence, to include not only overt acts of harm but also the denial of care, misrecognition, and indifference.

Through this comprehensive analysis, the paper aspires to inspire reflections on how care practices can engender transformative change in communities, promoting social justice

RC25-415.3

CAMPIONE, FRANCESCA* (Sapienza University of Rome, Italy)

Narration, Imaginary, Ideology

This work aims to explore how certain narrative structures, and the mechanisms of identification and projection they generate, are used to legitimize, maintain, and convey existing power structures and worldviews. Narratives have the ability to create a shared imaginary capable of justifying existing hierarchies, regulates behaviors, lifestyles, and values within a community.

In particular, the narrative of work ethics will be analyzed as an example, highlighting the narrative forms and semantic nodes it shares with the narrative of psychological self-work, particularly in regard to the ascetic aspect.

A focus will be given to the "compulsion to self-narrate" which increasingly characterizes both the media space and places of social interaction, whether work-related or not, proposing to read the phenomenon as a form of panopticon. The compulsion to self-narrate, regulated by rewards and punishments, along with the heteronomy of contents and narrative structures, operates as a horizontal social control mechanism, where individuals monitor, reward or punish how others narrate themselves. In this way, the subject of the narrative becomes its object, seeing their own perspective on themselves expropriated.

By offering an analysis of these themes, the paper proposes a critical perspective on the social functions of narration and the aestheticization of ideologies.

CAMPOLI, LARA* (Universidad de Barcelona, Spain)
PEROSA, GRAZIELA* (University of Sao Paulo, Brazil)

La Exclusión y El Silenciamiento De Las Trabajadoras Subcontratadas y Precarizadas En El Espacio Universitario Brasileño.

Este trabajo analiza las trayectorias sociales de 18 limpiadoras subcontratadas en una de las mayores universidades públicas de Brasil. Identificamos, interpretamos y relacionamos las jerarquías de clase, género y raza, sin descuidar otros clivajes sociales presentes en el espacio universitario. Destacamos cómo las esperanzas de un «mejor servicio» se proyectan sobre la generación de sus hijos, factor que resultó crucial para entender las razones por las que estas trabajadoras, en su mayoría mujeres negras, madres y cabezas de familia, toleran una ocupación marcada por la humillación y el acoso, la falta de respeto laboral, los bajos salarios, la segregación espacial, la inestabilidad y los diferentes derechos y prestaciones (guardería, hospital, red de internet, libre circulación) en comparación con los empleados contratados directamente por la universidad. Destacamos la contradicción entre la precariedad del trabajo subcontratado sumado a la exclusión de estas trabajadoras de la comunidad universitaria y el carácter transformador, crítico y reflexivo de la universidad. El recurso al trabajo tercerizado por parte de las universidades públicas no es exclusivamente una opción económica, es también una importante elección política y la contratación de servicios tercerizados altamente precarios indica una preocupante institucionalización del discurso neoliberal en el mundo académico brasileño. El material empírico se produjo entre 2017 y 2019, a partir de entrevistas semiestructuradas y observaciones etnográficas derivadas de la participación en talleres quincenales de manualidades a cargo de un grupo de auxiliares de limpieza. Estos talleres, organizados por un colectivo de educación y economía popular, no solo posibilitaron el intercambio de saberes, sino que también tuvieron como objetivo promover la interacción e integración entre las trabajadoras tercerizadas y la comunidad universitaria. A través de ellos, la investigadora pudo acercarse a las trabajadoras subcontratadas y tener acceso a sus testimonios.

CAMPOS KNOTHE, KATHERINE* (CIGIDEN & Instituto de Sociología, Pontificia Universidad Católica de Chile, Chile)

Challenging the Notion of Disaster: Women's Experiences from Chilean Informal Settlements

The global urban poor population, estimated at hundreds of millions, live in precarious conditions and is particularly vulnerable to natural or anthropogenic hazards due to their insecure and inadequate living conditions (Tippel, 2005). In Chile, informal settlements known as 'campamentos' are examples of such precarious living conditions, where people live in low-quality houses built by themselves, lacking access to clean water, sewage, and electricity, a common condition in informal settlements in the global south.

This presentation explores how women living in informal settlements (campamentos) in Chile experience and conceptualize disasters. Drawing from qualitative interviews conducted with residents of informal settlements in Copiapó (Atacama Region, north of Chile), this research examines the intersection of disaster risk with everyday hazards in contexts of socio-material fragility. The narrative of these women reveals an expanded understanding of disaster, not only as large-scale natural events like the 2015 Atacama floods but also as smaller, personal crises—such as struggles for basic services like water and electricity. For them, a disaster is defined by its inability to manage its effects, whether it be a natural hazard or an everyday hazard. The presentation critiques the institutional definitions of disaster risk in Chile taken by global north frameworks, which often prioritize large-scale natural hazards while neglecting the localized damage experiences. This gap results in the exclusion of informal settlement residents from public disaster mitigation efforts, leaving them reliant on informal networks of mutual support. Drawing on theories of the social construction of disaster risk (Gaillard, 2022; Lizarralde, 2021; Douglas, 1985), this presentation argues that disaster risk management must integrate local perceptions of risk and disaster to strengthen community capacities and agency. By examining women's lived experiences in 'campamentos', this research challenges conventional disaster risk frameworks and advocates for a more inclusive and capacity-building approach to disasters.

Social, Ecological, and Technological Transition Approach (SETT): Rethinking Extractive Landscapes and Alternative Futures in Latin America

To understand productive transformations, two main approaches have emerged. First, extractivist dynamics have been widely critiqued by Latin American political ecology due to their inability to achieve the desired social and economic development. Similarly, the incorporation of sustainable measures in industries is often met with skepticism due to the potential expansion of extractive frontiers. Second—closely linked to the first point—European ecological modernization theory, despite its capacity to describe institutional and economic transformations in developed societies, has been questioned when addressing the situation of dependent and peripheral countries.

Our proposal seeks to understand Latin American extractive landscapes not only as evidence of multiple modes of domination but also as assemblages that construct social realities. In this way, we propose a social, ecological, and technological approach that allows us to observe and analyze productive transformations in remote regions. Based on two ongoing research projects on the lithium industry in the Atacama Desert and the potential Green Hydrogen industry in Patagonia, we propose the **SETT (Social, Ecological, and Technological Transition)** approach as a way of understanding both habitability in extractive economies and the tensions surrounding alternative futures to extractivism in local territories.

This understanding highlights the “coordination” capacity that extractive dynamics achieve to ensure their persistence, while also emphasizing the assemblage of extractive infrastructures with social biographies in vast, non-urban landscapes.

This paper contributes to: i) developing non-binary discussions in contemporary Latin American environmental sociology, ii) linking the social, ecological, and technological dimensions in industrial landscapes criticized by the social sciences, and iii) bringing together disciplines such as sociology, ecology, and engineering from a transdisciplinary perspective.

Former Les Élus Locaux Aux Enjeux Climatiques

La question de la formation pour les élus restent lacunaire dans des disciplines telles que la sociologie et la science politique. L'objectif de cette session est de s'appuyer sur des exemples nationaux pour comparer les politiques / organisations de formation destinées aux élus locaux concernant les enjeux climatiques. Quels sont les organismes / formateurs ? Quels savoirs / pédagogies sont-elles transmises ? Autant de questions qui permettront de regarder comment les intérêts climatiques se posent aux élus en termes de développement de compétence ou de savoir à acquérir.

Evidence-Based Training Models for Preventing Sexual Violence and Promoting Consent

Sexual and dating violence is a major concern, with young people being one of the most vulnerable groups (Hazelwood, 2023; Development Services Group, 2022). Determining whether sexual consent occurred is key to defining

the nature of the relationship. Although many training programs on affective-sexual relationships and consent have aimed to address this issue, they often lack scientific evidence to support their social impact.

The CONSENTnet Network (RED2022-134866-T) has developed training materials and models based on scientific evidence about sexual consent, selected for their proven social impact. These infographics, co-created with researchers, participants, and the advisory committee, integrate evidence and examples tailored to different audiences, including testimonies from young people. The content is aimed at both youth and professionals such as victim support workers, legal operators, and law enforcement, among others.

Focusing on collecting social impact data, a survey has been designed to gather information on this aspect, and it is already receiving initial responses. It collects data on how the training can influence the prevention of assaults, conversations about consent, and the creation of safer environments. It also explores whether the training has facilitated dialogue, fostered debates, and promoted intervention in cases of abuse, as well as generating solidarity with victims and changing the way consent is approached in various contexts.

The integration of scientific evidence on social impact in the training materials can contribute to improving the identification of consent and preventing assaults.

Sociology of Place: The Case of Pamasawata in the Philippines

Pamasawata is an interesting case in understanding and applying the discourse on the sociology of place. The place of Pamasawata is situated at the margins. It is separated by a highway (Circumferential Road 3), secluded by a waterway (Maypajo River), bordered by different cities (Caloocan, Malabon and Navotas), and walled by factories and companies. This situation makes the place out of the way from the rest resembling a ghetto. In such an isolation, they are also neglected. The residents came from different parts of urban poor communities in the National Central Religion (NCR) and moved to that place for possible permanent residence. They have built their houses and formed their communities in the place. By convention, the place is called Pamasawata, but it comprises three communities: Dawata, Kumpol, and Pamasawata. The land area is under the name of the National Housing Authority (NHA). Although the people have submitted their proposal to the area, the NHA reserves its plan. The people know that the agency has planned to put up a mid-rise condo building, which they have outrightly rejected for their inability to pay the cost. Using Thomas Gieryn's metatheoretical premises, place involves location, materiality, and meaningfulness. Pamasawata is a unique spot since it provides people with a place of residence that has spared them from paying rent and fare. They build their houses from their wages and savings. They invest in the improvements of their place. Thus, the place is doubly constructed, physically as well as semantically. In Pamasawata, the people find the place as their home and develop their intimacy with the place.

Perception and Acceptability of Social Robots in Healthcare: Ethnographic Research Based on a Qualitative Case Study

Medical care is changing, driven both by necessity as well as innovation. The European healthcare sector's digital transformation involves the rapid adoption of advanced technologies such as AI, robotics, autonomous systems, and Big Data. The study “Perception and acceptability of social robots in healthcare: ethnographic research based on a qualitative case study” investigates interaction with and acceptability of social robots in a pilot project based in Maribor Hospital, as a part of the European HosmartAI project. These robots functioned largely to assist patients and as “administrative support” for the nurses and doctors. This study focuses on the interactions of healthcare personnel with robots, including any emotions or fears or barriers that arose. The goal was to understand robot acceptance and challenges from a human-centric and individual perspective, focussing on key stakeholders that both use and develop these robots. All stakeholders are part of HosmartAI Living Labs, which works through collaboration to design and deliver advanced technologies.

Paradoxical Empowerment: How Do Urban One-Child Generation Women Perceive and Navigate Fertility in Three-Child China?

Urban one-child generation middle-class women were believed to be empowered by the One-Child Policy (OCP). They received political prerogative, legal rightfulness, financial rewards, preferential school enrolment, more accessible healthcare and more job opportunities. Additionally, as only children, they reaped concentrated familial investment, leading to higher educational attainment, greater earning ability, improved social status, and stronger reciprocal intergenerational ties (Fong, 2002). However, female empowerment and gender inequalities are multi-dimensional phenomena with non-comparable elements that progress non-unidirectionally. This study explores how complex and contradictory structural and familial forces have shaped one-child generation women's contested empowerment with respect to their fertility.

Based on 90 semi-structured interviews with urban women born under the OCP, this study finds that their empowerment is characterised by temporal-geographical volatility, duality, and heterogeneity. First, the legal privileges of only daughters are contingent upon specific historical periods, subject to shifts in state priorities. What was once an advantage can easily become a disadvantage as the authoritarian state changes its scripts from anti-natalism to pro-natalism. As a result, the empowerment derived from their only-child status is precarious, leading to a contested sense of identity for these women.

Second, despite gains in education, career opportunities, property inheritance, and closer nuclear family ties, urban daughters remain trapped by reproductive expectations and exploitation. As only children, they face increasing matrilineal pressures, with the intimacy of caregiving becoming a means for parents to assert their expectations for grandchildren.

Last, the empowerment brought by the OCP was largely unintentional. Now, these women face a society that is far from gender-equal. Women with feminist beliefs are challenged by policies that reassert traditional domestic roles. Their embodied low-fertility culture contradicts the state's pro-natalist agenda, leading to an inherent ambivalence. In response, many choose to reject childbirth and resist reproducing a system that is unfavourable to women.

Emotional Labor in Intimate Relationships: A Gender Parallelism

Emotion is an experiential source for every individual, and since the 1970s, the sociology of emotions has allowed us to understand how emotion is a social product and construct, taking on a meaning shared by the entire social group. Even in the most intimate relationships, such as romantic ones, symbolically relevant emotions act as a glue throughout all stages of the couple's relationship. During the couple's journey, it is inevitable to encounter various circumstances that strongly impact the spouse's identity, and it is in these cases that emotional labor is employed to resolve potentially hazardous internal situations. Emotional labor manifests in the regulation and emotional resilience, as individuals conform to socially shared emotional patterns essential for couple life. The rules of feeling and the rules of expression influence social actors, as it is necessary to avoid social sanctions or the risk of becoming emotional deviants. The purpose of this study is to understand, based on a sample of 100 biographical interviews collected between April and May 2024, how socially shared emotions have taken on a fundamental role in intimate relationships. It will sociologically trace the role of emotional labor in the most salient phases of the relationship, how it has changed over time, and how the reference environment has influenced it. The stages to be analyzed include courtship, marriage, the arrival of children or drastic changes within the couple, up to the conclusion of the relationship through separation or the death of the spouse. Given the large volume of biographical material, the analysis is both quantitative and qualitative. The quantitative analysis includes: occurrence analysis, identification of keywords, and keyword in context analysis. To complement the quantitative content analysis, a qualitative coding of the text has been necessary to better understand the emerging categories.

The Other Emancipation: Decolonization of Knowledge and Academic Freedom in Latin America

The decolonization of knowledge in Latin America refers to the process of questioning and transforming the epistemological paradigms imposed by European colonization and which, to date, continue to influence the structures of knowledge, research, and education. Throughout history, educational systems in Latin America have reproduced Western models that not only ignore, but also devalue ancestral, local and popular knowledge. This project seeks to explore the "other emancipation," a concept that refers to academic and cultural liberation from colonial ways of thinking, focusing on how academic institutions in the region are navigating this process. The concept of academic freedom, in turn, is central, since it is in academia that knowledge and critical reflections are forged that can foster a broader process of decolonization.

Objectives

-To analyze how the decolonization of knowledge manifests itself in educational and academic institutions in Latin America.

-Investigate the relationship between academic freedom and the ability of institutions to promote non-Western knowledge.

-To evaluate the main challenges and resistances faced by the decolonization of knowledge in the Latin American context.

-To propose strategies to strengthen the process of decolonization of knowledge in higher education and in academic practices.

Academic knowledge in Latin America has historically been influenced by colonial frameworks that have marginalized local and non-European knowledge. Despite recent efforts to decolonize knowledge, there are tensions between institutions that promote academic freedom and those that perpetuate colonial epistemologies. This project will investigate how these tensions affect the emancipation of thought in the region and what strategies are underway or could be implemented to achieve a true decolonization of knowledge.

La Construcción Socio-Histórica Del «Carácter Femenino» En La Obra De Viola Klein: Una «Eterna» Violencia Simbólica

Viola Klein escribió en 1946 el libro *El carácter femenino: historia de una ideología*, fruto de su segunda tesis doctoral dirigida por Karl Mannheim. Klein investiga la existencia de un «eterno femenino» como carácter típicamente femenino, demostrando cómo lo femenino se ha construido socialmente en distintas épocas históricas para confinar a las mujeres en papeles y posiciones precisos (Piccne Stella, Saraceno 1991). La autora habla, en efecto, de marcos culturales específicos en los que se mueven las mujeres y que les atribuyen roles específicos como el de esposa, madre o hija, perpetuando una violencia simbólica «eterna» (Klein, Myrdal 1968). Aplicando por primera vez la Sociología del Conocimiento a la cuestión femenina, Klein propone una «investigación integrada» sobre el tema, que hasta entonces había sido explorado desde un punto de vista estrictamente biológico, considerando con múltiples perspectivas disciplinarias la evolución de los rasgos femeninos desde la revolución industrial hasta mediados del siglo XIX, periodo en el que la cuestión femenina adquiere relevancia científica.

El presente contributo, dando voz a una parte de la obra de Klein, pretende subrayar todos los fenómenos que han contribuido a la construcción del carácter femenino centrándose en dos ámbitos tratados por la autora: el histórico, para comprender como al cambiar de las épocas históricas cambian los estatus específicos atribuidos a las mujeres, y el sociológico, centrándose en algunos de los escritos de W.I. Thomas, sociólogo que por primero, y durante mucho tiempo, se ocupó de la cuestión femenina en el mismo ámbito científico (Cersosimo, 2020). Esta reflexión, a partir de Klein, asume importancia ya que los procesos históricos y sociales de construcción del carácter femenino han contribuido a una narración específica que todavía hoy es discriminatoria y está confinada en determinados marcos culturales que atizan la violencia de género (Marsh, Witz 2004).

CANTA, ALBA FRANCESCA* (Polytechnic of Turin, Italy)

Territoriality and Cooperation in Credit Cooperative Banks: A Case Study Among Young Members in Rome and Ravennate

In the 1940s arose the idea that economic development needed to be fostered in its multidimensionality, considering not only the economic but also the cultural, social and educational variables that spontaneously affect a person's well-being and promote development. These new developmental processes gave rise to considerable tools and organization based on a new cultural logic and values like solidarity, democratic participation, agency and cooperation. An example is the Credit Cooperative Banks (CCBs), whose social capital consists of the values mentioned. Among the various principles, one of the most important is territoriality, a tool, among other things, to concretize the principle of cooperation by strengthening the relations between members, territory and banks. With this aim, some Italian CCBs created a group of Young Members divided into Territorial praesidium. The present contribution aims to present some results of a research conducted in Italy in 2023 within the CCB of Rome with the Young Members Laboratory and the CCB of Ravennate with the Young Members Committee. Using qualitative methods of research - such as semi-structured interviews with the young members and brief observational participation - the goals were to investigate how the CCBs and the young members put into practice the principles of cooperation and territoriality if the young members interiorize the two principles and pose as a socially transformative resource for a specific context.

The results highlight the importance of the territorial principle for the banks and the young members, the essentiality of the role of the Territorial praesidium, and the deep interiorization of the young members of these principles. In this sense, young members assume the role of transformative resource for the territory and represent the bond between banks and specific contexts despite the multiple challenges.

Marketization Interwined with Cultural Transition: Explaining the Widening Gender Wage Gap in Post-Socialist Urban China

The pattern of exacerbating gender earnings inequality during the economic transition is shared by post-socialist countries in Eastern Europe, the former Soviet Union, and China. Among these, China has witnessed massive growth in individual earnings in urban areas since the 2000s, resulting in exceptionally high opportunity costs for female workers. The dominant explanation at macro level is the marketization theory, however, the operationalization of marketization from previous studies essentially only capture the dimension of privatization. This simplification is costly and it leaves significant logical gaps in the mechanisms that scholars usually refer to. This study aims to shed light on the issue by conceptually and empirically differentiate three dimensions of marketization that are equally relevant to the dynamics of the gender wage gap. Namely, the capital dimension (privatization), the labor dimension (the development of an integrated labor market), and the cultural dimension (the fall of doctrinal egalitarianism and the rise of the greedy work). Drawing on the Chinese General Social Survey (CGSS) 2005-2018, the Chinese Household Income Project (CHIP) 2003-2018, and the one-percent population mini-census of China in 2005, this study aims at teasing out different mechanisms clearly, which could better inform the policy.

CAPITANI, EUGENIO* (University of Modena and Reggio Emilia, Italy)

The Importance of Being "Official". the New Role of the Office As a Socio-Material Space in Digital Transitions

The digital transition and the forced digitalization of many workplaces and work environments have raised critical questions in sociological studies regarding the role of space in the tasks of each worker, particularly in the service sector and non-essential goods industries. The international debate has developed around the notion of the office and how it influences work relationships both in subjective-interpersonal and objective-performative terms (Tirabeni, 2024; Fullin, 2022). Moreover, the porous boundary between workspaces and private spaces (especially during the pandemic and lockdown phase) has highlighted how the absence of a concrete workplace can generate discomfort and disorientation, even at managerial levels (Albano, 2019; Wood, 2016). This contribution aims to reflect on the need to rethink work infrastructures based on a sociological analysis that addresses three potential levels of contemporary alienation (Rosa, 2016): technological acceleration that reduces spaces and resources for social interaction, digital automation that renders entire buildings obsolete and leads to their abandonment, and

the need to create shared coworking and flexible workspaces to revitalize neighborhoods otherwise destined for decay. Finally, this study seeks to show how rethinking urban spaces through qualitative research among remote workers can become a key strategy in countering the fragmentation of the social fabric and fostering more conscious and mediated innovation.

CAPPELLO, GIANNA* (University of Palermo, Department of Psychology, Educational Science and Human Movement (SPPEFF), Italy)

Digital Technology, Social Justice and the Commodification of Education

In the last decades schools (and schools' reforms) have been increasingly linked to a set of neoliberal ideas that are creating huge profit opportunities for edu-business, ultimately redefining the educational experience and what it means to teach and to learn today. Techno-giants (backed up by neo-liberal reforms) have contributed to redefining the very nature of schooling on a vast scale, using some of the same techniques that made them predominant in digital capitalism. They are influencing the subjects taught, the classroom tools used and fundamental approaches to learning. This entails a singular experiment in education, with millions of students, teachers and parents basically serving as beta testers (or unpaid "digital laborers") for their ideas and products. Profit opportunities for edu-business occur both at an infrastructural level in a shift from state to private provision (commodifying education), and at more cultural level with school's reforms and initiatives somehow related to digitalization and datafication (assessment, data analytics, big data and personalized learning, etc.). Unsurprisingly, the combined effect of corporate investments (especially during the Covid pandemic) and neoliberal processes of reform is the growth of a retail consumer base for hardware, software and online services curbing education policy towards ed-tech "solutions" which generate tons of big data and wholesale sales opportunities. Although we might debate whether these developments are inherently wrong (or especially new), more important questions need to be asked about regulation and oversight of corporate activities in schools. For example, how should public intervention oversight corporate activities in schools? Should techno-giants continue to offer their "free" services and tools to schools? How could we make them respond primarily to the ideals of public education rather than working to collect data on young Internet users and create demand for their products? Shouldn't we adopt non-corporate alternatives? How do teachers perceive these developments?

Media Education and Educational Commons for Youth Civic Engagement. a Case Study from the Horizon 2020 Project Smooth

This presentation reports the findings of a case study included in the Horizon 2020 project *SMOOTH: Educational commons for reversing inequalities*. The project's main objective was to introduce and study the emergent paradigm of the educational commons (Cappello, Siino, Fernandes, Arciniega-Caceres 2023; Cappello & Siino 2022, 2023) as an alternative system of values and actions for promoting intercultural and intergenerational dialogue and establishing spaces of democratic citizenship that support the development of local communities. Our case study adopts this paradigm with insights derived from the field of media education. Hence, our research questions were as follows: (a) How do young people collectively experience and build the notion of educational commons? (b) How do participants (youth and adults) experience peer governance and how do they handle and resolve conflicts? (c) How does the co-creation of a photo-blog as a shared space of work help young people discover and develop a "civic intentionality" in the (digital) public sphere? (d) What are the effects of applying a commons' logic to address inequalities and achieve social inclusion of young people from vulnerable social groups? Fieldwork, framed in an ethnographic and action-research approach, was developed by examining the three dimensions of the notion of educational commons (commoners, commoning practices, and community).

Study More, Grant More Benefits? the Intersection of Partnership and Educational Attainment in LGB Economic Outcomes

Despite achieving higher educational levels, LGB individuals often face significant earnings penalties. They are also less likely to have a partner, which is relevant as partnership status has been shown to moderate LGB people's earning outcomes. This study integrates literature on the LGB educational premium and earnings penalties to examine how sexual identity, education, partnership, and earnings interact, revealing a complex dynamic.

Using data from the UK Household Longitudinal Study (UKHLS), this study employs matching techniques with stratified samples and panel regression techniques. The analyses serve two main purposes: validating prior research on partnerships and earnings differences, and contributing to the literature by investigating how partnership moderates the relationship between education and earnings for LGB individuals.

The results show that LGB men are less likely to have a partner and transition to their first cohabiting partner, and they also face earnings penalties compared to heterosexual men, while findings for LGB women show mixed evidence. Further results reveal that the impact of sexual identity on earnings is not homogenous but varies by partnership and educational level. For instance, highly educated gay men do not experience significant earnings penalties, while a significant penalty is found among low-educated, non-partnered gay men. Similarly, having a partner is particularly beneficial for low-educated lesbian women, who tend to earn more than their heterosexual counterparts.

These findings illustrate the complex interplay between education, sexual orientation, partnership, and socioeconomic outcomes. While higher education protects LGB individuals from earnings penalties, it does not mitigate their lower likelihood of having a partner. Partnership, however, acts as a critical buffer against earnings penalties for low-educated LGB individuals.

These insights contribute to a more nuanced understanding of how educational advantages may be transmitted and how they may interact with partnership status and affect economic outcomes for LGB individuals.

D'ERRICO, LISA* (University of Naples Federico II, Italy)

Holistic Sex Education: A Tool for Preventing the Reproduction of a Machismo Culture

Comprehensive sex education not only promotes physical well-being, but also aims to ensure emotional, mental, and social well-being. The aim of the investigation is to demonstrate how the absence or lack of sex education (ES) programs has negative consequences not only on the personal development of individuals, but also on the entire community. In the initial exploratory analysis the European context was considered, from the results it was possible to divide the countries into three different blocks formed by countries representing three different ES models. This analysis revealed a fragmented situation with little attention to the needs of young people.

Next, attention was directed to the Italian context through an online survey to understand the impact the media has on access to information and taboos related to sexuality. The results showed that Italian schools are not perceived as an adequate source of information on these issues unlike the Web. In order to understand what is happening in Italian school contexts, semi-structured interviews were conducted with teachers in Naples's elementary, middle and high school institutions, with the aim of obtaining information on their opinions about ES.

The results of the interviews showed great inhomogeneity in terms of geographic distribution, sponsoring entities and goals of sex education programs. Most of the initiatives focus on STI prevention, neglecting the importance of a holistic approach to ES, which could also bring tangible benefits at the societal level, such as achieving greater gender equality and reducing homotrans-phobic discrimination. In addition, holistic ES develops young people's ability to relate in respect of themselves and others.

In conclusion, ES emerges as a crucial tool for preventing and countering the spread of a masculinist culture while fostering the creation of a more inclusive society.

FLAGIELLO, GIULIANO* (University of Naples "Federico II", Italy)

Surfing the Sexting: Between the New Sexual Practices and the Reproduction of Stereotypes for Young People Ang Lgbtqi+ Community

Sexting is a new form of relationship among young people. This practice reflects old patterns of sexual interaction but it appears in new environments: similar to casual sex with strangers (anonymous or physically distant partners), it is practiced by exchanging sexually explicit messages and images, but via digital devices. Although sexting can provide a space for sexual exploration and expression, it also carries significant risks, such as the reproduction of gender inequalities even in the online dimension. Indeed, gender dynamics, sexual orientation, and age deeply influence how young people experience sexting. Women and the LGBTQ+ community face a greater risk of stigmatization because of the higher moral responsibility that comes with double standards and the phenomena of homotransphobia.

These conditions are the starting point for a study created with the intention of exploring the practise of sexting, seen as both a contemporary sexual practice and a possible vehicle for perpetuating power inequalities related to gender and sexual orientation.

Using a mixed methods approach, the research first carries out an online survey with a focus on young people's experiences with sexting. At the same time, a netnographic analysis of major LGBTQ+ and non-LGBTQ dating apps was conducted to observe interactions between subjects and how these connections change across different apps and social groups. The aim is to observe how online flirting practices are constituted and how they change in relation to users' profiles.

Through the analysis of the intersection of gender, sexual orientation, and online interactions, the research aims to delineate the ideal type of sexting user. The results provide views into how sexting is not only an individual practice but it is also a social phenomenon and how digital platforms can reinforce traditional gender roles and inequalities.

Resource Nationalism, Just Transitions, and Evolving Labor Regimes in Indonesia's Nickel Nexus

Activists from the Global South have reframed discussions about climate change from one of green/just transitions to one of climate justice. This reframing foregrounds issues such as carbon debt and "green sacrifice zones" in the Global South, where many critical minerals are located. At the same time, some governments in the Global South—including Indonesia—have sought to harness their mineral wealth to foster economic development through resource nationalist policies. In Indonesia, nickel has been the linchpin of this effort. Yet the nickel boom, while creating tens of thousands of jobs in newly developed industrial estates and billions of dollars in increased exports, has also been fueled by massive amounts of coal-fired power and Chinese FDI. Intensifying jockeying for power between the U.S. and China and Indonesia's "dirty" nickel problem, also threaten to jeopardize its access to American and European markets for its nickel-based green technologies. The massive expansion of mining and the development of massive new industrial zones in remote areas have not only resulted in dispossession and environmental devastation, but they have also created new forms of labor exploitation. This paper documents the labor regimes that have emerged in the new nickel-based industrial zones, transnational spaces cut off from broader labor protections in Indonesia that rely heavily on imported labor from both China and other parts of Indonesia. It also analyzes how Indonesian union are navigating this new terrain.

Migrant Domestic Workers during the Pandemic – Challenging Media Narratives of Deprivation By Recognising Women's Agency

COVID-19 highlighted, reproduced, and exacerbated various forms of inequality. Compared to other groups, migrant domestic workers (MDWs) were especially hard-hit. In Switzerland, as in other European countries, such women occupy the lowest rungs of the social ladder in terms of class, gender, and race. The COVID-19 pandemic severely impacted the livelihoods of migrant domestic workers, many of whom were undocumented and informally employed. And yet, this work is essential to the functioning of society insofar as it compensates for a lack of public services for the care of young children, the elderly, and the sick. In Switzerland, media portrayals of these women as destitute victims exposed them to social risks. This article challenges such representations by adopting a decentered perspective and emphasising the varied experiences and social position of these women. Our analysis contributes to a more comprehensive understanding of the multifaceted dimensions of vulnerability in the context of migration and agency as two interrelated and mutually constituted phenomena.

Based on 49 interviews with MDWs in four Swiss cantons, we discuss how intersecting structural vulnerabilities associated with legal status and employment conditions shaped the exercise of critical agency. In this way, MDWs were able to cope with hardship and manage risk while constructing their subjectivities in alignment with or opposition to prevailing discourses.

Navigating Liminality, Filial Duty, and Agency: Syrian Refugees in Switzerland Caring for Parents amid Protracted Humanitarian Crises

This paper examines the experiences of Syrian refugees in Switzerland, with a particular emphasis on the nexus of liminality, filial duty, and agency within the context of protracted humanitarian crises. By extending the concept of liminality transnationally, the study highlights the multiple, overlapping states of "in-betweenness" that Syrian refugees navigate and how this shapes their cultural obligation to care for parents left behind, as revealed through narrative interviews. The preliminary findings indicate that liminality is a multidimensional condition that exerts a significant influence on migrants' roles and responsibilities within the context of transnational family dynamics, particularly in the context of protracted humanitarian crises. This research underscores the need for migration policies to consider the complex realities of transnational caregiving and contributes to a broader understanding of forced migration within crisis contexts.

CARBAJO PADILLA, DIEGO* (University of the Basque Country, Spain)

Global Grammars of Enterprise Located. a Review of the Spanish Critical Literature Around the Entrepreneurship Policies and Its Subjectivation Processes.

The paper presents and revisits the analytical concept of global grammars of enterprise developed in recent years together with Prof. Peter Kelly to test it in the Spanish context. This concept has enabled us to identify, examine and analyse the shifting, unstable, but always strategic power relations between the governmental discourses on entrepreneurship and the enterprising behaviour and dispositions of persons and groups, and the particular «declensions» and local «translations» of the ideas of entrepreneurship that supranational organisations and (mostly) young people perform within a process of globalised precarisation. Specifically, we seek to contrast the concept of global grammars of entrepreneurship with the critical literature published in the last decade in Spain on the discourses of entrepreneurship, its effects and its processes of subjectivation. The aim is to update the profile of the type of subjectivities that emerge at the crossroads between the processes of precarisation and the governmental programs for the production of entrepreneurs in a context marked by the various crises that the contested notion Anthropocene points out to.

RC34-558.2

CARBAJO PADILLA, DIEGO* (University of the Basque Country, Spain)

Unusual Travel Companions for the Anthropocene. Contemporary Enactments of the Iberian Donkeys.

Drawing on Actor Network Theory, multi-species ethnography and posthuman approaches, the paper presents some results of an on-going, slow and self-funded research on some contemporary uses, meanings and enactments of various donkey breeds of the Iberian Peninsula. For doing so, firstly, the presentation addresses some debates around the inclusion of animals as study objects in the research agenda of sociology. Then, making recourse to the posthuman theory, it briefly addresses a number of key debates around the notion of the Anthropocene. Thirdly it puts in context and describes some of the techno-cultural processes in which the donkey is currently getting involved and through which it is challenging many conventional narratives, stereotypes and binaries of western thinking (as well as the sociological one). It is in this stage where children, young people and activists emerge as elements of entanglements that have been studied in this research through qualitative methods. To conclude with, the array of study cases, examples and articulations with posthuman approaches will lead to open up fields of inquiry and pose alternatives to the ways in which the diverse crisis that the Anthropocene gathers are being framed. In other words, the paper will defend that the donkeys, as an unusual companions in the multiple crisis we are involved in, are beings that we can *think-together with* for developing a less anthropocentric (and harmful) social theory.

Subjective Wellbeing and Public Policy

There is a widespread idea that happiness is something to be achieved individually, a personal choice, outside of public policy. This is the traditional view, but it is changing and changing fast. Studies in the fields of economics, psychology and public opinion have shown that, although happiness is subjective, it can be measured and related to personal characteristics and societal trends. Through the World Values Surveys we can learn how subjective well-being has evolved and analyze the factors that correlate with happiness. In the past, success was measured primarily by economic growth - GDP - alone. But the data show that there are other, more important factors to consider. Happiness differs from country to country and over time, due to reasons that are identifiable and in many cases can be influenced by public policies, such as healthcare, education, family relationships or freedom of expression. This paper focuses on mapping global happiness, identifying the factors that correlate with it, and showing how public policies can help create the environment and conditions for happier citizens.

This paper will deal with the Happiness of Nations, with a special focus on Latin America. Some of the main questions guiding our analysis are: What is happiness? Why do some individuals claim to be happier than others? What factors determine happiness? Are there happier countries and cultures? How does Latin America compare with others? Are income or consumption the

main variables to achieve this state? What impact did the pandemic have on people's physical and psychological health? What can we do from the personal and, above all, from public policies to bring well-being to societies? How to do it if we want to respect people's individuality and freedom?

The presentation show their importance for public policies, with special emphasis on Latin America and Latin culture.

Is Surgery for Men and Pediatrics for Women? Gender Segregation, Agency and Structure in Italian Medical Schools

Despite the increasing feminization of the medical profession, gender segregation remains deeply embedded within medical specializations. Certain fields are still considered more suitable for women, particularly those associated with care, while others maintain a male-dominated status. This horizontal segregation shapes the career paths of male and female doctors, reinforcing traditional gender roles and expectations. The proposed paper focuses on the Italian context to investigate the educational and professional processes that contribute to this division.

Building on existing literature, the study highlights how medical specializations continue to be gendered, with women disproportionately drawn towards specialties associated with care work (such as pediatrics or obstetrics and gynecology), while men dominate more technical or prestigious fields (such as surgery or cardiology). This gendered orientation also manifests within specialties, where certain activities or sub-specialties are perceived as more appropriate for women, reinforcing stereotypes around emotional labor and caregiving.

The research draws on a mixed-methods approach, combining survey data from final-year medical students with 40 in-depth interviews conducted with male and female medical residents in traditionally male- and female-dominated specialties. The survey explores students' expectations regarding their future careers, shedding light on the early formation of gendered preferences and aspirations. The interviews with residents provide a deeper understanding of the socialization processes within medical residency programs, revealing how informal norms, mentorship, and professional expectations contribute to shaping career choices along gendered lines. Empirical research shows that medical training not only reflects but also reproduces gender inequalities, with implications for both the professional identities of healthcare workers and the broader structure of the medical field.

Training, Expectations, and Opportunities in Italian Medical Schools: A Gender Perspective

The evolving landscape of healthcare sector in Italy – characterized by chronic critical issues and exacerbated by the impact of the pandemic crisis – presents significant challenges for current and future physicians, particularly regarding professional orientation, work-life balance, and the intersection of public and private employment. This study explores the experiences, expectations, and concerns of medical residents from different specializations, with a specific focus on the gendered dimensions of their training and career paths. Combining survey data from hundreds of final-year medical students with 40 in-depth interviews with male and female residents, the research addresses two main areas.

First, it investigates residents' orientations towards the medical profession and their aspirations and uncertainties for future employment. Particular attention is given to their concerns about reconciling professional and

personal life, and how these concerns are reflected in their choices of specialty, where gender plays a key role, with traditionally male-dominated specialties facing different expectations and pressures compared to those with a higher female representation.

Second, the study examines the forms of professional socialization within medical residency programs, shedding light on the implicit and explicit norms residents are exposed to. It explores how these socialization processes, often differentiated by gender, contribute to shaping their professional identities and influence their career trajectories. By analyzing how gender dynamics manifest in specialties that are either male- or female-dominated, the study highlights the complex interactions between training, gender expectations, future career choices, and the well-being of healthcare workers.

Scientific Knowledge and Evidence in Planning of Government Regulatory Action

Regulatory planning, in contexts of uncertainty and risk, requires information and knowledge, today more than ever. Evidence is an enormously valuable resource for the formulation of legal norms and decision making in the Anthropocene. To explore capacities and channels of knowledge transfer and scientific-technical advice for planning and regulatory design is an unpostponable and growing demand. The subject matter is directly linked and cannot be separated from the socio-legal perspective. The use of evidence for making regulations establishes links between legal norms and reality. And this would allow in same way to make evaluation of results and analysis of regulatory action effectiveness.

Elitism and Marxism: Theoretical Intersections between the Italian School and Gramscian Analysis

This paper aims to analyze the points of contact and divergences between the classical elitist authors of the "Italian School"—Gaetano Mosca, Vilfredo Pareto, and Roberto Michels—and the concepts developed by Antonio Gramsci in his Prison Notebooks. In analyzing power dynamics, its exercise, and its distribution within society, elitist theory posits the existence of a relatively homogeneous and cohesive "power minority" that dominates over a disorganized majority (Mosca 1923) (Pareto 1916). Despite a fundamental conceptual divide between elitism and Marxism in their interpretations of social systems, both perspectives share a common view of an unequal society where a small minority holds state control, representing the most evident point of contact between the two. According to elitist theory, the assertion of a dominant, organized minority as a constant trait of human societies seems to challenge the core principles of democracy. It is essential to note that democratic ideals—such as the popular will and majority rule—are seen more as symbolic assumptions than as tangible realities in the functioning of human institutions. This is due to the democratic myth of mass participation serves merely as a selection mechanism for elites in a perpetually dominant oligarchy (Michels 1966). Gramsci, operating in a society undergoing massification and transition, offers a new interpretation of the role of the party, intellectuals, culture, and the state, viewing them as crucial elements for political struggle and revolution. In this context, Gramsci's rethinking of the democratic structure of society lays the groundwork for a re-examination of Marxian dialectics (Lenin 1970), not only in relation to class struggle but also in recognizing the increased importance of the superstructure over the economic base. This shift gives prominence to the concept of political and cultural hegemony and the role of the organic intellectual in transforming society (Gramsci 1975).

CARDIEL, JORGE* (National Autonomous University of Mexico, Mexico)

Critical Geopolitics, Framing and Second-Order Observation

The field of geopolitical descriptions operates on at least three distinct levels: "practical state reasonings," "popular geopolitics," and "formal or academic geopolitics" (Dodds, 2019). Geopolitics can also be categorized as either "traditional" or "critical" (Dodds, 2005). Traditional geopolitics encompasses categories such as national sovereignty, statecraft, fixed borders, deterrence, cold war, and cartographies. Critical geopolitics includes interdependent networks, deterritorialization, polycrisis, disruptions, cyberspace, hybrid warfare, information systems, de-risking, friendshoring, soft power, and structural power, among many others.

Frame analysis (Goffman, 1974), as a pivotal sociological concept and methodology, is particularly effective for advancing critical geopolitics. It utilizes dialectical reasoning, reflexivity, and second-order observation to reinterpret social geopolitical narratives. The framing of international and global issues directly influences decision-making, potential solutions, and recognized responsibilities. Geopolitical descriptions shape the state of the world, continually oscillating between first-order and second-order observations. This is especially true for the mass media (Luhmann, 2000), which presents framed information that aligns with specific forms of practical state reasonings and popular representations.

Currently, we are witnessing a shift from the Cold War era's "mutual assured destruction" to a contemporary context of "mutual assured disruptions" and "mutual assured dependence" (Wade, 2023). This paper reflects on the second-order observation of framing strategies in mass media and explores how this analysis can contribute to understanding a world characterized by mutual dependence and potential mutual disruption.

CARDIEL, JORGE* (National Autonomous University of Mexico, Mexico)

Large Language Models and Social Reproduction

The widespread use of Large Language Models (LLMs) is already reshaping societal semantics and practices. Their increasing application across various domains of social life raises concerns about their role in perpetuating existing dynamics such as bias and exclusion. I argue that the way LLMs function—by predicting the probability of language signs—effectively enhances normative reasoning. Research indicates that their deployment exacerbates existing inequalities due to the underrepresentation of languages, values, and norms of certain social groups. These issues particularly affect societies excluded from the data used to train the models, and current bias mitigation strategies are insufficient (Baguma et al., 2024; Yogarajan et al., 2023).

The study of LLMs is a promising new domain for understanding the relationship between social structures and semantics (Luhmann, 1980). As sociologists and sociocyberneticians aiming to comprehend the organizing processes of social order, including feedback loops that reinforce existing representations, we must ask: How do we build uses on top of LLMs? Are biases in discourse truly a bug, or are they a feature? To what extent do they reflect our current societies' normative reasonings and expectations, or can they reflect what we are not, i.e., what we desire to become?

Process the Struggle: Research Reflections on the Epistemological Framing of Intersectionality Against Climate Apartheid

In times of climate apartheid (Sultana, 2023; Táiwò, 2020), wherein already marginalised populations and territories become Most Affected People and Areas (MAPAs) by the climate crisis, and elites keep benefiting from recovery and adaptation actions, the work of tackling interrelated systems of oppression such as racism, patriarchy, coloniality, is one of the keys to climate justice. On my PhD research, I am currently exploring the potential uses of *intersectionality* as a theoretical, methodological, epistemological and ethical approach.

My research is carried out with activist collectives organised and communities connected around positionalities/differences, like youth groups and Quilombola communities, in Brasil and South Africa. With them, we held workshops on the intersecting positionalities of the participants (race, gender, class, age, etc.), questioning how they relate to inequalities that affect them and their territories.

As critical social scholars doing intersectional research, we need to acknowledge the activist history of this approach, and work against academic appropriation. In my research, I try to do that by creating workshops in which the *content* and the *format* are malleable to change during the event. Moreover, we need to acknowledge and make visible the complex interconnections among the webs of power we are dealing with in our research fields if we want to tackle them. A important part of that process is to acknowledge the non-neutral assumptions we have and the powers we embody as academics, especially when researching with subaltern contingents. For this, it helps to think of epistemology as yet another power system that needs to be looked at, analysed and thoughtfully criticised throughout our research process. I hope to present some of my research reflections thus far on this direction at this session.

CARLOS LIMA, JACOB* (Federal University of São Carlos, Brazil)

Precarious Labour and the Rise of Entrepreneurial Culture in Brazil

The purpose of this paper is to analyse the changes in the culture of work in Brazil since the economic and political changes of the 1990s, with economic restructuring and the progressive flexibilisation of labour relations. This process was accompanied by strong ideological investment from the state, business organisations and the media. Added to this was the growing advance of evangelical churches and their theology of prosperity. A series of labour reforms in the period resulted in a precarious flexibilisation of labour relations with a loss of social rights, and the emergence of digital technologies and platformised jobs. The entrepreneurial ideology is internalised by workers, who increasingly take on the culture of individualism, meritocracy, do-it-yourself and the refusal of the state to mediate capital-labour relations. We are witnessing the weakening of social movements and their replacement by Social Organisations, many of them of corporate origin, which operate in the peripheral areas of the big cities, spreading the entrepreneurial ideology that takes on various guises: social entrepreneurship, favela entrepreneurship, women's entrepreneurship, Afro-entrepreneurship and others.

The research is being carried out with business organisations, observing the activities of these organisations and with groups of informal formal workers and platforms over the last five years.

The preliminary conclusion is that the neoliberal changes have caused significant cultural changes in which the entrepreneurial ideology has been internalised as a new work culture. This new culture is marked by a rationality in which criticism and rejection of wage-earning is accompanied by political and behavioural conservatism and the advance of the extreme right in the country. The political left has also incorporated the entrepreneurial discourse, naturalising this framework among workers and the poor and peripheral population.

Studying Sociology in Brazil: The Eternal Challenges

This paper revisits a debate that has accompanied sociology since its inception: the specificity of the discipline, which manifests itself not only in its subject matter, but also in its training. Our question is to see to what extent this traditional training has kept up with the challenges posed by social transformations since the 1990s. Our hypothesis is that, during this period, little or nothing was changed in the curricular matrix of undergraduate training, with disciplinary specialisations remaining in postgraduate studies. The social sciences course trains a generalist professional who ends up opting for the areas of sociology, anthropology or political science, or as is the case in the majority, leaves the area. We believe that the social sciences, and sociology as far as we are concerned here, require permanent reinvention in order to keep up with social changes, and this is mainly reflected in the training of its professionals.

A Process of Socio-Spatial Segregation and Institutional Racism: The Case of the Picoto Neighborhood in Braga, Portugal

The main objective of this article is delve into reasons for the institutional and everyday discrimination and racism towards de Roma inhabitants of Picoto in Braga. This is a neighbourhood artificially created by City Council in the 1980 but with bad infrastructures and housing conditions and exclusively inhabited by Roma people in a (peri)urban space, which, despite being located close to the city, is still segregated, degraded and abandoned.

The core research question is to understand and explain both for the existence of institutional racism and failure of public housing policy and the lack collective action on the part of the Picoto Roma community, as an ethnic minority. Next, we briefly explain the main theoretical models, that aim to explain institutional and everyday racism, blatant and subtle racism from surrounding society.

Data were obtained through a variety of methods: documentary, particularly a official report of *BragaHabit*, a questionnaire survey, semi-structured interviews and other informations collected during fieldwork through participant observation in 2018. We undertake a brief analysis of the objective living conditions of Roma ethnic minority (schooling, work, source of income) and social representations of Roma people towards the authorities and non Roma people. Lastly, we describe the constraints and strategies behind the poor responses provided and/or even the absence of collective action, and the individual or family-based strategies in a social-political context that may, on the one hand, include racial and ethnic segregation and exclusion or, on the other, patronising or crony complacency, with, at best, a hint of what Scott (1990) has called semi-hidden transcripts and/or latent, infra-political conflicts in the family and community spheres.

CARLSSON KANYAMA, MARIAM* (Chalmers University of Technology, Sweden)

WIDENGÅRD, MARIE (Gothenburg University, Sweden)

Beyond Human Access: Exploring More-Than-Human Rights to Oceanic Connectivity

The ocean is not just an isolated ecological concern; it is intricately linked to other water bodies, with this connectivity becoming a central focus of scientific research, technological innovation, and legal regulation. It is not only a matter of how "our" access to the ocean is technologically and scientifically mediated but also about more-than-human access. This article adopts a more-than-human perspective, interrogating how human interests, technologies, and advancements in science and law might mediate or constrain the access and rights of non-human entities to the ocean. Through the cases of Vättern in Sweden and the Mar Menor in Spain, the article explores the right of connectivity and flow, and contributes to broader debates on society's evolving conception of the ocean as a shared resource. It explores the shifting understanding of shared rights between human and non-human actors, underscoring how justice for non-human entities expands the discourse of Knowing Justice in the Anthropocene. By challenging existing paradigms that prioritise human agency, the article foregrounds the rights and needs of non-human actors, advocating for a more inclusive legal and scientific approach that recognises the interdependence between human and non-human entities in accessing and preserving oceanic ecosystems. By examining the cases of Vättern and the Mar Menor, the article argues that these water bodies and their ecosystems serve as critical examples of how legal frameworks and scientific discourses have both restricted and enabled more-than-human access to marine environments.

CARO MOLINA, PAMELA* (Universidad Santo Tomás, Chile)

Neoliberal Ethos and Crop Colonization in Globalized Intensive Fruit Growing in Chile: Hyperprecarious Work in Rural Women Seasonal Workers

The problem addressed by the presentation is the relationship between the transformations derived from the global economic and productive restructuring and colonization of "star" crops such as cherries for export in rural territories, motivated by the exponential growth of a demanding consumer market (Chinese New Year celebration), as part of an *ethos*

neoliberal, and the material and emotional conditions of the work(s), observed over time, of Chilean rural seasonal workers (currently including Latin-American migrants), using feminist gender and intersectional theory and the theoretical approach of mobilities. The research that is the basis of the presentation seeks to understand the social, cultural, political, demographic and labor implications of the colonization of crops in rural territories that offer employment under constraint and modeling of time, which are forged in the biographical trajectories of the work of seasonal women in orchards and *packing*, through the knowledge of their representations, practices and genealogies of the intergenerational transfer of the trade, the exercise of salaried work, the arrangements with reproductive work and displacements that occur in their purpose. The main hypothesis is that the circuit of external demand and intensive production of cherry agribusiness, which colonizes territories by monocultures, has effects not only on nature, but also on the hyper-precariousness of work, since by concentrating the use of land and labor supply under constraints, modeling the organization of time and space of the feminized working population, tends to reproduce, from the perspective of structural gender violence, a ductile workforce, ignored and undervalued, and with poor mobility, which, in the case of women, would paradoxically be accompanied by changes in traditional gender identities when they emerge from private confinement and access a salary. The research uses a qualitative paradigm, whose information collection techniques are genealogical questionnaires, in-depth biographical interviews and ethnographic observation.

CAROLINA TREVISAN, ANA* (New University of Lisbon (Universidade Nova de Lisboa NOVA/FCSH), Portugal)

Argumentative Analysis of Visual and Audiovisual Content in Right-Wing Populist Digital Communication in Brazil and Portugal

This study analyzes how right-wing populist movements in Brazil and Portugal use social media to disseminate visual and audiovisual content aimed at triggering reactions from audiences and digital activists. These social media publications, featuring elaborate audiovisual content, go beyond mere propaganda—they mobilize and prepare audiences for action, as seen in the violent attacks on Brazil's Congress, Supreme Court, and Planalto Palace on January 8, 2023, mirroring the storming of the U.S. Capitol two years earlier. In Portugal, the rise of xenophobia, with a far-right party vocally opposing immigration since 2019, reflects a similar trend.

Focusing on argumentative analysis, this research provides a sociological perspective on how these communicative processes are embedded in conflictual power dynamics, shaping collective imaginaries and reinforcing material inequalities. Using the frameworks of Walton and Macagno, the study combines qualitative analysis with quantitative data on user interpretations. It examines how abstract, ambiguous images and audiovisual content are deployed to activate emotional and cognitive triggers, resonating with issues like precarity, anti-elite resentment, nationalism, racism, and gender chauvinism.

By analyzing audience responses in comment sections, the study highlights how right-wing populist leaders use multimodal communication strategies to shape public discourse, manipulate class grievances, and maintain economic hegemonies. The research underscores the importance of examining not only populist rhetoric, but also the communicative strategies that work within broader power relations to divide, polarize, and mobilize.

The study contributes to the broader analysis of right-wing populism, focusing on how these movements use social media to trigger emotions, control interpretations, and reinforce polarized collective imaginaries with significant sociopolitical consequences.

Exploring a Sociology Approach to Mitigate Youth Unemployment and Improve Youth Entrepreneur Development

The global population explosion in developing countries poses serious challenges in terms of high unemployment rate as the absorption of the youth into labour markets. A new vision must be developed to ensure the youth are properly prepared for the future

The inclusion of youth unemployment as part of a Sustainable Development Goal reflects the seriousness of global youth unemployment. Entrepreneurship can mitigate unemployment and enhance social and economic justice. Current approaches often ignore social and client context, a potential reason for the high failure rate of entrepreneurs. This omission accentuates the necessity to

explore social context and world views of entrepreneurs and the importance of development professionals having knowledge of socio-economic and political influences and structures that can limit entrepreneur development.

The link between personal biographies, history and social context of entrepreneurs must be understood. Sociology helps deepen our understanding how personal challenges are linked to broader societal challenges. The focus of Sociology on the cultural, political and socio-economic landscape makes it ideally positioned to influence and contribute to finding solutions in developing and under-developed countries with its various social issues.

This study will explore how various sociology professionals can identify entrepreneur challenges, inform development approaches and guide potential solutions and interventions. It is important that the inclusion of Sociology in the training of entrepreneur development professionals considered.

RC45-711.1

CARPENTRAS, DINO* (ETH Zurich, Switzerland)

Mass Validation of Opinion Dynamics Models

Many social issues, such as vaccination and climate change, depend on people's opinions. For this reason, it would be extremely valuable to have models that allow to simulate how a certain population would respond to a specific communication campaign, as this would allow to assess risk and design effective strategies. While the field of opinion dynamics produces models that may seem able to achieve this, most of these models have never been tested against real world data. Even models that claim to be more "realistic" often have been only fitted (i.e. calibrated) on data or tested (i.e. validated) against a single time point.

To test the potential opinion dynamics models, in this study we tested multiple models against multiple time waves and datasets. Specifically, in phase (1) we selected 4 "toy" models and other 2 "realistic" models. Then, we use each one to produce some simulated dynamical data, and then we use these data to train and test each model. This validation step allows us to say that, if we were in posses of data that exactly reproduces the model dynamics, the process of training and test would be successful. In phase (2) we repeat the previous step, but adding some noise, so that the simulated dynamical data does not reproduce perfectly the model dynamics. In this case, the process of train and test still shows the ability of partially reproducing the model dynamics, even if with much lower explained variance. Finally, in phase (3) we move from simulated to real world data. Indeed, we use the European Social Survey (ESS) containing opinion data for European countries nospanning over 2 decades. This allows us to test how much of the variance in the real-world data can be actually explained by each of these models.

MOKHTARI, NAIMA (Université d'Artois, France)

The Analysis of Workplace Conflicts to Question the Well-Being of Professionals in the Healthcare and Social Care Sector in France

Many scientific disciplines have long since seized the term "well-being", associating it with other related notions such as happiness, quality of life, or satisfaction. Its use by sociologists is much more recent, with questions of legitimacy, definition, and methodology arising acutely, as the established boundaries of well-being are linked to the individual, their subjectivity, and their health - physical, mental, and social - according to the definition given by the WHO (World Health Organization) in 1948. This research falls within a completely different perspective: to articulate subjectivity and objectivity, reposition the individual within their interactions and contexts of action, and move away from the medical perspective to align with a sociological perspective, consistent with the mentioned choices.

This study examines well-being through the lens of workplace conflicts. By adopting an interactionist and phenomenological perspective, we aim to understand the subjective dimension of professional experiences. Contextualizing this experience will facilitate its objectification by collecting data on the work environment and employment conditions. The understanding of the conflict dynamics at play and the underlying issues will help identify the factors detrimental to workplace well-being. The analysis of the absence of conflictual experience and the various associated factors will, conversely, bring to light the contours of workplace well-being. The survey was conducted in 2023 on a representative sample of professionals working in the healthcare and social care sectors. The results are based on the analysis of 728 questionnaires collected in northern France.

CARREIRA DA SILVA, FILIPE* (University of Cambridge, Portugal)

Decolonial Modernities: Navigating Climate Change, AI, and Global Challenges

In an era of increasing social complexity, decolonial theory has become central to understanding the plurality of modernities and shifting global structures of power, identity and knowledge. This paper revisits the concept of 'plural modernity' by addressing contemporary global challenges, such as climate change and the rise of artificial intelligence (AI), which highlight the limitations of traditional nation-state and Eurocentric narratives.

Both climate change and AI bring to the fore issues of inequality and marginalisation that disproportionately affect post-colonial societies. These challenges expose the limitations of dominant theories of modernisation and call for new frameworks that prioritise intersectionality, transdisciplinarity and ecological sustainability. By integrating decolonial perspectives with a focus on environmental justice and the ethical implications of AI, this paper argues for the need to rethink modernity as a plural, dialogical process. This approach allows for the inclusion of indigenous and marginalised voices in the global dialogue on science, policy and technology.

In a world facing unprecedented ecological and technological change, the need for new forms of global governance, knowledge production and democratic participation is urgent. This paper contributes to an emerging body of scholarship that sees decolonial thought not as a peripheral critique, but as central to reimagining our shared global future in the face of these crises.

CARREIRA DA SILVA, FILIPE* (University of Cambridge, Portugal)

The Sensory Foundations of Amílcar Cabral's Anti-Colonial Thought: Resistance, Belonging, and the Colonial Experience

This paper explores the centrality of sensory experience in Amílcar Cabral's anti-colonial thought, with a particular focus on how the sights, sounds and textures of his homeland shaped his resistance to Portuguese colonial rule in Cape Verde and Guinea-Bissau. By examining Cabral's connection to the land and his critical assimilation of colonial culture, the paper illuminates the complex interplay between the colonial imposition of sensory regimes and the embodied responses of the colonised. Through an analysis of Cabral's writings and correspondence, we examine how his sensory experiences formed the basis of his sense of belonging and resistance, making his anti-colonial movement not only a political endeavour but also a sensory revolution. This study contributes to the historical sociology of anti-colonialism by highlighting the importance of sensory and phenomenological approaches to understanding the lived experience of colonialism and the dynamics of resistance.

Beyond Fossil Capitalism and Ecological Imperialism

The contemporary poly-crisis has been shaped historically by fossil capitalism as it has globalized via ecological imperialism. In the global North, alternatives to the hegemonic regime have gravitated around Green New Deals and Degrowth. A third alternative, emanating from Indigenous lifeways in the global South, is Buen Vivir - 'living well' - which presents a deep critique of imperialism and extractivist capitalism. This paper contends that these movement-driven initiatives need to be braided into a wider transformative project that addresses the relations that reproduce capitalism as a way of life. Eco-socialism provides such a synthesis. It offers a just, viable economic alternative to capitalism, capable of addressing the climate emergency. It

provides an alternative hegemonic project capable of unifying a post-capitalist historical bloc. It challenges the geopolitical economy of ecological imperialism and opens toward a world order organized for cooperation, solidarity and peace. These gains stem from three important analytical elements in eco-socialist thought. First, a comprehension of the dialectical relation between *forces and relations of production* as central to socio-ecological transformation. Second, an emphasis on the imperative to replace the anarchy of the market, capital's governing mechanism, with *democratic planning*. Third, identification of the social forces that can be brought together in a movement of movements to form an *historical bloc* capable of leading the transformation. Our current trajectory is perilous, but there is still time to correct course.

CARTER, ADAM* (The University of Sheffield, United Kingdom)

Beyond Laughter: Attending to the Relational, Temporal and Structural Contexts of Everyday Family Humour Practices in the UK

Humour plays a multifaceted role in UK family life, particularly during challenging times. While it can be a valuable intersubjective tool for coping, this paper suggests that humour's use and effectiveness is deeply entangled with relational, temporal, and structural factors. Drawing on theories of ambivalence in family and humour studies, alongside conceptualisations of affective practices and affective atmospheres, this paper explores how families deal with tensions and foster laughter through everyday struggles. The paper presents three case studies drawn from a Leverhulme Trust funded study of 25 families in the UK, utilising video ethnography and in-depth interviews to explore everyday humour use amongst families in challenging contexts. The first case relates the intensification of parenting to commonly-felt pressures to maintain laughter-filled atmospheres. The second explores the effect of relational histories and the connection between felt 'time pressures' and 'forced fun' in the midst of a family member's health scare. The third illustrates the interplay between structural constraints and attempts at levity in a family navigating socioeconomic and racialised inequalities. Offering a critical perspective on the role of humour in family life, this paper argues that attending to the economic, societal and familial relationalities surrounding humour use reveals its potential complicity in perpetuating difficult situations. While not wishing to completely discount the positive potentials of humour, the paper asserts that vaunting it as an unproblematic means to cope overlooks the need to address broader social injustices that affect everyday family life – issues that require more radical and, perhaps, less humorous solutions.

The Gap between Declared and Practiced Environmentalism: A Quantitative Comparison of Sustainable Opinions and Behaviors Among Citizens in Spain and Neighbour Countries.

Surveys from Spanish and international official organizations reveal a growing environmental concern among citizens that does not translate into sustainable behaviors in daily life, both in the domestic and public spheres. This disconnection between discourse and practice persists despite the evident effects of climate change, which have led to some legislative changes and measures to promote sustainable behaviors among the population.

Since the term "environmental concern" was coined by Dunlap and Liere (1978), this phenomenon has been widely studied, with research now focusing not only on quantifying the degree of concern but also on assessing the population's willingness to act, introducing the concept of "environmental sensitivity" (Dunlap and Jones, 2002). This conceptual shift implies a willingness to act in response to environmental concerns, leading to a focus on the materialization of these attitudes into practices and habits.

Valencia et al. (2010) reformulated "ecological citizenship" as a variable commitment across moral, domestic, and public spheres, emphasizing citizens' obligations toward sustainability. Although Spanish society excels in the moral sphere, this is not reflected in the domestic and public spheres. This suggests that environmental commitment is expressed more rhetorically than in concrete actions, revealing a significant gap between declared values and practiced behaviors.

The overall aim of the present study is to provide plausible explanations for this gap. Two specific objectives were established: 1) to quantify the size of this gap over time and compare it with other countries in the region; and 2) to formulate and contrast various hypotheses about its causes, such as social desirability. The results point to perceived priorities, individualism, and a lack of incentives for collective action as explanatory factors.

CARVAJAL MARTÍN, CARLOS* (Universidad Complutense de Madrid, Spain)

The Influence of "What Will They Say?" in Mate Selection. a Comparative Analysis of Speed Dating Observations Broadcast Live on a Spanish Radio Channel

The study of preferences in mate selection has experienced a significant qualitative leap due to the development and proliferation of dating platforms and applications that allow for the collection of a large volume of real-time observations, rather than retrospective data obtained through interviews or direct testimony from participants. However, the matches facilitated by these apps are determined by algorithms that function as black boxes, inscrutable to the external social researcher, which in our own view greatly conditions subsequent analyses. This study aims to overcome this obstacle by collecting an extensive corpus of 230 speed-dating events and 2,254 questions recorded live on a well-known Spanish FM morning show of a Spanish FM radio, where participants question each other for one minute to decide whether they want to meet in person. These questions have been treated as responses to a hypothetical questionnaire about what issues are important to raise in order to secure that face-to-face date while maintaining a personal image that the speaker considers appropriate for the context. Participants' interactions are evaluated by the radio audience through comments submitted via messaging and social media. With these interactions, we have: 1) applied quantitative techniques to establish intergender comparisons in the preferences of heterosexual men and women; 2) confirmed the influence of "what will they say?" or the "generalized other," according to the concept coined by Herbert Mead; and 3) illustrated how interaction rituals, in Goffman's terminology, and public image strategies change when participants are aware of the presence of a large audience. The results demonstrate the adaptation of participants' preferences to the context and the gender differences in the attributes they consider relevant, a priori, when starting a romantic relationship.

CARVER, NATASHA* (University of Bristol, United Kingdom)

Gendering 'Girls' and Racialising 'Boys' in Group Prosecutions of Child Sexual Exploitation (CSE)

In the policing and prosecution of Child Sexual Exploitation (CSE), who is treated as 'a child' before the law (and who, therefore, can automatically occupy the category of 'victim') relates to gender, class, 'race', and sexual behaviour as much as age. In the Rotherham (UK) CSE scandal, for example, police and local authorities failed to recognise victims of abuse as *children* (and thus as vulnerable and victims) due to classed and gendered judgements about their behaviour (Casey 2015). Inversely, across multiple Western jurisdictions, scholars have found racialized children are subject to 'adulthoodification' by legal decision-makers (Davis and Marsh 2020; Hamilton-Jiang 2023).

This paper is based on a two-year ethnography in a city in England accompanying racialised defendants and their family members through the court process alongside analysis of closing speech transcripts – as a stylized form of talk-in-interaction in which power and social relations operate explicitly and in coded ways (Rosulek 2014) – in four multi-handed prosecutions for group-based Child Sexual Exploitation (involving a total of 27 defendants and 16 complainants). The paper examines the gendered and racialised construction of complainants and defendants by prosecution and defence barristers through analysis of person reference, and how complainants and defendants respond to or resist infantilisation / adulthoodification. Reflecting on notions of 'ideal' victims/perpetrators and their relationship to class, gender and 'race', along with the ways hegemonic narratives about sexual assault underpin judicial hearings, the paper asks what role court talk plays in providing a scaffolding for (in)justice.

PEITZ, LAURA (BAMF Research Centre, Germany)

Reaching Further: Insights from a Factorial Survey with a Hard-to-Reach-Population

Respondent-Driven-Sampling (RDS) is a validated approach for targeting hard-to-reach populations, such as drug dealers, elderly immobile individuals, sex workers, sexual minorities, and migrants. Nevertheless, the accessibility of these populations does not guarantee the success of a survey, as the particular circumstances of the group may make it challenging to obtain

valid and reliable responses to sensitive questions (reservations, traumatic experiences, etc.). Survey experiments, such as factorial surveys, are frequently employed to address complex issues, as they allow for a realistic representation of even more complex scenarios. However, it's still unclear if they are particularly effective for gathering high-quality data on sensitive topics or hard-to-survey groups.

The BAMF Research Centre conducted a fully app-based RDS with rejected asylum applicants from anglophone West Africa (Nigeria, Ghana, Gambia, Sierra Leone) between June and December 2023. The app encompassed all the elements necessary for conducting an RDS, as well as a factorial survey, while maintaining participant anonymity. Our factorial survey comprised four hypothetical scenarios (vignettes), each describing the living circumstances of a fictional person with tolerated status. Respondents had to recommend whether the fictional persons should stay in Germany, return to their home country, or migrate elsewhere.

This contribution offers insights into our methodological approach, particularly in terms of whether factorial surveys are an appropriate method for addressing sensitive questions to a hard-to-reach population. To this end, we compare vignettes with traditional survey questions and use paradata (e.g. dropout rate and response time) to gain valuable insights with a view to enhancing future factorial surveys addressing hard-to-survey populations.

CASAVECCHIA, ANDREA* (University of Roma Tre, Italy)

Engagement Changes without Disappearing.

The paper analyses the change in participation among young Italians. The first aim is to verify whether the trends in Europe are confirmed: the growth of civic engagement and disaffection for politics (Barret, Pachi 2019). The second is to explore the forms of civic engagement. A reprocessing of secondary data derived from two multidimensional Istat surveys from 2013 and 2022 described two demographic cohorts of young people (20-30 years old).

The analysis assumes that a different "generational placement" (Mannheim 2000, Chisholm 2002, Merico 2019) distinguishes these two cohorts: young people in 2022 have experienced COVID-19, lockdown, and war in Ukraine, for example.

Second, the profiles of the participatory style that characterize and distinguish the two generations. The results will confirm a withdrawal from political activism and a simultaneous increase in commitment to volunteering activities.

The second aim is to describe the characteristics of this form of engagement. A visual sociology method will detect the behaviors of three youth groups involved in social love activities. Through semi-structured interviews and images that describe the initiatives, the description tries to identify if the prosocial and inclusion actions remain within a traditional channel or highlight elements of innovation. These limited experiences are signs that express forms of resilience.

Mediterranean Youth, Mobility and/or Ecological Strategy of Resistance

The Mediterranean area is historically a space of migration, original cultural creation (Cassano), and cultural pluralities, centrifugal and centripetal forces that expel and attract people and characterize populations (Matvejević). Currently, the region is a critical space where climate change, economic crises, war conflicts, and migration flows converge.

From this starting point, the paper aims to analyze some strategies implemented by young Italians and compare them with the dynamics of previous generations. We examine two current trends: one that pushes a significant young Italian portion to emigrate and the other that leads another group of young people to remain. First, we compare the traits of the generations involved in the migration phenomenon during the 1960s and 1970s with those of the current generation using secondary data. Thus, the

differences are identified between strategies that characterized the migration project in the past and how they characterize it now. Next, the analysis focuses on young people who remain in their territory. Their actions aim to promote activities to revitalize local communities, enhancing the culture and environmental heritage of the Mediterranean.

The results show a generation in which two different generational units are configured (Mannheim, Chisholm). There are two groups of individuals. They belong to the same demographic cohort and are in a unique generational location, as they share a similar historical and social context but choose two different action strategies in this Mediterranean area. In the first case, one identifies an action of resilience sustained by a centrifugal force that adapts to the conditions of the social system and leads outward from the area. In the second case, one identifies an action of resistance sustained by a centripetal force that aspires to promote the characteristics of the local community from the existing environmental and cultural resources.

SELLA, AGOSTINO (Don Bosco 2000, Italy)

SEVERINO, SERGIO (University of Enna - Kore, Italy)

From the "Return Migrant" to the "Cooperating Migrant": The Linking Social Capital in the Innovative "Circular Cooperation" Model.

Return migration forces protagonists to face reintegration challenges: returnees are often considered by local communities as carriers of resources and acquired skills, but also as sources of economic support. In this context, movements, associations and NGOs play an important role in fostering positive reintegration by offering socio-economic support and promoting local development projects in which returnees themselves are active protagonists.

One of their main strengths is the 'know-how' acquired in the destination countries, which can be translated into entrepreneurial skills and technical expertise useful for the countries of origin. In this context, however, the economic pressure exerted by families and communities can be a significant weak point: many returnees find themselves 'assailed' by family expectations for financial support, which often lead to a rapid erosion of savings and hinder the start-up of productive activities.

Organisations operating in this field, therefore, work on several levels: economic support, management of social expectations and defence of migrants' rights.

Against this backdrop, our contribution aims to present the "circular cooperation" model promoted by the Don Bosco 2000 Association (Italy), an innovative strategy designed to support returning migrants in coping with the difficulties of return: it allows migrants to return temporarily to their countries of origin, guaranteeing continuous training and skills acquisition, without severing their ties with the destination countries.

The Association's experience shows that it is essential that the associations' role is limited to the "initial phase" of accompaniment and technical support, leaving the "ownership of initiatives" - in particular, management ownership - to the return migrants themselves.

This model, by leveraging the development of linking social capital, reduces economic pressure and enhances the return as an opportunity for growth and exchange for both communities involved.

Dress My Gender: Transgender Students and Their Aspiration for Full Acceptance on CROSS-Dressing in the University

This study delves into the experiences of transgender students at Iloilo Science and Technology University (ISAT U) in the Philippines, focusing on their perceptions of existing university dress code policies and their aspirations for greater acceptance of cross-dressing. Given the limited empirical research on transgender experiences, especially in the Philippine context, this narrative inquiry aims to contribute to a deeper understanding of the challenges faced by transgender students. Through in-depth interviews and

focus group discussions with five transgender students, the study revealed the complexities of conforming to gender norms while suppressing their authentic selves. The findings underscore the urgent need for institutionalized acceptance of transgender students to foster a more inclusive and equitable campus environment. Recommendations include revisiting the university's dress code policy to be more gender-sensitive and empowering transgender students to organize and advocate for their rights.

CASES, RIZZA KAYE* (Institute for Sociology of the Slovak Academy of Sciences, Slovakia)

Migrants' Social Positioning and Perceived Social Stratification Structures in the Countries of Origin and Destination

Scholars tend to examine migrants' social positioning in terms of their strategies to access various forms of capital transnationally (e.g., Plüss, 2013; Stock, 2024). While such works are important to understand the process of potentially achieving social mobility as well as acquiring/maintaining class position and identities, it is also equally important to pay attention and examine whether migrants imagine the structure of social stratification in countries of origin and destination differently and where do they position themselves in such hierarchies. This points to a possibly fragmented and more situated (rather than a consistent and continuous) understanding of one's positions and identities as migrants' traverse different types of societies and hierarchies.

Drawing on the use of visual tool within qualitative interviews, this paper compares how and why Filipino migrants working in the care sectors of New York and London (as nurses, caregivers, and domestic workers) perceive the US/UK and the Philippines as different types of societies based on inequality pyramids. At the same time, the paper also examines where and why they position themselves in such hierarchies.

The paper thus explores how (lack of) occupational prestige, accumulated capitals, and future imaginaries intersect with perceived hierarchy and desirability of destinations in relation to meaning-making related to structures of inequalities and (contradictory) social mobility.

CASES, RIZZA KAYE* (Institute for Sociology of the Slovak Academy of Sciences, Slovakia)

Recruitment of Third Country Nationals in Central and Eastern Europe: The Case of Filipino Migrant Workers in the Czech Republic and Slovakia

Countries in Central and Eastern Europe (CEE) are not the 'traditional' receiving countries nor the Philippines is the 'traditional' source country of migrant workers of the region. Nevertheless, ageing population, labour shortages, and recent crises have become driving forces that made the migration streams between the Philippines and the CEE to gain salience.

This paper is based on a research project that compares the processes, infrastructures, and networks involved in the recruitment and integration of Filipino migrant workers (as a case of third country nationals) in the Czech Republic and Slovakia. As comparative cases, the Czech Republic and Slovakia provide a way of understanding how the practices of state and non-state actors in receiving and sending countries as well labour market needs shape the particular migration streams of Filipino workers in these 'emerging'

destination countries, specifically with regards to deployment in more male-dominated jobs and the complexities of recruiting third country nationals amidst anti-immigration sentiments in the region. What are the similarities and differences between the two countries in terms of responding to the shortages of workers, manner of recruitment, and support and integration efforts?

It is also interesting to compare these destination countries not only in terms of the larger issue of the recruitment of migrant labour, but also in examining how these destinations are 'marketed' in the Philippines – where the desired destinations are primarily the United States and, to a certain extent, Canada. How are migration aspirations and place-specific imaginations relating to destination countries manifested in the discourse and individual narratives of migrants?

The paper brings together motivations and desires to migrate (micro), the channels through which such aspirations are formed, encouraged, and enabled (meso), and the policies and demands of destination countries for migrant labour as well as the emigration environment in the source country (macro).

CASEY, CATHERINE* (Loughborough University, United Kingdom)

DELANEY, HELEN* (University of Auckland, New Zealand)

A Green and Just Transition: Transnational Labour Governance and Climate Crisis Response

Trade unions, while showing notable industry and national variations, exhibit mixed histories of addressing environmental concerns. The persistent risk of a politics of conflict between environmental imperatives and workers' jobs and livelihood security put workers' interests into turmoil. Unions express more emphatically in the 2020s a two-fold interest: transition to a more sustainable economy, to an at least post-carbon dependency in economic and production activity, must attend to workers' socio-economic interests simultaneously with ecological protection. It must be a "just" transition.

Much attention to date on labour questions and sustainability addresses state actors and national or regional union bodies and other labour forums such as works councils, and international union confederations. Other debates pursue efforts of labour-environmentalist NGOs and community coalitions. Questions arise as to how labour actors in countries with highly sector variable or weak institutionalised social dialogue can effectively engage with a "just transition" and decarbonisation imperatives.

Our project, in contributing to advanced debate, focuses on transnational relations and dynamics among labour and company actors in global corporations. Global companies are significant non-state global actors. Their activities in regard to global climate response and acceptance of a just social transition can have significant influence among global MNC supply chain parties and regional powers. The quality and effectiveness of their transnational labour governance is a crucial factor in accelerated adoption and implementation of an eco-social program of response and reform.

This paper especially focuses on workers' voice, social dialogue, and demand formation in local and transnational labour relations. It discusses findings from our empirical study of labour and eco-social actors in Asia Pacific contexts. Multilevel transnational labour governance generates new qualities and capacities for more democratic global governance of common concerns, crucially including a just eco-social transition.

CASSING, TALKE* (Europa-Universität Flensburg, Germany)

Admission Restrictions and Social Inequality in Field of Study Choices: Evidence from the German Higher Education System

Social inequalities in field of study choices have been repeatedly documented in the context of German higher education. However, little is known about how admission restrictions exacerbate these disparities by diverting students from their desired fields to less selective programs. This study investigates how social class background influences students' chances of realizing their study preferences in the presence of admission restrictions.

Using an individual-level dataset (panel survey conducted six months before and after high school graduation) and an institutional dataset on the application of admission restrictions, I apply moderation analyses to explore whether students from disadvantaged backgrounds are more likely to be diverted into alternative programs and how the impact of social class varies depending on the selectivity of the preferred field. Initial findings suggest that social disparities increase as the selectivity of the preferred field rises.

Following analyses identify academic performance and information levels as mechanisms explaining these (moderated) disparities. Specifically, social class differences are most pronounced among high-achieving students with very good grades and among those who feel less informed. Privileged students are more likely to leverage their strong academic performance to secure spots in their preferred programs and are better equipped to compensate for information deficits, providing them a significant advantage over their disadvantaged peers.

This study critically evaluates German admission policies, revealing that not all students face equal opportunities to access their preferred fields of study. Admission restrictions disproportionately divert disadvantaged students into alternative programs, further exacerbating social inequalities in higher education access.

The Profession of Medical Researchers and State Intervention: Incentives for the Knowledge Production.

In the Mexican context in 1984, a program called the National System of Researchers (SNI, Sistema Nacional de Investigadores for its acronym in Spanish) was implemented, created by the Federal Government and the Mexican Academy of Scientific Research, considered as an innovative tool in relations between the Mexican State and the public universities through incentives granted by evaluations.

The SNI, sought to reduce the effects of the 1982 economic crisis that affected the scientific community of Mexico, offering a salary complement (non-contractual) to teachers who also demonstrated the development of lines of research, since the evaluation criteria were determined by: 1) primary products, which included the quality valued in articles, chapters, books, etcetera and 2) secondary products, such as teaching and dissemination evidences (Foro Consultivo Científico y Tecnológico, AC, 2016).

Forty years after its implementation, the SNI is still valid, offering the research teachers of eight knowledge areas, the possibility of accessing the monetary incentive in accordance with the evaluations that will determine the level at which they will obtain the distinction in: a) Candidate, b) Level I, c) Level II, d) Level III and e) Emeritus. This proposal aims to show the perception of twelve doctors who are also research and teachers assigned to the University of Guadalajara, who have the distinction of the SNI. Among the results that are presented, we distinguish some disagreements derived from: a) the speed with which they must present their research products to meet the evaluations of the SNI, b) the heavy institutional bureaucratic processes for the development of their research and c) The perception of gender distinctions in the institutional context.

Activismo Juvenil Universitario En Nicaragua: Repertorios De Lucha, Resistencia y Reacciones Gubernamentales

Este trabajo analiza el papel que han desempeñado los y las estudiantes nicaragüenses en las movilizaciones contra la violencia estatal y la erosión de las prácticas democráticas por parte del gobierno de Nicaragua desde 2018. Estas protestas, que comenzaron como respuesta a reformas gubernamentales y violaciones de derechos humanos, se han transformado en un movimiento juvenil más amplio por la justicia. El cierre de 27 universidades entre 2021 y 2023, que culminó con la toma de la prestigiosa Universidad Centroamericana (UCA) en Managua, ejemplifica la respuesta represiva del gobierno frente al activismo estudiantil.

La investigación se sustenta a partir de un estudio documental y de las narrativas de jóvenes universitarios nicaragüenses en el exilio co-construidas con la técnica de relatos de vida desde el enfoque biográfico y de otros testimonios de jóvenes publicados en diversos medios. Se analizan distintas manifestaciones de activismo y resistencia juvenil universitaria desde la migración forzada y el exilio, en la que se discuten aspectos puntuales como: sus demandas y los sentidos de justicia involucrados, sus formas de organización, sus repertorios de lucha, sus continuidades y rupturas con episodios pasados de movilización estudiantil, las formas inéditas de resistencia y las reacciones de autoridades universitarias y gubernamentales frente a estos movimientos.

Care and Quality of Life of Chronic Patients. Preliminary Findings from a Qualitative Research on Acute Myeloid Leukemia Patients

The Horizon IMPACT-AML project (a randomized pragmatic clinical trial for relapse or refractory acute myeloid leukemia), in which we are involved as health sociologists, aims to create a platform for rare chronic blood diseases to conduct clinical studies on alternative therapies. Our goal is to investigate, starting from a broader reflection on chronic illness, the quality of life of patients with acute myeloid leukemia and their family caregivers in order to emphasize the main care and assistance needs for AML patients, highlighting areas for potential improvement in treatments. We also investigate how the doctor-patient relationship is shaped when dealing with a chronic condition that requires continuous monitoring and care.

This research presents preliminary results from a qualitative study conducted with patients, caregivers, and healthcare professionals. Specifically, the research involved 30 AML patients who were interviewed through in-depth narrative-based medicine interviews. The patients are divided across three partner countries: Italy, Germany, and Spain.

In parallel, two Living Labs were conducted: one with healthcare professionals (using the Nominal Group Technique) and the other with caregivers (using the World Café Method).

The aim is to confirm, deepen, and expand what emerged in the literature, which already presents data on this matter: leukemia has an obvious negative impact on patients, carers, and their wider families. It is important that the healthcare system approaches this disease considering all the effects that a chronic condition has on the social and individual level, moving towards a holistic approach that encompasses the ethics of care in all its facets.

Chronic cancer patients require comprehensive care: from healthcare to social-relational, spiritual, and eco-systemic aspects. Care and society must be able to respond to and embrace the chronicity that is increasingly present.

(Celebr)Emotions in Social Media: The Prosocial Role of Young Sports Celebrities on Their (Young) Publics

Starting from the framework of the mediatization of sport (Frandsen, 2014, 2020; Tirino, 2023) and from celebrity studies that intersect media studies (Marshall, 1997, 2007; Rojek, 2001; Turner, 2004, 2010; Driessens, 2013; Hearn & Schoenhoff, 2016), our paper aims to emphasize the prosocial role that young sports celebrities have on their (young) sports fandom (Sandvoss, 2003; Sandvoss, Gray & Harrington, 2017). Relevant to our discourse is the role that social media play. Social media, in fact, act as affective media environments (Grusin, 2017; Farci, 2019; Tirino & Castellano, 2020), mediating sports emotions, which are reconfigured in the spaces of symbolic negotiation, shaped by Netenvironments. Sports fandom adapted to new patterns of sports consumption (Sandvoss, 2003; Williams, 2007) and new mediascape configurations, and interpret media content unexpectedly, participating in community processes (Hills 2018), within an affective dimension (Hills 2002).

The starting point is media education (Jenkins et al. 2006), more specifically social media education (Livingstone 2014), that enables young athletes to develop a high level of (digital) literacy so that these media are used consciously, exploiting their potential and avoiding their risks (Castellano, 2022; Tirino, 2023), but also to manage their success and their public image. In comparison to aged celebrities, who are in a waning phase of their careers, and not at the top, young sports celebrities, with highly structured and participative fandoms, need to develop an appropriate level of literacy. Our paper wants to investigate young celebrities' prosocial role and emotions exploitation through their communication and content, and their effect on fandom. To achieve our goals, we decided to apply media content analysis (Macnamara 2005) of the Instagram and TikTok profile of young sports celebrities (the football player Lamine Yamal, the F2 and F1 driver Kimi Antonelli, the swimmer Torri Huske).

GIL DE MONTES ETXAIDE, LORENA (University of the Basque Country, Spain)

The Meaning of Trust in the Relational Context of Long-Term Care: Some Keys to the Transformation of the Care Model in the Basque Country

The construction of trust in care relationships, both in the public and community spheres, is crucial for the promotion of well-being and facilitating processes of transformation of the current long-term care model (Comas-d'Argemir, 2019; Gilbert, 2020). This study, based on individual interviews (n=26) with caregivers, family members, and older adults with care needs in the Basque Country, aims to analyze how the meaning of trust in care relationships is constructed. To this end, we used the theoretical approach of social representations to study trust in a specific sociocultural and relational context (Gillespie & Marková, 2007).

The results revealed that trust is intersubjectively constructed through four dimensions. 1) *Taken-for-granted* trust referred to the naturalisation of care in family and gender relations, where care was perceived as a gift and a non-negotiated obligation, mainly of women. 2) *A priori generalised* trust was developed in proximity community networks and shared representations of the 'other' as caregiver. 3) *Context-specific* trust was built on perceptions of effectiveness, service coverage and good treatment in professional care services, influenced by the institutional context and one's own experiences. Finally, 4) *Inner dialogical* trust was based on the internal representations that individuals had about themselves and others in the care relationship, emerging from an internal dialogue about expectations, reciprocity and dependency.

This study highlights the importance of the psychosocial framework of trust, as it offers a deeper understanding of the multidimensional complexity of trust across various care contexts. The findings also provide key insights for guiding public policies that aim to enhance interpersonal, community, and institutional relationships—an essential condition for advancing more democratic care practices and perspectives in aging societies.

CASTILLO, JUAN CARLOS* (Universidad de Chile, Chile)

CARRASCO, KEVIN (COES - Center for Social Conflict and Cohesion Studies, Chile)

LAFFERT TAMAYO, ANDREAS (Universidad de Chile, Chile)

Meritocracy and Redistributive Preferences at School Level in Chile

The growing levels of economic inequality and income concentration have intensified research into preferences for economic redistribution, understood as beliefs about the need for financial transfers to those with fewer resources, usually through the state. However, most studies focus on adult populations, leaving little exploration of the factors shaping redistributive preferences at younger ages and how they develop over time.

This study draws on data from the *Education and Meritocracy* panel survey (N = 900, 2023-2024), conducted among primary and secondary school students in Chile. It examines how perceptions and preferences around meritocracy—both in school and society—affect support for redistribution. Meritocracy, a system where rewards are distributed based on individual effort and talent, is expected to influence students' views on the role of government intervention. Specifically, students who perceive greater meritocracy in their environment are likely to express lower support for redistribution.

The results show that stronger perceptions and preferences for meritocracy are associated with reduced support for redistribution, with secondary school students expressing lower redistributive preferences than primary school students. These findings underscore the role of educational and social contexts in shaping political and economic beliefs at an early age, with implications for students' future civic and political engagement.

BIEHL, ANDRES (Pontificia Universidad Católica de Chile, Chile)

Variedades De Mestizaje En América Latina: Los Casos De Brasil, Chile y México

Este proyecto de investigación ofrece un análisis comparativo de los discursos nacionales sobre el mestizaje en tres países de América Latina: México, Brasil y Chile. Cada uno de estos países refleja un arquetipo distinto de la construcción de la identidad nacional, basada en la mixtura racial que caracteriza a la región. En el caso de México, el discurso nacional se articula en torno a la exaltación del pasado indígena, con un énfasis en el legado azteca, y cómo este ha permeado la cultura mexicana. Este enfoque se explora a través de la obra *La Raza Cósmica* de José Vasconcelos, texto clave en la formación del discurso identitario mexicano.

Por su parte, el caso brasileño, representado por la obra *Casa Grande y Senzala* de Gilberto Freyre, pone de relieve la idea de una "democracia racial", basada en la convivencia armónica entre las diversas razas que componen la sociedad brasileña. Este concepto de multiracialidad ha sido un pilar en la construcción de la identidad nacional brasileña, diferenciándose de otras narrativas en la región.

Finalmente, el caso chileno, analizado a través de la obra *Raza Chilena* de Nicolás Palacios, plantea una visión diferente, en la que el mestizaje se asocia a un proceso de blanqueamiento racial. Este discurso refleja una construcción de la identidad nacional chilena que busca la homogenización étnica.

La investigación se enmarca en la sociología de procesos históricos y la sociología comparada, y tiene como objetivo rastrear la influencia de estos discursos nacionales sobre el mestizaje a lo largo de la primera mitad del siglo XX. Desde estas perspectivas teóricas y metodológicas, se examina cómo las obras seleccionadas han contribuido a la construcción de las identidades nacionales en México, Brasil y Chile, y cómo estas narrativas reflejan y perpetúan dinámicas sociopolíticas y culturales particulares en cada uno de estos países.

Whiteness in Witnessing Unto the Nations: An Ethnography of Whiteness in the Context of Evangelical Christian Missions in Northern Ireland

This paper aims to answer the lacunae of race and whiteness within the sociology of religion in Northern Ireland (NI). Based on ethnographic study of missionary networks, it will explore how "white" NI evangelical socialization shapes representations of and contact with racialized "others" within missions work at "home" and "abroad". Findings represent the first critical, empirical study of race in the context of religion in NI, contributing to understandings of social divisions there in entirely new ways and broadening discussions of evangelical whiteness beyond the hegemonic US context (Gorski and Perry, 2022).

Issues of religion and race are of paramount importance in Northern Ireland, a settler-colonial society emerging from a period of violent sectarian division (Cash, 2017), now facing concerns around social cohesion amid increasing ethnic diversity and a surge in racist incidents in recent years (Hart, 2022). Religious identification and observance in NI remains high compared to much of western Europe, yet there are few empirical studies of the sociology of religion in NI outside of sectarian conflict (Altglas, 2022). Issues of race are unexplored within the sociology of religion in NI (Wood, 2006), and research on race more broadly has omitted NI due to its history of ethno-national conflict (Gilligan, 2022). There has been no scholarship exploring how religious social structures shape processes of racialization in NI social groups, or how these processes structure the experiences of those racialized as "white".

NI evangelical communities constitute a key support base for international Christian missionary work (Tonkin, 2006), which has been critiqued for perpetuating neocolonial power relations of material and spiritual dependency (Cruchley, 2022). Whiteness can be methodologically challenging to explore (Twine and Warren, 2000), yet the ethnographic context of missions offers unique insights into how white racialization is constructed and disrupted in relation to racialized "others".

Displacement and Residential Mobility: The Perverse Effects of Gentrification? the Evolution of Urban Inequalities in Contemporary Paris.

Urban upgrading and gentrification have been some of the most widespread and powerful dynamics transforming cities over the past few decades. Global processes such as the liberalization and retrenchment of welfare state policies, the financialization of housing markets, and the increasing concentration of activities and population in metropolitan areas have contributed to making gentrification and embourgeoisement predominant forces in shaping urban social and spatial dynamics. After nearly eighty years of debate, it has become widely accepted among academics, journalists, and activists that gentrification leads to displacement, often cited as one of its most negative consequences. However, most quantitative empirical studies fail to fully capture this process.

By examining the residential movements of Parisian residents, my research seeks to establish a direct link between gentrification and displacement, aiming to address the challenging issue of "quantification in the battle against gentrification" (Easton et al., 2020). Using geo-referenced panel data from 2015 to 2022, collected from annual census records and public tax agency datasets, I explore whether gentrification in the French welfare regime triggers the displacement of low-income residents. This study has two main objectives: first, to identify the social and ethnic characteristics that drive residential mobility through a multilevel statistical model; second, to trace the mobility trajectories of different social and ethnic groups in both urban and suburban areas, mapping their movements over time and space.

Preliminary results suggest that gentrification and income upgrading in the private housing market contribute modestly to the displacement of low-income and immigrant residents to distant periurban areas and/or undervalued residential *banlieues*. By offering new insights into the specific mechanisms of displacement within the French context, this research challenges existing narratives and contributes to a deeper understanding of how gentrification negatively impacts vulnerable populations across diverse urban settings.

RC21-317.1

CASTRE, GIOVANNI* (University of Milan - University of Turin, Italy)

Displacement, Segregation and Residential Mobility: The Perverse Effects of Gentrification. Understanding Housing Inequalities in Contemporary Paris.

Urban upgrading and gentrification have been powerful forces transforming cities over the past few decades. Processes such as the commodification and financialization of housing markets, along with the retrenchment of welfare state policies, have shaped gentrification and embourgeoisement as key dynamics driving urban development. Displacement is often considered one of the most negative consequences of gentrification, yet many empirical studies fail to capture the full extent of this process. Moreover, residential segregation — historically one of the most important indicators of urban inequality — remains underexplored in relation to displacement.

This research seeks to explore the link between gentrification, displacement, and residential segregation, with a focus on Paris. Using geo-referenced panel data from 2015 to 2022, sourced from annual census records and public tax data, this study aims to trace the mobility patterns of different social and ethnic groups in both urban and suburban areas, mapping their trajectories over time and space. Additionally, it investigates the relationship between displacement and residential segregation, emphasizing the unique context of the French welfare regime.

Preliminary results suggest that gentrification and income upgrading through the private housing market contribute modestly to the displacement of low-income and immigrant residents, pushing them to periurban areas and undervalued *banlieues*. Displacement and segregation are intricately linked, as displacement often exacerbates segregation by reinforcing exclusionary patterns in urban centers. By examining the specific mechanisms of displacement in Paris and France, this research offers valuable insights into how gentrification impacts vulnerable populations, enriching the broader discussion on housing and urban inequalities across Europe.

Research on the Military: Personal Experiences

Between 2014 and 2023, Routledge published three books organized by Celso Castro, Helena Carreiras, Sabina Frederic and Eyal Ben-Ari: "Qualitative Methods in Military Studies: Research Experiences and Challenges" (2014), "Researching the Military" (2017) and "Understanding the Impact of Social Research on the Military: Reflections and Critiques" (2023). This trilogy reflected on the practice of research on the military, covering the following topics: the research methods used; the experiences of researchers in the field; and the impact of social scientific research on the armed forces. The objective of this presentation is to continue the reflection on these topics, from a personal perspective.

Social Work Profession and the State: The Re-Institutionalisation of Public Social Field in Italy

Over time, sociological debate has often highlighted relationships between professions and State as a key-element in the development of modern organisational setups.

The institutional approach considers professionalization as a subset of the broader institutionalization, insofar it is one of the ways to give order, structure, and meaning to the organizational context. Professions are themselves institutions and view organizations as the primary vehicle for conducting institutional work (Suddaby and Viale 2011), which regards the mediation between reforms (which are manifestations of institutional change) and the role identities of professionals (which, in turn, represent institutional stability). Thus professionals are institutional carriers, while organizations are sites and vehicles for professional action (Breit et al. 2022).

Institutional theory also allows to observe the hybrid professional work in public domains. Hybridization arises when professional and managerial principles come together (Noordegraaf, 2015) and it concerns different ways of merging contradictory/competing institutional logics (Breit et al. 2022) through hybrid professionals capacity to bridge them.

Within this framework, this work analyses the current re-institutionalisation of public social field in Italy, paying attention on mutual relationships between the State and Social worker profession, in a institutional perspective. Statal regulation is currently defining Essential Social Services Levels (ESSL), that are specific social services to guarantee throughout the country, due to their particular relevance. Within this reform, professional social work has formally recognized as the gateway to social measures and Social worker has taken on a new, relevant responsibility in organisational decision-making. Albeit within aims and organisational constraints, it can influence decisions and negotiate with the organizations, making an important contribution towards the development ways of public social services.

The paper shows the way in which the statal regulation is influencing the social workers professional project and, in turn, how the latter is contributing to social field re-institutionalisation.

CASTRO ROLDÁN, LAURA* (Universidad Complutense de Madrid, Spain)

Artistic Techniques in Fat Studies. Methodological and Ethical Dilemmas

The ABR (*Arts-Based Research*) is a versatile, creative, and accessible research method used to investigate non-exclusively verbal discourses (Kara, 2015; Scribano, 2016). Thus, we can find these types of techniques in research focused on vulnerable, stigmatized individuals, or those at risk of being so.

ABR reformulates the relationships between researchers and participants, involving participants in the research process from design to analysis, as well as in the feedback phase (Leavy, 2009; Carrillo, 2014).

In the specific context of my research, I draw from *fat studies*, exploring the violence and pain associated with embodying fatness. In this way, my methodological journey traverses autoethnography not only through words but also through drawings and textures, allowing me to explore uncertainties and subsequently design group techniques with the participants.

In my work, I explore how desire is constructed in bodies that embody fatness, shaped by fatphobic violence, through artistic and group techniques. This involves various methodological interests, such as the digitalization of body mapping techniques (Castro, 2023), as well as the exploration of texture to incorporate folds and fat.

I consider this process to be a twisted and uncertain path where it is necessary to get lost. I would like to reflect on our positions as participants and researchers, examining where we stand and where we want to go—or *not go*. This approach enables us to address the ethical limits of our own self-explorations and the potential consequences within our everyday academic environments.

RC54-JS-14.6

CASTRO ROLDÁN, LAURA* (Universidad Complutense de Madrid, Spain)

Fatphobia and Resistance to Discrimination from a Fat Studies Perspective

Fatphobia, as a system of discrimination and oppression, seeks the eradication of fat bodies by perceiving them as unattractive, unproductive, and pathological, thereby generating discrimination in all aspects of daily life, including the workplace, educational settings, emotional-sexual relationships, and medical care (Piñeyro, 2016). Consequently, my research focuses on the fatphobic violence and discrimination experienced by individuals socially understood as fat. In my investigations, I aim to address various issues related to practices of resistance, as well as the pains and pleasures of inhabiting fatness, which are often viewed as immoral, unhealthy, and grotesque (Esteban, 2016; Bakhtin, 1994).

In this panel, I would like to reflect on several topics addressed in my research. Specifically, I will consider how weight stigma affects the daily lives of fat individuals. Our system is characterized by fatphobia, in which fat people are constructed as lazy, unclean, depressed, and unhealthy, thus justifying their perceived unworthiness of respect, rights, and love. Using the results from my inquiries employing artistic group techniques and reflective mapping of audiovisual content that perpetuates weight stigma, this presentation aims to discuss the consequences of inhabiting fatness and the resistances to discrimination from the perspective of fat studies.

CASTRO-FERNÁNDEZ, PALOMA* (IPNA-CSIC, Spain)
PÉREZ-CASTAÑEDA, RAÚL* (IPNA-CSIC, Spain)

Mcdonaldization of the Canarian Gastronomic Culture: From Local Heritage to Tiktok Aesthetics.

El archipiélago de las Islas Canarias (España) es una de las regiones con mayor afluencia de turistas, extranjeros y nacionales, del país. En 2023 recibía 14 millones de turistas (INE, 2024), de los cuáles más del 20% conceden bastante o mucha importancia a la gastronomía, según diversas estadísticas (Dorta-Afonso y Padrón-Ávila, 2021; Pérez-Castañeda, 2024). Uno de sus reclamos principales es el guachinche, establecimiento singular de la zona norte de la isla de Tenerife, que se caracteriza por ser un pequeño local de venta de comida tradicional y excedente de vino de producción propia.

Paralelamente, a la consolidación de los guachinches como símbolo identitario de las gastronomía local, surgen los denominados “guachinches modernos”. Esto actúan bajo las lógicas de mercado de la restauración, manteniendo referencias estéticas y gastronómicas de los guachinches con los que establecen una competencia directa. Estos locales están impulsados por su integración en las cadenas de consumo gastronómico típicas del turismo de la isla, encontrando un referente en la propuesta de globalismo de Ritzer (1995).

Así, el turismo habría cambiado la definición de auténtico para simplificarlo a lo que se entiende por común y genuino de un sitio, borrando los condicionantes históricos de resistencia económica, ruralismo y producción minifundista. A cambio, genera locales con platos tradicionales y elementos estéticos folclóricos, patrones de venta capitalistas para un mercado global, y una adaptación de la oferta turista. Este proceso parte de una lógica colonial, mediante la que impone valores globales y simplifica los locales (Matusitz y Palermo, 2014).

CASTRO-FERNÁNDEZ, PALOMA* (IPNA-CSIC, Spain)

Mealspiration: From the 'Gram to the Data. Visual Methods and Its Role in the Study of Digital Food Practices.

En el contexto de los espacios socializadores de Internet, en los que se han digitalizado prácticas alimentarias y establecido procesos de datificación de la comida, emergen categorías como “digital food cultures” (Lupton y Feldman, 2020), o sistemas de creencias que emergen en torno a la alimentación, con un impacto en la expresión de la identidad online, la construcción común del conocimiento y la relación de los individuos con la comida. Una investigación llevada a cabo de estas comunidades en Instagram España, confirmó la existencia de 5 tipologías de contenido, así como el potencial de los influencers para enmarcarse en ellas y formar microcomunidades, a través de procesos de identificación y comparación social.

Mediante una observación de los contenidos digitales, se identifican variables que situaban cada microcomunidad en base a, por un lado, la relación de los influencers con la comida y los usuarios, y por otro, la gestión de los usuarios de su relación con el contenido en redes en su vida offline. Una parte fundamental de la producción de datos fue utilizar el potencial visual de Instagram, que permite formas de comunicación y transmisión de ideas particulares que condicionan a los usuarios (García-Mingo y Sádaba-Rodríguez, 2023)

A través del análisis visual de la difusión de información mediante publicaciones, se comprobaron patrones diferenciales entre comunidades y sus indicadores de uso (Renobell, 2017), definiendo parámetros estéticos que, a su vez, afectaban a factores identitarios y de pertenencia. Por ejemplo, la tipología de imagen definía a la comida como fin o como medio, y al influencer como figura de admiración y autoridad en la jerarquía de conocimiento, o como referente y elemento de identificación con la cuenta. A su vez, cada una de estas variables activaban de forma diferente los mecanismos de formación de comunidad.

RC52-JS-12.1

CATALÁN HIDALGO, RENÉ* (Pontificia Universidad Católica de Chile, Chile)

AI in the Skies: A Clash of Perspectives on the Future of Air Navigation

The aerospace industry envisions a future where aeromobilities becomes an integral part of daily life. To achieve this vision, three pillars are essential: decarbonizing energy sources, developing diverse aircraft capable of meeting various distances and requirements, and implementing an air traffic management system (UTM) that leverages artificial intelligence to control ground and airborne aircraft operations.

Given this scenario, this paper focuses on the third pillar, as it is currently experiencing the most significant progress and offers the most tangible vision. This allows for clearer understanding of the roles and perspectives of key figures, such as pilots and air traffic controllers, as well as those who utilize aeromobilities, including passengers.

To address these questions, this paper presents an ethnographic study conducted at Santiago International Airport in Chile. The study explores the experiences and perspectives of various actors involved in aeromobilities, including pilots, crew, air traffic controllers, and passengers.

The research aims to ascertain whether the industry's expectations align with those of those directly and daily involved in the system. It examines the tensions between efficiency and safety, flexibility and regulation, and environmental sustainability and user needs.

The research provides a critical analysis of the post-decarbonization aeromobility imaginary, considering the viewpoints of those who shape it. It seeks to foster dialogue between industry stakeholders, system actors, and society as a whole to develop a more equitable, sustainable, and humane future for aeromobilities.

RC56-JS-97.3

CATALÁN HIDALGO, RENÉ* (Pontificia Universidad Católica de Chile, Chile)

Becoming Aeromobile: Two Perspectives on How Our Vision of Future Flight Is Shaped

Infrastructure becomes embedded in our lives, reshaping them. This reshaping starts from the very promise of infrastructure and extends into the future. In the case of airports, moreover, this reshaping implies the possibility of accessing a territory that was only accessible for our mobility a mere 120

years ago and the visions, fuelled by science fiction, of a future relationship with this territory marked by the possibility of everyday travel via small aircraft.

This paper is based on an ethnography and focuses on understanding how air transport infrastructure has reshaped the experiences of the inhabitants of Santiago, Chile, and how these experiences offer a vision of the future of flight that contrasts with the aerospace industry's efforts and optimistic vision to reshape the industry and aeromobility in general.

To this end, the historical relationship of this reshaping is addressed to demonstrate that this relationship is dynamic over time, both of the infrastructure itself and in the time of those who have and will relate to it.

Firstly, the history of the city's two international airports is analysed, with a particular focus on the first one, which was located within the city between 1929 and 2006, amidst residential spaces, serving as a kind of experimental laboratory for approaching flight.

Secondly, it analyses how personal history is reshaped around the experience of flight, giving a particular form to the personal relationship with air mobility and its future possibilities. This perspective places particular emphasis on how others are accompanied in forming bonds with this experience, through the inclusion of families travelling with children.

CATALANO, GILDA* (University of Calabria, Italy)

The Men and the Sea. after a Trauma: Inhabitants, Tourists and Migrants Alongside the Calabrian Coast of Cutro

The paper deals with the different sea's representations in a Calabrian village, Cutro, which has been the context of a migrants' shipwreck. The research observation is based on three types of sea's users: inhabitants, tourists and migrants. This shipwreck of migrants has been about 100 meters near the coast; therefore the small town has received an high attention by public media because of the rescue failure of many migrants, who were almost near the shore.

Two years after this event, this paper describes the different narratives about the shipwreck by three different groups of actors: a. the group of migrants who have been saved, b. the inhabitants including the rescuers of survivors, and c. the visitors and tourists.

From the overall interviews emerge, not only different stories about the tragedy, but common representations towards the sea by a traumatic matrix. The above mentioned specific part of Cutro's sea is no longer a water where interviewees are able to go inside in a relaxed way. In the field observation, the common trauma does not appear as a consequence from a concrete territorial risk by rapid onset elements (for instance, tsunamis or storms) but it is the result of concrete social actions.

In the paper, the concepts of risk, vulnerability and time of exposure to risk - which in sociological literature are applied to physical territorial events (especially after earthquakes) - have been reviewed through the narratives of these three types of interviewees (inhabitants, tourists, migrants). Behind the common trauma, even the sea is not lived as previously, transformed into a surface by controverse social meanings and divergent cultural symbols.

CATANZARO, ALICE* (University of Oxford, United Kingdom)

Mediated Muftis: Seeking Islamic Guidance

This research explores how Muslims navigate living an ethical life through seeking expert guidance in the form of fatwas (non-binding Islamic legal opinions) in multi-mediated environments like Morocco. In September, I began conducting fieldwork in Sefrou, Morocco addressing state radio and television fatwas in addition to in-person oral and telephone fatwas at the local Sefrou Religious Council to understand the interplay between multiple forms of mediation and hierarchical Islamic guidance. I work specifically with petitioners to determine the importance of fatwas, their use, and the types of guidance consumed. The research envisions each context for seeking guidance as existing within a particular "media matrix". Each matrix has a series of possibilities, different mixes of types of media as well as degrees of mediation for each medium. In light of the variety of fatwa 'platforms,' the research thus explores the questions asked to different media, the decisions Sefrouis make when they approach one medium over another, and the impact of the final answer on their lives. According to the existing literature, even if subtle, the networks and mechanisms of different media can have profound effects on the final mediated product. I expect to find similar results in how modern Moroccans use multi-mediated fatwas to live ethical lives. This research complicates existing narratives in the wider literature. Islamic new media studies either rely on the notion of ethical self-cultivation or focus on changes in authority, re-emphasizing a top-down approach to the fatwa and

telling us little about how everyday Muslims engage with these new forms of ifta'. Yet ethnographic studies of the pedagogical in-person interaction also do not fully encompass the multi-mediated possibilities available for seeking guidance. Media matrices, which combine the value of both literatures, can better explain what seeking expert guidance means in an everyday context.

Embodiment and Digital Identities: An Empirical Analysis of the Emotional Codes of the Twitch Generation

This paper aims to investigate the relational and communicative dynamics that characterize the Twitch generation within digital contexts. Through a theoretical-empirical analysis, it aims to explore how this digital native generation constructs its identities, relationships and communities through the use of platforms such as Twitch. Beginning with a description of the peculiarities of these virtual environments, characterized by a highly codified visual language and forms of real-time interaction, the analysis will focus on the use of specific communicative elements such as stickers, emoji and emoticons. These elements, in fact, represent a visual language that, in addition to conveying emotional and affective content, helps define group dynamics and create a sense of belonging. The research will be based on a qualitative analysis of data collected through participant observation and content analysis of online conversations. The goal is to identify the most recurrent expressive and emotional modes within Twitch-related online communities, as well as to understand the meaning these expressive elements take on for users. In particular, the study will deal with the analysis of the following aspects: Digital identity: How does the use of these visual codes contribute to the construction and negotiation of users' digital identities? Social relations: What types of relationships are established within these online communities and how do they manifest themselves at the communicative level? Digital subcultures: To what extent do these languages contribute to the formation of digital subcultures and the creation of a sense of belonging? Finally, the presentation will provide some methodological considerations related to the observation of virtual environments, emphasizing the specificities and complexities of this type of approach. In particular, it will discuss the role of the observer in interacting with participants, the challenges of collecting and analyzing textual, visual data and the potential offered by new technologies for digital data analysis.

"We Will Let You Know". Ethnic and Gender Discrimination in the Italian Labour Market

Innovative ways of integration into the labour market of the most vulnerable groups need to be explored with the objective to reduce inequalities and promote social inclusion. To identify barriers for increasing inclusiveness appears crucial for the development of targeted policy interventions. To effectively fight labour market discrimination, it is necessary to understand its driving factors to gain insight into why and when employers discriminate. Using an experimental approach and a participatory action research approach, this study aims to promote social inclusion of vulnerable groups by identifying barriers in the labour market against them. The investigation aims to analyse the extent to which ethnic and gender discrimination affect the access of minority groups in the Italian labour market. We perform a vignette experiment to understand driving factors of discrimination to study how and why discriminatory process takes place to identify suitable theoretical and application-oriented concepts that foster inclusion in the labour market. For each discrimination ground (ethnicity and gender, ages, number of children) we design a specific vignette in which recruiters are asked to judge fictitious hiring decisions on a set of fictitious job candidates. With our experimental design, we have the possibility to ask recruiters their opinion also in terms of whether they would promote the candidate for a career advancement. Furthermore, according to the obtained results, we analyse underlying mechanisms and suggest remedies to overcome the observed discrimination. We use explanatory drivers of the discrimination found to develop strategies aimed at remedying the bias in the labour market. Our goal is to develop innovative policy approaches to promote inclusion and quality employment of the considered groups. The aim is to develop practices that facilitate reduction of employment gaps between vulnerable and mainstream groups, and to identify and compare the usefulness of different options for policies.

The Regulation of the Maintenance of Community-Use Spaces in Brazilian Favelas: Interactions between Local and State Agents and Interlegality Relations

This research departs from the sociolegal studies agenda on legal pluralism in Brazilian favelas and from legal geography studies on public space regulation. Its aim is to provide new insights and explore new perspectives regarding both research agendas. It intends to answer the following research question: "how can the regulation of the maintenance of community-use spaces vary in Brazilian favelas?". Community-use spaces are those used by local residents for daily encounters and community activities, representing important aspects of their rights to leisure and to the city. To address the research question, qualitative data from different Brazilian favelas were accessed. Part of the data was gathered from a multiple case study in a set of eight favelas located in four Brazilian cities – Belém, Porto Alegre, Rio de Janeiro and Salvador. Further data was collected through participant observations as a member of the "Observatory of Social-Interest Land Regularization" (Observatório da Regularização Fundiária de Interesse Social – ORFIS), a project from the Universidade Federal do Rio Grande do Sul (UFRGS) dedicated to gather information of favelas in the city of Porto Alegre. The data were analyzed by the identification of narratives that reveal the action of norms that regulate the maintenance of community-use spaces, especially social and legal norms that attribute responsibilities and procedures to assure that squares, streets, soccer fields and other community-use spaces and structures remain in adequate conditions for the daily life of local residents. Preliminary results suggest that the regulation of the maintenance of community-use spaces vary from situations in which they are considered both by local and governmental actors as a sort of condominium spaces managed by community institutions to situations of more intricate relationships between local and governmental actors, in which they share responsibilities under the influence of social and legal norms.

CAVALCANTI SIMIONI, ANA PAULA* (University of São Paulo, Brazil)

Qui Classe Les Classements ? : Une Analyse De La Présence Des Artistes Latino-Américains Selon Les Palmarès Internationaux (ARTFACTS)

La communication aborde la question de l'intégration des artistes périphériques (notamment ceux d'origine latino-américaine) dans le système artistique international. À cette fin, j'analyse les données produites par ARTFACTS, un important palmarès international, entre 2000 et 2022. Il s'agit de discuter la nature informative et « performative » d'ARTFACTS, car il s'agit d'un classement qui non seulement affiche des données objectives sur les artistes de manière hiérarchique dans un monde globalisé, mais il promeut également les hiérarchies. Comme j'ai l'intention de l'expliquer, même si ARTFACTS occupe une place de légitimité dans l'imaginaire des agents les plus centraux du monde de l'art mondial, il est considéré avec prudence par les agents de régions moins dominantes, comme le Brésil. Ainsi, la recherche développe des dialogues avec des études antérieures comme celles d'Alain Quemin (Les Stars de l'Art Contemporain, 2013) et de Larissa Buchholz (Global Rules of Art, 2022), mais en s'intéressant particulièrement à l'intégration des artistes latino-américains (nes) à partir d'un classement qui est vu à la fois comme source et comme objet à problématiser, puisqu'il est lui-même producteur de hiérarchies symboliques dans le monde de l'art contemporain.

CAVALIERE, PAOLA* (University of Milan, Italy)

Women in Faith-Based Disaster Response to the 2016 Kumamoto Earthquake

Although Japan is recognized for its specialized and efficient disaster management systems, the response to the April 2016 earthquakes in the Kumamoto area (southern Japan) was insufficient. A disaster culture focused primarily on non-seismic hazards affected the region's disaster preparedness. Moreover, despite the Japanese government's efforts to incorporate a gender perspective into disaster management policies over the past thirty years, these efforts failed to alter the gender-biased nature of the responses. As a result, the women of Kumamoto faced not only context-specific vulnerabilities due to inadequate preparedness for seismic hazards but also additional social vulnerabilities linked to their gender. In this context, religious organizations largely leveraged their localized culture to promote resilience by prioritizing

the knowledge and skills of both members and non-members, regardless of gender. Drawing upon 22 semi-structured interviews with women affiliated with Sōka Gakkai and the God Light Association (GLA), this paper investigates the intersection of gender and religiosity to evaluate the preparedness of women associated with religious organizations. The findings indicate that the persistent gender-blind nature of institutional post-seismic interventions exacerbates women's vulnerabilities and hampers their human rights. However, religious organizations, including conservative ones, may provide more inclusive disaster management and response models. The results of this study underscore the necessity for more inclusive disaster management frameworks to effectively mobilize and sustain community resilience, and provide a human-rights-based approach to disaster prevention, mitigation, response, and recovery.

CAVARO, FLORENTINA* (Universidad Nacional de la Matanza, Argentina)

Relatos De Cambio: Análisis Del Proceso De Desistimiento De La Violencia De Género En Argentina y Uruguay

El análisis del proceso de desistimiento de la violencia contra las mujeres es un área poco explorada, a pesar de su gran impacto en las políticas públicas. Desde un enfoque narrativo, que considera el desistimiento como un proceso de transformación tanto en el relato del actor sobre su comportamiento como en su identidad, este trabajo explora qué discursos están disponibles para pensar y experimentar el cambio subjetivo narrado por varones participantes de programas de abordaje de violencia de género en Argentina y Uruguay. Por *discursos disponibles* se entiende que los procesos de cambio, los "tratamientos" y su factibilidad depende de cómo se conectan los actores y los contextos que habitan, así como los discursos que intervienen en dichas relaciones.

El análisis se basó en un enfoque biográfico, con entrevistas narrativas a agresores (n=41) en Argentina y Uruguay. Se codificó temáticamente todo el corpus de entrevistas y se seleccionaron dos casos para reconstruir la historia de vida, buscando entender cómo los varones narraron su experiencia de vida y la situación de violencia vivida, diferenciando entre la vida narrada y la vivida.

Roberto y Gonzalo evidencian parte de los repertorios existentes para pensar el cambio. En este artículo se discute cómo las narrativas institucionalizadas para entender el pasado y el cambio guían ciertos relatos con un doble efecto: posibilitan la narrativa del cambio al revisar aspectos de la vida y aprendizajes, pero también limitan los procesos de desistimiento al excluir ciertas experiencias biográficas de ser consideradas "legítimas". Este artículo abre el camino para discutir el funcionamiento y compromiso de los programas en América Latina.

WG11-JS-128.1

CAVARO, FLORENTINA* (Universidad Nacional de la Matanza, Argentina)

The Making of a Violent Man's Past: How Discursive Contexts in Batterer Intervention Programmes Shape Biographical Reconstructions

Discursive offers are crucial not only for understanding biographical reconstructions but also for processes of subjective change. In the context of batterer intervention programmes—where biographisation of past aggression and its subjective motivations are central—the notion that men exhibiting violent behaviours can adopt new perspectives on their past actions is pivotal to interventions, desistance policies, and downstream policing. This paper adopts a social constructivist approach to explore how treatment programmes frequently promote individualised reconstructions, advancing discourses that may clash with participants' lived experiences. The study draws on narrative interviews with men at various stages of batterer interventions in Argentina and Uruguay, followed by biographical case reconstructions. I present the contrasting cases of Dalmiro and Pedro, who reinterpreted their life stories differently with respect to their experiences of victimisation. Dalmiro's reconstruction enabled him to view his experiences in a 'positive healing' light, facilitating his navigation through the system. He understood his past victimisation as a trigger for his later behaviour. In contrast, Pedro struggled to accept his father's violence as a trigger, encountering subjective and interpersonal barriers in his therapeutic journey. The notion of being a 'victim' and interpreting it as a conditioning factor for their own aggression was not a shared experience. These biographical reconstructions are far from neutral; they are shaped by power-laden discourses that decontextualise violence, oversimplify broader social processes, obscure the structural dimensions of intimate partner violence, and impede certain men's desistance. The absence of alternative therapeutic discourses—those acknowledging the broader

social forces shaping harmful behaviour—profoundly affects the therapeutic process and the formation of subjectivity. Ultimately, I argue that the discursive offer of these programmes also reflects pre-designed interventions for men, often developed in other regions.

Good Woman, Bad Woman: How Autocrats Frame Women's Rights and Status

Justice and Development Party (JDP) of Turkey has claimed to significantly improve women's status during its tenure while domestic and international women's organizations have consistently criticized its policies for being misogynist. JDP's claim to have improved women's status is common among many authoritarian regimes leading to disagreements among scholars about to what extent, if any, autocrats in the Middle East and North Africa (MENA) region have improved women's rights. How can we assess the discourses adopted by autocrat regimes regarding women? Studying discourse is significant because it frames women's rights and responsibilities, initiates policies, reveals the intentions of political leaders and defines the boundaries of what is politically acceptable, among others. To answer this question, this project undertakes the task of examining the speeches, interviews and media briefings by the top brass, particularly Recep Tayyip Erdogan, current president and the party leader, between 2002 and 2024 by using NVivo, a qualitative data analysis software. The qualitative data are coded and analyzed accordingly. The preliminary findings suggest two major trends taking place simultaneously: On the one hand, the discourses of the top brass praise women as mothers, wives, party activists, volunteers, pious Muslims, and voters, encouraging them to participate in politics in multiple ways. On the other hand, women are subjected to criticism if they engage in politics outside the boundaries of what is permissible. In other words, women are welcome into politics in large numbers as long as they do not question the roles assigned to them, but they are repressed, mocked, and ridiculed when they do. The dichotomy between "good woman" and "bad woman" is key to understanding the limitations of descriptive representation of women that often fall short of asking for gender equality in authoritarian settings and the significance of substantive representation of women that pursue feminist goals.

Mass Social Unrest and Political Disappointment: First-Time Protesters in Chile and Colombia

This research explores the political narratives of first-time protesters in the context of the social uprisings in Chile (2019) and Colombia (2019-2021). These individuals were crucial in turning these events into mass movements, effectively becoming their protagonists. By studying their narratives through a qualitative approach using narrative interviews and photo-elicitation (leveraging participants' Instagram stories), the goal is to understand how these contentious events contributed to the formation of new identities and political understandings among ordinary citizens.

This presentation focuses on the widespread feeling of disappointment experienced by first-time protesters. The diverse and, at times, contradictory nature of the demands emerging from the uprisings made it difficult for participants to feel that their objectives had been fulfilled. Unlike traditional social movements with well-defined goals, these uprisings posed significant challenges for governments due to the sheer complexity of addressing such varied demands.

I argue that despite the election of presidents aligned with the uprisings' rhetoric in both Chile and Colombia, a prevailing sense of disappointment persists among first-time protesters. Through narrative analysis, I demonstrate how deeply intertwined institutional and extra-institutional political processes are and how protesters articulate these dynamics in their narratives. In Chile, protesters often mark the end of the uprising with the rejection of the constitutional proposal, while in Colombia, it is linked to the election of Gustavo Petro. In Chile, the sense of defeat stems from the failure of the constitutional process, whereas in Colombia, it is associated with the lack of tangible changes in everyday life following the election of the country's first left-wing president. This analysis offers insights into the nuanced ways feelings of defeat shape identity formation and political understanding in both countries.

Experiences of Research and Action Work in the Central Areas of Havana.

Over the last 60 years, Cuban universities have established work on social problems as a key objective, both for undergraduate and postgraduate education and for scientific research. In the area of the built environment, work with neighbourhoods and communities has been strengthened. However, due to the complexity of the city, especially in Havana, the university's outputs and results have not always been applied. In the last decade, more collaborative work has been experimented with a research and action approach. It allows a greater involvement of the community as a key actor. Its basis in multi- and transdisciplinary research has demonstrated a greater impact on local transformation. Nevertheless, there are still few implemented solutions. The Urban Research and Action Group of the Technological University of Havana, CUJAE, has applied this kind of approach in different neighbourhoods and communities in Havana, with an increasing socio-technical co-creation process.

This paper shows some results of the experience of co-producing local solutions with multiple actors and especially with the neighbours as protagonists. It shows the relevance of the university when it plays a role of accompaniment and moderation. On the one hand, the creation of capacities to achieve the continuity of any action in the community and to be responsive themselves. On the other hand, the possibility of promoting new ideas and bringing together different social actors, demonstrating its catalytic role in the transformation of the local within global spaces. It also shows the importance of international cooperation as a driving force for such transformations, not only because of the financial contribution, but also because of the possibility of implementing international experience in an often virgin environment. The process of translating research into practice and viceversa finds in these experiences a vital space for development and innovation at the local level.

CÉ SANGALLI, LUCAS* (Ruhr University Bochum, Germany)

The Sociohistorical Construction of Slave Ancestry in Salaga, Ghana

Salaga, located in present-day Ghana, was a prominent trade hub in 19th-century West Africa, including the trade of enslaved persons. Although local authorities legally abolished slavery under British pressure in 1897, covert trade persisted. Following Ghana's independence in 1957, Salaga became the capital of the East Gonja District. Despite fading references to its collective history of slavery, the "Salaga Slave Market" remains a significant tourist attraction for those interested in the history of slavery in Africa.

Drawing on historical documents, participant observation, and interviews conducted in Salaga as part of the project *Individual and Collective Memories of Slavery and the Slave Trade in Ghana and Brazil* (DFG; PO 2422/3-1; RO 827/23-1), this paper explores the relationship between various forms of enslavement and servitude in Salaga and the contemporary social positions of those constructed as 'slave descendants' relative to members of more or less established groupings within the Salaga figuration. This is achieved by reconstructing the contrasting ways in which members of the so-called Grunshi — socially constructed as slave descendants — discuss their ancestry and collective history, as well as the slave trade in Salaga. By combining the sociology of knowledge with a social-constructivist figural and biographical approach, I demonstrate how different forms of slavery and servitude shape distinct perspectives on the collective past, influence the knowledge surrounding types of slavery, and affect the pride associated with ancestral heritage. The findings highlight the necessity of reconstructing the past of enslavement to understand power inequalities in contemporary societies.

Digital Lifelines: Exploring Mental Health Narratives and Help-Seeking Behaviors in Online Communities Among Filipino Domestic Helpers in Hong Kong SAR

This article is a component of an ongoing dissertation project examining how foreign Filipino domestic helpers (FFDHs) in Hong Kong SAR, China, navigate and negotiate their access to formal and informal mental health support within transnational contexts. Specifically, this paper aims to: (1)

identify primary causes of mental health issues among FFDHs, (2) characterize factors influencing their decision to seek mental health support in digital spaces, and (3) analyze how their narratives in digital spaces reflect and challenge intersecting power structures from local to global scales.

This exploratory study analyzed 49 Facebook posts published between July 1, 2023, and June 30, 2024, in two private online peer-support groups for migrant domestic workers. Posts were purposively selected using the search terms “depress,” “stress,” “anxiety,” and “homesick.” To safeguard user privacy, only published posts from anonymous members were included in the analysis. Reflexive thematic analysis, informed by a transnational feminist sociological lens, was utilized to identify recurring themes.

Preliminary findings reveal financial issues, employment-related concerns, and family-related problems in the Philippines as primary causes of mental health concerns for foreign domestic helpers. Their narratives also reflect how power structures at various scales intersect in their lives and mental health experiences, demonstrating how their mental well-being is intrinsically linked to their underappreciated role in the global care economy. Furthermore, the preliminary analysis indicates that online peer-support groups can serve as sites of transnational connection, highlighting the role of digital spaces in providing informal mental health support for migrant workers and potentially serving as avenues for connecting them to formal mental health services. The findings of this paper hope to contribute to discussions related to policy development, mental health service provision, and the conceptualization of transnational support networks for foreign domestic helpers.

CELERO, JOCELYN* (University of the Philippines Diliman, Philippines)

The Role of Social Networks in Securing Social Protection during Pandemic Times: Impact on Social Security Systems Literacy of Filipino House Helpers in Tokyo, Japan

While Japan is a less known destination for domestic workers, Filipino women have been recruited into the sector either work for expat families since the 1960s, or are outsourced through the Philippine recruitment agencies connected with Japanese housekeeping service companies beginning 2018. Compared to other migrants, their precarious legal status poses greater challenges to securing adequate social protection particularly during COVID-19 pandemic.

Building on 20 interviews and four focus group discussions, the study aims to map out how social networks enable or constrain Filipino house helpers' access to the social protection systems in the Philippines and Japan. Using the concept of social security systems literacy (Celero et al. 2022), the study examines how various actors extend information about social protection schemes in receiving and sending states, which influences the level in which Filipino house helpers are familiar with, know, and understand the policies and programs these systems make available to them. Findings reveal that migrants themselves, governance, social networks, informal channels, and media contributed toward either enabling or constraining Filipino house helpers' social security systems literacy, which then affected the range of social protection they claimed during the pandemic. Reliance on informal networks (consisting of employer, friends, migrant organizations) while in Japan, Filipino migrant domestic workers would often disregard Philippine-based programs and policies for ensuring their health and social welfare. As a result, their level of social security systems literacy tends to improve the longer they live and work in Japan, gradually alienating them from the Philippine social security system. The study underscores that access to information about social protection for migrant workers facing vulnerable social and legal statuses in receiving states affect the overall social wellbeing of Filipino migrant workers during and beyond pandemic times.

How Should We Categorize Population Movements after an Earthquake? an Analysis Based on Fieldwork on Mobility Following the February 6 Earthquakes in Turkey

The earthquakes in Kahramanmaraş on February 6, 2023, caused the largest disaster-related migration ever recorded in Turkey. More than 2 million survivors from the earthquake-affected area, which includes 11 city provinces with a population of approximately 13.5 million, relocated to other provinces. 2 million Syrians live in the area under temporary protection were also affected. The decision to migrate is typically seen as a strategy by individuals or households to maximize their utility based on personal, social,

and economic factors. However, it is challenging to understand how this decision is made in extreme situations such as war or disaster due to the uncertainty and urgency involved. Previous studies on population movements caused by disasters mainly refer to four types of mobility patterns: i) those who remained in their places (immobility), ii) those who migrated by their means, iii) those who migrated with the support of the public and civil society, iv) those who were displaced due to legal regulations. This study examines how and why the migration movements emerged after the February 6 earthquakes. Based on the mobility justice framework, one of the crucial questions is identifying these migratory movements by focusing on who had the means to leave, where, and why. Therefore, it is critical to determine whether these movements could be considered a type of forced migration, a displacement, or simply mobility of choice. Based on in-depth interviews with key experts who worked during the post-disaster recovery in the zone and survivors who relocated to Ankara and Mersin, the key aim of this study is to uncover the reasons behind in/outmigration to/from the zone. By doing so, it aims to draw attention to the multidimensionality of post-earthquake migration movements, contributing to the complexities of defining them.

Entangled Care in Immigrant Communities: A Post-Pandemic Lexicon of Care Dynamics in Queens

During the pandemic, a common scene worldwide involved a mother preparing lunch in the kitchen, a grandfather on a phone call, a child attending an elementary school class on Zoom, a dog barking, and a baby crying—all at the same time, in the same space. In immigrant neighborhoods of Queens, this situation was even more complicated: Queens was the epicenter of the pandemic in New York, immigrants disproportionately assumed essential care roles in the city (such as nurses, schoolteachers, food delivery workers, maids), and immigrant communities already faced a deficit in care infrastructure (schools, hospitals, and household support) before the pandemic, which worsened during the lockdowns. Although these scenes have become less intense in the post-pandemic era, the question remains: How do these multiple layers and crises of care (caregivers, care recipients, institutions, and infrastructure) interact? What are the forces and conditions that support a healthy care system, and what are the forces that burden it?

Drawing on semi-structured interviews with immigrant families, we propose four typologies of care-to-care interactions—antagonistic, complementary, supplementary, and constitutive—that describe the conditions under which care dynamics are sustained, strengthened, and overloaded. We conclude that sharing caregiving knowledge and establishing consistent care routines are essential for the sustainment and expansion of care dynamics, while failure often stems from unilateral decision-making and inflexibility in

caregiving practices.

ČEPYTĖ, KORNELIJA* (Lithuanian Centre for Social Sciences, Lithuania)

Feelings of (Not) Belonging: Everyday Nationalism and Emotions in Lithuanian Public High Schools

The role of schooling in (re)producing nation-states and nationalism is a well-established concept in sociological literature. Universal and centralized education, particularly through mandatory schooling, has been shown to foster common narratives, symbols, and imagery essential for imagining the national community. Extensive research has illuminated how structural aspects of education—such as state and school policies, curricula, and textbooks—contribute to constructing and reproducing national identity. However, schools are not only where students learn truths about their nations and “others”. Students also experience emotions related to this knowledge and patriotic/nationalistic activities and interactions. Still, significantly less attention has been given to how nationalism is shaped and reproduced through everyday practices, interactions, and emotional responses within the school environment.

This paper presents preliminary insights from my ongoing doctoral research, which employs multisited ethnography to explore the affective dimensions of everyday nationalism in Lithuanian schools. Drawing from theoretical frameworks of everyday nationalism and affective nationalism, I investigate how emotions and affective experiences rising from everyday practices in schools contribute to internalizing a sense of (not)belonging among ethnic minority students. Through participant observation, interviews, in different school settings, my research sheds light on how everyday interactions in educational institutions subtly but powerfully reinforce or challenge national and ethnic identity. The early findings suggest that the

emotional landscape of schools, including feelings of inclusion, exclusion, and belonging, plays a crucial role in shaping both the students' national identity and their broader social integration. These insights have significant implications for understanding the affective dimensions of nationalism and the role of education in shaping both individual and collective identities in multicultural settings.

Infrastructures of Inclusion and Exclusion: Examining Power, Access, and Contestation in Amritsar's Social Housing Projects

This paper investigates the role of urban infrastructures in shaping access, exclusion, and contestation within two social housing projects in Amritsar, India. Infrastructures—such as roads, water pipelines, electricity grids, and governance mechanisms—are often framed as facilitators of social inclusion and poverty reduction in urban planning. However, this study reflects on how the same infrastructures can also become tools for reinforcing marginalization and inequality, particularly in low-income housing contexts. Drawing on field research and access theory, the study explores how infrastructures mediate relationships between residents, government bodies, and urban resources. In the first case study, a resettlement project aimed at improving living conditions for marginalized migrant communities, the infrastructural layout and services provided by the municipality purposely do not meet the needs of residents, leading to further social exclusion. Here the analysis of everyday practices shows how infrastructural disconnects contribute to the marginalization of these communities. In the second case, an income-based social mix housing project, infrastructures designed to integrate diverse residents have instead generated conflicts over resource allocation and access to basic services. The case illustrates how urban infrastructures are instrumentalized by different actors with contested interests, each pursuing divergent objectives within the housing project. Drawing on these cases, the paper argues that infrastructures in social housing not only enable or constrain access to resources but also shape social relations and power structures. By focusing on the infrastructural dynamics in these two housing estates, the paper underscores the need to critically examine the role of infrastructure in urban planning and social inclusion, offering new perspectives on the relationship between the built environment and marginalized urban communities.

Sharing Practices and Collaborative Housing: Insights from the Stadtteilen Dialogues in German Cities

This paper examines the role of sharing practices and collaborative housing initiatives in fostering social inclusion, affordability, and sustainability in urban settings. Focusing on three German cities—Berlin, Kassel, and Stuttgart—this study draws on a series of dialogue events organized by the *StadtTeilen* transdisciplinary research network. These events brought together a diverse set of stakeholders, including residents, civil society actors, urban planners, and researchers, to exchange knowledge on urban sharing practices, particularly in the context of housing and public space. The analysis highlights the spectrum of sharing practices, from commoning—defined as de commodified, community-driven sharing—to market-oriented approaches within the sharing economy. By exploring motivations, drivers, and structural challenges faced by urban actors engaged in these initiatives, the study reflects on dynamics that enable or constrain sharing practices and collaborative housing efforts. The paper shows for instance the contrast in Berlin between tenant-led housing cooperatives and the commercially driven CoLiving model, which illustrates the tensions between commoning efforts and market forces. In Kassel and Stuttgart, public-private partnerships and community-led interventions in public and semi-public spaces further emphasize the diversity of space-sharing and collaborative housing practices. Ultimately, the paper also reflects on the potential of knowledge-sharing platforms, such as the *StadtTeilen* dialogue events, to foster mutual learning among stakeholders with differing objectives and knowledge bases. Finally the paper concludes that challenges remain in scaling both sharing and collaborative housing initiatives and ensuring their sustainability, especially in the face of ongoing market pressures.

Beyond Flexibility: Digital Technologies, Caregiving, and the Struggle for Time in Post-COVID Work-Life Balance

This paper delves into the relationship between personal autonomy encompassing the time, place, and structure of both professional and private life, and the role of digital technologies (DT) in shaping these dynamics. Drawing from the TIMED (Time Experience in Europe's Digital Age) project, we focus on post-COVID-19 digital practices in Czechia, Switzerland, Poland, Germany, Spain, and the UK, with a particular emphasis on individuals with caregiving responsibilities. Our research highlights the importance of an intersectional approach to understanding how DT influences work-life balance and individuals' capacity to negotiate and re-negotiate their control over time and space. Our findings are based on semi-structured interviews (n=450, collected 2022-2024) and real-time behavioural assessment to establish how digitization affects time usage and the passage of time during daily life (n=450, collected 2024-2025).

While remote work enabled by DT has been celebrated for its flexibility, particularly for caregivers, it also brings new challenges. Constant connectivity, blurred boundaries between work and personal life, and the increased pressure to meet heightened expectations in shorter time frames are prominent concerns. Our findings indicate that despite the advantages of remote work, particularly for those juggling caregiving duties, it can lead to burnout, isolation, and a diminished sense of well-being.

Through our collaboration with trade unions, a key partner in the TIMED project, we advocate for a deeper understanding of the sociocultural context and gender+ inequalities in DT-facilitated work. We argue that better regulation is crucial to address these complexities and ensure that digital technologies support not only professional flexibility but also a more balanced personal life.

Crossroads of Reform: Why Rape Redefinition Advanced While the Istanbul Convention Stalled

This paper explores the contrasting trajectories of two pivotal gender-based violence (GBV) reform efforts in the Czech Republic in 2024: the successful redefinition of rape in national law and the stalled ratification of the Istanbul Convention. Both processes unfolded against a backdrop of intensifying anti-gender narratives, with conservative and populist actors portraying the Convention on Preventing and Combating Violence Against Women and Domestic Violence as a threat to traditional values. While the feminist civil society campaign for rape redefinition succeeded in galvanizing public and political will, leading to a historic legal shift, the broader protections offered by the Istanbul Convention were met with fierce opposition. This opposition not only hindered progress but reinforced moral panic around gender-related issues. By framing GBV narrowly, as a legal rather than a structural issue tied to broader gender inequalities, political actors could advance isolated reforms while resisting more comprehensive approaches. The paper argues that selective moral panic, reluctance to address the intersection of GBV and gender inequality, and strategic framing allowed one reform to succeed while the other stalled.

New Dynamics of Racialised Labour Disciplining in Central and Eastern Europe

Our intervention focuses on the operation of racial capitalism on the periphery of the Global North—in Central and Eastern Europe (CEE). We examine the entanglement of racialisation in the disciplining of labour through household debt in Czechia and Hungary. Drawing on empirical data from both countries, we discuss how the mechanisms of labour racialisation evolved around Roma and how they expanded to migrant workers. For

decades, Roma workers in both countries have been disproportionately affected by unpaid debts and they also remain confined to low-paid and precarious jobs. Despite nationalistic and racist rhetoric of leading politicians, the demand for cheap manufacturing labour in CEE increased, which led the rise of the number of migrant workers. In 2024 in Hungary, 100,000 migrant workers, mainly from Ukraine, Philippines and Vietnam, were reported to work in automobile and electronics factories. The number of migrant workers in Czechia was reported to be even higher (Desku, 2024). Researchers have described their situation as “perpetual temporariness” (Bisztrai et al, 2022), marked by precarious employment contracts and racialisation (Schling, 2022; Sachetto & Andrijasevic, 2016).

We propose that the entry of new migrant labour from Global South to CEE countries, builds on the existing dynamics of labour racialisation in employment and household indebtedness. Our intervention explores these dynamics of racialisation in workplaces and neighbourhoods, and examine how it affects the existing mechanisms of residential confinement and labour disciplining and racialisation of Roma?

We will conclude with a discussion on the responses of workers to these dispossessive mechanisms, and the new opportunities to re-politicise these struggles through the presence of workers from Global South. Our focus on social reproduction and anti-racism struggles aims to provide an opportunity to re-articulate the demands of labour movement at this junction.

Re-Visiting Walter Benjamin: The Work of Art in the Age of Digital Reproduction

Walter Benjamin's essay “The work of art in the age of mechanical reproduction” has become a milestone for art theory, reconsidering the way that art establishes some statements about politics and social environment. Benjamin's work is crucial to distinguish between classic and modern art through strong concepts like “aura” and “uniqueness”. The richness of this theory allowed contemporary art productions through the second half of 20th Century to state their political and social relevance for the people they aim to reach. With the rise of digital tools, art practices were modified, establishing new ways for art production and re-production. Through this reality, most of Benjamin's theory should be revised to understand this new digital art production. This work intends to apply fundamental Benjamin's concepts like aura, oeuvre singularity, cult value, exhibition value and art politics in post-modern digital era of art production and reproduction. The main purpose is to demonstrate that the powerful Benjamin's concepts can still be active to revise the way digital art can talk to people plunged in over-informed societies where post-truth, fake news and polarization is constructing politics and understanding multicultural societies.

RC14-211.3

CERRILLO GARNICA, OMAR* (ITESM, Mexico)

Télé-réalité au Mexique : l'empire de la télévision contre-attaque

At the beginning of the 21st Century, a new television programming format became popular worldwide: the so-called reality shows. This format declined its popularity at the 2010s, when television as a concept slowly declined as the most popular media, giving up its place to YouTube and other social media platforms that began to incorporate video formats in digital support created by prosumers, that were at the same time content producers and consumers of related content. Reality wasn't in TV; it can be seen directly from producers' homes. In 2023, Televisa, the Mexico biggest and otherwise very powerful TV broadcasting corporation, launched a new reality show called “La Casa de los Famosos” [The Famous House], in a very similar format from the vintage popular “Big Brother”, a transnational TV format show popular at the beginning of this century. In this new show, Televisa recruited some famous social media influencers to participate in the show. The most significant persona was Wendy Guevara, a transgender woman that become very popular through her funny Internet videos. In the 2024 edition, Adrián Marcelo was included, a controversial influencer known best for his patriarchal assurances. Both characters located in extreme poles of gender considerations. This work aims to analyze how these controversies helped to locate “The Famous House” as a very popular “trending topic” in Mexico, by considering classic Birmingham School of Cultural Studies –Morley, Hall, Jameson–, which considerations are relevant to analyze how TV is working to stay as an important source of content and entertainment for masses.

CERVIA, SILVIA* (University of Pisa, Italy)

Gender As a Battleground: (Re)Degendering the Construction of 'I' and 'we' Identities in Populist Discourses

Gender has increasingly permeated public discourse, evolving from an academic and feminist topic to a central, divisive issue. The push to overcome gender inequalities has led to a paradigm of degendering, with linguistic degendering seen as key to reducing gender biases (Liu et al., 2018). The argument is that if gender categories are blurred, differential treatment based on gender becomes difficult. A perspective that has permeated not only the academic debate (Butler, 1990; Lorber, 2021) but has also proven capable of sparking public debate where the instances of degendering intersect with identity politics, offering it new nourishment (Moran, 2020).

This paper explores gender and identity construction in the public sphere, considering gender as a social and constitutive category for self- and others-identification (Ridgeway, 2011). Building on recent sociological literature (Riesman, 2018), the paper proposes a framework based on structuration theory, exploring the duality of structures through “cultural schemas” and “symbolic resources” (Cervia, 2024). It views gender identity as a structure driving individuation and singularization processes in late-modern societies (Martuccelli, 2010; Reckwitz, 2022).

The proposed interpretative framework is used to analyze the narratives put forward by anti-gender movements in Italy (the pro-life and family movement) over the past two years, as well as those advocated by LGBTQI+ movements, and the reconfiguration offered by populist parties. The empirical base, composed of a variety of sources (official documents, mandate programs, social media pages, etc.), is analyzed through a qualitative content analysis in order to examine how “cultural schemas” and “symbolic resources” interact with the reconfiguration of individual and collective identities, mobilized by populisms (Westheuser, Zollinger, 2021).

The paper concludes by interpreting the polarization in the public debate on gender identities as a reflection of the cleavage between hyperculture and cultural essentialism (Reckwitz, 2020).

Social Inclusion of Transnational Families in Lithuania: The Case of War Refugee Children from Ukraine

War refugees often are from transnational families, as many of them have members residing across state borders. Since the beginning of the war in Ukraine in February 2022, approximately 86,000 Ukrainian refugees have arrived in Lithuania in search of temporary settlement. The majority of these arrivals were women with preschool and school-aged children, as well as unaccompanied minors.

Lithuania swiftly mobilized its education, social, health, and other systems to receive war refugees from Ukraine. Initially, the most pressing concerns were accommodating refugees and addressing their basic needs. Currently, the focus has shifted to their social inclusion into the society. War refugee children represent a particularly vulnerable group, and their social inclusion is essential for their full development and well-being.

Therefore, a qualitative study conducted in 2024, aiming to explore the social inclusion of Ukrainian war refugee children, focusing on their social inclusion into the education system. The participants were upper-grade students who arrived in Lithuania from Ukraine after the outbreak of hostilities, along with teachers who work with Ukrainian refugee children. All participants either have family members still in Ukraine, or members who have migrated to other countries.

The study found that the most pressing issue of social inclusion relates to learning the Lithuanian language. Motivation to learn Lithuanian primarily depends on the family's decision about their future. If the family decides to stay in Lithuania, parents encourage their children to learn the language. The extent of the child's interaction with Lithuanian peers greatly influences language learning. Similarly, how much those around the child encourage them to speak Lithuanian also plays a significant role. It became evident that Ukrainian children show a strong interest in Lithuanian history, customs, and culture, eagerly participating in celebrations of commemorative days and seeking similarities with Ukrainian history and traditions.

CETINER, OZAN* (Ankara University, Turkey)

The Persistence of the Peasantry in Türkiye: Economic Crises, Government Policies, and the Impact of Ecological Degradation

Whether the peasantry will disappear or not has been a central question debated globally throughout the 20th century, as well as in Türkiye. Like many "developing" countries, Türkiye has not yet eliminated its peasantry, despite the widespread effort to abandon villages. The latest statistics on population and agriculture reveal that almost 30 percent of the population still lives in areas designated as "rural," and 90 percent of agricultural enterprises operate on less than 200 da of land, indicating the persistence of petty-commodity production. A recent agricultural law in Türkiye states that if an agricultural area remains unplanted for two years, it can be rented to someone else to cultivate. The recent protests by peasants in Türkiye clearly illustrate the severe crisis in earning a livelihood from agriculture, leading some farmers to destroy their crops or leave their fields fallow. The government has turned this struggle into an opportunity to address the food crisis and food inflation in Türkiye.

What is often overlooked is that a significant number of peasants are adamant about not abandoning their villages and local cultures. As is well known, the Anatolia region is home to diverse ethnicities and cultures, including Alevi-Bektaşî, Kurds, Laz, Zaza, Romani, Arabs, and others. I argue that the determination to stay in the villages is not only about the ability to survive despite dire economic conditions but also due to strong local community ties across Anatolia. Two field studies conducted in different villages in Türkiye highlight this determination and reveal the peasants' strategies. What makes this struggle even more compelling is the impact of ecological degradation, particularly water scarcity, which has begun to affect these villages. We can say that both state policies and ecological disasters are attacking the peasantry in this century, especially in Anatolia, leaving villagers increasingly vulnerable and desperate.

Digitalisation and Precarisation in Sports Journalism in Turkey: Invisible Emotions of Sports Journalists

Sports journalism in Turkey has been based solely on football. Other sports, especially amateur sports, have been covered in a limited way, except for the Men's Basketball National Team and the international successes of basketball clubs or the championships of the Women's Volleyball Team in recent years. The processes of denunciation and the precariatization of labour in the Turkish media have led to the news sources of newspapers and televisions depending on agencies. Sport is a social organisation where emotions are intense. It is possible to trace the traces of an emotional intersection by both the spectators, the newsmakers and the athletes. The study will have two main axes. First, it will be questioned how the news production processes are shaped by the reporters working in the Istanbul bureau of İhlas News Agency, and how the journalism traditionally hegemonised by football and Istanbul teams in football affects the reporters' perspectives. In this respect, the professional dimension of digitalisation processes in journalism, especially in sports journalism, will be emphasised and it will be tried to be understood how it affects the self-definition and self-perception of journalists. At another stage, it will be tried to question how working conditions and social media affect news making processes. Answers will be sought to the questions of digitalised working conditions, the digitalised daily lives of sports journalists, and which emotions are brought to the fore by the blurring of the boundaries of professional and daily life. It will be sought to answer the question of what contradictions the precariatized labour processes in sports journalism reveal in the self-presentations of journalists. In the study, in-depth interviews will be conducted with sports reporters working in the Istanbul bureau of İhlas News Agency and Istanbul-based Fanatik and Fatomaç reporters, and news-making processes will be investigated through participant observation.

Personal Branding for Doctoral Students: What Purpose for Their Professional Project?

Every year, a few hundred doctoral students graduate in Morocco. Among them, some will hold a position as university professor, others will exercise various functions in the public or private sector, or on their own, freelance. Everyone contributes to the promotion of a knowledge economy that is increasingly in demand; and which is focused on discovery and innovation.

Throughout the doctoral journey, a range of soft skills is mobilized, and skills are consolidated, which forge profiles different from those already on the job market, and above all having modes of thinking and resolution distinctive problems for certain specific missions and positions.

In light of our experience with doctoral students and doctors, their concern to build a professional project challenged us; and above all their attraction for the foundation of "Personnel Branding". This brand image which could possibly open the door, for these profiles, to career opportunities in all socio-economic sectors.

Their culture of working in "project" mode, their methodology, their autonomy, their resilience and perseverance, their autonomy and many other soft skills which are highly sought after on the job market and which we have been able to detect in these hardworking people push us to dig deeper to be able to:

- Identify the soft skills most used and coveted by doctoral students.
- Understand why this generation of doctoral students would so much like to get involved in self-marketing and personal branding.
- How this could impact their professional career.
- And finally provide universities and directors of doctoral centers with a starting point for rethinking the programs offered to doctoral students.

Preventing and Resolving Violence through International Standards in the Thai Context: A Training Program on Dispute Mediation for Restorative Conflict Management Under the Mediation Act B.E. 2562

The training course on dispute mediation for restorative conflict management under the Mediation Act B.E. 2562, certified by the National Justice Administration Development Committee, serves as an essential tool for managing criminal conflicts in line with international standards and United Nations principles, as outlined in the "Basic Principles on the Use of Restorative Justice Programmes in Criminal Matters." This course effectively contributes to reducing violence in Thai society. To enhance mediators' knowledge of restorative mediation processes, relevant legal frameworks, and essential skills for acting as intermediaries in conflict management, the Academic Services Center of Chulalongkorn University, in collaboration with the National Research Council of Thailand (NRCT) and the Thailand Institute of Justice (Public Organization),

organized a training program on dispute mediation for restorative conflict management. The course, conducted from July 3-19, 2024, included both online and on-site sessions, totaling 54 hours of training. The program was attended by 29 participants from government agencies, civil society organizations, and the academic sector, all involved in the justice process and conflict management across various contexts. All participants (100%) successfully completed the program, with overall satisfaction rated at the highest level (\bar{x} = 4.88, S.D. = 0.05). The modules "Psychology for Communication and Body Language in Mediation" (Module 3) and "Practical Training in Mediation of Civil, Criminal, and Public Issues Using Simulated Scenarios" (Module 5) received the highest satisfaction scores, with ratings of (\bar{x} = 4.99, S.D. = 0.03) and (\bar{x} = 4.99, S.D. = 0.15), respectively. In order to provide greater benefits to participants, the duration of the "Practical Training in Mediation of Civil, Criminal, and Public Issues Using Simulated Scenarios" (Module 5) should be extended more than a day or the online training format should be adjusted to be entirely on-site.

Affects and Solidarity Work in the Aftermath of the Beirut Port Explosion

Most studies on disasters and crises focus on immediate relief, framing post-disaster organizing primarily as a response geared toward physical reconstruction. Less attention is given to the long-term, affective recovery of communities. In this study, I investigate the affective recovery of communities devastated by the Beirut port explosion in 2020, focusing on the role of solidarity in this process. Drawing on ethnographic work conducted from February 2021 to September 2023, I explore post-disaster organizing efforts in Lebanon and how affective solidarity shaped the emotional healing of those affected.

This study adopts an iterative interpretive and affective analytical approach to analyze interviews, fieldnotes, and secondary data, uncovering how emotions like anger, guilt, and shared suffering acted as affective triggers, mobilizing individuals into solidarity initiatives. Through the analysis, I propose a process model that outlines three trajectories: (1) affective triggers, (2) solidarity engagement, and (3) healing pathways. This model illustrates how negative affects were processed and transformed through collective action, fostering a sense of shared purpose and emotional recovery. Ultimately, the study reveals how solidarity contributed to the redirection of affective energies, gradually leading to a new social arrangement centered on solidarity and a return to affective stability.

By highlighting the long-term affective dimensions of post-disaster organizing, this research offers new insights into the transformative potential of affective solidarity, shedding light on its role in both individual and collective healing.

Clicks, Risks and Awareness: A Sociological Understanding of Media Literacy and Cyber Security Among University Students in Kolkata, India

The rapid expansion of digital technology has brought both opportunities and challenges for college and university students in India. With increasing reliance on the internet, social media, and digital platforms, media literacy and cyber security have emerged as critical areas of concern. As digital media continues to proliferate and evolve, understanding the sociological implications of students' media consumption and their ability to navigate online threats becomes imperative. Media literacy is the ability to access, analyze, evaluate, and create media in various forms. In the context of students, media literacy is essential for critically assessing the flood of information available online and making informed decisions. Cyber security refers to the protection of internet-connected systems, including hardware, software, and data, from cyberattacks. The rise in digital activity among students has exposed them to cyber threats such as hacking, phishing, and identity theft. Students often overlook basic security practices such as using strong passwords or enabling two-factor authentication. Utilizing a qualitative approach, this study aims to gather comprehensive data about university students' media literacy levels; cybersecurity knowledge; experience with online threats such as phishing, data breaches, and identity theft; and the strategies employed by them to protect themselves in the virtual world. This study highlights the perception of relationship between media literacy and cyber security among students of various universities in the urban landscape of Kolkata, India.

Struggling to Balance: Understanding Role Conflict Among Working Women in Kolkata, India

Background:

Working women face significant challenges in balancing professional and domestic responsibilities, leading to increased stress, reduced well-being, and lower quality of life. In a rapidly evolving urban context like Kolkata, traditional gender roles clash with modern expectations, heightening the pressure on women to excel in both spheres.

Objective:

This study explores the nature and extent of role conflict among working women in Kolkata, focusing on how they manage the demands of careers and household responsibilities in contemporary Indian society. It also aims to identify socio-cultural and organizational factors contributing to these conflicts.

Methodology:

This descriptive qualitative study utilized purposive sampling based on socio-economic status (Kuppuswamy scale, 2022). In-depth interviews were conducted in private, neutral locations to allow participants to freely share their experiences. Audio recordings were transcribed and analyzed thematically to gain sociological insights into role conflict.

Results:

For lower socio-economic groups: 1. Small families ease the balance between work and home life. 2. Workplace demands are more significant than family responsibilities. 3. They actively participate in decision-making. For middle socio-economic groups: 1. Significant work-family conflict is managed through better planning. 2. Sacrifices are made in one area to meet the demands of the other. 3. Decisions are made after consulting family or spouse. For higher socio-economic groups: 1. Women in government jobs experience less conflict than those in private sectors or businesses. 2. Women in private sectors or businesses make more sacrifices. 3. All are involved in decision-making.

Contribution:

This study provides a nuanced understanding of role conflict among working women in Kolkata, highlighting the influence of socio-economic status. It emphasizes socio-cultural and organizational factors and calls for a supportive environment and societal mindset change to improve quality of life and promote gender equality.

Exploring Changes to Girls' Everyday Mobilities over the Last 20 Years in the Urban Slums of Kolkata, India

Drawing on two decades of longitudinal participatory, qualitative research with young people in the urban slums (*bustees*) of Kolkata, India, my presentation uses spatial exploration as a window into social and cultural changes which have occurred over time. Specifically, this presentation explores the way everyday mobilities of leisure, romance, and employment have changed in my last 20 years in the field. By longitudinally mapping girls' everyday spatial literacies in the slums, I demonstrate clearly how, more than any other period in my research, post-pandemic technological access has been critical in instilling confidence in both girls, and their families, to participate in new areas of "respectable" female employment, higher education and newly forged relationships. This is an important shift over the last two decades, and using young people's own words and experiences, I show how new mobilities allow girls to feel like participants in an exciting, modern India. At the same time, cultural expectations around honour and shame continue to reinforce patriarchal control over girls' movements. By presenting participatory and qualitative longitudinal evidence of mobility changes, I showcase some important social and cultural shifts in a globalizing India, while also describing how many things have stayed the same.

Safeguarding Well-Being through Friendship Intimacy: The Experiences of Girls in Patriarchal Slum Communities in India

This presentation reviews how, in conservative slum communities in India, girls actively and purposefully nurture positive and meaningful same-sex friendships to safeguard their well-being in patriarchal societies that are deeply suspicious of them. I show how friendship intimacy allows girls to expand their social and cultural knowledges, and navigate challenges in their relationships, schooling and family lives. Studying these intentional friendships reveals a culture of vendettas, injustice, patriarchal control and generational misunderstandings which shrouds the everyday lives of girls in the slums. By demonstrating how girls actively and mindfully develop and engage in same-sex friendships, this presentation shows how they take charge of their own well-being to invest in happiness and social connection within patriarchal societies.

Finding Place, Making Home: Narratives of Crisis and Agency Amongst Resettled Ecological Refugees on Sagar Island in the Indian Sundarbans

The Anthropocene has intensified the ecological fragility of the vulnerable islands of the Sundarbans region in the Bay of Bengal. The deltaic zone is impacted by the constantly shifting boundaries of downward islands due to recurrent geomorphological processes and fluvial activities. This study centres on Sagar Island, the largest inhabited island in the estuarine region of the Southern Sundarbans in India. Characterised by the recurrent mutation of riverine geographies, its inconsistent terrains are at the 'mercy' of surrounding rivers. As everyday life on the island is shaped by rapid erosion and planetary changes, displaced communities are faced with the urgency to relocate to relatively safer resettlement zones, namely colonies. The paper compiles data from cartographic resources and revenue records with ethnographic findings from ongoing fieldwork to understand the social implications of the transformation of inhabitants into ecological refugees. It argues that the process of relocating islanders into downstream colonies is much more than a simple shift in geographical location. Instead, it entails deep socio-economic and cultural dislocations, leading to new forms of precarities. It shows how the aggravation of environmental risks in the Anthropocene reframes the lived experiences of inhabitants in a constantly changing deltaic landscape. The paper traces the diverse experiences of agency and relational entanglements on the island by analysing the intersections between environmental crises, displacement and place-making. Concluding how a sense of home in a relocated place is crafted amidst the spiralling tendencies of land loss and anticipation of safety, the paper contributes to a broader discussion on climate-induced migration and adaptation strategies in deltaic regions.

Pilgrimage to Gangasagar Mela in the Anthropocene: Understanding Sacred Geography and Hydrosocial Entanglements at Sagar Island in the Indian Sundarbans

Gangasagar Mela is the second-largest annual gathering of Hindu pilgrims in India after the Kumbh. Situated on Sagar Island in the Southern Sundarbans, the Gangasagar sacred complex marks the confluence of the holy river Ganga and the Bay of Bengal. Gangasagar is a revered pilgrimage site where Hindu devotees partake in ritual bathing to seek liberation from reincarnation. This paper maps the diverse meanings of Gangasagar Mela by locating the sacred geography of Gangasagar within the vulnerable waterscape of Sagar Island, which is affected by cyclones, tidal events and planetary changes. It employs hydrosociality as an analytical framework to identify the plural discourses of religious *milan*, communitarian *mel* and everyday *mela* associated with Gangasagar Mela. It suggests how mythologies, ecological conditions and the everyday resonate with the spirituality of pilgrims and visitors who travel to Gangasagar and the environmental concerns of communities that inhabit Sagar Island. Historical evidence is compiled with ethnographic details to contextualise pilgrimage from the religious, tourist and everyday perspectives to highlight the diverse yet overlapping experiences of crisis and agency. The paper argues that understanding places of pilgrimage requires emphasising the

entanglements that make up its sacred geography. In waterscapes like Gangasagar, where the ebb and flow of water shapes the social, political and economic constitution of a pilgrimage site, hydrosociality foregrounds how the site remains ever-emergent due to the reciprocity between cultural practices, ecological conditions and everyday life.

CHAKRAVARTI CHAKRAVARTI, PAROMITA* (Jadavpur University, Department of English, India)

HOWLADER, AMRITA (Independent Consultant, India) Bollywood Cinema and the New Single Indian Woman

The growing international scholarship on Bollywood (popular Indian cinema) has focused not just on its stylistic features or mass appeal but on its enormous ideological influence, particularly on its constructions of nationhood, family, community and gender relationships. Recent work on the post 1990s Bollywood films have examined how the emergence of a new kind of female protagonist, the "new woman" has helped to articulate the tensions and possibilities of a neoliberalising, globalising India (Megha Anwer, Anupama Arora). The proposed paper will look at how the single woman emerges as a sub type of the new woman who forges a new understanding of Indian femininities, gender roles and patriarchy. Single women are emerging globally as a significant demographic category. 39.8 million single women comprise 7.4% of the Indian population. However, women's status and identity in society, state, law and social discourses are still defined by marriage and the heteropatriarchal family making it impossible for single women to access rights. Against this dominant construction, a trend is emerging in recent Bollywood films [Queen (2014); Highway (2014); Piku (2015); Pink (2016); Masan (2015); Anarkali of Arrah (2017)] of representing the independent single woman who asserts herself against family, community and state power. Not a victim like the widows, divorcees and "fallen women" of older Bollywood cinema, the new single woman is not overtly "feminist" either like the empowered women walking out of marriages in the progressive cinema of the 1980's. Hailing from villages and small towns the new single women aspire for a life defined not by conjugal, kinship or community identities but lived as autonomous citizens of a globalised India. The paper will examine how the new Bollywood single woman challenges the patriarchal constructions of Indian women's identities in everyday life, law, policy and social discourse.

CHAKRAVARTI CHAKRAVARTI, PAROMITA* (Jadavpur University, Department of English, India)

Intergenerational Solidarities in Political Activism: The "Daadis" Protests in India

Older men have held institutional and State power in most societies traditionally. However there is a growing concern now about the youth's apathy towards political participation in the ageing economies of the West. This pitting of the young against the old has created a polarised political discourse which presents them as enemies. Despite being a demographically young nation, Indian politics and its multigenerational family system remains gerontocratic, led by the elderly who fail to represent or serve the disaffected youth. Against this international and national context the proposed paper will read the political emergence of older women referred to as "daadis" (grandmothers) as leaders of a pan Indian protest against the Citizenship Amendment Act, 2019 passed by the government. The agitation which started in a Delhi neighbourhood with the local Muslim women's public sit-in, was replicated by neighbourhood mobilisations across India marked by the leadership of *daadis*. Uninitiated in politics, unfamiliar with the public sphere, weighed down by age related disabilities, the *daadis* took control of a national movement for the right to equal citizenship—because they felt the futures of their children were at stake. Bringing in a different language of protest and understanding of politics they radicalized ideas of power and agency by marshalling their vulnerability into an idiom of resistance. While they were dependant on the youth to help them walk, go to the toilets, give social media bytes, the youth looked to them for political direction. This created a collaborative, co-dependant intergenerational collectivizing—an "assembly of bodies" providing strength. This paper will use Vulnerability theory to read the *daadis'* protest, looking at age not as a source of individualized masculinised gerontocratic power but as an aspect of bodily fragility deployed to underline the need for mutually caring solidarities.

Photographic Exploration of Accessibility: A Collaborative Pedagogical Approach to Understanding Disability in Education.

This presentation explores how visual methodologies, particularly photography, can be utilised to engage MA students in critical, collaborative, and democratic learning processes. As part of my course *Sociocultural Issues in Education* at the European University Cyprus, students were tasked with adopting the perspective of individuals with disabilities and documenting the "architecture of disability" within their everyday environments, such as schools and public spaces. This experiential approach brought the "outside world" into the classroom, facilitating a deeper understanding of the challenges faced by individuals with disabilities and the implications for educational accessibility.

The analysis examines the pedagogical impact of using photography as a tool for visual research within an educational setting that emphasizes collaboration and democratization. Through capturing, sharing, and analyzing photographs, students engaged in discussions that highlighted the intersections between physical spaces and social barriers. The collaborative nature of this assignment, where students worked in groups to select and analyze images, fostered a participatory learning environment that mirrors democratic practices in decision-making.

This session will delve into the theoretical underpinnings of this visual approach, the methodologies employed, and the outcomes achieved. Additionally, it will address the challenges and advantages of using photography to explore educational experiences, focusing on how this visual methodology can illuminate both participatory and exclusionary dynamics within educational spaces. By reflecting on these processes, this presentation aims to contribute to the broader discourse on democratizing education through innovative research practices that emphasize horizontality, reciprocity, and mutuality.

On (Not) Being Heard in the Swiss School Context – Postcolonial Orders and the Construction of Hegemonic Knowledge

In this paper, we explore the question which and whose knowledge is constructed as hegemonic in the context of European postcoloniality, utilizing negotiations surrounding (neo-)linguicism as an example. Following Castro Varela (2016), we understand epistemic orders as contested and assume that a hegemonic "epistemic matrix" is, among other spaces, also enforced in educational institutions (ibid., p. 48). This happens by delegitimising and dethematising pre-colonial knowledge or knowledge marginalised in the context of European migration societies and by consolidating hegemonic eurocentric regimes of truth. We aim to understand, how this process works by looking at an empirical example. Within the context of a research project in Switzerland, analysing parents' experiences of schools via subjectivation-theoretical biographical research (Rose 2019; Spies 2019), we explore, how a racialized parent, speaking one of the national languages of Switzerland, has to struggle to be heard in the school context, as her language skills are devalued as a "migrant language" within a hegemonic setting which usually prides itself on national language plurality. On this basis, we propose a situated postcolonial view on the dichotomy 'non-hegemonic/hegemonic' that understands this distinction itself as embedded in (post-)colonial relations. Building on this, we reflect (not without a pinch of pessimism) on how "epistemic change" (Castro Varela 2016) can actually occur – without falling prey to "impasses/apories" (Boger and Castro Varela 2021) and "without replicating the grammar of violence" (Hartman 2008:4).

CHAMBLISS, ELIZABETH* (University of South Carolina, USA)

Rural Legal Markets

The U.S. legal profession tends to appeal to a romantic conception of rural lawyers as accessible generalists who serve their communities through pro bono and community service, and some characterize rural private practice as public interest work. Many commentators call for programs to attract law graduates to rural locations and at least fifteen states have implemented such programs. Yet we know very little about modern rural legal markets or the role of rural private practitioners in serving low-income clients.

This mixed methods study investigates the contours of private practice in rural South Carolina. It finds, first, that rural private practitioners play a limited role in serving low-income clients. Less than 25% of South Carolina's rural practitioners practice in the state's poorer rural counties and most report doing limited pro bono work. Second, specialization is a key ingredient for successful rural practice. New lawyers may take whatever clients they can get, but most practitioners quickly become more specialized, and some specialties can be lucrative, such as personal injury and real estate. Third, personal injury cases can be an important means of subsidizing less profitable work, but personal injury work has become more commoditized as the result of mass market advertising, making local ties less important to plaintiffs, and making low-margin practice sustained by periodic personal injury cases less viable. Finally, family ties play a central role in attracting and sustaining rural private practitioners, raising questions about the scalability of recruiting lawyers without local ties.

Rather than providing incentives for private practitioners based on location, the study suggests that we look for ways to directly subsidize specific types of service based on evidence of legal need. We also should consider new ways of marketing flat-fee, routine legal services to make them more geographically accessible and capture economies of scale.

CHAN, ALEX, LIH-SHING* (Soka University, Japan)

Media Narratives and Framing of the Poor: A Study of Japanese Print Media on Poverty Issues

Mass media have been playing a crucial role in communicating public policy while targeting the audience as consumers. Such a contradictory nature of media operation is apparent when media report social issues related to marginalized populations. Poverty issues may appear bland and lack commercial value, resulting in less coverage in the media. Nevertheless, poverty remains a pervasive problem even in advanced societies, including Japan. Once a role model for Asian countries to emulate, the prospering image of Japan has glossed over the Japanese government's failure in the past two decades to create wealth for households via higher wages. Notably, the urban older poor often face the most pressure as they are assumed to possess a self-reliance ethos. How has the Japanese media represented the people who experience poverty?

The study will present the preliminary findings from the data collection from three major national print media outlets in Japan, i.e., Yomiuri Shinbun, Asahi Shinbun, and Nikkei News. Yomiuri is the national paper with the highest circulation, while Asahi and Nikkei have different socio-political interests. The study selects news from significant periods in the past 30 years, such as the economic bubble burst and the coronavirus outbreaks, to identify and reveal the shifting patterns of media narratives on poverty. The implications of the use of media language in Japanese society will be discussed.

CHAN, EDWARD KO-LING* (The Hong Kong Polytechnic University, Hong Kong)

CHEN, QIQI (The Hong Kong Polytechnic University, Hong Kong)

Measuring Multiple Types of Violence in a Family: The Application of the Family Poly-Victimization Screen

Introduction: Various forms of violence, including partner violence, child maltreatment, elder abuse and neglect, sibling violence, in-law violence, and parent abuse, often co-occur within a family. Family polyvictimization (FPV) refers to the co-occurrence of at least three types of family violence and adopts a family-oriented approach, considering the family as the basic unit to understand and address the problem.

In response to the lack of a validated screening tool, the authors developed and validated the Family Polyvictimization Screen (FPS), the first brief screening tool applicable to members of the same family across up to three generations. The objective of this presentation is to provide a reliable estimate of the pooled prevalence of FPV.

Method: A cross-sectional household survey was conducted on a population-based probability sample of Chinese families in Hong Kong. A total of 1,400 eligible families administered the FPS to report on victimization occurrences against an adult parent, a child, and an elderly member. The relationships between perpetrators and victims were recorded to define the types of family violence.

Findings: The prevalence of family victimization was computed on both an individual and family basis. Individually, the lifetime prevalence of victimization against an adult parent, a child, and an elderly member was 15.6%, 17.0%, and 14.5%, respectively. On a family basis, the lifetime prevalence of family victimization against an adult parent, children, and the elderly was 22.2%, 17.7%, and 7.9%, respectively. Regarding the number of victims in a family, 71.2% of families reported no victimization over their lifetime, 19.2% had 1-2 victims, and notably, 9.6% had three or more victims.

Implications: Empirical evidence shows a high prevalence of FPV, highlighting the need for early detection of victims and effective interventions using a family approach, rather than treating victims from the same family individually.

WANG, JING* (The Hong Kong Polytechnic University, Hong Kong)

A Gendered Flexibility Regime in Platform Work

Flexibility in platform work is contested by both digital platforms and workers. This paper argues that workplace flexibility is a gendered outcome, with men and women enacting masculinities and femininities and fulfilling their family responsibilities. A growing body of literature has examined women's experiences in the platform economy, particularly their participation and practices in gig work. However, a comparative analysis of men's and women's strategies in negotiating flexibility is missing. Drawing on interview data with food-delivery riders (33 men and 34 women) and home-cleaning workers (36 women) in China, this research reveals how platform management has created a nuanced framework of labor flexibility. Meanwhile, workers select scheduling and payment arrangements that may best fulfill their gender roles and responsibilities. Platforms redesign rules to accommodate and utilize workers' gendered approaches to further enhance control and efficiency. The result is the formation of what we call a gendered flexibility regime, that is, a gendered contentious process in which platforms and workers contest flexibility. While this research highlights the agency of workers in reshaping flexibility, we are concerned about the power imbalance and the precarious working conditions facing both men and women.

Perceived Social Support and Health Care Spending As Moderators in the Association of Traditional Bullying Perpetration with Traditional Bullying and Cyberbullying Victimization Among Adolescents in 27 European Countries: A Multilevel Cross-National Study

Existing research has documented the association between bullying perpetration and bullying victimisation. However, it is still unclear how different sources of social support moderate the association between bullying perpetration and bullying victimisation at a cross-national level. Using multilevel binary logistic regression models, this study examined the moderating role of public health care spending and perceived social support (i.e., family and teacher support) in the association between traditional bullying perpetration and victimisation by traditional bullying and cyberbullying among adolescents across 27 European countries. Country-level data were combined with 2017/18 Health Behaviour in School-aged Children (HBSC) survey data from 162,792 adolescents (11-, 13-, and 15-year-

olds) in 27 European countries. Results showed that adolescents who perpetrated traditional bullying had a higher likelihood of being victimised by traditional bullying and cyberbullying than adolescents who did not bully others. Results also indicated that the magnitude of the positive association between traditional bullying perpetration and victimisation by traditional bullying and cyberbullying was mitigated among adolescents with more family, teacher, and public health care support. These findings support the notion that multilayered systems of social support could play a vital role in bullying prevention and intervention strategies to address bullying among adolescents.

Autonomy As Integration: How Marriage Immigrants Leverage Role Complexity Advantage through Engaging in Civic and Ethnic Roles in Asian Democracies

Three decades after the onset of intra-Asia marriage immigration to Taiwan and South Korea, two emerging migrant-hosting societies with Confucian heritage, much research attention has been given to how the long-lasting sociocultural foundations produce and reproduce marriage immigrants' status subordination within and beyond marital families. In reality, some marriage immigrants have engaged in and socialized into multiple civic and ethnic roles, participating in local civic communities and serving co-ethnics from home countries. Using long-term ethnography and life history interviews with Vietnamese marriage immigrants with multiple civic and ethnic roles in Taiwan and South Korea, this paper has three aims. First, I examine how marriage immigrants with limited social and cultural capital engage in multiple civic and ethnic roles. Second, I demonstrate the challenges these women face and their strategies, when transforming role strains or role conflict to role complexity advantage. Third, I show how role complexity advantage leads to various paths of autonomy for these women, bringing forth diverse consequences to marital family relations and individual subjectivity. This paper extends Rose Coser's (1991) theory of role-set complexity and women's autonomy. It examines the longitudinal making of immigrant women's civic roles in Asian democracies. It shows how immigrant women and host states' policy trajectories co-create ethnic roles. The paper also discusses the implications for research on immigrant women's structural opportunities for empowerment and autonomy, which should be considered as important outcomes of long-term integration.

CHANG, KYUNG-SUP* (Seoul National University, South Korea)

Normal Corruption: Utilitarian Institutional Dualities and Technocratized Authoritarian (In)Justice

In South Korea and other postcolonial societies, modernization began as a *reflexive* process in that their initial critical self-appraisal was usually focused upon their perceived weaknesses and deficiencies vis-à-vis Western forces that had ruled and/or liberated them. Such reflexive modernization has usually assumed on an *institutionalist* nature centered upon institutional emulation of the politico-legal, economic, and social systems of "advanced nations". Paradoxically, reflexively adopted Western institutions did not necessarily enable to solve the impending material and social exigencies for postcolonial societies. In fact, the borrowed Western social institutions – such as market economy, democracy, and social citizenship – are the long historical outcome of their arduous efforts, struggles, and achievements in coping with own material and sociopolitical challenges. That is, South Korea's immediate, and even long-term, material exigencies of economic and social provision have had to be acquired through various self-taught measures, necessitating very flexible compromise, distortion, or even nullification of West-reflexive formal institutions in public governance. South Korea has ended up establishing an effectively functioning, yet socio-politically vulnerable and chronically unlawful, system of industrial capitalism and social provisioning that effect its liberal order's endemic legitimization crisis. A general systemic order of *normal corruption* has thereby prevailed under the pervasively utilitarian institutional dualities between the West-reflexively adopted liberal institutions and the practically devised methods and improvised orders for pragmatic and expedient problem-solving, often beyond legal principles. The state's judicial organs – prosecution in particular – have had to technocratically manage such systemic corruption for practical national and/or social utilities. As the nation's political leadership, whether autocratic or democratic, has to juggle with such complicated practical and (il)legal necessities, its liberal systemic order has incurred built-in irregularities and instabilities, regardless of its success in practical problem-solving in economic, social, and other affairs.

CHANG, KYUNG-SUP* (Seoul National University, South Korea)

Transformative Contributory Risks: Compressed Modernity and Risk Citizenship in South Korea

A systematic probing into the structural nature of South Korea as risk society leads to a revelation that virtually all categories of risks have practically reflected the pragmatic, strategic, and/or urgent efforts to expedite and aggrandize developmental, institutional, and/or civilizational purposes and utilities in the nation's particular historical and international contexts. As these diverse risks are seen and accommodated in terms of various transformative functions, those citizens, communities, and organizations otherwise liable for or knowingly sacrificed by them are often praised and rewarded risk-reflective citizenship. To begin with, a sort of national fetishism prevails in glorifying those experts with some supposed scientific, technological, and/or industrial achievements (particularly in catching up with the West), at whatever risks would be revealed later on. Many of those managers, workers, farmers, researchers, and local residents who have bravely overcome or sacrificially endure dangerous outmoded conditions in carrying out either prioritized or neglected yet essential functions have been offered to be praised as indispensable national, industrial or organizational heroes under their tacit acceptance (or forced excuse) of such otherwise problematic dangers. Those hard-working South Koreans – with the world's longest hours and/or incomparable intensity in work, study, human care, and so forth – have been portrayed domestically and internationally as model citizens of South Korea's miraculously compressive economic and other marches. Those South Koreans who have cooperated or contributed in executing overambitiously targeted and often irregular or illegal activities and operations (without regulatorily or legally challenging them) have been preferentially given stable employment, positional promotion, extra wage or revenue, and so forth, on top of inner-circle honors and influences. In these diverse recognitions of transformative contributory risks, both formal arenas and personal spheres have been inundated by political, organizational, and private discourses on transformative risk citizenship.

CHAPMAN, NATHAN* (University of the West Indies, Trinidad and Tobago)

Policing, Social Injustice and Decolonization

This study explores the emic concept of the "Frame Case," arguing that it serves as an entry point in deconstructing and dismantling the colonial entanglements in contemporary systemic policing practices. Frame Case is a culturally specific term used by typically black and brown residents in criminally labelled communities—poor, working-class urban, suburban, and rural neighbourhoods—to describe experiences of how and why police officers falsely accuse, target, and arrest individuals for crimes they did not commit (Chapman 2019). Situated within the coloniality of power theory, I extend the definition of systemic policing entanglements to refer to the reproduction of colonial hierarchy, knowledge and cultural inequalities in contemporary practices of surveilling working-class communities (Müller 2019; Jackson et al., 2021). Utilising a narrative design and intertwining qualitative methods within a Caribbean-centric virtual environment, sixteen culturally relevant 'on/lime and ole talk' virtual sessions were conducted incorporating 15 semi-structured interviews with Frame Case survivors and knowledgeable observers and one chat-based focus group and archival data. The findings suggest that Frame Case both exemplifies and counters neo-colonial/systemic policing entanglements in 21st-century Trinidad and Tobago. I identified this dual connection guided by Hilde's (2020) work on counternarrative analysis, demonstrating how master narratives uphold and re-enforce and counter-narratives challenge and resist the functioning of systemic policing. To address this multi-layered problem of Frame Case, this study proposes a community-led Frame Case non-governmental organisation that utilises decolonial principles to address the problem. The elements of this unique strategy comprise strategic activism targeting systemic policing institutions and advocating for the humanity, rights and redress to the issues of the Frame Case Survivors, a self-financing element in reducing economic dependency and fostering a sustainably led mission-driven social enterprise for community justice, as well as decolonising capitalism in structure and operations, particularly in its focus of prioritising social and economic needs over profit.

RC05-77.15

CHAPMAN, NATHAN* (University of the West Indies, Trinidad and Tobago)

Social Injustice, Migration and Colonial Entanglements

This chapter utilises the term "Trinbago Trumpism" to explore local attitudes towards Venezuelan migrants. This research builds on the work of Gul and Preston (2017, 2), who conceptualised Trumpism as a "contemporary form of colonial domination." The author of this book chapter situates this phenomenon in Welsch's (1999) notion of transculturality, which advocates the search for interconnections between or among cultures beyond borders. This approach historicises local attitudes within a transatlantic nexus. Notably, from the colonial past (Euro-America), cultural hegemonies continue to re-establish their influence within less powerful territories, for example, Trinidad and Tobago, in the contemporary era. Using an approach informed by digital anthropology and an anti-colonial theoretical standpoint, the data analysis includes nine Trinidad and Tobago newspapers' online commentaries, participant observations and historical inquiries on colonial attitudes. This study also utilises recorded speeches from former US President Donald Trump and the current Prime Minister of Trinidad and Tobago, Dr Keith C. Rowley. When triangulated, these data sources suggest that Trumpism and colonial attitudes influenced local anti-immigrant sentiment towards Venezuelan migrants from 2018 to 2021. This research reiterates the need to explore the lingering coloniality shaping our post-independent twenty-first century.

Social Norm Dynamics in a Behavioral Epidemic Model

Understanding the social determinants that influence the adoption of preventive measures during a disease outbreak is crucial for building effective epidemic models and hence for policy making. While traditional behavioral epidemic models focused on rational decision-making, psychological biases and the incorporation of simple imitation-based mechanisms to account for social influence, recent experimental studies highlight the necessity of considering the role of social norm dynamics. Here, we develop a behavioral epidemic model on a multilayer network, by integrating an Experience Weighted Attractor (EWA) learning mechanism with the dynamics of social norms. The resulting decision making process, can potentially lead to a boost in vaccination coverage and hence to a significantly reduced final infected fraction, offering an alternative social mechanism to altruism that can achieve this. Furthermore, we examine the importance of the dynamics of each one of the social norms' types, injunctive or descriptive, in reducing the infected fraction, finding that the former have a more significant effect. We also explore the effect that external interventions on the dynamics of social norms can have on the expansion of an epidemic, aiming in identifying improved public communication protocols. Enhanced models of social norm dynamics, if validated and tested, can better capture the complexities of human social behavior and mitigate various societal challenges beyond pandemics.

Perpetuating the Phad: From Performative Scroll Painting to Interactive 3D Game

Our research revolves around *Pabuji ki Phad*, a large visual narrative scroll painting from Rajasthan, India, activated through performative orality and music. The narrator (*Bhopa*) guides the audience through the intricate scenes, mediating the embedded story. Their recitation epistemically bridges the visual and verbal, transforming the scroll into a participatory, intersubjective experience. *Phad* functions as both a cultural artefact and visual ethnography, preserving collective memory, moral frameworks, and aesthetic practices. It acts as evidence in storytelling and reinforces social cohesion by reflecting shared values and identity. Using visual anthropology and cultural semiotics, we explore the visual-textual tradition as an archive of embodied knowledge, where meaning is co-constructed through performative seeing and multi-sensory engagement. The team consists of researchers specialised in ethnography, visual arts, and vernacular knowledge systems, who actively collaborate with the *Bhopa* narrators. Through Action Research, we analyse

and reinterpret the socio-cultural practice into an interactive 3D game as an alternative form of research expression. Our work introduces innovative co-creative methodologies through a transdisciplinary approach that intersects sociology and creative practice. This approach underscores the potential of a new paradigm of interactive digital platforms to function as a tool of cultural continuity, educational engagement and social research.

Neo-Municipalism: A Political Alternative for French Rural Declining Areas?

In 2014, the municipality of Saillans caught the attention of researchers with the election of a citizens' list, a radical innovation for France at that time. This small municipality of 1,200 residents became a focal point for discussions on the renewal of neo-rurality and the potential for neo-municipalism. While the case of Saillans is somewhat unique—being located in a region known for proactive environmental transition policies (the Bio-Vallée)—its small size is a common characteristic shared by tens of thousands of French villages (out of a current total of 35,000 municipalities). Beyond Saillans' specific appeal, this communication will explore to what extent such political innovations can be transferred to declining rural peripheries, and how far the small size of French municipalities, for long considered a problem, may become an asset.

The presentation will highlight emerging political alternatives in rural areas that, despite facing decline, are also resourceful: local development policies, new social organizations, and political initiatives such as municipalism. This presentation draws on the findings of two research programs, one focused on post-COVID 'rural exodus' and the other on 'left-behind places'. Through interviews with residents and elected officials, it examines formerly industrialized villages and rural areas, such as Saint-Julien-Molin-Molette and La Salle with their silk mills, as well as La Grand Combe and its mining activities.

This communication will begin by integrating literature from rural geography on neo-rurality with urban studies on political alternatives in shrinking towns, creating a theoretical framework to better understand the renewal of shrinking rural municipalities. The second section compares different cases: from the artistic revival in La Salle, to neo-municipalism in SJMM, and the challenging renewal process in La Grand Combe. Finally, the last section will leverage these political innovations to reconsider the concept of the right to the city from an external, rural perspective.

Scaling up Farmers Markets in Thailand: Obstacles and Opportunities

When food becomes a commodity, natural resources and farmers' livelihoods are commoditized. However, the price of environmental and agricultural labor is suppressed. During the pandemic, numerous farmers' markets in Thailand gained more attention from the public since people craved fresh food, and open-air markets provided a sense of safety. This study was conducted during the crisis to investigate these alternative markets' role and explore how to scale up this food initiative. We conducted interviews with market managers and observed nine farmers' markets nationwide. Additionally, we collected questionnaires from 55 peasant sellers and 110 buyers using purposive sampling. Findings are that farmers markets provided a platform for increased visibility, empowered farmers through entrepreneurial ventures, and revitalized the consumer-grower bond. By offering diverse products and fostering a sense of responsibility among consumers, these markets have built trust within urban communities and strengthened rural networks. Various barriers and opportunities for scaling up farmer markets are the lack of excellent and affordable market locations, the lack of entrepreneurship skills of farmers, consumer expectation of off-season food, price and cost of standardization of organic food provision, etc. Some best practices will be presented and discussed.

Love Mobility and Care Strategies: Marriage-Retirement Migration Among Norwegian Pensioners and Thai Wives amid Structural Challenges

Due to historical connections, a substantial number of Norwegian retirees have married Thai women and have chosen to live their later lives in Thailand, where their pensions are valued significantly more. Recently, however, unforeseen structural challenges, including climate change and the dropping rate of the Norwegian Krone, have made it difficult for them to access Thai healthcare. Reaching their 80s, many Norwegian pensioners are considering returning to Norway with their Thai wives for life. Our paper examines the interplay of love, care, health, and the cost of living in the context of a highly-mobile world. It is based on in-depth interviews with 12 Thai-Norwegian couples residing in the beach resort city of Pattaya and Bangkok. We trace the migration trajectory of Norwegian retirees from their marriage and move to Thailand to the realization that seasonal migration may no longer be viable. We aim to illustrate how transnational welfare regimes affect both the health and care aspects of healthcare and how people navigate their life strategies through such constraints.

Against 'Historical Injustice': Studying the Implementation of the Forest Rights Act (2006) in Post-Colonial Eastern India

The Environmental Justice Movement (EJM) has different trajectories in the Global North vis-à-vis the Global South. While in the United States, the movement for environmental justice has been associated with the collaboration of students, Marxist unions, BIPOC identity groups and environmentalists, in the global south the movement for social justice and the movement for environmental conservation have not always gone hand-in-hand, especially with the middle-class environmentalists clashing with the urban poor and the forest-dependent Adivasi (Scheduled Tribes) communities on the issue of conservation. However, across the global south, the issue of environmental justice is increasingly associated with the politics of identity particularly among the indigenous communities to whom politics for environmental justice often include assertions over reclaiming alienated landscapes like forests, hills, or lakes. The Forest Rights Act (FRA) 2006, is an important intervention by the Indian government, aimed to address the 'historical injustice' faced by the forest-dwelling Scheduled Tribe communities since the state appropriation of forestland in the colonial period. The current paper has studied how multiple identity groups, NGOs and other political organisations have converged in the Ajodhya Pahar hill range of eastern India to demand proper implementation of FRA (2006) since the announcement of a new pumped storage project in the area. Based on ethnographic observations, the paper has tried to understand how EJM in Ajodhya Pahar could be studied in terms of particular landscapes becoming political based on the contested claims of customary rights and identity assertions, and how such politicization has strengthened the movement for FRA (2006).

Revisiting the 'Criminalization' of De-Notified Tribes: Challenges and Prospects of Inclusive Development Among the Kathodis of Maharashtra, India

The forest-dwelling indigenous communities encounter persistent challenges posed by external forces, often portrayed as the "other." These communities possess invaluable knowledge of forest resources, making them targets for exploitation in resource tracking endeavors or to use as bait in resources extraction and commodification. It was the time of Colonialist interventions, which initiated the 'criminalization' of these forest dwellers on purpose, characterized by subjective judgments labelling them as wild, underdeveloped, and necessitating control over them. Such derogatory categorizations encompassed allegations of habitual criminality, perpetuating marginalization through a plethora of literature.

Additionally, observations reveal that, the Kathodis residing in squalid conditions within areas relegated to them by higher caste groups, indicative of entrenched socio-spatial segregation. This study presents findings from a systematic fieldwork survey conducted among the Kathodis of Dadra and Nagar Haveli, Maharashtra, exploring the historical origins and contemporary ramifications of their criminalization by colonial powers. Through an analytical lens, this research elucidates the enduring socio-economic disparities and challenges faced by the Kathodi community in present-day society.

CHATZICHRISTOS, GEORGIOS* (Aristotle University of Thessaloniki, Greece)

Formalising Social Workplace Innovation: The Role of Formal Organizations in Navigating Polycrises

The European Union (EU) has faced significant challenges during the 2008/2009 global economic crisis and the recent Covid-19 pandemic. In response, the EU has emphasized the importance of innovation-led recovery as a key strategy. Despite numerous initiatives across Europe labelled as "social innovation" or "workplace innovation," there is a notable gap in understanding how these efforts are systematically integrated into formal organizations to produce tangible performance outcomes. This paper examines how Social Workplace Innovation (SWI) can be harnessed within formal organizational structures to support the EU2020 Strategy's goals of smart and inclusive growth. Using a sociological institutionalist perspective, the study explores the dynamics between SWI, formal organizational processes, and broader institutional influences. The research draws on the CLLD/LEADER program, where Local Action Groups (LAGs) operate within formal structures to foster social innovation. The findings reveal that while SWI often emerges as a reactive response to institutional barriers, these innovations are typically spontaneous and driven by employees rather than being formally embedded as organizational norms. This paper highlights the implications of these findings for the concept of formal organization, especially in the context of ongoing polycrises such as pandemics, economic downturns, and climate change. The study argues that formal organizational structures, such as the EU LAGs, play a crucial role in institutionalizing and sustaining innovative practices, ensuring that they become an integral part of the organization's operations rather than temporary, ad-hoc responses. By examining the CLLD/LEADER program, the research offers insights into how formalization can either support or constrain innovation, ultimately contributing to a broader understanding of the role of formal organization in addressing complex and distributed challenges in today's world.

CHAUDHARI, DISHA* (Centre for Law & Policy Research, India)

Deconstructing Family: Adoption, Kinship and Family Diversity in India

Recently, a 5-bench Constitutional Court gave a 3:2 verdict against the Constitutionality of same-sex marriages in India. The minority opinion upheld the right to adopt. However, the influence of societal norms related to gender and sexuality on citizenship is evident in the State's regulation of private relationships through marriage and kinship laws. This presents a complex issue for the LGBTQ+ community, as it challenges traditional heterosexual family structures and often results in the marginalized status of non-conventional relationship forms. While the decriminalization of same-sex relationships based on privacy rights is a significant development in India, it fails to fundamentally question the societal structures that uphold heteronormativity.

In this paper, I critically analyse the Indian adoption laws, which, due to their exclusion of LGBTQI families and non-marital relationships, adopt a limited perspective on what constitutes a family. I argue that the State's power to validate certain unions while disregarding others needs to be questioned. The distinction made between married couples and other forms of companionship, particularly in terms of parental rights, is arbitrary. I emphasize the need to reevaluate the State's role in regulating personal relationships, especially in the context of adoption laws in India. To address this, I utilize a queer theory and critical kinship studies framework that challenges conventional family structures and the reproductive heterosexual and explores the concept 'family diversity' in the Indian context, thereby challenging the naturalization of heteronormative kinship and parenting.

Contemporary Views on Leisure Activities and Quality of Life

Mental and emotional health refers to our overall state of psychological well-being, shaping how we view ourselves, the strength of our relationships, and our ability to handle emotions and overcome challenges. Leisure, the time that people spend outside their productive activities, has a major impact on their sense of well-being, happiness and life satisfaction. Social interactions, interpersonal activities and relationships are related but conceptually different issues, which may be considered as 'social capital' for both individuals and society that also affect people's quality of life. However, recreational and leisure activities may also be central to feeling connected to community life.

Research has consistently indicated that physically and socially active recreation and leisure activities are related to a higher quality of life in the general population, as well as in people with various disabilities. The quality of life is determined by objective factors and also by the subjective perception of factors which influence human life. Leisure activities play a very important role in subjective well-being because they provide opportunities to meet life values and needs. Through participation in leisure activities people build social relationships, feel positive emotions, acquire additional skills and knowledge, and therefore improve their quality of life. If we maintain a balance between our daily responsibilities and the things we enjoy. If one takes care of their mental and physical health, better prepared to deal with challenges and feel good and one can live a quality life. This article will explore how leisure activities improve subjective well-being and will try to distinguish among different types of leisure activities and find those which contribute more to gain quality of life.

CHAUDHURY, SUKANT* (University of Lucknow, India)

Leisure in India in the Ancient Times

Euro-American-centric perspectives or Western perspectives have dominated leisure studies. It implied that non-Western societies didn't have any concept of Leisure. Some experts have even said that leisure has not been found in agrarian societies and also cannot be applied to archaic period and that Leisure was born in the civilization out of industrial revolution. However, some leisure scholars traced its origin to the writings of Aristotle in the city-state of Athens in ancient Greece. But these theories are not well founded in the sense like non- country like India, also had a rich tradition of Leisure through the ages i.e., Ancient, Medieval and Modern. This paper has two objectives: (a) to find leisure in the ancient age i.e., 3000 BC to 10th century AD; (b) to analyse leisure patterns among the different classes in the ancient times.

CHAUHAN, ABHA* (Central University of Himachal Pradesh, Dharamshala, India)

Understanding Culture and Society in India: A Study of Sufis, Saints and Deities in Jammu Region

The cult of Sufis, saints, and deities portrays a living spiritual heritage of culture, society, and religion of the region as depicted in the book (ed. Abha Chauhan) *Understanding Culture and Society in India: A Study of Sufis, Saints and Deities in Jammu Region*, published in 2021 by Springer Nature Singapore Pte Ltd. The 13 chapters in the book are accounts of various forms and modes of saint and deity worship in the Jammu region of the Union Territory of Jammu and Kashmir in northwest India. The chapters bring out the significance of local religious traditions as lived experiences, and Sufi and deity shrines as alternative and shared places of worship that give meaning and purpose to people's everyday lives. These sites and associated religious beliefs and practices serve as liminal spaces cutting across organized and dogmatic religious traditions of Islam and Hinduism, exhibiting the underlying strength of the composite and pluralistic culture in the conflict and violence-ridden territory of Jammu and Kashmir. As this book explains, it is these fuzzy religious sites, sacred time, spaces, and persona that provide mutual tolerance, inter-community harmony, and flexibility to the cultural landscape of Jammu and Kashmir. Herein lies the strength of the book, making it useful for scholars working in the areas of the sociology of religion, social anthropology, religious and cultural studies, Sufism, shrines, and deity worship, particularly in South Asia. The chapters in the book are largely based on ethnographic data collected through qualitative methods like participant and non-participant observations, case studies, narratives, in-depth interviews, and oral history.

CHAUHAN, ABHA* (Indian sociological Society, India)

War, Conflict, and Human Rights Violation: People's Narratives from the Borders of Northwest India

The memories of violent incidents of war and conflict during the partition of India and Pakistan in South Asia as two independent nations in August 1947 are still alive. It is estimated that nearly 1 million people died, and 20 million were displaced between the two countries in complete violation of their human rights to live and survive well. For those living in the areas of Jammu and Kashmir (J&K) on the northwest Indian side of the international border and the Line of Control (LoC), a de-facto border that still remains disputed, the memories reflected in their narratives get pronounced with every fresh incident of conflict or war in the recent times. People living in the villages along the LoC have faced the violence and trauma of major wars between India and Pakistan (1947-48, 1965, 1971, and 1999) and continue to suffer due to incidents of border skirmishes, firing, and shelling from across the border. Each 'war' and 'war-like situation' has forced people of all ages and genders to migrate to safer places for a longer or shorter duration. This has resulted in the violation of their human rights of livelihood, education, health, and housing, among other things. This paper argues that unsettled and prolonged conflict with uncertain goals impacts the lives of people at the borders severely and violates their basic human rights. Their voices remain at the margins in the grand discourse of nation and nationalism. The paper draws from the experiences of villagers living near or close to the border (LoC) between India and Pakistan in the Jammu district of Jammu and Kashmir, India. It focuses on the narratives of people as expressed through their collective memories of partition, wars, conflict, and migration and the coping mechanisms used by them in the process.

BURTE, HIMANSHU (Indian Institute of Technology Bombay, India)

Framing Risk Thinking in Urban Planning Practice

Though Urban planning has historically been rooted in risk negotiations, it often fails to acknowledge risk explicitly. The master plan, or development plan, with a pointed focus on "development," is primarily concerned with "planning the use and development of land in cities" (Phatak, 2011), and conversations around risk are often masked in project proposals aiming at improving or upgrading infrastructure, health, and environmental parameters. An explicit acknowledgment of planning as a negotiator of risk is absent in theory and practice. This has led to a limited development of risk vocabulary in the planning realm. Jabreen (2015), too, in his articulation of "risk city," argues that due to the linearity of planning theories, practices, and education, planning fails to engage with risk and uncertainty. He further argues that risk is a key factor influencing change and social transformation in urban societies and should, therefore, be a central concept in the theory and practice of urban planning.

Through a study of the contemporary practice of planning, I argue that planning lacks an expansive vocabulary to capture the various forms of risk negotiations undertaken in planning practice. I borrow vocabulary from insurance and project management to build an analytical framework through which I analyse the planning decision flows in the statutory planning process of making the development plan 2034 for the city of Mumbai. Planning's engagement with risk results from knowledge, institutional structure (seeped in political economy), and negotiations between the two. This framework reveals the often hidden and implicit structures involved in navigating risk. Situated in Mumbai, India, my research highlights southern perspectives on risk negotiations that shape cities in the Global South. By broadening the discourse around risk thinking in planning practice, this framework provides a logical substratum to critically view decision-making in planning practices, emphasizing the importance of risk thinking.

El Vínculo Entre La Heterogeneidad Estructural y Los Cambios En El Empleo Impulsados Por La Economía Digital y La Automatización En Argentina

La economía digital y la automatización están transformando la estructura del empleo a nivel global. Sin embargo, estos cambios no afectan a todas las economías de la misma manera, debido a la heterogeneidad estructural presente en distintos países y regiones. Este estudio propone investigar cómo la heterogeneidad estructural influye en los cambios del empleo en el contexto de la economía digital y la automatización.

Para ello, analizamos seis ramas de actividad, de distinto nivel de productividad, del mercado de trabajo argentino: software y telecomunicaciones, farmacia y productos químicos, metalmecánica y producción de bienes, textil, alimentos y bebidas, fabricación de muebles y hotelería. A partir de dicha selección, buscamos identificar sectores económicos más vulnerables a la automatización en diferentes estructuras económicas.

El enfoque teórico incluye una revisión de los conceptos de heterogeneidad estructural, economía digital, y automatización, explorando cómo interactúan para influir en el empleo. Se revisarán teorías de desarrollo económico y estudios previos sobre la digitalización y sus efectos laborales.

El diseño metodológico que se plantea es cuantitativo, partiendo de una encuesta no probabilística realizada en cuatro aglomerados de Argentina: Ciudad de Buenos Aires, Partidos del Gran Buenos Aires, Mar del Plata y Córdoba. Dicha encuesta es una adaptación nacional de la encuesta llevada a cabo por el Programa para la Evaluación Internacional de las Competencias de los Adultos (PIAAC) de la OCDE. A partir de dicha fuente de información, se construirá un índice de automatización, replicando lo realizado en otros estudios (Arritz et al., 2016; Egana-delSol et al., 2022; Martínez, 2023).

POY, SANTIAGO (Interdisciplinary Institute of Political Economy (IIEP), University of Buenos Aires, National Council of Scientific and Technical Research, Argentina)

Thinking about Welfare: Approaches to Time Poverty in Argentina.

Excess time in employment leads us to the notion of time-use poverty, which refers to the lack of access to temporal resources that affect the quality of life of an individual or a community. Unlike material poverty, which focuses on the lack of income or material resources, time-use poverty relates to the unequal distribution of time and how this affects well-being.

This form of poverty can manifest itself in a variety of ways, including lack of time for self-care, leisure, recreation, family time or personal development. For example, people who work long hours in low-paid jobs may experience time poverty because they have little time to rest, spend time with loved ones, or engage in activities that enhance their emotional and physical well-being.

There is a growing consensus in the international literature on the multidimensional nature of well-being, which has led to a questioning of the validity of traditional measures based solely on income. In addition to being unidimensional, these measures tend to focus on the household as the unit of analysis. However, this choice has been criticized for not adequately reflecting the complexity of individual experiences of well-being. Well-being is a broad concept that encompasses different aspects of people's lives and cannot be captured solely by indicating the extent to which people's well-being can be measured.

In this sense, one of the aspects that has received increasing attention in the analysis of well-being is the availability of time. The Levy Institute Measure of Time and Income Poverty (LIMTIP) methodology pioneered the introduction of the concept of "time poverty," which refers to the lack of sufficient time to perform both household and care activities or to earn an adequate level of income.

Precarious Work and Labour Relation in Thailand

Contemporary work circumstances in the world economy since 1970s have brought to many changes of wage labour relation. The term 'precariat' was coined to indicate the new trends of the effects of socio-economic change on labour employment and class concept. The precariat appears as the general form of labour relation in productive sphere and digitalized productive platform.

This paper traces precarious work in Thailand contemporary labour employment. Precarious employment in Thailand is increasing widely spread in several economic sectors. Education business, for example, employ various categories of precarious university jobs. Many small enterprises in service sector is increasing using many forms of precarious work and have become the important form of labour relation. These circumstances create frustration and anxiety for the workers. Working in precarious work is difficult situation and has less bargaining power. They are unable to organize trade unions. The paper is based on my survey research on precarious work and the changes of labour employment in Thailand. Using statistic data analysis of labour employment both in macro and micro levels and documentary investigation, the paper shows that work situation in Thailand contemporary labour employment in Thailand has been changed to precarity and uncertainty situation. This has much effect on labour organizations, changing of definition of work and working class. Increasing precarious employment has brought about the problems of people quality of life and the work security.

The Attitudes of Representatives of the Catholic Church's Contemporary Clergy Towards the Phenomenon of Suicide in Poland

The influence of Christianity on attitudes towards suicide over the centuries has been fundamental. Nowadays, according to the *Catechism of the Catholic Church*, the responsibility for the sin of suicide may be mitigated if a mental disorder or illness is documented in the person who has taken his or her own life.

This research is the result of a comparative study analysing the attitudes of clergy in urban and rural areas of Poland towards the phenomenon of suicide. The following research questions have thus arisen: What is the attitude of Catholic clergy towards suicide, particularly youth suicide? Is it coherent with Church doctrine, and how is it interpreted by the clergy? What role does the contemporary Catholic Church play in suicide prevention?

Additionally, we will consider the following: What role does religion play in suicide prevention? What role does the Catholic Church have in shaping the image of a person in suicidal crisis in both urban and rural areas? How does the Catholic Church support individuals and families affected by suicide attempts, and is it adequately prepared to do so?

An individual perspective from clergy members can reveal their awareness of the problem, preparedness to intervene and provide support, and the interesting interrelationship between scientific knowledge, personal beliefs, and adherence to Church policy. The phenomenon of suicide is no longer a taboo subject, and in many communities, the important role of prevention is openly discussed. Christianity in Poland, as the dominant religion, undoubtedly has a strong influence on shaping the opinions of a large part of society. In the future, this research may serve as a foundation for extending the study to explore the approaches of other religions to the phenomenon of suicide, as well as for examining the issue in other countries.

Socioeconomic Inequality in Post-Secondary Transitions: The Causal Impact of Admission Reforms in Germany

This study investigates the effects of admission restrictions on post-secondary educational trajectories, with a specific focus on socioeconomic disparities in Germany. By analyzing how institutional reforms in the admission system have shaped access to higher education, the research addresses a critical gap in understanding the interplay between social class

and educational outcomes. Using data from national surveys of high school students (1996–2018), conducted six months before and after graduation, this study tracks students' intended educational pathways versus their actual post-graduation enrollment.

The study employs a Difference-in-Differences design to assess the causal effect of key admission reforms in 1998 and 2004 on transition inequality by comparing pre- and post-reform cohorts of eligible high school graduates, while controlling for other individual and institutional factors. Additionally, logistic regression models are used to examine the mechanisms that lead to divergence in educational pathways, alongside tests of the mediating effects of students' social class, preferences, and attitudes toward higher education. This research builds on theoretical insights from Alon (2009), who conceptualized the "effectively expanding inequality" (EEI) framework, linking increased competition in admissions to widening class disparities. In line with Alon's findings, this study considers how exclusion and adaptation mechanisms may similarly influence class inequality in Germany, especially in periods of heightened competition for university slots. The findings offer new insights into how admission policies either perpetuate or mitigate class-based inequalities, with implications for policy reforms aimed at enhancing educational equity. This research ultimately sheds light on the long-term consequences of institutional barriers and the critical role of admission systems in shaping the educational and social mobility of students from underrepresented backgrounds.

CHEE, ROBIN MING FENG* (Singapore Management University, Singapore)

Effectively Integrated? A Study of the Lived Experiences and Challenges Faced By Vietnamese Working Professionals in Singapore.

For the last 40 years, Singapore has positioned itself as a migrant-friendly city-state due to its small population size and a rapidly decreasing birth rate. In order to attract younger skilled migrants, the authorities introduced the Tuition Grant Scheme to encourage talented foreign students to enrol in Singapore universities at a subsidised rate. Coupled with this scheme, the blossoming of several multi-national corporations and small and medium-sized enterprises which require workers from the region have led to more Vietnamese expatriates sinking roots in Singapore in recent years.

It is often perceived that Vietnamese migrants would find it easier to integrate into Singapore's society because their physical features are almost indistinguishable from Singaporean Chinese, which make up the vast majority of the population in Singapore. It can also be argued that a majority of these well-educated migrants share common traits and values with Singaporeans and are able to converse in English and/or Mandarin, thus making their task of assimilating into the country easier.

This research primarily aims to uncover the lived experiences of Vietnamese professionals of working age in Singapore and whether they are willing or able to integrate into Singapore's society. Through face-to-face interviews (garnered through convenience and snow-ball sampling methods) with 25 Vietnamese expatriates in Singapore over the course of 6 months, the study will elucidate the fundamental difficulties experienced by these migrants. These include being stigmatised along with their much-maligned blue-collar compatriots, being labelled as job-stealers by local professionals, not being accustomed to supposed liberal values of the host country and disagreeing with the work and recreational cultures embraced by most Singaporeans. The study will also showcase the coping methods utilised by these expatriates to deal with these problems.

Genomic Data Colonialism in Scientific Practice: Stewarding Our Non-Human Kin and Relations through Indigenous Data Sovereignty

A major goal of settler-institutions in biodiversity and conservation genomics is to understand the complexity of life through the collectivization of large amounts of DNA across many organismal taxa. Hence, a common practice is to legitimate and mandate the open sharing of genomic databases among universities and other settler entities, often without due deference and respect for the long-term stewardship and care of non-human kin by global Indigenous peoples. This may lead to the bypassing of Indigenous communitarian ethics which are colonially placed in opposition to "Western" self-ascribed permissivity to previously collected biospecimens. Furthermore,

the prioritization of ideologically colonial approaches is problematic as it situates Indigenous territories and traditional ecological knowledges as mere objects of Science, and it imposes disproportionate power dynamics to hypocritically instantiate itself as normative. These practices go against Indigenous Data Sovereignty, which is the recognition of Indigenous peoples' and communities' rights to exercise authority, agency, and autonomy over their stewarded genetically-associated knowledges and data. We will mainly focus on the scientific data practices regarding non-human living beings in the context of extractivism and the exploitation of territories and resources by scientists in terms of their perception of their own scientific labor as well as others'. We have conducted qualitative research via an international-scale survey in order to understand how biodiversity genomics researchers perceive their academic work, their praxes, and how they relate to extractivism to their understanding of Indigenous genomic data sovereignty. The results obtained will be used for establishing recommendations and strategies complying with Indigenous Data Sovereignty Frameworks, that could be applied inside universities and research institutions in order to guarantee the full and effective participation of Indigenous Peoples and their rights to their own resources and lands.

CHELLAN, NOEL* (Howard College Campus, South Africa)

Capitalism and COVID-19: Time to Make a Democratic New World Order

Using COVID-19 as the primary case study – this paper seeks to contribute to discussions and debates on why and how to transcend the current capitalist system – one that is responsible for so much that is wrong in the world today viz. the critical crises of the natural system and the disastrous environmental consequences such as climate change and deforestation, the widespread inequality – especially in countries like South Africa which is the world's most unequal country. Poverty, unemployment, violence, wars, etc. are also prominent features of the capitalist system. The paper puts forward arguments and suggestions for transforming the current socio-economic capitalist system towards a post-capitalist society – one that should be premised on living in harmony with nature, equality, the common good, happiness, etc. The paper argues for the imagination of the best of all possible worlds that humankind can and should create. Some of the suggestions that the paper considers for transforming towards a post-capitalist society are ensuring that the free market serve people and the planet rather than vice versa. The paper calls for a global environmental movement to reimagine and recreate 'the best of all possible worlds for current and future generations.' A post-capitalist society should ensure the well-being of the planet and people – and not only focus on economic 'well-being' as is currently the case – especially the obsession with GDP. This requires that 'economic science in its current ideological form should be revisited'. Co-operation amongst countries instead of ruthless competition which seems to be the case currently is what is required to solve global problems. The paper also puts forward the idea and motivation for celebrating 14th MARCH of every year as #END CAPITALISM DAY! In the final analysis – the paper argues and predicts that *capitalism too shall pass!*

Les Arts Et La Culture Entre Les Médias Et l'État : Cas De La Tunisie

Les Arts et la culture étaient au lendemain de l'indépendance une affaire d'État. Nous allons commencer par exposer l'historicité de l'instrumentalisation de la culture populaire, des arts populaires qui s'est vu exposé dans des documents de politiques culturels répondant aux recommandations de l'UNESCO. Dans ce cadre les médias au lendemain de l'indépendance étaient au service de l'État qui relayait et traduisaient les directives de l'État dans l'optique de construire la nation. L'argument de construire la nation à induit d'autre qui sont « relevé le goût » et « éduquer le peuple » dans cette politique l'État s'est octroyé le pouvoir d'interdire des arts au dépend d'autres.

La politique a mis à l'écart les arts populaires tel que le mezwed et se sont vus pendant longtemps interdit dans les médias. Des arts qui ont des privilèges tel que la mise en place d'écoles, instituts, de programme d'échanges internationaux, de fond dédié ainsi que la carte professionnelle qui aussi était un moyen pour l'État d'exercer une hégémonie et un pouvoir sur certaines disciplines plus que d'autre.

Environmental Justice and Power Dynamics in Taiwan's Energy Transition

As the 2050 net-zero target approaches, the global shift to renewable energy is accelerating, bringing challenges such as land use conflicts, job displacement, and the unequal distribution of benefits. Taiwan aims to source 20% of its energy from renewables by 2025, requiring large-scale solar and wind projects that impact agriculture, forests, fisheries, and coastal areas. However, a critical gap remains in understanding how power dynamics shape stakeholder engagement and influence the equity and socio-political outcomes of renewable energy projects. The concentration of decision-making power among energy companies and government bodies limits meaningful participation by local communities, particularly non-landowning farmers and fishers. This exclusion creates unequal distribution of benefits and burdens of renewable energy projects, worsening social inequities. This study applies energy and environmental justice frameworks to agrivoltaics conflicts, aquavoltaics in fish farming areas, and offshore wind projects, exploring the balance between Taiwan's energy independence and socio-environmental impacts. Data analysis builds on content analysis of government policies, Environmental Impact Assessment reports, public statements, and 24 semi-structured interviews with officials, corporate representatives, NGOs, and community members. Preliminary findings show that power imbalances hinder farmers, especially non-landowners, from meaningful participation in agrivoltaics. Despite government's efforts to promote public engagement since 2017, energy companies and government bodies still dominate decision-making, leaving limited room for local voices. Unions and fishery associations monopolize representation, overshadowing individual farmers. NGOs and coalitions do empower local stakeholders, but their efforts remain insufficient in addressing these structural imbalances. These findings suggest Taiwan continues to face challenges in achieving distributional, procedural, and recognition energy justice. Agrivoltaics disproportionately burden non-landowning farmers, while offshore wind projects, though experiencing less resistance, still struggle with high-quality engagement around changing access to marine resources. Despite government recognition of the need for more inclusive policies, further efforts are required to align these policies with energy justice principles.

Perception of the War in Ukraine and a Possible 'Reunification' War with Taiwan

This study examines the perspectives of Chinese citizens regarding two ongoing international conflicts: Russia's invasion of Ukraine and the hypothetical scenario of China employing force to reunify Taiwan. The former conflict has persisted since February 2022, while the latter remains an unrealized but increasingly pressing concern due to growing threats from Beijing authorities. Utilizing online surveys conducted among Chinese citizens, this research aims to address several critical inquiries. Specifically, it investigates the level of support among Chinese citizens for these two conflicts. To what extent do Chinese citizens endorse Russia's invasion of Ukraine, and how many are in favor of the Chinese government using force to unify Taiwan? Are there significant differences in support for these conflicts across different social groups? Do the urban-rural divide, socioeconomic status, educational background, and occupational experiences significantly influence individuals' attitudes toward these conflicts? Is there a correlation between those who support Russia's invasion of Ukraine and those inclined to support China's potential intervention in Taiwan? Beyond individual characteristics, this study explores how social experiences and socio-psychological attitudes may impact people's stances on these conflicts. For example, it investigates the degree to which exposure to foreign media and online information, as well as contact with official propaganda, affects individuals' attitudes toward these conflicts. Furthermore, the research examines whether individuals who hold a more optimistic outlook on China's future development and have greater confidence in the Chinese political-economic system are more likely to support Russia's invasion of Ukraine and China's potential use of force in Taiwan. Conversely, do those with a more pessimistic view of China's future and greater dissatisfaction with their living conditions exhibit significantly different attitudes toward these conflicts? This paper presents the potential mechanisms that influence the attitudes of the Chinese populace toward these conflicts and discusses their implications.

CHEN, HSING-JUNG* (Graduate Institute of Social Work, National Taiwan Normal University, Taiwan)

When Family and School Are Not Safe: Resilience and Help-Seeking in Taiwanese Youth with Childhood Adversities

Childhood adversities have far-reaching implications for the physical, mental, and social development of individuals. Children's loyalty to their families often complicates direct help-seeking, particularly when parental mental illness necessitates caregiving roles. Those facing adversities are more prone to interpersonal difficulties, bullying, and academic failure. Limited community support and familial obligations exacerbate these challenges. Although schools are pivotal in identifying abuse and facilitating early intervention, there is a paucity of research on how Chinese children navigate these risks in both familial and educational settings.

This study adopts a resilience framework to explore how family and school environments shape help-seeking behaviors in Taiwanese youth. In-depth, semi-structured interviews were conducted with 20 emerging adults who had experienced multiple childhood adversities. All participants encountered significant challenges in school and some had experienced prolonged bullying. Over 70% of participants were diagnosed with psychiatric disorders, engaged in self-harm, or attempted suicide.

Thematic analysis revealed that fear and systemic failures significantly hindered help-seeking. Many participants remained silent about domestic violence for years, either unaware of its illegality or fearing repercussions. Attempts to disclose abuse were often overlooked by educators, and the support provided by schools and police was inadequate, exacerbating the participants' suffering. Over time, cumulative risks led to maladjustment, with some individuals resorting to self-harm. However, protective mechanisms such as peer support, engagement in schoolwork, and the presence of a supportive adult offered temporary relief. Notably, some participants demonstrated post-traumatic growth, characterized by increased altruism and the formation of meaningful relationships, driven by resilience and timely interventions. The findings underscore the urgent need for reforms in mental health services for children from high-risk families. Enhancing institutional support, reducing barriers to help-seeking, and providing consistent emotional support are essential to mitigating the effects of childhood adversities and promoting post-traumatic growth.

Changing Neighborhood Environment and Residents' Subjective Well-Being in Urbanizing China

Urbanization has been one of the primary forces driving the spatial configuration and the demographic, socio-economic, and political transformation of China's grassroots neighborhoods. Although the scale of urbanization in China, together with its global influence, has generated a rapidly expanding field of study, the literature dealing with the country's rural-urban transition at the neighborhood level is primarily based on cross-sectional surveys or case studies of specific localities. Few efforts have been made to present a more complete picture of the neighborhoods undergoing transition, the residents experiencing in-situ urbanization, and the associated consequences and challenges. In this paper, we aim to provide a comprehensive understanding of the changes in neighborhood environment of places experiencing in-situ urbanization, and examine the effects of such changes on the urbanized residents' subjective well-being.

Based on the 2018 Urbanization and Quality of Life Survey and the 2024 follow-up survey we conducted in 40 township-level administrative units undergoing rural-urban transition via administrative reclassification, we will deal with the endogenous issues that have limited the scope and reliability of existing research based on cross-sectional data. We are also collecting and compiling factual information (such as administrative reclassification, demographic composition, land use, health facilities, and social services) on selected neighborhoods in the 40 townships, and integrating this information with the survey data.

With the multi-level data, we will examine the changing neighborhood environment and its effects on the in-situ urbanized residents' subjective well-being, and reveal the important role of community facilities and social services in promoting citizens' subjective well-being. The research will shed light on the administrative and territorial factors directing China's ongoing urbanization, and will contribute to both academic and policy discussions concerning rural-urban transition, effective social service provision, sustainable urban development, and citizens' well-being.

Job Destruction or Job Creation? Impact of Digitalization on Unemployment*

This study contributes to the ongoing discourse on the transformative effects of digitalization on labor market by exploring its dual impact in both job creation and destruction. Using a two-way fixed effects model and panel data from 224 cities in China between 2003 and 2019, we empirically test three potential relationships between digitalization and unemployment: positive linear, negative linear, and non-linear trajectories like U-shaped and inverted U-shaped patterns. Our results show that (i) each unit increase in digitalization corresponds to a 0.136% decrease in the unemployment rate, a finding that remains robust after a series of robustness check and addressing endogeneity through instrumental variable (IV) estimation; and (ii) mediation analysis using structural equation modeling (SEM) identifies industrial upgrading and entrepreneurship as key channels through which digitalization mitigates unemployment. This study makes several theoretical contributions. First, it provides valuable insights into how digitalization shapes labor market outcomes and enhances our sociological understanding of how technological change interacts with and reshapes economic activities and structures, enriching existing theories on the varied effects of technological advancement on labor markets, particularly its long-term role in fostering job creation. Second, it highlights the proactive role of government in promoting digitalization, suggesting that technological change primarily driven by state-led initiatives has the potential to reduce inequality and foster more inclusive development compared to market forces. Finally, this study offers broader developmental implications for regions that are undergoing similar transition. China's trajectory—initially lagging in digital development until 2010, then catching up to the global frontier offer wide range and valuable implications for how digitalization can be leveraged for better development in other developing regions such as Africa and South Asia. Our findings highlight the significant potential of digitalization to mitigate unemployment, thereby addressing broader inequalities and promoting a more equitable society in the long run.

CHEN, JUNRU* (The Chinese University of Hong Kong, China)

The Impact of Internet Use on Social Trust in China: An Institutional Perspective in the Digital Era

Trust is becoming more fluid and dynamic in the digital society. While existing research has extensively explored the relationship between Internet use and social trust using a cognitive mediation model, this study introduces an institutional perspective. As Internet usage grows, both social trust (generalized trust in others) and institutional trust (confidence in public institutions) are experiencing significant changes, especially in China, where institutional reliance is high. Previous research has highlighted institutional trust's role in fostering social trust by enhancing perceptions of fairness and stability, reducing uncertainty in social interactions. However, few studies have explored the role of institutional trust in shaping the relationship between Internet use and social trust in the new digital era. To address this gap, we propose two key propositions: (1) Increased Internet use can enhance social trust by strengthening institutional trust, as digital platforms improve information access and government responsiveness, fostering public confidence and creating a more stable environment for social interaction. (2) Conversely, Internet use may undermine social trust by weakening institutional trust, as online spaces introduce new arena that may challenge traditional institutions, amplify polarized discourse and expose users to a broader range of societal problems, diminishing certainty and trust in others. Using data from the 2021 Chinese General Social Survey (CGSS), with robustness checks from the 2015 and 2017 waves, we find a significant negative relationship between Internet use and social trust, mediated by institutional trust. To address potential endogeneity between institutional trust and social trust, we employ an instrumental variable approach using confidence in government after COVID-19. This study contributes to the sociological discourse on how the digital era reshapes trust and distrust, emphasizing the crucial role of institutional trust in these processes.

CHAN, EDWARD KO-LING (The Hong Kong Polytechnic University, Hong Kong)

Interventions on Bullying and Cyberbullying Bystanders for School-Aged Children: A Meta-Analytic Investigation

Introduction: Bullying, characterized by intentional harm and power imbalances, is prevalent in schools, workplaces, and online. Evaluating both bullying and cyberbullying under a unified framework helps identify factors influencing bystander behavior, leading to robust interventions. Bystanders play a crucial role in either reinforcing or inhibiting bullying through their actions. Interventions for younger students should focus on recognizing bullying and seeking help from adults, while college students require strategies addressing complex social dynamics. Understanding bystander interventions in bullying scenarios is essential. Offline bullying triggers more immediate empathetic responses due to physical presence, while cyberbullying lacks these cues (Wright et al., 2018). School programs have effectively reduced bullying and increased bystander intervention (Ttofi & Farrington, 2011), but similar strategies in cyber settings are less understood.

Method: Following PRISMA guidelines, we conducted a meta-analysis, searching databases like PsycINFO and Medline. Inclusion criteria included RCTs or quasi-experimental designs with sufficient data for effect size calculation. Data extraction focused on study characteristics and outcomes, with quality assessed via the CONSORT checklist.

Results: From 8,563 studies, 49 met the inclusion criteria. The pooled effect size was 0.25, indicating effective interventions. Offline interventions showed slightly higher effect sizes than online ones. College students exhibited the largest effect sizes, especially in cyberbullying contexts.

Discussion: Interventions improve bystander behaviors, with knowledge enhancement and empathy crucial. Smaller studies showed higher effect sizes, emphasizing careful interpretation. Offline methods proved more effective, suggesting the importance of direct engagement. Schools should integrate comprehensive bystander education, focusing on safe online practices and inclusive interventions to enhance effectiveness.

Taiwan's LGB Demographics, Happiness, and Income

Obtaining representative samples of Lesbian, Gay, and Bisexual (LGB) populations is challenging, often leading to a hardship in ascertaining their demographic proportions and a scarcity of comparative studies. This study, luckily, leveraged and analyzed gender-specific data from the 2022 Taiwan Social Change Survey—one of the few nationally representative random samples with sexual orientation information—to explore the population proportion of LGB individuals based on self-identification and to compare key indicators of happiness and monthly income. Excluding those with indiscernible self-identification, the sample size was 1,708 (Sample 1) for population estimation and analysis of happiness levels. For income comparisons, individuals without employment or income were excluded, resulting in a sample size of 1,098 (Sample 2). Additionally, a supplemental analysis was conducted using Taiwan's LGBTI Living Condition Survey, yielding the following findings:

Population Proportion: In Sample 1, 3.8% self-identified as LGB (20 males, 45 females). Weighted estimates based on the population structure indicated approximately 4.3% (21 males, 52 females), with a Weighted Bootstrap 95% Confidence Interval of [3.7%, 5.9%]. The Weighted Bayesian Estimate was 4.3% with a 95% Credible Interval of [3.4%, 5.3%].

Happiness Levels: From the gender-specific analysis, gay and bisexual males reported lower happiness than heterosexual males.

Income: In Sample 2, employed gay and bisexual males reported a 35% lower monthly income than heterosexual males in our model, while lesbian and bisexual females showed no significant income difference compared to heterosexual females. This finding aligns with recent trends observed in the United States and the United Kingdom, underscoring the global relevance of our research.

Supplemental analysis: Gay and bisexual males experience higher rates of discrimination and receive less social support compared to their lesbian and

bisexual female counterparts. Significantly, these factors are also negatively correlated with income, suggesting a potential reason for the income disparity observed among gay and bisexual males.

The Dark Side of Trust: How Trust in Online Health Information Impacts Well-Being and Mental Health

Every day, hundreds of millions of people around the world search for health information on the Internet, and many of them firmly believe the information they found, but there are risks involved.

This empirical study utilizes data from the China General Social Survey 2021, encompassing a sample of 2,690 respondents, to explore the relationship between trust in online health resources and individual well-being and mental health. **The analysis reveals a significant negative correlation between trust in online health information and subjective well-being and mental health.** Disadvantaged groups, including individuals with low income, low socioeconomic status, those residing in rural areas, and less developed provinces, exhibit higher levels of trust in online health information. This trust is linked to increased health risk cognitive biases and anti-doctor attitudes, which may serve as pathways leading to lower subjective well-being and mental health.

The study further identifies that overconfidence in one's ability to discern the quality of online health information and the negative impact of trust in such information on mental health have a substitution effect. Individuals who are overconfident in their ability to evaluate online health information quality predominantly belong to low SES groups. Additionally, the adverse effects of trust in online health information on subjective well-being and mental health are more pronounced among individuals with poor health status or those lacking public health insurance.

These findings underscore the need for targeted interventions to improve health literacy and critical evaluation skills, particularly among disadvantaged populations, to mitigate the negative impacts of trust in online health resources on well-being and mental health. This research contributes to the sociological understanding of digital health and highlights the complex interplay between trust, health literacy, and socio-economic factors in shaping health outcomes.

Enhancing Employment Recovery Capital (ERC) for Individuals with Substance Use Disorders: Practical Lessons from Taiwan

Purpose: Employment Recovery Capital (ERC) has emerged as a critical factor in the recovery process for individuals with substance use disorders. To optimize recovery outcomes, it is essential to assess the strengths and limitations within key domains such as job seekers, employment services, workplaces, and policy frameworks. However, current research in Asia lacks sufficient analysis of barriers related to personal circumstances, labor market conditions, and employment services. This study aims to explore the experiences of case managers and assess the role of formal employment services within a comprehensive recovery strategy.

Method: A qualitative thematic analysis was employed to investigate the experiences of 19 case managers providing employment services to individuals with substance use disorders. Semi-structured interviews were used to examine how case managers assessed ERC, the challenges they encountered, their coping strategies, and recommendations for improving employment services at official Employment Service Stations and Centers.

Results: Case managers reported that individuals with lower ERC, resulting of higher life vulnerabilities, faced substantial barriers to stable employment. These included limited formal work experience, unemployment exacerbated by multiple stigmas, and restrictive labor policies. Particularly vulnerable groups, such as women, middle-aged and elderly individuals, and those with co-occurring mental health disorders, faced heightened difficulties in building ERC. For individuals with fewer vulnerabilities and higher ERC, positive employment experiences—fostered by supportive employers and targeted employment services—were critical in mitigating self-stigma. For individuals

with higher vulnerabilities and lower ERC, detoxification shouldn't be required for service access. Instead, case managers should prioritize basic needs, vocational training, and self-image improvement over immediate income generation as a harm reduction strategy.

Conclusions: Accumulating ERC is essential for continuous care, with case managers playing a crucial role. Tailored interventions and inclusive employment policies are necessary to address the complex labor dynamics affecting these individuals.

CHEN, YING* (National University of Singapore, Singapore)

Qigong and the Reconstitution of the Revolutionary Self-Cultivation Culture Among the Cancer Communities in China

This paper explores the transformative role of Qigong in the context of the post-Mao public healthcare sphere in China. By exploring how the 1950s-born Chinese working-class individuals redefined their lives in the face of cancer through the practice of Qigong, this article reveals that Qigong functions not merely as a mitigating force but also as a grassroots vehicle for reconciling divergent value systems precisely because it allows reworking the sediments that lie beneath each phrase of contemporary Chinese societies to be developed in different contexts. Self-cultivation emerges as a desired form of technology of self because it allows them to approximate the sense of social belonging previously emphasized and cultivated within socialist medicine. This sense of belonging encompasses the capacity to gain public recognition through collective efforts. The findings challenge the perception of socialist medicine as a bygone era, positioning it as an object of desire and mourning that still wields significant social influence. As people strive to recapture or at least approximate the collectivist forms and feelings of stability and belonging they experienced during the marketized medical regime, socialist medicine endures as a source of inspiration. Additionally, this article sheds light on the dynamic reshaping of Chinese religious practices in response to the rapidly changing contemporary society. It underscores the enduring relevance of Qigong as a healing practice and the profound impact of historical medical systems on present-day Chinese society.

CHEN, YING* (National University of Singapore, Singapore)

Surveillance of Mosquitoes: Dengue Control, Biotechnology of Wolbachia, and Spatial Governance in Singapore

In Singapore, dengue control has constituted a central objective of public health interventions since the 1960s, resulting in decades of notable achievements. However, due to climate change, dengue fever has recently emerged as a severe mosquito-borne disease in Southeast Asia, as well as in numerous other tropical regions globally. Consequently, dengue control has once again become a significant concern for the Singapore government. This paper presents the findings of eight months of ethnographic research conducted with the NEA, scientists, and residents. It examines the social construction of the Wolbachia Project in Singapore as a case of biotechnological governance aimed at combating dengue, an infectious disease. The research aims to reveal how the implementation of Wolbachia-Aedes suppression technology, an international technology advocated by the World Mosquito Program, was adopted in Singapore to align with local social and cultural realities related to the disease. The findings emphasize the pivotal role of Housing and Development Board (HDB) policies and spatial governance in facilitating the project's success as a political and cultural infrastructure. This study demonstrates how the historical evolution of dengue control is a dynamic process shaped by the interplay of state interests and objectives, international influences, the emergence of new medical knowledge and technology, evolving perceptions of disease and health, local environmental conditions, societal dynamics, and the political, social, and economic forces at play within a specific locality at a particular point in time.

The Emergence of Economic Rationality of GPT

As large language models (LLMs) like GPT become increasingly prevalent, it is essential that we assess their capabilities beyond language processing. This paper examines the economic rationality of GPT by instructing it to make budgetary decisions in four domains: risk, time, social, and food preferences. We measure economic rationality by assessing the consistency of GPT's decisions with utility maximization in classic revealed preference theory. We find that GPT's decisions are largely rational in each domain and demonstrate higher rationality score than those of human subjects in a parallel experiment and in the literature. Moreover, the estimated preference parameters of GPT are slightly different from human subjects and exhibit a lower degree of heterogeneity. We also find that the rationality scores are robust to the degree of randomness and demographic settings such as age and gender but are sensitive to contexts based on the language frames of the choice situations. These results suggest the potential of LLMs to make good decisions and the need to further understand their capabilities, limitations, and underlying mechanisms.

Race-Gender Intersectionality and Financial Health of Older Americans: Empirical Insights from the Financial Capability Framework

Background: Financial capability, encompassing financial literacy, access, and behavior, can influence individuals' ability to manage finances and is a precursor to robust financial health and wellbeing in later life. However, individuals with distinct social identities, such as gender and race, may have varied experiences of financial socialization, resulting in heterogeneous financial capability and health later in life. Guided by the financial capability framework, we examine the intersectional gendered and racial pathways to the links between financial capability and financial health using nationally representative data in the United States.

Methods: We used 11,618 individuals aged 50 and over from the 2018 National Financial Capability Study. Latent path models via structural equation modeling were used to examine the mechanisms of financial capability on adverse financial health (e.g., carrying too many debts, difficulties in making ends meet, and use of alternative financial services). Multigroup comparison was further employed to investigate the moderated effects of race-gender intersectionality (white men, white women, black men, and black women).

Results: Financial literacy and access were positively associated with financial behavior, but financial behavior was negatively associated with adverse financial health. The multigroup comparison revealed that these links operated differently across race-gender intersectionality. Overall, the effects of financial literacy were pronounced in men, whereas financial access and financial behavior were evident in whites. A gradient protective effect of financial capability on adverse financial health was identified in the race-gender intersectionality, suggesting that black women were the most vulnerable group in terms of financial health.

Discussion: Strategies to promote financial health (e.g., financial coaching, credit counseling, and financial profile assessments) in later life should consider targeting blacks, women, and particularly black women. Policies and programs that expand financial inclusion should be developed to reach and cover the financially underserved black and women older adults.

TAM, TONY (Chinese University of Hong Kong, Hong Kong)
Assessing Two Dimensions of Institutional Trust Building in China

Institutional trust refers to the level of trust that individuals have in an organization, system, or professional group. It is an important measure of social capital and overall social stability. This study utilizes data from the Chinese General Social Survey (CGSS), World Value Survey (WVS), and an online survey to explore the influence of two organizational characteristics—competence and moral hazard—on the patterns of institutional trust in China. We obtained three main findings. First, institutional trust decreases from central authorities/professions to local administration/business/social organizations. Second, competence and moral hazard can explain the differences in institutional trust. Higher competence and lower moral hazard are linked to higher levels of institutional trust. Third, the impact of competence on institutional trust is greater than the impact of moral hazard. We discuss the implications for how to improve institutional trust in contemporary China.

CHEN LARA, TIENSHI* (Waseda University, Japan)
Autoethnography of Three Generations of Chinese Diaspora in Japan

My father was born in Heilongjiang Province, China, lived through the Manchukuo Period, the Sino-Japanese War, fled to Taiwan during the Chinese Civil War, later immigrated to Japan in 1950's, and turned 103 years old in 2024.

In 1972, Japan normalized diplomatic relations with China. My family lived in Japan with Republic of China (Taiwan) citizenship were asked to choose either Japanese or People's Republic of China citizenship. They could not bring themselves to choose due to memories of the war with Japan and ideological differences with the Chinese Communist Party. The whole family became stateless.

As a second-generation overseas Chinese born and raised in Yokohama Chinatown, I lived as a stateless person for three decades. This autoethnography looks at a family history in Yokohama's Chinatown to reconsider the meaning of homeness and homelessness, exploring tensions between the individual and the state experienced by three generations of Chinese Diaspora- my father, myself, and my son.

CHENAULT, TIFFANY* (Salem State University, USA)
Recreational Running and Black American Women's Bodies: Challenging Inclusiveness in an Non Inclusive Place Around Recreational Running

The resulting marginalization of Black women ignores their intersectional experiences and renders their narratives invisible. In other words, the deconstruction of whiteness and its negative impacts in and through sport involves recognizing how historical and current systems (including narratives) exclude the perspectives, experiences, and contributions of racially oppressed groups such as Black women. Physical activities such as running are seen as a welcoming and all-inclusive activity that all people can participate in. Yet Black women and men, especially Black women, have found that recreational long-distance running has been framed as a white sport and a "white space." This paper focuses on the connection between Critical Race Theory and recreational running. Using critical race methodologies I will show why there is so little progress in the elevation of Black women in recreational running and how black women resist racism and intersecting forms of oppression through creative expression, relationship building (social bonding and bridging), resource sharing, mutual respect, trust, and intentionality in the sport.

CHENG, KENT SHENG YAO* (National Chung Cheng University, Taiwan)

A Study on International Trends and Development of Indigenous Schools between the United States and New Zealand

The United Nations defined "Indigenous peoples" as ethnic groups that have long resided in a country or region, possessing their own "unique" social, economic, cultural, and political systems. However, due to the invasion and conquest by colonial nations or cultures, their legal status is often not respected (United Nations, 2009). In response to the reality that Indigenous peoples' legal rights are often unacknowledged, how to deeply discuss and plan issues such as the preservation of indigenous culture, language revitalization, and educational equity has become a key focus for governments to demonstrate social fairness and educational justice in governance. Among these issues, the context, current situation, and challenges of the operation of indigenous schools have garnered the most attention. To better understand the efforts and planning of the United States and New Zealand in indigenous school policies amidst globalization and localization, this study will first review existing research findings on indigenous schools to establish a theoretical foundation. It will then adopt the educational policy implementation analysis framework proposed by the OECD (2020), focusing on three main dimensions: smart policy design, inclusive stakeholder engagement, and conducive environment. Finally, the study aims to juxtapose and compare the indigenous school policies of the United States and New Zealand, hoping to provide valuable references for the future planning, implementation, and reflection on indigenous school policies in Taiwan.

Alternative Credential or Alternative Pathway? Military Experience and STEM Occupations By Gender

Previous research indicates a strong association between military service and STEM trajectories, especially for women veterans. In this paper, we analyze the extent to which military service functions as 1) an *alternative credential*, allowing veterans to bypass classic postsecondary credentials, and/or 2) an *alternative pathway* via educational benefits, that facilitate earning a (non)STEM bachelor's degree. Using ACS 2014-18 data, we perform a mediation analysis using the potential outcomes framework to examine the total, direct, and indirect effects of military service on STEM occupational outcomes. Results suggest three distinct pathways into STEM occupations. Military service serves as an alternate credential that enables veterans to move directly into STEM occupations. This finding holds for all veterans, regardless of gender. Military service also serves as an alternative pathway via STEM degrees, but the returns to post-secondary credentials are gendered, producing dissimilar career trajectories among veterans: For veteran women, military service indirectly increases rates of employment in STEM via higher rates of bachelor's degree earning, especially in STEM fields. In contrast, veteran men are overall less likely to earn bachelor's degrees, yet both STEM and non-STEM degrees help propel them into STEM occupations. In other words, for veteran men, military service boosts the impact of any bachelor's degree earned, making it more likely that veteran men smoothly transition from (non)STEM degrees to STEM occupations.

CHENIER, VALENTIN* (Tampere University, Finland)
Shaping Tomorrow in Changing Global Societies: Young People's Roles and Influence amid Morocco's New Development Model's Policies and 2030 FIFA World Cup Development Plans

Globalization is rapidly transforming the economic and cultural landscapes of the Global South, yet young people's pivotal role in shaping their societies' future remains undervalued. In the Middle East and North Africa, governments invest in development policies to address economic instability and high youth unemployment. However, these initiatives often overlook youth perspectives, potentially failing to provide sustainable prospects. This gap underscores the urgent need for youth-centered global development research to inform policy recommendations.

This interdisciplinary study bridges Youth Studies and Global Development Studies, exploring how young Moroccans negotiate their agency amid significant regional changes. Through immersive ethnography, I examine the lives and aspirations of 15-30 year-olds on Morocco's Atlantic coast — an area experiencing unprecedented transformation due to the country's New Development Model and preparations for hosting the 2030 FIFA World Cup. Using a post-Fordist lens and acknowledging globalization's power dynamics, the study critically addresses 3 research questions:

1. How do young people's new aspirations, subcultures and innovative entrepreneurial ventures drive regional economic and cultural shifts?
2. To what extent can youth influence Morocco's development policies, and how to amplify their voices in decision-making processes?
3. How do globalization and neo-liberalization of Morocco's society impact its youth, and how are young people, in turn, shaping these processes?

The research has direct policy implications due to my collaboration with international research teams appointed to issue policy recommendations. By providing a youth-centred perspective, this research ensures inclusive bottom-up policy decisions. On the macro level, the study critically examines globalization processes and Global North influences on policies shaping the future of Global South youth and societies.

CHERBIT, ZOHAR* (Aix-Marseille Université, France)

Urban Transformation and Culture: A Case Study on the Museum of Civilizations of Europe and the Mediterranean

The Museum of Civilizations of Europe and the Mediterranean (Mucem) opened in 2013, during the consecration of Marseille as the European Cultural Capital. As one of the few national museums located outside the Parisian region, its relocation to the south of France raises important questions: What motivated the relocation of a museum whose collections were not initially linked to Marseille or the Mediterranean? Over a decade later, what have been the effects on its surrounding neighbourhoods, and how is the museum perceived by its nearby residents and merchants?

This research draws on archive work (museum records, political discourses) to trace the genealogy of the Mucem. These findings will be contextualised within the broader urban mythologies portraying Marseille as a city of migration and crime. Additionally, qualitative fieldwork, including photo elicitation with nearby merchants, will be used to understand how the museum is perceived and used ten years after its opening.

The findings reveal that local perceptions of the museum are inseparable from the broader urban transformations of the neighbourhood in the past ten years, such as increased tourism, social housing evictions in Le Panier and Joliette, and reduced access to the sea due to new infrastructure.

Furthermore, the museum's efforts to meet national museum standards (while being an outsider), and responding to Marseille's sociopolitical context and specific needs tend to create aesthetic contradictions. These contradictions manifest in the museum's architecture, in its programming (blending contemporary art within exhibitions about civilizations, a focus on fine arts in terms of workshops), and reflected back by neighbours' blurry perceptions of the museum as either a modern art space or a historical institution.

MIRONOVA, ANNA* (RUSSIAN STATE UNIVERSITY FOR THE HUMANITIES, Russian Federation)

Collection and Use of Feedback in the Development and Optimization of Public Services: A Customer-Centric Approach

The concept of customer-centricity in Western business terminology has been used for a long time. Nevertheless, this is a relatively new practice for the sphere of public administration. The introduction of the principles of customer-centricity into the practice of public administration is considered to be a new stage in the development of the concepts of New Public Management, the Service State, the Digitalization of Public Services and Social Contract Theory.

One of the main principles of this approach is a constant work on the collection and analysis of the feedback from citizens which provides the possibility of taking into account people's opinions in the decision-making process including political decisions as well.

Currently, the requirements for working with feedback in Russian state bodies include: 1) the need for constant collection and regular analysis of the feedback; 2) assessment of customers' satisfaction in all the processes and at each stage of public services provision; 3) monitoring of various satisfaction parameters; 4) using the results of the feedback analysis in further optimization and transformation of the services.

Encouraging feedback, focusing on taking into account the interests and needs of citizens and business representatives when developing new and optimizing existing services is an important part of the process of agreeing on new terms of a social contract and updating it.

The report will present the first results of the implementation of the customer-centricity principles at state bodies in Russia: the identified peculiarities of collecting and analyzing feedback in various state bodies, as well as conclusions based on data from sociological representative studies.

CHERUBINI, DANIELA* (University of Parma, Italy)

Title Intersectionality As a Social Movements' Strategy and a Challenge in Anti-Racist Struggles

Intersectionality, as a tool for critical analysis and practice (Collins & Bilge 2016; Collins 2019), comes from critical theories and social movements of the past but its story continues to be written and renewed today. Intersectionality keeps being an inspiring perspective, which provides an empowering framework that fuels the collective organizing of multi-marginalized subjects and social groups. It also poses specific challenges to different social justice movements, in various contexts, prompting them to deal with complex inequalities and power imbalances among their members and in society. There is a growing debate both inside and outside academic circles about how intersectionality is interpreted and applied in these different situations. In my presentation, I'll delve into this debate and discuss the uses and challenges of intersectionality in anti-racist struggles. Leveraging insights from my research, I will spotlight cases from Southern Europe and Latin America, focusing on the fight against discrimination in migrant women's groups, the mobilizations for rights and decent work by racialized domestic workers, and the anti-racism engagement of racialized youth with immigrant backgrounds (*"Growing old, feeling like citizens?" PRIN Project*). On the one hand, the analysis will show how an intersectional approach is reflected in the construction of political identities, coalitions, and alliances which go beyond a single-issue construction of anti-racist struggles. On the other, the intersectional approach helps to bring to light the situated character of the category of race and the forms of racism that take shape in different historical, cultural and political contexts, in intertwining with other systems of oppression based on gender, social class, origins, citizenship, age and so on.

Studying No Children? Factors and Diversity of Event Sequences in Women's Female Educational and Childbearing Trajectories

Educational trajectories after high (secondary) school are closely interlinked with other life choices to be made during the transition to adulthood, including those related to marriage and childbearing. This study examines relationship between these choices and aims to establish whether these events compete in the lives of young Russian women born in the 1990s.

The study uses longitudinal data of the first ten waves of the survey "Educational and Professional Trajectories" (2011-2021), whose participants in the first wave were ninth-year high school students (panel sample N = 992). The study applies sequence analysis, clusteranalysis to reveal most typical trajectories, and regression analysis.

The latter shows that the early motherhood trajectory is chosen by young women who from the beginning have no plans for a long course of study.

Giving birth while studying tends to lengthen the educational trajectory rather than put an end to it altogether. However, the preferred strategy of Russia's young females is a long course of study and delayed childbearing. The predictors of this choice include: high socioeconomic status of the parental family, residence in large urban centers, good grades at high school, individual plans to study at university, and greater educational expectations of parents. These factors affect both educational and reproductive choices.

ANDHARIA, JANKI (Tata Institute of Social Sciences, Mumbai, India)

The Role of Folklore in Decolonizing Knowledge Production Around Disasters: An Ethnographic Enquiry Among Three Indigenous Communities of Assam, India.

For indigenous communities, folklores constitute a cultural heritage that provide continuity and a sense of connectedness to the past and the present. From a colonial and modernist perspective, these are often considered as myths, baseless and illogical and tales constructed by "primitive" human imagination and interpretation. However, it has often been observed that folklores have their roots in human observation, real world experiences and past events and patterns. They have an underlined meaning, including a suggestion of caution or warning against potential risks. Folklores are known to hold records of unique events such as disasters and of how humans have coped with these events. For a given community, folklores are also a way of teaching lessons to the younger generations from the experiences of the old. They provide a sense of place and self, often communicate a sense of safety and convey the meaning of resilience. Thus, indigenous knowledge often found in folklores of communities provide pointers to how the community evolved, creating a shared sense of history over generations.

From these perspectives, the present study, using an ethnographic approach explores and systematically documents oral traditions of three indigenous communities of the district of Dhemaji of the North-East Indian state of Assam, namely, the *Mishings*, the *Tai-Ahoms*, and the *Sonowal Kacharis*. The paper maps the role of folklore in shaping disaster perceptions of these three communities and their adaptation and resilience as riverine communities experiencing periodic flood disasters. Using a decolonial lens, the paper argues that attention to indigenous knowledge, requires using a cohesive, interwoven, interdisciplinary methodology, where local community must be seen as agentic, adapting to the changes in the environment, and responding to disasters. Policy makers engaged in prevention, mitigation and post-disaster efforts, would find valuable insights in these folklores that embody experiences and perceptions of the community.

Beyond Visibility: Navigating the Educational Journeys for Students with Albinism in KwaZulu-Natal, South Africa

Albinism is an inherited condition affecting individuals across all ethnicities globally, but it is especially prevalent in sub-Saharan Africa. Those with oculocutaneous albinism have minimal or no pigment in their hair, skin, and eyes, which results in visual impairments and increased sensitivity to sunlight. Despite medical advancements in understanding albinism, individuals

often face significant challenges, including discrimination and stigma in educational environments. This paper reports of the findings of my PhD study which explored the experiences of students with albinism in primary and secondary schools in KwaZulu-Natal, South Africa. Utilising a qualitative, interpretive, phenomenological approach, the study employed semi-structured interviews and focus group discussions to capture the educational journeys of students and explore how they navigate their personal and social worlds within mainstream and special schools, as well as the broader societal implications of their condition. The findings reveal a paradoxical existence for these students, characterised by being highly visible due to their physical appearance but often rendered socially invisible. Students reported varied educational experiences, with many encountering bullying, name-calling, and emotional abuse from both peers and educators. The existence of myths and stereotypes regarding albinism was also prevalent. In mainstream schools, students tended to exclude themselves from other students to avoid discrimination and stereotypes surrounding their condition. Moreover, teachers in mainstream schools often lack the training to support these students effectively. Most students felt safer in special schools, as these environments were perceived as more accommodating. Mainstream school environments were frequently ill-equipped to accommodate their visual impairments, exacerbating feelings of isolation and academic challenges. The study highlights the need for greater awareness and targeted interventions within educational systems to create inclusive environments for students with albinism. The findings were integrated to inform the development of a multi-sectoral framework to address the challenges that students with albinism face.

RC04-68.1

CHETTY, ROVASHNI* (University, South Africa)

Visible Yet Invisible: Breaking Barriers for Students with Albinism in Higher Education in KwaZulu-Natal, South Africa

Albinism is a genetic condition characterised by a deficiency or absence of melanin pigment, which impacts normal pigmentation. Persons with albinism occupy a paradoxical position - they are simultaneously "visible" and "invisible". While they are visible because of the physical manifestation of the condition, when confronted with discrimination, labelling, and alienation, they often withdraw from the broader community, making themselves "invisible". This extends to the higher education sector, where students with albinism experience various social, environmental, cultural, and institutional barriers. While South Africa has made significant strides towards a more inclusive education model, my experience as a Sociologist in higher education revealed that persons with disabilities face persistent challenges. Discrimination, logistical hurdles, and social marginalisation continue to hinder their educational journey. The findings of my multidisciplinary PhD study show that the challenges faced by students with albinism at four higher education institutions in KwaZulu-Natal, South Africa, do not necessarily stem from their physical traits. Rather, their limited access to educational opportunities is more closely linked to broader issues such as poverty, discrimination, stigma, social exclusion, and human rights abuses. There are significant gaps in existing interventions and policies, with current frameworks and support systems falling short of achieving their intended outcomes for students with albinism. The findings, obtained from qualitative interviews and focus groups, provide valuable insights and recommendations that can inform policy reform, enhance educational practices, and promote inclusivity for students with albinism. There is a need for urgent reforms, including clearer legal definitions, amendments to national legislation, and improved institutional support systems. The findings were integrated to inform a framework that specifically addresses access to higher education for persons with albinism. It is recommended that the frameworks be adopted and implemented across all sectors that cater to the needs of persons with albinism.

CHEVALIER, DANIELLE* (Leiden Law School, Leiden University, Netherlands)

Close Encounters with a Third Leg: Using Fieldwork Experiences of Sexual Harassment As Research Data.

Participant observation is a core component of ethnographic research. Doing participant observation means being a participant to what you observe, and the participation can take on a very visceral and bodily stance. One example in case is encountering sexual harassment. This paper argues that experiences of sexual harassment during fieldwork should be considered as potentially relevant data and analyzed as such. Though sexual harassment in the field is suspected to be a common experience, its occurrence is not a consolidated 'tale from the field' (Hanson and Richards, 2017). At the same, sexual harassment experienced during ethnographic fieldwork plays an important role in power dynamics both in the research field and in the academic domain. This paper engages (a) with the role that encounters with

sexual harassment (can) have in data collection and analysis, and (b) what sharing experiences of sexual harassment in the academic domain entails. It pulls examples from the author's own experiences in ethnographic research on the role law plays in social interactions in diverse public space. The aim is twofold; to contribute to a still too limited body of literature on sexual harassment experienced by researchers in the field and to pose a challenge to the assumption that sexual harassment during fieldwork is not a veritable source of data and not a profitable ground for analysis.

CHEVALIER, DANIELLE* (Leiden Law School, Leiden University, Netherlands)

RATH, JAN (University of Amsterdam, Netherlands)

Skateboarding and City Branding

Skate culture is an intrinsically urban phenomenon, an embodied practice that reimagines urban public space in a creative but also subversive manner. From the iconic Z-boys of Dogtown in the early 1970s, the boom in skating ramps in the mid-1980s and the proliferation of street skating in the 1990s, skateboarding has never really gone out of fashion. Throughout, skateboarding has appealed to the public imagination as a transgressive urban counterculture of the young. Authorities struggled in their response to the use of public space for skateboarding, often criminalizing the activity or redirecting it to the peripheral, derelict spaces of the city.

From the 2000s onwards, municipal policies start to shift. A new trend evolved of municipalities constructing designated skate spaces as integrated part of the urban fabric. These free, open access facilities are chronicled as community spaces, fostering healthy and sustainable communities, facilitating the contact and collaboration between people across the lines of gender, age and socio-economic background. That's not the whole story however. As cities venture to re-invent themselves under pressure of the financialised context of the post-industrial era, skate spaces and the social life they generate are also increasingly used as marketing tool in city branding.

This paper compares the development and governance of three skateparks in three West-European cities: Stapelbäddsparken in Malmö, Skatemark des Chatrons in Bordeaux and Skatemark Zeeburgereiland in Amsterdam. It traces how these parks came about in partnership with local skate communities and how skate culture is used to regenerate urban spaces, not just for local communities but also as tourist destinations. Building on the concepts of the new urban aesthetic (Montserrat Degen & Rose, 2023) and Wanghong urbanism (Morris et al., 2022), it moreover investigates the role social media plays in the marketization of the social spaces arising out of skateboarding practices.

WG10-927.2

CHIANESE, DARIO* (University of Naples Federico II, Italy)

AI Systems, from Objects to Subjects: Comparing Frameworks from AI Literature and Social Sciences

Artificial Intelligence (AI) systems have predominantly been studied with regard to their impact on social, political and economical domains. The emphasis of their role within larger assemblages clarifies the depth of their interaction and mediation of social relationships, power structures, and cultural norms, calling for holistic approaches to research but also to a refinement of the conceptual understanding of these systems. Notwithstanding their contribution as tools for research, many perspectives on their agency fall short of a rigorous interpretation of their role as social subjects and its implications for empirical work. However, reconceptualizing AI systems considering recently acquired capabilities is an important step towards research on how AI systems represent and influence social phenomena. AI literature itself provides valuable insights into understanding AI systems as social subjects by highlighting their emergent properties and technical capabilities and by mobilizing frameworks from different disciplines. A more comprehensive perspective can be then reached when considering theoretical traditions from social sciences and philosophy, such as actor-network theory, posthumanism and assemblage theory. By acknowledging the complementarity of AI research and social science perspectives, unique contributions of these frameworks in comprehending AI's role as social subjects are underscored, while also shedding light on unknowns and topics of speculation. The decisive role of AI systems as subjects in contemporary society, and related limitations, both theoretical and practical in nature, in areas like interpretability, explainability and access, are recognized. It is also posited that social scientists are in an advantageous position to face said challenges, by virtue of sharing similar difficulties and uncertainties in their field and having developed a versatile toolbox for tackling them. Strong theoretical foundations are however needed to adequately make use of this expertise and identify opportunities and boundaries in research methods.

RC33-539.5

CHIANESE, DARIO* (University of Naples Federico II, Italy)

The Challenging Adaptation of Research Methods from Human Subjects to AI Systems

Today's Artificial Intelligence (AI) systems stem from recent advancements in Natural Language Processing (NLP) capabilities and are enabling applications across a wide range of disciplines. While social sciences have a long history of adopting this and similar emerging technologies, the possibility of interrogating the systems themselves by exploiting their conversational or instruction-following capabilities is a relatively new possibility. To some extent, many research methods typically involving human subjects can now be considered for many classes of AI systems, with varying degrees of complexity. This approach can be useful in detecting the representation, be it manifest or latent, that a system or its underlying model has of a given social phenomenon. Some theoretical frameworks can be mobilized in support of a similar application, while there is limited guidance for it on an operational level.

It is argued that, when adapting human methods to AI systems, a complete operative equivalence with human subjects is never possible, and properties of cultural products can also be lacking or inadequate. A hybrid category is therefore needed to account for many of the peculiar properties of AI systems. These properties can be system-agnostic or present with varying degrees in different systems and determine the range of considerable methods, and while many of them present practical limitations to a given administration, others can render it easier, scalable and reproducible. This arrangement of properties also offers opportunities for research methods that are considered obsolete or impractical for human administration, and for the adoption of dedicated computational methods. Some examples concerning both mainstream and exotic methods are presented, and key methodological takeaways are outlined along with suggestions for improvements and further research.

CHIANG, TIEN-HUI* (Anhui Normal University, China)

The Practice of Care of Self through Performance Management in the Regime of Neoliberal Governmentality

From the perspective of neoliberal governmentality, this study sets out to investigate the linear relation from agency to performance through a survey of junior-high-school teachers' (n=2,319) attitudes toward performance management. While this linear relationship is documented, the best model of the SEM analysis shows that intermediates positively mediate this linkage. It also distinguishes a theoretical path for the six factors, commencing from self-consciousness, technologies of agency, human capital, international competitiveness, to responsible subjects and finally technologies of performance. Unlike the Western literature, self-discipline serves as the primary element calibrating respondents' perceptions of performativity. As this unique feature, resulting from Chinese culture, objectifies teachers' subjectivities, self-discipline is embedded within the agency-performance association carrying out the mission of human capital discourse.

Taiwanese Elementary School English Teachers' Design and Implementation of Concept-Based Instruction on Global Citizenship

Lanning (2013) defines a concept-based curriculum as "a focus on the transfer of the important conceptual ideas of a discipline [that] facilitates synergist thinking" (p. 7). Under concept-based instruction, learners can make connections between prior and new knowledge, relate the facts to their real-life scenarios, and analyze and evaluate the acquired information for deeper learning. Since concept-based instruction is coherent, different concepts are unified and connected by the relevance of learners' lives (Nair et al., 2015). Such learner-centered pedagogy has been proven to significantly improve learners' understanding.

This collective case study explored Taiwanese elementary school English teachers' designs and implementations of concept-based instruction on global citizenship. The thematic analysis of documents, interviews, and observation achieved the following major findings. Firstly, teachers' decision-making on concepts relied on the standards of the content areas, learners' lives, and community, and concepts varied from "appreciating floral festivals" to "appreciate and consume lunch fully." Secondly, diverse instructional strategies in concept-based instruction were designed and implemented, such as teachers' employment of multimodality to present and explain the

main concepts, drill practice, tasks, and individual and group sharing for learners to connect and demonstrate their understanding of concepts. Thirdly, teachers faced challenges in terms of learners' limited English proficiency levels, scaffolding strategies, and assessment. Finally, the collaborative lesson planning enabled teachers to identify the concepts to be covered in content areas and to design strategies for concept-based instruction. Suggestions on effective designs and implementations of concept-based instruction on global citizenship were provided in terms of diverse instructional strategies in concept-based instruction, equipping teachers with competence in integrating differentiated instruction for concept-based instruction, and integrating assessment as learning into concept-based instruction.

Assembling Control Strategies for Fall Armyworms: Infrastructure, Invasive Networks, and Civic Science

This paper explores how Taiwanese farmers and government agencies collaboratively learned to manage and control the spread of fall armyworms, a highly aggressive invasive species. Since the first sighting in June 2019, this pest has rapidly spread across Taiwan, causing significant damage to a wide variety of crops. While insecticides remain the most effective method of control, alternative environmentally friendly approaches—such as pheromone traps and the release of natural predators—are still in development or under debate. Despite limited prior experience with this pest, Taiwanese farmers quickly adopted multiple strategies that effectively reduced the pest population and minimized crop damage to acceptable levels. This response has been notably successful compared to many neighboring countries also affected by fall armyworm invasions.

This study highlights how small-scale farmers adapted to this new agricultural threat. I analyze how human actors, non-human actors (including the worms and their predators), farming infrastructure, and socioeconomic forces have collectively shaped the “sociobiological networks” of fall armyworm invasion and its control. Data were collected through participant observation, in-depth interviews, and fieldwork. The findings reveal that while conventional insecticides played a key role in pest management, organic farmers contributed through intensive land management, coordinated surveillance programs, and flexible production schedules. Taiwan's smaller average farm sizes also made it easier to implement these complex and evolving strategies within the local agricultural context. By examining the different control methods employed by both conventional and organic farmers, this paper enhances our understanding of the intricate relationships between humans, agricultural infrastructure, and nature.

Scientific Parenting for Your Fur Kids: How the Science of Animal Behavior and Welfare Transforms Human-Animal Relationships

This paper examines how the scientific study of animal behavior and welfare is transforming the human-animal relationship, particularly as more people regard their pets as “fur kids.” Behavioral science offers insights into animals' emotional and psychological needs, enabling pet owners to better understand and respond to their pets' behaviors. Through interviews with pet owners and observations of training sessions, the study argues that contemporary pet parenting has become more intensive and scientific, emphasizing evidence-based methods over intuition. In Taiwan, approaches to animal behavior have shifted from punitive, obedience-focused training to positive reinforcement and recognition of animals' needs. Pet owners are encouraged not only to modify their pets' behaviors but also to adjust their environments to support species-specific behaviors. This reflects a broader transition towards “scientific parenting,” where the care of pets increasingly mirrors child-rearing, recognizing animals' rights and fostering healthier, more informed human-animal interactions. Scientific knowledge has redefined the concept of care, reshaping how we engage with our pets.

Valuing the Use of Agrobiodiversity By Combining Policy Instruments and Local Measures: From the Diversity of Initiatives to Policy Recommendations

Biodiversity, essential to the health of humans and the planet, is under threat. The decline in food agrobiodiversity is less well publicised than that of wild diversity, but just as dramatic. An abundance of literature has shown how public action has been detrimental to maintaining agrobiodiversity on farms. However, few studies have examined the way in which public action provides, directly or indirectly, economic support for the maintenance or use of biodiversity. At the same time, while local food systems are presented as solutions for preserving orphan crops in the Global South, there is little information on how the development of local food policies in northern countries can open up a new perspective for public action to economically support the use and maintenance of agrobiodiversity by farmers. As part of the European DIVINFOOD project, this article aims to present, discuss and enrich a typology developed within the project on local initiatives combining policy instruments and voluntary measures to provide direct and indirect economic support to farms for the use of agrobiodiversity, in particular neglected and underutilised crops (NUCs) such as minor cereals and legumes. This typology was established on the basis of an analysis of institutional documents and scientific literature, as well as case studies in France, Italy and Portugal, representative of the diversity identified through the desk research. Three types of initiatives are proposed here for discussion, each combining specific policy instruments and voluntary measures. The discussion about these three types will help to formulate recommendations to policy-makers to support new economic models for farms using agrobiodiversity.

Varieties of Solidarity and Worker Organisation in South Africa's Gig Economy

The rise in digital platforms represents a new form of infrastructure which is shaping working people's realities and everyday social life. This has effect on how workers organise and experience solidarity. Solidarity and workers organisation is shaped by various factors including local norms and values and how the labour process is organised. Drawing from a qualitative research design, this paper explores how the digital economy in South Africa is shaping workers organisation and how they articulate solidarity. There are varieties of such solidarities and workers in the gig economy articulate and value it beyond the work space into the realm of social reproduction. Worker solidarity in the gig economy is divided and undermined by power disparities and pre-existing inequalities.

Who Covers the Cost of Care for Older Persons in Malawi?

The dominant focus on long term care for older persons in Malawi has been on family support. Whilst the Malawian government with the assistance of foreign agencies including the World Bank, Irish Aid, EU, KFW and others have introduced a growing number of food and social assistance support to older person households, this reaches only a minority of the 1 million older persons in Malawi. Family care for older persons in Malawi is extremely challenging in a context of massive food insecurity and inadequate access to health care services. By drawing on community meetings and semi-structured interviews with older persons and their caregivers, this paper reveals how older persons at the community meetings listed natural disasters, currency devaluation and limited seed/fertiliser support as the main reasons families were unable to support each other. Assigning more responsibility to families and expecting families to carry the everyday consequences of a deepening financial crises is unrealistic and unfair. In a context of ongoing poverty and inequality, and in the aftermath of reoccurring climate-related disasters, greater support is required.

*The Association between Physical Fighting and Victimization
 By Traditional Bullying and Cyberbullying Among School-Aged
 Adolescents in 27 European Countries: The Moderating Effects
 of Perceived Social Support and Public Education Spending*

Literature indicates scarcity of cross-national research on the association between physical fighting and bullying victimisation among adolescents, and the moderating role of perceived social support and education spending in this association. Using multilevel binary logistic regression, this study examined the association of physical fighting with traditional bullying and cyberbullying victimisation, with public education spending and perceived social support from families and teachers as moderators. Country-level data were combined with 2017/18 Health Behaviour in School-aged Children (HBSC) survey data from 162,792 adolescents (11-, 13- and 15-year-olds) in 27 European countries. Results showed that physical fighting was positively and significantly associated with cyberbullying and traditional bullying victimisation. These results signify that physical fighting is a robust predictor of bullying victimisation. The findings demonstrate that perceived social support and education spending buffered the association of physical fighting with traditional bullying and cyberbullying victimisation. The findings imply that social support not only prevents adolescents from engaging in physical fights, but also reduces the risk of bullying victimisation. Accordingly, to deter adolescents from engaging in physical violence and reduce the risk of bullying victimisation, there is need to fully comprehend the influence of physical fighting on bullying victimisation, and the moderating role of social support.

*Gender Disparities in Forest Governance: Men Profiting from
 the Marginalization of Women in Southeast Nigeria*

Forest governance in Africa often mirrors the deep-rooted gender inequalities that perpetuate poverty, particularly among women. In Southeast Nigeria, these inequalities manifest in the economic marginalization of women, as men largely control access to and profits from forest resources. Despite numerous studies on poverty and gender inequality in Africa, little attention has been given to the gendered dynamics of forest governance in Southeast Nigeria. This study explores the factors sustaining this gendered disparity, focusing on how societal norms, cultural practices, and unequal access to resources contribute to the impoverishment of women. Adopting mixed-method; in-depth interviews and questionnaires were used to collect data on a sample of 251 respondents selected using a multi-stage sampling technique. Data were analysed using descriptive statistics. Findings reveal significant gender disparities in resource management, with men benefiting disproportionately from forest governance. Key factors identified include women's limited access to education, lack of inheritance rights, exclusion from decision-making processes, and the burden of unpaid domestic labour. The study recommends improving girls' and women's access to education, reforming inheritance laws to include women, and ensuring equitable access to public services like healthcare and education for both genders, as critical measures for dismantling the patriarchal structures in forest governance and empowering women to contribute meaningfully to national development.

*Exploration Des Discours Religieux Sur Les Réseaux Sociaux
 Et Leur Rôle Dans La Construction Identitaire Des Jeunes
 Marocains*

Dans un monde où les réseaux sociaux redéfinissent les dynamiques de communication et de pouvoir, cette recherche se penche sur le rôle crucial que jouent ces plateformes dans la construction de l'identité religieuse des jeunes Marocains. À travers les voix de figures religieuses, qu'elles soient traditionnellement formées ou autodidactes, les réseaux sociaux deviennent des espaces de régulation, d'influence et de transformation des pratiques religieuses.

Les discours diffusés par ces acteurs sur les plateformes numériques créent de nouvelles normes comportementales, invitant les jeunes à se conformer à une certaine éthique religieuse tout en imposant une redéfinition des frontières entre le licite et l'illicite. Ces discours, porteurs d'une vision normative et parfois moraliste, exercent une influence profonde sur la manière dont les jeunes perçoivent leur appartenance religieuse et leur identité sociale.

En croisant une approche discursive et ethnographique, cette étude analyse comment ces interactions numériques façonnent les trajectoires identitaires des jeunes. Elle s'appuie sur des théories sociologiques et communicationnelles pour explorer comment ces discours, imprégnés d'un mélange de tradition et de modernité, participent à la reconfiguration de l'espace religieux au Maroc. Loin d'être de simples spectateurs, les jeunes Marocains négocient, contestent et parfois réinventent leur identité religieuse à travers leurs interactions sur ces plateformes, dans un contexte marqué par des tensions entre héritage culturel et influences globalisées.

Cette communication cherche ainsi à éclairer les mécanismes par lesquels l'espace numérique devient un terrain fertile pour la (re)construction identitaire, tout en interrogeant les dynamiques d'autorité et d'influence dans un Maroc en pleine mutation.

*News Speaking Truth for Whom? Content, Formats,
 Authenticity, and the Chase for Younger Audiences*

News avoidance among young adults presents a critical challenge to news media across democratic societies worldwide. However, existing research has predominantly focused on, firstly, audience studies and the reasons for their lack of interest in news – such as the feeling of news boiling down to politics which they feel powerless about, and the sense that news equals bad news which makes them depressed – and, secondly, on the forms (less often content) of how news media try to reach young people (e.g. using social media, especially Instagram and TikTok; short graphic and video forms; presenting news right before or after popular entertainment programs). What's more, although evidence points to growing mistrust and avoidance of news (e.g. Reuters Institute for the Study of Journalism; Toff, Palmer, Nielsen 2024), the broader implications for democratic resilience remain underexplored. After all, the fourth estate is supposed to speak truth to power, protect against disinformation, and, essentially, function as the backbone of democratic societies.

It is therefore clear that exploring the problem of news avoidance requires not only an analysis of the reasons why recipients avoid news, but also understanding how news creators can reach this "escaping" group, where fundamental trust in the media as a source of information is of key importance. This is why this study aims to expand the scope of analysis by examining content-related activities of news media in terms of gaining and maintaining the interest of young adults; exploring alternative sources such as lifestyle podcasts which occasionally focus on "traditional" news topics; and pointing at the issue of personal authenticity as an increasingly important measure of trustworthiness among younger audiences. The goal of this research is thus to contribute to a more nuanced understanding of news consumption dynamics and their implications for the future of democracy.

Migrant Women's Transnational Experiences of Seeking Support and Navigating Domestic and Family Violence: The Case of the Korean Australian Community

Rather than view domestic and family violence (DFV) as occurring within the borders of a single nation-state, this work approaches DFV as a *transnational* phenomenon subject to the social and cultural understandings, bureaucracies, policing and justice systems, media representations and information shared between origin countries and destinations. Transnationality can create opportunities for some women; however, other women may experience a lack of support and increased vulnerability due to their unclear legal and citizen rights, visa status or ineligibility for support due to non-residence. By amplifying the lived experiences of Korean Australian women and some theorisations of power throughout the work, this paper provides detailed insight into how a lack of structured support from both states and diasporic communities influences women's decisions to seek support and enables perpetrators to continue to exercise violence against victim-survivors. In doing so, I aim to address the following question: What does it mean for the state to enact violence and add to the situation of DFV for diasporic women in particular? By addressing this important question, I argue that visa arrangements can be seen as a form of violence enacted by the state. This work adds to the current knowledge about how gender-based violence intersects with diasporic women victim-survivors' transnational experiences of migration and seeking support.

Rites of Reintegration: Building Shrines and Cooking Votive Meals Among the Alawites in Hatay, Turkey

The Alawite veneration sites scattered throughout Hatay, Turkey are referred to as *ziyaret yeri* (visiting place), *makam* (shrine), or *türbe* (tomb). In the vicinity of these places, people sacrifice animals and prepare votive meals, notably *harisa*, during over a hundred religious holidays a year. While these places and practices possess timeless spiritual qualities, most structures have been built relatively recently, mostly by returning migrant workers from the Gulf. Since the 1980 coup in Turkey, many male members of the community have migrated to Arabic-speaking countries, often enduring harsh working conditions and long periods of family separation. When these migrant workers are returning home, either temporarily or permanently, many contribute financially to building sacred sites and cooking votive meals.

I propose the shrine construction booms and devotional cooking of votive meals, particularly *harisa*, since the 1990s as the rite of reintegration for those workers and further discuss different layers of meanings. I will first discuss types of returns- short family visits and permanent returns, which often come after purchasing land, building their family house, or retiring. Further more I address the questions such as, 'What does it mean to return?', 'What motivates these rites of return?', 'How are building shrines and cooking votive food relevant in this discussion?'

The second part of my discussion engages with ways of offerings and vows based on ethnographic field research. Some acts of devotion are one-time events, such as building a shrine or distributing votive food, while others are annual dedications that continue for a lifetime. Affluent individuals sponsor the major holiday of *Gadir-i Hum* each year, whereas a villager may buy and raise a calf for a year to fulfil his devotion. What is the moral hierarchy of types of offerings and vows? Can money buy one's beneficence (*hayır*)?

CHOI, HEESUN* (Chung-Ang University, South Korea)

The Experiences of Autonomy and Constraints of Crowdworkers

With the growing number of online crowdworkers in Korea, both positive and critical perspectives on their autonomy coexist. This study goes beyond a binary perspective to examine the conditions that both ensure and constrain their autonomy in the labor process, analyzing the structural and individual factors that influence autonomy. To investigate this, in-depth interviews were conducted with 14 online crowdworkers in Korea, and the research data were analyzed using thematic analysis. The main findings are as follows. First, during peak seasons, when work availability is plentiful and piece rates are high, crowdworkers tend to work with limited autonomy to maximize profits, even under poor working conditions. In contrast, during off-peak seasons, when work availability is lower and piece rates are low, they are more likely to make choices that offer greater autonomy. Second, the differences in autonomy between peak and off-peak seasons are influenced not only by

direct corporate control but also by structural constraints, such as piece rates, work availability, information asymmetry between platforms and workers, and hierarchical relationships between them. Third, even under the same structural conditions, workers' ability to exercise autonomy varies based on their individual market bargaining power. Those with greater market bargaining power can exercise more autonomy, while those with less market bargaining power face greater constraints. This study suggests that online crowdworkers do not exercise the same levels of autonomy and as it varies depending on corporate control, structural constraints, and workers' market bargaining power. Therefore, future discussions on enhancing the autonomy of online crowdworkers must consider the various structural constraints of the labor market and the individual characteristics related to their market bargaining power.

Cyber Sexual Harassment in Four East Asia Societies- a Techno-Gender Framework

Scholars researching gender and technology has shed light on both the emancipatory potential of communications technologies, as well as the problematic reproduction of gendered power relations in online spaces. In terms of the emancipatory potential of technology, 'cyber' or 'techno' feminists have expressed optimism about the capacity for communications technologies to transform gendered power relations fundamentally by decentering the body and thus blurring the boundaries of male and female identities. Other feminist scholars have highlighted the increased participation of women in the virtual community and the proliferation of their counter-patriarchy discourses made possible by the 'new media'. However, other feminist scholars have noted the problematic reproduction of gendered power relations online. Communications technologies, and social media in particular, have been used to extend the harm of sexual violence through further harassing, humiliating, shaming and blaming victim-survivors. Furthermore, communications technologies have been taken up as tools with which to facilitate sexual violence and harassment against women and girls as well as to express gender-based hate speech online. Developing a feminist-techno framework that pays close attention to gender inequalities, cultural and local sociolegal contexts, this research examines the complex relationship between technology and gender, as simultaneously creating new gendered harm and facilitating novel forms of resistance against such harm. The data come from questionnaire surveys with university students and in-depth interviews with victims of cyber sexual harassment in Hong Kong, Taipei, Beijing, and Osaka. These four cities have comparable rates of technology use, and share a similar cultural heritage related to gender while also having different levels of online feminist activism, online misogynistic subculture, and legislation to combat sexual violence. We believe that such a comparison brings to the fore how gender inequalities embedded in social structures, online subculture, and government legislation may interact with technology to shape cyber sexual harassment.

Defining Cyber Sexual Harassment Experiences and Unraveling Frame Ambiguities

Cyber sexual harassment (CSH) encompasses a spectrum of sexually aggressive or harassing conducts such as unwelcome sexual solicitation, which are delivered through digital platforms. It is a prevalent but poorly understood issue. On the one hand, extant research reports prevalence rates range from 1% to 59% globally. On the other hand, some studies show that over a third of victims struggle to correctly define their victimization as CSH. Critically engaging with Goffman's concepts of frames and frame ambiguity and based on in-depth interview data with university student victim, this research scrutinizes the interpretive processes of CSH victims and examines the contexts and challenges hindering the timely definition of victimization experiences. First, ambiguity manifests in the sexual harassment frame, wherein factors such as inadequate sex education, perceived hierarchy of sexually harassing behaviours, the unclear boundary between public and private spheres, and a lack of consensus about what constitutes privacy in cyberspace complicate victims' ability to apply such a frame to interpret their encounters. Secondly, victims often struggle to comprehend the nuanced interactional dynamics during CSH encounters. The absence of sexual interests, the intertwining of sexual and non-sexual communications, and the masculine subcultural norms in the cyber space introduce multiple and

(often) conflicting interpretive frames, engendering ambiguity as victims try to reconcile these differing perspectives. Third, ambiguity arises from the roles of perpetrators and victims in CSH encounters, with the overlap between friends and perpetrators and unclear victim roles impeding clear definitions of the situation. Our findings point to a heightened need to deepen understandings of the cultural, relational, and gender contexts impeding victims of CSH to define their victimization in a timely manner. Theoretical and conceptual insights of the findings for frame analysis and policy implications of the findings will be discussed.

Intersectional Action Research: Uncovering Life-Course Narratives with Young Migrants with Disability in Australia

Australia is a migrant country, with more than 7 million migrants and an impending post-pandemic "2023 migration boom" (Australian Bureau of Statistics, 2021; Karp, 2023). The notion of the "Australian Dream" continues to attract a diversity of migrants, with the biggest proportion being young adults (Australian Bureau of Statistics, 2018). While experiencing a potentially life-changing event of migration (Vitus, 2022), young migrants simultaneously transition from the dependence of childhood to the independence of adulthood with varying structural positions and access to resources (Thomson et al., 2002). Our understandings of these critical life transitions have largely neglected disability, with little to no research exploring the intersections of youth, disability and migration in Australia. Responding to Shakespeare's (2019) call for diverse voices to be heard in disability research and recognising the dearth of voices from migrants with disability (Goggin & Newell, 2005), this study adopts a Pragmatic Action Research strategy comprising of search conferences and life mapping interviews (Garratt et al., 2021; Greenwood & Levin, 2007) to uncover the marginalised voices of young migrants with disability. In so doing, this study utilises an intersectional approach to demonstrate the usefulness of biographical methods in uncovering the diversity of youthhoods.

CHOO, BELLA* (University of Melbourne, Australia)

Navigating Liminality As Young Migrants with Disability in Australia: An Intersectional Perspective

Australia is a migrant country, with more than 7 million migrants and an impending post-pandemic "2023 migration boom" (Australian Bureau of Statistics, 2021; Karp, 2023). The notion of the "Australian Dream" continues to attract a diversity of migrants, with the biggest proportion being young adults (Australian Bureau of Statistics, 2018). While experiencing a potentially life-changing event of migration (Vitus, 2022), young migrants simultaneously transition from the dependence of childhood to the independence of adulthood with varying structural positions and access to resources (Thomson et al., 2002). Our understandings of these critical life transitions have largely neglected disability, with little to no research exploring the intersections of youth, disability, race/ethnicity and migration in Australia. To understand experiences of liminality across multiple axes of marginalisation, this study uses an intersectional approach to uncover the aspirations of young migrants with disability, as well as the enablers and barriers they face in achieving their aspirations. Using a Pragmatic Action Research strategy comprising of search conferences and life mapping interviews conducted with 18 to 25 year old migrants with disability from the Asia Pacific region (Garratt et al., 2021; Greenwood & Levin, 2007), this study highlights the unique experiences of navigating migration with a disability, and vice versa, where participants perceive both their migrant status and disability as barriers to achieving their aspirations.

Care As a Strategy for Countering Backlash: Building Solidarities within Women's Movements

This paper studies women's movements through the analytic of 'care' as an emotion and practice of love. Examining who cares, for whom, and what expectations of receiving care (from whom) will help reveal dynamics of movement formation, how movements are strengthened and enable an examination of practices within women's movements that promote cohesion and mutual support.

The paper will pay attention to the practices, processes, and perceptions of care, and how care is used to build identities and solidarity within women's movements. Focussing in on care practices and processes will highlight the basis for these care practices – especially in terms of nature of different struggles and the forms and effects of backlash that members within the movement experience. In doing so, the paper will put forth a novel conception of care as a strategy for countering backlash – mainly through forging solidarities within women's movements. We will re-think care as both an affect and as practice, providing a rejoinder to the critiques of empathy as the basis for solidarity, instead arguing that processes and practices of care are central to the politics of solidarity.

While the paper will draw on affect theory, especially following affect to find sites of care (and its' deficit) and how care is enacted, the main analytical contributions of the paper will be to feminist social movement theory (using care as an entry point to analysis of feminist movements and understanding care practices as a means to countering backlash), and to literature on care (conceptually expanding the concept of care beyond the family/ community sphere to the public sphere of feminist social movements and delineating what care is for in women's movements). Finally, the paper will shed light on how the emotion of care influences the creation of sustainable and supportive environment within women's movements.

Invoking Idioms of Kinship in Women's Movements in South Asia: Towards an Intergenerational Feminist Future

This paper explores the analytical, methodological and political possibilities and challenges of how idioms of kinship are constructed and invoked in the process of forging and tightening intimate bonds amongst women activists in South Asia. It juxtaposes excerpts from conversations with activists across generations against scholarly generational narratives and critiques, thereby offering reflections on how intergenerational kinship idioms are put into use, and what effects these have on conceptualisations and constructions of intimate feminist friendships and solidarities within women's movements.

The paper stages a productive encounter between generations of feminist activists from 16 women's struggles across four countries (Bangladesh, India, Nepal, and Pakistan) engaged in feminist solidarity and coalition building in South Asia. Presenting these women's voices alongside feminist theorisations of and challenges to generational analytical frames, the paper reflects on idioms of kinship repeatedly invoked in telling inter-generational tales. Extending beyond dominant narrations of entitled, ungrateful daughters pitted against capitulating, coopted and even tyrannical mothers of feminism (Hemmings 2017), we explore what these references to kinship reveal about heteropatriarchal structures and logics (and resistance to them) within women's movements. Exceeding the Euro-centricism of dominant feminist generational accounts (Browne 2014), we amplify post-colonial activist articulations of feminist kinship as a site of both domination and conflict as well as care, mutuality and solidarity. These narratives thereby offer a re-interpretation of kinship idioms as a response to backlash which seeks to rupture, fragment and isolate women's collective endeavours. The paper argues that in the forging of intergenerational kinship idioms and bonds, women activists become intimate, critical witnesses of a collective struggle and engage in productive tensions propelling movements towards a collectively imagined and negotiated feminist future.

CHOUKRI, MERYEM* (University of Warwick, Germany)

Food As a Carrier of Memory & Belonging in Transnational Families

This paper explores the role of food in the transmission of memory and negotiation of belonging within transnational and multi-generational contexts, with a particular focus on mixed-race children of migrant parents in Germany. Drawing on empirical research from my doctoral project on archives of women of color, I examine how food operates as a non-verbal medium of connection, particularly for the second generation of migrants who may not speak the language of their migrant parent and often feel disconnected from their heritage. Through an interdisciplinary lens, I

analyze how food and food practices serve as a vehicle for intergenerational knowledge transfer, embedding cultural memory, and fostering a sense of belonging in transnational families. In the absence of a shared language or written narratives, food becomes an essential means for transmitting family histories, cultural identities, and collective memory across generations and borders.

This research contributes to the broader understanding of how transgenerational memory processes are organized in transnational spaces, particularly in cases of migration, exile, and forced displacement. By focusing on the sensory and embodied practices surrounding food, this study highlights how memory and cultural continuity are preserved through everyday activities, offering new perspectives on the intersections of migration, memory, and identity. The findings emphasize the pivotal role of non-verbal practices in sustaining transnational ties and intergenerational dialogue, expanding the scope of biographical research on memory transmission beyond the written and spoken word.

Social Inequality and Affirmative Action Policy in India: A Sociological Perspective

Social inequality refers to the disparities in wealth, income, power, and access to resources and opportunities among individuals or groups within a society. These disparities can manifest in various forms, including economic inequality (such as differences in income and wealth), educational inequality, healthcare inequality, and other dimensions like gender, race, ethnicity, religion, sexual orientation, and disability. Social inequality often leads to unequal opportunities, privileges, and outcomes, perpetuating cycles of advantage and disadvantage across generations. It can contribute to social tensions, injustice, and hinder societal progress towards equality and justice.

Government of India set up two commissions to identify the Other Backward Classes (OBCs). The First Backward Classes Commission was set up on 29th January 1953 and it submitted its report on March 30, 1955.

The Second Backward Class Commission (Mandal Commission) was appointed to identify the socially and educationally backward classes (SEBC). The Commission identified 3,743 castes as OBCs and 2,108 as Depressed Backward Classes. They were inadequately represented in Government jobs. The Prime Minister V.P. Singh implemented the recommendations of Mandal Commission in government jobs in August 1990. There was massive student protests started throughout the country against the recommendations of Mandal Commission. The Supreme Court gave the verdict in the favour of reservations for OBCs in Government jobs. Supreme Court asked Government to exclude 'creamy layer' (high income family members) to avail the benefit of the reservations in government jobs.

In 2006, Prime Minister Dr. Manmohan Singh implemented 27 percent reservations for OBCs in Higher Educational Institutions.

On April 10, 2008, the Supreme Court of India upheld the government's initiative of 27 percent reservations for OBC quotas in government institutions.

In 2019, 103rd Amendment Act of Parliament, Prime Minister Narendra Modi implemented 10 percent reservations for Economically Weaker Sections (EWS) in Government jobs and the Higher Educational Institutions.

CHOWDHURI, DR. JOY PRAKASH* (International Sociological Association (ISA), Social Media Manager, Spain., India)

Social Justice and Affirmative Action Policy in Brics Nations: A Sociological Perspective

BRICS is an association of five major emerging economies namely Brazil, Russia, India, China, and South Africa, house 41 percent of the world population (3.1 billion people) and have more than 30 percent of global GDP. BRICS nations have a significant influence on world geopolitics, markets, and regional economies. Social inclusion, the fight against poverty, inclusive and sustainable development, and national sovereignty are some of the important flagship agendas of BRICS. The BRICS is one the most evident products of the change process in social inclusion and development in the emerging economies. In spite of significant achievements like reduction in infant mortality, maternity mortality rate, and poverty; social inclusion is still a crucial debatable issue in BRICS due to diversified growth models of the countries which have comprehensive social protection system not only for the economic growth but also for improving the social situation. Considering these elements justifies the intention of social inclusion, but are these actions affirmative, keeping in view the heterogeneous social groups and their

problems in BRICS along with hegemonic dynamics of power and markets leading to the new multilateral arrangement, which may set the developmental and inclusion needs of the diversified population at vindication. Affirmative action means the special consideration for disadvantaged groups in publicly funded opportunities. The words, affirmative action do not appear in the 1948 Universal Declaration of Human Rights. The declaration does, however, contain two intellectual anchors for affirmative action. First, the declaration repeatedly endorses the principle of human equality. Second, it declares that everyone has the right to work, to an adequate standard of living, and to education. The declaration does not command that all will share equally, but it does suggest strongly that there are minimum levels of employment, education, and subsistence that all should share.

Unpacking the Paradox: Development, Politics, and Sociology in Bangladesh

Over the past four decades, Bangladesh has achieved significant economic and social progress, particularly in the last two decades, where consistent economic growth has positioned the country as a "new tiger" in South Asia, according to international economists, politicians, and media. This transformation marks a departure from the earlier label of "an international basket case," now reframed as a "development model." However, this progress has been accompanied by persistent political crises, including prolonged unrest and military rule until 1990, and ongoing electoral conflicts between the two main political parties since 1996. Consequently, the development story of Bangladesh is often viewed as paradoxical.

While there are numerous economic analyses of Bangladesh's development, sociological perspectives remain limited. This paper seeks to address this gap by tracing the country's development trajectory within the context of neoliberalism and climate change. It evaluates both theoretical and empirical perspectives from post-development studies to determine whether Bangladesh's development achievements and plans are truly sustainable. Additionally, the paper assesses the role of Dhaka University, particularly its Sociology Department, in contributing to the development process by nurturing expertise and knowledge in this field. Finally, it highlights how Sociology at Dhaka University continues to engage with post-development discourse, enriching the understanding of the Sociology of Development in Bangladesh.

Gender, Leisure and Media Representation in India through a Social Justice Lens: A Sociological Study

Leisure, as delineated by the World Leisure Organization is considered as a vital component of human right which enable individuals to develop an agency. Likewise, leisure studies scholars (Zarezaadeh, Rastegar:2023) have also posited that access to quality leisure also encompasses social justice offering individuals a chance for relaxation, self-development, social interaction, and wellbeing. However, previous research conducted across both English & Non-English-speaking countries suggests that globally and cross-culturally leisure activities are not gender-neutral i.e., women have been the disadvantaged sex vis-a-vis men due to the prevalent social regulations when it comes to choosing and engaging in desired leisure activities (Yerkes, Roeters, Baxter:2018). Similarly, in India, access to leisure is regulated by the social expectations prescribed separately for both the sexes, which situates women as the primary caregiver, confining their everyday activities to domestic responsibilities and childcare. Such practices are further exacerbated through media representation like advertisements, films etc. by glorifying and idolizing women's domestic duties, advocating and promoting them as a 'religious calling' irrespective of their multifaceted intersecting social identities. Therefore, against this backdrop, this paper aims to explore through the intersectional paradigm how women's engagement in desired leisure activities is predominantly proscribed in contemporary India. This paper is grounded in the in-depth interviews and analysis of the narratives of 25 employed women and 25 employed men in both private and government sectors, aged 35-50 years, alongside an analysis of Indian visual advertisements.

CHRISTINCK, LEA* (DeZIM, Germany)

From Humanitarianism to Rights? (Un)Deservingness Frames in the Central Mediterranean.

This paper identifies and explores (un)deservingness frames towards People on the Move (PoM) discursively constructed by representatives of Search and Rescue (SAR) actors in the context of precarious migration across the Central Mediterranean. It draws from eight qualitative interviews with heterogeneous civil, as well as state, EU and international institutional SAR actors active in Italy, the primary country of arrival via the Central Mediterranean Route and employs reflexive thematic analysis.

The findings reveal several overlapping (un)deservingness frames, which are intertwined with gendered and racialised logics. Moral-based deservingness frames are mobilised throughout to varying degrees by civil and institutional actors, with situational vulnerability as the central criterion of deservingness, mobilising idealised figures of PoM. By emphasising situational vulnerability, the (un)deservingness frames obscure the structural causes of the unequal distribution of vulnerability, resulting in an ahistorical and depoliticised framing.

Performance-based undeservingness frames are also evident, mainly mobilised by institutional actors, wherein concerns about assimilation and security combined with racialised imaginaries, produce a hierarchy of undeservingness.

These frames are consistent with the rationales inherent to the humanitarian government of migration, and hence perpetuate existing power asymmetries and reinforce the EU border regime. To address power relations and structural causes, the paper advocates moving beyond the logic of humanitarian reasoning towards rights instead of rescue. It proposes situating and rendering visible this humanitarian border within the long history of migration and neocolonial continuities, through a feminist reappropriation of vulnerability and by centring the perspectives and practices of PoM in the analysis.

ENGLER, MARCUS (DeZIM, Germany)
PALOP-GARCÍA, PAU (DeZIM, Germany)*Including Migrant Perspectives into Hegemonic Migration Narratives: The Case of Germany*

Narratives are one of the most important indicators of public attitudes and behaviour in relation to migration. They are essential for understanding and interpreting complex migration realities and phenomena. However, the perspective of people with migration biographies are often neglected in existing narratives. This paper tackles this gap in the literature by answering the question of how to include migrant perspectives in hegemonic migration narratives. To address this question we have focused on the case of Germany and conducted focus groups with people with migration background. At the centre of the focus groups were the migrant perspectives, lifeworlds and experiences with the objective to jointly explore how migration could be told in a more differentiated and just way.

CHUN, JENNIFER* (University of California Los Angeles, USA)

Intergenerational Care, Intersectional Feminism and Reproductive Justice

Intergenerational care is a key concern for families and communities grappling with the dilemmas of providing care for young children and aging parents in countries such as the United States with little to no institutional safety net for either childcare or elder care. Yet, discussions of reproductive health and reproductive justice, rarely, if ever, address the intersectional inequalities of engaging in both paid and unpaid care work. This paper reflects on collaborative research with Asian immigrant women employed in California's homecare industry over the past ten years to better understand the critical nexus among intergenerational care, intersectional feminism, and reproductive justice. In particular, I focus on collective efforts by labor unions and community organizations to improve the working conditions of Chinese, Korean, and Filipinx women workers who provide co-ethnic elder care in low-paid, socially devalued, and highly precarious homecare jobs in Los Angeles. What does the social and institutional organization of home-based elder care reveal about the multi-level dynamics that shape care provisioning for immigrant elders in intergenerational families? What is the role of labor unions and community organizations in challenging

inequalities that are simultaneously intimate and systemic? How might feminist frameworks of intersectionality and reproductive justice be applied to better understand the horizons of more just and sustainable approaches to intergenerational care?

Entangled Modernity of South & North Korea: Uneven & Combined Development of the Two Koreas

What is *modernity* in the first place? Confronting reality! What kind of reality do we stand up? It depends on the geopolitical and geoeconomic context of each individual and each state. After the liberation from Japanese colonial rule, South & North Korea allied different external forces and took different developmental paths, the former capitalist, the latter socialist. Scholars all around the globe try to compare the two Koreas in many different angles. South Korea seems to accomplish nation building process such as state formation, economic development and democratization. It's a successful case. After the digital transformation, K-Culture dominates the global cultural scene. North Korea, in contrast, seems to fall far behind compared to the progress of S. K. It looks like a failure. However, N. K. armed herself with nuclear weapons and insisted on the rank of 'nuclear state'.

In this article we will try to delve into not only the emergence of divergent paths taken by the two Koreas, but also explain the interconnection and interaction of S.K. & N. K. By applying *uneven and combined development* theory to the South & North Korean case, we can highlight the entangled characteristics of the two Koreas under radical transformation: *the singularity of modernity in the two Koreas*.

CHUNG, IL JOON* (Korea University, South Korea)

Recasting Inter-Korean Relations Under 'the Nuclear Crisis': Two Koreas in between the Geopolitical Rivalry of USA & China

On August 15th of 1945, Korea got liberated from Japanese colonial rule just after the USA dropped two atomic bombs over Japanese islands. In the meantime, Americans drew 38th parallel that divided the Korean peninsula in two parts. After three years of military rule by Russians in northern part and Americans in south, separate regime did emerge in North and South. During the Korean war, American commander MacArthur toyed with the idea that UN forces would need A-bomb to win the battle against Chinese army. Additionally, American president Truman and Eisenhower publicly threatened North Korea and China by releasing the news, potential use of A-bomb. In secrecy, from 1958 till 1991, USA deployed nuclear warheads and delivery systems in South Korea. All through the years, it was North Korea which advocated 'the denuclearization of the Korean Peninsula.' 'Nuclear Crises' of Korea have very complex and twisted trajectories.

In this article, we are going to delve into 'the nuclear issues' over the Korean peninsula not only from geopolitical security angle but also from geoeconomic development project. To understand the developmental trajectories of the two Koreas, we should take into consideration global rivalry between America and China as well as inter-Korean competition. Unlike some scholars and policy makers in America and South Korea who argue that North Korea developed nukes *contrary to* promoting economic vitality, this article tries to show having nukes is a precondition for the Kim Jung Un regime not only to survive but also to thrive. Geopolitics get entangled with national developments of both Korea in the future as it did in the past.

CHURCHILL, MARY* (Boston University, USA)

Access to Education and Knowledge: Crucial Shared Spaces for Creating Understanding and Building Democracy

This paper outlines a few points of access and barriers to formal spaces of knowledge and education as key to the future of the democratic project in the United States.

I argue that recent attacks on institutions of higher education, elementary and secondary education, public libraries, and local media outlets in the United States are attacks on and attempts to limit access to knowledge and information that represent increasing challenges to democracy.

Contested definitions of truth, including the belief in the validity of science as witnessed in the ongoing denial of climate change and the display of COVID-19 pandemic denial exhibit a true test to democracy with the attempted

coup on the US capitol on January 6, 2021, just one display of the conflict of power in contemporary democracy in the United States.

As access to higher education in the US increased, politicians started to challenge the value of a college education. In this paper I explore the following: barriers to access to knowledge in primary and secondary schools, public libraries, colleges and universities, and local newspapers and, what I argue is the consequent decline in college going behavior.

While young people who do not go to college are not formally denied access to education, the delegitimization of education and the process of socializing future generations to discredit education and to distrust science is more insidious. Does this crisis of the legitimacy of education represent a necessary element of post-democracy?

Social institutions such as schools, libraries, universities, and local media are key to creating a shared understanding which create norms that structure daily interactions and create the possibility for shared narratives and understanding. When local newspapers close down, public libraries are shuttered, curriculum is curtailed, and young people stop going to school, we eliminate traditional spaces for creating shared understandings.

CHURCHILL, MARY* (Boston University , USA)

Contemporary Challenges of Governance for Women Presidents in Higher Education.

Leadership and good governance have become increasingly challenging in universities. For women presidents, especially women from historically marginalized and underrepresented minorities, leadership has become even more difficult. Higher education in the United States and other countries is under attack and the university president receives the majority of those attacks. For women of color serving as college presidents, the challenges have multiplied.

This paper draws upon the results from the American Council of Education's American College President Study which has long served the higher education community as the most comprehensive, in-depth, and frequently cited source of information about the college presidency and pathways to higher education leadership in the United States. The survey has been conducted approximately every five years since 1986; the most recent edition is The American College President: 2023 Edition.

In the study, presidents of color, and women of color in particular, were more likely than men to feel they did not receive a realistic assessment of the challenges facing the institution during their search process. While the majority of presidents felt that they had a support system, some presidents indicated that they struggle to find people who understand the experience of being a college president in today's shifting environment.

Presidents feel the pressure to become more relevant, more modernized and more efficient. As the majority of the colleges and universities in the United States face declining student enrollments and increasing hostility from elected officials, presidents face pressures to increase revenues and minimize expenses and to prove their worth.

This paper aims to explore the dilemmas, challenges and potentials in university governance with respect to institutional leadership, management and governance amidst the contradictions that arise as a result of the unintended and intended consequences of wider policy issues and the impact of the neo-liberal agenda on university reform.

Taking Italian Colonialism Seriously: A (visual) Sociological Approach

Unlike other countries, Italy seems not have reflected enough on its colonial past. Only in recent years the topic gain relevance, but the discussion is limited to narrow circles, like academics and political activists. In this sense, before to question about – often unclear – concepts like “decolonisation” or “postcolonialism”, it is necessary to understand why the Italian colonialism is scarcely thematised in communication. In order to do this, it could be useful to separate the normative claims to collective and civic memory and justice, on the one hand, from the lack of effective narratives, on the other hand. The hypothesis is that a visual and sociological approach could help both to collect and classify the existing material about Italian colonialism (places, memorials, and so on) – especially through visual information – and to investigate – especially through visual methods – the dynamic between remembering and forgetting in the national context.

Neocolonial Urban Development in the Mediterranean: The Case of the Ellinikon

This paper investigates the neocolonial discursive practices surrounding The Ellinikon, the redevelopment project of the former Athens airport. It aims to illuminate the socio-cultural aspects of the project through visual discourse analysis, demonstrating how these aspects reflect a neocolonial logic of domination and dispossession.

The Athenian Riviera has seen revitalization initiatives, particularly the major redevelopment led by LAMBDA Development, which plans to create an expansive urban park, Greece's first financial community, and mixed-use developments that integrate modern living with coastal recreational spaces. To promote the project, LAMBDA established the Experience Centre within the former airport Hangar C. This exhibition features over 20 interactive installations organized into five thematic areas, showcasing The Ellinikon's innovative vision.

This research contributes to critical urban studies by employing the postcolonial frame as a method for examining the discourse that the West adopted when referring to itself, rather than merely as a means of narrating the postcolony. Within urban studies, this entails further investigation into the political effects of such self-construction and critiques of the teleology of progress and linear modern (urban) development that often accompany it (Roy, 2006. Roy & Ong, 2011) in the urban Mediterranean. This perspective allows for an exploration of the discourse and politics shaping Athens' construction of The Ellinikon, positioning it as a symbol of urban futures envisioned by the developed Western world.

Using visual discourse analysis (Rose, 2001), the paper aims to unveil the ideological narratives of urban modernity promoted through the Experience Centre, highlighting the neocolonial implications inherent in urban development in the Mediterranean.

CICCHELLI, VINCENZO* (Ceped, université Paris Cité, IRD, France)

MEYNARD, CÉCILE* (CIRPaLL (Université d'Angers), France)

In Quest for Justice: Generational and Social Conflicts in Contemporary Dystopian Novels for Young Adults

In this presentation, we propose a content analysis of three globally successful young adult dystopias-The Hunger Games (2008-2010), The Labyrinth (2009-2016), and Divergent (2011-2018). Our investigation is drawn on the classic literary matrix of Bildung and refers to the paradigmatic sociological question of the transition to adulthood. These novels reflect the anxieties and desires of young people and the social problems of our time.

The synoptic analysis of these trilogies enables to identify the renew the image of youth in the social debates. It replaces the classical vision of an age in which the individual is in search of his or her identity with that of a generation rebelling against the totalitarian system established by adults. Through an individual gesture that becomes a collective action, the main characters of these novels (Katniss Everdeen, Tris Prior, Thomas) revolt against a tyrannical power that is systematically justified by the calling for the restoration of order, the advent of peace, the salvation of humanity, and against the functioning of an illegitimate political, economic, and social system.

These dystopias depict a post-apocalyptic world devastated by human actions (genetic manipulation, nuclear war, climate change). They raise fundamental questions for sociologists about the place of young people and the possibilities of their empowerment in our societies in which democracy, equality and freedom are at risk. By inviting the reader to imagine a dystopian future, they address the consequences of the internal division of societies (called “districts”, “factions”, “age classes”), on the conflicts between dominant and dominated, adults and young people, rich and poor. In these novels, however, the revolution does not lead to a rosy future, and these dystopian societies remain unable to resolve the great generational divide that overwhelms them. These novels portray teenagers as disillusioned, pragmatic, without ideals but taking action all the same.

CICCIA, ROSSELLA* (University of Oxford, United Kingdom)

Intersectionality and Family Policy Research: Four Approaches

This paper contributes to ongoing debates about the need to incorporate intersectionality in research on family and care policies. For a long time, scholars have lamented the middle-class and white-bias implicit of notions such as work-life balance and dual earner-dual carer models. While an increasing number of studies have worked to include a wider set of inequalities beyond gender, progress towards the incorporation of intersectionality in family policy research has remained scattered and piecemeal.

This paper argues that the complexity and polysemy of intersectionality align with multiple analytical approaches. Because intersectionality possesses multiple meanings, a wide range of existing research adopting widely different concepts of intersectionality, and designs to investigate relationships between inequalities is compatible with an intersectional approach to the analysis of family policies. Further research that does not claim to be explicitly intersectional is also informed by varied assumptions about the way specific policies address the inequalities experienced by different social groups. Therefore, there is a wealth of research that is relevant to advancing an intersectional understanding of family policies.

This paper aims to advance the consolidation of knowledge about different ways to do intersectionality in family and care policy research. Building on the work of Ange Marie Hancock, Leslie McCall and Olena Hankivsky, and secondary analysis of published research, this article delineates four distinct approaches that can be used to advance the application of intersectionality in policy analysis. The four approaches illuminate aspects of intersectionality which nospan across the outcomes, policy design, the policy process and the development and politics of family and care policies.

Community-Led Adaptation: The Role of Beach Management Units (BMUs) in Addressing Climate Change in Tanzania

As climate change increasingly affects coastal communities in Tanzania, local responses have emerged as essential strategies for adaptation and resource management. Beach Management Units (BMUs), community-based organizations initially formed to oversee sustainable fisheries, have taken on new roles in responding to the multifaceted impacts of climate change. This paper explores how BMUs have adapted their activities to mitigate the effects of rising sea levels, coastal erosion, and shifting fish populations, highlighting their role in local climate governance.

The study draws on qualitative data collected from coastal regions of Tanzania, where BMUs collaborate with local governments, NGOs, and international organizations to implement climate-resilient practices.

These include reforestation of mangroves, enforcement of sustainable fishing regulations, and education programs aimed at increasing community awareness of climate risks. The BMUs also serve as crucial actors in disaster response and preparedness, coordinating efforts to protect vulnerable coastal areas from extreme weather events.

Findings suggest that BMUs not only contribute to the sustainable management of marine resources but also play a vital role in enhancing the resilience of coastal communities to climate change. Their integration of traditional ecological knowledge with modern conservation techniques represents a hybrid approach to climate adaptation. However, challenges such as inadequate funding, limited technical capacity, and policy fragmentation hinder the full potential of BMUs in addressing climate change at scale.

This paper argues that strengthening BMUs through increased investment, capacity-building, and policy support could further enhance their effectiveness as frontline organizations in the fight against climate change. As such, BMUs present a model for community-led, adaptive management that can be replicated across other coastal regions facing similar climate-related challenges.

European Academic Debates on Energy Transitions: Reflection of Cross-National Differences in Academic Publications

Within the framework of the Green New Deal, the European Union officially aims to reduce greenhouse gas emissions by 55% by 2030 and achieve climate neutrality by 2050, which would require an Energy Transition of unprecedented proportions. Such a transformation in the societal modes of energy production and consumption would require a massive and rapid shift from fuels (coal, gas, oil) to renewable energy sources (wind, solar, geothermal, hydrogen). The feasibility of such transitioning to renewable energy depends on the social, political, and economic conditions in specific EU member states, as well as their technological capabilities and preexisting energy mix. Our presentation focuses on the reflection of those cross-national differences in the academic journal publications dealing with issues of energy transitions, green transformations and decarbonisation. The query of Web of Science and Scopus identified approximately 40 thousand publication records in this content domain, a plurality of which involved publications whose authors have been affiliated at European academic institutions. Using BERTopic, a machine learning approach to text mining and content classification, we classify these publications into stable, distinctive and coherent content clusters. In a second step, we explore the prevalence of research interests relative to the authors' countries of origin as well as the types of funding agencies. We aim to investigate the ways in which country characteristics and the country-level public opinion patterns can be reflected in the academic output regarding energy transition policies and technology debates.

The Transformative Capacity of Urban Spaces: From Cultural Experiences and Negative Emotions to Activation Competencies

This research explores how potentially destructive emotions, such as anger, frustration, and inadequacy, can be transformed into resources for social love and grassroots mobilization. Focusing on youth activism in Southern Italy, specifically in the Puglia region, it examines how these emotions influence the formation and development of youth associations and collectives. The study aims to identify the circumstances under which these emotions lead to constructive, non-violent actions that promote prosocial behavior, and how these emotions are shaped and transformed throughout the process.

The research employs a realistic evaluation approach to assess the transformative potential of emotions and cultural experiences in "Third Places" (Oldenburg, 1999)—social spaces that suspend hierarchies and foster creative, collective action. Specifically, it looks at urban spaces regenerated through co-design between public administration and youth associations, which serve as "enabling ecosystems" for youth activism. These spaces aim to inspire young people to become agents of change, share a collective vision for the future, and engage in community practices that promote social transformation.

Methodologically, the study includes interviews and participant observation with young people involved in initiatives within the Puglia Region's "Youth Policies" section. It examines the role of urban spaces in developing key skills such as a sense of community, participation, and volunteerism.

The theoretical framework draws on the 5C model (Competence, Confidence, Connection, Character, Caring) and its extension, Contribution, to understand the competencies non-formal education should foster in young people transitioning to adulthood. The concepts of self-agency and agentic power are central to understanding how young people can shape their developmental trajectories and influence social structures.

The findings are expected to deepen understanding of how maladaptive emotions can be channeled into prosocial actions and guide the design of interventions that empower youth activism for positive social change.

*The State of the Art in Research into the History of Sociology
 Teaching in Brazil and Argentina*

This paper aims to investigate, quantitatively and qualitatively, the growth of research into the history of sociology teaching in Brazil and Argentina. To do this, we surveyed theses and dissertations in online databases to identify the number of publications on the subject. In Brazil, we used the search engines "Teaching Sociology", "Sociology at school" and "School Sociology", in institutional repositories such as the Banco de Teses e Dissertações (BTD) and the Biblioteca Digital de Teses e Dissertações (BDTD) of CAPES, as well as in the repositories of 28 public and private postgraduate teaching institutions. In Argentina, we used the keywords "Enseñanza de la Sociología" and "Historia de la Sociología", since other search engines such as "Historia de la Enseñanza de la Sociología" and "Sociología histórica" did not produce positive results. The main repositories used were the digital database of the Instituto de Investigación Gino Germani (IIGG) of the Universidad de Buenos Aires (UBA), the Base de Datos Unificadas de Bibliotecas de Universidades Nacionales (SIUBDU), complemented by consultations with 36 public and private universities. Data was collected between August 12 and 20, 2024. In Argentina, we found 9 doctoral theses and 19 master's dissertations on the subject of the history of sociology. In Brazil, we found 8 doctoral theses and 28 master's dissertations on the subject of the history of sociology teaching. We observed that this topic has gained prominence in both countries, especially since the 2010s. In Brazil, there is a predominance of research focused on the teaching of sociology and its history in basic education, while in Argentina studies are mostly concentrated in higher education.

*Does More Egalitarian Ideology, Foster More Egalitarian
 Household Work Division? Marriage, Work and Family Life in
 Japan*

There is accumulating and strong empirical evidence that a gender egalitarian ideology of the partners is related to a more egalitarian share of housework among couples. Recent research also points out that gender ideology itself may not be stable among individuals over time. However, there is little evidence on the changes in gender and family attitudes in non-Western contexts. Using data from 25 waves (1993–2017) of the Japanese Panel Survey of Consumers (JPSC), we construct fixed-effects models that reveal how women's gender attitudes, together with life events just as parenthood and women's employment, shape unpaid work distribution in Japanese couples. The findings reveal that the change in wife's gender ideology does not have a significant effect on increasing the husband's share of domestic work over the course of the relationship. However, the interaction effect with parenthood is statistically significant. For couples without children, the more egalitarian attitudes wife has, the higher the husband's share of housework/childcare. However, for couples with children, there is no significant relationship between women's gender role attitudes and the husband's share of housework/childcare. It suggests that, once a couple has a child, the husband becomes unresponsive to the wife's gender-role attitude, even if the wife's working conditions or the wife's share of income do not change after the birth.

Does Sexual Orientation Affect Kinship Ties?

Intergenerational support is crucial for LGBT adults, as it is associated with positive outcomes like life satisfaction, well-being, self-esteem. In the last two decades, due to expansions of homosexual legal rights, social science scholars started to show an interest in homosexual family issues. In terms of intergenerational relations of homosexual individuals, the previous research is quite limited and most studies have qualitative research designs.

In this study, we employ descriptive analyses to report how kinship ties of heterosexual and non-heterosexual individuals from 25–35 age group change across countries, utilizing data from KINMATRIX Survey 2023. The literature suggests that LGBT individuals face disadvantages in traditional kinship structures. Our findings confirm these disadvantages across all the countries studied. Moreover, in countries with lower levels of institutional and cultural acceptance of homosexual individuals, such as Italy and Poland, non-heterosexuals report experiencing higher levels of conflict with parents and less closeness with grandparents.

*From Disempowerment to Empowerment: The Case of
 Precarious Migrant Workers Organising in the Italian Logistics
 Sector*

There is growing interest in understanding workers' effective collective actions. When these actions are effective, we know that workers and trade unions secure material gains such as higher wages and better working conditions. Yet, although union-centred studies have long extended the analysis of economic gains to moral ones (e.g., Clegg, 1976), these studies overlook actors' identities and, therefore, the various subjective gains that can contribute to making workers' organising initiatives effective against different experiences of injustice and discrimination. More importantly, we know little about the implications of these subjective gains on workers' organising initiatives. To address this gap, this article draws on long-standing multi-sited ethnographic research on precarious migrant workers mobilising with the support of SICobas, an Italian independent union. This research was conducted mainly in Bologna and Milan (Italy), involving participant observation at 124 events (e.g., union meetings, training, demonstrations, help desks, strikes, assemblies and social gatherings) and over 75 interviewees, such as migrant workers, union activists and allies. The article examines three subjective gains – changes in workers' self-representation, a sense of belonging and political citizenship – that result from participatory organising. Following Collins (2000), the article argues that achieving material and subjective gains can be interpreted as empowerment, a process that transforms social institutions and produces emancipatory knowledge that has implications for migrant workers' organising beyond workplace issues.

CIOTTI, MANUELA* (University of Vienna, Austria)

*Can a Cloud Speak of Justice in India, and How? De-
 Universalising the Representation of Climate Change*

This paper focuses on art projects that engage with climate change in India and offers a granular analysis of its representation. The analysis is informed by scholarly interventions on the nexus between art and the environment and the need of a more-than-human geography approach. In *Can Art History be Made Global? Meditations from the Periphery* (2023), art historian Monica Juneja asks us to conceive afresh the worlds of human creativity we study as immersed within multispecies and multi-material ecosystems that are also profoundly shaped by climate change. She invites us to rethink transcultural critique whereby 'its understanding of culture no longer rests on a nature-culture divide' (2023: 282). In turn, a non binary understanding of nature-culture within the visual arts today compels us to reflect on how art works addressing climate change have represented the 'livingness of the world', that is what produces a shift in 'the register of materiality from the indifferent stuff of a world 'out there' [...], to the intimate fabric of corporeality that includes and redistributes the 'in here' of human being', to make room for "more-than-human" approaches to this world – as geographer Sarah Whatmore (2006: 602) has argued. Building on these interventions and with climate change in view, this paper argues that representations of such change cannot be assumed to be one and the same globally because of both local ontologies and the different ways in which the climate crisis manifests itself across world locations. The paper foregrounds this diversity and the ways in which art works in India might speak to several audiences and contribute towards climate justice.

CIRDAN, CLARA* (London School of Economics, United Kingdom)

Curating Atmospheres: Sensory Encounters within Museum Spaces in London

This paper explores how the atmosphere of museum spaces in London shapes sensory experiences and fosters cultural participation, focusing on an ethnographic comparison of the Migration Museum and Turner Contemporary. Drawing on Georg Simmel's sociological aesthetics (Simmel, 1896) and Henri Lefebvre's rhythmanalysis (Lefebvre, 2004), the study investigates how these museums curate sensory environments that influence visitor engagement and the construction of cultural narratives. The Migration Museum creates an atmosphere centred on activism and participatory encounters, while Turner Contemporary fosters a more contemplative, visually driven space. These contrasting approaches reflect different conceptions of cultural democracy, with each museum using aesthetic choices to mediate their public role.

The analysis highlights how sensory atmospheres—through lighting, spatial design, sound, and materiality—shape the relationship between visitors and exhibits, functioning as tools of inclusion and exclusion (Thrift, 2008). These affective atmospheres structure the ways in which visitors experience cultural stories, engage with social issues, and participate in the museum's broader political and cultural missions. While the Migration Museum adopts a forum-like atmosphere to promote active participation, Turner Contemporary's temple-like environment encourages a more distanced, reflective engagement, illustrating different methods of facilitating or constraining participation (Leschenko, 2013).

This comparative analysis contributes to the intersection of aesthetics and sociology, offering insights into how museum atmospheres are used to mediate power, knowledge, and sensory engagement. It underscores the role of museum spaces in negotiating cultural democracy, shaping affective experiences, and revealing the sociopolitical implications of aesthetic practices in public institutions.

Temporalities in Museum Spaces

This paper examines how temporalities within museum spaces shape sensory experiences and inform knowledge construction, using Turner Contemporary and the Migration Museum as case studies. Through an ethnographic approach, the research identifies three key temporalities—mythical time, reflexive time, and time as a resource—that configure visitors' sensory engagement. These temporal dynamics influence everyday practices, such as routines, encounters, and affective responses, mediating the relationship between time and perception.

At the Migration Museum, mythical time is reflected in storytelling practices that connect personal histories to broader migration narratives, fostering emotional connections and a participatory atmosphere. In contrast, Turner Contemporary emphasises reflexive time through contemporary art and critical discourse, encouraging visitors to reflect on their experiences in relation to artworks and current social issues. This engagement resonates with Lefebvre's concept of rhythmanalysis, which highlights the importance of everyday rhythms in shaping social practices (Lefebvre, 2004). Additionally, time as a resource is explored, showing how temporal rhythms shape visitor interactions and institutional dynamics. Ethnographic data, including observations and interviews at both museums, reveal how rhythms—such as exhibition openings and educational programs—affect interactions within the space.

By analyzing these practices, the study reveals how temporal rhythms challenge traditional understandings of time and knowledge, offering new insights into cultural narratives and experiences. This comparative analysis highlights museums as spaces where temporalities intertwine with sensory perception, fostering critical reflection on cultural participation.

'My Needs Change with the Others': Therapeutic Pathways and Dementia in Old Age

Legislation on old age is strongly associated with the indications of international organisations. The concept of Active Ageing (now renamed Healthy Ageing) of the World Health Organisation (WHO) has permeated policies and programmes for the older population. In this sense, various types of ageing have been excluded, homogenising this stage. This paper

seeks to problematise old age that is accompanied by cognitive impairment. Dementia is one of the major causes of dependency in old age and affects both the person who suffers from it and his or her family environment. The Latin American region, and Argentina in particular, is characterised by scarce data on dementia.

How is the process of caring for an elderly person suffering from dementia carried out? Due to the persistence of a family-oriented culture, the general assumption is that the therapeutic itineraries and care practices of people with chronic neurodegenerative diseases remain 'behind closed doors' in the private sphere and those who have historically been catalogued as responsible for care: the women in the families.

The aim of this study is to investigate the characteristics of the therapeutic itineraries of elderly people who are dependent due to a mental illness from the perspective of their families as the main caregivers in the city of Buenos Aires. The design is exploratory and qualitative, based on primary sources (in-depth, semi-structured interviews) and secondary sources (analysis of health policies, statistics on illnesses, number of institutions offering care services).

Transformation of Public Space As a Controversy: The Case of Opening the Black Box of Social Conflicts in Vilnius, Lithuania

The collapse of the 20th century totalitarian regimes left cultural landscapes marked by memorials and ideological symbols. A notable example of this in Eastern and Central Europe is public urban spaces. Local and national governments have proposed transformation plans to replace the symbols of former regimes with new ones, aiming to reflect modern societal values and address the needs of democratic societies. However, these transformations have not proceeded smoothly. Redevelopment plans of public spaces in Vilnius, capital of Lithuania faced and face undergoing conflicts, turning into protests, opposition of social groups, tensions between self-government and local residents, and lost funds. Public space as an essential part of the urban space, not only serves complex societal functions, but also reveals what groups constitute society and can belong to it. Transformation projects highlight sociopolitical divisions, related to different interpretations of historical memory and national identity formation in public spaces that are sensitive in post-socialist region. Additionally, these discussions highlight conflicts over ecological issues, biodiversity, possibilities for appropriation of space that reflect global trends in urban development and use practices. These public disputes are not simple differences of opinion, but complex socio-technical debates or controversies (Yaneva 2012, Venturini, Munk 2021), in which the actors involved disagree on the very premises of the disagreement. Remodeling projects face complex political debates, various uncertainties, contested responsibilities, competing knowledge and ambivalent value creation. Our research, grounded in discourse analysis and controversy mapping, seeks to unpack the "black box" of disagreements and explore how miscommunication arises. The presentation is based on the research of the transformation of 5 public spaces in Vilnius. We will discuss one of the analysed cases: Lukiškės square, the most iconic public space controversy that is related to the ongoing debates, conflicts and material interventions in Vilnius since the collapse of the Soviet Union.

A Cross-Cohort and Cross-Country Exploration of Relationship Dissolution across the Life Course

While once the exception, relationship dissolution has become an everyday - albeit diverse - reality, of which the consequences are known to differ by, among others, socioeconomic and socio-demographic profiles. Especially relevant in this respect are one's birth cohort and country context, as both relate to diverging experiences and outcomes of a separation. On the one hand, sequential romantic relationships (and thus separations) have become seemingly inherent to the developmental stage of the "transition to adulthood", and these complex relational trajectories are increasingly perpetuating in mid and later life (exemplified by e.g., research into "grey divorce"). The incidence and implications of relationship dissolution however, differ considerably across cohorts. On the other hand, country contexts are known to differ in terms of judicial conditions (e.g., length of factual separation), related policies (e.g., housing), macro relational trends and

societal norms surrounding separation, and may thus lead to significant variation in the timing, actualisation and consequences of a relationship dissolution across countries.

Considering the rapid (inter)national changes in terms of relationship formation and dissolution, correctly mapping these trends is a crucial exercise – both from a demographic and a policy standpoint. However, significant empirical challenges, starting with the requirement for comparative, longitudinal data on relationship trajectories, imply that how relationship dissolution currently presents itself in light of simultaneous cohort and country realities remains largely uncharted. In answer, this paper makes use of seven large-scale comparative datasets that (retro- or prospectively) register relationship histories to i) investigate the frequency and timing of separations and the duration of the preceding partnership across cohorts while ii) simultaneously gauging to what extent these differences converge or diverge across countries. Through descriptive and sequential analyses and employing a life course perspective on dissolution, this study takes an important step in simultaneously mapping dissolution trends across time and space.

CLAIRAY, PHILIPPE* (Université Rennes 2, France)

Les Stations Balnéaires Européennes : La Fin d'Un Modèle Touristique ?

Les questions autour du surtourisme font l'objet de beaucoup de publications en ce moment. C'est particulièrement le cas depuis la fin de la crise COVID. Parmi les questions qui pourraient être posées et celles de savoir si c'est le seuil de tolérance des populations accueillant les touristes qui a évolué vers le bas ou si c'est le modèle lui-même du tourisme qui est mis en cause. Comme tout progrès social, car on peut considérer le tourisme comme un progrès social, le fait touristique, fait total, possède également un côté plus obscur. Le tourisme se comporte souvent comme un Léviathan, capable de phagocytter l'objet même qu'il tend à développer et à promouvoir, il le possède depuis sa naissance. On semble découvrir aujourd'hui les méfaits du tourisme comme on semble découvrir aujourd'hui les méfaits de la mondialisation, les méfaits de la pollution, etc. Les stations balnéaires comme les stations de montagne et tous les autres resorts, sont un bon exemple de ce constat. Elles conjuguent souvent les problématiques de surtourisme (sur-fréquentation touristique, désaisonnalisation impossible, bétonnisation, pollutions environnementales etc.) à celles liées réchauffement climatique (hausse du niveau de la mer, hausse des températures, érosion marine, disparition de la ressource etc.). C'est donc à la fois la typologie de développement et l'existence même de ces stations qui semblent mettre en cause un modèle au final ancien, issu de la civilisation industrielle, et peut-être inadapté aux défis environnementaux actuels. La mer reprend aujourd'hui sa place centrale, et de simple décor balnéaire, elle devient ou redevient une menace existentielle. C'est cette rupture sociétale qui sera étudiée dans ce propos : d'une société de la consommation touristique à celle de l'adaptation écoresponsable.

CLARNO, ANDY* (University of Illinois at Chicago, USA)

Israel's AI Powered Weaponry: A Joint Production of Empire

In April 2024, investigative reporter Yuval Abraham exposed the Israeli military's use of an A.I.-powered kill list to eliminate Palestinians suspected of association with the armed wings of Hamas and the Islamic Jihad. The kill list is generated by an algorithm called "Lavender" which reviews vast amounts of surveillance data and assigns every person in Gaza an individualized risk score of 1 to 100, with higher numbers suggesting an increased probability of belonging to an armed faction. The result is a ranked list that the Israeli military uses to prioritize targets for assassination. In this paper, I argue that the Israeli military bears responsibility for deploying the kill list, but the technology itself is the product of an imperial network of military/carceral forces.

In 2012, the Chicago Police Department rolled out the latest innovation in predictive policing: the Strategic Subjects List (SSL). Designed as part of the CPD's War on Crime, the SSL algorithm analyzed CPD data and produced individualized risk scores on a 500-point scale, with higher scores meant to signal an increased likelihood that the person would become either a shooter or a victim. Police commanders used the SSL to identify people for targeted interventions.

Unlike the SSL, Lavender incorporates A.I. technology and is being used for the targeted annihilation of Palestinians. But the SSL clearly helped pave the way for Lavender. So how should we understand the movement from the SSL to the Lavender list? Drawing on research in Palestine/Israel and the United States, this paper traces the flow of data and technology through webs of imperial policing. Advancements in one arena fuel developments in others, generating an expanding spiral of surveillance. In short, Lavender is best understood as a joint production of the Israeli settler colonial state and the U.S. empire state.

CLEMENTE, CARMINE* (University of Bari, Italy)

Social and Physical Activity to the Healthy Ageing in the Policies

Improving health, to increase life expectancy, is a fundamental part of an individual's existence. Health is a complex concept, the protection of which must be framed within a vast interdependence of subjective and objective factors. The challenges to be adopted, to ensure healthy living conditions, have led the scientific community and stakeholders to reason around a vast array of elements. What emerges from these reflections is that it may be useful both to incentivize public policies that emphasize new ways of promoting health and to support educational processes that look at the assumption of a correct lifestyle. In relation to the increasingly ageing world population, health is not exclusively a political issue, but is linked to the biographical experiences of the individual. Individuals take personal responsibility for their needs at the various stages of life, since neither public policies nor medicine alone can promote the achievement of an overall state of well-being. Improving the quality of life and psycho-physical well-being of the elderly represent some of the most important social and cultural challenges of our time. Old age is a population-wide process, maximizing the potential of old age means enabling the elderly to live fulfilling lives, also challenging the stereotypes of ageism. What the contribution aims to do is to empirically analyze, with the use of SHARE data, the relationship between physical activity - one of the most important determinants of lifestyle health - and perceived health among subjects of different age groups - with reference to the elderly. The analysis will be conducted on a model that considers several indicators such as age, socio-economic status (SES), gender, etc., which will allow for a greater understanding of the relevance or otherwise of physical activity for the attainment of well-being and good health.

Psychosocial Pathways between National Resilience and Mental Well-Being: Evidence from Filipino Emerging Adults at Risk for Depression

Background: National-level social contexts play a significant role in shaping individual mental health outcomes across the lifespan. According to Social Psychiatry, macro-social factors such as national resilience impact mental well-being through individual psychosocial pathways. Emerging adulthood (18 to 29 years old), marked by identity exploration, experimentation, and instability, is a crucial developmental phase that heightens vulnerability to psychological distress, including depression. This study is based in the Philippines, a developing nation frequently confronted with natural disasters and sociopolitical challenges that may undermine national resilience and affect the mental health of its young population.

Aim: This study explored the relationship between national resilience and mental well-being among Filipino emerging adults at risk for depression (EAARFDs), focusing on the mediating effects of peace of mind and life satisfaction in this relationship.

Method: A cross-sectional design was used, employing an online survey to gather data. The analysis included 920 EAARFDs, with standardized scales measuring key variables such as National Resilience, Peace of Mind, Life Satisfaction, and Mental Well-being. Parallel mediation analysis was conducted using the GLM Mediation Model module in JAMOV, incorporating bias-corrected bootstrapping (N=5000).

Results: National resilience was found to positively predict mental well-being, with peace of mind and life satisfaction serving as significant mediators. Peace of mind had a more substantial mediating effect than life satisfaction. The overall model accounted for 43.8% of the variance in mental well-being ($p < 0.05$).

Conclusion: The study highlights the positive impact of national resilience on the mental well-being of EAARFDs and identifies peace of mind and life satisfaction as key psychosocial pathways. These findings emphasize the importance of mental health initiatives that focus on enhancing both societal resilience and individual psychological resources during emerging adulthood.

Acceptance of Gender Based Violence and Willingness to Intervene: Results from a Vignette Experiment

Gender-based violence (GBV) is a critical global public health issue and both a cause and consequence of gender inequality. In Italy, persistent challenges remain in combating GBV, with violence against women and girls as a significant concern.

This study examines perceptions of GBV and the willingness to intervene in Italy using a pre-registered factorial survey experiment. More specifically, it studies subtle forms of violence such as verbal and psychological violence and the level of their acceptance at the individual level and at the level of society. Here, we present the findings of our research, which explores GBV perceptions within a feminist perspective that emphasizes gender asymmetry in violence. The objective of this study is threefold: i) assess the perception and normality of GBV in Italy; ii) investigate the link between perceptions and willingness to intervene in violent situations; and iii) examine whether perceptions vary based on respondents' gender and past experiences of violence.

The experiment was run within a representative survey of Italian population conducted by Dynata in November 2024 on 2000 respondents. The experiment contains seven factors, and these are context (public vs. private), type of violence (no violence, non-verbal, verbal, physical), gender of the victim and offender, their relationship (acquaintance, colleague, partner, friends), victim's perception of the situation (whether violence is acknowledged or not), and their reaction (no reaction vs. reaction). These factors provide a nuanced view of how GBV is perceived across different situations.

In conclusion, this research provides a novel study on GBV perceptions and the willingness to intervene in Italy, informing policy and program development aimed at mitigating GBV.

What Influences Attitudes Towards Refugees and Asylum Seekers in Italy: An Image-Based Vignette Experiment

Due to its geographical position at the border of Europe, Italy has played a crucial role in managing migration, particularly during the ongoing refugee crisis. This issue has become central in Italian politics and media, often linked to illegal immigration, security, and crime (Nese, 2022). Right-wing parties have adopted strong anti-immigration stances (Colombo, 2018). Meanwhile, media portrayals frequently depict migration as a "massive invasion," labeling migrants - regardless of their status - as "clandestine" or "illegal" (Quassoli, 2013). Furthermore, the arrival of newcomers from diverse religious backgrounds has fueled anxieties in a country that is the heart of Catholicism (Nese, 2022).

Given the prominence of migration in public discourse, this paper presents the results of a study exploring if, and to what extent, attitudes toward refugees and asylum seekers in Italy vary according to refugees' gender, ethnicity, age, religion, social class and the contextual setting in which they happen to be. This study is grounded in two main theories: Social Identity Theory and Ethnic Competition Theory, which explain how prejudice and negative emotions can lead to restrictive attitudes toward refugees. Our methodology involves using pre-registered AI-generated image-based vignettes with randomized characteristics. Vignette experiments enable to evaluate in parallel the influence of various characteristics of generated vignettes on respondents' opinions. Furthermore, image-based vignettes provide a more subtle way to examine how the characteristics of individuals and groups influence attitudes towards refugees and asylum seekers while minimizing social desirability bias. To this purpose, we conducted a survey in November 2024 and administered a questionnaire, along with AI-generated image-based vignettes, to a representative sample of 2,000 individuals of the Italian population.

This study is among the first to examine perceptions of migrants in the Italian context (Nese, 2022), with its novelty stemming from the use of AI-generated image-based vignettes to depict refugee profiles.

CLIFFORD, ALICIA* (McMaster University, Canada)

Better Than Therapy: Body Mapping As a Tool to Explore the Health and Well-Being of Indigenous Women Who Have Been Imprisoned in Canada

Despite being one of the healthiest countries in the world, Indigenous women in Canada experience some of the highest rates of chronic disease and ill health. These conditions are further compounded when someone engages with the criminal justice system and goes to prison. In Canada, Indigenous women represent the fastest-growing demographic in its carceral network at a time when the overall number of individuals entering prison is declining. While qualitative research in carceral spaces is increasing, significant gaps remain around community arts-based research methods that specifically centre health and illness and substantively give something back to the community. This presentation explores the intersection between the body, state policy, and prison, much like French theorist Loïc Wacquant. However, its application goes further by centring embodied knowledge expressed through art as the primary mechanism to explore the implications of settler colonial violence on the health, mental health, and well-being of Indigenous women who have served time in Canada's network of jails and prisons. The focus will be on an arts-based method called body mapping. Body mapping uses various mediums on life-size canvases to create a visual map that explores health and well-being from the perspective of the creator through targeted activities that have the potential to reveal patterns of illness in the population. The method combines visual art and therapeutic practice to empower individuals to communicate, process, and witness their embodied somatic journeys about their health and well-being. The presentation will highlight the need for increased arts-based research methods that have the potential to tangibly contribute to an individual's healing, health, and well-being while simultaneously allowing their voices to be heard.

Lost and Sensation: Embodied Encounters with Industrial Ruins in the Anthropocene

The contemporary life of industrial ruins has received significant academic attention in recent decades, along with widespread public interest, exemplified by the Urbex phenomenon. This paper focuses on contemporary postindustrial landscapes, where various types of ruins persist, endure, and accumulate. I turn my attention to the ruins in their current state and concentrate on the textures of their materiality, exploring how they enable us to confront large-scale phenomena, such as the ecological crisis, in a tangible way and ground abstract narratives like the Anthropocene (Armiero, 2021) through sensory encounters with their materiality. The paper is based on ethnographic research conducted in the Berguedà, a postindustrial and historically extractivist region in the Catalan Pyrenees (Spain). Drawing upon walking as a methodological tool (Careri, 2002; Sebald, 1995; Solnit, 2000), I examine the visual, auditory, olfactory, and tactile experiences that arise from these material industrial remains, discussing how our interactions with them can stimulate a critical encounter with the self-destructive forces of the Anthropocene. The paper addresses how approaching the sociopolitical asymmetries of the ecological crisis, as evidenced by these ruins, can benefit from this sensory approach. Likewise, I explore the emancipatory potentials that these damaged, sensory-laden landscapes can evoke (Ahmann & Kenner, 2020; DeSilvey, 2020; Fly, 2021; Tsing et al., 2017). By attending to the sensory ambivalences they generate, I contribute to current debates on how they can challenge the illusions of modern capitalist progress (Berlant, 2011; Koselleck, 2004) and prompt critical reflections on habitability and our embodied relationship with damaged environments.

WAGNER, PETER (University of Barcelona, Spain)

Modern Infrastructures through the Lens of Classical Sociology: Unpacking Ambiguities

Infrastructure—as a concept, word, and physical construct—is deeply intertwined with the shaping of modern societies. The term infrastructure emerged amidst the context of rapid societal changes brought by the Industrial Revolution, evolving from an initial specialized usage associated with railway development to a broader concept materially encapsulating 'sociotechnical imaginaries of modernity' (Jasanoff & Kim, 2015). Therefore, an intriguing connection exists between the spread of the notion of "infrastructure" and the roots of sociology as a social science discipline that is worthy to explore. This article delves into the historicity of this concept in relation to classical

sociological thought, focusing on the often-implicit notion that “modern” infrastructures developed to collectively organize and support social life on a given territory in enduring ways, indeed, to create “society”. Through a historical-sociological approach, we closely look at specific trajectories of infrastructures of/in modernity and discuss the ambiguities that arise from tracing their historical developments and revisiting classical understandings in the present. Specifically, we focus on shifting world-regional dependencies, collective and individual tensions, and dynamics of rise and decline.

COCCO BELTRAME, DANIELA* (University of Manchester, Argentina)

African Youth and Urban Social Movements: Possible Becomings of a Time-in-Itself

For the last 20 years, Africa has been the continent with the highest urbanisation rate, and the largest youth populations in the world. There, being young and living informally in cities is the rule rather than the exception. The lives of the young and marginalised in African cities are marked by quotidian interconnected problems deriving from the climate crisis, unsustainable economic pattern, political conflicts, rampant inequalities, and systematic exclusion from decision-making. While this scenario poses undermines African youth's trust in current systems and institutions, it also ignites their commitment to mobilise for a better future, with much of that engagement being channeled through urban social movements.

In the past decades, specialised scholarship on social movements has grown. However, it is yet to grapple with the subjective narratives and potential of youth collectives as emancipatory actors, particularly those from urban Africa. Conversely, even though the lives of the young and marginalised in cities are being studied through multiple dimensions and lenses, there persists a lingering characterisation of youth, and particularly African youth, as a paradoxical reality. There is a dearth of studies examining young people's participation in social movements in the African continent, alongside the causes that mobilise them.

This paper highlights the multiple and diverse contributions of marginalised youth collectives both to the conversation and action towards emancipation, as well as to social movements' theory and practice. Moving away from relentless dichotomies, this research a) offers a review of the dimensions (economic, social, political, intersectional), and lenses (conceptual, categorical, phenomenological, developmental, ideological) that have characterised previous scholarly work; and b) proposes an integrative framework to move beyond compartmentalised through a tripartite conceptualisation of youth; as a dialectical becoming (away from linearity); as a possibility (beyond a phenomenon), and as a time-for-itself.

COCHRANE, LOGAN* (HBKU, Qatar)
AMIN, HIRA (College of Public Policy, HBKU, Qatar)

Navigating Identity and Values in a Globally Connected Middle Eastern City

This study aims to explore how youth in Doha, Qatar perceive identity formation, changes in identity over time, and the integration of their own values within a globally connected capital city. The purpose is to understand the impact of globalization, mega-events, and tourism on traditional forms of national identity and socio-religious values in the Middle East, specifically in the Arabian Gulf region. The research was conducted through interviews with youth aged 18-35 in Doha, Qatar. The photovoice methodology was employed to allow participants to visually express their perspectives on identity and values. Multiple papers were written to present the findings, focusing on the themes of globalization, clothing, education, and values. The methodology aimed to capture the diverse experiences and perspectives of the national youth population in Doha. The findings of this study highlight the complex intersection of economic, political, social, religious, and demographic factors with identity and values in a global city like Doha. The interviews revealed that the increased influx of tourists and mega-events, such as FIFA 2022, have intensified encounters with diversity and challenged traditional forms of national identity. The youth participants expressed a sense of pride in their city's global connections but also raised concerns about the potential erosion of their socio-religious values. This research contributes to the understanding of the impact of globalization and tourism on identity formation and values in the Middle East, specifically in the Arabian Gulf region. The use of the photovoice methodology adds a visual dimension to the exploration of youth perspectives. The findings have implications for policymakers in various sectors, as they highlight the need to navigate the tensions between globalization and the preservation of national identity and socio-religious values in global cities like Doha.

WG01-879.6

COCO, SIMONA RITA* (Università degli studi di Catania, Italy)

Rethinking Educational Poverty: The Complexities of NGO Interventions in the Global South

International non-governmental organizations (NGOs) are often seen as vital in addressing global inequalities, particularly through education initiatives in the Global South. While education is frequently portrayed as a solution to poverty and social exclusion, this view can oversimplify the complex nature of educational poverty, which involves more than just access to education. In Madagascar, evidence shows that educational initiatives, despite good intentions, may reinforce existing social hierarchies, benefiting certain groups while marginalizing others.

The research challenges conventional approaches to educational poverty by examining targeted interventions such as school-family partnerships, teacher training, and infrastructure improvements. These efforts often fail to address underlying structural conditions, including local governance issues, power dynamics, and conflicting international aid agendas. As a result, these initiatives may not adequately challenge the deep-rooted inequalities tied to gender, ethnicity, and socio-economic status.

The paper underlines the relevance of calling for more holistic strategies involving collaboration between schools, communities, NGOs, and local authorities. Expanding educational access without addressing broader social inequalities may perpetuate the very problems it seeks to solve, highlighting the need for context-sensitive approaches to sustainable development.

Transformative Education through PLAY and Action: The Brincadas Project and Colina'S Response to Social and Environmental Vulnerabilities

This paper presents the Brincadas Project and its role in transforming education through play and collective action to address social and environmental vulnerabilities in São Paulo, Brazil. The project established Collectives of Investigation and Action (COLINA), which engage participants in community-based efforts to foster agency and resistance in marginalized groups, including Indigenous, Quilombola, and urban communities. Grounded in Vygotsky's (1933/1991) theories of play and Freire's (1970) concept of the *inédito viável*, the project emphasizes critical reflection and collective action as essential elements for creating viable futures. Informed by Critical Collaborative Research (Magalhães, 2011), the Brincadas Project integrates collaborative inquiry to empower participants and challenge social injustices. In 2023 and 2024, COLINA participants co-created sustainable solutions to local problems such as water scarcity and cultural exclusion. The concept of Good Living (Krenak, 2020) guided the project's focus on ecological and social justice, fostering collective empowerment and engagement. The outcomes demonstrate the potential for educational interventions to contribute to lasting social transformation, particularly within marginalized communities. This presentation will explore how the Brincadas Project promotes engaged pedagogy, as advocated by Freire, through the use of play and collaborative inquiry, aligning with the conference's goals of advancing justice-driven educational practices.

COENDERS, YANNICK* (Washington University in St. Louis, USA)

Understanding State Responses to Collective Nativist Violence: White Appeasement in Rotterdam, 1972

Nativist violence illuminates a tension between two pillars of the modern nation-state: on the one hand the concentration of the means of coercion guaranteeing state control and on the self-legitimizing profession of deference to mythological and racialized notions of “the nation”. In this article I examine how states grapple with this challenge, resulting in four types of responses. Three of these: *condonement*, *containment*, and *suppression*, have been empirically studied in various contexts of nativist vigilantism. Subsequently, I present a case study of *appeasement*, a fourth response to violence that has been empirically overlooked. Prevalent in nation states that nominally reject racism, appeasement is a law generating force turning racial violence into ostensibly non-violent racialized law that seeks to preserve the racial hierarchy. Drawing on a case of nativist vigilantism in Rotterdam (NL), the so-called Afrikaanderwijk riots in 1972, I outline some mechanics by which appeasement comes to be a *modus operandi* for state officials in

racial democracies. During the riots, vigilantes raided the lodgings of Turkish migrant workers in attempts to chase them away from the neighborhood they resided in. Drawing on rich archival material that includes archives from leaders of neighborhood organizations, the city council, court cases, local newspapers, and radio- and television broadcasts, I examine the processes that lead to the Labor-led city government's attempt to appease the violence by passing discriminatory legislation to limit the presence of migrants in the city through immigrant quotas and lodging closures.

COHEN, MATHILDE* (Tilburg Law School, Public Law and Governance Department, Netherlands)

Le Colonialisme Vert à L'épreuve Des Tribunaux: Le Droit Comme Levier De Lutte Pour Les Populations Autochtones

Face au colonialisme vert que subissent les populations autochtones, de nouvelles formes de lutte émergent, notamment devant les tribunaux nationaux et internationaux. La vision occidental-centrée de la protection de l'environnement, fondée sur la notion de « développement durable », a écarté les peuples autochtones des processus décisionnels. Si les injustices environnementales ne pourront pas se résoudre en maintenant un statu quo des systèmes juridiques non-autochtones, les populations affectées tentent de se réapproprier ces systèmes. Le droit devient alors un moyen de lutte visant à faire condamner les Etats ou les multinationales responsables d'accaparement de terres, de déforestation, de violation de leur droit au consentement libre, préalable et éclairé.

Cet article vise à rendre compte des différents types de contentieux mobilisés par les populations autochtones pour faire respecter leurs droits. Ces contentieux ont d'abord émergé devant les juridictions internationales, telle que la Cour africaine des droits de l'homme et des peuples, afin de faire condamner les Etats. Face à des décisions qui peinent à être implémentées, de nouveaux contentieux voient le jour, visant des acteurs non-étatiques et s'appuyant sur des législations à la portée extraterritoriale. Des coalitions d'associations de représentants des peuples autochtones et d'ONG occidentales installées dans les Etats ou les multinationales climaticides ont leur siège social se montent, créant ainsi de nouvelles formes de solidarité et de luttes.

The Environmental Benefits and Harms of AI: Preliminary Results from a Review Study

In recent years, the environmental impact of Artificial Intelligence (AI) has garnered significant attention, leading to the emergence of Green AI research. Green AI focuses on mitigating the carbon footprint of AI systems, driven by the recognition that the computational resources required for AI operations are substantial and growing. The current body of research primarily addresses the operational phase of AI systems. These studies emphasize the importance of monitoring energy consumption, optimizing model parameters for sustainability, and developing tools to measure and reduce the carbon emissions associated with AI training and inference processes. Despite the extensive research conducted on the environmental impact of AI operations, the effects of AI hardware production, logistics, deployment within industry, and end-of-life management remain overlooked within the Green AI literature. Therefore, we seek to broaden the definition of Green AI to these other aspects and rely on a tertiary literature review to create an evidence base to support this. We ask, 1) What are the key environmental sustainability benefits and harms associated with AI production, logistics and hardware end-of-life? 2) What are the key indirect environmental sustainability impacts associated with AI deployment across various sectors and contexts?

In this tertiary review we aim to gather and synthesize the literature in order to develop a robust understanding of AI's environmental impact and foster the development of effective mitigation strategies where necessary. We include in our analysis downstream societal impacts that may follow environmental impacts. Our review includes existing peer-reviewed secondary studies (reviews) and grey literature and is carried out in accordance with the PRISMA guidelines for systematic reviews. In this presentation, we provide preliminary findings that illustrate the sustainability risks and challenges associated with AI hardware production, logistics and end-of-life, and indirect environmental benefits and harms that stem from AI deployment in various industrial contexts.

Energy Cooperatives and Communities in the Just Transition: Work Organization and Structural Contradictions in Italy.

The paper addresses the emerging contradictions between energy markets and systems, on the one hand, and decentralisation processes in energy governance, on the other. It focuses on the organisational aspects of work in the sector of renewable energy cooperatives and communities in Italy. In general terms, the transition to a renewable energy system is believed to be contingent upon the advent of decentralised, democratic energy models in which energy cooperatives and communities represent a promising alternative to the previous centralised models, advocating for local production and consumption from renewable sources. Nevertheless, in Italy the growth of these initiatives and energy decentralisation itself is constrained by the complex nature of the energy infrastructure and markets. In this regard, the organisational processes of energy cooperatives are typically dependent on the influence of major energy corporations, which hold an oligopoly position. Thus, energy cooperatives are at risk of being either absorbed or influenced by larger companies, which could ultimately compromise their capacity to facilitate a democratic and just transition.

With regard to Renewable Energy Communities (RECs), the advent of this innovation has resulted in a notable increase in the number of start-ups and companies seeking to assume control of all aspects of their development. These companies act as intermediaries between the energy market and RECs, aiming to achieve economic and technical efficiency. In this context, there is a broader trend among innovators in this sector to view citizens engagement as an unnecessary and time-consuming factor in the success of decentralised energy configurations.

This study has two main objectives: first, to identify the complex balance between autonomy and dependence of cooperatives and communities on established energy actors, as evidenced by an analysis of several case studies in Italy. Second, it aspires to offer insights that can inform the design of a just (energy) transition.

Active Labour Market Policies and Undeclared Work. Reflections on an Understudied Relationship

The contribution aims to provide insights into how employment services and, more specifically, active labour market policies (ALMPs) relate to the policy field focusing on Undeclared Work (UDW). To deal with UDW, attention is increasing to the so-called holistic approach, which includes preventive and curative policy measures, besides the more traditional one based on repressive measures. In this approach, there is a focus on policy measures able to transform UDW into declared work rather than 'simply' repress it. Within this scenario, active labour market policies (ALMP) gain in importance, given their potential for supporting the workers from irregular to regular jobs.

We analyse this unexplored relationship in three steps: in *principle*, in *policy design*, and in *street-level actions and discourses*. Based on (European) policy models and guidelines, we unpack ALMPs into their fundamental components (employability, personalisation, activation and conditionality,) and explore how they intersect with and confront undeclared and informal work. Second, we use Italy as a case study to explore the links between two recent policy measures, introduced with the Recovery and Resilience Plan: the ALMP reform and the national plan to tackle undeclared work. From the in-depth analysis of policy regulations and policy instruments, we shed light on both smooth links and critical knots and contradictions of policy design. This documentary study forms the context for the third step, which delves into how and to what extent undeclared work is considered in the daily activities of employment services. Ethnographic data concerning the street-level implementation of the ALMP reform serve to depict how the relationship under study takes concrete shape.

Beyond Established Unions: The Informal Transport Sector and Worker-Led Organizing in Tanzania

There is a growing academic interest in trade union organizing among urban informal workers across the Global South. Much recent research focuses on established trade unions, often staff-led, affiliated to a national trade union congress, and with additional ties to international donors. The emphasis is then on how these established unions expand beyond a core membership of formal employees to also recruit informal workers, either directly or via their associations (Rizzo 2017; Spooner and Mwanika 2018; Steiler 2023). This literature makes a vital contribution. However, there are forms of labour organizing that occur independently of established trade unions—or that are even in tension with these unions—which deserve more attention (Atzeni 2021; Bieler and Nowak 2021; Nyamsenda 2018). This paper develops this point through a study of organizing among informal transport workers in Tanzania. It takes as a focal point a 2015 strike involving different categories of road transport worker—city bus drivers, upcountry bus drivers, and some truck drivers. The strike represents one of the few instances of *nationwide* industrial action in Tanzania's post-colonial history, and crucially, it was organised entirely independently of formal trade union structures. The strike had an extended pre-history, one of incremental organising and experimentation. It also had a long afterlife, spawning a new 'worker-led' union, a plethora of promises from the state and capital, new institutions for mediating labour relations, repeated threats of industrial action, and, in 2022, a follow-up strike among truck drivers. The paper retraces these cycles of contestation, exploring what they tell us about forms of worker-led organizing, the potential for informal transport workers to leverage 'associational power', and the remaining political-economic obstacles that nevertheless limit long-term improvements to precarious work conditions. The paper draws on 10 months of fieldwork in Tanzania, including semi-structured interviews, archival research, and press reviews.

Understanding Digital Financial Practices through Trust Among French Young Adults

This study investigates digital financial practices of French young adults, focusing on online transactions, e-banking, and internet income generation. Despite France's above-average engagement in e-banking relative to the European Union, trust in traditional and digital banking remain underexplored.

Adopting Lahire's dispositionalist framework (Lahire, 2013), I investigate how economic dispositions, digitalisation context and risk perception (Borraz, 2007) shape young adults' online financial practices, while highlighting the role of trust in this process. Employing mixed methods, I conduct thirty semi-structured interviews to explore the construction of trust in traditional banks and digital financial services (DFS), and its influence on the online financial practices of young adults. Furthermore, I apply hierarchical cluster analysis to French data from the 2021 EU survey on the use of Information and Communication Technologies in households and by individuals. Using variables related to digital financial practices, I create clusters to identify patterns and disparities among young adults.

Findings suggest that engagement with DFS is not just age-related, but correlated with economic resources, broader digital practices, and professional digital integration. Results show that beyond economic dispositions, digital financial practices are influenced by trust and risk perception. It also highlights the innovative use of DFS by some young adults, distrusting traditional banking institutions. Moreover, this study challenges the concept of digital and financial literacy (Lyons & Kass-Hanna, 2021), advocating for a broader understanding of digital financial practices. It also contributes to research on the "privacy paradox" unraveling the risk-benefit assessments young adults undertake in online financial transactions.

Inequitable Climate Responses and Their Impacts on Southern Louisiana Tribal Communities

Southern Louisiana Indigenous communities have been confronting the harmful results of exploitive capitalist exploration and development in their bayou areas for decades. Oil and gas exploration cut massive swaths of

canal-works through important marsh and wetlands, which serve as storm barriers. The network of canals allows salt water from storm surges to reach farther into the area, killing freshwater root systems. Consequently, these communities are experiencing unprecedented land loss, while simultaneously enduring subsidence and sea level rise. Climate crises contribute to higher water inundation levels during storm surge, devastating flooding, and increasing numbers of hurricanes that are landing at higher strength levels. These storms are threatening cultural survival and livelihoods because of forced displacement from homelands. Louisiana's massive coastal protection project offered hope, until it was announced that the tribal communities were to be excluded from the barrier's extension. Since then, the communities have been fighting back, developing projects to backfill some of these canals to restore marsh ecosystems to reduce land loss and protect sacred sites. Other Indigenous nations have engaged in the use of recycled oyster shells to create new reefs. The presentation will discuss the evolution of the canal project with partners that include members of the First Peoples' Conservation Council of Louisiana, several Indigenous nations, the Lowlander Center, and other stakeholders. Resistance to these efforts at the state level will be presented, along with strategies that have been used to overcome and circumvent this resistance to create more disaster resistant communities.
