Academics participate in various evaluation processes of their work and receive multiple demands from the universities and from society. This fact impacts the working conditions of postgraduate teachers and researchers. In the context of the Applied Ethics and Education Project, a question was included: What are the main working conditions needed to have an adequate environment for research? Purpose: Analyze the answers obtained and compare them with the results of a previous research to identify changes that have occurred in recent years. Method: It is a descriptive and interpretative study that used Qualitative Content Analysis, and in which 291 postgraduate educators from a public Mexican university participated. Results: They refer to the infrastructure and resources, having adequate and fair working circumstances for the professional group, and the need for a favorable environment of freedom and respect for the members of the community. Discussion: The results obtained and their comparison with previous research and other studies show that the difficulties to develop an autonomous professional practice are increasingly evident, especially for the new generations of university professors.

Powering Minds, Empowering Lives: Understanding the Effects of Energy Poverty- Low-Carbon Energy Transition Nexus on Children in MENA

Energy poverty in the Middle East and North Africa (MENA) region profoundly affects millions, particularly children, with significant implications for their health outcomes. This paper investigates the relationship between energy poverty, low-carbon energy transition, climate change and child health across twelve MENA countries. Proposing several modifications of a Multidimensional Energy Poverty Index at the household level, and matching high-resolution temperature data to districts where households live, we analyze child health outcomes – namely stunting, wasting, infant mortality, and neonatal mortality – across twelve countries and two points in time (around 2014 and around 2018). Our findings indicate that higher energy poverty is associated significantly with increased stunting in Morocco, Palestine, and Tunisia. Female children exhibit lower probabilities of becoming stunted in most countries, although this result requires cautious interpretation due to potential region-specific heterogeneities in anthropometric standards. Wealthier households generally show lower stunting rates, except in Jordan and Mauritania. The results for wasting rates are similar quantitatively but weaker in significance. For infant and neonatal mortality, energy poverty shows a positive significant effect in Tunisia and Turkey, while extreme temperatures have limited but notable impacts in select countries, including a positive association in Comoros. Over time, children's health has become more strongly related to variations in the sources of energy and to extreme climate events. These initial results underscore the necessity 1) for carefully tracking of children's outcomes as well as of the indoor and outdoor environmental conditions they face, and 2) for targeted policies addressing energy poverty and climate resilience with regard to improving child health outcomes in the MENA region as well as across the global south broadly.

Social Capital and Employment Prospects of the Korean Elderly: Silver Lining in an Aging Society?

Social capital and its dimensions – trust, networks and social engagements – are often discussed in relation to individuals' health and subjective wellbeing, but less frequently in relation to employment prospects, particularly in individuals' late-career years. With a premise that social capital and its components are individual-level assets in which individuals purposely and methodically invest, we estimate elderly individuals' stock of social capital using the Bayesian approach as a function of their trust in social institutions, social networks and social engagement. Using all up-to-date waves of the Korean Longitudinal Study of Ageing (2006–2020), we describe the distribution of social capital stock across genders, age cohorts and years. We then assess the value of social capital for individuals' prospects of attaining full-time regular employment, part-time or irregular employment or self-employment, as well as economic, health and life satisfaction more broadly. We find that, for men, the most effective social capital type for attaining higher quality jobs or self-employment is the frequency of active socializing, while club membership is more conducive to precarious or part-time wage work. For women, all three pillars of social capital – social engagement, networks and trust – are conducive to self-employment, and detracting from wage employment. These findings point to a divergence in the effects of socializing on wage work and self-employment between the two genders.

Access Concerns and Dispute Resolution within Plural Justice Systems: Administration of Justice Under Customary Law in Northeast India

Access to justice is often studied in conjunction with Alternate Dispute Resolution (ADR) and dispute perspective studies. The paper is based on the practical application of the dispute perspective model to identify access concerns and issues in plural justice systems. It involves the application of a non-linear and fluid dispute pyramid model that encompasses adaptive implementation and monitoring, apart from the conventional model of identifying, attributing blame and asserting claims to avoid oversimplification and implementation of superficial remedial measures on complex and multifaceted societal issues. This research incorporates ethnographic observations and oral histories, substantiated by case studies, to explore inconsistencies in existing mechanisms and approaches to justice. ADR is especially significant for the case of indigenous societies in Northeast India because of three major reasons: problems in accessing formal courts, the ambiguous concept of justice in informal customary courts, and the autonomy of administration under customary law. The tribes included in the study have multiple and parallel forums for dispute resolution circumscribed by customary law. Perceptions of justice in tribal societies can be dynamic and depend not on procedural justice but on restorative justice guided by customs. This leads to the subjective connotations of justice in tribal societies, which may differ across tribes depending on what is considered just in relation to the existing norms. In a scenario where the notion of justice is contested and where multiplicities of justice exist, how does one formulate policies for equal access to justice? This question warrants a critical analysis of access to justice through the lens of intersectionality to devise alternative mechanisms for grievance redressal and resolution of disputes in tribal areas. Another major concern in customary law is its gendered implications. The study employs the 'woman question' to study women's negotiation for space and access concerns for women under customary law.

HMANGAIMAWI, MELODY* (Indian Institute of Technology, Madras, India)

Asking the 'Woman Question': Pathways for Political Leadership of Women Under Customary Legal Frameworks in Northeast India

The paper explores the evolving landscape of women's political leadership under the framework of customary law and electoral politics in Northeast India with specific focus on the state of Mizoram. The study further investigates the prevalent gender stereotypes associated with Mizo women within the domains of politics and leadership roles which is underlined by the change and continuity of gendered spaces in politics. The family unit in Mizo society is characterised by its patrilineal system and reinforced by the patriarchal values

of customary laws. Within this context and against a societal backdrop heavily influenced by customary laws, the study examines the power dynamics within familial settings and broader societal structures to map women's political participation. The abolition of chieftainship in Mizoram and the reservation of seats for women in local governance have created pathways for transformative networks, including a rise in women's participation in leadership roles. The paper explores the profound influence that religious institutions, particularly the Church, exert on Mizo women's political perspectives and perceptions of social respectability. I examine how these influences shape their political participation and political aspirations by employing the 'woman question' to discern masculinist norms within customary law and social structures. The 'woman question' as a method can be used to consistently pose questions and interrogate existing biases, including gender implications of traditional norms and practices. The intersection of gender, law, and politics within social systems and how these elements intertwine within the legal discourse hold significant political and social relevance, particularly in addressing gender disparities. The discourse presented in the paper is situated at the intersection of law, gender, tradition, and administrative autonomy. It involves ethnographic research, documentary analysis, and case studies to study the political participation of women within the confines of customary law.

Making Tradition Great Again: Educational Cadres, Rural Schools, and Decolonization

Despite the foundational role of rural communities in 20th-century revolutions, little research explores how mass education influenced agrarian mobilization under colonialism. By showing how Vietnam's Confucian village education shaped persistent violent rural rebellion, whereas Senegal's Islamic education system was associated with more peaceful agitation among the urban working class, I analyze the material and cultural conditions that shaped diverse decolonial trajectories resulting in Vietnam's independence from France in 1945 and Senegal's in 1960. Using a paired comparison, consisting of both correlational and process-based analysis, I examine colonial archival data collected over two years in Vietnam, Senegal, and France to understand the triadic interactions between rural indigenous teachers, colonial elites, and urban indigenous elites. Urban indigenous elites who underwent modern forms of schooling were perceived by colonial authorities to be a threat and source of decolonial thought. Yet, village schools were what anchored agrarian communities in intellectual, social, and religious traditions, equipping them with tools to govern autonomously. Findings suggest that village schools, rather than being mere vectors of colonial propaganda and urban-elite mobilization, played critical roles in fostering self-determination and mediating between tradition and modernity. Rural indigenous actors experimented with novel forms of educational practice as they faced a crisis of legitimacy from within precolonial traditions. These indigenous elites sought to make traditional institutions "great again" while confronting the issues it posed for indigenous communities. I thus argue that traditional indigenous teachings flourished alongside Western ones so that political ideologies, such as democratic Confucianism or pan-African socialism, could find resonance among the masses and re-constitute political community precisely through the work of educational cadres in traditional village institutions. This study confronts the well-worn binary of domination versus resistance often used to understand peasants by showing how rural indigenous elites enabled and constrained the emergent decolonial projects of their urban counterparts.

Innovación Metodológica y Rupturas Epistemológicas Desde La Investigación Social Digital Feminista: El Caso De Estudio De La Relación Entre Hombres y Feminismo En Twitter/X

El presente trabajo pretende poner de relieve algunas fortalezas de los espacios digitales como campos para la innovación metodológica, así como exponer las rupturas epistemológicas que estos nuevos itinerarios de investigación supondrían. En concreto, se tratará de cuestionar la *falsa antinomia* entre lo cualitativo y lo cuantitativo en la investigación social digital. Y es que, en la medida en que cada toma de acción de los usuarios de las plataformas digitales queda registrada mediante mecanismos de *automonitoreo*, se generaría todo un *continuum* desde las micro-interacciones hasta las macro-estructuras sociales acontecidas en los campos digitales de estudio, objetando en cierto sentido dicho par conceptual. Para ello nos apoyaremos en los aprendizajes adquiridos en un estudio de caso acerca de los discursos sobre la relación entre hombres y feminismo digital en España emitidos desde la red social Twitter. En esta investigación se diseñó un plan de análisis en el cual se partía de técnicas "cualitativas" para transitar paulatinamente hacia análisis "cuantitativos". Así, se analizó una muestra de

más de 4.000 tweets articulando inmersiones etnográficas digitales, análisis del discurso, análisis visual digital, conglomeración de imágenes, modelado de temas y modelos topológicos. Los resultados pusieron de manifiesto que estas fórmulas de articulación metodológica hicieron emerger patrones en los discursos de estudio que difícilmente hubiesen sido perceptibles sin la retroalimentación entre familias de técnicas. En este sentido, la presente comunicación procura señalar la necesidad de una actitud crítica frente a las concepciones heredadas de la investigación y las potencialidades de una mirada multidimensional desde la investigación social digital feminista que rehuya del *automatismo metodológico*.

Migrant Entrepreneurs As a-Typical Expatriates: Practices of Future-Making Among Highly-Educated Migrants in Singapore and Tokyo

This presentation examines global cities outside of the West as destinations of hope and future-making for a-typical expatriates, that is, self-initiated highly-educated migrants who choose to work and eventually become migrant entrepreneurs in these metropolises. Based on data from ethnographic fieldwork and qualitative interviews with roughly 35 migrants in Singapore and Tokyo I engage with notions of hope, aspirations, and future-making in order to disentangle the processes of embedding in a given host society and labor market for those supposed to be privileged. The presentation examines migrants' expectations towards the future and according strategies to establish host country networks that allow to root, to maintain transnational networks that offer a fall-back option or an infrastructure through which to return, and practices of home-making and anchoring through employment and legal stability. The analysis holds that expectations and strategies are not merely rational but are made-up of, negotiated, and reworked through hopes and aspirations. It proposes that disentangling the anthropological concept of hope from the sociological study of aspirations in migration research is fruitful for analyzing how supposedly privileged or 'skilled' migrants engage in practices of future-making, that is, practices directed towards building a viable, secure, and stable future and livelihood post-migration. Highly-educated but mostly from under-represented groups, including men and women from developing countries, migrants of colour, and second-generation migrants, these foreign entrepreneurs rarely pursue the stylised pathways of corporate – and mostly male – expatriation. The presentation sheds light on specific characteristics of Singapore and Tokyo, which enable these migrants to project hopes of career development or family building to life in the two cities and lead them to invest in establishing themselves in-place, thereby challenging the image of both the cities as short-term destinations and the migrants as uprooted individuals.

HOF, HELENA* (University of Zurich, Switzerland)

Participation in the Labour Market through Transnational Entrepreneurship: Migrant Entrepreneurs Navigating Professional Work in Singapore and Japan

This presentation examines how migrants' access to the host country labour market is facilitated by a classed habitus and by engaging in digital transnational entrepreneurship in the knowledge-intensive sector. As migration scholarship and the sociology of labour have demonstrated migrants often face barriers when trying to access the host country labour market due to lack of social or cultural capital and institutional knowledge. A frequent strategy is entrepreneurship, which however tends to push migrants in ethnic niche businesses that do not allow them to utilize their skills or to further develop their careers. I use an institutional approach to demonstrate how highly-educated migrants circumvent the aforementioned barriers by founding knowledge-intensive firms that either operate fully online or hire digitally (and thus remotely) working staff overseas, while the migrants stay physically put in their host societies. The argument builds on qualitative fieldwork among migrant entrepreneurs in Japan and Singapore. Both countries' labour markets are difficult to access for foreigners. Singapore's increasingly strict visa regime presents obstacles to hiring even highly-skilled foreigners while Japan's internal labour market and the need of Japanese proficiency are major obstacles to foreigners' employment. Data from interviews with 69 migrant entrepreneurs in both countries reveal that (partly) digital work allows these business owners to a) venture into self-employed work that is commensurate to their professional training and qualifications, b) hire staff overseas and thereby overcome language barriers or skill shortages among the workforce in the host society, and c) access new markets or clients. The study finds that while this helps migrants establish themselves in their countries of residence, and thus enables them to maintain life as a foreigner, some of the digital and internationally executed work and hiring practices do not necessarily contribute to social justice.

HOFFMANN, MAREIKE SOPHIE* (Passau University, Germany)

Climate Change and Youth Participation in Small Island Developing States

In the face of escalating environmental crises, including rising sea levels and extreme weather events, there arises a critical question: Does the exacerbation of these crises serve as a catalyst for heightened civic participation, or does it breed disengagement among the youth population? This ethnographic research delves into the intricate interplay between direct crisis impact and youth climate activism, focusing particularly on the context of the Pacific Islands and other small island developing states. Drawing upon interviews with youth climate activists at the UN climate conference COP28 as well as participatory research in the Solomon Islands, this research investigates the nuanced responses of young activists to environmental adversities. The research findings reveal that activists from most affected regions argue that they see a need for their participation in climate action on local and global level due to the urgency of the climate crisis as their physical and cultural survival depends on it. Despite expressing a reluctance to attend global negotiations such as COP28, participants indicated a sense of responsibility due to the lack of viable alternatives. In addition, observations imply that youth activists who faced existential threats through climate change themselves showed more empathy and solidarity towards other populations facing ecocide and genocide. This was particularly evident in rallies and protests at COP28.

This study makes two critical empirical contributions to Youth and Social Movement Studies: Firstly, it provides empirical evidence that suggests a strong connection between direct impact of the climate crisis and increased civic participation. Secondly, it suggests that empathy and solidarity play a role for engaging in civic participation for matters without direct personal impact. Additionally, it offers methodological contributions through a reflection of meaningful cooperation between activists and academics.

The Socializing Effect of Psychiatric Treatment

In his book from 1996, <REF><BOOK><AU><SNM><BTL>The Psychiatric Team and the Social Definition of Schizophrenia, the Australian psychiatrist and anthropologist, Robert Barret, concluded that the most important effect of psychiatric treatment was that the patient acquired an understanding of personality and illness as two different things that could be held apart from each other. Between 1997 and 2007 we collected a sample of 90 interview with professionals and patients in different phase of contact with public mental health services, and this sample of interviews have now been analyzed to get a deeper understanding of the transformation of identity and illness narratives in the meeting between patients and professionals in the rather advanced psychiatric services at this time. The presentation will review the results of this investigation.

HOHMANN, MARCO* (University of Hamburg, Germany)

Turning Waste into Wants

A colorful patchwork of nylon fabrics, oversized, "unisex" and "unique". And a price tag of 265,00 €. The rain-jacket's label explains that the garment is made out of 100 percent up-cycled waste material from broken tents that the manufacturer has "harvested" on festival grounds and therefore "saved from destruction" in the incinerator.

Since the early 2000s, the term "upcycling" has become established for these and similar products. Historically, waste practices such as reuse, repair, and recycling stem from an "economy of makeshifts" (Hufton) born out of poverty and associated with dirt and shame. Over the last 20 years, their cultural meaning has fundamentally shifted. They are now being appropriated by a startup culture of change makers. Especially upcycling has become one of the emblems of a *Green Economy* of consumer products.

From a sociological point of view, however, upcycling is a highly complex process of a material, symbolic and economic transformations of values that I empirically reconstruct in my follow-the-waste-approach. In my ethnographic field research I accompanied upcycling startups as they tracked down, collected, sorted and cleaned waste materials. I visited urban mines, places of value transformation and spoke to the actors who turn waste into wants, i.e. specific commodities with culturally and economically distinctive values.

In my contribution, I develop a sociological typology for the transformation of values. I show how upcycling-start-ups not only create a whole new category of consumer products, but also deploy new regimes of value—to counteract material loss and to address 'overproduction' and allegedly excessive forms of consumption. Valuation practices, however, always entail respective forms of devaluation, as well as new categories of social classification and distinction. Studying upcycling provides sociological insights on how these value regimes shape the moral economies and organizational structures of sustainability today.

The Politics of Gender and Sexuality: The Promotion, Contestations, and Resistance to Anti-Gender Ideologies in Brazil and South Africa

Contemporary global, regional, and national politics are the sites of fierce (racialized and classed) contestations over gender and sexual rights between anti-gender movements and women's and LGBTIQ+ defenders (including other actors). Characterized as an anti-gender ideology, the anti-gender movement refers to social movements, organizations and forces drawn from right-wing and fundamentalist religious and political lobbies. Drawing on decades-long historically and nationally specific trajectories, this current 'backlash' is contributing to an increasingly uncertain and polarized world by feeding increased authoritarianism, fundamentalist religious resurgence, and populist hyper-nationalism, a threat to democracy itself. Brazil has recently emerged from a Bolsonaro-led government, propelled to power by religious fundamentalists and right-wing political and economic groupings. Their bid to gain political and economic power mobilized populist nationalism based on the promotion of traditional family values, religion, and 'democracy'. Bolsonaro's government saw the rolling back of feminist and LGBTIQ+ rights and gains. These political and sociocultural contestations continue today under a Lula-led government. In South Africa, the politics of race, class, gender, sexuality, and age were integral to the colonial and apartheid project and continue to be central organizers of social relations today. The abrupt change from apartheid-era sexual regulation and censorship to a language and practice of sexual and gender rights and equality intensified existing disputes over gender and sexual norms, contested notions of culture and tradition and a shifting cultural politics of class, status, and generation. The last decade has seen an increasingly vocal anti-Constitutional populist discourse embodied in a range of religious and cultural right-wing groupings. This presentation will map key actors and processes of gendered and sexual contestations in Brazil and South Africa, foregrounding the sites of struggle of LGBTIQ+ movements, within and in relation to political, religious and cultural actors and sites.

HOLMWOOD, JOHN* (University of Nottingham, United Kingdom)

In Search of American Socialism? Oliver Cromwell Cox and Talcott Parsons on Race and Citizenship

The fate of socialism (social democracy) is usually addressed in terms of issues of class formation and agency. Writing 20 years apart, Oliver Cromwell Cox in *Caste, Class and Race* (1948) and Talcott Parsons, in 'Full citizenship for the Negro American?' (1967) came to the similar conclusion that American socialism depended on recognising the leadership provided by the political agency of African Americans in overcoming racialised divisions for the benefit of all. Cox and Parsons are usually seen as diametrically opposed – one a Marxist, the other a structural-functionalist – but I shall argue their arguments share Weberian assumptions that de-centre economic class (assumptions that Cox later left behind), albeit differently articulated. Parsons asked the question, "Why 'freedom now', not yesterday?", highlighting the agency that had produced the Civil Rights Acts, while identifying the possibility of reaction. For Cox 20 years earlier, it had also been 'freedom now' similarly based on ideas of political agency against racial inequality. By the time that Parsons declared America to be once again ready for freedom, Cox's arguments were forgotten, including those of possible resistance to freedom for all. The paper will address the different approaches of Cox and Parsons to identify the racial obstacles to socialism. It will conclude that Cox's arguments are more cogent. They have been neglected within sociology, but the paper will argue that they are central to providing a sociological understanding of the possibility, finally, of freedom now.

HOLTZHAUSEN, NATASJA* (University of Pretoria, South Africa)

Navigating the Complexities of Whistleblowing in the Gauteng Province: Social Norms, Corruption, and the Path to Integrity

This paper examines the intricate dynamics of whistleblowing within the context of Gauteng Province, South Africa, focusing on how entrenched social norms and corruption influence whistleblower behavior. In many societies, whistleblowing is perceived as a breach of loyalty and trust, often stigmatized by underlying social norms that discourage dissent. This cultural backdrop presents a formidable challenge in regions battling systemic corruption, as seen in Gauteng. Here, public and private sectors alike face integrity crises, where accountability measures are frequently undermined. The study configures whistleblower behavior as a critical catalyst for transparency and accountability, emphasizing the role of comprehensive legal and organizational protections in safeguarding individuals who expose malfeasance. Presently, in the Gauteng Provincial Government, the fear of retaliation and lack of adequate protection mechanisms dissuade potential whistleblowers, perpetuating a cycle of silence that enables corruption to flourish. The paper argues that reinforcing whistleblower protection policies, consequence management and creating a supportive infrastructure is pivotal in encouraging reports of misconduct. Through selected interviews and analyzing existing legal frameworks and protection mechanisms in the Gauteng Provincial Government, this paper identifies both strengths and shortcomings in current practices. It proposes enhanced strategies for effective whistleblower protection, drawing on successful models from global contexts. Key recommendations include the implementation of robust confidentiality measures, incentives, independent oversight bodies, and educational campaigns sensitizing the public to the importance of integrity and accountability. Ultimately, this paper calls for a paradigm shift in societal perceptions, advocating for a cultural emphasis on moral courage and ethical responsibility. By aligning legal safeguards with an organizational culture that values integrity, the Gauteng Provincial Government can foster an environment where whistleblowing is not only protected but also embraced as a vital tool for good governance and social justice.

Reducing Poverty for Families with Children: Interrelationships between Gender, Policies, and Culture

Gender inequalities are reflected in poverty for families with children, but there are surprisingly large variations in poverty rates across industrialized countries. This article focuses on the cross-national variations in poverty rate by gender and parenthood across 19 industrialized countries (Austria, Czechia, Denmark, Finland, former East and West Germany, Hungary, Italy, Japan, Luxembourg, the Netherlands, Norway, Poland, Slovakia, Spain, Sweden, Taiwan, the United Kingdom, the United States), using Luxembourg Income Study data. Descriptive analyses on post-tax-and-transfer poverty show that mothers' poverty rates are higher than childless women in all but a few countries. While fathers are always less likely to live in poverty than mothers, in some countries, childless men are more likely to live in poverty than childless women. Second, adjusted logistic regression models generally show that mothers are more likely to live in poverty than childless women, suggesting that higher poverty for childless women in descriptive analyses reflect their earlier career stage. Third, we found that two important work-family policies, parental leaves and childcare for aged 0-2, are associated with a lower risk of poverty for families with children, and the leave effect is curvilinear (long parental leaves may instead be associated with greater risk of poverty). Interestingly, indicators of more progressive gender culture, including attitudes toward gender equity and more egalitarian divisions of household labor, are also associated with a lower risk of poverty for mothers with children. Policy effects are stronger when gender culture is more egalitarian, but this effect is only consistent when we focus on pre-tax-and-transfer poverty. For post-tax-and-transfer poverty, only the combination of childcare and more egalitarian divisions of household labor are associated with a lower risk of poverty. These findings suggest that work-family policies and gender culture may play a role in alleviating poverty for mothers, whereas anti-poverty policies may complement them.

Exploring Key Trends of Lower Fertility Rates Among Women in England, Italy, South Korea and Taiwan

With the tertiarization of the labour market, and women have moved into the paid workforce, fertility rates have rapidly declined. Yet, according to social policy and political economy research, the relationship between female labor market participation and fertility might have reversed from a negative to a positive association. Does it mean that low fertility is an inevitable choice only when pregnancy and childcare are incompatible to work? And, how do national governments address these inadequacies through family policies?

The current study aims to compare the experience of England, Italy, South Korea and Taiwan, as they are currently grappling with falling fertility rates, to different degrees and under different labour market conditions. I will engage into a comparative case analysis of these four cases using official statistics, policy documents, and interviews, to make sense of the fertility crisis and how different governments are responding to this emergency. Using the policy discourse frame, governments exhibit a different degree of reliance on the neoclassic economic assumption, typical of the social investment approach, that the decision to have a child is subject to an economically rational decision (a utility maximization process). The degree to which governments are sensitive to women and family's considerations in their reproductive decisions, and their gender equality considerations, might make a difference in this comparative analysis.

HOOSHYARI, LAYA* (The University of Manchester, United Kingdom)

Beyond Adaptation: Transforming Mental Health through a Psycho-Political Program

In most societies, mental health systems are primarily designed to help individuals adapt to existing structures, often reinforcing family and workplace dynamics that perpetuate exploitation and oppression. These systems focus on maintaining normalcy rather than fostering radical societal or personal transformation. This realisation led me to question how lived experience (Perezhivanie)—the interplay between personal and social development—can be harnessed not only to address mental health issues but also to drive deeper societal change. I began to explore how we might better understand that “the personal is political,” moving beyond individualistic approaches to recognise the social and political roots of suffering.

Reflecting on my experiences in leftist groups, I observed that even disciplined revolutionary movements could become dehumanising, turning individuals into alienated political machines. Similarly, my participation in psychoanalytic group therapies revealed a disconnection, where participants were often viewed more as cases to analyse than as people to understand. However, my involvement in women's and queer circles uncovered a different kind of knowledge—one rich with the potential to foster genuine connections, although this deeper solidarity required both education and discipline to thrive.

In response to these insights, I collaborated to develop a psycho-political programme that integrates the lessons I gained from these groups: discipline and strategy, analysis and self-reflection, and solidarity and *sumud* (دومص)—the Palestinian concept of resilience. In this paper, I wish to discuss this programme, which transcends conventional mental health care by coherently understanding *Perezhivanie* and promoting collective reflection. Ultimately, I argue that the path forward lies not in reforming existing mental health systems but in dismantling them to create new frameworks that prioritise collective solidarity and political action. Only by embracing this radical shift can we genuinely address the roots of suffering and cultivate transformative change.

HÖPPNER, GRIT* (Catholic University of Applied Sciences, Muenster, Germany)

Vulnerabilities in the Context of Violence in Later Life: Insights from the Perspective of Material Gerontology

When it comes to violence in later life two types predominate: violence in domestic or institutional elder care and domestic or partnership violence. In each type vulnerability plays a central but different role. In elder care a concept of vulnerability is widely used that links the human body to physical frailty and dependency and thus highlights features of a human body in need of care.

Here, vulnerability of a human body is mostly understood as being the source of overload that can lead to violence in elder care (Höppner, Wanka & Gallistl, 2024). In domestic or partnership violence the concept of vulnerability is used to differentiate between gendered positions in violent situations. Following Theresa Wobbe's (1993) idea of the "power to violate" (*Verletzungsmächtigkeit*) and the "openness to violation" (*Verletzungs Offenheit*) the construct of masculinity portrays the male body as having the power to harm and that of femininity portrays the female body as being open to suffer harm.

In this presentation I aim to further develop these concepts of vulnerability in the context of violence by using the perspective of material gerontology (Gallistl et al. 2024; Höppner & Urban). Approaches of material gerontology question how to analyse the materialities of age/ageing and the relevance and effectiveness of materiality in its constitutive role of the human body and the material environment in ageing processes. By using exemplary data from interviews, vignettes, and narratives I will show how, where and when vulnerabilities in the context of violence in later life are produced and that in such a more-than-human understanding vulnerability is distributed across and thus is co-constituted through meanings, human and non-human forms of materiality, their productive dimensions and their relations to each other. I will conclude with methodological implications for researching vulnerabilities from a material gerontology perspective and in different life stages.

Knowing Families in the Digital Era

Reporting on empirical findings, this paper will explore digital family practices to ask how the use of smart technology has inaugurated new ways of knowing in the context of the family home. Much human-computer interaction literature on smart technology is concerned with user acceptance, while sociological research has centred on perceived threats to family life that include the imposition of artificial conversation, the normalisation of sexism and instant gratification, and the undermining of autonomy (Kucirkova and Hiniker 2024; Festerling and Siraj 2021).

Through mixed qualitative methods including child-led mobile interviews, the Smart Living study investigates the nuanced ways in which technologies become embedded in, and reconfigure, family life, and what 'doing family digitally' might mean for the future of knowledges in a domestic setting. We explore the relationships different family members have to the knowledge sources and practices smart technology brings into the home, what kind of everyday family practices smart technology is designed to reproduce and augment, and what forms of knowledge might become unfamiliar, inaccessible or unthinkable. To what extent are family norms changed or challenged by the affordances and function creeps of technology, as doing family offline becomes alien, and the dynamics of the home shift as children take advantage of 'democratising' aspects of technology?

This paper focuses on the use of voice-based interfaces, which represent a significant shift in how information is accessed, with important consequences for the production and sharing of information. We draw on empirical evidence that suggests the prevalence of design values that are not reflective of families' everyday needs, which are nevertheless 'satisfied' (Edmond, Horsley, Lehmann and Priddy 2022) as users are 'locked in' to big tech companies' visions of sociodigital futures. Finally, we discuss potential consequences for the representation of diverse knowledges in the context of the family home.

Equity in Access and Success: Institutionalising a First-Year Experience Programme to Support Student Transition and Success

Equity in access and success, social inclusion, and diversity are critical national imperatives in higher education in South Africa post-1994. The University of KwaZulu-Natal's (UKZN) policies and strategies to support student success align with these national imperatives. UKZN's Academic Monitoring and Support Policy (2023) commits the institution to provide quality and responsive student support. The diversities and differentiation within our student population produce unequal preparedness. This compels us to envision socially just, inclusive, and humanising/ ubuntu approaches and practices. UKZN enrolls up to 10,000 first-year students across its four Colleges at its five campuses annually. The institution's planned enrolment prioritises

quintiles 1 to 3 schools, which are no-fee paying and located in mainly rural and resource-poor communities. Between 60 and 70% of the students are from these quintiles; most are recipients of the national funding scheme and live in university residences. There is a relatively equal representation of students from urban versus rural communities, and more females than males. isiZulu is the dominant mother-tongue language of students, while English is the language of learning and teaching. The institution-wide, compulsory, and holistic year-long non-credit-bearing co-curricular First-Year Experience Programme (FYEP) supported by academic and curriculum advising is crucial to student transition from high school to university. The Bachelor's degree rule (BR10) makes it compulsory for students to complete the FYEP in their first-year of study. The senior peer Mentorship programmes are pivotal to supporting students and building a sense of belonging. In the session, we will briefly discuss how our institutional policies align with the national imperatives for higher education and how the FYEP, alongside academic advising, supports student success and transition from high school to university.

Challenges of Care in the Era of Super-Aging Society: Focusing on Changes in Certification and Discretionary Authority of Nurses in Japan

Japan is simultaneously facing a super-aging society and a declining birthrate, leading to a labor shortage and lower tax revenues. Increasing healthcare costs and the increasing burden of medical and nursing care are also becoming an issue. In response to these issues, long-term care insurance has been introduced, and a shift from institutional care to home care has been made to curb healthcare costs. At the same time, the government is expanding the autonomy of existing healthcare professionals and creating new certifications. We will discuss the transition in response to these social issues in Japan, particularly for nurses, from the 1990s to the present, clarifying the process from a neo-Weberian perspective. Nurses in Japan were created in 1948, after WWII, as a national certification with a modern, Western-style education. Since then, nurses have moved in the direction of enhancing both quality and quantity by increasing professionalism and securing the number to respond to social changes such as the advancement of medical care and the aging of society. Since 1995, certified nurses and specialized nurses have been established by the Japan Nurses Association, and since 2015, the specific nurses, who are similar to nurse practitioners, has been created. On the other hand, in addition to nationally licensed nurses, there are also licensed practical nurses appointed by prefectural governors, and unlicensed nursing assistants and attendants. In addition, home helpers and nursing support workers with certain qualifications have also been providing nursing care. In this situation, several problems can be pointed out in terms of the boundaries between the various qualifications related to nursing care and the collaboration between nursing and other professions (e.g., physicians, pharmacists, clinical technicians, etc.). We hope that this conference will provide an opportunity to discuss these issues and compare them with those in other countries.

Sociological Perspectives on Planetary Health: Understanding Human-Environmental Relationships for Sustainable Futures

This study will explore the interface between human society and the health of the planet, with an emphasis on how social behaviors, cultural values, and institutional inequalities contribute to environmental degradation and public health crises. Planetary health is an important interdisciplinary field that focuses on the relationship between human well-being and the Earth's ecosystems. However, sociological inquiry into this field has not yet been fully explored. The study presents a sociological approach to planetary health that emphasizes the complex relationship between human society and its environment. By examining social drivers of environmental change, such as industrialization, globalization, and socioeconomic inequality, the paper seeks to understand how these factors exacerbate public health challenges such as climate change, biodiversity loss, and pollution. It incorporates the concept of environmental justice and discusses global inequalities, revealing how socially vulnerable populations bear a disproportionate share of the health costs of environmental degradation. It also examines the role of social movements and policy reform in shaping sustainable solutions and emphasizes the need for systemic change to reduce harm to human and global health. This approach suggests that sociological tools such as social network analysis, cultural theory, and political economy are essential for designing equitable strategies to improve global health while sustaining the planet's ecosystems. This presentation will provide an overview of the concept of planetary health, show how events threatening planetary health are occurring on a global scale, and raise discussion about what role we as a society can play as academics.

HOSOGAYA, NOBUKO* (Sophia University, Japan)

Social Empathy in the Workplace: Elucidation from the Relationship between Prosocial Voice Intention and Personal Involvement, Workplace Institutions and Supervisor Influence.

This study examines the relationship between employees' experiences, workplace systems and the influence of superiors on their motivation and behavior in relation to pro-social voices. In contemporary Japan, although the position of employees appears to be improving, it cannot be merely recognized that their working environment and rights are guaranteed. In particular, there is a large gap between companies in terms of their awareness regarding improvement of the workplace environment and diversity. Under the circumstances, how can employees in reality exclaim about problems in the workplace?

Employee voices regarding the improvement of workplace issues have traditionally been dealt with from the perspective of VOICE exit. In Japan, due to the stagnation of labor union movements, this framework is rarely used to solve problems at the macro level within organizations. On the other hand, labour mobility has been increasing, and if we focus on this phenomenon, it is possible that the power of employee voice is weakening and that exit alone indicates employee dissent. However, workplace stress and psychological disorders have become social issues, and companies are now obliged to address these issues through human resource management systems. There are aspects of social systems that may address the source of employees' voice. Do such systems calm employees' dissatisfaction and lead them to silence, or do they increase employees' personal empathy, leading to more voices and awareness of problems?

In this study, the main focus is placed upon employees' willingness to speak for prosocial issues, and the factors influencing it are hypothesized as their own experience, the company's policies on diversity and personnel practices, and the influence of their direct supervisor. I will analyze the outcome of the employee survey to clarify the interrelationships between these factors.

Understanding the High Prevalence of Premature and Early Menopause in South and Southeast Asia: Evidence from Demographic and Health Surveys

Premature menopause (occurring before age 40) and early menopause (occurring between ages 40 and 44) have significant adverse effects on older women's health and well-being. However, existing research primarily focuses on high-income countries, thereby limiting the relevance of these findings to low- and middle-income countries (LMICs). This study investigates the disproportionately high prevalence of premature and early menopause in South and Southeast Asia (SA/SEA) compared to high-income countries (HICs). Previous studies in some HICs report prevalence rates of premature menopause at $\geq 1\%$ and early menopause at 2–3%, whereas SA/SEA shows significantly higher rates of 2.7% and 4.5%, respectively. To understand this disparity, we analyze the influence of demographic and socio-economic factors in SA/SEA creatively utilizing Demographic and Health Survey data from 12 SA/SEA countries. Preliminary findings reveal striking regional differences with prevalence rates of premature and early menopause ranging from a staggering 12.2% and 14.7% in Bangladesh to the lowest 2.3% and 4.1% in the Philippines. Employing Cox proportional hazard models, we aim to identify key determinants and assess the extent to which demographic and socio-economic factors contribute to these elevated rates. The results of this study will enhance the global understanding of menopause within the context of LMICs and offer a foundation for future research and policy development to address the increasing prevalence and associated health disparities of premature and early menopause in SA/SEA.

Understanding the Mediation Effect of Women's Empowerment in Education-Fertility Nexus in Bangladesh

Background: Although the relationship between education and fertility is found to be universally inverse, something about what causes the two to interact in this manner still needs to be known. This study aimed to explore whether the mechanism by which education affects fertility is through women empowerment (WE) in the context of Bangladesh. We hypothesized that higher education leads to women's empowerment which in turn reduces their fertility.

Data and Methods: We utilized cross-sectional data from Bangladesh Demographic and Health Survey 2022 to test the hypothesis. The analytic sample comprised 17102 currently married women aged 15-49 with at least one child ever born. We conducted mediation analysis based on the multivariable ordinary least squares regression method.

Findings: Women with higher education had on an average two children less than the women with no education ($r = -0.433$; $P < 0.001$). We found eight dimensions of WE from the 30 observed variables. These dimensions included the *resources* (asset ownership and exposure to mass media, and reproductive knowledge), *agency* (attitude towards wife-beating, participation in household decisions, and reproductive autonomy), and *achievements* (economic autonomy, social independence, and knowledge and use of contraceptives). In terms of the mediation effect of WE, we found that higher education led to higher social independence ($b = 0.105$, $p = 0.000$) among the women which in turn decreased their number of children ever born ($b = -0.346$, $p = 0.000$). Thus, education had a significant negative indirect effect on fertility through women's social independence ($b = -0.036$; $p = 0.000$). However, the hypothesis that higher education leads to WE which in turn leads to lower fertility didn't hold true for the rest of the seven dimensions of WE.

Conclusion: Our study advances research on education, women empowerment, and fertility by examining whether women's empowerment mediate the negative relationship between education and fertility in the context of Bangladesh.

An Analysis of Vocational Education Reform in Western China Since 2010s: Neoliberal Policies and Rural Transformation

In China, where economic growth is emphasized since 1980s, the vocational education and training (VET) policies are strongly influenced by economic needs. The development of VET is perceived as a tool to help with the country's economic and social progress, especially as it aligns with the shift towards a high-skills value-added economy. Therefore, the VET reform started from 2010s placed particular emphasis on the role of VET in industrial transformation.

This paper analyzes China's vocational education reforms over the past decade, focusing on the development of VET in western regions (TAR and Qinghai). Through field interviews, and analysing data from existing databases, policy documents, and media reports, this study examines education outcomes and changes after vocational education reform in Tibetan communities, including the enrollment, standards-setting, language barriers, and the increasing role of enterprises. It argues that the reforms reflect a neoliberal tendency, shifting the burden of social inequality and the consequences of individual choices onto participants in the vocational education system. Though the setting of vocational education programs try to meet economic needs, they often fall behind or do not fit local economic conditions. As a result, the employment difficulties are imposed on students and local educators in the form of 'employment rates.'

Additionally, the paper highlights the unique characteristics of China's VET policies, which are closely tied to the country's urban-rural dual structure. Vocational education plays a critical role in facilitating labor migration between rural and urban areas. However, it also leads to rural brain drain and shows an implicit functions of buying regional stability in Western China. Meanwhile, vocational education often enrolls local students who have tendency to work in local communities, thereby offering new hope for rural society and culture.

KALETKA, CHRISTOPH (TU Dortmund, Germany)

Social Innovation and Innovation Policy: The Development of a Comprehensive Innovation Policy in Europe

In recent years, there has been a growing realization that innovation policy is falling short of its potential to address the multiple, complex and interrelated global challenges that affect contemporary and future societies. Social innovation will play a key role within innovation policy if social, economic, political and environmental challenges of the 21st century are to be successfully tackled. As a novel approach to find solutions for global, national and local problems in health, education, energy, environmental and other policies, social innovation has been embraced by stakeholders and communities on the local, regional and national level.

The dynamics in the field of social innovation in the international discourse is reflected by the increasing number of (public) programs that initiate and support social innovation at local, regional, national, and global levels. European innovation and research policy has played an important role in this regard (see Edler 2023). At the programmatic level of European research and innovation policy, a new perspective on innovation has emerged since 1992. The social has been substantially upgraded compared to technology development in the EU research framework programs (cf. Howaldt/Schwarz 2010, pp. 33ff).

Similar to the European Commission's approach, many governments in Europe and beyond also begin to recognize the importance of social innovation in developing a sustainable innovation policy (Howaldt et al. 2018). In Germany, too, corresponding efforts have intensified in recent years, while initiatives to develop a comprehensive understanding of innovation can be traced back to the early 2000s.

The presentation outlines the contours of a mission-oriented innovation policy which is based on a comprehensive concept of innovation. This includes a new role of public policy and government for creating adequate framework conditions and related support structures. It also reflects upon the significance of using the innovative capacity of all societal sectors.

In Search of Social Justice in the New Arrangement of Water Services in the City of São Paulo

Although located in a tropical region with high rainfall, São Paulo faces severe water scarcity related to its high population density and political decisions on who has access to it. The UN classifies a region as experiencing water scarcity when its annual availability is less than 1,500 m³ per inhabitant; in 2021, São Paulo had less than 125 m³ per inhabitant. One need not be an expert to see the exponential rise in climate change and extreme events reflected in changes to hydrological cycles. We face a contradictory situation of excess and scarcity – worsening floods alongside increasing water shortages. While geographers focusing on mitigation pathways have addressed water availability issues, the matter remains underexplored within urban political sociology.

The alarming averages mask even more striking variations, particularly affecting low-income populations in precarious urban settlements, who faced water access challenges long before they became a public concern. In these cases, the risk of excess is evident in the material losses caused by storms. Scarcity, in turn, arises from a technical-political choice by its water supplier – Sabesp – to reduce water pressure at the system's edges, often coinciding with urban peripheries. At the same time, residents cannot afford private supply options like water tanks.

Amidst this scenario, in 2024, Sabesp was privatised, contrary to civil society organisations advocating for water as a universal right. Introducing this private actor adds further layers to an already complex water governance system that overlaps different federal and decision-making entities. In climate uncertainty, how can we ensure that low-income populations access water within a financialised framework post-privatization? This research combines interviews, document analysis, and quantitative data to analyse Sabesp's Concession Agreement contract with the municipality of São Paulo, identifying and discussing whether we have mechanisms to ensure water access for those unattractive to the market.

Reimagining Queer Kinship: The Use of Assisted Reproductive Technologies By Lesbian Parents

My research centers the discussion about imaginations of kinship on Lesbian parents, particularly people who used assisted reproductive technologies (ARTs) to conceive. In the context of Taiwan's legal regulations, lesbian couples cannot legally access in-vitro fertilization (IVF), despite Taiwan's high IVF success rate and affordability. The process of traveling transnationally in order to obtain reproductive treatments not available or accessible in one's own country has been called "reproductive migration." Intended parents from Taiwan have traveled to the United States, Denmark, Cambodia, and Japan to receive IVF treatment. In this research, I use in-depth interviews to explore how the process of realizing one's desire for motherhood intersects with an imagination for queer futurity. I argue that through the process of reproductive migration, lesbian parents often reimagined kinship in a transformative way. The deliberate decision-making that nospans across various stages of the reproductive journey testifies to a constant negotiation between conformity to the established social norms and contesting those existing norms in a way that seeks to actively reshape, rather than passively accept the given definition of kinship. From the selection of the race of sperm donors to discussing who would be the genetic or gestational mother, and choosing care providers, the process is saturated with social meanings and imaginations. An understanding of the multiple stakeholders and institutions that one ought to contest in the decision-making process helps us gain a contextual view of what reimagining the future of queer motherhood and kinship would entail.

Hearing Silence: Teaching and Studying the Politics of Qualitative Interviewing

When conducting qualitative interviews, researchers are ready to hear informants' narratives that align with common assumptions, idiosyncratic concepts, or their own theoretical frameworks. Accounts falling outside these pre-existing boundaries become inaudible and overlooked. This presentation posits that spoken and unspoken silences are hidden treasures. I will illustrate the strategies I've developed to help students recognize the mechanisms of silencing and hear these silenced accounts. I will also use the empirical case of China's Great Leap Forward and Great Famine (1958-1962) to show the silences that arise from the challenges of accessing archival data and engaging with survivors of traumatic historical events. I will demonstrate how, despite these obstacles, it is possible to uncover a locally grounded lexicon of discontent through a secondary analysis of survivor interviews. Ultimately, I argue that the ability to *hear silence* is not only indispensable in academic pursuits but also essential in everyday life.

HSU, CHIEH* (St.Gallen Institute of Management in Asia, University of St.Gallen, Singapore)

How Does Marriage Inform Intergenerational Ties? Reconceiving Relationships through Financial Allocations

Economic activities are indicative of the social relations we maintain with one another (Bandelj 2020; Zelizer 2012), including intimate relationships. The monetary practices, resource allocation, and financial transfers hence could reflect and embody how we conceive and calibrate marital and intergenerational ties. Literature on monetary practices primarily focuses on how social class, relative resources, gender attitudes, and macro-level institutional factors affect the management system couples adopt. Research on intergenerational transfer investigates its nature, motivation, and content often in the context of wealth and privilege reproduction. Yet, few studies have examined how economic activities in marriage and parent-child dyads reciprocally inform these two sets of relationships, both in terms of their respective boundaries and meanings. Drawing on interviews with middle-class and educated Taiwanese couples (22 couples, 3 married individuals) who are in their mid-thirties, I have found relational work that foregrounds economic activities to be a learned skill among spouses that are situated in these two distinctive relationships. Through constant referencing and differentiation, married couples when managing their finances are also prompted to revisit and reassess their emotional and financial ties with their parents. These reciprocal evaluations—gauging parental ties based on couple-dyadic transactions—have led to an assertive demarcation between blood/biological ties and conjugal unions for couples in their early family

formation. This paper contributes to our understanding of the relationship between marriage and intergenerational ties from a financial perspective. It also underscores how the conceptualization of marital relationships in developed East Asia has shown individualistic tendencies while accounting for their potential dissolution.

HSU, CHING-FANG* (National Chi Nan University, Taiwan)

Right to Counsel Defended By Four Lawyers: Empirical Studies on Lawyers' Diverse Roles in the Taiwanese Compulsory Defense Cases

In Taiwan, the right to counsel is clearly stipulated in Article 31 of the criminal procedural law, where a criminal defendant has the right to legal representation in severe crimes and disadvantaged conditions, including physical and mental disability, mid-to-low income, aboriginal identity and/or other socioeconomic disadvantages recognized by the presiding judge. In practice, however, four different types of legal counsel may be retained by the defendants in need: regular lawyers, legal aid lawyers, voluntary counsel and public defenders. Do different lawyers perform differently in compulsory defense cases? Using both quantitative and qualitative data, this paper makes two claims. First, in terms of case outcomes, lawyers paid by the government perform only slightly differently from those in the regular legal services market on the metrics of guilty/innocent and the length of sentence. The court, nevertheless, drastically relies on public defenders and legal aid lawyers, both financially supported by the government, to represent disadvantaged criminal defendants. Second, in terms of professional autonomy, public defenders, voluntary counsel and legal aid lawyers experience different degrees of court dominance, which affects the volume of caseload and the lawyers' willingness to participate in the compulsory defense system. The public defenders, as government lawyers stationed in court, experience the least autonomy from judicial administration, but intriguingly develop an autonomy free from clientele and market pressure. Data used in this paper include (a) a database composed of 27,692 cases from the first two instances of the Taiwanese judiciary from 2013 to 2023, and (b) in-depth interviews with 65 legal practitioners in Taiwan, including 2 judges, 9 public defenders, and 54 lawyers (45 lawyers were interviewed in 2018 and 9 lawyer were interviewed in 2024).

Linked Lives: Adult Children's Assortative Mating and Older Parents' Depressive Symptoms in China

Drawing on the linked lives perspective, patterns of adult children's marriage matching may profoundly influence older parents' well-being. Despite its significance, the links between adult children's marriage matching and older parents' subjective well-being remain understudied. This study examines such relationships in China. We hypothesize that the influences of assortative mating may be gendered, due to the greater emphasis on sons' importance in old-age support than daughters' and the norm for women to marry up. Given the strong association between marriage matching and inequality, the links between children's marriage matching and parents' well-being may differ across education and *hukou* (household registration) status.

We use data from the 2012 China Family Panel Studies ($n = 4,365$) and employ diagonal mobility models to estimate the impacts of assortative mating by adult children's education and *hukou* origin on older parents' depressive symptoms.

The descriptive results suggest that matching of *hukou* has a stronger association with older parents' depressive symptoms than matching of education. As hypothesized, the results of the diagonal mobility models show that adult children's *hukou*-education status matters more than their spousal *hukou*-education status in predicting parents' depressive symptoms. Contrary to our expectations, once the effects of adult children's own and spousal *hukou*-education statuses are accounted for, marrying up or down, being a daughter or son, and being an only child or not do not seem to matter in parents' depressive symptoms.

In China, adult children's compatible matches with their spouses and an urban *hukou* are protective of parents' mental well-being, suggesting the perceived centrality of assortative mating and the *hukou* system in maintaining socioeconomic status. While this study offered no evidence for a gendered association between adult children's marriage matching and parental psychological health, we caution against writing off this hypothesis due data limitations.

HUANG, CHUN-MING* (National Chengchi University, Taiwan)

Tuning-in Together, Art Worlds and Cultural Air in Taiwan

Taiwan's indie music is dominating the local music scene, while art music, which used to be seen as reflecting middle-class tastes, is losing its cultural distinction. This article uses two contrasting bands as case studies: Sorry Youth and Academy of Taiwan Strings, to explore how they have benefited from (or struggled with) their respective 'art worlds' (Becker, 1982) and Taiwan's current 'cultural air'.

Sorry Youth is considered to be one of the most 'Taiwanese flavoured' bands, a new cultural entrepreneur who makes a living by taking on prolific cases. It participates in anti-China campaigns and supports Taiwanese independence, performing and profiting from a mixture of aesthetic autonomy and political practice. The Academy of Taiwan Strings, a European-trained classical music ensemble, is more of an amateur in society, earning a living as a private music tutor, adhering to the rules of the art world but also is constrained by it, wandering between the western canonical repertoire and the limited social activities that are still seen as lacking Taiwanese flavour or 'rebellion'.

This study reconstructs the methods of Becker, Schütz and Adorno to compare how the two ensembles operate in normative ways to maintain their legitimacy, particularly by absorbing 'cultural performance' (Alexander, 2006; McCormick, 2015), and how they collaborate (including in external relations) with the systems of collective representation, the means of symbolic production, audience perspectives and social power.

This article argues that musical communication is inseparable from social cooperation, and is a 'mutual tuning-in' of identity, social resources and even social space in a particular 'cultural air', constituting of actions that serve idealised and instrumental interests (in the Weberian sense); it is not only 'musical performance', but also not entirely a product of 'identity'. Musicians participate in social change through multiple practices of creativity, resistance and conformity.

HUANG, HAI SU* (College of William and Mary, USA)

Workers' Transition from China's Coal Sector

Phasing out the fossil fuel industries, particularly the coal sector, is one of the most urgent tasks to mitigate human induced climate change. However, how would the workers and communities thrive after losing work in coal? While some just transition models suggest policy strategies and tools that may assist just transition, they mostly remain on the policy level and largely rooted in western democratic societies. China, as the largest producer of coal in the world, has undertaken measures to phase out its coal workers, but how the Chinese coal workers experience their transition and how their life is after leaving coal remains largely understudied. Building on recent research on China's just transition, this work-in-progress paper uses qualitative interviews with former coal workers from both public and private mines, to address the social processes of the coal workers shifting to non-coal sectors. The initial literature review, including my own past research on Chinese coal workers, suggests that understanding the historical context of China's labor transition, together with the structure of Chinese domestic politics can shed light on China's current practices in coal workers' transition. For example, even though it appears to comply with the international norm in limiting global warming, in fact it merges into the larger downsizing project of the state owned enterprises, which began in late 1970s following the economic reform. Focusing on the social transition being just is important but since it is often related to private property rights within capitalism, we may consider moving forward with the transition by building trust and cooperation for interdependence.

Taste of Nostalgia: Russian Emigrants, Field and Spatial Production of Astoria in Taipei

On the streets of Taipei in the 1960s, Astoria was not only a café for exiled Russians to satisfy their cravings for homemade food, but also a shelter for indigenous writers to produce literary works. Against the background of the cold war and martial law in Taiwan, the existence of Astoria depends on factors such as management model of the store, the preferences of the guests and the social atmosphere. A delicate balance between foreign and local cultures was also formed here. Although the White Terror remained, the patronage of Chiang's sons and daughter-in-law made the "US-Soviet" relationship under the atmosphere of the Cold War exceptional, thus providing fertile ground for

the development of contemporary literature in Taiwan. The birth of Astoria, its location and customers created a special field involving power, discourse and the senses of taste which is still remembered for almost seventy years long until today.

HUANG, XIAN* (Rutgers University, USA)

From Easy to Hard Redistribution: The Chinese Government Strategy in the 21st Century

Authoritarian leaders face a tradeoff of effectively balancing benefits between elites and masses to maximize the regime's survival and stability prospects. This is especially salient when the leaders must undertake "hard redistribution" -- sustaining and improving the social welfare provision within the current political framework but without a substantial increase in fiscal commitments and social contributions. Facing the challenges of formidable structural changes such as rapid population aging and slower economic growth, the Chinese government has been leveraging regional disparities to undertake inter-regional redistribution instead of inter-class redistribution to meet public demands for better social protection. I draw upon a text analysis of 24,699 social welfare policy documents issued by the Chinese central and local governments between 1993 and 2024 and a qualitative study of China's pension reform in the recent decade to support the argument.

Navigating a Contested Field: A Study on the Practice of a Chinese NGO in Ethiopia

With the emergence of China's "Going Out" policy in the early 2000s, Chinese non-governmental organizations (NGOs) have attempted to expand their international role by positioning themselves, particularly in Africa, as providers of social welfare and basic services. This paper suggests that Chinese NGOs may be a growing influential force within the international aid arena. The operational dynamics of the China Rural Development Foundation (CRDF), a prominent Chinese NGO in Ethiopia, are critically examined within the context of China's expanding global influence and evolving approach to international aid. This research provides a nuanced analysis of CRDF's ground-level operations, exploring the complexities of aid delivery, local responses, and practitioner challenges.

Focusing on CRDF's activities in Ethiopia since 2015, the research encompasses projects aligned with the UN 2030 Sustainable Development Goals, including school feeding programs, educational resource provision, and women's employment skills training. CRDF's unique position as the sole Chinese NGO with a registered local office under the Ethiopian Civil Society Agency offers an opportunity to scrutinize the operational intricacies of Chinese NGOs in Africa. Through examination of practitioner experiences, local stakeholder responses, and the navigation of organizational mandates and governmental influences, the processes shaping China's international aid praxis in Ethiopia are illuminated. The research explores how various actors adapt to and negotiate cross-cultural challenges and ethical dilemmas encountered in the field.

Employing a multi-method approach, including interviews, participant observation, and document analysis, this research contributes to the discourse on global aid practices, focusing on Chinese NGOs in Africa. The findings engage with debates in development studies and offer insights into the implications for social development and Sino-Ethiopian relations. This research aims to inform policy and practice for Chinese NGOs in Africa, advancing understanding of South-South development cooperation in an increasingly multipolar world.

HUANG, YANHUA* (Chinese Academy of Social Science, China)

The Hand of Culture: The Formation Process and Dynamics of Domestic Goods Consumption in the Digital Era

The consumption of domestic goods in China is both a socio-cultural phenomenon and a production-consumption practice, which can be regarded as a new and typical example of how economy and society mutually shape each other. Taking domestic beauty brands as an example, this paper attempts to analyze the formation process and driving mechanisms of the consumption

of domestic goods in China, focusing on the transmission and influence mechanisms of culture in economic phenomena. The study finds that, firstly, the development of domestic brands, along with their supply-demand matching, emotional connection, and cultural resonance with consumers, are the foundations for the formation of the domestic goods consumption trend. Secondly, in the context of digitalization, online interactions among diverse agents such as brands, E-commerce and social media, livestream salesperson, and consumers have constructed a community culture, which merges social networks and market networks, facilitating consumers' rational and emotional understanding and selection of domestic brands. Lastly, the rise of guochao culture, the activation of youth culture, and the enhancement of cultural confidence are the driving forces that propel individual consumption behavior to evolve into collective consumption trends.

PEITZ, NINA-MADELEINE (Federal Institut for Vocational Education and Training, Germany)

Innovation and Transfer in Vocational Education and Training: An Investigation Applying a Design Research Approach

Social innovation in education requires the transfer of knowledge between research and practice. In Germany, vocational education and training (VET) represents a mature educational sub-sector in which processes of developing innovation and transferring it into educational practice is often hampered by a complex and long-established structure of stakeholders and institutions.

In this context, the study "Accompanying Research InnoVET" aims at developing, testing and evaluating support mechanisms for facilitating translational processes between research and practice. The study is conducted in connection with the national InnoVET programme, funding and supporting 17 projects across Germany in developing and implementing innovative approaches in the VET sector.

This contribution outlines the requirements of collaboration between research and VET practice in innovation and transfer processes. It examines the features that can contribute to the success of a research-practice dialogue and addresses the question which contribution design-based research (DBR) can make to innovations developed in the InnoVET programme.

For this purpose, case studies of a number of InnoVET projects were conducted, involving a number of research methods: interviews with a wide range of key stakeholders (e.g. chambers of industry and commerce, vocational colleges, training companies), a survey of programme participants, development talks with practitioners and researchers, and observation of collaborative structures within projects. Analytical strategies include thematic coding of qualitative data, collaborative research-practice workshops, and contrastive triangulation of different types of data.

Results emphasize, e.g., the significant role the interaction between research and practice plays, the specific opportunities and limitations for this interaction in a mature VET system, the importance of actors' transfer-oriented mindset and furthermore, the need for collaborative exchange formats. The results demonstrate the contribution DBR can make to improve innovation transfer in large-scale political innovation programmes thereby generating new theories for transfer strategy measures.

AI-Assisted Trend Radar and/or Reading between the Lines? Conflicting Methods to Capture the Future.

The article reflects results and the methodological approach of the strategic research project "Value Creation Trend Radar.AI-assisted Foresight Tool to identify Weak Signals of Value Creation", funded by the German Ministry of Education and Research (BMBF) (01/2022-12/2026). The aim is to use an AI-supported technical "radar tool" and large amounts of data to draw conclusions about future trends in value creation. At the same time, the technical radar tool is integrated into a comprehensive methodological process with numerous references to various methods of qualitative empirical social research. It is exciting to observe how different ideas and practices of anticipating the future come together in this mixed methods approach.

On the one hand, there is the radar tool, which attempts to use statistics and AI in textual data (e.g. scientific publications) to identify conceptual

connections or “weak signals” based on statistical characteristics that have the potential to point to future trends. On the other hand, there are various qualitative approaches (interviews, future workshops, data analysis, etc.) that seek insights into possible futures “between” the data or in the interplay of specific information and generated findings. This is where methods, knowledge and sensitivity for interpretation and anticipation come together. “Weak signals” are then not due to the statistical behavior of letters, but are rather to be understood as implicit contexts of meaning “behind” the data.

Different forms and practices of scientific anticipation of futures collide: objectifying formal measurement and assessment on the one hand and knowledge- and experience-based interpretation and understanding on the other. The project is attempting to bring together and further develop both approaches. This is being done on the basis of six-monthly studies of various specific empirical subject areas. The article will draw on empirical findings from the third field examined: “The future of plant and mechanical engineering”.

A Climate of Distrust: How Affective Climate Polarization Shapes Attitudes Toward Decarbonization

Do those who support and those who oppose decarbonization trust or distrust one another? And does it matter? For over a decade, political scientists have been theorizing growing dislike and distrust between partisans – a phenomenon termed ‘affective polarisation’. Affective polarisation is crucial to understand as it is linked with increased tolerance for political violence and an overall decrease in adherence to democratic norms. Despite paying considerable attention to ideological polarisation over climate change, environmental sociologists have been slow to attend to affective dynamics between climate partisans. We address this gap by analysing representative survey data from a sample of Canadian households (n=2503). We find evidence of high and asymmetric levels of affective polarisation, with supporters of decarbonization expressing stronger out-group dislike and ingroup favouritism compared with opponents of decarbonization, across a suite of measures. We use these measures alongside demographic controls to predict attitudes toward climate change and decarbonization. Interestingly, we find that higher levels of affective polarization (i.e., stronger out-group dislike and ingroup favouritism) are associated with pro-environmental climate attitudes. We reflect on the significance of these findings for climate politics and environmental governance, as well as for broader questions of the relationship between democracy and climate action.

MARTÍNEZ VIRTO, LUCÍA (Universidad Pública de Navarra, Spain)

Un Estudio Preliminar De Las Emociones Que Emergen En Las Mujeres Como Resultado De Su Participación En El Programa De Renta Garantizada De Navarra

En las últimas décadas, las políticas sociales de lucha contra la pobreza han adquirido especial relevancia en el contexto internacional, fundamentalmente en el marco del diseño de las prestaciones (Cantillon et al., 2018). En este sentido, la literatura académica viene enfatizando la necesidad de valorar las experiencias de participación de las personas beneficiarias para la configuración del diseño de las políticas públicas (Pérez, 2004; Manzanera, Carbonero, Hernández y Raya, 2019). En la presente ponencia, se acomete esta cuestión mediante un primer análisis de las emociones que emergen de los procesos de participación en uno de los diecinueve programas que conforman el sistema español de garantía de ingresos mínimos; el programa de Renta Garantizada del territorio foral de Navarra.

Con este propósito, y considerando que a nivel mundial los programas de garantía de ingresos mínimos están predominantemente feminizados (De Sena, 2014), se examinan los discursos de diez entrevistas semi-estructuradas y en profundidad a mujeres receptoras de este programa mediante la herramienta analítica de la Sociología de los Cuerpos/Emociones. Concretamente, el programa de Renta Garantizada presenta una tasa de participación femenina del 53,34% (Observatorio de la Realidad Social, 2023). En este contexto, se inicia con la descripción del sistema español de garantía de ingresos, seguido de un recorrido histórico del programa de Renta Garantizada de Navarra, y se concluye resaltando las

emociones preponderantes que surgen de las entrevistas: agradecimiento, cuestionamiento y solidaridad. Por tal razón, se remite la comunicación al simposio TG12 Social Love and Solidarity, específicamente a la sesión Poverty, Social Policies and “New Commodifications”.

About Help, Helpers and Helpers' Helpers - Volunteering for Refugees in Rural Areas

Since 2014, refugee migration has been an issue also in rural areas, and the war in Ukraine in 2022 has made it even more topical in Germany. The voluntary help that takes place in this context is of particular relevance, as it bridges a state gap and requires the selforganised engagement of local residents. Therefore, building on Gouldner's norms of interaction, this thesis research explores the role that reciprocity and beneficence play in rural support for refugees. Drawing on the community studies, I used qualitative interviews to explore how power relations and group configurations within a village structure this support as reciprocal or beneficent help. The dense village networks can generate help as people become helpers by assisting other local residents in helping. In addition, beneficent help takes place in direct and hierarchically structured relationships between local residents and newcomers. This can lead to access to resources, but also has problematic aspects due to the inherent arbitrariness of interpersonal dependency.

Leveraging Family History As a Tool for Wealth Transmission: A Case Study of the Rong Yiren Family in Post-Reform China

The establishment of the People's Republic of China, family lineage, and wealth inheritance experienced significant disruptions due to anti-capitalist movements and the campaign to Destroy the Four Olds. While historical research on Chinese family history often focuses on ancient China, there is a noticeable gap in modern narrations. After the 1997 Reform and Opening, newly emerged Chinese entrepreneurs emphasised wealth and family legacy, developing a keen interest in documenting their family histories and constructing family identities. This paper explores how Chinese entrepreneurs have recreated wealth post-reforms and analyzes how they continue or reconstruct their family narratives. Focusing on the prominent Rong Yiren family, this study examines how, unlike most wealth creators of the Reform and Opening era, the Rong family successfully reconstructed and extended their family history by leveraging Hong Kong as a strategic base for wealth preservation and inheritance. Through case study analysis, this paper investigates how contemporary Chinese entrepreneurs, exemplified by the Rong family, utilize family history to facilitate wealth transmission. The findings indicate that, despite the Rong family's success, most wealth-building families face numerous inheritance challenges, such as negotiating with government authorities, adapting to cross-cultural environments, the implications of the one-child policy, and generally low educational levels. Understanding these challenges is crucial for addressing the complexities surrounding wealth succession in modern China and gaining deeper insights into the difficulties of sustainable development within the private economy.

Experimental Evidence to Optimize Linkage and Panel Consent Rates in a New Online Panel

The analytical potential of linked panel surveys depends on respondents' informed consent to both linkage and panel consent. Previous studies have explored different arguments and framings (gain/loss) to optimize linkage consent, but results are inconsistent (across studies). Very few of them have focused on panel consent, with inconsistent results.

This paper reports on four experiments aimed at optimizing both linkage and panel consent within the first wave of the new “Online Panel for Labour Market Research” (OPAL) in Germany, which comprised about 19,000 interviews. To improve linkage consent, the first question was placed at the

beginning of the questionnaire. After the request for panel consent at the end of the interview, respondents who initially refused linkage were asked again for linkage consent. The framing (gain or loss) of these three requests was randomly varied.

The first request yielded a linkage consent rate of 84% to 85%, with no significant framing effects. The second request resulted in consent rates between 22% and 31%, indicating that about a quarter of respondents changed their mind after an additional request. Notably, loss framing resulted in a 6 percentage point increase in linkage consent for the second request. Overall, the cumulative linkage consent rate reached 88%.

The panel consent rate was approximately 62%, with no significant differences between the framing conditions. Multivariate results on the factors influencing both types of consent will be presented additionally.

In conclusion, the results of the experiments show that specific survey design features need to be taken into account when deciding whether a loss or gain framing is likely to be more effective in influencing respondents' consent decisions. In addition, this study also provides evidence that repeated requests minimize the proportion of initial linkage nonconsenters, leading to an increase in the cumulative linkage consent rate.

HURCH, NEPOMUK* (Universität Bremen, Germany)

Future Construction and the Trajectories of Classes

That the (imaginative) construction of the future guides social practice and can thus have real consequences for individuals, social groups, movements, classes, and even entire societies is an important insight from the older and more recent sociological examination of the future. The manifold interdependencies between subjective and objective futures have not been fully deciphered, but it seems obvious to analyze the construction process of the future both as an instrument of domination and as a possible transformative power. The pathos of agency, however, which is sometimes posited against the fatalism that accompanies the multiple crises of contemporary societies, once again fails to adequately account for the structural side of the dialectic of the future. Another world is certainly possible, but neither is every future possible nor desirable for everyone. Who can be addressed with which future narrative and when is by no means clear – and often the question on which social movements fail. The proposed contribution is conceptual in nature and argues for a stronger focus on the material foundations of the construction of the future. With the help of Bourdieu's concept of the "trajectories" of social classes, which has so far received little attention in his reception, a heuristic for a dynamic class analysis is developed. Trajectories are upward and downward movements of classes along crucial dimensions of inequality. They are intended to explain deep-seated dispositions for the future, on the basis of which future narratives emerge and take hold. Because trajectories cut across established principles of hierarchy, they should also help to identify homologies of classes across the social space and thus the basis for possible coalitions, both regressive and progressive.

HURCH, NEPOMUK* (Universität Bremen, Germany)

On the Temporality of Status Perceptions and Anxieties

To date, research on status perceptions and anxieties has varied widely in terms of the concepts involved and the instruments used. This poses a challenge, not least in terms of comparability. The inconsistency of approaches is already evident in the variety of terms used to study the phenomenon, such as (status) anxieties, worries, concerns, fears, deprivations, etc. This is certainly also due to the fact that the field involves several disciplines, especially social psychology and sociology. A systematic account of how status perceptions and anxieties are measured and what this means for empirical findings is largely lacking. Rather, the field seems to be only vaguely structured on the basis of respective understandings of status. We therefore propose a new systematization of status perceptions, conceptualized in terms of a temporal logic, while at the same time differentiating along different status dimensions. We assume that perceptions of one's status (and any associated anxieties) either refer to the present (where do I stand currently), are oriented towards the past (what have I gained or lost), or project into the future (what can I achieve, what threatens me), and that different empirical patterns are predominant in each case. Methodologically, we show that the temporality of status perceptions can be precisely identified in the semantics of the numerous indicators used in the field. Furthermore, using data from a large panel data set, we test our assumption of temporality with factor analyses and examine its different effects with regression analyses based on right-wing populist attitudes. We find that different empirical patterns emerge depending on the temporal logic of status perceptions. The proposed systematization should help the field resolve ambiguities and increase compatibility with research on other topics, such as the social construction of time and the future.

Ecologies of Hope, Love and Care Among British Muslims in Turbulent Times

Britain's Muslim population has come to occupy an increasingly salient role in public discourse. While there is significant research on what might be described as negative aspects of citizenship - derived from patterns of inhabitation such as socio-economic deprivation and institutional discrimination - there has been less focus on dynamics internal to Muslim communities that are also important aspects of this growing population's identity and citizenship potential. Contemporary events such as the war in Gaza and the imbrication of Muslims in debates on Islamophobia and representation within mainstream politics, are recent examples of their precarity but also potential to affect public discourse on emergent planetary issues. This paper draws on ethnographic research conducted with collectives of people and place that become an *affective resource* to help communities navigate precarity in the wake of Islamophobia and ensuing disenfranchisement with formal political processes. Through presentation of participatory research conducted with urban Muslims during the height of the so-called war on terror, and associated technologies of governance and control targeting Muslim communities, I describe itineraries of operation and resistance that help people navigate turbulent times.

The Legal Complex: Professionalisation of Human Rights

This chapter offers a compelling exploration of the intricate evolution of the legal profession specialising in human rights litigation within Eastern European countries and Russia. This in-depth, comparative analysis unravels the transformation of human rights practice into a formalized and prominent field of expertise. This chapter utilises the theoretical concept of 'a legal complex' by Lucien Karpik and Terrence Halliday (2011) to demonstrate the relational nature of human rights professionalisation, encompassing the networks of legal professionals, activists, journalists, and grassroots organizers as a broader collective social actor. Alongside the professionalisation of human rights among trained lawyers, through human rights educational programmes and professional associations organized by local bar councils, this chapter traces the emergence of various specialized human rights organizations and NGOs, which openly replaced the previously covert Helsinki Groups. Finally, it explores the pivotal

role played by transnational educational and exchange networks that shaped this critical aspect of the region's human rights landscape (educational exchanges with Western scholars, universities, and the regional cooperation under the auspices of the International Helsinki Federation for Human Rights).

Harm, Risk and Damage: Preventive Approaches to Social Problems Inspired By Harm Reduction in Brazil and France

Based on an ethnographic and comparative research carried out in institutions that work with risk reduction (*réduction des risques*) and prevention of risky behavior (*prévention des conduites à risques*) in Paris, France, and with harm reduction (*redução de danos*) in Sao Paulo, Brazil, this paper aims to discuss some aspects of the differential developments that such preventive approaches to social problems, derived from harm reduction, have had in these countries. Therefore, it uses local translations of harm as "damage" or "risk" as a narrative support to reflect on the characteristics that the strategies, discourses and practices based on this model have assumed in Brazil and France.

"Some May Never Stop Drinking and Using, but One Becomes a Person" – a Triangulated Homecare for Older Adults Ageing with Harmful Substance Use and Complex Needs.

Older adults ageing with harmful substance use and complex needs are a group that arouses frustration both in addiction care and eldercare because they do not fit into the way the activities are organized. Hence there are a need for specialized interventions due to the increasing number of individuals ageing with harmful substance use worldwide.

Study aim: To analyze homecare staff and care recipients' understanding of specialized homecare. What characterize specialized homecare and how does it differ from ordinary homecare? What are the potentials and drawbacks with such arrangements?

Methods: The study design has a qualitative approach with an ethnographic design. The empirical material was collected through qualitative semi-structured interviews individually and in small groups of two informants. Data consist of interviews with fourteen staff members from three specialized homecare teams in municipalities in the southern, middle, and northern region of Sweden. Further, five care recipients were interviewed individually. All interviews were recorded and transcribed verbatim and coded in NVivo.

Results: Following three overarching themes was found in this study: *Flexibility, Commitment, and Relational trust.*

Discussion: Results from this study shows that harm reduction approaches is used in specialized homecare which has a tremendous influence on building relations and trust between care recipients and staff. According to the results, it is highly important that staff has temporal flexibility and continuity incorporated into their efforts, work with individually tailored interventions, are committed and have the desire to work with this target group because results indicate that it enhances the lives of care recipients in a positive way. The results further suggest that specialized homecare has the potential to contribute to reduced harmful substance use among care recipients and reduce the strain on societal resources as well as help to provide financial gains for society.

IAN, GRAY* (Columbia Climate School, USA)

Getting Risk Wrong? Scenarios As Regulatory Devices in Mitigating the Financial Costs of Physical Climate Impacts

While climate knowledge is proliferating in multiple economic domains, we have a poor understanding of how this information is concretely being used or integrated across sectors (Fiedler et al 2021; Siders 2019; Sobel 2021). This paper examines the use and negotiation of scientific knowledge by central banks as an input into the categorization and management of climate change as a systemic risk. It focuses on the choices made by experts assisting the Network for Greening the Financial System (NGFS) in their process of designing climate scenarios for the purpose of "stress testing" financial institutions. Through a set of preliminary interviews, I present an empirical account of which experts are (and which are not) involved in the discussions around scenario design and the kinds of assumptions underpinning their estimates of future economic damages from climate impacts. A growing community of climate scientists (Pitman et al 2022; Rissing et al 2022; Trust et al 2023) have begun to critique this top-down economization of physical impacts, calling for more pluralistic approaches to risk assessment. Combining approaches from science and technology studies (STS) and economic sociology, this paper analyzes the distribution of practical labor between these different communities of experts, and the epistemic constraints on central bankers as they work to define joint ways of framing the problem of climate risk and incorporating such framings into forms of banking oversight.

TG04-970.1

IANNI, AUREA* (University of Sao Paulo, Brazil)

Uncertainty in Health: Theoretical and Empirical Debates

Beck introduced the concept of organized irresponsibility, which expresses the definitions, calculations and decisions of risk based on modern traditional rationality and its impact on institutions, which become, to some extent, ghost institutions due to the confusion of large-scale risks. In health, it can be suitable to several areas: epidemiological surveillance, surveillance of food, chemical and pharmaceutical products, the market and transplantation of human and non-human organs, tissues and fluids, iatrogenesis in healthcare services and health systems, etc. In all of them, the issue of uncertainty and large-scale risks is so difficult to address, since the entire healthcare apparatus presupposes linear responses to risk and effective actions regarding the alleged safety and protection of life. The empirical-theoretical challenge is how to introduce uncertainty into the definitions, calculations and decisions of risk, considering the context of the risk society and the protection of life?

The institutional dimension of healthcare services and health systems is another challenging topic, since in the current scenario they reproduce and multiply organized irresponsibility they are co-producers of risks and uncertainties. This creates a paradox and an ambiguity. Health - a field of knowledge, practices and public policies - is perceived as legitimate and safe. However, anchored in the logic of first modernity, it is faced with a reality of reflexivity and risk in a second modernity way. The ambiguity is therefore evident: health produces and is a result of organized irresponsibility. Such paradoxes and ambiguities call into question the ideals of social protection, not only in relation to access to health, health insurance, retirement and pensions, but also in relation to the preservation and protection of life. What is the preservation of health and life, what is social protection in the context of large-scale uncertainties and risks? This work problematizes these questions on Brazil's perspective.

Discursive Frames of Domestic Violence Against Women and Child Abuse in the Russian Newspapers, 2013-2023

This paper is focused on the representation of domestic violence against women and child abuse in mass media in Russia. The quantitative and qualitative analysis of the main Russian newspapers was conducted using the Critical Discourse Analysis approach. The results show that contradictory

to the official statistics, the media articles prefer the publicise cases of child abuse over the violence against women. The findings show that there are two main aspects in the media representation of domestic violence - the sensitivity and the informal nature of the actors' relationships. The first aspect implies the publication of the most acute stories, where the violent actions of the aggressor fall under a criminal article and guilt from the point of view of society can be easily justified. At the same time, in the description of the aggressors, one can find references to their ethnicity, citizenship or criminal record. Thus, domestic violence is considered as cases uncharacteristic of the life of "ordinary" people, associated with the wrongness of the actors of domestic violence themselves. In this regard, domestic violence has the character of an informal resolution, where the victims themselves or those involved from a third party (relatives, neighbors) must provide information about what happened. Moreover, informality, which implies the self-resolution of conflicts, leads to non-interference before the direct commission of violent acts, even taking into account the obvious possibility of their implementation, which explains the low potential for the prevention of domestic violence. Although throughout the years in the selected period the media reinforced harmful stereotypes, by blaming the victim, trivializing violent behavior of aggressors and ignores structural context that is responsible for reproducing the domestic violence, there was some increase in mentions of structural reasons to be blamed for domestic violence.

Inclusive Education for Migrant Children in Russia: Discursive Frames of Social (in)Justice

This paper investigates the issues of inclusive education of migrant children in contemporary Russia. The study applies the framework of social injustice developed by Nancy Fraser enabling the distinction of affirmative and transformative politics and is based on the analysis of the discursive frames in the Russian print media (2005-2023). We conducted quantitative and qualitative content-analysis focusing on culture conflicts between proponents and opponents of inclusion to reveal the rationale behind each position, to understand how the interests of various stakeholders have been shaped. While considering the claims of the parties in this cultural conflict, we pay attention to the symbolic codes by which values and beliefs are framed. This study employs critical discourse analysis to the study of discursive production of race/ethnicity, racist ideologies and asymmetric discourse of power, discursive marginalization of migrants and minorities. We distinguish claims to restore justice employed by various actors of public discourse in Russia to pursue both affirmative and transformative remedies and strengthen social justice in relation to the inclusion of migrant children. The analysis of the empirical data collected combines Fraser's distinction between affirmative and transformative responses to social injustice with Booth and Ainscow conceptualization of inclusion. Naturalization of intolerant attitudes and aggressive behavior of children and adults is characteristic of the discursive strategies of othering that deny inclusion. The statement about the absence of an inclusive culture in society becomes one of the dominant discourses in the media, working to make the existing hierarchies indisputable. Claims about the benefits of inclusive education often refer to the neoliberal discourse of productivism that is opposed to agency, advocacy and resistance. The results show how the affirmative and transformative politics allow the actors to pursue implementation of guaranteed rights and promote structural changes through challenging racist assumptions.

Informal Microfinancing Systems and Networks: Transnational Senegalese Tontines in the Migratory Context

ROSCAs constitute informal savings and credit associations involving a group of individuals, often women, who pool their resources and distribute the funds periodically with each member taking turns to receive the total sum. This form of microfinance is widely practiced among small-scale networks of women in different West African countries, where it receives different local names and plays a crucial role in economic, social, and cultural fields.

In the migratory context, tontines also serve as a critical economic, social, and cultural strategy among West African men and women. As an economic strategy, tontines facilitate savings and provide credits to meet diverse needs, from financing entrepreneurial ventures to managing unforeseen circumstances, such as unemployment or expenses related to family events and obligations. As a sociocultural strategy, tontines contribute to diversify

and strengthen networks, fostering the development of relationships based on trust, solidarity, and cooperation while empowering their participants given that involvement in a tontine is a symbol of honour and prestige, of good reputation and trustfulness (qualities much needed in the migratory context).

This paper examines the interrelationships between the socio-economic characteristics of the migratory context, particularly the labour market, and the formation of transnational tontines. It will explore the different types of tontines, as well as the motivations for participating (or not), the selection process for members, the contribution schedules, and the mode of redistribution.

This study is based on ethnographic fieldwork with Senegalese men and women residing in Spain (Burgos and Calella), either permanently or seasonally, who participate in tontines. A key contribution of this research is the identification of two specific types of tontines within the migratory context: the "seasonal tontine," formed by seasonal workers in the tourism sector, and the "remittance tontine," where savings are allocated to support tontines organized by family members in other migratory contexts.

From Slavery to Sponsorship: Tracing Eritrean Migrants and Labour in Saudi Arabia

This study will explore the intersection between migration and the enslavement through the case study of the Eritrean diaspora in Saudi Arabia (1970-2010). Drawing on archival data and qualitative interviews, this study will situate contemporary Eritrean migration to the Kingdom of Saudi Arabia within the longer histories of (forced) labour migration across Red Sea. I will compare how generations of Eritrean migrants fleeing conflict, war and political instability navigate Saudi Arabia's restrictive and shifting labour sponsorship system known locally as the *Kafala*.

I will assess how the legacies of race and enslavement reproduce or even reinforce inequalities within and across these two countries. This will contribute to providing a nuanced account of how perceptions of space, race and labour shaped the everyday experiences of Eritrean migrants. This research project highlights the precarity of forced migrants in the Gulf states, the wider gaps in international responsibility-sharing and protection for forced migrants caught in the limbo of being displaced due to changes in labour laws and restrictions within the labour sponsorship *Kafala* system. This has broader relevance to all forced migrants in the Gulf who are ostensibly there as 'labour migrants' but have compelling reasons not to, or are unable to, return to their countries of origin.

Las Proyecciones Del Género En El Influjo De La IA En La Esfera Universitaria

La llegada de la Inteligencia Artificial (IA) a nuestra cotidianidad ha transformado lo aprehendido hasta el momento, envolviendo progresivamente nuestras acciones y condicionando nuestras interacciones en sociedad, así como los espacios en los que nos desenvolvemos. Estos últimos años, la IA se ha asentado en la esfera universitaria, alterando el proceso de producción y difusión del conocimiento científico. No obstante, el influjo de la IA a nivel micro no ha sido un objeto de estudio destacado. Su interés reside en cada ámbito falto de análisis, sin embargo, la Universidad apremia su observación. La institución universitaria se entiende como un campo clave en la formación y preparación de las generaciones futuras y en el amparo de la educación de calidad. Asimismo, como cada ámbito estudiado, el género opera como un condicionante clave. Por consiguiente, esta investigación sociológica, programada para el curso académico 2025-2026 y por tanto, aun en proceso, tiene como objetivo principal dimensionar los usos e impacto que la IA está teniendo en el estudiantado universitario español, atendiendo especialmente a las diferencias por género. Se incidirá tanto en sus labores académicas como en la forma de plantearse sus futuras trayectorias académicas y laborales. Los objetivos secundarios comprenden la observación de su efecto en sus métodos de estudio y trabajo, sus

habilidades tecnológicas y su configuración de preferencias académicas y laborales futuras. Además, se indagará en las prácticas de uso y los estándares de performatividad que condicionan al ejercicio (Butler, 1990). En el mismo, se empleará una triangulación metodológica que combinará diferentes técnicas -encuestas online, entrevistas presenciales y test de usuario- para analizar la interacción humano-máquina y profundizar en las particularidades por género en su relación con la IA, así como los dilemas epistemológicos, éticos y políticos que se nos presentan en el transcurso de la investigación.

The Creation and Dissemination of New Knowledge By Social Enterprises

This presentation explores the unique role social enterprises play in achieving the SDGs, focusing on the creation and dissemination of new knowledge. Using data from questionnaires and in-depth interviews with social enterprises in South Korea and Japan, I organize the findings theoretically, drawing upon the concept of Knowing Justice.

Concerning the impact of social enterprises, tangible outcomes such as number of service users and job creation for disadvantaged individuals have received attention. However, the impact of knowledge creation and dissemination is harder to measure yet equally important.

The persistence of SDG-related issues stems partly from the functional differentiation of various systems, making it difficult to generate comprehensive solutions. This fragmentation is also reflected within the SDG framework itself, where each goal is described independently, leading to criticism of the lack of consideration of the inter-relationship between goals.

Social enterprises address these gaps by linking fields traditionally seen as separate and proposing actual innovative solutions. Our research highlights two key findings:

First, many social enterprises engage in research in addition to business activities, generating new knowledge. Furthermore, several social entrepreneurs prioritized diverse and complex activities, rather than simply scaling up the same business model.

Second, social enterprises give employees new opportunities for 'knowing' about themselves and society. It may include recognizing systemic causes behind personal challenges, such as childcare difficulties, and realizing their potential roles in driving change. Publicizing research and holding volunteer events were crucial for promoting the dissemination of new ideas.

Although most social enterprises are small and may face challenges in measuring their social impact, this presentation demonstrates that their contributions, especially in knowledge creation and dissemination, are significant and should be considered in policy-making.

Evaluating Dementia Prevention from a Dementia-Inclusive Perspective: A Qualitative Analysis of Dementia-Related Articles in Japanese National Newspapers

The aim of this study is to categorize the activities recognized as dementia prevention in Japanese society since the 1980s and to critically examine their relationship with the ideals of 'living with dementia' and 'healthy aging.'

Prevention, conceptually, refers to actions taken to avert anticipated risks. In clinical medicine, prevention is typically divided into primary, secondary, and tertiary forms. Approaches to dementia prevention have evolved over time. In the 20th century, the focus was primarily on understanding dementia from a neuropathological perspective, particularly in relation to Alzheimer's disease. However, more recent attention has shifted towards lifestyle-related diseases and social health inequalities. The specific methods of prevention vary according to the dominant medical paradigm of the time. Furthermore, as dementia refers to a group of symptoms, its prevention now encompasses a wide range of activities.

It is undeniable that dementia is difficult to distinguish from age-related cognitive decline. The rise of dementia prevention in the 20th century reflects the broader medicalisation of ageing. In addition, since the end of the 20th century, activities such as the sharing of lived experience by people with dementia have deepened understanding of the condition and fundamentally challenged the concept of prevention itself. A leading dementia patients' group in Japan has introduced the concept of 'dementia preparedness' and adopted the philosophy of living with dementia. In line with these activities, Japan enacted a Basic Law on Dementia in 2024, which includes the principle of 'inclusion'.

Against this background, this study analyses descriptions of dementia prevention from national newspaper articles in Japan using qualitative content analysis. Through this analysis, we aim to identify which forms of dementia prevention are criticised and why. Finally, we will explore whether a logic of prevention can be developed that is consistent with the ideals of 'living with dementia' and 'healthy ageing'.

Accumulation through Human Vulnerabilities: The Role of Migrant Workers in Peasant Differentiation and Japan's 24/7 Food Systems.

This study examines how the in-migration of agrarian workers has reshaped rural society and food systems in Japan, through the lens of "accumulation through human vulnerabilities." Since the 2000s, Japanese agri-food system has increasingly relied on Southeast Asian agrarian workers through programs like the Trainee and Technical Internship. Although these temporary labor programs have been associated with significant human rights violations, they have become central to the agricultural and food industries, particularly in regions focused on horticulture and factory-based food production, such as bento and sandwich manufacturing.

Migrant workers, subjected to demanding work conditions—long hours, irregular shifts, and low wages—have enabled small-scale agribusinesses to engage in what can be understood as "primitive accumulation." The availability of cheap, vulnerable labor has allowed these businesses to maintain operations, including supplying Japan's 24-hour convenience stores. These dynamics have led to "modern-day peasant differentiation" in Japan's rural areas. A few large farms have survived and prospered by taking advantage of this labor, while many smaller farms have been forced out of business, contributing to increased stratification within the rural economy.

At the same time, this influx of migrant labor has contributed to significant changes in Japan's foodways. The growing market for ready-prepared meals has externalized the labor of food preparation from households to factories, particularly in urban areas, where convenience is paramount. This shift has deepened the demand for migrant labor in overnight operations in food factories, further embedding a reliance on temporary workers in the food system and transforming consumption patterns.

Based on statistical analysis and over a decade of fieldwork, including interviews and participant observation in horticulture and food production industries, his study reveals how international migration drives agrarian transformation in Japan and its broader implications for global labor and migration regimes.

The Differential Inclusion Based on the Stratified Rights Under the Humanitarian Control Regimes: The Experiences of Latin American and Other Refugee-Migrants in the Mexican Asylum System

In recent years, especially since the mid-2010s, Mexico has been greatly affected by United States' border control policies that seek to prevent the movement of migrants into the U.S. Furthermore, with the increased presence of international organizations such as UNHCR and IOM in the North American region, Mexico has been simultaneously providing refugees with protection and at the same time containing the mobility of migrants seeking to transit to the U. S. (Vogt 2018; Cantalapiedra et al. 2021). As a result, Mexico is now considered both a "transit" and "immigrant receiving country." This means that some refugee-migrants from Latin America and elsewhere who planned to enter the U. S. are being forced to give up their mobility or are choosing to remain in Mexico. As international organizations and states try to manage and control the movement of refugee-migrants in the North American region, Mexico has also expanded its own system for assessing and settling refugees. But what impact has this expansion of Mexico's asylum system, and the formation of stratified rights for refugee-migrants had on their "differential inclusion" into the labor market (Papadopoulos and Tsianos 2013; Kononen 2017).

In this presentation I aim to explore how different legal categories formed under the Mexican asylum system affect the experiences of labor market incorporation of refugee-migrants in different parts of Mexico. I will present data obtained through field research conducted primarily near Mexico's southern border, and in the central and northeastern regions. I interviewed local researchers to get a general understanding of the situation. In addition, I visited relevant institutions and NGOs, and conducted semi-structured interviews, mainly with their staff.

Acting Together to End Sexual and Gender-Based Violence in Nigerian Tertiary Institutions: An Action-Oriented Study

Sexual and Gender-Based Violence (SGBV) is a public health and human rights concern globally. Incidents of SGBV are increasingly reported in Nigerian tertiary institutions, making the teaching and learning environment uncondusive for many students and staff, especially females. This action-oriented study aimed to institutionalise an enabling environment for reducing SGBV in Nigerian tertiary institutions. This project also aimed at strengthening Nigerian higher institutions and its regulatory bodies' response to SGBV through selected tertiary institutions across the country zones and scaling up the initiatives into other institutions not reached in the project at the post-intervention stage. This study was guided by the *socio-ecological theory* of violence against women and the *theory of change*. These two theories were used to identify and develop policies and programs related to sexual and gender-based violence (SGBV), as well as the interventions needed to achieve zero SGBV in Nigerian higher education institutions. The aim was to produce early and intermediate outcomes leading to the ultimate goal of eliminating SGBV.

Findings from the baseline study revealed that SGBV is widespread in the selected study locations, with reported cases across all the institutions visited. The drivers of SGBV were categorised into personal, structural, and environmental factors. Perpetrators of SGBV include academic and non-academic staff, family members, strangers, and neighbours of students living outside the campus. The study findings shed light on critical roles played by stakeholders across the different tertiary institutions. Some available SGBV policies across the selected campuses include anti-sexual harassment policies, codes of conduct, and various SGBV laws and policies. The project aimed to unite all identified stakeholders to develop strategies to end SGBV in tertiary institutions in Nigeria and is at the intervention stage. The study concluded that for SDGs 5 and 10 to be achieved, deliberate SGBV plans and actions are necessary.

Partnership in the Reintegration and Empowerment of Return Migrants in Nigeria: The Need for Co-Created Interventions

The project aims to address the challenges return migrants face and the programs that support them as they reintegrate into social, cultural, economic, and political life. It will provide cost-effective intervention models and baseline data for policies and programs to support the returnees in their communities. The study will map stakeholders using a cross-sectional research design. It will explore the perspectives of service providers on available programs and design an action plan for improved collaborations and reintegration policies. The study will use an action-oriented process to address the reintegration and empowerment of return migrants through participatory, collaborative, and cyclical approaches. The ultimate goal is to generate data and foster partnerships among key stakeholders. The study will be conducted in three phases: baseline, intervention, and post-intervention. During the baseline, data will be obtained on the existing programmes for reintegration as well as challenges encountered in implementing the programmes. The intervention stage will involve addressing some of the identified challenges at levels of return migrants and relevant stakeholders. For return migrants, interventions will include inculcating entrepreneurial, financial literacy, and psychosocial skills, while the skills deficits among state and non-state actors (stakeholders) will be addressed. The co-creation approach will be adopted at the three stages of the study and all stakeholders will be engaged via seminars, workshops, and other hands-on training processes.

Variant Perceptions of Health Professionals in Turkey in Interwar Period Tuberculosis and COVID-19

This paper analyzes the historical development of the visual discourse on health professionals in Turkey by comparing the public health communication of tuberculosis in the interwar period with COVID-19. The variation of scientific knowledge's authority has always projected through the state direction of biopolitics in the communication of the pandemic and thereby reflected in the imagination of health professionals' role in biopolitical command. Visual communication practices, especially for its easy access for diverse segments of the public, have been used to plot how subjects need to organize their bodily gestures and define both individual and social realities of how "healthy" subjects can be captured. In recent years, in Turkey, we experienced a visible increase in the number of violent acts against medical practitioners. We agree that the evolution of contemporary health professionals' imagery demonstrates how discontent appears regarding the value of medical practice with biopolitical discourse. Thus, biopolitical visibility encompasses affective sensibilities and imaginations about the nation and its health professions in health crises. Analyzing the biopolitical discourse in visual materials from the interwar period of tuberculosis and COVID-19 will shed light on the shifting forms of vulnerability. Our analysis is based on the research findings of the state-funded project "Analysis of Public Health Visual Communication Methods". The analysis is based on the critical multimodal discourse analysis that we conducted on these two distinct public health communication. We contend that it is urgent to acknowledge the role of biopolitical state historical development through communicative assets to deduct how reflections of systematic changes affect the imagery of health professionals and reveal shifts in the perception of who should be involved in decision-making processes and how normative notions of individual freedom and responsibility intersect with biological factors.

ILMONIEMI, MIKKO* (Tampere University, Finland)

The Condition of Oppression and the Social Organisation of Homelessness in Finland

The concept of oppression has been used to describe large-scale systems or regimes that benefit a few while depriving many, including colonialism, capitalism, patriarchy and neoliberalism. It also encompasses hegemonic ideologies, discourses and mental structures that promote harmful patterns of reasoning, which manifest in social practices such as exclusion, racism, sexism and stigmatisation. The concept of oppression is also used to describe specific groups of people who experience these injustices in their everyday lives. In my inquiry into homelessness in Finland, employing the concept of oppression may appear contradictory, given the context of a relatively generous Nordic welfare state and the country's internationally recognised success in reducing homelessness. However, approaching homelessness as a condition of oppression has the advantage of articulating social problems on normative grounds: homelessness is not solely a result of 'failures' of the welfare state, such as poor service accessibility, lack of supportive housing or shortcomings in addressing clients' needs, but is, more broadly, a manifestation of social injustice.

As de Montigny (2011) argues, empirical studies on oppression have often focused on the negative effects that oppressive social relations have on people rather than explicating these relations themselves. While recognising harms and suffering is crucial for identifying morally wrong practices, it is equally important to investigate the translocal social organisation from which oppressive conditions arise. In this institutional ethnography, based on 30 interviews with social care workers employed by various services for the homeless, I argue that oppression is not always actualised as concrete unjust practices, as much of the everyday interaction between clients and workers is based on mutually sincere respect and care. However, as I will demonstrate, the oppressive condition remains if well-intentioned practices can at any moment turn into harmful violations of recognition without adequate protection or means of redress.

Social Media Consumption and Beliefs in Conspiracy Theories: Lithuania and Finland in Comparative Perspective

Many studies find a relationship between social media consumption and beliefs in conspiracy theories. Those findings are often presented as evidence that social media causally endorses beliefs in conspiracy theories. In this paper, we argue that the association between social media and beliefs in conspiracy theories is conditional on both individual and country-level factors.

Based on European Social Survey (2020) data from Lithuania and Finland, the paper examines the indicators that impact beliefs in conspiracy theories and considers possible solutions to mitigate conspiratorial beliefs in the context of Lithuania and Finland.

The paper concludes that three groups of citizens (believers, undecided, and non-believers) may be identified according to their levels of belief in conspiracy theories. These groups significantly differ by socioeconomic status, social media consumption, individual values, interpersonal trust, and attitudes to media freedom and inequality within a country. We also find that these relationships are conditional on evaluations of media freedom; social media consumption becomes more strongly associated with conspiracy beliefs as the more pessimistic assessment of media freedom intensifies.

The findings also demonstrate that inferences about the correlates of conspiracy beliefs are highly contingent on the specific conspiracy theories researchers employ. We argue that improved media literacy may be part of a strategy to mitigate conspiracy beliefs. Still, each identified group requires different media literacy measures to address its needs.

Urban Collective Action Around Green Spaces: A Case of Lithuania

Urban green spaces are important landscapes that provide urban residents spaces for physical activity, and social interaction and may accelerate local community building. However, the urban planning process often is characterized by formal citizen participation, and the needs of local residents with green spaces are often not taken into account.

The focus of the study is protest mobilization and repertoires of collective actions against the decision of the local government to build a road at the expense of green spaces in the Šančiai neighborhood. Based on in-depth interviews and participant observation, the study concludes that experiential tools are important in promoting a sense of belonging and solidarity within community. The highly creative experiential tools allow to attract national mass media attention, make the community issue more visible, and foster mobilization of supporters outside the community.

INVERARDI-FERRI, CARLO* (Italian National Research Council, Italy)
Disarticulations in Naples: Regional Disinvestments, Resistance, and the Green Transition at a Whirlpool Factory

This paper develops a cultural political ecological approach to disarticulations and labour unrest. It suggests that the (post-)pandemic landscape is characterised by opening cultural and political-ecological spaces for worker agency that connect geographies beyond the north/south divide. The reference point for analysis is a struggle at a Whirlpool factory in Naples that the company announced would close in 2019, six months after signing an agreement with the Italian government, including a multi-million investment plan. Despite experiencing continuous growth, Whirlpool, Italy's biggest manufacturer of home appliances, has engaged in disinvestment strategies in recent years aimed at reorganising production activities on a global scale. The article documents workers' attempts to resist the plant's closure and shows how their fight with the American multinational corporation was engrained within demands over the green transition that contributed to the outcome of the dispute. Assessing implications for environmental labour studies, the article reflects on the broader dynamics of intra-worker competition and collective action on a transnational scale.

IPSEN, ANNABEL* (University of Oklahoma, USA)
New Borders of Precarity in the U.S. Agrifood System: Refugees, Labor, and the State

This article analyzes how government regulation, refugee resettlement policies, and industry practices converge in an industry-state nexus that positions refugees, paradoxically, as uniquely "protected" but precarious workers. Bringing scholarship on precarious labor into conversation with immigration, citizenship, and critical refugee studies, and drawing on interviews and document analysis, I study the case of refugee employment in the meatpacking industry in Colorado from 2005–2024. I show how federal policy resettles economically vulnerable refugees in areas with few labor options and pushes them toward work at all costs, while deregulating meatpacking in ways that normalize degrading work. Meatpacking firms, meanwhile, recruit and hire refugees to replace undocumented immigrants in order to exploit the former's "legal" but vulnerable status, all while positioning themselves as benevolent employers of "deserving" workers. Finally, the outsourcing of refugee resettlement to structurally constrained NGO actors affords the state bureaucratic distance from a process that effectively supplies firms with citizen-workers for dangerous, low-status jobs. Together, I argue, these practices constitute a refugee labor regime that exploits and maintains refugee workers' precarity, while leveraging it to divide and stratify immigrant workers more broadly.

Road Safety and Vulnerable Road Users in Islamabad, Pakistan

Road safety is becoming a serious public health challenge in Pakistan and developing countries. Each year, about 40000 people die, over 100000 people are disabled with 4% loss of the GDP. The costs of the human lives hardly been realized in the low middle income countries. A content analysis of the road safety literature on Pakistan was done for the last 10 years publications in Pakistan. We used MAX QDA and NVivo to analyze the literature. It was found that road users' careless behavior, rash driving, less or no enforcement of law, low fine and weak governance were the contributing factors in the road accidents/ road crashes. It was also found that there were very less pedestrian paths and separate lines for the bicycles/ motorcycles. Pedestrian (vulnerable road users were victim of the road accidents. It was also noted that 70 to 80% road crashes were due to the two wheelers vehicles (motorcyclists) in Pakistan. Surprisingly, motorcycle drivers were also engaged in the road crashes in rural areas of the country. It was also revealed these findings were in-line of the WHO report (2018) where the low- and middle-income countries have 9% vehicle ownership and 44% road accidents. Whereas the technological countries have 44% vehicle ownership and 9% road accidents. This study conclude that Ogburn's cultural lag is still valid apostolate in the low- and middle-income counties.

ART and Religion in Argentina: Experiences of Religious and Non-Religious Users

The intersection of science and religion, a pivotal issue in the social sciences and philosophy, has evolved from focusing on their contradictions to exploring their articulation in everyday life. In Argentina, where Catholicism holds sway as the predominant religion, the disconnection between sexuality, reproduction, and family presents a unique challenge of ART to the doctrines of the Catholic Church. However, it's also intriguing to note that religions in this context offer interpretations that not only oppose but also endorse reproductive technologies.

This study analyses how Argentinean women identified as religious and non-religious use ARTs and how biomedicine and religion act as complementary sources of knowledge, support and assistance in their reproductive experiences. Religion offers interpretative frameworks and resources, such as rituals and healing spaces, that give meaning to seeking pregnancy.

Our study, employing a qualitative and quantitative approach, delves into how ART users in Argentina construct their reproductive journeys, drawing from religious and biomedical practices. The results highlight that religion influences these processes and significantly shapes the interactions between users and the biomedical system, reflecting regional and generational variations and religious affiliations.

This analysis shows that advances in reproductive medicine have transformed health policy, human rights and the definition of family, challenging religious beliefs and reconfiguring kinship ties and notions of life. In short, ART revolutionises medicine and legislation and profoundly affects Argentina's social and religious imaginaries.

Genetics and Human Rights in Contemporary Argentina

This paper aims to analyze the socio-historical relationships between genetics and human rights in recent Argentine history, focusing on health policies, justice, and identity from the 1980s to the present. Our research examines the inter-institutional network, the main trajectories of actors involved in promoting, designing, implementing, and managing these policies, and the procedural practices employed in various cases over time. Additionally, the paper seeks to unravel the beliefs and meanings that accompany or challenge these processes and the hybridization between these fields.

To achieve this, we conduct a comparative analysis of cases in three areas of genetics: human rights, public health, and identity. Specifically, we analyze:

1. The National Genetic Data Bank
2. The Argentine Forensic Anthropology Team (EAAF)
3. The National Center for Medical Genetics (CENAGEM), the National Network of Medical Genetics and Congenital Anomalies, and hospital-based genetics services
4. The National Genetic Data Registry for Sexual Offenses, established by Law 26.879 on July 3, 2013, and its provincial predecessors, including genetic data banks within judicial systems and provincial forensic genetics laboratories.

Through this comprehensive, multi-layered investigation, the paper aims to shed light on the evolving intersection of genetics, human rights, and identity in Argentina.

Ankle Shackles: "Alternatives to Detention" Immigration Enforcement Programs As Digital Surveillance Cages

"I felt like less of a person" says Sarah, a client from National Immigrant Justice Center about the pain she feels wearing an ankle monitor. Ankle shackles ('ankle monitors') are widely used as GPS tracking tools as part of the United States' Immigration and Customs Enforcement's (ICE) Alternatives to Detention (ATD) surveillance program. ATD operates using electronic ankle monitors, in-person check-ins, and home visits. ICE claims ATD is meant to reduce the number of people held in detention centers and be a 'more humane' path for immigrants registered with customs enforcement. However, these alternatives have proven to propel a different form of punitive, degrading policies such as informing structures of electronic-incarceration, increasing risk of actual deportation for immigrants, and expanding the number of people living under government surveillance. This study outlines how the ATD program operates as a part of a racialized architecture of social control and a mechanism for labeling, legitimating surveillance, and creating a state apparatus for tracking immigrants. Highlighting historical analysis of immigrant policy in the United States that led to ATD, I detail how the United States' laws and policies on immigration are rooted in white supremacy, structural exclusion, and control of borderlands to outline who is 'deserving' and 'undeserving' of rights. This study traces the history of the creation of ATD and rise of electronic-incarceration through reference to statistics on racialized surveillance and highlights in-depth case studies regarding people's lived experiences with ankle monitors and associated mental and physical health risks, as well as ATDs heightened use since COVID-19. I end with a discussion of community demands for the abolition of immigrant detention/incarceration, showcasing the power of community resistance to state control and deportation regimes.

Identifying Trinary Control Patterns in Civil Disputes in Contemporary Chinese Rural Villages

Examining "self-governance" [zizhi 自治] within Chinese governance structures finds a self-run, yet ideologically-driven, grassroots system. Self-governance is used in China to manage the civil disputes in organizations and companies and community committees, both rural and urban. The language of self-governance reinforces a Marxist structure of democratic centralism that regulates public affairs at the grassroots level where governance is comprised of rural village and urban resident committees. We focus on the role of rural village committees that are given quasi-bureaucratic powers in matters of social order and justice. Using the authors' 2021 sample data of 2,343 respondents collected from 164 villages in rural China (Jiang et al. 2024) and recent conceptual views on rural social stability (Trevaskes, 2024), we examine the rural village committee's influence on governance.

Scholars find the "fusing" of governance models for grassroots conflict mediation is administered in rural Chinese villages using a trinary control system (Trevaskes, 2024; Jiang et al. 2024). At the village level, committees exert measures of semiformal control, promote solidarity through informal social controls, often through an elite gentry (or *xiangxian*), and allow police to exert formal control, to maintain community social order and justice (Jiang et al. 2024). The administration of law, ranges from mediation to punishment, though invoking punishments is normally left to the formal control agents. Semi-formal controls may be effectively used for resource allocation, land management disputes and civil disputes among villagers, who tend to be elderly as their children migrated to urban areas. Village committees are shown to develop autonomous self-governance, through coordination with formal institutions, such as the Chinese Communist Party, and informal institutions within villages, to resolve disputes, combat crime, allocate resources, and establish community solidarity.

ISAACSON, SUMMER* (University of Konstanz, Germany)

Environmental Inequalities and Activism in the Global South: The Case of South Africa through an Intersectional Gender Lens

Research strongly points to that women are more negatively affected by climate change than men, particularly in the Global South. Yet, research on these women's climate-related grievances, coping mechanisms, and activism remains scarce. Building on ongoing field work in South Africa (until December 2024), we are conducting 25 qualitative expert interviews to examine the role of gender in experiencing and protesting environmental issues. The study will build on local voices ranging from affected civilians and scholars, to public officials and activist organizations. As a country, South Africa holds some of the highest levels of economic inequality in the world, which strongly align with racist political legacies, and is very vulnerable to climate change in the form of e.g., extreme weather events, droughts, and floods, as well as being known as a global "protest capital". In other words, it is a highly relevant case for the study of the relationship between climate change, inequality, and activism. Through our field work, complex structures of vulnerability are explored in depth, with a focus on gender, race, and class. Women in rural areas are often in charge of working agricultural land, gathering water and firewood, as well as large portions of the family and community care work. Simultaneously, women are significantly less likely to own land, face a gender pay gap, and live in largely patriarchal structures. How do these inequalities translate into patterns of engagement in environmental activism and protest, and which tactics are being used? How do women, particularly poor women of color in rural areas, strategically cope and politically engage with the environmental challenges they face? And how do environmental organizations help women and other vulnerable groups to overcome these inequalities?

RC13-200.1

ISHIDA, KENJI* (Institute of Social Science, University of Tokyo, Japan)

Decomposing Gender Gap in Subjective Time Pressure: Time Use Perspective in Japan

In contemporary societies, people enjoy technological developments, which have resulted in more efficient ways of using time. For example, the current digital transformation in our daily lives particularly weakens the temporal and spatial restrictions for both paid and unpaid work. Eventually, technological developments can contribute to increasing free and leisure time, which makes people feel less busy.

Meanwhile, such an argument lacks a perspective of heterogeneity in time pressure among sub-populations in a single society. Gender is a primary driver of generating inequality in time-use structure because gendered divisions of labour for paid and unpaid work persist in many contemporary societies. In general, previous studies report that married women are more pressed for time than men due to their difficulties in managing the time for paid work and family care. In Japan, a typical case of the persistent strong gendered division of labour, gender inequality in time pressure and where it comes from are still understudied empirically.

To address these issues, I utilised a nationally representative dataset in 2023 that includes various relevant information about time pressure, working, and family lives. First of all, women feel pressed for time more than men, and the difference is more salient in the married sub-sample. Furthermore, with the Kitagawa-Oaxaca-Blinder decomposition method, the gender gap in time pressure reflects the gendered division of labour in Japanese society. While men's longer working hours contribute to decreasing the gender gap in time pressure, women's longer housework hours expand the gender gap. Also, the number of household members increases time pressure in general, and its contribution is larger in women, which implies women have to take on more family responsibilities that make them much busier. To conclude, the gender gap in time pressure in contemporary Japan is due to the concentration of family care on Japanese women.

ISHIDA, KENJI* (Institute of Social Science, University of Tokyo, Japan)

Re/Integration into the Destination and Home Societies of Japanese Self-Initiated Expatriate Workers: A Longitudinal Data Approach

The number of Japanese nationals living abroad has been steadily increasing. This trend is due to many young Japanese nationals, known as self-initiated expatriates (SIEs), actively seeking career opportunities in overseas locations following the long-term economic downturn since the 1990s, particularly in East Asian global cities like Hong Kong, Singapore, and Shanghai. The careers of Japanese SIEs represent a case of expatriates from non-Western and high-income societies, which are relatively understudied in migration research.

While Japanese SIEs have been fulfilling the labour needs of Japanese and multinational companies in destination societies, previous studies have indicated that they encounter obstacles in advancing their careers, particularly in Japanese branch firms, due to entrenched Japanese employment practices. This phenomenon, known as the "rice-paper ceiling," may hinder both local workers and Japanese SIEs from accessing better career prospects within Japanese organisations. Additionally, Japanese SIEs may face difficulties in obtaining better positions upon returning to Japan because their international experiences are not valued by Japanese domestic employers, who have maintained domestic-centred perceptions about valuable skills in the Japanese labour market.

In light of these issues, an investigation into the economic re/integration of Japanese SIE workers when working in destination societies and upon returning to Japan was conducted. The study, based on a three-wave panel survey of Japanese workers overseas from 2019 to 2021, revealed that while the SIE workers' wages are lower than the assigned expatriates, they increased over time in their destination societies. Furthermore, upon returning to Japan, the growth rate of the SIE workers' wages surpassed that of the assigned expatriates. Contrary to the marginalisation scenario, Japanese SIE workers seem to be economically integrated into their destinations and successfully reintegrated into Japan after their return.

Doing Sociology with People: Disability, Coloniality and Reflexivity in Institutional Ethnography

Based on a study conducted with disabled students in a post-colonial higher education (HE) context, this paper offers a novel approach to reflexivity in institutional ethnography (IE). It shows why and how existing approaches to reflexivity in IE have been inadequate in preserving the voice of the subaltern subjects. It engages with the question of reflexivity for "academic homecomers" who have been educated in the countries of the global North and go to research or engage communities in the South. By proposing a decolonial institutional ethnography that demands *biographical, epistemic, analytical, and transformational reflexivity*, this paper advances the argument that IE should move from a "sociology for people" (Smith 2005) to a "sociology with people" who are being ruled by the colonial matrix of power. In this study, a decolonial institutional ethnography takes a reflexive approach to understanding how

the trans-local conditions of coloniality shape the social relations of inclusion and participation for disabled students. The study concludes that while IE provides the opportunity to empower those under a matrix of domination with knowledge of how things are organised, it does not offer researchers a method to collaborate with people to transform their everyday realities. By engaging with Touraine's (1981) sociological intervention, the study concludes that reflexivity can be more than just textual; it can also be transformational.

Working-Class Protest in Turkey (2015-2023)

This presentation analyzes dynamics in working-class demonstrations in Turkey between 2015 and 2023. The research addresses key questions such as: Why did these protests occur? In which sectors? Were they aimed at promoting or defending rights? How many workers were involved? Was the union involved? What was the duration? Were these one-time events or continuous actions? Was production halted? Did women lead the protests? What was the workers' employment type? Were there attacks by police or employer security? What were the outcomes, and did any lead to legal processes?

Our descriptive analysis, based on a labor-intensive data collection process, reveals that the working class in Turkey continues to resist, even during a period of union weakness and an authoritarian political sphere. Through this analysis, we also seek to answer new questions: What factors make worker resistance stronger? Is it the industry, the number of workers, the persistence, creative methods, independent trade unions, support of political groups or the ability to gain public support?

The data on working-class demonstrations, compiled by scanning local and national print media and relevant websites, was coded and analyzed collectively by the Labor Studies Group (LSG – emekcalisma.org).

This study also aims to contribute to quantitative research methods in the social sciences, drawing inspiration from Beverly Silver's work. A key limitation of the research is that the protests analyzed reflect only those reported in the media.

Ultimately, we aim to interpret the losses and gains of workers' actions and contribute to the data-driven policy-making capacity of workers' organizations.

A/Synchronous Youth Work Subjectivities: A Feminist Hauntological Approach to Digital Futures

The concern with 'future' looms large in both youth studies and the growing scholarship on digitalisation of work. While youth studies scholarship has drawn attention to the impasse that youth face when promised futures (of economic liberalisation, structural adjustment programmes, or globalisation) fail to materialise, research on digitalisation of work highlights the persistence of 'old' social inequalities in impending work futures. This paper – based on my research with young women in Delhi, India, who work for e-commerce companies, and who experienced working from home for the first time during the Covid19 pandemic – brings these two disparate sets of literature together to think through when, where, what, and for whom are the digital futures of work in the Global South. The paper considers the temporalities of working-from-home and how these shape youth worker subjectivities. This 'temporal turn', the paper argues, is needed for disrupting the modernisation thesis that informs the conceptualisation of the relationship between work and technology, particularly in the Global South. Specifically, I borrow the concept of 'hauntology' to understand young people's orientations towards work and technology as embedded in interlinked past, present, and future, and shaped by social structures. A feminist hauntological approach does so with particular attention to enduring structures of gender. Through feminist hauntological analysis of women's narratives about work-from-home, I understand emerging worker subjectivities as 'a/synchronous subjectivities', which make visible the discrepancy between rapid advancement of digitalisation and workers' embrace of digital cultures on the one hand, and infrastructural 'lag' and inequalities, and gender norms on the other hand.

Barriers to Seeking Healthcare Services Among Labor Migrants in the Gulf Countries: A Systematic Literature Review

Aim: Despite of having one of the highest labor force migrant populations in the world, there is still notable gap of empirical studies addressing healthcare facilities and services for the labor migrants in the Gulf Cooperation Council (GCC) countries. This systematic literature review explored the barriers to seeking healthcare services for labor migrants in these countries.

Method: Following the PRISMA guideline, we searched Web of Science, Google Scholar, and PubMed for English language articles between July 15, 2023, and July 20, 2023, using Boolean search terms. The search included empirical studies published between January 1, 2013, and July 15, 2023, addressing any of barriers related to availability, accessibility, affordability, utilization of labor migrants in the Gulf Cooperation Council countries. To follow a rigorous process for ensuring the quality of included studies, we used JBI critical appraisal checklists.

Results: Our review addressed the limited mention of healthcare accessibility, availability, affordability, and the predominant mention of related barriers of the labor migrants in these countries. The review identified a range of barriers to healthcare access, including limited health insurance coverage and insufficient occupational health and safety standards. Additionally, socio-cultural challenges such as language barriers, discrimination, and low health literacy were prevalent. Many labor migrant workers believe that health insurance is only needed to renew their work permits. Disparities in healthcare access become apparent compared to the citizens of the host countries.

Conclusions: Our review recommends actions like enforcing comprehensive health insurance policies, enhancing cultural competence among healthcare providers through training programs, and implementing community-based health literacy campaigns tailored for international labor migrants. Effective implementation of these strategies aligns with several Sustainable Development Goals (SDGs), including good health and well-being, reduced inequalities, and decent work and economic growth, thereby fostering a healthier, more inclusive environment for all residents within the GCC.

Data Availability and Challenges to Achieve the Sustainable Development Goals in Bangladesh

The availability and quality of population and development disaggregated data are crucial for monitoring the progress of sustainable development goals (SDGs). Tracking progress and improvement in policy agendas, enhancing demographic data availability, validating statistics, and setting goals is essential. This study assesses the progress of the availability of data and the challenges to achieving SDGs in Bangladesh by reviewing the government's SDG tracker and relevant national policy documents through web searching. The study finds that 36.9% of the SDG indicators are updated, 31.7% are in progress, and 32.1% are unavailable. 60% of data are unavailable for specific SDGs 12 and 14. Existing policies also need to be updated to follow the SDGs. Bangladesh encounters notable obstacles in pursuing SDGs, including the need for baseline data. Other challenges involve the absence of guidance for generating new data, reliance on outdated data, limited tools and methods for disaggregation, inadequate coordination in sharing data among agencies, and a need for more awareness about international metadata standards. It

is necessary to make urgent efforts to make available quality data for all goal indicators through effective multi-sectoral partnerships, coordination, and integration among stakeholders to strengthen and improve the data capacity of the country. Thus, establishing a national data repository or information bank that consolidates relevant data from each concerned organization is necessary, and it will be linked with the SDGs Tracker. This configuration will facilitate tracking initiatives, enabling effective monitoring and evaluation of real progress. The government should undertake systematic data assessments and advocate for UN agencies to enhance and improve administrative data capacity. Each ministry or directorate ought to establish a unit dedicated to overseeing high-quality scientific research that will create a suitable environment essential for unbiased and fruitful quality research outcomes, fortifying infrastructure, and ensuring information accessibility.

Balancing Individuality and Global Citizenship in Philippine Tourism Centers

This paper investigates the interplay between individuality and global citizenship within Philippine tourism centers, where diverse cultural identities converge. As globalization fosters a shared identity among cultures, tourism—while a significant driver of economic growth—often promotes homogenization, threatening the uniqueness of local cultures. This study highlights strategies that tourism enablers in the Philippines embrace in their distinct cultural heritage alongside global citizenship values.

The phenomenological approach of the study looks into various forms of tourism centers that integrates local traditions with sustainable practices, illustrating how communities can maintain their cultural identity while addressing global issues such as environmental conservation and social equity. Through participatory approaches, local stakeholders engage tourists in authentic cultural experiences that celebrate individuality, fostering mutual respect and understanding.

In this context, the study also examines the shifting role of AI – from artificial insemination to appreciative inquiry, active imagination to artificial intelligence, which can enhance tourism experiences by facilitating personalized interactions and promoting local ingenuity. By leveraging AI to curate unique experiences, tourism can transition from mere consumption to a celebration beyond cultural abundance.

Moreover, the study explores the role of responsible tourism in encouraging appreciation for local customs, suggesting that initiatives involving local communities in decision-making can help preserve cultural individuality while contributing to global citizenship.

Ultimately, this paper argues that a balanced approach to tourism enhances both the tourist experience and the well-being of local communities. By recognizing the value of individual cultural expressions within a global framework, Philippine tourism centers can foster a richer, more inclusive experience that respects local heritage and promotes global interconnectedness. In doing so, we highlight the importance of nurturing individuality within the broader context of global citizenship, paving the way for a more harmonious world.

RC05-74.2

ISLEYEN, MELIKE* (Oslo Metropolitan University, Norway)

Intersecting Struggles: Queer Decolonial Feminism and Comparative Settler Colonialism in the Context of Palestinian Liberation and Environmental Justice

This theoretical article explores the intersections of settler colonialism and environmental justice in Palestine through the lens of queer decolonial feminism (Elia, 2023; Lugones, 2010; Vergès, 2019) and comparative settler colonialism (Veracini, 2013), illuminating how these frameworks collectively critique the ongoing legacies of coloniality and racial capitalism. By examining the historical and contemporary implications of settler colonial practices in Palestine, the article highlights the profound inequalities experienced by Palestinians, particularly regarding access to land, water, and other essential resources. Through a queer decolonial feminist lens, it challenges normative narratives that often erase the gendered and sexualized dimensions of settler colonial violence, arguing for a more complex and nuanced understanding of resistance, which connects to global struggles of gendered, racialized, and sexualized others.

In addition to the main guiding frameworks, the theoretical exploration draws on the works of critical scholars across multiple disciplines, situating Palestine within a broader context of global struggles against racial capitalism (Bhattacharyya 2018; Kelley, 2023; Robinson 2000) and environmental degradation (Gilmore, 2022). By integrating insights from black studies,

Indigenous studies, and abolitionist feminist theory, the article proposes that a nuanced critique of these intersecting oppressions is essential for envisioning alternative futures rooted in liberation and justice.

Furthermore, this research situates climate justice as a critical site of struggle, arguing that it is inseparable from the legacies of settler colonial violence, colonial exploitation, and modern colonial policies. Ultimately, this article aims to contribute to the ongoing discourse surrounding environmental justice, advocating for solidarity among diverse movements and a queering of global priorities in the face of escalating ecological and humanitarian crises. Through the case of Palestine, it underscores the need for transformative approaches that recognize and address the interconnectedness of social, environmental, and economic injustices in the quest for liberation and sustainability.

Albanian Youth on the Move: The Dual Impact of Migration—Barriers and Pathways to Future Success

Migration has far-reaching effects on youth and children, shaping their development, education, and overall well-being. This study explores the experiences of young migrants, focusing on how both internal and international migration impact their lives. Using Albania as a case study, a country with one of the world's highest emigration rates, this research employs a mixed-methods approach, combining quantitative and qualitative data to provide a comprehensive analysis of migration's impact on youth.

The methodology includes a desk review of existing literature on migration patterns, a detailed household survey, and focus group discussions with families and young migrants. The household survey sampled 1,400 households across urban and rural regions of Albania, with a focus on areas most affected by migration. It gathered demographic data, migration history, and its socioeconomic impacts on children. Focus groups were conducted to capture in-depth insights into the psychological and emotional challenges faced by children in migratory contexts. The qualitative data were analyzed to identify patterns in family reunification, educational disruptions, and the resilience of children adapting to new environments.

Findings from the study highlight significant disruptions in education, emotional stress due to family separation, and challenges in social integration for children who experience migration. Moreover, the study identifies key support systems that are crucial for their successful reintegration, including psychological counseling, peer support networks, and targeted educational programs.

ISOPP, NICOLE* (Sigmund Freud PrivatUniversität Berlin, Germany)

Subjectivation Analysis of Queer Sugar Babes

Sugar-dating relationships are typically portrayed as transactional arrangements in which one party, the Sugar Daddy, provides financial/material support, while the other party, the Sugar Babe, usually younger and economically less privileged, offers emotions, time, and, in some cases, sexuality in return. In public discourse, this arrangement is often viewed through heteronormative and binary gender lenses, with cis-men depicted as financially dominant actors and cis-women as economically dependent ones. This binary gender logic also shapes much of the academic research, leading to the frequent neglect or omission of queer individuals' experiences in this context.

This study aims to close this research gap by focusing on queer individuals who act as Sugar Babes. Three queer individuals were recruited through a German-speaking sugar-dating online platform, and narrative interviews were conducted. The question of the relationship between subjectivation and empowerment of the subject was examined within the framework of a power-critical subjectivation analysis, using the methods of positioning and agency analysis. Additionally, it aimed to reconstruct what knowledge, practices, and techniques of self-governance accompanied the subject position of the Sugar Babe.

The preliminary findings of the study show that queer individuals in the subject position of Sugar Babes navigate a tension between affirming their gender identity and the financial/material benefits of the arrangement. To manage this contradiction, they develop techniques that emphasize the transactional nature of the arrangement to legitimize the practice of sugar dating. Through contractual-like agreements on how the meeting with a Sugar Daddy is structured, the arrangement also functions as a kind of safe space, enabling the generation of knowledge about heteronormative dating without

fully abandoning their queer identity. Overall, the study highlights that queer Sugar Babes are able to both preserve their identity and create new spaces for emancipation and awareness of queer life realities.

From Shelter to Burden: Complex Effects of Post-Disaster Relief Activities of International Organization on Women in Nepal

The risk of increased violence against women after a disaster has been identified as an issue in post-disaster international relief efforts. In Nepal international relief activities targeting women have been performed extensively since the 2015 earthquake. This presentation focuses on a specific women's shelter created in this context and examines its impact on women living in the post-disaster world. The research methods used for this presentation are qualitative research, including observations, participatory observations, and interviews, as well as the acquisition and analysis of materials issued by government agencies and media were conducted in the affected areas of Nepal.

At the study site, an international non-governmental organization constructed a women's shelter to provide safe showers and toilets to women living in temporary huts. A user group was formed by the organization to manage and operate the shelter. Additionally, the organization provided empowerment training to the user group. This series of support activities for women affected by disasters presents two contradictory long effects. First, the organization categorized the women in terms of diversity and equity, which is different from the typical village logic, thus resulting in a range of friendships and activities that differ from those during normal times. The second issue is the continuously increasing burden. Originally, the women were responsible for housework and agriculture. However, when they were selected to join the group, they were presented with the additional burden of attending weekly classes and becoming leaders in local disaster management. The project was terminated three years after the earthquake. Meanwhile, the shelters are currently used as storage facilities for emergency supplies. The women's shelter and group, which were established during the disaster, have been integrated into the daily lives of the women in a dual manner, i.e., expanding the world in which they live and adding to their burdens.

Changes in Network Diversity and Attitudes Towards Market Distribution of Social Services: Longitudinal Evidence from Chile

Unlike state redistribution, the market plays a role in distributing services within welfare systems. From a distributive justice perspective, social services are viewed as legitimate objects of commodification, ranging from market-driven to state-led provision, where services are traded, evaluated, and priced. Higher-income individuals in better-paying labor market positions are less likely to challenge market-based distribution, justifying that access to welfare should be determined by ability to pay. Justifying unequal access is not only driven by self-interest or values but also by socioeconomic diversity in interpersonal networks—understood as an individual's connectedness to dissimilar ties (e.g., occupations). Two mechanisms by which networks shape attitudes are (i) social influence and (ii) network segregation. Networks act as spaces for understanding inequality, providing information, and facilitating inter-group contact, which may foster empathy. It has been shown that greater diversity in broader networks encourages more critical views on resource distribution and its consequences for welfare. Also, network diversity may be experienced differently depending on economic resources, possibly making those in advantaged positions more critical of the market's role in the provision of social welfare. An open question remains: how do individual changes in network diversity influence support for market-based welfare distribution? It's also worth exploring whether changes in individual income moderates this relationship. I investigated these questions using longitudinal individual panel data from Chile (N=1500), a country characterized by high-income inequality and a strongly market-oriented welfare system. The results show that increasing network diversity is associated with lower support for market justice attitudes in education, health, and pensions. Furthermore, the effects of increasing diversity are more pronounced as individual income increases over time. This study highlights the role of both cross-status connections in understanding market justice attitudes, as well as their implications for policies and cohesion.

ITURRA, JULIO* (University of Bremen, Germany)

Reference Groups and Social Solidarity: A Comparative Factorial Survey of Social Cohesion between Chile and Germany.

In recent years, global economic inequality, public health crises, and increasing migration have intensified social science interest in social cohesion. This concept includes interpersonal trust, collaboration, openness, and relationships with civil society and the political system. Studies in sociology and social psychology emphasize how social interactions shape attitudes, particularly through social comparison. People evaluate their attributes against those of others, influenced by reference groups. These groups provide a basis for comparison that can shape attitudes toward inequality, welfare policies, and social trust. Demographic and socioeconomic factors in reference groups can impact support for social policies like pensions and taxes. Social cohesion is closely tied to societal values, which form the foundation for popular support and the legitimacy of welfare regimes. Contact with working-class individuals, for example, may increase support for redistributive policies, while professionals in interpersonal occupations may foster more inclusive attitudes. However, rapid demographic changes, such as those brought about by migration, can lead to perceived threats and reduced solidarity among certain groups, especially the working class. This study aims to examine how reference group characteristics relate to attitudes toward social cohesion through a vignette-based survey experiment conducted in Chile and Germany. Chile, with its high inequality and market-based welfare system, contrasts with Germany's more state-involved, corporatist welfare model. The research seeks to understand how demographic and socioeconomic factors influence trust and willingness to support others, even when reciprocity is uncertain. It focuses on the role of reference groups in shaping attitudes toward social solidarity, with specific attention to friendship, collaboration, and territorial conflict. Survey respondents will evaluate vignettes of individuals varying in characteristics such as gender, education, income, employment status, and migration background to assess the potential for friendship, collaboration, and closeness.

IU, WAI FUNG* (Monash University, Australia)

Reimagining Hong Kong: Transgenerational Memory and Identity Construction in the Diaspora

This study explores the reconstruction of Hong Kong diasporic identity through the lens of transgenerational memory, focusing on the discourse of Hong Kong Diaspora Organizations (DOs) in the UK, Australia, and Canada. Following the 2019 Anti-Extradition Law Amendment Bill (Anti-ELAB) movement and the imposition of the National Security Law (NSL) in 2020, a new wave of migration has reshaped Hong Kong's socio-political landscape. This research investigates how DOs utilize collective memory, past presencing, and postmemory to shape the identity of overseas Hongkongers, highlighting the role of intergenerational dialogue in sustaining a cohesive diasporic identity.

Using Critical Discourse Analysis (CDA) and Corpus-assisted Discourse Studies (CADS), this study examines the online discourse of DOs on platforms like Facebook, where identity and belonging are actively negotiated. It delves into how these organizations construct and sustain an "imagined Hong Kong nation" by invoking shared histories, values, and experiences while addressing the challenges of maintaining a distinct Hong Kong identity under the influence of mainland China. Additionally, the study considers how different generations within the diaspora engage with these narratives, contributing to an evolving identity that balances historical continuity with adaptation to new socio-political contexts.

Preliminary findings suggest that DOs strategically mobilize historical narratives and cultural symbols to cultivate solidarity and community among Hongkongers abroad. This process not only preserves cultural heritage but also serves as resistance against political oppression and cultural assimilation. By employing the concepts of past presencing and postmemory, this research underscores the role of memory work in diasporic identity formation and the complex interplay between transnationalism, generational exchange, and political activism.

This project provides empirical insights into how Hong Kong DOs shape the diasporic identity of overseas Hongkongers, offering a new perspective on transgenerational processes in the transnational space and contributing to the broader discourse on diaspora studies and identity formation.

RC35-577.3

IVANOV, DMITRY* (St. Petersburg state university, Russian Federation)

Critical Theory of the Digitalization

The paper contains the critical analysis of the digitalization discourse which is reflecting not social innovations but managerial and bureaucratic appropriation of routine practices of virtualization (the research is supported by Russian Science Foundation, project #24-18-00261). Virtualization as a replacement of things and real actions by images and communications was the anti-system tendency at the end of the 20th century when digital technologies enthusiasts created virtual networks escaping control of reified institutions of late industrial society. But now that 'Great Escape' of cyberpunks, hackers, pirates, and copyleft activists has been absorbed by the system as digital technologies usage became social routine and simultaneously the newest form of social control. Social life is alienated into virtual realities arising on the digital platforms exploiting human interactions.

To reveal contradictions and true direction of digitalization, we need a development of critical theory following the dialectical line of the Frankfurt School neo-Marxism. The totality of domination structures and new forms of social control in postindustrial society are analyzed on the basis of algorithmic rationality conception. Algorithmic rationality now has replaced instrumental reason (Horkheimer) and technological rationality (Marcuse) which organized praxis and thinking of people in the early and late industrial ages. Algorithmic rationality is a new domination logic as reality is perceived to be dynamic and hybrid network of objects functioning automatically without human subjectivity. The current post-virtualization tendencies and micromovements in everyday life can be treated as a source for an authenticity resistance to the virtual and artificial substitutes of humanity brought by total digitalization / coercive virtualization of social life. Distinction between emancipative digital technologies and oppressive algorithmic rationality should become the basis for the new critical theorizing in the age of the digital.

IVANOV, DMITRY* (St. Petersburg state university, Russian Federation)

Religious Identities and Practices in Russia Impacted By Post-Globalization

Religiosity expanded dramatically in the late USSR and post-Soviet Russia. Surveys by the main pollster agencies showed regularly the growth in numbers of people identifying themselves as orthodox Christians and Muslims. Resurgence of religiosity has been mostly symbolic and only in a small part practical. Empirical data provided by recent national surveys reveal the high level of identification with distinct religion (70-80% of respondents) and the low level of involvement in religious practices (10-15% attending temples, praying, fasting etc.).

Now the turn to post-globalization is the change impacting all aspects of social life including religiosity. Post-globalization is a set of tendencies towards: 1) localization of globality in networked super-urban enclaves where flows of things, symbols, and humans made social life really global – open, borderless, mobile, multicultural; 2) widening economic and social gaps between super-urban points of access to networks and flows of resources and surrounding towns and rural areas; 3) rising new barriers (trade wars, sanctions, anti-migrant walls, quarantines, military confrontations etc.) restricting transnational networks and flows.

Post-globalization influences religious identities among Russian people in two ways. Localization of globality in super-urban enclaves is evident in metropolitan areas (Moscow and St. Petersburg) where people (especially the youth) demonstrate relatively weak religious identity being immersed in the intense social life becoming an augmented Modernity. Religious identity is stronger in small towns and rural areas where social life looks like an exhausted Modernity. Facing new barriers and confrontations after Russian invasion of Ukraine in 2022, people declare stronger identifications with national institutions and traditions including religious ones. The most recent surveys reveal the rising levels of religious identity and more approval of Russian orthodox church. This paper presents the research supported by Russian Science Foundation (project #24-18-00261).

IVANOVA BONCHEVA, ANTONINA* (Universidad Autónoma de Baja California Sur, Mexico)

The Belt and Road Initiative of China and Low Carbon Growth in Africa: Just Transition Pathway

China's Belt and Road Initiative (BRI), an emerging economy-led cooperation, represents one of the largest infrastructure, trade and economic agendas in history, which, in front of the current lower global growth and intensifying trade tensions, demands the utmost attention. In 2023 BRI accomplished 10 years of activities and is beginning the stage BRI 2.0. A series of studies by the World Bank estimate that it can increase the GDP of developing countries by 2.6 to 3.9 percent on average. The growing South-South cooperation (SSC) is a very promising instrument to advance towards the fulfillment of the Sustainable Development Goals, including a successful climate action under the Paris Agreement.

This study looks at the BRI's orientation towards African countries, green infrastructure and low-carbon green pathways in Africa. Decarbonisation of the energy system requires investment and innovation in growing the low carbon system. Additionally, the just transition requires the planned retirement and decommissioning of the carbon energy system. But in a way that does not unfairly or unjustly impact workers, communities, and vulnerable sections of the population. To develop the study, the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) methodology was applied. A search was carried out for articles from indexed journals on several academic websites. These sources were complemented with some reports and hemerographic materials.

First, the Belt and Road initiative is presented as a South-South integration project. Special attention is paid to low-carbon development pathways in the BRI countries and the agreements and principles to promote them. Some risks presented at the stage BRI1 are highlighted. The second part, dedicated to African BRI countries, introduces some projects implemented by China, discussing some challenges and opportunities for the Just Transition. Finally, we present the concluding remarks with some recommendations.

IWAI, NORIKO* (JGSS Research Center, Japan)

In a Society Where Nonreligious Mind Is Mainstream but Majority Pray for Good Luck: Japanese Case

In the world where religion could be the genesis of dispute, Japanese society shows somewhat different contradictory picture. According to the Agency for Cultural Affairs, Government of Japan, the number of religious groups is 179 thousand, and the total number of followers is 163.0 million which is 1.3 times of Japanese population in 2022. On the other hand, according to major national surveys, more than 70% of Japanese do not have any personal religious faith (Japanese National Character Survey). Looking more closely, less than 10% believe in religion and about 20% do not believe in personally but have a family religion (Japanese General Social Survey). The figure is far less compared with other East Asian societies, such as Taiwan (77% have a religion) or Korea (53%; East Asian Social Survey). Trust in religious groups is very low in Japan.

How does this happen? The key for understanding the situation is fading of people's religious belief and rootedness of observing religious practices which became seasonal events in the Japanese society. The Bon Festival in summer was originally a Buddhist event and the Harvest Festival was a Shinto event. People visit a shrine on the New Year's Day and visit a graveyard at temple on equinox. In rural houses, a home shrine and a Buddhist altar often coexist.

Regardless of their religious belief, Japanese often go to a place to pray for good luck. It is also common for Japanese to get a charm and keep it close to oneself for good luck (62% compared with 52% in Taiwan, 17% in Korea and 8% in China).

In response to urban migration and changes in social attitudes, some of the religious practices have been abandoned. The presentation will also discuss differences between religious and nonreligious people in political and social value orientation.

IWATA, KOH* (Momoyama Gakuin University, Japan)

Transformation of Friendships: Diversifying Intimate Relationships in Japanese Youth

The purpose of this report is to clarify the transformation of friendships in Japan over the past 20 years using quantitative data. In particular, we will examine a remarkable weakness in the expansion tendency of friendships, which can be said to be the collapse of the "friends bubble".

This report primarily utilizes data from three surveys on actual media usage conducted by the Mobile Communication Research Group, targeting individuals aged 12 to 69 across Japan (2001, 2011, and 2021). Specifically, it aims to reveal the changes in the number of friends and the ways of interacting with friends over the past 20 years, in relation to media usage. Next, it investigates the factors contributing to the weakening of the inclination to expand friendships.

The current survey has revealed a notable weakening of the inclination to expand friendships. Regarding this trend, it is explained that in the context of reflexive modernity, friendships developed through the process of "disembedding" (a shift from extrinsic criteria, such as kinship and neighborhood, to intrinsic criteria). Nevertheless, due to the anxieties associated with constructing intrinsic criteria, these friendships underwent a process of "reembedding." However, the diversity of friendships has not necessarily been lost, and this perspective of a return to external criteria does not fully explain the situation. It reveals that the privilege of relationships previously categorized as 'friends' has diminished amid the diversification of intimate relationships.

IWINSKA, KATARZYNA* (Collegium Civitas, Poland)

Women Energy Citizenship in Net-Zero Target

Energy citizenship, a concept that frames individuals and communities as active participants in energy transitions, has gained significant attention as a critical element in achieving sustainable and just energy systems. This paper builds on energy citizenship scholarship and explores women's energy citizenship as a multidimensional and evolving phenomenon. It analyses current trends in energy research, focusing on the intersection of energy transition, justice, climate action, and environmental awareness, particularly within European contexts.

The main aim of this study is to discuss the role of women in energy transitions and their contribution to achieving net-zero goals through the lens of "energy citizenship." Drawing on my recent empirical research, including 1) case study of women's perception of the decarbonisation process in the mining region in Poland (Silesia), (2) the hydrogen technologies narratives and opinions on green hydrogen, and (3) the survey on the attitudes towards the Green Deal and energy transition (2024), I examine the strategies adopted by women and their perceptions of rights, responsibilities, and motivations in response to climate change.

Through interviews with active women in mining communities, supplemented by surveys and focus group interviews (FGIs), I analyze gendered perceptions of coal, renewables, new technologies adoption, and energy transition in general. By applying the frameworks of energy citizenship, energy justice, and knowledge-power relations, I explore how women and men perceive and respond to the evolving energy system of post-petromodern era.

IZAGUIRRE, LORENA* (FNRS & UCLouvain, Belgium)

Classed Experiences of Exclusion and Uncertainty Among Displaced Women from Venezuela

This article examines how university-educated women displaced from Venezuela navigate exclusion and uncertainty, employing a transnational and intersectional lens. Amid the ongoing mass displacement from Venezuela, research has shown that Venezuelan migrant women in Peru experience various forms of discrimination, including racialization, sexualization, and xenophobia. However, the role of social class in shaping these exclusionary processes has been underexplored.

Drawing from 25 biographical interviews with university-educated Venezuelan and Peruvian-Venezuelan women who arrived in Peru after 2015, this article analyzes how class-based resources from the (upper) middle classes are reconfigured as these women move across different social stratification systems and privilege regimes. By focusing on educated women moving from the South, the study sheds light on an understudied group in

migration research. It challenges the assumption that all displaced people are poor or class-less, emphasizing the effects of class-based resources on mobility trajectories.

The findings reveal that, while these women's habitus locates them in (upper) middle-class repertoires, rooted in their prior social status, educational level, and consumption habits, they are often limited to low-skilled, informal jobs, leading to downward social mobility. This paper conceptualizes class not only as a socioeconomic position but also as an internalized identity and subjective positioning. It shows how these women resist their loss of status by deploying distinction discourses based on embodied cultural capital (e.g., *savoir être*, ability to navigate the bureaucracy), even as their institutionalized cultural capital is unrecognized or devalued in the Peruvian labor market. They also engage in "Othering" by contrasting themselves with less-educated Peruvians to affirm their own status.

Finally, the article argues that the systemic degradation of living conditions in Peru, coupled with rising xenophobia and aporophobia, exacerbates these women's uncertainty and hinders their ability to plan for the future.

WG06-895.3

IZAGUIRRE, LORENA* (FNRS & UCLouvain, Belgium)

Contra La Hegemonía Del Concepto De "Integración": Repensar Migraciones y Movilidades Desde El Sur

Este artículo articula los aportes teóricos de la colonialidad (Quijano) y del feminismo interseccional para contribuir a la literatura que cuestiona la hegemonía del concepto de integración en los estudios sobre migraciones y movilidades. En el marco del debate actual sobre la descolonización de los estudios migratorios y la cuestión migratoria como un problema de justicia social, el artículo analiza los usos, promesas y efectos del concepto de integración.

El concepto de integración abarca procesos diferentes en los países de origen, tránsito y destino de migrantes, y sus implicaciones varían entre los países del Norte y del Sur. Al estar enraizado en epistemologías del Norte, no solo normativiza las experiencias migratorias, sino que también contribuye a la reproducción de injusticias epistémicas al invisibilizar los saberes situados y las trayectorias de movilidad que no se ajustan a los parámetros occidentales. Más allá de las críticas a sus implicaciones normativas e ideológicas, el uso del concepto de integración invita a cuestionar la percepción de los procesos migratorios como excepcionales y la necesidad de políticas específicas para integrar, incluir o incorporar a las personas en movilidad. ¿Tiene sentido el concepto de integración, tal como se plantea desde el Norte Global, en los contextos y realidades de los países del Sur?

Siguiendo la línea de investigadores que han abogado por romper con este concepto, por estar arraigado en lógicas de colonialidad y racismo, este artículo se apoya en la literatura producida desde y sobre América Latina. Tomando como punto de partida la literatura sobre las políticas y programas de integración para migrantes y refugiadxs venezolanxs en la región, el artículo busca identificar otros enfoques epistémicos y políticos para pensar lo que actualmente nombramos como "integración," dando un rol central a las voces y conocimientos de los migrantes.

Home As a Concept of Belonging: Narratives of Three Generations of Kurdish Women in Diaspora

This paper analyzes the meanings of home(s) found in the biographical narratives of three generations of Kurdish women who live in the diaspora in Germany. Blunt and Dowling (2006) argue that home must be considered a spatial imaginary (the relations between feelings, attachment, and dwelling) and a political space of negotiation and contestation. This sociological analysis of 'de-territoriality' and displacement of an ethnic group is guided by the issue of how displaced populations deal with questions of 'home' as a concept of belonging(s) such as origin, homeland, nation, diaspora and the hosting country. This research focuses on the collective memories, life stories, migration experiences, and diaspora effect in (re)making homes, sense of belonging(s), and identities from a gendered and inter-generational perspective. This study will show what it feels like to feel at home in terms of belonging and seen from "migration-home nexus" (Boccagni, 2017:2): what is home, how diaspora and hosting country influence the idea of home, and what are the inter-generational transmissions of the sense of home, belonging, and identities? Analysis of the 'sense of belonging' found in the narratives of Kurdish women in the diaspora shows transformation not only from one generation to another but also indicates a broader social change because experiences of belonging and identities are dynamic and sensitive to changes since self and society are interconnected and cannot be analyzed separately (Simmel 1964; Elias 2001; May 2011).

Gender, Ageing, and Transnational Social Protection: The Case of Ukrainian Eldercare Workers in Italy

The present work delves into the complex connection between gender dynamics and transnational social protection, looking at the exemplary case of older Ukrainian eldercare workers women in Italy. The migration of eldercare workers from Ukraine to Italy began in the late 1990s. Since then, Ukrainian eldercare workers have been actively involved in transnational care practices to support their families. At the same time, they have become a crucial part of the workforce providing essential care for older people within the Italian welfare system. However, existing literature suggests that Ukrainian eldercare workers may have limited access to social protection, which could become even more challenging as they age in migration (Vianello and Escrivá, 2019). This study aims to shed light on how gender roles and expectations influence the experiences of migrant eldercare workers and their access to transnational social protection resources. It argues that gendered assumptions about care work within the Italian welfare system, compounded by the gendered responsibilities of Ukrainian eldercare workers towards their families in Ukraine, have a profound impact on their life trajectories. By drawing on a qualitative dataset collected in Italy between July 2023 and January 2024, this study seeks to provide valuable insights into the underexplored topic of the aging experiences of migrant eldercare workers. The findings will contribute to a better understanding of the complexities surrounding transnational social protection, transnational families, and gender dynamics urging for the need to address the challenges faced by migrant eldercare workers.

Beyond Production: A Sociological Study of Occupational Hazards and Their Impact on the Health of Workers at a Car Plant in Tangier

This article presents a field study conducted in a car plant in the city of Tangier, aimed at exploring risk factors for workers in the automotive industry. Based on a sample of 294 workers, the study revealed that 46.3% suffer from stress and psychological pressure, mainly due to repetitive tasks and strict productivity targets.

Physical and mental health problems such as sleep disorders (34.4%), muscle spasms (16.3%) and migraines (15%) were also identified. The main physical risks were noise (37.4%), heat (25.9%) and air pollution (22.4%). A further 28.6% of workers reported a lack of workspace and 27.2% a lack of maintenance of tools and machinery.

Production pressure is a stress factor and also has a significant impact on workers' performance, with 80.3% of those questioned explaining that each team has to produce between 400 and 500 cars.

It should be noted that the study revealed that 61.9% of workers resorted to drugs to cope with stress at work. According to the participants, certain jobs such as sheet metal work have a higher rate of accidents at work (66%), followed by logistics (16.3%), and it is important to note that 79.6% of these accidents occur at night.

As far as night work is concerned, workers indicated that bonuses motivate them to work at night despite its negative impact on their health (87.8%).

Alianzas Femeninas Que Mejoran El Estatus Laboral

En diferentes contextos y países, las mujeres se han organizado como sujetos colectivos para obtener mayor reconocimiento social. Analizamos dos casos muy diferentes entre sí, pero con similitudes. Una colectiva de mujeres en México que se constituye en torno a la formación y la oferta de servicios domésticos de reparaciones para el hogar (fontanería, electricidad, pintura, albañilería, carpintería). El otro caso es el de una asociación española de empleadas de hogar, en su mayoría inmigrantes, que se colectiviza para concienciar y transformar las precarias condiciones de trabajo que caracterizan la contratación y el empleo en este ámbito de actividad.

El objetivo es conocer y comparar el proceso de emergencia y organización de dos colectivas de mujeres en torno al continuo trabajo remunerado y no remunerado, y las reglas de inclusión y permanencia que establecen con sus integrantes, como así también, las que las diferencian de organizaciones masculinas. La metodología es la realización de entrevistas en profundidad para conocer las motivaciones y condicionamientos sociales, culturales y familiares de las mujeres.

La pandemia fue un catalizador de formas de asociación entre mujeres que, gracias al apoyo mutuo, tejieron redes informales. Aun cuando son organizaciones que persiguen el lucro, tienen una alta cohesión moral entre sus integrantes y reglas de sororidad entre compañeras y para con las clientas.

El estudio habilita una reflexión en torno al continuo entre trabajo remunerado y no remunerado. La colectiva de oficios ofrece un trabajo técnico cualificado a clientas que se sienten más seguras al contratar mujeres

para que realicen trabajos de mantenimiento en sus domicilios. En el caso de la asociación de empleadas de hogar, buscan establecer colectivamente unas reglas para delimitar las tareas por las que se las remunera, para negociarlas informalmente en los lugares de trabajo y mejorar las condiciones de ejercicio de esta profesión.

"Towards an Innovative Organizational and Pedagogical Model: An Analysis of the Implementation of Secondary Vocational Education (EPS)"

La investigación busca describir la implementación de la Educación Profesional Secundaria (EPS) en la Argentina durante 2022-2024. La EPS es una nueva oferta educativa, que otorga certificación profesional y título secundario. Se implementa desde el año 2022 (Res. CFE N409/21) y está destinada a jóvenes entre 14 y 18 años que no iniciaron la escuela secundaria, que la iniciaron y abandonaron, o que presentan sobreedad.

En este marco, las reformas al régimen académico cobran relevancia frente a las dificultades para incluir a todos/as los/as estudiantes en edad escolar en la escuela secundaria. Como parte de estas iniciativas, la EPS busca, entre sus objetivos prioritarios, hacer efectivo el derecho a la educación secundaria. Con este propósito despliega un formato escolar innovador, que involucra un cambio en el modelo organizacional y pedagógico al de la escuela tradicional. Ofrece una cursada flexible y personalizada; integración curricular (respondiendo a las dificultades de la secundaria común); reconocimiento de trayectos formativos anteriores, saberes y experiencias laborales previas; acompañamiento personalizado; grupos de hasta 15 estudiantes y espacios para tutorías. En particular, se busca profundizar aquí en el análisis de los dispositivos de acompañamiento, que implican un especial esfuerzo por atender las particularidades que asume cada trayectoria, con el fin de sostener el vínculo pedagógico.

El estudio utilizó una metodología cualitativa orientada al análisis de la implementación de la EPS en las siguientes jurisdicciones: Corrientes, Misiones, Salta y Buenos Aires. En el marco de un estudio de caso múltiples, se realizó la recopilación de normativa, entrevistas al equipo del INET -a cargo del diseño de la propuesta- y a referentes jurisdiccionales. Asimismo, el trabajo de campo incluyó 89 entrevistas individuales y grupales a estudiantes, docentes, instructores/as, coordinadores/as de trayectorias y equipos técnicos, además de observaciones de clase en cada una de las sedes visitadas.

Dignity Versus Advancement: How Social Class Shapes Students Strategies for Finding Work and Jobs They Take in College

Colleges are recruiting more lower-income college students and undergraduates who are the first in their families to go to college. But do they know how to support them? Although undergraduates from all class backgrounds work while attending college, little is known about how students approach finding work and the benefits they reap from different on-campus roles. Drawing on interviews with 110 undergraduates at Harvard University, we show that in the absence of clear institutional expectations surrounding on-campus work opportunities, students draw on class-based strategies to determine which jobs are "right for them." Upper-income students pursued "life of the mind" jobs that permitted them access to institutional resources and networks. Alternatively, lower-income students pursued more transactional "work for pay" positions that yielded fewer institutional benefits and connections. The consequences of these differential strategies were amplified during COVID-19 campus closures as work-for-pay positions were eliminated while life of the mind continued remotely. Through documenting heterogeneity in work experiences, we reveal a class-segregated labor market on campus and extend previous analyses of how university practices exacerbate class differences and reproduce inequality.

Corporations As Arenas of Responsibility and Irresponsibility: A Multi-Level View

We examine the relationship of corporate responsibility and irresponsibility across multiple levels of analysis. While corporate responsibility and irresponsibility were often considered to be opposites, recent literature has problematized the dynamic relationship between them. We argue that corporate responsibility may be an ethical response to past irresponsibility by companies, but also ultimately enable new forms of corporate irresponsibility. In this paper, we explore these dynamic tensions from a Polanyian perspective of embedding and disembedded capitalism. We examine these movements and countermovements at different levels of analysis in order to show the potential and limitations of corporate responsibility in addressing core sources of irresponsibility. At the societal level, we explore the emergence of 'transparency regime' focused on market-oriented disclosure. At the organizational level, we focus on the phenomenon of greenwashing through decoupling of positive responsible actions from the prevention of negative irresponsible actions. At the individual level, we focus on the psychology of moral hypocrisy and its role for consumers and employees. Taken together, the paper aims to make a theoretical contribution to disentangle and understand the ambivalence related to corporate responsibility among both scholars and citizens.

Categorization and Relational Processes in Breeding : The Ties between Animals and Breeders' Families

The aim of this paper is to show that in livestock farming, the categories of livestock, pets, work animals and stray or feral animals are more porous for farmers' families than is commonly thought (E. Gouabault & C. Burton-Jeangros, 2010).

Although pigs and cattle aren't considered pets by breeders and their families, specific relationships are in some instances forged that come close (J. Porcher, 2002). Sometimes at odds with the relationships studied between humans and pets, we'll show that a certain affectivity, but above all a particular "familiarity" emanates from these relationships. The farm is not only the place where the breeding activity takes place, but often also where the breeder's family lives. These spaces of life and production then overlap, creating interstices that enable relationships between family members and animals (D. Haraway, 2021). Processes of habituation and individualization then take place, leading to the establishment of genuine attachments, which can sometimes even have a real impact on the operation of the breeding activity.

While the conditions under which the animals are raised and their purpose call these relationships into question, especially in the case of animals intended for the family's personal consumption (N. Vialles, 1998), we shall see that they are ultimately to be seen as the basis of these particular conditioned relationships.

More than just a place to live and produce, the farm is a veritable microcosm, where various inter-species relationships are forged. In addition to production animals, we often find the herding dog, whose status within the family is always ambiguous, since it's somewhere between a pet and the farmer's working animal. The place of so-called "farm cats" is also interesting to study. Stray on farms, they have gradually gained the status of pets for breeders and their families, despite the health issues they may raise.

Future of Identity in the Global South

Future of identity in the global south

First, the global south has always been on the receiving end of the ripples of war, economic fallout or the perturbation posed by climate change, the global south is exposed to this formidable threat with no signs of contrition from the north. The article elucidates the global media's proclivity towards the west and how intransigence towards the global south has shifted the trust from media to self-representation and active engagement through forums like BIMSTEC, Indian Ocean Region Association (IORA), ASEAN, SAARC & recently concluded G-20 in India.

Second, The New age colonialism

Data being the new gold, the global south becomes the repository of data for developed economies with a vast consumer base while mechanization for economies is imperative, it exposes the grey areas of the nation with AI driven tech industry being inherently biased towards local cultures leading to local erasure, triggering the inchoate culture of technology in developing nations which are shaping individual identities, to destabilize democracies. However, the article highlights most formidable solutions to the high percentage of unemployment risk posed by AI.

Third, Turning adversity into opportunity

Global souths abnegation to submit to the global norths whims and fancies have upon itself to revolutionize its economies by AI, actively deploying AI into agriculture, security, trade or value chains. The article examines about how global south is coping and shaping its own destiny for instance India and Nigeria.

Fourth, Shaping Narratives

Global south has been able to shape new narratives by engaging in intergovernmental forums highlighting how climate justice eludes climate change and inept efforts by the developed nations towards fulfilling its climate objectives.

Finally, AI and media has a bigger role in addressing the inequalities to shift from Sabre rattling towards global rule-based order for maintaining equilibrium.

JAKANI, YASSIR* (Ruhr University Bochum, Germany)

Trauma, but Whose? Memories of Right-Wing Extremist Violence in Germany Since 1990: Continuities and Ruptures in Negotiation and Recognition

The paper investigates the historical and contemporary treatment of right-wing violence in Germany – focusing on the perspectives of victims and affected communities. It highlights the insufficient historical contextualization, which often leads to these acts being treated as isolated incidents. Addressing these violent acts (e.g., arson attacks on refugee shelters or racist assaults) involves not only critiquing and mourning them but also explicitly acknowledging the suffering of the victims and those affected. This challenge is crucial for both pluralistic societies and the academic community.

Historical discourse analysis is used to show how discourses not only shape social perceptions but also construct social realities. Discourses are understood as structured patterns that are closely linked to power and both constitute and restrict knowledge and reality. Drawing on the work of Foucault, this approach is based on the interdependence between discourse and power and thus enables a nuanced examination of historical conceptions of reality and power relations – which are primarily expressed through language, though not exclusively. The analysis therefore attempts to uncover the conditions under which specific knowledge and truths are recognized in particular contexts. This includes exploring why certain (historical) statements by political actors, security agencies or victims of right-wing violence are (not) publicly articulated, acknowledged, or overlooked.

Based on an analysis of the relevant discourse in Germany since the 1990s, the paper identifies continuities and ruptures in public recognition of right-wing violence. The paper examines which narratives gain legitimacy in the

public sphere and why these particular narratives hold discursive power. It also highlights how competing narratives are constructed, institutionalized and contested. By providing crucial insights into the social-historical treatment of victims of right-wing violence, the paper deepens our understanding of how processes of recognition can either alleviate or perpetuate trauma and underscores the need for an inclusive memory culture.

Feminist Politics for a Multipolar World? a Speculative Paper from a Transnational Feminist Perspective.

Scholarly and popular analysis related to the emergence of a 'multipolar world' tends to focus on the political and economic aspects of the relative decline of the US-dominated "Rules-Based International Order." Highlighting the need for more scholarly attention to the social and cultural implications of these developments, this paper speculates on the possibilities for feminist space/s in an emerging multipolar world. Rather than offering a framework for action my aim is to elicit feminist debate around the questions: What kinds of alternatives might open for anti-oppressive feminist politics to dismantle discursive cultural and civilizational dualities rooted in histories of European colonialism and post-Cold War US hegemony? How can vernacularize the universalist/hegemonic framing of human rights, gender justice and freedom and so on? How can we ensure that the nascent transnational and global solidarities related to BLM and Settler Colonialism are prioritized in the anticipated South-South solidarity? The context for these questions is my interest in decolonial transnational feminisms, my decades of research with both 'secular' Muslim feminists and 'Islamist' women in South Asia and Canada, and my insight that many Muslim and Arab societies are increasingly invested in a multipolar political order.

Equal Rights, Equal Voices: The Crpd and the Pursuit of Legal Capacity for Persons with Intellectual and Psychosocial Disability

The adoption of the UN CRPD marked a new social, legal, and political paradigm that recognizes to all persons, regardless the complexity of their support needs, the right to "equality before the law, on equal terms with all other citizens, in all areas of their life" (art. 12). From 'objects' of charity and pity, persons with disabilities were recast as 'subjects' and holders of rights, while States were required to put in place the necessary supports to ensure citizenship and participation for all. However, prevailing notions derived from the so-called 'capacity contract' (Simplican, 2015), which bases full citizenship on a threshold level of mental capacity and excludes those who fall below it, coupled with the lack of adequate supports for wellbeing and full exercise of rights in the community, continue to prevent participation and citizenship to many persons, even where (as in Portugal), legal reforms have been initiated.

This paper explores these tensions, through six case studies that encompassed the collection of life stories of persons with intellectual and psychosocial disabilities who have been deprived or limited in their legal capacity. These narratives provide an in-depth understanding of the trajectories and experiences of these persons, their perceptions about their rights and the challenges they have encountered to exercise self-determination. These narratives are contrasted with the analysis of the court sentences and related documents to understand the arguments used by the courts to justify the sentences, and discuss the paradoxes and contradictions they entail.

This analysis is informed by a Sociology of Human Rights lens, which is useful to uncover how social contexts and power relations, institutional arrangements, societal reactions and representations hinder the realisation of human rights and provide a justification for measures intended to "protect" persons with disabilities that may, in fact, compound their vulnerability to abuse and violence.

Loneliness and Perceived Social Isolation: The Role of Personal Networks and Online Interactions

This study explores the determinants of loneliness and perceived social isolation, focusing on the roles of personal networks and social context characteristics. Perceived social isolation is an individual's subjective feeling of disconnection, regardless of actual social interactions. Loneliness arises from a perceived gap between desired and actual social relationships, encompassing both the quantity and quality of connections. We examine the associations between these feelings and specific characteristics of personal networks, including their structure and composition of social roles, support exchange, temporal dynamics, and modes of communication.

First, we focus on personal network characteristics as potential determinants of perceived isolation and loneliness: network size; emotional closeness; geographic distance; network cohesion; diversity of roles and interaction foci; sociodemographic diversity; and network turnout. Second, we investigate the role of online interactions, exploring whether virtual communication mitigates or exacerbates these feelings. While online platforms expand the reach of social networks, their effects on perceived connection and satisfaction with relationships remain mixed. We hypothesize that reliance on online communication weakens social bonds typically fostered through face-to-face interactions, potentially leading to a greater sense of isolation and loneliness. Finally, we consider whether the effects of personal network characteristics on perceived isolation and loneliness vary by gender, race/ethnicity, and migration status.

Using three waves of egocentric network data from the UC Berkeley Social Network Study (UCNets), which provides detailed longitudinal measurements of personal networks and individual-level observations, this study makes both theoretical and empirical contributions. First, it refines and advances theories about social and relational determinants of loneliness. Second, it provides new insights into how modern modes of social interaction, particularly online communication, influence negative feelings associated with social interactions. Ultimately, this study enhances understanding of the complex interplay between social context, individual characteristics, and modes of interaction in shaping experiences of loneliness and social isolation.

Social Empathy and the Korean Wave: Building Transnational Social Empathy through Fandom

Social empathy is a concept that has recently gained attention for its role in alleviating social conflict, not only within a single society but also among different societies. By fostering the understanding of situations and problems that other groups of people face, social empathy can lead to the development of policies and practices that address social conflict in ways that realize and promote social justice. Social empathy is an especially important resource in the contemporary world where we are witnessing many social groups showing anger, hatred, and even violence against other social groups. The Korean Wave refers to the global spread of Korean cultural products, predominately K-pop and Korean dramas. One key factor behind the success of the Korean Wave is its fandom, which consists not only of consumers but also active participants who contribute to the promotion and dissemination of the Korean pop culture. In this sense, they function both as consumers and producers of the Korean Wave content. These fans are more likely to open to other cultures, transcending their ethnic-based affiliations, which leads them to have open- mind to the people of different countries.

An example of this can be seen in the social empathy demonstrated by the Japanese youth toward Koreans despite a long history of political conflict

between the two countries. This paper explores the potential for social empathy to be fostered through the fandom of the Korean Wave, supported by the data from in-depth interviews with Japanese youth.

"(Not) Gonna Dig": Mapping Controversies in the Anthropocene Era of Lithium Extraction in Serbia

Since its revitalization in 2023, Rio Tinto's (a British-Australian multinational company) plan to open a lithium mine in Serbia's Jadar region has sparked extensive public debate. The project's status, implementation, and justifications by authorities and the corporation have triggered conflicting reactions, ranging from concerns over the energy and economic colonization of Serbia to fears of environmental damage. These controversies arise within the context of radical uncertainty characteristic of the Anthropocene, where unpredictable energy transitions and metabolic interdependencies shape new geosocial conflicts, particularly around extractive practices. Additionally, these debates, situated at the intersection of politics and science, unfold through digital platforms, amplifying public engagement. This paper draws on Latour's discussions of Gaia and the politicization of science, alongside digital sociology's focus on the relationship between technology and knowledge. It employs controversy mapping as a digital method to untangle the complex web of events, protests, documents, and research surrounding the lithium mine debate, focusing on developments since the summer of 2023 and using a large digital dataset. The mapping process follows several steps: first, it identifies key statements and constructs a "tree of disagreement" about the project (what); next, it links these statements to their respective actors (who); then, it visualizes networks of alliances and oppositions between actors (how). The broader goal is to situate these networks within the larger context of meta-controversies related to the Anthropocene, particularly resource sovereignty (where), and to trace the evolution of these debates over time, highlighting when certain arguments become dominant and when the debate intensifies (when).

JANSSEN-WNOROWSKA, IZABELA* (University of Vienna, Austria)

Narratives of Conflict and Community Life in Vienna's Public Housing: Exploring Imagined Communities, Symbolic Roles and the Responsibility of Integration

In my dissertation, I examine the complex social dynamics within Vienna's public housing model *Gemeindebau*, originally intended for the Austrian working class but now home to many people with migration background as well. As these communities evolve, the coexistence of culturally and socially distinct groups generates a range of tensions. Using the constructivist Grounded Theory approach and qualitative methods such as participant observation and interviews, this study explores social, cultural and emotional dimensions underlying these conflicts.

Conflicts often emerge not from direct confrontations but from imagined communities formed through narratives that attribute fabricated traits to different groups. Seemingly minor disputes—such as children playing loudly or damaging shared spaces—mask deeper tensions. Children, in particular, play a significant role in these dynamics, often becoming symbolic figures. They are used as a focal point, with disputes centered on their behavior, but in fact, these conflicts represent broader issues of cultural integration and belonging.

The older residents without migration background find themselves in conflict with younger migrant families, using everyday incidents as proxies for more profound cultural challenges. While many residents assert that they hold no anti-immigrant views, subtle biases emerge through language, body language, and communication patterns. Residents with migration background sense these underlying hostilities but struggle to fully articulate them, as they are often expressed through micro-aggressions and indirect cues. These dynamics are influenced by broader societal structures, where expectations of integration are placed on individuals, often without adequate support or preparation. The complexity of navigating these challenges falls largely on those directly involved in interactions, while the broader framework is shaped by decisions from higher levels of governance.

Ultimately, this research demonstrates how these conflicts, although appearing mundane, reveal underlying power dynamics and emotional undercurrents.

RC21-337.3

JANSSEN-WNOROWSKA, IZABELA* (University of Vienna, Austria)

Symbolic Capital and Symbolic Power: Understanding Coexistence and Conflict in Vienna's Social Housing through a Bourdieusian Lens

Based on my ongoing dissertation project, this paper applies Pierre Bourdieu's theoretical framework to analyze the conflicts between migrant families and long-established residents in Vienna's *Gemeindebau*. Once emblematic of working-class solidarity, these social housing estates are now sites where different *habitus*, shaped by distinct social and cultural backgrounds, come into conflict. Everyday disputes—over children playing or the use of communal spaces—often reflect deeper meanings, revealing struggles over symbolic power, symbolic capital, and the maintenance of established identities.

Bourdieu's concept of symbolic capital is critical to understanding how long-established residents, though not part of the ruling class, view themselves as guardians of the *Gemeindebau*'s historical ethos and resist the housing of migrants. They perceive newcomers as threats to both the physical space and the symbolic order of the community. In doing so, they attempt to assert control over communal norms, wielding whatever symbolic power they have to resist the changes that migrant families represent. Despite their disadvantaged position, these residents enact symbolic violence—often invisible, yet powerful forms of exclusion manifesting in seemingly trivial interactions.

At the same time, migrant families, often with limited social and cultural capital, navigate a complex social field where their presence challenges established power dynamics. Bourdieu's critique of how dominated groups internalize the logic of the dominant class is key here. Both conflict parties are disadvantaged; yet, in their efforts to secure their place in the *Gemeindebau*, they inadvertently replicate broader hierarchies of exclusion defining their marginalized status.

The *Gemeindebau* becomes a contested space where different forms of capital—economic, social, and cultural—are continuously negotiated. This presentation argues that these micro-level conflicts reflect larger structural inequalities. By applying Bourdieu's theories, it sheds light on how power, *habitus*, and symbolic capital shape the lived experience of both migrant and non-migrant residents in urban settings.

JANSSON, JENNY* (Uppsala University, Sweden)

UBA, KATRIN (Uppsala University, Sweden)

Threatening to Strike: How Swedish Unions Are Using Notice of Industrial Action

The labor movement is known for using strikes as a primary strategy to achieve its goals. However, we demonstrate that sometimes merely threatening to initiate industrial action can be just as effective as actually striking. While other social movements might use protest announcements to inform and mobilize their supporters or strategically pressure their targets for concessions, the procedure of striking is regulated by law in most context. In the Swedish case, examined here, every legal industrial action requires a notice of industrial action seven days prior to the strike. Each of these announcements signals a deadlock in the bargaining process and constitutes a credible protest threat within the ongoing labor dispute.

Using unique archival data of all announced and executed notices of industrial action by the Swedish labor movement over four decades, we show that about one-fourth of these threats were never carried out. Assuming that non-execution indicates that some goals were achieved (at least to some degree), we analyze which types of unions (public or private sector, large or small, male- or female-dominated), and under what conditions, are more likely to secure concessions through the threat of protest.

Unexpectedly, the results provide no support for the argument that the perceived costs of potential disruptions are crucial for securing concessions. Unions in the transport sector are more likely to follow through on their threats compared to those in other sectors. Over the past 40 years, the number of 'empty' threats has increased, indicating that the declining size of the Swedish labor movement has not diminished the likelihood of obtaining concessions from employers without resorting to actual industrial action.

How Are the Children? Experience-Based Perspective on Global Indicators of Early Child Development and Well-Being

The expansion of global application and accountability afforded in the transition from the Millennium Development Goals spurred the global networks of researchers, practitioners, and agencies to ensure child well-being, development and education were included in relevant goals' targets and indicators in the newly formulated Sustainable Development Goals in 2015. This was built on recognition, using the evidence emerging in the first two decades of the century, that despite diversity of cultures and geographies, equitable and comparable social indicators can be designed for young children. This presentation will draw on my experience of development and use of several indicators of development in young children (e.g., Early Development Instrument, Early Development Index and Early Development Index 2030, Measuring Early Learning and Quality Outcomes) across multiple settings and cultures. Three key issues will be addressed: 1) the holistic nature of concepts of health, development and well-being in early childhood and its implications for measurement; 2) changing landscape of the need for informative yet comprehensive indicators to inform policy and practice; 3) challenges in feasibility and applicability of measures and interpretation of indices across cultures and geographies. The presentation will conclude with the promises for better understanding of children's well-being, with particular references to the changing world. Global shocks such as COVID-19 pandemic and climate crisis will be used as examples of how better understanding of children's development and well-being could provide means to advocate for attention and policy at all governing levels and information on how best to protect children and prevent long-lasting negative impacts of adverse events.

Academic Dependency and Semi-Peripheries of European Sociology

This paper analyses peculiarities of academic dependency in sociology, with a specific focus on the European context. It argues that the conventional geographical frameworks used to study academic dependency needs reconsideration since this dependency transcends the Global North - Global South framework and exists inside the European academia as well. This system of dependency is rooted in hierarchical distinctions between "large" and "small" countries, as well as historical divisions created by the "Iron Curtain". Key characteristics of this dependency are the growing dominance of the English language in the national sociologies of smaller European countries, unequal distribution of resources and opportunities, reliance on publications in English-speaking journals, and adherence to standard research topics.

JANUŠAUSKIENĖ, DIANA* (Lithuanian Centre for Social Sciences, Lithuania)

National Security and Eastern Europe: A Sociological Reframing

The goal of this paper is to critically discuss the frame of Eastern Europe within the context of Russia's war against Ukraine. In the research, special attention is given to the analysis of causes and consequences of framing Europe along the lines of cold-war frontiers. The issue of Eastern Europe as a frame is analyzed by concentrating on the impact of this framing for subjective and objective security in Lithuania and beyond. Firstly, the paper examines shifts in external and internal perceptions of security in the region and its implications. Secondly, it explores changes in migration flows and their ramifications (increased immigration flows to Lithuania from Ukraine, Belarus, and Russia), as well as other changes that have occurred due to the Russia's war in Ukraine. Methodologically, this paper utilizes a synthesis of previous studies, content analysis of documents and texts, and analysis of statistical and empirical data from five representative national surveys and fifty qualitative semi-structured interviews. In addition, the sociological datasets of Eurobarometer and the European Values Study as well as statistical data from Eurostat are used for a contextual analysis of the researched problems.

Intersectional Lives: Participatory Video for Inclusive Urban Imaginaries

Participatory Video (PV) has emerged as a powerful methodological tool in urban studies, offering a platform to uncover complex social realities and challenge dominant narratives through community-driven storytelling. This paper critically examines our experience in the PopuLab employing PV within the applied research project *Gridding Equitable Urban Futures in Areas of Transition* in Cali, Colombia (GREAT). Along the research process we deployed a collaborative video agenda called "*Intersectional Lives*" to explore the multiple experiences of residents in self-built neighborhoods.

Our methodology centered on engaging diverse community members, including LGTBQ individuals, people with functional diversity, community kitchen leaders and members, among others. Through intensive training in video production techniques and participatory methods, we facilitated a process that enabled participants to become active producers of their own narratives. This approach generated rich, nuanced data while fostering empathy, solidarity, and reflexivity among community members.

The PV process revealed intricate layers of intersectionality present in informal urban contexts, highlighting how diverse identities intersect to shape lived experiences. Our findings show that PV can effectively capture and communicate complex social realities often overlooked in conventional urban planning discourses. Enabling a deeper understanding of communities, the video served as a powerful means for dialogue, building bridges between community members and local governments.

Critically, our research highlights the potential of PV as a transformative tool in urban studies. By amplifying marginalized voices and facilitating their integration into broader urban narratives, the PV process challenges traditional power dynamics in knowledge production and plays a crucial role in formulating more inclusive self-built neighborhood upgrading strategies that consider the multiple social identities and interactions shaping these urban areas. This study complements the growing body of literature on participatory methodologies and intersectional approaches in urban studies, offering insights on how PV can contribute to more inclusive urban policies.

JARROUX, PAULINE* (Université libre de Bruxelles, Belgium)

De Quoi La Criet Est-Elle Le Nom ? État De Droit Et Droit De l'État Au Bénin

C'est en 2018 qu'a été créée la Cour de Répression des Infractions Économiques et du Terrorisme (CRIET), qui siège désormais à Cotonou, au Bénin.

Cette juridiction spéciale, largement mieux dotée en moyens matériels que les tribunaux de droit commun du pays, est présentée comme répondant aux besoins d'une justice efficace et transparente, et aux enjeux des « nouvelles criminalités » (terrorisme, blanchiment de capitaux, cybercriminalité etc.) auxquelles le Bénin est désormais confronté.

Si elle est réputée pour la dureté de ses décisions, elle est aussi critiquée dans le pays pour sa « politisation », en écho à certaines affaires qui y ont été jugées, impliquant des opposants politiques ou, au contraire, des proches du pouvoir. Son installation a, pour de nombreux observateurs et analystes, confirmé le constat du « tournant autoritaire » pris par le pays, à la suite de l'élection en 2016 du Président Patrice Talon.

Ma communication vise à interroger ce que signifie, pour le personnel et les professionnels du droit et de la justice, travailler à la CRIET, alors que le pays était jusqu'ici loué pour la vitalité de sa démocratie. Quelle forme y prend, et où se loge le « tournant autoritaire » ?

Dans le travail quotidien, le respect des normes, la probité des magistrats, l'accueil des justiciables, sont mis en avant comme des éléments distinctifs du fonctionnement de la juridiction. Le procureur et ses substituts, mes principaux interlocuteurs au cours de mes dix premières semaines d'enquête, sont eux aussi soucieux du respect des procédures. L'interventionnisme politique y serait, en somme, localisé, circonscrit, de l'ordre de l'exceptionnel. Cette grille de lecture est-elle pertinente ? Que permet-elle de dévoiler, ou au contraire d'obscurcir, à propos du fonctionnement quotidien du droit et de la justice dans un régime « illibéral » ?

Contested Waterscapes: Power, Exclusion, and the Politics of Urban Ecorestoration in Bengaluru's Kempambudhi Lake

In the context of burgeoning urban environmental challenges, ecological restoration has emerged as a strategic response in Indian metropolises, with Bengaluru leading such initiatives by rejuvenating its historical man-made lakes to combat water scarcity and enhance environmental sustainability. This article delves into the Kempambudhi Lake Restoration Project, exploring how ecorestoration drives convert ecologically sensitive urban zones into contested social territories, often excluding the urban poor and marginalized communities by restricting their rights and access to water and lake resources.

This study employs Situated Urban Political Ecology (SUPE) as its theoretical lens, focusing on "situatedness" to dissect relational power dynamics among diverse stakeholders within local socio-political contexts. Utilizing qualitative methodologies such as In-depth Interviews, Focused Group Discussions, and Oral Histories, along with geographical and ecological mapping, it meticulously examines the lake's transformation before and after restoration efforts.

The findings identify two primary impediments to the inclusive ecorestoration at Kempambudhi Lake. Firstly, social fragmentation within civil society engagement, driven by caste politics, neighborhood class dynamics, migration, and encroachments, curtails certain groups' access to lake resources and excludes them from participating in the restoration process. This fragmentation often facilitates the consolidation of a dominant State-Market-NGO nexus, which monopolizes lake-space management and promotes a capital-intensive, exclusionary restoration model. This model prioritizes environmental aesthetics and economic enhancements, sidelining critical ecological and social justice considerations.

Based on the findings, the paper argues that these processes create a "power geometry" where state, market, and civil society interactions dictate the ecorestoration grammar in ways that marginalize alternative epistemologies and practices associated with these ecological spaces, leading to a homogenized and exclusionary approach to urban environmental sustainability. Therefore, despite benefits like groundwater recharge and biodiversity conservation, post-restoration governance is potentially marred by deficiencies due to limited stakeholder engagement and growing community apathy towards the future management of the lakes.

JASIM, ANSAR* (Free University of Berlin, Germany)

Urban Planning Against the People: Doxiadis' Plans for Baghdad and Urban Auto-Construction

Sadr City, the largest and most densely populated district in the east of Baghdad, was planned in the 1950s as a slum clearance project. In the context of the Cold War, urban planning had become part of the cultural 'war against communism' (Provoost 2006). The Greek urban planning and architecture firm of Constantinos Doxiadis was proposed to design Third World cities as an anti-thesis to 'communist cities' with their hierarchical top-down planning. A grid system of sectors was to 'facilitate the unlimited growth of people, money and cars' (Provoost 2006, p. 2), and the focus on a bottom-up approach to architectural planning was to be the antithesis to the communist understanding of state-imposed collectivism.

In the case of Iraq, Doxiadis was quickly dismissed as a consultant to the Iraqi government after the anti-monarchist coup of 1958, while his plans for urban reconstruction in Baghdad were not abandoned. In fact, the new government gave them a new superstructural understanding. Thus, the district became the "City of the Revolution", which Abdelkarim Qasim presented to Baghdad's poor as *their* new city (Sudani, Al, Haider Atiya Kathim 2015).

In this paper, I examine Doxiadis' urban planning through an evaluation of Sadr City's local politics. This research is based on 11 months of ethnographic fieldwork in Baghdad. I want to discuss how the urban structure of Sadr City in the 1960s and 1970s served the development of communist activities and the development of localised identities. The concept of *ibn qita'i* (son of my sector) shows the development of strong neighbourhood solidarities that challenged the penetration of the district by the central state and later the US-military. I will discuss this by looking at the tension between the planning of cities and their auto-construction by their inhabitants as dialectical relationship that illuminates the materiality of state-society-relations.

JASSO, GUILLERMINA* (New York University, USA)

Mathematizing Mechanisms: The Key to a Future of Linking Theory and Empirics, Linking Individual and Society

When a theory's premises include an input-outcome relation, denoted $X \rightarrow Y$, where X is a personal characteristic and Y a personal outcome, its mathematization is immediate, and links theory and empirics as well as individual and society.

1. From $X \rightarrow Y$ to general function to specific function. Example:

"actual reward X and just reward X^* produce justice evaluation J " to "as X increases, J increases at a decreasing rate, and as X^* increases, J decreases at an increasing rate" to $J = \ln(X/X^*)$

Note: In general, the specific function may emerge in empirical work or be obtained by imposing additional conditions on the general function (or both).

2. If the probability distribution of X is known or can be ascribed, the probability distribution of Y is immediate. Example:

If X is ordinal, lognormal, Pareto, or power-function, J is negatively-skewed exponential, normal, positively-skewed exponential, and negatively-skewed exponential, respectively.

Graphs of the distributions provide pictures of society; e.g., the quantile function depicts both the location of every person and major aspects of the society – minimum, maximum, inequality, proportion below the mean, etc.

Further Y distributions emerge if there are multiple X s or, in the case of J , if X and X^* both vary. For example, status S can become Erlang or Mirror-Exponential, and J can become Equal, Erlang, Laplace, Logistic.

3. Two types of empirical work follow:

3.1. Testable propositions can be generated from both the specific function and the Y distribution. These include classical deductive implications (including novel predictions) and Toulmin-type propositions.

- 3.2. Terms from the specific functions can be approximated or estimated.

The justice evaluation J , the actual reward X , and the just reward X^* are routinely estimated. Moreover, the determinants of the actual and just rewards can also be estimated and contrasted, as can their distributions.

Micro and Macro Features of Inequality and Justice: Estimates across Generations in 29 European Countries

Since antiquity it has been thought that justice concerns play an important part in sociobehavioral phenomena and are thus deeply consequential for individual and society. Recent theoretical and empirical developments show that (1) the microlevel justice evaluation J , which increases with actual income X and decreases with ideas of just income X^* ,

$$J = \ln(X/X^*),$$

depends crucially on ideas of just income X^* , and (2) aggregating multiple individuals produces three new macrolevel distributions (for X , X^* , and J), each of which has its own mean and inequality, with average J considered a bellwether of overall injustice. This paper, leveraging recently-shown superior properties of the Theil MLD, obtains a new decomposition of average J ,

$$E(J) = \ln[E(X)] - \ln[E(X^*)] - MLD(X) + MLD(X^*),$$

making it possible to discern microlevel ideas of just income and assess macrolevel links between mean X and mean X^* and between X inequality and X^* inequality. We use data from 29 countries in the European Social Survey of 2018 to test five patterns in microlevel ideas of just income – whether people choose equality as the just income; whether every person compares own income to the income of every other person; whether just income is a constant; whether, if just income is a constant, it is close to the actual mean; and whether just income is an equal addition to actual income – and to assess two macrolevel relations beyond average J – whether the mean of actual income is larger or smaller than the mean of just income and whether actual income inequality is larger or smaller than just income inequality. We report all estimates for each country and for each country's generations, specified as ten-year birth cohorts, thus obtaining a detailed view of micro and macro features of inequality and justice in Europe.

JAVADI, REYHANEH* (University of Alberta, Canada)

Making Sense of Law: Iranian Women's Informal Networks and Community Building in Navigating Legal Alienation

This paper examines the ways Iranian women overcome legal alienation through informal networking and community building to counter structural gendered oppression. When discussing Iranian women's encounters with the legal system, the body of literature often overlooks how lay people navigate a highly specialized field. This paper addresses this gap by studying individual women's struggles to overcome legal alienation and exclusion in the juridical field. Focusing on the women's individual cases and their attempts to redress their grievances, this paper investigates sources women use to understand legal procedures and translate the laws. Adapting Bourdieu's account of the juridical field and employing *netnography*, this research studies how women network for their legal cause and navigate their entry into the juridical field. It analyzes a popular online social forum (*Ninisite*), widely used by housewives and mothers, as an online ethnographic site and examines the dynamics, interactions, and relationships within the forum.

A preliminary analysis of interactions within the forum from 2020 to 2024 reveals that women engage in dynamic exchanges on topics such as divorce, custody, alimony, rebellious wife behaviour, and extramarital relationships. Women use the platform to share experiences, seek legal advice, translate complex legal terms, interpret laws and legal procedures, and collectively make sense of their legal rights. The study highlights how women use these informal, supportive networks to challenge legal exclusions, bridge knowledge gaps, and navigate the juridical field more effectively. This research contributes to our understanding of gender inequality and legal alienation by elucidating the role of informal community building in helping women confront discriminatory legal structures. Rather than depicting women as helpless and passive victims of rights violations or as unknown and silent heroines of resistance, this study illustrates how women actively engage with legal processes, create networks, and make sense of the law in their everyday lives.

The Challenges of Adoption of Artificial Intelligence in the Health Care Sector in Nigeria

The adoption and implementation of artificial intelligence in the health care sector has brought along side with it, innovative ideas and applications leading to improvement in patients outcome, reducing clinical work flows, fostering effective decision making, amongst others Africa as a continent is struggling with various health issues such as infectious and communicable diseases, maternal and child health care concerns The Atlas of African health statistics states that African region faces significant challenges which include high maternal and mortality rate, with 390 women dying in child birth, for every 100,000 live birth and 72 infant death per 10,000 infant birth .The growth of artificial intelligence in the health care sector in Africa is promising and has been on a steady rise across the continent. In spite of this, there are various challenges influencing the adoption and implementation of AI in Nigeria. This study examines the challenges of AI in the health care sector in Nigeria. This study is anchored on the Technology Acceptance Model(TAM) The research team conducted 30 in-depth interviews (IDI) among purposively sampled health care practitioners in the six geopolitical zones between December 2023-April 2024. The data were content analysed. The study found that the challenges were multifaceted and includes limited infrastructure, staff shortage and skill gaps, data privacy concerns, cultural and social barriers, socioeconomic disparities such as access to education resources, and infrastructure fraud, embezzlement and weak and obsolete infrastructure. The study concludes that there is need for government policies on adoption and implementation of AI and more intervention and support in the health care sector.

JAYASURIYA, KANISHKA* (Murdoch University, Australia)

Populism, Social Reproduction and Authoritarian Statism

The central contention of this paper is that contemporary radical right wing populism needs to be placed in the context of state transformation and the emergence of the new forms of political regimes. We build on the work on Poulantzas and his work on the exceptional state – including fascism – to tease out the key elements of transformation b We argue that radical right wing populism reflects twin forces : a) a political crisis of social reproduction and its management by the state and its increasing coercive management of these crises of social reproduction B) broader global capitalist process and their impact on the fragmentation and disarticulation of classes of labour -. We draw attention to the fragmentation of the labour classes and their increasing disincorporation (or disarticulation) from formal political processes. We see populism and the exceptional state as a way of managing this disincorporation. C) finally, the ideological resonant role of the 'household' in both the economic and ideological dimension of populism.

The Vulnerable Police? – Health and Negotiation in the Police

In capitalist democracies, health and stress of police officers has long been the subject of both political debate and extensive research. Psychological research in particular takes a quantified view of the stress experienced by police officers and comes to the conclusion that stress, workloads etc. are very high. However, little attention is paid to how these stresses can be understood using a sociological, qualitative research logic. How are police workloads constructed beyond their metrification? What role does social change (using the example of migration) in the context of a hierarchical police culture and the growing role of health play?

This is where the ethnographic research comes in and asks how police officers interpret their everyday work in times of social change and what subjective work and health stresses they perceive. This locates the study in the research field of qualitative health research. As part of a field study lasting several weeks in a police station that also includes a refugee camp, participant observations and ethnographic interviews were conducted. Subsequently, guided interviews were used for contrasting purposes and analyzed using the research logic of grounded theory.

The results show that the police, like other areas of the German administration, are subject to economization processes. They are required to make their work visible and measurable. These new paradigms are

implemented extensively in the policing of migration and create highly meaningless work for Police officers. This senseless work, in combination with the highly hierarchical organization of the police, leads to health problems, which are mirrored at street cop level in increased sick leave (in the sense of absenteeism). Because of the additional work, however, the police are demanding more staff and more competences. The complex and ambiguous relationship between work and health can therefore be better understood through a qualitative research.

JEMAA, AHMED* (Institute for Migration Research and Intercultural Studies (IMIS) - Osnabrück University, Germany)

Migrant Disappearances across the Atlantic: Mourning and Grassroots Knowledge Production in Morocco

The Canary Islands route across the Atlantic Ocean is considered by several actors in the field of migration, notably the Spanish NGO Caminando Fronteras, as the deadliest migration region in the world, with more than 6000 deaths in 2023 (Caminando Fronteras 2023). This shift to this dangerous 'irregular' maritime route to the EU in recent years is a result of the European Union's policy of restricting migration and externalising borders to North and West African countries. However, despite this increase in border deaths and disappearances, this region has received little public attention compared to the Mediterranean, thus remaining invisible. In fact, spaces in which migrants 'disappear' are produced through a complex interplay of policies, actors, practices, infrastructures and geographical conditions, in this case the maritime border area between Spain, Morocco and West Africa. While the areas of responsibility for border protection, sea rescue and state statistical recording in this region remain ambiguous, this paper examines how and why the lack of systematic efforts by states to count and account for these disappearances contributes to their invisibility. Through ethnographic fieldwork in Morocco, the research explores non-state practices of mourning, counting and identifying the disappeared, as carried out by NGOs, activist groups and families of the disappeared. The study examines the knowledge produced by these actors and assesses whether these grassroots practices of mourning and bottom-up knowledge are becoming socially and politically prominent, particularly in relation to states and resource-heavy organisations such as the International Organisation for Migration (IOM).

Stayer Children's (Self-)Positioning in Transnational Spaces: Methodological and Ethical Reflections on Data Collection

In this contribution, I will discuss the first findings of the current German-Polish project '(Self)Positioning in Transnational Spaces – Children's Narrations and Narrations about Children Living Transnationally' (TraNa). This project examines the crucial role of socialization within transnational families for children's self-positioning in transnational contexts. Self-positioning is viewed as a process of positioning oneself in various ways and time perspectives: as current positioning in (trans)national spaces while family members live abroad as well as prospective positioning in the sense of their own future plans between mobility and staying in place. Transnational spaces emphasize and reflect the action spaces perceived by children, as well as the possible boundaries they interpret in light of their own transnational family experiences.

In the presentation I will firstly explore the consideration of the methodological and ethical reflections on data collection, which comprises biographical, map-based ("Google MyMaps") interviews with children from Poland aged 12 to 14 who live in transnational family contexts. Secondly, I would like to outline the initial findings and address two questions: How do children position themselves in transnational spaces in the present and the future, and what knowledge, resources, and interactive experiences do they draw upon? The analysis follows the methods of Grounded Theory as proposed by Strauss (1998).

The two endeavors are connected by their focus on the appropriateness of the methodological approach for research with children and their self-positioning, with particular attention given to its potential opportunities and challenges.

Global Crowns: Black Women's Emotions and Experiences with Natural Hair across the Globe

The *Global Crowns* project investigates the complex emotions and social dynamics surrounding natural hair for Black women across different cultural and geographical contexts. Despite the progress made by initiatives such as the CROWN Act in the United States to combat hair discrimination, the lived experiences of Black women globally remain underexplored. This research expands beyond the U.S. context to examine how Black women from Cuba, Brazil, France, Burundi, and the Americas navigate societal pressures and cultural significance tied to natural hair. Using a combination of ethnographic fieldwork, in-person interviews, and Artificial Intelligence (AI) for data analysis and translation, this study gathers rich, diverse narratives from Black women about their natural hair. Through AI-assisted thematic analysis, we examine recurring themes of identity, anti-Blackness, and empowerment. The project underscores the global resonance of hair discrimination and the need for legislative and societal reforms beyond U.S. borders. By capturing these narratives, *Global Crowns* not only documents the emotional toll of natural hair discrimination but also amplifies the voices of Black women in global conversations about beauty standards and racial justice.

RC23-368.3

JENKINS, NICOLE* (Howard University, USA)

Leveraging AI for Advanced Methodologies in Global Sociological Research

This presentation explores the innovative use of Artificial Intelligence (AI) technologies to enhance the methodological rigor of the *Global Crowns* project, which investigates Black women's experiences with natural hair across diverse cultural contexts. By integrating AI tools to support global qualitative sociological research, this research redefines traditional qualitative methodologies. AI-powered translation services ensure inclusivity by allowing interviews to be conducted and analyzed across multiple languages, including French, Spanish, and local dialects in regions such as Cuba, Brazil, France, and Burundi. The use of AI enhances the efficiency and depth of thematic analysis by identifying patterns in large-scale qualitative datasets that are difficult to capture through manual coding. AI-driven sentiment analysis further enables a nuanced understanding of the emotional experiences shared by participants. Additionally, real-time AI transcription assists with data collection in ethnographic settings, such as providing detailed fieldnotes from salons, festivals, and community spaces. This technological integration represents a significant advancement in computational social science, offering new possibilities for scaling qualitative research across global regions while maintaining cultural sensitivity. Through this presentation, I will discuss the practical applications of these AI tools, the ethical considerations of using AI in social research, and the potential for AI to revolutionize the way sociological research is conducted on a global scale.

JENNIFER, VAN BEEK* (University of Amsterdam, Netherlands)

Urban Inequalities Measured through Citizen-Defined Wellbeing Indicators

Marginalisation and intensifying inequalities are a persistent issue in high income urban contexts including Western European cities. Yet, urban policy in these cities is not able to effectively address marginalisation as it works from a narrow framing of the problem, and conceptualises and measures the problem and solutions top-down instead of bottom-up (Verrest et al., 2021; Cardoso et al., 2022; Caprotti, 2018; Pouw, 2020).

Within this context a PhD research is being conducted that aims to (i) understand context-specific structural causes and dynamics behind urban inequality from a multi-dimensional wellbeing perspective, (ii) develop bottom-up indicators and a measurement tool to derive wellbeing needs on level neighbourhood level, (iii) field test these bottom-up tools and instruments in a series of real-life experiments together with citizens and community groups, (iv) renew urban policy practice with a key role for community self-organisation and locally-owned policy instruments. The research takes place in Amsterdam where it applies an action-oriented and community-based participatory approach, using co-creation, surveys and stakeholder dialogues as specific methods.

A first case-study in the research led to the creation of a robust bottom-up methodology to develop and measure multidimensional wellbeing indicators on neighbourhood level. This bottom-up method is now applied in two

additional case-studies. First findings indicate that citizens' self-identification of indicators provides credible data on needs and priorities of marginalised citizens, otherwise ill-captured in formal economic indicators (van Beek et al, 2024, under review; van Beek et al, 2024, submitted). Moreover important correlations are found between the multidimensional wellbeing indicators and patterns in wellbeing levels are found and currently further explored.

This submission proposes to present and discuss two particular parts of the PhD research: 1) the steps taken to develop and measure the context-specific wellbeing indicators, 2) the differences in wellbeing levels found between neighbourhoods and specific demographic groups.

JENNIFER, WIDMER* (University of Lucerne, Switzerland)
HOEHN, CHRISTOPHER* (BHH Hamburg University of Applied Sciences, Germany)

Bringing Formal Organizations Back in: How an NGO Challenges a State in the Polycrisis Era

In times of multiple crises, such as climate change, formal organizations are becoming increasingly important. The "KlimaSeniorinnen Schweiz" case shows how a non-governmental organization (NGO) sued the Swiss government at the European Court of Human Rights (EMGR) for its inadequate climate protection measures. With the EMGR's ruling, the NGO "KlimaSeniorinnen Schweiz" challenged the Swiss state by claiming responsibility for the protection of vulnerable population groups (senior citizens). This precedent illustrates how formal organizations can use transnational legal pathways to change national policies in dealing with global crises. As counter-examples, we see social movements such as "Fridays for Future" and "Last Generation", which have also challenged governmental climate protection policy, but have dispensed with single formal organizational elements. Our thesis is that foregoing formal organizational structures weakens the ability of collective entities to effectively address complex challenges such as the climate crisis, as there is a lack of clear accountability and coordinated processes that are necessary to sustainably tackle such issues. We thus question the traditional notion that states alone are responsible for tackling multiple challenges and why we need to bring formal organizations back into the discussion.

RC39-JS-191.4

JENNIFER, WIDMER* (University of Lucerne, Switzerland)
HOEHN, CHRISTOPHER* (BHH Hamburg - University of Applied Sciences, Germany)

Guardians of the Common Good: NGOs in Climate Disasters – the Case of the Organization "Klimasenioren", Swiss Climate Seniors

As climate disasters increase in the Anthropocene, vulnerable groups, especially the elderly, face significant challenges. In this context, non-state actors are playing an increasingly important role in crisis management. A recent case illustrates this shift: in June 2024, the European Court of Human Rights (ECHR) ruled in favor of the Organization "KlimaSeniorinnen Schweiz" (Climate Seniors of Switzerland), which had sued Switzerland for inadequate climate protection measures. They invoked their human rights and pointed to gaps in the state's protection of the common good. For the first time, the ruling upheld a Swiss NGO's complaint that the state's responsibility to "protect and promote the common good" had not been fulfilled. This ruling in favor of the Association of Climate NGOs provides a starting point for examining the impact that the involvement of NGOs can have on governments' climate change policies and strategies. This is linked to the increasing potential of NGOs for (i) participation and (ii) advocacy for justice in climate disasters. This raises the question of the common good, which is why this contribution addresses to what extent climate NGOs contribute to justice and equity in the context of climate disasters. The focus is on the distinction between the role of "guardian" of the common good vs. the role of "bearer" of the common good and the related governance and policy-making activities - especially with regard to supporting vulnerable population groups. It examines whether their interventions promote structural change or stabilize the status quo.

The article thus contributes to the discussion on the role of NGOs as non-governmental organizations and transformative actors in governmental climate protection policy that go beyond mere emergency relief. The focus is on the question of whether the bearers of the common good can also become its guardians if the original guardian (state) neglects its task.

Access/Access Denial: Critical Mineral Strategies amid Polycrisis

Vectors of the polycrisis such as the pandemic, Russia's invasion of Ukraine, and rising geopolitical tensions have all contributed to a major economic trend of the 2020s- the securitisation of key value chains. This has been nowhere more evident than in a range of minerals (rare earths, lithium, nickel, and cobalt, among others) deemed critical for the energy transition. In line with recent theorisations of an incipient Second Cold War, this paper frames contemporary US, EU, and Chinese critical minerals strategies as part of a struggle for centrality in key global political-economic networks. EU and US dependence on China (and Chinese-invested firms in third countries) has prompted a flurry of efforts to diversify and secure critical mineral supplies. With China currently holding a dominant position in extraction and processing, US and EU strategies concentrate on securing and expanding their own access to these production networks in third states, without necessarily seeking to exclude Chinese actors. This approach contrasts to other sectors where the US and/or EU is stronger (e.g. semiconductors) and where the goal tends towards access denial, for example via export controls. China, for its part, has leveraged its domestic critical mineral dominance towards access denial strategies, including export controls on various metals, introduced in response to US semiconductor restrictions. Concurrently, Chinese firms have pursued access strategies outside China, acquiring stakes in 23 critical mineral ventures worldwide since 2018. Several mineral-exporting states seek to leverage this geopolitical competition for developmental advantage, insisting, for example, that minerals extracted by EU, US, or Chinese firms be processed domestically. Such strategies may be feasible while access remains the predominant form of critical mineral competition. However, should global powers shift towards more aggressive access denial tactics in third countries in future, this would likely substantially weaken the bargaining position of southern mineral producers.

Opposition By Imitation: The Economics of Italian Anti-Mafia Activism.

Mafias are now renowned for their international business enterprises, ranging from the trade of drugs to waste. What is less known, is that for over one hundred- and fifty-years Italy has been bubbling with collective action that opposes mafias. Since its manifestation in the 19th century, anti-mafia activism has undergone many changes. Most recently, activists have started opposing mafias by mimicking their entrepreneurial activities. Activists increasingly compete with them for social consensus, and try to beat them at their own game. Drawing on a decade of ethnographic work, this paper introduces three different forms of mimicry that are tactically used to oppose mafias, questioning the implications that this mimetic opposition might have for broader questions of crime prevention and criminalisation.

The Airbnb Redemption: The Business of Repopulating Ancient Towns in Italy

When cities become overpopulated and gentrified, Airbnb and other travel platforms are often blamed. This paper examines a case where such platforms and their entrepreneurs are instead viewed as redeemers. It specifically discusses the biopolitical role played by travel brokers in regions of Italy that are on the brink of extinction.

Italy is currently facing its worst demographic crisis since World War I. The most remote areas, including islands and regions near the Apennine Mountains, are particularly affected by "brain drains" and significant declines in birth rates. These areas have essentially become ghost towns, inhabited mainly by the elderly, and represent forms of human settlement that are nearing extinction.

To combat this phenomenon, various entrepreneurs, policies, and communities are promoting these spaces through place-branding strategies aimed at attracting a specific type of migrant: the digital nomad. These are urban workers from high-income, high-output jobs seeking a place to breathe.

Through the lens of a successful partnership between Airbnb and a group of architects in Grottole, Italy, this paper explores the entrepreneurial initiative to revitalize the streets of these quasi-abandoned villages from a sustainability perspective.

Fragility in Memory Production: A Comparative Ethnography on Two Memorial Museum Commemorating WWII Atrocities in the U.S. and China

Scholars have long explored the role of memorial museums as a material, institutional form of producing and legitimizing a particular articulation of collective memory of a historical atrocity. Using archival and content analyses, these studies provide rich empirical descriptions of museum content and their associated historical backgrounds. Yet missing from this scholarship is the role of human agency in memory production; in particular, how museum workers, whose identities infiltrate multiple social networks of the commemorative politics and economy, produce and elevate certain forms of memorial narratives and practices in reaction to contemporary social, political, and economic challenges. To answer this question, the author conducted comparative ethnography at two memorial museums in the U.S. and China that commemorate WWII atrocities – a privately funded Holocaust Museum in a liberal democracy and a government-owned museum on Japanese war violence in an authoritarian state. Despite their differing funding streams and political contexts, both museums resort to a distinct composite model of memory-making that strategically blends nationalistic fervor and universalistic humanitarianism that characterize the group as one of the many tragically victimized by war horrors. However, the model is fraught with tension and risks dissolution during times of crises, especially when the group goes through another round of perceived victimization or is portrayed as “perpetrators,” because the structure of epistemological domination and capitalist exploitation undergirding the model remains intact. This paper illuminates how seemingly benign efforts to transcend historical trauma and build long-lasting peace can be inherently violent if commemorative institutions continue operating within a global structure of violence.

Exploring over-Tourism: A Stakeholder Analysis of Visitor-Resident Conflicts in Post-COVID Hong Kong

Over-tourism is a recently identified yet ambiguously defined phenomenon that lacks a clear consensus in both the tourism industry and academia. While research on this topic surged before the COVID-19 pandemic, it focused on destination management and traveller behaviour, often neglecting the complex interactions among stakeholders in tourist cities. Hong Kong, as a major international tourist destination, has long experienced issues with over-tourism and visitor-resident conflicts. This study aims to examine the dynamics of these conflicts by employing conflict theory to analyze the perceptions of various stakeholders regarding over-tourism in a post-COVID context. Through stakeholder analysis, key stakeholders were identified via a literature review, and interviews were conducted with 44 entities, including government officials, businesses, tourists, residents, and media, which helped to create a stakeholder power-interest matrix. Additionally, a survey using a 5-point Likert scale with 120 respondents assessed benefits, negative impacts, and types of conflicts. The findings indicate that the definition of over-tourism is fluid and context-dependent. In Hong Kong, visitor-resident conflicts are shaped by cultural, social, transactional, and resource issues, government policy and media-driven informational conflicts. This study provides insights into the development of communication strategies for tourist cities by examining broad stakeholder groups and assesses how different groups perceive over-tourism to better address urban tourism conflicts.

Gender Disparities in Residential Relocation: Exploring Intra-Urban Migration Patterns in Shanghai

Residential relocation within a city is a significant event for families and individuals, involving not only adapting to a new local environment but also reflecting the diverse reasons behind such moves for different social groups. While existing research has focused on gender differences in long-distance migration, such as rural-to-urban moves, less attention has been paid to

gender disparities in short-distance migration. Furthermore, with the change in the economic and policy environment, it is worthwhile, despite a lack of studies, to study how the social dynamics in different periods influence the intra-urban migration of male and female groups. This study addresses these gaps by studying the gender differences in motivations of residential relocation and examining how economic and policy changes have influenced the intra-urban migration patterns of men and women in Shanghai across three distinct time periods. Using data from the Shanghai Urban Neighborhood Survey, our analysis reveals that men tend to move longer distances and more frequently than women, aligning with patterns seen in other types of migration. Additionally, we find that motivations for relocation differ by gender, with men more likely to move for work or housing reasons, while women are often motivated by family or marriage considerations. Interestingly, these gender differences have become less pronounced over time. Our study contributes to the literature on intra-urban migration by providing new insights into gender dynamics within the Chinese urban context.

Combatting Digital Capitalism: The Criminal Strategy behind Big Tech's Social Harm and the Need for Transformative Justice

This paper proposes rethinking Big Tech's socially harmful behavior as the consequence of a deliberate strategy that is inextricably linked to its business model and thus cannot be corrected by conventional means. The crimes of digital capitalism relate to upstream and downstream operations. It ranges from modern slavery in the context of mineral extraction to Taylorist exploitation in Chinese hardware production industries. It shifts to machinic dispossession in automated warehouses, algorithmic discrimination in welfare systems, and the deployment of policing technologies by private and public actors. Although we all suffer the consequences of a digitized global structure of inequality, the resulting social damage is not equally distributed. The crimes of digital capitalism are, by nature, an inherent and organizational part of an imperialist phenomenon. Hegemonic digital corporations are often headquartered in countries in the Global North, while their victims are disproportionately located in the Global South. Moreover, this structure of inequality is intertwined with prior forms of racial, class, and gender oppression. We need new approaches, methods, and institutions of the commons capable of enforcing concepts of justice that lead to a real and profound transformation that shakes the causes of social harm. Thinking about the crimes of digital capitalism is an exercise aimed not at reaffirming mechanisms for punishment but at producing the necessary tools to abolish the conditions that make them possible. Drawing on the approaches of white-collar crime and crimes of the powerful, and complemented by recent contributions from critical legal studies, the paper lays the theoretical groundwork from which to analyze the crimes of digital capitalism. In doing so, this paper aims to explain why certain specific behaviors of the “digital powerful” are often not criminalized and, moreover, have become essential to the operation of the digital capitalist system of exploitation.

JIMENEZ, ANTHONY* (Rochester Institute of Technology, USA)

The Lazarus Effect: Decolonizing Social Death through Migrant Caregiving

Low-income undocumented immigrants predominately rely on the US health care safety net for their medical needs. Since the passing of the 2010 Patient Protection and Affordable Health Care Act, however, this safety net has been shrinking, resulting in a range of adverse migrant health experiences that are – because of migrants' increasing social death – rendered invisible. I explore how low-income undocumented migrants navigate this invisibility. Drawing on eleven months of ethnographic and interview research with migrant men at a community-based organization and informed by Irene Bloemraad's theory of citizenship as a claims-making process, I find that migrant men challenge the terms of their invisibility through their care work for one another. When migrants provide broadly defined care for one another, care acts as (1) a *service* that addresses a range of urgent medical and non-medical needs and (2) a *mechanism of “re-membering”* that validates migrants' social and legal personhood. First, care as a *service* addresses a range of needs medically and socially denied to migrants vis-à-vis the health care system, including direct medical provision and a sense of communal/familial belonging. Beyond service provision, however, care also operates as a decolonizing mechanism of re-membering – that is, reintegration into the realm of mattering. Re-membering vis-à-vis caregiving allows migrant men to validate each other's suffering, challenge the healthcare system's colonialist structures of exclusion, and reaffirm migrant personhood – essentially, to perform a “Lazarus Effect” that brings migrants *back* from social death. Accordingly, I argue that decolonization and care work are intimately

connected. Attesting to the importance of policy that supports immigrant community-building and contributing to the literatures on immigrant health disparities, citizenship, and decolonization, this research illustrates ways in which migrant caregiving can challenge socio-legal structures of exclusion and manifest new terms of social and legal belonging.

JIMENEZ AMORES, JAVIER* (Universidad de Salamanca, Spain)

Online Hate Speech: A Sociological Approach

Hate speech spread online has become a threat to social cohesion and human rights. This form of communication, which promotes contempt and hostility toward individuals or groups based on traits such as race, ethnicity, religion, or nationality, have found a conducive environment in digital platforms for their rapid dissemination. Social media such as Twitter and YouTube have facilitated the amplification of messages that incite hate and violence, directly affecting the most vulnerable and stigmatized communities. The need to investigate this phenomenon is more urgent than ever, given the rapid and uncontrolled viral spread of such discourse on social media. Hate speech dehumanizes the targeted group, polarizes society and hampers social integration. Furthermore, it poses serious challenges in terms of digital governance, as platforms and policymakers must balance protecting freedom of expression with the need to prevent the incitement of hate and violence.

We analyzed and monitored online hate speech over the past seven years. This line of research has involved the use of various methods, such as both manual and automated content analysis, computational techniques, and experimental studies, with the aim of generating robust empirical knowledge on the phenomenon. We diagnosed its current state and evaluated its evolution and severity in Spain and southern Europe. These studies have revealed not only the magnitude of its spread but also its direct effects on the attitudes and behaviors of Spanish citizens toward migrants and refugees. Broadly speaking, the results indicate that this type of discourse has increased in recent years, often relying on hoaxes and fake news, showing a significant relationship with the media representation of migration predominantly disseminated in news outlets, and that exposure to such messages significantly amplifies negative attitudes toward these groups, thereby contributing to the polarization and dehumanization of already vulnerable social groups.

Measuring Reputational Risk in NGOs through Artificial Intelligence: Applying Transformers and Social Network Analysis to the Gaza-Israel Conflict

In a digital era of social hypertransparency, external perception and image are now considered among the most significant risks for senior executives in all organizations, and especially for NGOs, as their work and purpose depend on their reputation. In this work, two indices are proposed, built using novel artificial intelligence techniques to measure the reputational risk of an organization or a group of organizations. The construction of the indices is based on the use of Transformers combined with social network analysis techniques. Results and conclusions from their implementation are presented in an example of X in the case of the conflict between Gaza and Israel.

Ecosistemas Populares y La Globalización Desde Abajo: Circulaciones De Mercancías Usadas En La Región Surandina

Este trabajo explora el ecosistema popular de la Zona Franca de Iquique (ZOFRI), un espacio en el norte de Chile, Sudamérica, donde convergen actores vinculados a la globalización desde abajo, específicamente en la circulación de autos y ropa usada. Este ecosistema se produce por la interacción de nuestros

interlocutores con las infraestructuras materiales (no humanas) de la región surandina, que permiten y organizan movibilidades humanas, de mercancías, de información y de dinero.

Estamos siguiendo dos tipos de mercancías usadas importadas—autos y ropa—mediante etnografías multi-escalas y multi-situadas. A partir del análisis de estos circuitos comerciales, se investiga a emprendedores y trabajadores y sus interacciones con las infraestructuras humanas y materiales. Encontramos que estos actores económicos son parte del desarrollo de zonas grises producidas por la regulación estatal. Interactúan con estas regulaciones adaptando, aprovechando y flexibilizando las políticas públicas y los regímenes de trabajo.

No buscamos romantizar la participación de estos actores en los circuitos globales; más bien, intentamos reconocer sus esfuerzos por apropiarse, reconceptualizar y adaptar las diferentes etapas de la cadena de suministro. Las mercancías usadas permiten comprender cómo los intentos por extender su vida útil impactan en la logística. Nuestros interlocutores nos muestran que los espacios de almacenamiento, distribución y desecho, son flexibles, temporales y elegidos por su conocimiento práctico del territorio y los mercados. De esta manera, las nuevas modalidades de almacenamiento reflejan los debates sobre el antropoceno, donde las mercancías usadas circulan entre espacios de vida y de muerte, en zonas difusas entre el almacenamiento tradicional y los espacios de desecho que crea la ZOFRI.

JIMENEZ GARAIALDE, MAIALEN* (University of the Basque Country, Spain)

Collectivity As an Alternative Form of Interaction

It is an understatement that society is living a severe period of crisis regarding various and diverse aspects of it. Starting from the way humans interact between each other, to the way they interact with what surrounds them, it is really easy to find crashes that could, eventually, end with our life the way we know it.

However, there is still some hope. Throughout the world, there are groups of people developing alternative lifestyles that try to take care of basic social needs, as well as the way they use the available natural and economic resources.

We are talking about communities who gather and start common lives based on values such as collectivity and care. From the starting point of several feminist theorizations, they pretend to develop sustainable ways of living, in the broad sense in which sustainability can be understood, to get lives that are really worth living.

For this task, they replace nuclear families for bigger self-selected groups, in which the main focuses are, on the one hand, to create strong and long-lasting support networks that fight against social inequality and, on the other hand, to respond to other several problems that capitalism has created. Regarding this last issue, their lifestyle seeks critical thinking that leads to cooperativism, self-management and self-supply, as well as avoiding materialism, private ownership and the exploitation of nature.

Un Evento Emocionante: Aproximación Empírica De Las Emociones Asociadas Al 8M.

La presente investigación pretende analizar los factores sociodemográficos y actitudinales que influyen en los sentimientos generados por las movilizaciones del 8M de la oleada de 2019. Para ello, se han adoptado como marco de referencia los enfoques que estudian las emociones en la protesta y que asumen que los sentimientos relacionados con la acción colectiva tienen su base en intereses, valores e identidades colectivas. Para abordar esta problemática, se ha recurrido a datos secundarios procedentes de una encuesta realizada en el marco del proyecto PROTEICA, que contiene datos sobre las actitudes hacia la igualdad y sobre las emociones generadas por las movilizaciones del 8M. Para abordar los objetivos se proponen dos estrategias. Por un lado, se utilizan tablas de contingencia para describir los distintos perfiles asociados a las emociones. Por otro lado, se emplean regresiones logísticas y técnicas estadísticas apoyadas en Stata para generar modelos que expliquen la probabilidad de expresar sentimientos negativos o de indiferencia hacia las movilizaciones. El análisis profundiza en las distintas características

y factores que mejor explican la vivencia de emociones concretas. Aunque la investigación está en marcha, los primeros hallazgos confirman que el 8M, en este momento de auge, genera ampliamente sentimientos positivos, entre los que predominan la solidaridad y la esperanza. Los sentimientos negativos son minoritarios, y entre ellos destacan la desconfianza y el aburrimiento. Por el momento se han identificado dos perfiles: el positivo, que es amplio y diverso, mientras que el negativo e indiferente posee características más acotadas y podría estar relacionado con características del perfil *antigénero*. Finalmente, se han encontrado diferentes conjuntos de variables asociadas a cada una de las diversas emociones consideradas.

From Internalism to Externalism: Unanticipated Consequences of Early Spread of Marxist Views on the History of Science

The Second International Congress on the History of Science and Technology in 1931 was an important event in the history of the development of Marxism. The Soviet delegation showed the Marxist views on the History of Science to the western world. Hessen's report had a profound impact on Bernard, Needham, and Merton, triggering the Science of Science and the Sociology of Science in the United States, and also triggering the transformation of the theoretical paradigm of the History of Science from internalism to externalism. In fact, externalism or economic determinism is not the complete form of the Soviet Marxist views on the History of Science. Externalism is an unexpected form of Marxist social theory accepted by Western academics in the process of international ideological battle before World War II. This paper explains the Sociogenesis of externalism in Historiography of Science through the excavation of the Russian archives.

Racial Inequality in Rental Markets: How Algorithms Shape Rental Decisions

The use of tenant screening companies is becoming increasingly prevalent in the rental market, where professionalized landlords with large portfolios now rely on the algorithms provided by these companies to screen tenants. Drawing from a growing body of research that examines how discrimination in the housing market has become more subtle (yet nevertheless insidious) in form compared to the explicit discriminatory practices of the past, this paper explores how this technology changes how racial inequality is operationalized in the tenant screening processes. Preliminary findings from an online survey experiment suggest that explicit racial biases may decrease when tenant screening scores are provided. However, in reality, these algorithms are fed information that are highly correlated with race. It may be the case that the increasing use of these algorithms may shift how racial inequality is operationalized in rental markets, from explicit racial biases to an increased salience of structural racial inequality.

Institutionalizing Old Age: Living with Dementia in the Anthropocene

Background. The aging of the population is often celebrated as a triumph for humanity, partially due to progress in biomedical sciences. While these technological advancements in healthcare have allowed people to avoid or better manage illness and frailty for longer, society has yet to provide those reaching old age with meaningful and fulfilling lives. The emphasis on compulsory youthfulness, coupled with ageist attitudes, has stigmatized frailty and loss of autonomy, rendering older adults with dementia among the most marginalized members of the aging population. In response to the increasing demand for care, and in an unstable societal context where governments have resorted to institutionalizing older adults in long-term care facilities reminiscent of early 20th-century asylums, the disjunction between the everyday lives of institutionalized older adults and the pressing challenges of the Anthropocene raises important questions. How did aging transform from a "triumph" to a "burden"? What does it mean to be an older adult with dementia in a neoliberal, capitalist society?

Methodology. To better understand the reality of this population, an institutional ethnography was conducted in a long-term care home in Québec,

Canada. Data generation process included analyzing institutional discourse, participant observation nospanning over 6 weeks (133 hours) and non-directed leisure-based interviews with residents with dementia (n=4).

Results and discussion. Our results notably put in light how institutionalized older adults with dementia ultimately endorse the burden of being "the good resident" in a fast-paced system that is not built around them, notwithstanding what governmental policies suggest. For public healthcare systems to adapt to older adults' needs, and truly put them in at the center of their own care, substantial changes must be made at the population and institutional levels. Our societies must reconcile the human desire to grow older and the dehumanization of our daily practices.

JOBERT, ARTHUR* (EDF R&D, France)

Public Participation and Environmental Evaluation Managers: New Professional Jurisdictions at the Edge of Professional Groups

Public and private organizations are increasingly solicited by external stakeholders on issues related to the preservation of the environment and the preservation of the interests and well-being of different groups. These pressures of the environment on the organization can take the form of political mobilizations or even institutional mechanisms organizing the relationship between the organization and its environment: environmental assessment procedures, regulatory procedure for public participation, external control of compliance with corporate social and environmental responsibility standards. These new pressures, and in particular those that are becoming institutionalized, call for new forms of professionalism. Based on a four year participatory observation of teams within a large industrial group engaged in public participation and environmental assessment procedure, we will explore the boundaries of these new professions. These are characterized in part by the defence of new professional jurisdictions but also by the redefinition of certain existing jurisdictions. The emergence of new professional groups is however thwarted by these previous attachments. However, another important factor in professionalization can be identified: the desire to create organizational learning experiences and to transmit it to peers within the organization. Paradoxically, this also involves calling on specialists from outside the organization more frequently. Professionalism is embodied here by the search for a new balance between internalized skills and the reasoned call for ad hoc support, which in turn raises questions about the forms of professionalism within large organizations.

TG04-965.4

JOBERT, ARTHUR* (EDF R&D, France)

Risk Avoidance, Blame Avoidance: Understanding of the Barriers to Public Participation in Risk Management

Public participation is often promoted as a solution for developing shared strategies to prevent risks associated with industrial installations and infrastructure. However, the implementation of this idea faces numerous obstacles, both before a crisis or accident occurs, and even more so when a crisis has already emerged. These limitations can be understood as processes of avoidance. This conclusion can be drawn from studies that examine both the daily practices of populations and the practices of bureaucracies responsible for risk management. By drawing on findings from studies of industrial incidents and analyzing risk situations related to recreational activities near hydroelectric dams, we will highlight the relevance of Weaver's concept of "blame avoidance" in analyzing how public practices are considered in risk management policies. Indeed, the concept of avoidance can be applied to explain the behavior of affected populations in response to information, proposals for preventive actions, and, more broadly, the offer of participation. The mechanisms of this avoidance are diverse, including what J. Scott refers to as "everyday forms of resistance," which allow populations to distance themselves from authorities' recommendations that interfere with their way of life. Similarly, for institutions, blame avoidance helps explain the often simplistic representations of society used to design risk prevention policies. To mitigate the risk of legal or political liability, public policy actors often prefer to address an undifferentiated audience and establish general norms, without considering their alignment with actual social practices. The challenge for social sciences focused on risk and participation is to move beyond this deadlock.

JOBIN, PAUL* (Academia Sinica, Taiwan)

Be Prepared! Taiwan Social Responses to War and Natural Disasters

The notion of resilience has become a catch-all for a wide range of initiatives to increase preparedness on different sorts of risks, from natural disasters to war scenarios. It remains unclear however what these two types of risks share in common in terms of preparedness and coordination between the state, the military and civilians. In the case of Taiwan, the marine and the air force of the People Republic of China (the People's Liberation Army) now harass almost daily their counterparts from Taiwan (alias the Republic of China). But except noise disturbance around air force bases, Taiwanese civilians do not suffer much from the PLA's bullying, and consequently, they have little risk awareness and understanding of what they are supposed to do in case of a military aggression. The last confrontations with the PLA dates back to the late 1950s. Instead, Taiwanese—both civilians and the military—are regularly exposed to natural hazards such as earthquakes, landslides, typhoons and floods—made worse by the climate disruption: and to a lesser extent, Taiwanese also have some experience with industrial accidents such as explosions from petrochemical plants or from the urban gas network. These experiences provide valuable clues about civil-military cooperation in case of an emergency. Drawing on surveys from the Institute of Sociology and other research centers, as well as interviews conducted over the last two years with Taiwanese civil defense organizations, state executives and politicians, this paper aims to highlight effective synergies between on one hand, the experience accumulated thus far in Taiwan in response to natural (and industrial) disasters, and on the other hand, the preparedness required in case of a cross-strait war. Moreover, this paper should also debunk false expectations or the taken for granted regarding "social resilience" in these different ranges of threats.

RC22-349.3

JOE, SARAH* (Rivers State University, Nigeria)

Mediating Indigenous Knowledge: The Politicisation and Commodification of the Oro Festival in Nigeria

The Oro festival, a sacred tradition among the Yoruba of Nigeria, has increasingly become a contested site of political appropriation and commodification. Historically a communal ritual reinforcing social cohesion, the festival has been recontextualised by political actors in response to shifting socio-political realities and modernity. This research explores the mediation and renegotiation of the Oro festival in the digital age, focusing on its intersections with political structures, media representations, and Indigenous epistemologies.

The politicisation of the Oro festival underscores the instrumentalisation of Indigenous religious practices by political elites as tools for consolidating power and asserting hegemony. By manipulating ritual timings, orchestrating public declarations, and leveraging media visibility, political actors co-opt the festival to suppress opposition, bolster authority, and sometimes pursue exclusionary agendas. These interventions often generate tensions between traditional custodians, political elites, and legal governance, positioning the festival as a mechanism of political intimidation and strategic leverage.

In the digital era, the commodification of the Oro festival has taken on new dimensions as its representations circulate widely across media platforms, reframing its sacred meanings. While digital technologies facilitate the preservation of Indigenous practices, they also expose the festival to reinterpretations that commodify its spiritual essence, often reducing it to a cultural spectacle or political tool. This commodification raises significant ethical concerns about preserving Indigenous knowledge systems in globalised media economies.

This paper critically examines the digital mediation of the Oro festival, exploring how Indigenous Yoruba epistemologies are simultaneously obscured and amplified. By interrogating the negotiation and contestation of Indigenous practices at the nexus of politics and media, the study offers nuanced insights into the ongoing struggle for epistemic sovereignty in contemporary Nigeria.

JOELLE, BADRAN* (University of Antwerp, Belgium)

The Unaccompanied Refugee Minors' Experiences of Solidarity and Recognition in Their Everyday Social Life

While the majority of research on solidarity focuses on practices among adults, little is known about the experiences of solidarity among children, particularly unaccompanied refugee minors (URMs). Studies involving URMs

reveal that their basic needs are often met by the asylum reception systems in Europe. However, the recognition of their human rights, and acknowledging their voices and agency as unique individuals, are frequently faced with encounters of struggle and misrecognition.

This study, part of a larger PhD project, builds on Axel Honneth's critical theory of recognition, which is fundamentally concerned with social inequalities. It adopts a revised approach to Honneth's theory through the lens of the new social studies of childhood, situating children as autonomous agents, rather than passive adults in waiting. The study argues that for solidarity, defined as support towards and among forced migrants, to be truly experienced, it necessitates recognition.

Drawing on 16 months of ethnographic fieldwork conducted in a small-scale reception center for URMs operated by a non-governmental organization in Belgium, the study involves extensive participant observation of 13 young people aged between 11 and 18 years, complemented by 43 semi-structured interviews. It investigates how these URMs understand, exercise, and receive the different forms of emotional, legal, and social recognition, examining where solidarity practices are present and where they lack.

The study calls for acknowledging URMs not solely as recipients of support, but as active and potential contributors who can enrich their new environments, thereby transcending their perpetual victimization and positioning them as agents with capacities.

JOHN, VIKAS* (Indian Institute for Human Settlements, India)

BHATIKAR, TANVI (Indian Institute for Human Settlements, India)

Research Communication at the Crossroads of Cultural Flows

Communication for change has had long and storied history particularly in the global south. In particular the allied practice of Research Communication has become an integral component enabling the amplification of societal impact. This is particularly so for organizations engaged in knowledge production that enables sustainable development and just futures. However, an important, but understudied, layer in understanding research communication and communication for change is the inherent socio-cultural tensions that emerge in the flows of communication as evidence from international and comparative research now finds its voice in multiple local and global media intersections.

In this paper, we draw on the idea of "Cultural Flows" to highlight how the practice of communicating research flows across multiple geographic and disciplinary divisions, and cultural contexts, implicating organizations as well as researchers. We do so by critically examining media discourses around issues of development, focussing on the documentary form created for digital platforms as a cultural artefact. In our analysis we draw on frameworks provided by critical cultural studies, and the concepts of 'scapes' and 'flows', arguing that research communication practices and by extension the imperatives of communicating for change, differ across both geographies and disciplines. These differences are embedded in cultural contexts and are therefore produced not only through objectives practices of research, but also through subjective productions of messages. Facets such as evolving media landscapes in the global north and south, digital penetration, access, language, medium, the various cultural frameworks and structures that define an 'issue' within and across boundaries, as well as political climate play a key role in shaping communication practices and allied strategies for institutions and organizations.

A Dialectic Approach of Women's Labor Experiences in Ridesharing: The Case of Uber Africa

Insights on women's labor experiences remain scant despite the interest in proposing ridesharing as a means of addressing gender inequality. Drawing upon Marxist and Foucauldian perspectives, this study explores the experiences of women drivers involved in Uber located in six African countries. Findings illustrate that women experience eight oppressive practices prior to, during and post travel that create and emerge after times of emotional, bodily and economic vulnerability. Oppression is maintained through ideas and material resources resulting in three dialectic experiences in ridesharing (exclusion-inclusion; control-autonomy; and inequitable-equitable). Experiences are later transformed in-practice in three ways for not only service providers but also travelers, namely learning, evaluation and identity transformation. This study proposes a dialectic view of women's

labor experiences in ridesharing to move away from the dominant marketing practice perspective to one that is based on socio-political labor. The study provides a gender-aware, processual labor perspective to highlight the challenges of addressing gender inequality.

Stigmatize or Valorize?: Leisure, Gender Hysteria, and the Performance of Masculinities

This presentation explores how leisure spaces provide vital contexts for reimagining masculinity in the Anthropocene, drawing on three distinct cases from the upcoming *Special Issue of Leisure Sciences* on the performance of masculinity. Reactionary responses to shifts in gender norms—exemplified by all sorts of events globally (e.g. Olympics, Eurovision, etc.)—reflect an epistemic crisis in which hegemonic masculinity is being destabilized. As public discourse around gender expands, we must ask: whose knowledge counts in this context, and what does it mean to know justice in the Anthropocene?

Leisure, far from being a trivial pursuit, offers a powerful space for resisting dominant masculinist ideologies. It allows men to engage in alternative ways of knowing and being, aligned with feminist and ecological understandings of justice. The first case study examines how men's book clubs foster communal discussions that challenge traditional gender norms. The second case focuses on artistic pursuits, such as theater, where men explore emotional expression and vulnerability, destabilizing rigid masculinity. The third case highlights environmental stewardship activities like gardening, which cultivate masculinities attuned to ecological and social sustainability.

This presentation demonstrates how leisure serves as a site of epistemic resistance, creating space for masculinities that prioritize relationality, embodiment, and interdependence. These insights contribute to broader discussions of justice in the Anthropocene, including environmental, gender, and epistemic justice. The sociology of leisure with its emphasis on social structures and relationality, plays a key role in understanding how masculinities intersect with these justice frameworks. Ultimately, this presentation argues that rethinking masculinity in leisure can help us envision more just and sustainable ways of living together in an era marked by major environmental and social challenges.

Nehiyawak Intellectual Traditions in Colonial Spaces

The stories of my People are written on my body. As the lines on my face tell a tale of laughter, my eyes also show hope, and my lips give shape to a prayer. All that I am is because of the land and the stories of the Nēhiyawak Nation that I embody. The stories of who we are are echoed throughout generations, connecting us to time and place to ensure regeneration for those not here. In this presentation, I share the intellectual traditions of my people through our oral narratives or story medicine that are used as legal codes to ensure we hold to who we are and where we are going, especially in colonial systems such as universities and academia. Through oral narratives, we witness the legal traditions of the Nehiyawak, *Four Spirit*, within Canada as we share the truths of our reality through relationality and kinship in systems that were never designed for us. I share stories of what it means to be rooted in the land and how the warmth of my People's teachings can help us reclaim our minds, reconnect to ceremony, and liberate our hearts in anti-colonial work that allows us to be who we were always meant to be.

La Lecture Fait- Elle Encore Partie Des Loisirs Des Jeunes ?

Les discours pessimistes sur l'évolution de la lecture font florès et pointent souvent les jeunes générations comme les plus éloignées du livre, sous l'effet de la concurrence exercée par des écrans omniprésents, tout particulièrement dans le cadre des loisirs. Ce diagnostic nécessite d'être nuancé (Chartier, 2017) et éclairé par une série de mutations survenues dans les rapports des jeunes à la lecture.

D'abord, les humanités littéraires ont largement reculé dans la bourse des valeurs culturelles face aux humanités scientifiques, avec pour conséquence l'affaiblissement de la rentabilité scolaire de la lecture mais aussi de sa fonction de cohésion au sein d'un groupe social ou d'un groupe d'âge (Octobre, 2013). En outre, une grande partie des loisirs des jeunes sont aujourd'hui ancrés dans des univers médiatiques et numériques : les fonctions fictionnelles et

informationnelles, autrefois monopoles du livre sont désormais prises en charge par d'autres propositions culturelles comme les séries, les vidéos en ligne, les réseaux sociaux. Enfin, l'acte-même de lire s'est largement transformé, se déclinant sur une grande diversité de supports et de natures d'offre (formats brefs ou sériels, lectures numériques conjuguant lecture et écriture, contributions individuelles ou collectives) (Poissenot, 2019).

Une analyse multivariée des données de la dernière enquête *Pratiques culturelles en France*, concernant les jeunes de 15 à 24 ans a été réalisée sur leurs pratiques et goûts en matière de lecture de livres et de presse sur supports papier et numérique. Elle fait apparaître un paysage beaucoup moins uniforme qu'il n'y paraît, traversé par des clivages de sexe, d'âge et d'origine sociale et migratoire, et met en évidence six rapports à la lecture. La présentation se focalisera tout particulièrement sur deux de ces univers qui témoignent de l'étendue des transformations en cours.

JONES, ANTWAN* (The George Washington University, USA)

Material Disadvantage and Cardiovascular Health Among Urban Older Adults in Latin America

The ageing population is a significant global trend, intensifying the focus on late-life mortality and chronic disease prevalence. This study examines how childhood and adult socioeconomic conditions influence cardiovascular health among the elderly in Latin America—a region experiencing rapid demographic shifts. Projections indicate a 42% increase in Latin America's population from 2003 to 2050, with the elderly population growing from 4% to 17%. This demographic transition is associated with an elevated burden of chronic diseases and increased demand for health and social services. Utilizing data from a multinational survey of individuals aged 60 and older, this research investigates the impact of life course socioeconomic factors on heart health in this region. The study aims to discern whether socioeconomic disadvantage or medical awareness, reflecting improved health behaviors, plays a more significant role in cardiovascular outcomes. The findings will provide insights into how socioeconomic conditions and healthcare advancements shape elderly health in lesser-developed settings, highlighting the interplay between material conditions and health behaviors in predicting cardiovascular well-being among older adults in Latin America. Understanding these dynamics is crucial for developing targeted public health strategies and policies to address the evolving needs of this growing demographic.

Architecture, Capitalism, Space: A Sociology of the Atrium

In part due to its ostensibly non-material character, the atrium presents a challenging case for sociological analysts of architecture. At the same time though, critical sociology can nonetheless help; to explain some puzzling things concerning the atrium, an increasingly widespread element of the designed urban environment. Double height or greater vertical voids to be found dominating the interiors of a wide range of building types, the atrium flourishes in those parts of cities where land value is highest; given that these 'empty spaces' could be filled with directly rentable space this is a somewhat curious affinity. Drawing primarily on the ideas of Henri Lefebvre and Walter Benjamin, this paper suggests that the global proliferation of the atrium grows from oblique attempts to generate combinations of material and symbolic surplus value. In fact, it is the voided character of the atrium that allows us to explain key elements of contemporary capitalist strategy with respect to revaluing space. In fact my argument here is that voids of open space such as the atrium can actually increase the value of objects, bodies, and practices that are assembled in and around them; pushing this further, 'emptiness' itself can underpin the creation and extraction of surplus value from architecture in the context of rentier capitalism. Defamiliarising the atrium, which is a distinctive and singular architectural feature of this moment, suggests a wider research agenda for those sociologists interested in critical analysis of the contradictory spaces that are produced when capital builds.

The Interplay between Education and Digital Skills in Shaping Social Mobility: An International Comparative Perspective

Education is central in determining occupational outcomes and social mobility, but rapid digitalisation and skill-biased technical change has transformed occupational hierarchies, as well as the skills needed in the

workplace. In this context, digital skills, particularly in information and communication technologies (ICT), now take a pivotal role in predicting occupational outcomes. This may offer new possibilities for social mobility, or may further strengthen social inequalities. Indeed, the classic interplay between class origin, education, and class destination (OED triangle) may be modified in important ways based on these new sets of skills that impact successful labour market integration. Through analyses of Programme for the International Assessment of Adult Competencies (PIAAC) data, this paper considers the relationship between social background, education, digital skills, and employment outcomes across 30 countries. We use PIAAC's *Problem Solving in Technology-Rich Environments* competency domain assessment to examine the associations between country-specific relative digital skills and social origin, education, and occupational status. Furthermore, we study how 'old' mechanisms of social mobility interact with 'new' skills by examining the interplay between education and digital skills in predicting social mobility between the status of family of origin (measured by parents' education) and current occupational status (measured by the International Standard Classification of Occupations, ISCO). Finally, we compare hypotheses of cumulative and compensatory effects, perspectives which provide two divergent explanations of the size of the effects of education and digital skills depending on class origin when predicting occupational outcomes. The originality of this approach lies in its effort to demonstrate empirically how the interplay between education and digital skills is shaped by class origins and theoretically how cumulative advantage and compensatory advantage perspectives both contribute to understanding this relationship.

Multigenerational Approaches to Cultural Capital in South Korea

The purpose of this paper is to highlight the significance of a multigenerational perspective on the (re)production of cultural capital in South Korea, where social stratification is increasingly entrenched, and to propose qualitative methods as an approach. First, through an extensive literature review, we outline the rationale for employing the multigenerational mobility model and examine how cultural capital is addressed within this framework, reconstructing it as a theoretical resource. This perspective acknowledges background factors such as social institutions and demographic processes that shape patterns of inequality across generations. It also provides a comprehensive understanding of the 'lagged effect' and 'cumulative advantages and disadvantages' inherited from ancestors, along with direct resource transmission. While the multigenerational model underscores cultural capital as a hidden pathway to social reproduction, its manifestations in studies vary. Cultural capital, often in conjunction with education and other class-related indicators, can serve as a possible path for the 'grandparent effect,' where grandparents directly influence their grandchildren. It can also function as family culture, acting as a "toolbox" for formulating action strategies that impact social mobility, akin to norms and reference frames. We argue that while most multigenerational mobility research relies predominantly on statistical analysis, the mechanisms by which cultural capital operates across generations are more effectively illuminated through qualitative data and methods, particularly through an examination of rich narratives from actual actors. Finally, we discuss the unique characteristics of Korean society that create a fertile environment for multigenerational research on cultural capital, emphasizing the historical context of 'compressed modernization' and the prioritization of family community and education. Representative cases of in-depth interviews conducted with a diverse range of Koreans are also presented.

Living with Slow Disasters: The Role of Collective Efficacy in Disaster Recovery

This study delves into the sociological dimensions of "slow disasters," which are characterized by their gradual, cumulative impact on communities, often lacking the immediacy and visibility of sudden disasters. Drawing from theories of collective efficacy and disaster sociology, this research examines how social structures and community cohesion influence the capacity for disaster recovery in these prolonged crises. The concept of collective efficacy, rooted in social capital theory, refers to a community's shared belief in its ability to achieve collective goals through coordinated action. Through an empirical analysis of Aceh, Indonesia, the research investigates post-disaster

recovery following both the 2004 Indian Ocean tsunami and decades of internal conflict. By examining the interplay between social networks, trust, and local leadership, this study highlights how collective efficacy mediated Aceh's recovery processes in the face of compounded, long-term crises. Through comparative case studies and qualitative fieldwork, the research illuminates how communities mobilize collective resources to mitigate harm, adapt to changing conditions, and rebuild over time. The findings suggest that high levels of collective efficacy not only accelerate recovery but also foster adaptive capacities that transform the socio-environmental vulnerabilities of affected communities. This research contributes to the growing body of sociological literature on disaster recovery by offering a nuanced understanding of the role of social capital and collective action in navigating the protracted temporalities of slow disasters.

Resistance, Erasure, and the Life & Politics of Coloniality in Norwegian Schools

In this paper, we examine the Lillesand-case, where three sisters faced severe racist bullying in a Norwegian school. Despite clear evidence of racism, local authorities and school officials framed the incidents as mere conflicts or bullying, denying the racial aspect. This denial is contextualized within Norway's broader historical and cultural reluctance to acknowledge racism, rooted in a national self-image of exceptional democracy and humanitarianism (Lofsdottir & Jensen, 2014; Eriksen & Jore, 2023).

The study aims to understand how the denial of racism is produced and maintained through the operationalization of bullying in media discourse and court documents. Using critical discourse theory inspired by Bacchi's (2000;2009) policy as discourse analysis, 61 newspaper articles and two verdicts from the district court of Agder are analyzed. In line with policy as discourse analysis, we ask what the problem is represented to be for different actors in the Lillesand-case. We argue that the concept of bullying in Norwegian schools has been used to obscure and deny racism, maintaining schools as "white spaces." (Ahmed, 2007). Using decolonial theory (Maldonado-Torres, 2007) to analyze how the denial of racism perpetuates colonial power structures, we identify four strategies used to frame the bullying: Denial of Racism through Insisting on Conflict, The Ideology of Colorblindness, Strong and Difficult Girls, and Continued Mistrust. These strategies collectively invalidate the victims' experiences and uphold racial hierarchies.

The historical context of Norwegian education policies, particularly the Norwegianization of Sámi and Kven peoples, is discussed to highlight how these policies have long perpetuated racial inequalities. The article concludes that the denial of racism in the Lillesand-case reflects broader systemic issues in Norwegian education, where colonial legacies continue to shape social relations and institutional responses to racism.

JÖRN, AHRENS* (Justus Liebig University Giessen, Germany)

Modernity and the Institution Gap: How to Govern Sustainability?

The contemporary crises of modernity, above all environmental and security issues, have led to an enormous boom of transnational institutions and infrastructures for crisis governance. For a close examination of these efforts and resulting problems, this paper will focus on issues of climate change governance, based on research conducted in Botswana and South Africa. Since the 2015 Paris Agreement significant instruments for transnational climate change governance have been implemented. National governments are requested to produce National Development Plans and Climate Change Strategies in which they outline their sustainability policy agendas. Every five years they need to report to the UNFCCC on the progress they have made. Annually COPs are organized on which national governments, transnational bodies, and NGOs negotiate the situation. Despite such institutional efforts, the 2015 defined Sustainable Development Goals are, according to the UN, far from being accomplished, often delayed. In the Southern African region large percentages of the people are climate change illiterate; in many countries 50% and more of the population still have not heard about climate change at all, although the region is extremely vulnerable to drought, extreme weather events, and food insecurity. Our research confirms a significant gap between government representational politics on institutional meta-level and a missing communication to and collaboration with local communities. This strand is stressed by the tendency to understand climate change governance according to a paradigm of development that derives from a classic understanding of

modernity and its timely regimes. Such regime of modernization neglects the needs of local communities and marginalized actors and opens a significant gap between the successfully represented institutions on the one hand and the vulnerably affected communities on the other.

RC07-JS-59.1

JÖRN, AHRENS* (Justus Liebig University Giessen, Germany)

Nature's Revenge? a Third Nature in the Anthropocene

This paper aims to discuss a new quality of nature in the Anthropocene. The consequences of which call for an understanding of the alteration, maybe even othering, of nature which is processed by that anthropogenic influence on the Earth's condition. Not only the relation between man and nature needs to be reflected, the question also is what kind of nature it is precisely with which the world is today confronted, and that now impacts on the human-nature interaction. The contemporary type of nature that emerges from processes of human-based interference, alteration, and transformation, forms a significant threat to the existing forms of life, their structures, shapings, ontologies, interactions, and interdependencies. Today a "Third Nature" is established that has, on the one hand, become radically anthropogenic when it, on the other hand, consequently, detaches from the influence of human agency. It is a nature that has been produced and formed by human procedure, most of all in the wake of modernity. Modern ways of a domination of nature have decisively changed its existing forms. These ways of a domination over nature have resulted in the shaping of a new state of nature that escapes such modes of control and leashes back on the agents of its domination. This Third Nature is a hybrid form of nature whose anthropogenic ratio is enormous, but at the same time detached from its originators—human society and its actors. Today, Third Nature unfolds as climate change, flash floods, cyclones, El Nino phenomenon, poisoned soils, plastic enriched flora and fauna, shifts of seasons, etc. None of the existing concepts for a definition of and dealing with nature is capturing these new forms of nature that, after they had been colonized and domesticated for a long time by human agency, are now out of control.

Rethinking Sustainable Development: A Du Boisian Critique of Neoliberalism in African Development

This paper uses W.E.B. Du Bois's perspective of 'double consciousness', 'colour line' and 'racial capitalism' to examine African development approaches within the sustainable development framework. The need for sustainable development has grown over the years as a response to the effects of climate change, global warming, social inequalities, and social justice. African countries have in the past few years been encouraged to pursue development models that provide for the needs of the people and enable partnerships while safeguarding the environment and ecosystems. At the same time, the expansion of global cultural, economic and political ties means that several African countries are embracing neoliberal economic development strategies that are integrating them into global markets. The adoption of these neoliberal economic approaches has had checkered outcomes in different countries. In several places, economic growth is being prioritised over human wellbeing and environmental sustainability. Some governments, private sector actors and foreign investors, on the back of neoliberal economic approaches, are undertaking activities that are threatening to, and in some instances truly undermining progress made in the pursuit of sustainable development. The consequence is that wealth is being produced at the expense of human wellbeing and safety. The adoption of such neoliberal development approaches constitute a significant challenge to sustainable development because it perpetuates epistemic injustices, racial capitalism and environmental degradation, leading to structural inequalities in these countries. We argue from the Du Boisian perspective that several of the challenges to sustainable development in Africa emanate from the failure of development actors to acknowledge epistemological diversities in Africa and incorporate indigenous knowledges and traditional practices into sustainable development models. There is the need to decolonise development epistemologies to address the power dynamics that often characterise neoliberal development approaches. This will promote epistemological diversity, respect for indigenous cultural knowledges, and emphasise participatory and inclusive development.

JOSHI, SHANGRILA* (The Evergreen State College, USA)

Tensions between REDD+ and Climate Justice movements in the West

As climate justice movements in North America have for the past decade held on to a non-negotiable premise of 'No REDD+', decrying it as a false climate solution, research that reveals an embracing of REDD+ in various forest communities begs the question of whether there is a need for nuance within the climate justice movement, particularly on the matter of the relationship between Indigenous communities and market-based solutions. A number of issues will be discussed in this paper, including the thorny question of commodification of the commons, questions of Indigenous self-determination and the variety of ways in which they manifest, as well as the question of who represents the Indigenous voice in matters of climate (in) justice and whether a monolithic position is possible. Drawing on empirical field research in the Terai region of Nepal where REDD+ was introduced to community forests in 2018, I discuss the implications and paradoxes of climate mitigation projects for local/Indigenous communities when viewed from a climate justice lens, and offer suggestions to mitigate harm to the most marginalized within these communities.

(Un)Expected Consequences of Desegregation Educational Policies on Families: Stigma and Emotionality

Recently, policies against school segregation have emerged as a crucial strategy for public administrations aiming to create more equitable educational systems. Specifically, the "Shock Plan Against School Segregation" (SP), launched in 2019 in Barcelona, seeks to reduce educational segregation through a more equitable distribution of vulnerable students, utilizing targeted funding, preassigned school seats, and quotas.

This article examines the impact of SP on targeted families, focusing on the emotional factors involved, particularly stigma. It is based on a qualitative study comprising 60 semi-structured interviews with families benefiting from SP across 32 schools in Barcelona.

Findings indicate that the policy's impact is marked by a pervasive sense of calm and relief among the targeted families. The perception of public support fosters a deep sense of gratitude, consistently expressed in the interviews. However, a complex interplay of emotions also arises alongside these positive feelings and talks about different forms of expression of stigma. Many families report experiencing guilt and shame, viewing the assistance as a privilege. Additionally, those assigned to elite schools often face discrimination. This discrimination manifests in practices such as imposing unjustified fees and creating a sense of alienation within the school community. These experiences can lead families to feel as if they are being exploited by the very assistance designed to help them.

In conclusion, while the emotional benefits of the policy are significant, unexpected consequences related to stigmatization must be considered to fully understand the key elements of desegregation policies as SP.

Informalidad, Desempleo y Precariedad Laboral: Tramas Del Trabajo En La Sociedad Chilena Postpandemia

La sociedad chilena ha atravesado por múltiples transformaciones en la última década. Si bien la revuelta social de 2019 vino a cuestionar el neoliberalismo y la desigualdad social estructural, la pandemia (2020 - 2021) se encargó de fijar un nuevo horizonte de estabilización y conservación del modelo. Los efectos se perciben en una sociedad con un incremento en las tasas de desempleo, un incremento en la informalidad y la expansión de las formas de trabajo precario. Sumado a lo anterior, procesos de automatización y digitalización han fijado nuevas formas de trabajo, erosionado el estatus de algunas ocupaciones y simplemente suprimiendo otras. Este fenómeno de

alta complejidad, invita a considerar la nueva fisonomía que ha asumido la sociedad chilena a partir de los cambios en el mundo del trabajo. Para ello, en esta exposición, relevamos una tipología del trabajo precario en Chile con datos del año 2019 y 2023. Utilizamos un conjunto de dimensiones ya probadas en el análisis y operacionalización de la precariedad del trabajo, relevando el sexo, pertinencia étnica/nacionalidad y ocupación, además de las dimensiones de inseguridad, insuficiencia, cronopiedad, condiciones de trabajo e inestabilidad (Blanco & Julián, 2019). Nuestro objetivo es comparar ambas series de datos y relevar los cambios en la composición de la fuerza de trabajo, poniendo énfasis en las múltiples formas en que se expresan las dimensiones del trabajo precario y sus potenciales efectos en relación con el desempleo.

Differentiated Temporal Orientations between Generations of Activists in the Turkish Ecological Movement: Strategies Adopted to Ensure the Continuity of the Struggle.

Turkish society is characterized by a strong hierarchy of roles, based on a strict distinction between "elders" (*büyüklär*) and "young people" (*küçükler*), which prevails in order to define oneself as a person. This distinction affects all aspects of an individual's life and determines his or her place in society (Neyzi, 2015). It is also reflected within the Turkish ecological movement, where three generations of activists, from generations X, Y and Z, have trouble coexisting. This is reflected in the overall lesser involvement of younger people in the movement.

While intergenerational exchanges and interactions within the framework of mobilization and activism can ensure its continuity through the transmission of know-how and knowledge, they are also likely to have significant consequences on the modalities and durability of the commitment of younger activists.

Based on our research, we have found that the three generations of activists within the Turkish ecological movement have different temporal orientations. One, common to generations X and Y, is more focused on long-term actions and a strategy of gradual transformation, whereas one, innate to generation Z, favors immediate and radical action, driven by a sense of urgency regarding a near-future that is uncertain due to climate change. Our proposal is to study the adaptation strategies activists use to reduce the risk of tensions and breakdowns in intergenerational transmission in order to ensure the continuity of the movement.

This paper explores this question through the case of the Children of Nature collective (*Doğanın Çocukları*), composed exclusively of young people aged 18 to 24, and the collective For a Terrestrial Ecology (*Yeryüzü Ekoloji Kolektifi*), composed of individuals from generations Y and Z. The same entity initially split into two generations, allowing each group to adopt its own mobilization strategies and tools based on their own temporal orientations and future imaginings.

JULIE MARIE, GLOANNEC* (Tours University, France)

Resistance through Knowledge Production: The Case of Two Ecological Collectives in Authoritarian Turkey.

Nowadays, social movements can be seen as key players in the production of knowledge, and even more so in authoritarian regimes. A fundamental role of ecological collectives in producing and disseminating critical knowledge has been played in Turkey since 2002 under the repressive rule of the AKP (Justice and Development Party). This study explores how two generations of environmental activists, driven by a desire to produce and disseminate alternative, performative knowledge to government *doxa*, have challenged state disinformation and the modalities of living together imposed by the latter, regarded as contrary to the optimal conditions for thriving as a society with respect for each individual's dignity and the preservation of the environment as a common good share among the population.

Polen Ekoloji Kolektifi, a Marxist-ecologist collective made up mainly of generation X and Y activists, and *Doğanın Çocukları Kolektifi*, a generation Z anti-capitalist youth organization, share a common goal: to use knowledge production as a tool of resistance. As a result of their differing generational contexts and theoretical foundations, they bring distinctive renewed meanings to life in society, as emancipated from the neo-capitalist extractivist rule over nature and people in Turkey.

Our aim is to demonstrate how these movements reinvent the concept of dignity, justice, and democracy, through an intersectional approach of ecology and politics, by examining both their knowledge production activities and the corpora they produce - translations of foreign knowledge, seminars and workshops, and online publications.

The methodology involves analyzing thematically the texts published by these collectives and conducting in-depth semi-structured interviews with members involved in the production of knowledge. The purpose of this study is to shed light on how ecological social movements can provide a space for counter-power and the reconfiguration of essential values in the face of repressive political systems.

JULIO MEDEL, GABRIELA* (University of Padua, Italy)

SACCHETTO, DEVI (University of Padova, Italy)

RAKOWSKA, KATARZYNA (University of Warsaw, Poland)

The Swimmers: Labour Turnover Against the Cage of the Collective Agreement

This paper explores turnover as a form of workers' resistance within the automotive sector in Italy and Poland during a period of major global industry reshuffling. In Italy, this sector has historically been a key arena for working-class struggles, addressing not only sector-specific issues but also broader social concerns. Capital's response – shifting from vertical integration to lean production with extended supply chains – has contributed to a protracted workers' leverage erosion. In Poland, neoliberal reforms accelerated this process, severely weakening unions and curtailing negotiation capacity.

Labour turnover is often linked to union weakness and, therefore, with voice (Alberti, Sacchetto 2024). Differences turnover levels between Italy and Poland are often explained by the greater presence and strength of the Italian unions, compared Polish counterparts. However, we argue that industrial relations and collective agreements must also be considered. In Italy, the absence of state-mandated minimum wage is offset by a national collective agreement, renewed every three years, which ensures fair conditions for the core metalworkers, with company-level agreements often improving these terms. Workers can exercise their right to strike for various reasons. Conversely, in Poland the minimum wage is set by the state, collective bargaining occurs sporadically at the company level, and has been called a "near death experience" (Czarzasty, 2019). Furthermore, workplace disputes are subject to protracted mediation processes, delaying and defusing strikes.

Based on qualitative research conducted in Italy and Poland between October 2023 and October 2024, we argue that while in Italy strikes can be practised more frequently and for different reasons allowing disputes to immediately erupt, in the Polish case the lengthy dispute resolutions, together with trade union weakness result in a high turnover rate. We theorise turnover as form workers' resistance against the difficulties to change working condition in the short term.

How Do Youths Cope with Crisis?: Focusing on the Narratives of Their Vulnerable Situations and Well-Being Strategies

South Korea has recently had one of the highest suicide rates among young people (25-34 years old) in the OECD (2021). Korean youths face intense competitive pressures, economic realities that make it difficult to prepare for the mid- to long-term, and overlapping cultural pressures that make them confused where to settle their value orientations and convictions. Nonetheless, Korean youth are standing away from traditional religions, which have historically covered them with value orientation and meaning in life.

This study focuses on the religiosity of youths who have faced excessive vulnerability; suicide, self-harm, or mental illness in the "individualization under multiple pressures (Jung, 2023)" which is South Korean young people's socio-structural backdrop. It analyses the meaning-making process of religious reflexivity in vulnerable situations, especially, how religious resources play roles in dealing with their turbulent pain and ongoing emotional crises.

One-on-one in-depth interviews with religious youths who have attempted suicide, self-harm, or felt pain from psychological problems with overlapping vulnerability were conducted to gather data. It develops a "substantial theory (Glazer and Strauss, 1967)" of religious resilience in vulnerable young people, preserving their lives through not only psychological counseling and psychiatric therapy but also transcendental horizons.

The preliminary findings indicate that religions provide reasons for the essential will to live from a vulnerable experience and that religious-spiritual resources and contents alleviate the strain of harsh mental stresses. In this sequence, they develop a well-being strategy based on reflexivity derived from their entangled extremal and religious-spiritual experiences.

This study has the potential to sophisticate the relationship between young adults' religiosity, vulnerability, and well-being in the South Korean context, moreover, to implicate supplement perspectives for young people policy by incorporating religiosity and spirituality into institutional assistance, which is frequently limited to psychological viewpoints.

Religious – Spiritual Coping and the Therapeutic Role of Reflexivity on Mental Health: Focus on Young Adults' Mental Illness

These days, South Korea's suicide rate among young adults (25-34 years old) has been one of the highest in the OECD (2021). Korean young adults endure severe competitive pressures, economic conditions that make it hard to plan for the mid- to long-term of their lives, and overlapping cultural codes that make them unsure where to anchor their values and convictions. All these things make them vulnerable and weaken their mental health. Nonetheless, Korean youth are dropping out of established religions, which have traditionally provided them with values and meaning in life.

This study analyzes the religiosity of young adults who have tried extremal behaviors like suicide, self-harm, etc. in the South Korean young adults' structural background; "individualization under multiple pressures (Jung, 2023)". It focuses specifically on the process and meaning of religious reflexivity in extremal experiences, as well as how they use religious resources to cope with sentimental compulsions and emotional crises that persist.

Data were collected through one-on-one in-depth interviews with religious young adults who have experienced suicide and critical mental illness. In doing so, it develops a "substantial theory (Glazer and Strauss, 1967)" of religious resilience in young adults facing vulnerability, sustaining their lives through not just psychological counseling and therapy, but also transcendental horizons.

The tentative results show that religions give reasons for the fundamental desire to live from a vulnerable experience, and religious-spiritual resources and contents mitigate the tension of harsh mental pressures. Thus, they make the strategy for well-being by reflexivity stemming from the intertwined extremal and religious-spiritual experience.

It can help not only close the research gap on young adults' religiosity, vulnerability, and well-being in the South Korean context but also implicate additional viewpoints for policy for young adults by including religiosity and spirituality in institutional assistance, which is frequently limited to psychological viewpoints.

Governing Path Constitution of Energy Transition in Fields: A Practice-Theoretical Perspective on Establishing a Green Hydrogen Infrastructure in Germany

Today, heterogeneous organizations constitute energy transitions in globally embedded social fields by coordinating activities around specific issues like wind and solar energy, electromobility, or green hydrogen in time-space. One of the main challenges of energy transitions is the constellation of paths: Some highly established paths support national energy systems, while various issue-based paths related to the energy transition challenge them. Ensembles of organizations with different societal backgrounds and capabilities govern the paths and transformations to some degree, with some organizations engaging in parallel paths. Using the ongoing transformation of German industrial energy infrastructure from fossil fuels towards green hydrogen and its new transnational supply chains, we will present some ideas and findings from our research project, "Recursive Norm Formation in the Energy Transition," funded by the German Science Foundation.

Our approach goes beyond traditional views of path dependence and creation by examining the simultaneous constitution (Windeler 2003, Sydow et al. 2012) of multiple paths by reflexive organizations (Ortmann et al. 2023[1997]). We look at how ensembles of organizations coordinate social interactions and relations around issues in time-space (Windeler 2021), shaping constellations of paths and developments like the energy transition in social fields. Our research utilizes a processual multi-level analysis to capture the dynamics between organizations and fields (Windeler/Jungmann 2023). It

examines the coordinated organizational field practices constituting different socio-technical pathways in the energy transition (Berkhout et al. 2004, Geels/Schot 2007, Geels et al. 2016).

Empirically, we investigate cooperation between companies, ministries, associations, think tanks, courts, and movement organizations that shape the socially embedded energy transformation processes and path constitution. Using the example of green hydrogen infrastructure, we show how organizations in social fields and constellations of paths make the European paths partly overlap and contradict the global ones.

How to Analyze Post-Bureaucratic, New, or Alternative Organizational Forms

Weber and his ideal type of formal hierarchical bureaucracy is widely recognized as the core of modern organization theory. Today, organization research often focuses on organizing as connecting heterogeneous actors pointing to "new" organizational forms, e.g. projects, networks, or self-organized teams. I aim to outline and compare different conceptual tools to analyze such forms without ignoring formal hierarchical elements.

Permanent Distinctions: Tattoos, Taste and Cultural Capital

Taste and consumption are a recurring focus in the sociological analysis of cultural knowledge, drawing upon Bourdieu's seminal work in Distinction. How and what we consume is shaped by, and continues to shape, our class-based cultural knowledge, as well as how we are seen by others. In our paper, we want to continue the study of visual representation of cultural class, through the empirical analysis of tattoos as representing a permanent and embodied marker of taste, cultural capital, and class. In previous sociological work, the analytical categories have been 'tattooed versus non-tattooed', and the tattooed population has been associated with deviance of different kinds (criminality, low class). However, in many contexts (including Sweden), the tattooed share of the population has grown significantly over the last decades, making the tattooed—non-tattooed division too blunt to capture class differences. Thus, in this paper, we aim to study how class-based differences in aesthetic or style in tattoos are seen, interpreted, and evaluated by others: do people recognize a lowbrow versus a highbrow tattoo, and if so, how do these assessments of cultural class shape their perception about the person carrying them? We are fielding a factorial survey experiment using a pool of online respondents from Sweden. Respondents will be tasked with evaluating several sets of tattoos on a range of different outcomes, including cultural class, warmth and competence, and other attributes.

The Public Sphere Fragmentation and Its Political Consequences: Between Democratic Promises and Authoritarian Biases

The expansion of digitalization and the adoption of social media as a means of daily communication and information have changed the contours of what is now understood as the public sphere. The link and importance of this concept to democracy and the formation of political will, however, remains relevant. In this paper, I bring together elements on the meaning of the diagnosis of the fragmentation of the public sphere amid digitalization and the expansion of social media in order to contribute to a conceptual update. Considering the close link between the public sphere and democracy, these elements show the political consequences of these processes amid recent threats to democracies. To accomplish these tasks, I first organize the characteristics that point to the occurrence of a new structural change in the public sphere, with the central characteristic of a radical fragmentation (1); then, I analyze what is characteristic of this new structural change in the public sphere and what elements can be considered as a continuation of past conceptions (2); finally, I sketch a possible relation between the new transformation of the public sphere to the political consequences of the democratic "paradoxes" found in the description of the new structural change in the keys of authoritarianism and democracy, thinking about its current and future consequences for the democratic rule of law (3).

War through Images: Visual Communication of the War in Ukraine in Lithuanian Media

Two years ago, the world was shocked by the sudden war in Ukraine. This event quickly became the primary focus of global news, with media outlets rushing to cover the unfolding crisis. News media became society's primary source of information, providing real-time updates on the war's developments. Visuals played a central role in this coverage, not only in capturing the harsh realities but also in conveying emotional and human dimensions. Visual communication became a powerful tool in making the war feel more immediate and tangible to audiences, enhancing the impact of the presented information.

This presentation is based on the findings of a scientific study conducted in Lithuania. The objective of the research was to examine how the war in Ukraine is visually represented in the country's most widely read online news media outlets and to identify the types of visual communication that have the greatest impact on audiences. The media content analysis demonstrated that the depiction of the war is centered on images of political leaders and the material damage caused by the conflict, such as infrastructure and buildings that have been destroyed. However, the audience eye-tracking study yielded different results, indicating that the most impactful visuals for viewers are not images of political figures or destroyed property, but rather those depicting human suffering. Images of war victims – those who are injured, mourning, displaced from their homes, or otherwise in distress – elicited the strongest emotional reactions from audiences. These findings suggest that while the media tends to focus on the broader political and structural aspects of the war, it is the human cost that resonates most deeply with viewers. This highlights the powerful role that human-centered visuals play in shaping public perception of conflict.

JUZASZEK, ANNA* (Jagiellonian University, Poland)

The Twilight of the Right to Marry. Remarks on Article 12 of the European Convention on Human Rights.

The presentation focuses on Article 12 of the European Convention on Human Rights (ECHR) and its response to the observed variety of relationship designs. The basic assumption is that human rights should commit to value pluralism and embrace social diversity rather than suppressing it. However, Article 12 promotes a very homogeneous vision of family life based on heteronormativity and does not increase the number of people who can live in harmony with themselves, their needs, and values. Instead, it perpetuates an oppressive status quo.

This is because the European Court of Human Rights' (ECtHR) interpretation of the right to marry is very narrow, applying only to heterosexual and monogamous marriages. The ECtHR also uses a wide margin of appreciation to respect the culture and tradition of each society. Consequently, supporting a very particular way of life based on heteronormativity. Moreover, the adjudication focuses on the institution of marriage and its preservation rather than on the actual bond between people. Finally, the mere existence of the right to marry in ECHR has a strong symbolic meaning that sends a clear message about what kind of relationship is considered the most desirable.

This approach to the right to marry consequently practiced by the ECtHR has far-reaching consequences especially for the LGBTQ+ community in particular, as they are the ones whose relationships often do not follow traditional patterns. Just because of their preferences for love, commitment and intimacy, they are almost automatically excluded from the protection of human rights when it comes to Article 12. Article 12 thus becomes a distorted human right, failing to recognise the dignity and agency of a significant part of European society.

Transnational Nomadic Epistemologies & Stateless Subaltern Struggles: On the Coloniality of International Human Rights on Statelessness

Academic discussions and international efforts such as the UNHCR's global iBelong campaign (2014) that aim to prevent and "end statelessness" are mostly oriented toward citizenship acquisition. In this article, we critically explore the coloniality of international human rights discourses in relation to statelessness. The coloniality of the prevailing knowledge systems of international human rights, with its time-space provincialism, and its gendered and racialized underpinnings, puts in place particular forms of epistemic and political erasures that inform dominant knowledge production and representations of statelessness which view it as a 'problem' to be resolved. This knowledge, we argue, is rooted in a Eurocentric political history that forms the field's conceptual terms, theoretical frameworks, and philosophical principles. But is statelessness a 'problem' to be resolved? And does the term 'stateless' include the subaltern struggles of stateless people in 'most of the world'? We insist on a critical reflexive feminist politics of location that centres a subaltern group not often recognized as having political and epistemic presence: the stateless 'Bidoon Jinsiyya' (translating to 'without citizenship') in Kuwait. The Bidoon are nomadic and transnational Bedouin tribes who became stateless due to state formation processes, the introduction of citizenship and border regimes, and developmentalist dispossession in the Arabian Peninsula. By focusing on the life histories, nomadic epistemologies, and contemporary subaltern struggles of the Bidoon, this paper challenges the coloniality of international human rights in two ways: First by arguing that global human rights discourse on statelessness reproduces colonial, depoliticized, decontextualized and developmentalist narratives that are embedded in "methodological nationalism" (Wimmer & Schiller 2002), reifying the nation-state as an essentialized ontological category and state-centric notions of sovereignty, territoriality, and membership. Second, it argues that the coloniality of international human rights on statelessness makes "unthinkable" (Trouillot, 1995) the epistemic agency and political imaginaries of stateless rights mobilisations.

Addressing Prevalence of Infertility and Its Implications: With Special Reference to India

Infertility is a global Reproductive Health issue, that has socio-economic implications on both the individual and society. The prevalence rate of infertility has been reported as 3.5% to 16.7% in more developed nations and from 6.9% to 9.3% in less-developed ones. Worldwide, 8–10% of couples are suffering from infertility every year and 25% are in India. Primary or secondary Infertility may be caused by a number of factors in either male or female reproductive systems. Indian Council of Medical Research says that, the prevalence of male infertility is around 10–15%, among women, it is 13.4% in 1015–2019. WHO estimated prevalence of primary infertility among women is 11.8%. 40% of infertility cases were related to men, out of every 100 couples, 10–15 of them will be facing difficulties due to male infertility. Various studies have been evidenced the remarkable rise in the infertility rate. NFHS survey, 2019–21 assessed the prevalence of primary infertility at both national and state levels in India with 3.9% to 16.8%, higher in urban areas.

In this backdrop, the study aimed to comprehend the infertility scenario in the world and in India. It explores the determinants, causes, challenges and its implications based on systematic standard survey data from a Sociological Perspective. The study on infertility is important for health-care providers and policymakers to design and implement policies related to prevention, diagnosis and treatment. The impact of infertility on the woman's life in India is also substantial. Due to socio-cultural factors, they suffer from social stigma of being infertile. It has an impact on their families and communities. Equitable access to fertility care is also a challenge for poor, un-educated and marginalized groups. Fertility care is not prioritized in national health coverage. The study suggests to improve the current reproductive health programmes

Indigenization of Sociology: A Transformative Perspective in Higher Education with Reference to India

Indigenization in understanding society is a way for self-awareness and rejection of borrowed consciousness by opposing Western perspective and its universalism. Many Indian scholars questioned the western model, pleaded for the adoption of new approaches and methods which are applicable in Indian context. Sociologists and Anthropologists have tried to explore social institutions through the analysis of contemporary ideologies, Values and norms of Indian Society. In the Asian context, Indigenization of teaching sociology in higher education has been pursued as teaching Sociology in national language, research by insiders on prioritizing the relevant researchable issues, theoretical and methodological reorientation and challenges in accepting the Indigenization in the academic culture under the Globalization. The objective of this paper is, to re-conceptualize the sociological concepts for a scientific study of Indian society, to provide a vision for future development, social innovation and its implications. It mainly emphasizes on contextualizing the Indianization of education on social and cultural institutions of Indian society. This will lead to the growth of Native Scholarships and the Nation-building process.

The article concludes and justifies the need to re-examine to evolve suitable strategies in understanding the Indian Society. The Indian education should synthesize traditional principles in terms of modern rationalistic-positivistic ideas and also the western value-neutral scientific attitude. Infusing Indigenous perspectives in the curriculum is important and this kind of transformation is desirable also, so that society can be examined through new lenses. It emphasizes the positive aspects of indigenization in understanding the social and intellectual traditions and institutional growth of Indian society.

L'Indépendance En Tant Qu'Étiquette Et Enjeu Du Pouvoir Médiaque : Cas Du Magazine Le Journal Au Maroc

Erigée tantôt comme « mythe » tantôt comme « idéologie professionnelle », l'indépendance constitue l'une des fortes préoccupations de notre époque, et elle traverse, bien entendu, nombre de domaines et d'activités. Ici, c'est une étude-réflexion à la fois théorique et empirique sur la question spécifique de l'indépendance appliquée au domaine médiatique. D'une part, il s'agit de voir ce que permet aujourd'hui l'étiquette « indépendant » en termes d'influence et de visibilité-crédibilité pour les acteurs médiatiques qui s'en réclament. D'autre part, l'on tentera de démontrer que le pouvoir d'influence des médias doit pour partie à cette étiquette d'indépendance. C'est sur la base d'un matériau recueilli, à partir du cas du magazine marocain *Le Journal*, que la réflexion est menée sans toutefois s'y limiter.

KAALUND, MARIA* (Aarhus University, Denmark)

What Luhmann Can Tell Us about Rights of Nature: Conflicts of Communication in the Negotiations of Non-Human Nature's Status As a Legal Subject in New Zealand

How can the social systems of a functionally differentiated society, which have detached themselves from their perceived environments of nature, re-establish a place for nature? An innovative way in which the legal system has communicated about nature in recent years is in the form of Rights of

Nature (RoN) laws, that is, laws which endow nature or natural entities with legal rights. However, the existing literature on RoN tells us that one of the underlying issues of understanding nature as a legal subject is the way in which this status exists and moves across different societal spheres; legal, economic, political, etc. This makes it important to ask how RoN is translated across these spheres, including how meanings are altered and how that potentially instructs understandings, analyses and recommendations differently. In this paper, I argue that Luhmannian systems theory provides us with a theoretical lens through which we can productively analyse this. I then proceed to investigate parliamentary negotiations of the inclusion of nature into the category of legal subjects in New Zealand's 2017 Te Awa Tupua (Whanganui River Claims Settlement) Bill - a decision presented as a way to advance both environmental justice and justice for the Māori population. Using a second-order observation approach one sees how the river's status as a legal subject is negotiated in the light of a range of communicative logics, including political, legal and economic, and care communication. One can further call into question the attempted equation of legal communicative logics about the river's status as a legal subject and what in parliamentary negotiations is presented as the Māori view of the river - a cluster of intimate communication, care communication, and religious communication.

KABANI, ANIKA* (University of Oxford, United Kingdom)

"Performing Secular Relatability: Muslim Asylum Seekers and the Securitised U.S. Humanitarian Immigration Apparatus"

This presentation explores how Muslim heritage is securitised through the United States immigration process, particularly for asylum seekers, and what performances this securitisation gives rise to. Focusing on the 'terrorist bar to asylum' and the ambiguous classification of Tier III terrorist organizations, I examine how this legal fiction disproportionately impacts asylum seekers from Muslim-majority countries. Drawing on ongoing ethnographic fieldwork with attorneys, legal advocates, and asylum seekers, I trace how the potential of legal ambiguity enabling exclusion incentivises secular performance - how asylum seekers and their advocates perform compliance with U.S. cultural and political norms to navigate the securitised terrain of asylum adjudication. I argue that through these performances, Muslim asylum seekers are compelled to downplay religious or cultural identity to present themselves as 'non-threatening,' conforming to secular liberal narratives, a move I term 'secular relatability'. This presentation reflects on the broader implications of this securitised approach and how immigration legal regimes shape the lived experiences and possibilities of belonging for Muslim asylum seekers in the United States.

Expectation Management Among Family Caregivers of Youth with Substance Use Disorders in Zambia.

Background: Research has established that family caregiving roles are shaped through interaction and depend on social and contextual factors. Caregivers of youth struggling with substance use disorders (SUDs) face a complex web of expectations and challenges as they navigate their youth's journey towards recovery. On one hand, they must contend with societal pressures and misconceptions about SUDs, which is characterized by stigma, blame, and a lack of understanding. On the other hand, they are often expected to be the primary source of discipline, support and care, ensure their young adult recovers, secure the emotional well-being and safety of their family and community members.

Methods: This qualitative study used semi-structured in-depth interviews, participant observations, and a caregiving timeline with 30 family caregivers of youth with substance use disorders to get their subjective lived experiences.

Findings: Balancing these community expectations with the realities of their youth's SUD recovery trajectory was a daunting task and dilemmatic experience for many unsupported family caregivers. Community members often reprimanded most family caregivers for their youth's unresolved SUDs and disruptive behaviors. Over time, most caregivers developed resilience and became acclimatized to their caregiving situation, albeit with the expressed need for more financial, emotional, and practical support.

Implications for policy and practice: These findings underscore the need to promote caregivers' psychological resilience and reduce stress and burnout. Doing this will help family caregivers provide quality care to their youth and help them live meaningful lives in their communities as they manage daily care. Sensitization campaigns and stigma-combating strategies are imperative in working towards a more supportive and compassionate community that promotes the well-being of SUD caregivers, the affected youth, and other family members. This would help community members to gain new insight into the causes, symptoms, treatment options, and the chronic and relapsing nature of SUD recovery.

RC49-778.4

KABEMBO, IREEN* (University of Zambia, Zambia)

Informal Practices of SUD Caregiving Support for Carers without Mutual Support Groups: Experiences of SUD Carers of Young Adults in Zambia.

Background: Caregiving for a loved one with a Substance Use Disorder (SUD) is a complex, highly stressful, and often isolating experience. Extant literature shows that mutual aid groups offer a structured antidote, providing safe spaces to share experiences, adaptive coping strategies, and finding a community. Despite this, SUD caregiving in Zambia lacks mutual support groups for family caregivers accessing outpatient public hospitals. While there is established support for young adults grappling with addiction problems, their caregivers navigate the turbulent SUD caregiving experience with near non-existent mutual support groups.

Methods: A qualitative phenomenological study with 30 family caregivers was conducted using in-depth semi-structured interviews, creation of a caregiving timeline, and participant observations. This research explored the diverse ways caregivers without mutual support groups navigate the challenges of SUD caregiving.

Findings: For caregivers of youth struggling with SUDs, the emotional toll and practical burdens are immense. SUD caregivers in Zambia had common experiences including emotional distress, financial strain, and decreased self-care. With limited access to formal support groups, online resources and telehealth services, informal practices of support were crucial for these caregivers. These included leaning on friends and family, neighbors, and community members, and developing self-care behaviors such as reducing worry about the problematic youth to secure one's physical and psychological wellbeing. Although this was the case, some caregivers reported that not all social networks offered emotional validation, practical help with caregiving tasks, and the much-needed breaks.

Implications for policy and practice: Findings of the study call attention to how formal and informal support networks can be fostered and strengthened to effectively meet the diverse needs of stigmatized and marginalized SUD caregivers. There is need for targeted policies, programs, and a unique model of support that would reach all who are walking this challenging, and often isolating, caregiving path in Zambia.

RC09-140.1

KADIMI, PROF. DR. MADHU BABU* (Acharya Nagarjuna University, Nagrjuna Nagar, India)

Dynamics of Tribal Economy Under Globalization in Andhra Pradesh State in India.

Primitive conditions of the tribal life, ignorance, illiteracy their vulnerability to economic exploitation, the existing socio - psychological barriers due to isolation, necessitated a cautious and phased approach for the development of tribals. More than three decades have passed in implementing the new economic policy by the Government. This was done on the name of globalizing Indian economy and integrating it to the world economy. It was thought that the policy would not only end the economic deadlock but would also bring prosperity to all including weaker and marginalized sections of society. However, the studies in India and elsewhere abroad have empirically proved that these policies have worked against the poor and well off in the society have been benefited. The tribes are one of the marginalized communities in India. They are very much exploited and excluded population. The policy of globalization has reversed the earlier policies of the government which are bound to have long-term implications for the welfare and future of tribes as they are the most vulnerable group-socially and economically. The process of globalization has made disastrous changes in the lives of indigenous people across the world, though the degree of exploitation and marginalization vary from state to state and tribal group to group. The various academicians, researchers, intellectuals and grass root level activists have expressed concern and apprehensions about the potential adverse impact of globalization on the marginalized and socially underprivileged and neglected community of the tribes. The researcher had therefore decided to make a field based inquiry about the problem and study the present socio-economic status of tribes and its associations with the impact of globalization.

Green Transitions in the Periphery: Derisking, Dependency, and Alternative State-Capital Relations

Governments across the Global North and South are turning to green industrial policy to address the ongoing climate crisis. However, the financial architecture of these policies has become subject to heated debate, with critics pointing to predatory state-capital relations embedded in the "derisking" of green investments. In this paper, I examine this "derisking" critique and its limits. While critics correctly index an ongoing subordination of the state to capital, I argue their misunderstanding of 20th century developmental states entails a misdiagnosis of contemporary industrial policy. I then apply this argument to the Global South, where Just Energy Transition Partnerships (JETPs) threaten to reproduce structural adjustments in order to ensure stable returns for Northern donors and exporters. Finally, I offer a set of recommendations for states pursuing just green transitions without core-periphery dependencies. Taken together, these alternative state-capital relations shed light on the institutional transformations necessary for meaningful low-carbon development.

RC02-32.1

KAHAN, GABRIEL* (University of Wisconsin-Madison, USA)

The Specter of State Discipline: Green Industrial Policy and Low-Carbon Development in France

Demands for decarbonization have triggered a renaissance of state intervention — or so we are told. Pointing to the rise of "green industrial policy," social scientists now debate the return of economic planning in the name of reindustrialization and fossil fuel phase-outs. In this article, I outline an updated theory of what scholars of development term "state discipline" as a key heuristic for evaluating this state-led decarbonization. Through the crucial case of the French state and its relation to the global oil major TotalEnergies, I show how the efficacy of green industrial policy is a reflection of the state's capacity to discipline firms. Drawing on a corpus of public documents as well as in-depth interviews with civil servants, lawyers, and activists, I trace the formation of this state discipline as (a) *conditional incentives* mediated by (b) the *exogenous coercion* of firm participation. Without the latter, states prove incapable of systematic discipline and industrial policy devolves, at best, into piecemeal interventions and, at worst, legally ambiguous partnerships enabling corporate welfare. This research reveals the contradictions between the policy instruments and policy autonomy of the emerging green state. While there is clear evidence that "post-neoliberal" regimes are now defined by a renewal of economic planning, I suggest this planning remains subordinated to the interests of highly globalized firms. And yet, given ongoing shifts in multilateral governance, space maybe opening for a reversal of this structural dependency.

Gendered Imaginaries: The Role of Lebanese Sociologists in Shaping Women's Issues Post-Arab Spring

This paper delves into the transformative role of sociology in addressing gender dynamics and women's roles in Lebanon and the Arab World following the Arab Spring. Rather than examining the influence of societal changes on sociology, this paper focuses on how sociological scholarship actively shapes gendered social, political, and economic imaginaries. Utilizing the Cultural Political Economy (CPE) framework, the panel analyzes how sociology contributes to the conceptualization of gender roles and its impact on women's empowerment and social justice in post-uprising contexts.

The methodology includes a macro-level analysis of the autonomy of sociology in Lebanon, coupled with a micro-level investigation of the contributions of prominent Lebanese sociologists. Key figures include scholars, such as Fadia Kiwan, whose influential work on gender equality and women's rights has significantly impacted public discourse and policy-making in Lebanon; Mona Fawaz, and Carmen Geha, whose activism and scholarship on political reform emphasize the importance of women's political participation and its role in shaping Lebanon's socio-political landscape.

Key research questions guiding this paper include:

1. How has sociology in Lebanon contributed to the formation of gendered social, political, and economic imaginaries post-2011?
2. In what ways has the autonomy of sociology as a discipline influenced its ability to address and challenge gender inequalities in Lebanese society?

3. How have the contributions of individual Lebanese sociologists shaped policies and public opinion on women's issues and gender justice?
4. To what extent have sociological insights into gender issues impacted women's roles and status in Lebanon's socio-political environment?

By exploring these questions, the paper aims to highlight the significant role of sociology in advancing gender studies and advocating for women's rights in Lebanon. The discussion will provide insights into how sociological practice can drive gender-based social change and contribute to feminist scholarship in complex socio-political settings.

Ensuring the Rights of Ukrainian War Refugee Children in Lithuania: Challenges and Opportunities

War refugee children are a particularly vulnerable group of children, and their rights and inclusion in the education system must be given special attention. As the war in Ukraine continues, minor war refugees from Ukraine, as well as from other countries, continue to arrive on the territory of the Republic of Lithuania. The inclusion of these children remains a topical issue. It is important to assess the challenges and opportunities for ensuring the rights and inclusion of war refugee children in the Lithuanian education system in order to fully ensure the right of every learner, including vulnerable children, to inclusive and equitable educational opportunities.

The qualitative study aimed to explore how the rights of Ukrainian war refugee children are guaranteed in the context of their inclusion in the education system. The participants were pupils in upper grades who arrived in Lithuania from Ukraine after the outbreak of hostilities and teachers who work with Ukrainian war refugee children.

The study found that the rights of Ukrainian war refugee children are not sufficiently guaranteed in Lithuania. Children experience discrimination, especially from older people, because of their arrival in Lithuania and their lack of knowledge of the Lithuanian language. The living conditions of the children do not provide them with sufficient privacy and space. Although the learning conditions are sufficient, the learning process is complicated by the emotional trauma each of them has experienced, the anxiety about the course of the war, and the relatives left behind. Some children have difficulties to continue in Lithuania the non-formal education activities they started in Ukraine. Once they arrive, the children become independent very quickly, which affects the importance of their opinion in the family.

Climate Crisis, Livelihood Vulnerability, and Human Health: A Study of Coastal Women in Bangladesh

As a mounting global crisis, climate change inflicts severe consequences on coastal regions worldwide. The adverse impact of global warming on livelihoods in coastal areas is a central policy concern in Bangladesh. Facing climate threats like cyclones and riverbank erosions, men and women in the coastal regions constantly experience 'solastalgia', a fear of dislocation from their place that acts as a livelihood vulnerability. Coastal women, often engaged in agriculture, aquaculture, and fishing, face significant losses due to shifting weather patterns, increased salinity, and extreme climate events. Resulting economic and social repercussions force women to adapt to hazardous circumstances to support their families. This empirical study delves into the intersections between climate-induced livelihood vulnerability and gendered health implications in the Global South, especially in Bangladesh. Primary data were collected by interviewing two doctors, a survey of 61 women, six case studies, and two focus group discussions in Shyamnagar area of Satkhira district. The study highlights the climate vulnerability of coastal women and shows that many of them are forced into dangerous and physically taxing work, such as shrimp fry collection from nearby rivers, to secure a livelihood that jeopardizes their health. It also finds that prolonged exposure to salty river water, rain, and heat causes these women to face multifarious health challenges such as skin diseases, respiratory ailments, malnutrition, and gynecological problems – that impact women's well-being as well as strain ill-equipped local healthcare systems. Furthermore, access to healthcare services in remote coastal regions is limited, making it difficult for women to address their health problems effectively. The study underscores the need for long-term,

sustainable solutions to improve the lives of marginalized coastal women. This paper is expected to contribute to generating further theoretical and empirical discourses on health and livelihood vulnerability of coastal women in similar situations around the globe.

ZENITH, JEBA TASNIA (University of Rajshahi, Bangladesh)
Psychosocial Correlates of Birth Order in Bangladesh

Throughout history, hierarchy based on age difference and birth order played a pivotal role in family relationships. Although age difference and birth order remain constant during the entire life course, the social construction of elder/younger, based on the above two, is more malleable. With a view to exploring the cultural practices relative to positional sibling roles in modern families, we conducted a short-term observational study upon twenty individuals from seven families in Northwestern Bangladesh. The findings of this qualitative study indicate that although age difference, gender, quality of relationships, and family structure affect the predominance of a particular pattern of sibling relationship and behavior, some crucial psychosocial characteristics are discernible. The first-born children are emotionally unstable, conservative in nature, and tend to hold the family traditions and social values securely. They also become passionate believer, care giver, responsible, and more sympathetic toward others. On the contrary, the latter-borns behave more liberally especially with regard to financial matters. They also pursue specific goal-oriented interests more often than their senior counterparts do. Furthermore, latter-born children are more radical, less emotional, innovative, and courageous by nature. Finally, the middle-born children are found to be particularly introvert. Thus, the place of individuals within the family acts as an influencing factor that shapes human social behavior. This paper is expected to contribute to generating further theoretical and empirical discourses on the intersections between birth order and psychosocial characteristics of siblings in families around the globe.

Visual and Sensory Methods in the Study of Everyday Bordering Processes: Insights from the Finnish-Russian Border

Contemporary interdisciplinary border studies understand borders as dynamic and multidimensional processes of "bordering" that are produced by people and communities in their everyday lives through ideology, discourses, political institutions, attitudes, and agency (Scott 2015). This paper examines such everyday bordering processes at one of the world's most rigid and divisive borders: the Finnish-Russian border. The aim is to demonstrate how visual and sensory methods can deepen the understanding of borders as more than static state lines, highlighting their role in shaping individuals' perceptions, experiences, and identities. The paper draws on two studies conducted within the "Borders and Borderlands Revisited" project at the Visual and Digital Cultures Research Center, University of Antwerp, Belgium.

The first study employs visual and sensory ethnography to explore everyday bordering processes in Finnish and Russian border cities during the period following the COVID-19 pandemic and the onset of the war in Ukraine. This approach captures the affective and embodied dimensions of bordering processes and their interaction with material borders and landscapes. The second study investigates the visual representation of the Finnish-Russian border in the Finnish national press over the past decade (2013–2022), a period marked by deteriorating political relations between Finland and Russia and significant changes in everyday life at the border. The analysis reveals four overarching visual rhetorical strategies that construct the image of the border, showing how shifting social and political contexts influenced these representations.

By employing these examples, the paper aims to shed light on the power relations embedded in everyday bordering processes, illustrating how visual and sensory methods offer new avenues for understanding and making visible the complexity of borders in everyday life.

"My Grandparents' Backgrounds Were Very Different....": Ruptures and Non-Linear Trajectories in Intergenerational Class (im)Mobility in Poland

This presentation is based on the analysis of the biographical-narrative interviews with academics, artists, and business managers, examining how their current professional statuses reflect two divergent paths: upward mobility for those from working-class backgrounds and class reproduction for those continuing their parents' careers. A significant observation from this analysis is the complexity and non-linearity of intergenerational class mobility and reproduction when considering the social statuses of both parents and grandparents.

The individual experiences revealed a heterogeneous and sometimes contradictory set of resources employed in shaping life, career trajectories and obtaining prestigious occupational positions. To fully grasp these life narratives, it's essential to consider the historical and geographical contexts. Given that the interviews were conducted in Poland, the impacts of significant events such as World War II, subsequent introduction of authoritarian socialism and the post-1989 transition are crucial, as they frame the family experiences of the interviewees—ranging from loss of wealth and social status to sudden economic success.

To delve deeper into the interplay between individual narratives and broader social history, the presentation will spotlight four selected case studies. This examination of how personal experiences intersect with macro-historical contexts in Poland highlights the necessity of historical contextualization in class studies. Therefore, it reflects on the significant contribution of qualitative (e.g. biographical) approaches in studies on class structure. Moreover, it illustrates potential challenges of applying the theoretical models developed in Western capitalist countries while studying nations with distinct historical trajectories.

The empirical material was collected in the framework of two research projects: "Crossing (in)visible boundaries: Experiencing upward mobility in individuals' biographies." (2020-2021), and "RaM-CLASS. Class reproduction and mobility - biographical experiences in academic, artistic, and business fields" (2023-ongoing).

Development without Empowerment: A Subaltern Perspective

This paper focuses on the state of displacement and its implications on the marginalised communities across the states of Rajasthan and Maharashtra in the West and Odisha and West Bengal in the Eastern parts of the Indian sub-continent. The present study has been conducted by the authors to assess the nature, type and extent of displacement that has occurred over the years using mixed methods so as to bring out the perils of development induced displacement.

Additionally, this paper brings to light the fact that more than sixty-five percent of the dispossessed are living in precarious conditions without any just alternative to their sustenance, thus consequently leading to extreme marginalisation. Since, the community relies extensively on the informal sector for livelihood hence any form of alienation of the Common Property Resource (CPR) dependants has led to an alienation from the economy, culture, social systems and political structures too. This study uses David Harvey's theory of 'Accumulation by Dispossession' that argues the eminent domain of hegemonic concept of monopolization of community resources in the contemporary society.

Thus, in the light of this situation, the current study tries to understand this complexity from the dispossessed's point of view while also searching for alternatives to minimise the issue of displacement that has gained precedence in the current academia. Though the country has witnessed an amendment of the Land Acquisition Act, yet the socio-economic deterioration of the displaced people continues to appear as a perennial issue. Hence, this paper tries to reveal a bird's eye-view of the disempowerment of communities through displacement and inadequate rehabilitation that pose a challenge to the national conscience.

Coloniality Non/Belonging and Aspirations of Racialised Migrant Youth

The belonging of migrants in a new country of settlement is a widely studied topic in migration studies. Existing research explores how migrants express belonging and how this relates to their legal status as temporary or permanent residents. However, little is known about how young migrants from the same racial group but with differing legal statuses, such as temporary residents without citizenship rights and those with full citizenship experience and express (non)belonging to place. This paper explores how 20 Black African youth who migrated to Newcastle, Australia, under various circumstances either as students or dependents of skilled migrants or refugees navigate exclusion and construct belonging. Using coloniality as a theoretical lens, the findings reveal that participants with temporary residency expressed non-belonging due to restricted rights, limited resources and precarious work conditions. Those with citizenship also reported exclusion, particularly in the labour market, where racialised barriers undermined their aspirations. Despite these challenges, participants resisted coloniality by pursuing education, contributing to their communities, and fostering connections through family and kinship. Some aimed to return home after enduring current hardships, while others sought

belonging within Australia. The paper highlights the enduring impact of coloniality on exclusion and aspirations while showcasing the resilience of racialised migrant youth.

LEMPIDAKI, MARIA (National and Kapodistrian University, Greece)

Dehumanisation As a Result of Immigration Policies: Are Graduate Albanian Immigrants in Greece in Social Despair?

Our research focuses on the views held by young Albanian immigrants who have graduated from Greek Universities between 2022-2024. This specific time period is characterized by an upsurge in the "working poor youth" in Greece. This phenomenon entails flexible employment arrangements and a low income as well as significant financial instability, leading to difficulties in meeting basic needs such as housing, nutrition and health care. We centre on Albanian immigrants who constitute a unique category of graduates whose financial investment in university studies underpins their immigrations goals. The participants of the present qualitative longitudinal study comprise different categories of Albanian university graduates with their common denominator being the fact that they are employed in low social status positions unrelated to their degree. It is noteworthy that the participants of the present study have participated in previous studies undertaken by us and therefore, we have amassed a great wealth of qualitative data, including data on their hopes for a prosperous future, their trust in the Greek institutions as well as on their aspirations about the overturning of the immigrant stigma. Through semi-structured interviews we revisit their earlier ideas and attitudes and discuss them in light of their present circumstances allowing for the emergence of a multitude of political, financial and social factors, which appear to have impacted their life scenarios and aspiration for progress. One significant question arising from this study is whether this new reality is shaped by the newly-emerging challenges that they face causing them to dispute and question their previously held notions, ideas and interpretations.

JACKSON, GREGORY* (Freie Universität Berlin, Germany)

Contextualizing Civic Engagement: The Dynamics of Civil Society Organizations and States

This paper develops a contextualized approach to studying civic engagement focusing on civil society organizations (CSOs) and their interactions with states. Existing research documents how civic engagement may create both a 'bright' and 'dark' side of social capital with differential effects on democracy and development. However, the mechanisms underlying these effects and the contextual effects within different macro-level politic structures have not been sufficiently studied in an integrated comparative fashion. Research on the frequency and density of civic engagement tends to downplay the qualitative differences in the *kind* of networks and normative orientations underlying civic engagement. Likewise, comparative scholars have not systematically explored the different impacts of civic engagement in contexts beyond liberal democratic countries.

To overcome these limitations, we develop a theoretical framework for comparative analysis that locates different types of CSO engagement in different state contexts. Underlying our framework is the distinction between the network dimension of engagement, and its normative dimension. Based on whether CSOs use weak vs. strong network ties and inclusive vs. exclusive norms, we propose a typology of civic engagement: universalist, communitarian, particularist, and populist. Likewise, states develop liberal vs. co-optive networks with CSOs and follow democratic vs. autocratic norms, leading to four types of state responses: pluralist, corporatist, state-dominated, and containment. Our conceptual framework situates different kinds of CSOs in different state contexts, thereby moving beyond the “bright” and “dark” sides of civic engagement. In addition, our configurational analysis conceptualizes the alignment and conflicts between CSOs and state actors, and argues that this framework be used to develop deeper theoretical understanding of state-society relations in both the Global North and Global South.

Politicizing Prophethood: Techniques of Far-Right Encroachment on Civil Society in Pakistan

How do far-right parties expand and legitimize their ideas within the civil society? Research on far-right parties has focussed on their electoral successes and increasing normalization of their exclusive ideologies within formal politics. However far-right parties often function as hybrids combining electoral strategies with social movement activism. This paper draws attention to movement characteristics of far-right politics through the case of Tehreek-e-Labbaik Pakistan (TLP) – an anti-blasphemy political party in Pakistan – a country where elections co-exist with military authoritarianism and constrained civil liberties. Based on longitudinal ethnography of the party, and drawing from social movement literature, the paper identifies three techniques through which TLP expands its influence within the civil society: *Reframing Narratives* where the party grounds its narratives in familiar and legitimate sources but reframes them to foster hate against specific social groups; *Bridging and Bonding networks*, where the party recruits grass roots activists and co-opts brokers who disseminate its narratives across different organizational and social media networks; and *Practicing Contention*, where the party symbolically appropriates existing cultural objects and practices to engage in both routine and episodic forms of contention. Taken together these three mechanisms which I call ‘Techniques of civil society encroachment’ not only expand the party’s exclusionary, particularist, and repressive norms but also lead to erosion of inclusionary, universalist, solidaric norms from the civil society. The paper concludes with a discussion of contextual factors which facilitate far-right encroachment of civil society in the context of Pakistan’s religious nationalist and politically hybrid regime.

Alternative Food Initiatives in Germany and the Value of “Good Food”

For several decades, alternative food initiatives have been advocating and acting to transform food systems. Valuing local food and bringing consumers and producers closer together are some of the strategies they have adopted to ensure ‘good food for all’. In Germany, these initiatives take different forms, such as CSAs, food cooperatives and other consumer and citizen-led movements.

This paper takes a closer look at three different initiatives in the country: a consumer cooperative supermarket, the Slow Food movement and Food Policy Councils, which address different spheres of change (market, civil society, politics).

Slow Food’s philosophy is “good, clean and fair food for all”, and the international flag is translated in different ways in the German branch. One of these is a commission for food quality and the creation of standards that would guarantee “good food”. Combining intangible principles such as solidarity, equality, sustainability and mutual trust with economic value is one of the biggest challenges for the movement.

The cooperative supermarkets studied face similar challenges. They present themselves as a community working to ensure that everyone has access to good, healthy and fairly produced food.

Finally, food policy councils bring together different stakeholders to promote more democratic and just participation and co-determination in (local) food policy. Despite initial successes, there is still a long way to go to meet the demand for good food for and with ‘everyone at the table’.

The aim is to empirically explore what the concept of ‘good food’ means in these different types of initiatives, the similarities and differences, the potentials and limitations. Furthermore, comparing the different strategies and scales of collective action provides new insights into social innovation and value creation around food system transformation in Germany and beyond.

Enhancing Roma Children’s Education through Digital Parent-School Communication

In recent years, technology has increasingly impacted communication and relationships between schools and families, particularly since the pandemic. The use of electronic information for school matters, monitoring children’s attendance, organizing virtual meetings, and providing training for parents are examples of how digital media have transformed these interactions. However, a key concern is how these digital services might affect the school’s relationship with families who, despite having smartphones and internet access, struggle with using digital tools and media—such as Roma families. Research across Europe indicates that the Roma community faces significant challenges in education and social integration. Both boys and girls experience learning difficulties and high rates of early school leaving or dropout. Since parents play a crucial role in addressing these issues, consistent communication between them and the school is essential. In this context, the shift to digital communication between parents and schools can help mitigate some of these challenges. It can bypass barriers that parents face, such as being unable to visit the school due to distance, work commitments, or language barriers. This presentation aims to outline a communication model between Roma families and schools, emphasizing the conditions necessary for organizing intervention activities in Roma communities, particularly focusing on improving parents’ digital literacy. In Greece, improving living conditions for the Roma is a key goal of the national Roma strategy. Training parents to use digital communication tools will be a central proposal we develop to empower families. Therefore, investing in digital literacy is an innovative and practical approach to supporting the Roma community, especially in the field of education.

The Role of Shadow Education in the Process of Generating Educational Inequality: An Approach Using Causal Decomposition Analysis

This study aims to clarify shadow education’s role in generating educational inequality using a new statistical approach called causal decomposition analysis. Shadow education, such as cram schools and private tutoring, was once a unique educational phenomenon in East Asia but has now spread worldwide (Park et al. 2016). In the sociology of education, shadow education has been positioned as a mechanism that exacerbates educational stratification by conferring advantages on already privileged students (Buchmann et al. 2010). On the other hand, recent research focusing on the causal effect of shadow education has demonstrated the heterogeneous effect that shadow education has more significant effects in disadvantaged groups (Choi and Park 2016). This result suggests that shadow education

potentially has the function of reducing disparity as an equalizer. However, prior studies have independently examined the relationship between social origin and shadow education participation and between the use of shadow education and educational attainment. Therefore, it has not been able to directly examine how much shadow education contributes to the generation of educational inequality. Therefore, in this study, we use a novel causal decomposition analysis and a double machine learning technique rising in recent studies on inequality and health disparity to directly examine how much equalizing opportunities for shadow education among the social classes reduces the educational achievement gap among the social classes and how much of the gap remains. The results of the analysis using the SSM 2005 and 2015, Japan's national representative data, showed that even if opportunities for shadow education were equalized, the gap in educational achievement would not be significantly reduced. This result suggests that shadow education is neither a stratifier that increases educational inequality nor an equalizer that reduces it.

Digital Infrastructure of Atheist Activism in Pakistan:

This paper aims to map the digital landscape of atheism in Pakistan and explore the evolution of atheism amidst its proliferation in the country. It examines the digital infrastructures used by Pakistani atheists to promote atheism online and build online networks.

Scholars of Islamic Studies have highlighted the role of the internet as a key factor in the growth of atheism across the Islamic world as information technologies and online platforms have created new means for social organization among atheists, offering a "safe space" for interaction and a platform for expressing views in a new, virtual public space. The possibilities these technologies and platforms offer—such as widespread social communication, information gathering, global exchange of ideas and dialogue, and, not least, anonymity—have proven to be significant.

In the context of Pakistan, atheism is predominantly practiced and propagated as an ideology within the digital realm due to the country's unique Islamic identity and strict blasphemy laws. While studies have examined this phenomenon in other Islamic countries such as Indonesia, Turkey, and Egypt, scholarly exploration in the context of Pakistan, the second-largest Islamic country, remains scarce.

This paper aims to fill this scholarly gap by exploring the digital landscape of atheism in Pakistan, elucidating the challenges and opportunities faced by Pakistani atheists within the country's Islamized socio-political paradigm.

AI-Replicas As Ethical Practice: Introducing an Alternative to Traditional Anonymization Techniques in Image-Based Research

This paper introduces AI replicas as an innovative alternative to traditional anonymization methods in image-based qualitative research. It highlights the ethical and practical dilemmas posed by conventional anonymization methods, such as the distortion or loss of emotional and contextual information, and proposes AI replicas to preserve the integrity of visual data while ensuring participant anonymity. The paper explains the use of generative artificial intelligence (AI), particularly Stable Diffusion, to create AI replicas for anonymization and fictionalization purposes. Additionally, it addresses potential biases in generative AI and offers strategies for mitigation through careful prompt engineering and participatory approaches. This approach aims to enhance ethical practices in visual research by maintaining participant anonymity without compromising the data's qualitative richness and interpretative validity.

Visual Self-Presentation in Online Dating: Behavioral Styles and Patterns across Culture, Gender, and Sexualities

The actions, motivations, and justifications of users engaging in picture-based online dating are common research subjects across fields such as communication studies, psychology, and sociology. Most current studies focus on analyzing user reception and exploring the reasons behind participation. However, the specific ways in which users present themselves visually in picture-based online dating, and how these modes of self-presentation are culturally rooted, are largely overlooked. This study employs computational methods, including dimensionality reduction and image clustering, alongside documentary picture interpretation. An analysis was conducted on 13,000 profiles comprising 73,208 online dating pictures from male, female, heterosexual, and homosexual users across 13 locations in Europe, Asia, Africa, and the Americas. The findings identify 11 modes of self-presentation, which appear in 8 distinct behavioral patterns. The results show that culture is the major determinant of visual self-representation in picture-based online dating, taking precedence over gender and sexuality. Additionally, the findings indicate that similar modes of visual self-presentation align with cultural patterns identified in value-based studies. These insights highlight the significant influence of cultural context on visual self-presentation in digital domains and emphasize that these spheres do not produce self-contained modes of self-presentation.

Welfare States and Informal Employment: A Global Comparison Beyond the North-South Divide

Until recently, the goal of undertaking comparative social policy in Japan was to position the nation among the advanced welfare states of Europe and the United States. However, with the rise of welfare states in the Global South, the field of comparative studies is also changing. How can we understand the spreading mechanism of welfare states from North to South? The advanced welfare states established in the twentieth century were founded on the ideas of a robust government with regulatory capacity and a labor market centered on full-time, regular employment. The conditions for social insurance with contributions from employees and employers to work well are: 1) the government's capacity to establish and operate the system and 2) a labor market dominated by stable companies that can afford to cover insurance premiums for their employees. The recent emergence of welfare states in the Global South prompts us to consider whether this logic applies to these regions. The issue of informal employment is central to understanding the mechanism by which welfare states have spread from North to South. Is the rise of welfare states in the Global South a result of the increasing formalization of employment or the expansion of non-employment-related social protection floors? I will look at seventy populous countries, with a particular focus on Japan, Taiwan, Indonesia, and India, while focusing on pensions, unemployment, and healthcare, to provide an overview of the current spread of welfare states from North to South and offer a perspective for the future. It will be necessary to combine the formalization of employment and the extension of non-employment-related social protection floors to overcome informal employment in the Global North and South. A combination of techniques must be devised in order to simultaneously link and separate work and welfare.

KANAI, MASAYUKI* (Senshu University, Japan)

Perceived Income Inequality and Social Cleavage: A Latent Class Analysis across East and Southeast Asia

Perceived income inequality has been considered a pivotal motivation for addressing social disparities and realizing justice. This hypothesis posits that perceived inequality diminishes individuals' quality of life and subjective well-being, prompting them to seek societal change to enhance their well-being. However, recent studies in several societies have identified heterogeneity in perceived income inequality (PI) types: PI as Complaint and PI as Knowledge. While the former negatively impacts subjective well-being, the latter enhances it through such psychological mechanisms that one is fortunate to be well off despite significant societal disparities. If PI as Knowledge predominates, the motivation to improve society may be diminished. Therefore, this study analyzed a cross-national quantitative dataset from seven East and Southeast Asian societies (Japan, Korea, Taiwan, Indonesia, the Philippines, Thailand, and Vietnam) to estimate the composition of PI as Complaint and Knowledge, as well as the demographic and socioeconomic characteristics associated with each type of PI. Finite mixture models were employed to detect the latent structures of covariates.

The results are as follows. (1) Both PI types are present in East and Southeast Asia. (2) The composition of PI as Complaint versus PI as Knowledge is approximately 6:4 in East Asia and 4:6 in Southeast Asia. (3) Individuals with PI as Knowledge report higher subjective well-being than those with PI as Complaint in both East and Southeast Asia. (4) In East Asia, individuals with PI as Knowledge perceive less inequality and are younger, more educated, and more affluent than those with PI as Complaint. In Southeast Asia, both PI types show no significant differences in their demographic and socioeconomic characteristics. These findings suggest that PI as Knowledge is more prevalent in advanced societies than in middle-income societies, potentially exacerbating social cleavage and impeding efforts to overcome inequality in the former.

From Denormalization to Neutral Vulnerability: How Feminist Women with Eating Disorders Perceive and Reconstruct Their Experiences

This study explores the relationship between feminism and the experiences of women with eating disorders, focusing on how feminism enables them to reinterpret their mental conditions and the stigma surrounding them. Since the 2010s, there has been a rise in the number of young women suffering from eating disorders such as anorexia nervosa, bulimia nervosa, and binge eating disorder in South Korea. Notably, many of them have publicly identified as feminists on social network services, following the resurgence of feminism around 2015. This appears paradoxical, as traditional psychological research links eating disorders to gender norms that idealize thin bodies, while feminism advocates for the body liberation. Why, then, do feminist-identifying women continue to struggle with these disorders? Is feminism failing to bring about the transformative changes in women's self-perception on their bodies?

To investigate these questions, the author conducted in-depth interviews with 15 young women who self-identified as feminists while experiencing eating disorders. Thematic analysis on these interviews revealed that, though feminism did not immediately alleviate their symptoms, it provided a strong framework for self-acceptance and reduced self-deprecation. Feminism gave them a language to reframe their 'abnormal' eating behaviors, helping them view their experiences as a 'neutral vulnerability' through a reflective, meta-perspective. They distanced themselves from their disorders and explored the social roots of their conditions, framing their symptoms as products of gender oppression. Additionally, they connected their vulnerabilities to stigmas faced by LGBTQ+ and lower-class women, rejecting exclusionary feminist views in favor of more inclusive perspectives.

This study uncovers a new pathway through which feminist ideology supports women, emphasizing its role in fostering self-reinterpretation and empowerment. Furthermore, the findings highlight the social origins of eating disorders and suggest that feminist narratives can play a key role in articulating mental symptoms and building solidarity among those with shared vulnerabilities.

Labor Politics of Self-Employed Workers in the Making: Focusing the Case of Safe Rates for Owner-Drivers in South Korea

While some existing literature on the platform economy has characterized collective actions of self-employed workers as a "theoretical puzzle" for sociologists, these workers have actively developed their own labor politics, challenging the constraints of the current labor system and union movements. This study investigates (1) how the labor politics of self-employed workers differ from those of standard workers and (2) how these differences transform the relationships among labor, market, and state.

Empirical data are drawn from an extensive field study of owner-drivers and their association, the Cargo Truckers' Solidarity Divisions (TruckSol), in South Korea. Conducted through multi-method qualitative research between 2022 and 2024, this study explores why and how owner-drivers successfully introduced but ultimately failed to sustain Safe Rates—minimum wage standards within the road transportation industry.

The precarious position of owner-drivers as the self-employed has imposed constraints but also created opportunities. The lack of traditional employment relationships suitable for collective bargaining compelled these workers to seek alternative avenues to voice their demands. Consequently, TruckSol shifted its focus from elusive employers to the state, which plays a central role in the (re)construction of the industrial relations system.

In this redefined arena of struggle and negotiation, TruckSol's rationales and strategies evolved. The organization leveraged economic pressure to prompt the state to manage and stabilize industrial conflicts (the logic of industrial conflict), while simultaneously employing a dual approach of resistance (the logic of market failure) and incorporation (the logic of public safety) to legitimize their demands. These efforts culminated in the legislation of Safe Rates in 2018. However, TruckSol struggled to extend the law's effective period, a challenge attributed to the inherent instability and vulnerability of the three guiding logics. This study calls for scholarly attention to various paths to represent the broader working class rather than limiting the focus on collective bargaining alone.

Union Responses to Migrant Workers in South Korea's Shipbuilding Industry

Against the backdrop of a recent boom in shipbuilding production, South Korean shipbuilders have increased their reliance on foreign migrant workers in the 2020s. By granting special visa status to migrant workers in shipyards, the Korean state has made efforts to secure the workforce, allowing for the long-term stay of labor migrants. This transformation in migration policies signals the emergence of a new migration-development regime in Korea, facilitating the settlement of foreign migrant workers in export-oriented manufacturing industries. This study explores how regular (formal) and non-regular (informal) workers, along with their unions in Korea's shipyards, have responded differently to the growth of foreign migrant workers. The authors find that while regular workers and their unions sought to limit the influx of migrant workers, non-regular workers proactively organized migrants into a labor union. Additionally, the authors argue that these divergent responses to the influx of migrant workers have led to an increasing potential for intra-working class conflicts between regular and non-regular workers in Korea's shipyards. These differing responses can be explained not by racial antagonism among workers or their attitudes toward labor migrants, but by the political ideologies of union leaders and activists, as well as the lived experiences of rank-and-file workers within the labor process.

World-Economic Change and Waves of Social Protest: Findings from the Global Social Protest Database, 1851-2023

This panel presents findings from a major new dataset on global social protest from 1851-2023 created by the Global Social Protest Research Working Group at the Arrighi Center for Global Studies (Johns Hopkins University). We will introduce the data-collection process and present key findings on the relationship between world-economic restructuring and social conflict since the mid-19th century, with an eye towards implications for current struggles.

The panelists will present analyses using the data relating to three main issues of concern:

First, we compare the frequency, geographical spread and class composition of the current protest wave with previous global waves of protest (such as those in 1905, 1917-1919, 1968, and 1989). Our data shows that years in which mass social unrest is taking place simultaneously in many countries are rare, and that periods of **war** and **world-hegemonic transition** are disproportionately represented among these years.

Second, we examine the relationship of social conflict and the expansion of the world economy, tracing the **capitalist incorporation of countries across the global south**. Through this analysis, we see how socio-economic processes (especially, global patterns of proletarianization, fluctuations in demand, and pendulum swings between “free” and “regulated” markets) shape national-level patterns of social unrest and vice versa.

Finally, we address the relationship between **economic change, ethnic conflict, and racist/anti-racist movements**. By placing these social protests in a global and historical context, the panelists will shed light on how the patterns discussed above facilitate the growth of **right-wing populist movements** around the world in recent decades.

Traveling through Different Transitions in Latin America and the Post Socialist Europe

The concept of political and economic transition has been a catch-all term to capture diverse varieties of regime changes across the regions. By transition scholars have referred to the end of authoritarian rule and the return to democratic regimes in Latin America, and the route leading out from socialism and into capitalism in Eastern Europe. Despite diverse socioeconomic context and historical circumstances, the concept of transition underlines the idea of a period of cumulative changes that reshape institutions and reconfigure social relations (including social structures) into a new stage presumed to be significantly different. These epochal transformations have profound implications on gender equality both in the Latin America and Eastern European countries. Because no simple answer on how these transitions influenced both gender politics as well as the institutions of gender equality, an attempt to contribute to understanding of the gendered dynamics under periods of social and institutional upheaval require to put into dialogue different accounts of transition. After three decades after the major wave of transitions, the Social Politics special issue contribute to the discussion on gender equality across transitions and regions towards a broader debate on obstacles and incitements to gender inequality universally.

Accounts collected in the Social Politics special issue examine the actual effects of transitions. Predictions regarding the impact of transition on gender equality have been based on different assumptions of the legacy of the previous regimes at one hand, and on the opportunities/threats of the changes in transition (political and economic freedoms vs. rising social inequalities and re-traditionalisation/new forms of patriarchy) on the other. Rather than assuming a linear narrative of history, the special issue acknowledges the specific patterns of countries and regions.

Resilience to Right-Wing and Islamist Extremism: A Survey Experiment on Recognizing and Responding to Signs of Radicalization in Germany

Resilience plays a pivotal role in shielding individuals from radical influences and addressing the root causes of radicalization. To effectively address radicalization, individuals must possess the ability to recognize its signs and respond appropriately to suspected cases. This study assesses individuals' capacity to identify signs of radicalization into right-wing and Islamist extremism, as well as their preferred modes of reaction using a large-scale pre-registered survey experiment in Germany. Results indicate that while respondents perceive and problematize signs of radicalization similarly for both forms of extremism, they express a greater need for action regarding Islamist extremism and are more likely to turn to formal measures, such as involving the police. Moreover, subgroup analyses reveal that, compared to non-Muslim respondents, Muslim respondents tend to problematize Islamist radicalization less, whereas left-leaning respondents tend to problematize both forms of extremism more than right-leaning respondents. These findings hold practical implications for policymakers and social workers engaged in preventing and countering violent extremism.

Young and Resilient? Impact of Outgroup Threat on Anti-Immigrant Attitudes Among Adolescents and Young Adults: Experimental Evidence from Germany

As European societies become increasingly multicultural and diverse, understanding young people's attitudes toward immigration is becoming more crucial. Adolescents and young adults, growing up in such multicultural and diverse contexts, are likely to play an important role in shaping future societal cohesion. This developmental stage is a formative period where individual beliefs and attitudes are solidified, making it a critical time for shaping perspectives on social issues. This experimental study conducted among young adolescents (n = 3,590) investigates how reports of sexual violence committed by asylum seekers can influence young peoples' attitudes toward refugees and asylum seekers. The findings show that exposure to scenarios of sexual violence by asylum seekers increases anti-immigrant sentiments, with participants expressing more negative views on asylum policies and refugees in general. Sexual violence is perceived as particularly severe, eliciting harsher responses than other types of violence, regardless of the perpetrator's ethnicity. This research highlights the potential for specific events to shape public opinion and incite intergroup hostility and conflict. Media, political actors, and right-wing parties may exploit such incidents to fuel anti-immigrant sentiments, making it essential to counteract these effects through balanced reporting and civic education initiatives.

KANTI CHAKRABARTI, NIRMAL* (West Bengal National University of Juridical Sciences, India)

Alternatives to Incarceration in Domestic Violence: Indian Experience

Some recent studies suggested that many women who suffer violence in the domestic or family may not want the abuser be punished severely, as it may drive them in financial hardship and derange the relationship between the father and the children. Similarly, Horstman, Bond & Eriksson (2019) study suggested that Judges when imposed sentences take into consideration victim—offender relationship as it may occur sometime without premeditation and on a spur of moment. Hence Domestic Violence Laws generally framed in such a way that the penal measures are remedial in nature rather than punitive. Some countries, like Malaysian law incorporate community service as part of the form of punishment in dealing with domestic violence offences. Community service is a form of restorative and rehabilitative method of intervention and treaded as amicable form of self-realization way to remorse for hurting their loved ones. In India the domestic violence in rural areas mostly suffered by rural and disadvantaged groups. The judicial attitude also look into the domestic violence in a different traditional way. The disposition of cases and conviction rate in such cases indicating something wrong directions. The study seeks to suggest a legislative reforms which will suggest a comparative study of other jurisdiction.

Women and Children As Victims of Cross-Border Trafficking: Languishment for Access to Justice

Across the border trafficking is a common phenomenon. India and Bangladesh have frequent porous border, that's why traffickers use it very often. Women and Children from rural areas of Bangladesh are taken away by some agents who are usually known to the families. Even sometimes knowing everything fully, in the name of marriage, the families sell the daughters because of some money. So undoubtedly poverty is one of the main reason for trafficking. That means because of their no fault only as they are the girls of the family, they become victim by their own family. A real life situation is described her. On 14 January 2013, M brought HN, his wife, two sons and a few other villagers-altogether 13 persons-from Bangladesh to India. M lured them with the promise that the adults would be given domestic work in Delhi and the children would be sent to the Middle East for appropriate work. M1 trafficked these 13 persons through the Indo-Bangladesh border at Chander Kuthi, Kuchlahat. They were on their way to Delhi. As they were moving to Silliguri, they were intercepted by Dhupguri police, who asked them to provide citizenship documents. As they were unable to provide any documents, and on realizing that they were from Bangladesh, the police arrested them on 24 January under S13/14 of the Foreigner's Act. On being produced before the judicial court, the court ordered that HN's two children, seven years old HQ and five year old AL were sent to Korak'a Home in Jalpaiguri. They are still languishing for repatriated to Bangladesh.

Bodily Labor and Gendered Flexibility in Taiwan's Coffee Chains: Comparative Ethnographic Insights

This comparative ethnographic study examines the integration of human resource flexibilities with the labor practices of women workers in Taiwan's service sector, focusing on coffee shops. It uncovers the intrinsic link between corporate flexibility strategies and the mobilization of gendered norms. The study provides a novel perspective on how workforce management configurations achieve both numerical and functional flexibilities through physical labor. Two coffee shops, one a multinational chain and the other a local franchise, serve as case studies. Despite offering similar services, their technological and bureaucratic settings vary significantly, leading to distinct labor dynamics.

In multinational chain stores, individual cooperation with automatic machines is enforced, turning workers' bodily labor into an extension of the machine and facilitating flexible scheduling. Conversely, small franchises rely on teamwork, where semi-automatic machines become an extension of the collective body, leading to adaptive ritualization of tasks. Both businesses achieve flexible accumulation: the multinational chain transfers global standardized processes to the local market, while small franchises adopt flexible specialization through regional adaptations.

The study highlights how both models exploit low-wage, low-skilled, full-time female workers to carve out a niche in Taiwan's semi-peripheral position within the global economic system. Multinational chains streamline operations through technological deskilling and numerical flexibility, while small franchises capitalize on workers' multi-skilled adaptability and functional flexibility. This gendered exploitation reveals broader implications for understanding labor control and flexibility in the service sector, illustrating how global capitalist strategies intersect with local gender norms to sustain economic growth and manage labor costs.

Farmer-Led Innovations in Specialty Coffee: Terroir, Taste, and Sustainability in Taiwan

This paper explores the resurgence of coffee cultivation in Taiwan, particularly how farmers in the specialty coffee industry strive to produce high-quality flavors that express the concept of terroir through innovative agricultural methods. Rooted in the Third Wave coffee movement, Taiwanese farmers are embracing the challenge of crafting "authentic" coffee flavors by engaging in selective breeding and meticulous farming practices. These practices include grafting, field management, and the adoption of advanced technologies to enhance coffee beans' quality and consistency.

Through extensive field research and interviews, this study examines how these farmers cultivate authenticity, focusing on the sociological and

economic dimensions of their work. While pioneering farmers succeed in producing high-scoring coffees for global competitions, such as the Cup of Excellence, these successes highlight the inequalities within both local and global coffee markets. The economic and cultural capital required to thrive in this niche industry creates barriers for smaller farmers, amplifying domestic disparities and reinforcing global inequities rooted in unequal access to resources and expertise.

Furthermore, this paper sheds light on the challenges that Taiwanese coffee farmers face in navigating the complexities of terroir. These challenges, which include geography, climate, and human intervention, are significant. However, by positioning themselves as key players in the global specialty coffee value chain, these farmers are also confronting issues of authenticity and sustainability. Their practices contribute to the evolving discourse on taste and value in the agri-food sector, illustrating the intersection of local innovation and global market demands. This study underscores the Taiwanese specialty coffee industry's entanglement in broader socioeconomic structures, raising critical questions about sustainability, inequality, and the role of farmer experimentation in shaping agri-food futures.

KAO, YING-CHAO* (Virginia Commonwealth University, USA)

The Glocal Right Circuits: Mapping the Transnational Flows of Anti-LGBTQ Conservatism between Taiwan and the United States

This research tracks the development of the anti-LGBTQ (pro-family) movement in Taiwan and analyzes how American and Taiwanese conservative groups have built transnational connections through pan-religious networks to launch the "culture wars" locally and globally to maintain their dominance in moral regimes of family/marriage, gender, and sexualities. The study is based on my accumulative 23-month ethnography during Taiwan's peaks of anti-LGBTQ campaigns in 2015–2020 and 104 in-depth interviews with leaders representing moral conservatism, moderate liberalism, and queer radicalism, as well as the content analyses of more than 200 relevant Christian books collected during the fieldwork. Research findings show that the global anti-LGBTQ conservatism has operated in five hermeneutic types of transnational processes: (1) *Western Importing*: It directly imports Euro-American sexual panic, "televangelical" materials, and global Pentecostal spirituality to shape Taiwan's counterparts. (2) *Asia-Manufacturing and Export-Processing*: Euro-American-originated conservative elements are shipped to and processed in Asian neighbors before being exported to Taiwan as Asianized morality. (3) *Anti-Queer Regionalism*: Anti-LGBTQ ideology is essentialized as part of the imagined "Asian values" and circulated among four "Asian Tigers" (South Korea, Taiwan, Hong Kong, and Singapore). (4) *South-South conservatism*: Anti-LGBTQ conservatisms from South Asia, the Middle East, Africa, and Russia are introduced to legitimize moral campaigns in East Asia. (5) *Reverse Remittance*: Taiwanese-Asian conservatives are not (only) passive recipients but also agentive in-between processors who proactively translate, assemble, invent, and (re)produce the *glocalized* anti-LGBTQ discourses and transport them back to influence the moral politics in Euro-American homelands. Based on the empirical findings, I coined the concept "glocal right circuits" to push forward the literature of global gender/sexualities studies and transnational religion-based movements by visualizing the typology of transnational conservative flows and bringing the "culture war" debates into the studies of cultural globalization and transnationalism and Queer Asia studies.

Digital Religious Identities As a Subject of Study: New Methods, New Challenges

In the field of anthropology and sociology, observation has been for a long time the best technique deployed by researchers to study the religious phenomenon. However, the digital revolution resulted in a shift of paradigm amid the anthropology and sociology of religion on many levels. During the last three decades, we have been witnessing a real change in the ways of expressing religiosity as well as in the methods employed by the researchers to approach it. Instead of limiting observation to the physical field, we talk nowadays about observing and trucking digital traces and immersing ourselves in the religious and irreligious electronic communities in a specific way that allows us to observe *semi-virtual* entities. Thus, this paper aims to shed light on these new ways of studying digital religious expressions through a reflexive study of our personal experience in the fieldwork. The conclusions displayed in it draw on the results of many qualitative researches that we have been conducting for more than a decade in Moroccan digital spaces regarding specific aspects of digital religious identities such as religious plurality, extremism, religious reform, and gender. The paper will elucidate some procedures to be used in netnography to study digital Religious expressions through online observation, and to exploit Computer-Mediated Discourse

Analysis to interpret digital religious content. Furthermore, the paper intends also to outline the challenges that the researcher could face while using these methods and the alternative procedures that he could resort to in order to handle them appropriately.

Imaginaries and Conventions in Commensuration Work: The Financial Valuation of Social Values in Socially Sustainable Investing

This paper studies the commensuration work that serves as foundation for the operation of *socially sustainable investing* (SSI), a global field of financial activity entailing the systematic inclusion of extra-financial factors related to particular social values into investment practices and products. We probe the imaginaries and conventions that constitute SSI as a field, focusing on the ways in which they define the rules of valuation through which extra-financial factors are financially valued. At the conceptual level, we consider SSI as a field that is constituted by the explicit interweaving between two orders of worth, which are usually understood in society as belonging to separate spheres of life: the civic order of worth and the market order of worth. Thus, there is, in principle, a condition of incommensurability between the two orders of worth that brings about evaluative uncertainty. We postulate that the operation of SSI is dependent upon the achievement of commensurability between the two orders of worth by institutional actors who formulate imaginaries and conventions that shape the field's contours and mode of operation.

At the empirical level, we examine the imaginaries and conventions formulated and communicated by *Principles for Responsible Investment* (PRI), an international multilateral organization that plays a central role in the development of the SSI market, especially by formulating and promoting principles, practical blueprints and tools. Established in 2006, the PRI is an association of institutions in the financial industry with more than 5,300 signatories from all over the world. We analyze an extensive array of documents and reports produced by PRI, focusing on the repertoires of notions, categories, and causal and prescriptive models inscribed in the texts. The analysis sheds light on the ways in which institutional actors conduct commensuration work between different orders of worth through the formulation and communication of imaginaries and conventions.

The Post-Modern Connection between Democracy and Justice; Social Justice Effects

Nowadays a decline in rule of law prevalence can be easily noticed worldwide. More than obviously, post-modern states and jurisdictions constantly "struggle" to maintain a commonly accepted level of equity and justice, when new endeavours keep escalating.

Based on the experiences and perceptions of the general public and in-country legal practitioners and experts worldwide, rule of law implementation shows continuous recession. The latter is genuinely stated in independent evaluations or indexes as well as in EU/US reports' discoveries concerning the fact of declining balance between actual democracy and justice, with social effects.

Key factors of those examinations looking for stable institutional developments and providing follow-up assessments are: Justice system, media pluralism and freedom, anti-corruption framework and general issues related to "checks and balances".

Within country borders special parameters of oecumenical values are also estimated: Social and gender inequality, progress without discriminations or exclusions, functionality of social mobility "ladder" and sustainable development showing respect to climate change.

Furthermore, educational system status is concerned; use of language and mass media connection is currently taken into account, since language works as facilitator of human communication and means of education.

Expectations are always high; lack of sufficient policies should provoke social upbringings in the era of "4th Industrial Revolution" that we witness,

when adapting to new rules and facts by maintaining social coherence and ideal solidarity is necessary.

Another topic of our presentation will deal with justice and politics(policy) in the Anthropocene thinking. The dilemma of justice during the Anthropocene era has opened new questions and debates which are a challenge for a multifaceted strategy.

The various forms of injustice during this period need an interdisciplinary analysis which creates difficulties to policy and law makers to tackle with the needs for more egalitarian and sustainable society which is the goal of equity of justice.

KARAPEHLIVAN, FUNDA* (Leibniz Center for Science and Society, Leibniz University Hannover, Turkey)

Between Authoritarianism and Internationalisation: Making Sense of Higher Education Policies in Turkey

This work aims to provide a systematic analysis of higher education policies in Turkey since the 1980s with the start of the introduction of neoliberal policies and the application of New Public Management at the universities. It is going to be a comparative analysis of the two periods: the 1982-2001 period (beginning with the adoption of the new constitution after the military coup in 1980) and the 2002-2020 period (the period of the AKP governments). The central aim of the comparison is to explore whether the higher education policies in Turkey demonstrate continuity or rupture, particularly in the last decade during the authoritarian populist phase of the AKP governments. There is a growing literature arguing that the authoritarian tendencies of the AKP governments have intensified and authoritarian populism has been consolidated especially since 2013. By doing this comparative analysis of the two periods, I would like to determine the extent of similarities and differences in higher education policies over time. Moreover, I will try to examine the degree of the internationalization of the Turkish higher education system and situate Turkey's policies within the global higher education policy environment. One of the goals of this paper is to assess whether the higher education policies in Turkey are in conflict or in accord with global policies. By doing so it also seeks to initiate a discussion on the interaction of different policy levels that influence the higher education policies.

Institutional Isomorphism in Poverty Alleviation within Armenia's Social Protection System: A MULTI-Layered Analysis

The article discusses the poverty alleviation policies in Armenia from the point of view of the institutional contradiction of the goals set and interventions applied. With an insufficient number of social service workforce and a low level of professional competence a centralized approach to decision-making, Armenia's social protection system is unable to apply social activation approaches. However, it has announced its intention to abandon residual policies.

In the country, the factor of non-governmental organizations and charity foundations has also changed significantly. NGOs have traditionally offered more personalized and innovative services. However, recently, the policy of co-financing these services by the state has led to a state of institutional contradiction, forcing NGOs that are usually innovative in the social sphere to adapt to the working style of state institutions.

The article discusses the existing institutional obstacles to the self-sufficiency policy application in poverty alleviation strategies targeting the institutional capacities and practice specifics in the country.

Within the framework of the study, a system-analysis approach was applied, with a focus on the mechanisms for the development of social work, decentralization of decision-making, reduction of institutional contradictions, development of professional competence, which will allow for substantive and semantic revisions of the strategies of social work and social services to combat poverty.

KARAZARIFI, LYDIA* (Scuola Normale Superiore, Italy)

Ecologies of Care during Extreme Weather: Collective Actions and Bottom-up Mechanisms in Stagiates, Greece

This paper takes place in an ongoing PhD research in Political Science and Sociology focusing on water as a commons' practices and claims through an intersection between social movement studies and political ecology. The data that will be used derive from ethnographic fieldwork and document analysis in Stagiates, Greece, where there have been commoning processes related to water connected to social movements. What is more, in 2023, extreme weather conditions took place in the region of Thessaly in Greece. Stagiates community has a long and historical relationship with 'water as a commons' related practices and claims enacted through collective actions towards solidarity and innovative mechanisms to face the environmental and political crisis. Through a relational scope, this paper aims to trace the innovative mechanisms that were created to face extreme weather conditions and provide care to the areas and communities in need. Besides, through collective actions, the relations with the place and the local communities have been re-signified through the transferred water where was needed. Therefore, the argument of the paper is two-folded; first, it argues that climate change should not be considered as a disconnected phenomenon from the historical and social trajectories of the place and secondly, that the role of local communities is crucial for innovative mechanisms dealing with environmental and political uncertainties.

RC47-737.2

KARAZARIFI, LYDIA* (PhD Candidate in Political Science and Sociology, Scuola Normale Superiore, Greece)

Social Movements and Democratization Processes: Water Culture and the Notion of Care in Stagiates, Greece

This paper aims to explore the notion of care produced by the Stagiates community connected to water movements in Greece. It is a part of a PhD research in Political Science and Sociology at Scuola Normale Superiore. It is based on a three-month ethnographic fieldwork and document analysis of archives produced by the focus groups.

Stagiates is a village in the region of Thessaly. There has been a tradition of self-management of the hydrological network in Stagiates since the 18th century. Reforms in policy-making affected water management and increased the pressures towards the privatization attempts of the water sources in the area. The financial crisis of 2008, widened the water conflicts and broadened the space for collective actions from the grassroots. In 2009, an independent group of action was created in the village connected to a wide sphere of social movements. Collective actions were unfolded to protect water as a commons. Additionally, in 2020 there was the broadening of the Popular Assembly of Stagiates, which functions through open democracy.

The paper perceives social movements as agents of knowledge production and democratization processes. In the case of Stagiates, the paper argues that water movements connected to commoning enhanced the space of care production in and beyond the Anthropocene; care for the hydrological network, care for the place, and care for the community.

To sum up, this paper will attempt to illustrate the water culture from the past to the present through the lens of commoning and collective actions. Furthermore, it will address the question of what makes water a commons in times of crisis through the collective actions that lead to ongoing processes towards care. To conclude, community-building in and beyond the place and care production through collective actions will be explored through a micro and meso level of analysis.

Housing First and the Reduction of Homelessness in Finland Among Substance Abusers

Finland's response to homelessness is based on Housing First, a comprehensive approach that combines unconditional access to housing, tailored support and homelessness prevention. This system has

been recognized as a success both nationally and internationally. The effectiveness of different Housing First models have been largely studied and discussed internationally. The Finnish studies and evaluation reports have relied on mixed-methods data, but the use of national level register data has been quite narrow. In this paper, we discuss the effectiveness of the Housing First model in reducing the homelessness and improving lives of one of the most marginalized subgroups of residents: substance abusers. We analyse the relationships between the implementation of housing first for this subgroup in different areas in Finland and the changes in the regional homelessness rates of the group as well as their later life outcomes. The regional differences are used to achieve more causal estimates of the programs effectiveness. We compare our results with previous literature. We identify the homeless substance abusers from national registers based on their visits to substance abuser care centers. We are able to follow the identified people in the following years nospanning over a decade and identify their later housing outcomes and socioeconomic standing. These results offer reliable register-based insights into the program's impact and lay the groundwork for more systematic studies of its various phases and components. Given that homelessness is a persistent global issue, our study offers valuable insights from a context where at least partial solutions have been achieved.

Racialisation of Islam and Boundaries of Citizenship

Islamophobia is one of the ways in which racism and Whiteness perform in our contemporary world. My presentation asks what are the intersections of Islam, racism and lived citizenship. It theorises the ways in which the racialisation of Islam operates in everyday encounters. Through an interdisciplinary lens, it argues the continuous mechanism through which Whiteness and racial order are reproduced in relation to Islam and its outcome in terms of lived citizenship and the labour imposed on racialised bodies. The spatial, affective, relational and enactment aspects of lived citizenship are carefully analysed in relation to the racialisation of Islam. My theorisation is based on the fieldwork research conducted from 2020 to the present in the Nordic context. The participants in this research come from diverse religious and non-religious identities which allows room for theorising the ways racialisation of Islam operates. While the discussion connects the racialisation of Islam with the broader geopolitics of the current time, the context of Nordic is important since it is being represented as "the role model" for (gender) equality and secularisation in the public discourses. After reflecting on my fieldwork analysis, my presentation will point at the uneven labour of some bodies to dismantle such structures (enacting citizenship). It claims that any attempt to proceed with decolonising citizenship needs to confront the foundations of racialization processes which shape our participation in racial structures. It invites everyone to reflect and rethink how they participate in such structures. This may open pathways for dismantling the same structure.

KARIN, VAN NIEUWKERK* (Radboud University, Netherlands)

Building One's "Moral Compass" Post-Religion in Egypt: Ordinary Ethics and Changed Views on Sexuality, the Body, and LGBTQ+ Rights

Morality and ethics are hotly debated topics between religious and nonreligious people in Egypt. Since religion is perceived as a primary source of morality, atheists are often accused of immorality. In these debates, morality and ethics are often narrowed down to sexual behavior. Therefore questions such as "Do you now sleep with your mother or sister" are often hurled at nonreligious men. The link between atheism and immorality also negatively affects nonreligious women since they are perceived as morally loose. For that reason, it is interesting to consider nonreligious interlocutors' changed views of morality in general and of sexuality, the body, and LGBTQ+ rights in particular.

This presentation draws upon interviews conducted with 40 young male and female nonreligious Egyptians from both Muslim and Coptic backgrounds. It also involves the analysis of various atheist channels as well as Egyptian state TV and religious media coverage surrounding atheism. This presentation will examine nonreligious interlocutors' narratives on how leaving religion changed their ethical outlook on life. If the source of morality and ethics is no longer religion how do nonreligious people ground ethics? How does their changed view on morality and ethics play out in the field of sexuality, the body, and LGBTQ+ rights?

Coming to Portugal: Migration, Retirement and a Reimagined Life

Between 2022 and 2023, Portugal experienced 130% increase in the number of migrants living in the country. It is estimated that approximately 14,000 of the new migrants are from the United States. The number of US citizens living in Portugal has steadily grown by 274% since 2016. Fueled in part by a number of pro-migration policies Portugal enacted (Non-habitual residency (NHR) taxation law (2009), the Portuguese Golden Visa law (2012), and the Sephardi Nationality Act (2015), to make the country a financially attractive place to reside. Drawing from ethnographic participant observation data (ongoing), this study of young U.S. retirees who have migrated to Portugal and established residency there go about negotiating their new expat lives. Many state the lower cost of living and the quality of life as their motivations for choosing Portugal. While some do attempt to learn Portuguese prior to arriving, the majority do not speak the language. This project focuses on the US citizens perceived impact on the Portuguese culture and, in turn, how living in Portugal impacts their sense of themselves. This work contributes to our understanding of expat retirees, their motivations, expectations, and their reimagined lives.

MROZOWICKI, ADAM (University of Wrocław, Poland)

The Hope for New Solidarity: Migrant Unionization in Poland

Existing research suggests that the relationship between unions and migrant workers has not been straightforward or without tension. On the one hand, unionization has been made difficult by the high turnover of migrant workers, migrants' orientation toward maximizing short-term financial benefits, ethnic (and language) barriers, and the segmentation of the workforce. On the other hand, unions have traditionally focused on the interests of core local workers and have faced organizational and financial dilemmas about the rationale and ways to integrate migrant workers into their ranks.

Drawing from biographical-interviews with 35 migrants working in industries such as logistics, care, retail, and hospitality, as well as 23 expert interviews with trade union leaders, we aim to explore the mechanisms of migrants' unionization in Poland as a country that has recently transitioned from being an emigration state to an immigration state.

The analysis of the collected biographical and expert interviews allows us to contribute to the debate on the subjective and objective conditions for organizing migrant workers. Subjective barriers include a weak awareness of the role of trade unions, a strong individualization and pragmatization of migrants' life strategies, as well as the "normalization" of precariousness, reinforced by a belief in the discourse of meritocracy and entrepreneurship. Objective challenges include the low visibility of migrant workers in public discourse and the reluctance of unions to invest in organizing migrant workers as it rarely results in significant membership growth due to high turnover and the temporary nature of migrant work.

However, by examining two recent cases - unions formed by couriers and South American workers - we identify ways to overcome these obstacles. A participatory approach, coupled with extensive cooperation with NGOs that have built trust with migrant workers, as well as the emergence of new migrant worker activists, emerge as key factors in successful organizing efforts.

Do Competence Frameworks Know Justice in the Anthropocene?

In Europe, the education and training of youth workers is largely governed by competence frameworks. In a recently completed qualitative research project, we looked at competence development for youth work in the context of the European youth programmes. Through interviews and focus groups with youth workers, youth work trainers, and youth work training providers, we explored among others rationales for developing training offers, youth workers' own perceptions of training need, and how training offers and realities align with and differ from the needs of youth workers.

Knowing what justice means in the Anthropocene is certainly a key discourse for youth workers, who challenge their own practice and the priorities of their organisations and networks in response to the magnitude of change caused by humans. In our paper, we will explore to which extent – if any – the governing competence frameworks for youth workers have caught up to these discourses, and whether they guide, ignore, support or suppress them.

Multi-Level Education Governance: The Current State of Knowledge

The application of multilevel governance (MLG) concept in studying various socially important issues is diverse, ranging from topics of environmental sustainability (e.g., Saito-Jensen, 2015) to immigrant integration (Zapata-Barrero et al., 2017), and more. The current presentation will focus on the application of MLG concept in education research due to the proliferation of studies using MLG framework (e. g., Chou et al., 2017).

This presentation will report the results of a systematic review of literature applying PRISMA framework (Page et al., 2021) addressing the following questions. What are the topics in education that are studied applying MLG framework by the level of education (basic, secondary, and tertiary), type of education (academic, professional), geography of research (countries in Global North, Global South)? What methodologies are applied in education research using MLG framework (quantitative, qualitative, mixed), including the sample size, sampling approach, data analysis techniques? What results these studies report?

This presentation will contribute information on the state-of-the-art research that applies MLG framework in higher education studies in the broader context of educational research. It will enable a discussion on which issues in higher education governance are addressed through the MLG framework and which are overlooked.

Recognition and Interpretation of Community Formation History: A Case Study of a Japanese New Town

From the 1960s, "new town" development flourished in Japan, reaching its peak in the early 1970s. In these newly developed areas, it was necessary not only to construct buildings but also to create connections and form communities among people. At the time, Japanese sociology placed a

Are Democracies Loosing Young People?

The World Values Survey has measured, among many things, the development of institutional trust across decades. It is particularly striking that young people have come to trust core institutions of democratic societies less and less over time. Between 1989 and 2023, the trust that young people extend to governments, parliaments, and political parties, has deteriorated and is now below 20% of all young people.

With our contribution, we will explore young people's diminishing trust in core democratic institutions over time. We will contrast the development over time as documented by the World Values Survey with other global surveys and indices to demonstrate that young people loosing trust in democratic institutions is a misleading narrative: it is much rather democratic institutions squandering the trust young people had placed in them.

strong focus on community formation; however, today, half a century later, new towns are gaining attention as regions facing challenges such as aging populations and vacant homes.

This report analyzes the process of community formation from a historical perspective, focusing on a specific new town in Japan. First, analysis of a half-century of monthly newsletters reveals that community formation can be divided into three phases: generation, disruption, and maturity. Second, analysis of oral histories from 20 elderly residents shows how these individuals, who experienced the disruption phase, perceive their community activities as failures. This perception leads to an interpretation of a certain "disconnect," suggesting that their experiences in workplaces and families are unrelated to their activities within the community.

The newsletters and oral histories underwent text mining with co-occurrence analysis and self-organizing mapping, which revealed the different trends each year. This approach of using computational techniques to identify key themes and cases for deeper analysis, followed by qualitative analysis, draws on the methods described in S. Weller et al.'s book *Big Qual*.

The report also touches on the differing interpretations of "community" by sociologists and local residents in each phase. Through examining the historical development and reinterpretation of this new town over fifty years, the report reflects on the challenges of community formation in the present day. Particularly, it is crucial to understand how the younger generation, who are now the primary leaders of current community activities, interpret the history of the new town they live in.

Africans in the Relationship between Human Mobility and Disaster: The Case of Ankara-Turkiye

Turkey has been struggling to meet the basic needs of millions of people who came from Afghanistan and Africa, primarily due to the civil war in Syria, since 2011. The conservative government, with great pragmatism, turns a blind eye to the fact that the refugees, to whom it has given a status like those under temporary protection. It is no longer possible to manage the population that has come to Turkey with more than 10 million people, including those with or without documents, and asylum seekers, and has reached disaster levels. In this presentation, the strategies of African immigrants, whose numbers exceed one million in Turkey, the adaptation problems they experience, the communication and solidarity networks they have built using digital opportunities, and their visions of the future (return migration) will be analysed in relational sociological and intersectional terms. Various documents and qualitative data collected through interviews in the field will be presented. The preliminary findings of the study are that the increase in xenophobia throughout Turkey and the security forces' removal of immigrants from city centres in order to make them invisible, have led to the concentration of Africans who are excluded due to their race and are subject to multi-layered stigma, by sharing houses and establishing workplaces in poor neighbourhoods in urban peripheries. While their solidarity increases due to segregation, their integration decreases and their capacity to be a risk group for Turkey increases. In fact, the daily lives of Africans living in Ankara/ Türkiye will be shared as a digital ethnographic study by applying to the sociological film program announced by ISA for the Rabat Forum.

Demand for Tribal Status: Hattee Community of Himachal Pradesh (India)

Introduction: In India, socio-cultural diversity is a distinguished feature. The word *hattee* is based on local dialect '*haat*' which means bazaar or market. The term is in vogue for the people of Sirmour District of Himachal Pradesh in Trans-Giri area. They find their ancestry to *Pandavas* of Epic age. The people used to sale or barter the essential items in those areas. The *hattees* have age-old relations with people of Jaunsar-Bawar of Uttarakhand state, who are enjoying the tribal status. Cultural similarity is a strong base to demand the tribal status. Geographically, entire area is hilly with least transport and communication facilities. To improve the economic standard, these people demanded the tribal status from Ministry of Tribal Affairs, Government of India. The Government considered their demand but the implementation of status is still hanging fire for various reasons.

Goals and Method: Constitutional benefits available to scheduled tribe people include the reservation in Government services, admission in educational institutions and assistance by central or state schemes. *Hattee* people are eager to avail all these benefits. But the matter is pending in High Court. The paper reviews their efforts for tribal status with related issues and hindrances. The research is based on Historical Method with primary and secondary sources of information.

Conclusions: The *hattees* adopted constitutional and peaceful ways to achieve the goal of the tribal status. They formed '*Kendriya Hattee Smiti*' for the purpose. Their sincere efforts brought the positive results. Press played an effective role for awakening the people. The media highlighted the genuine demands of these people with ground reports. But the 'Gujjars Social Welfare Council' and 'Trans-Giri Scheduled Caste's Rights Committee' have challenged the grant of Tribal status to *hattee* people.

Culture of Migrant Livelihoods from Southern Odisha: An Ethnographic Study Among Two Tribes of Koraput

The paper vividly addresses the pertinent and precarious question of the livelihoods of migrant people of Western Odisha. The paper draws inferences from the ethnographic research conducted during 2020-21 to gather data from the two particularly vulnerable tribal groups (PVTGs) from the Koraput district of Odisha, eastern India. It also draws its analogy with the existing literature and secondary data sources. The paper also critically analyzes and addresses PVTG women-centric issues regarding their life and livelihood, socio-cultural hindrances, and problems they face in their work environment. In the Koraput district, the majority of Poraja and Gadaba tribes are involved in wage labor and perceive it as their primary source of livelihood. The tribal laborers of the Koraput region and district are more dynamic concerning the rate of changes in their livelihood and living conditions. Because of the prevailing extreme poverty, illiteracy, and inaccessibility to the services of the government, their development is prolonged due to precarious situations. Today, people are moving for many reasons, like escaping from poverty, conflict, and devastation within their regions and expanding their education, livelihoods, and opportunities. Taking evidence from the above discussion, an ethnographic attempt is made in our paper to explore the life, living, and working conditions of two vulnerable tribes from Southern Odisha. Our paper is also trying to find out the culture of migrant livelihoods, the role of NGOs and the state in mitigating tribal livelihood, and issues of young women laborers from the social and cultural perspective of Poraja and Gadaba tribes inhabiting the Koraput district, Odisha.

The Future of the Workplace: How Coworking Spaces Provide an Alternative to Traditional Offices?

Working life has been undergoing structural transformations in the last two decades as globalisation has accelerated, the integration of information technologies into work has increased, flexible working practices have become widespread, and the workforce is concentrated in the service sector. With the pandemic process that further accelerated this structural transformation, remote and hybrid working models have become widespread; it has raised the question of what the future of workplaces will be by differentiating the nature and meaning of work. In this paper, the function and future of traditional offices are problematised and it will be discussed how coworking spaces, which are rising as a new workplace trend and increasing in number day by day, will constitute an alternative to the traditional office. Professionals, defined as 'knowledge workers' and 'creative class' in the literature, have the skills and qualifications to perform their work largely independent of time and space. The independence of work from space and time does not eliminate the need for a workplace where the employee can work efficiently, socialise and network. Since traditional office, home or café spaces cannot fully meet this need, the trend of coworking spaces where employees can both work efficiently and socialise and network is increasing day by day. Based on the current data of the website 'Coworker Turkey' (2024), we can see that in Turkey. In this research, which is based on a completed master's thesis, in-depth interviews were conducted with 24 professionals in a total of 5 different coworking spaces belonging to Kolektif House and Workinton in İstanbul. Professionals consider coworking spaces to be cost- and transport-friendly and more efficient than working at home or in a café. This situation shows that the future of workplaces will differentiate and diversify in the transforming working life.

Digital Labour Experiences of Women Dietitians: Opportunities and Limitations

Technological innovations and developments in the social structure from Industry 1.0 to 5.0 have caused some changes. One of the areas of influence of this change is working life and forms of labour. The active use of digital technologies in working life has led to the digitalisation of working conditions and working styles. Especially the Covid-19 Pandemic process has accelerated the digitalisation process; it has been observed that it has also digitalised working conditions and forms of labour. This paper focuses on how the digitalisation process and the Covid-19 Pandemic have affected the digital labour process and transformed working life and working conditions. Qualitative method was used in this research based on a completed master's thesis. In-depth interviews were conducted with 21 female dietitians who actively use digital tools and digital platforms in their professional and working life, accompanied by a semi-structured questionnaire. MAXQDA 2024 analysis software was used and the data were analysed using thematic analysis technique. As a result of the research, it was observed that dietitian women who experienced digital labour in their working life drew attention to the advantages and disadvantages. Factors such as the fact that digital working conditions do not have strict working hours, eliminate space and time limitations and provide the opportunity to work anytime and anywhere, and that being present on digital platforms with a professional identity creates professional prestige are considered as advantages. On the other hand, factors such as flexible working hours making it difficult to establish a work-life balance with the digital labour process, the precariousness of digital work, the digitalised working process making it difficult to cope with the competition on digital platforms and the increase in digital surveillance were evaluated as disadvantages.

KAŞKAYA, SELENAY* (Hacettepe University, Turkey)

The Role of Social Media in Facilitating Migration for Highly Skilled Turkish Women

Migration is a complex journey, marked by both challenges and opportunities. While individuals often face various difficulties during this act, they also benefit from factors that ease their transition, known as 'facilitators of migration.' These factors can manifest themselves during or after migration, as well as shaping their decision to migrate. In this study, grounded in the aspiration-capability framework, the use of social media is conceptualized as a capability, as it provides vital information and connections that facilitate the migration process. Hence, this study examines how highly skilled Turkish women migrating to Germany and the Netherlands utilize social media as a facilitator pre and after migration to form connections, gather information about their destination, and make informed decisions about their migration paths. Drawing on qualitative data from in-depth interviews with 20 highly skilled Turkish women, findings reveal that social media plays a crucial role in shaping many facets of migration experience. It influences participants' choice of destination, supports their settlement process, enhances emotional well-being, and aids in their professional integration. This study also highlights that along with globalization, social media has transformed the concepts of 'migration' and 'migrant,' enabling easier access to information and networks, and reducing uncertainties typically associated with migration. With the rise of vlog culture, participants reported that information gathered through online platforms helped them perceive migration as merely relocating rather than navigating unknowns. Following the decision-making phase, they extensively relied on expat groups on platforms to navigate bureaucratic procedures and adapt to life in the host country. These women also formed online solidarity networks, where they shared not only the challenges of migration but also their personal struggles and experiences. These findings underscore the evolving role of digital platforms in shaping contemporary migration experiences by enabling access to a complex web of solidarity, networks and information.

KASSEM, SARRAH* (Scuola Normale Superiore, Italy)

Amazon Labor Struggles & Solidarity in Germany

As platforms have been growing in societal and political-economic power, they have also become increasingly integral in mediating our social and labor relations. These platforms reshape these while reproducing neoliberal trends – from algorithmic management to the further normalization of precarious labor relations, first and foremost through the gig economy. One of the largest and most powerful platforms that has exponentially grown over the last decade has been Amazon. Focusing on Amazon warehouse workers

in Germany, in its biggest market outside of the US and centering labor's perspective, I ask: what are the different forms by which Amazon warehouse workers form solidarity and express their agency given the variation of industrial relations and its decentralized network of warehouses in Europe?

Based on original qualitative fieldwork, I investigate the working conditions and forms of labor organization of warehouse workers across Germany. Grounded in a critical political economy perspective, I examine the structural power, associational and institutional power of workers according to Erik Olin Wright and Beverly Silver. I argue those warehouse workers who are organized along hypertaylorized circulation lines and divisions of labor, supervised by the social and technological panopticon, are dialectically able to grow their associational and workplace power precisely because they are location-based. In the case of German they have, however, been unable to successfully grow their institutional power through a collective bargaining agreement, as Amazon continues to argue that works councils are sufficient and rejects coming to the table with unions.

KASTEN, ANNA* (Ernst-Abbe-University of Applied Sciences Jena, Germany)

Social Protection for Refugee Families in Community Work in Poland

Human made shocks cause people to flee. Due to Russia's second war of aggression against Ukraine in 2022, millions of Ukrainians fled to various countries, many of them to Poland, where humanitarian aid initiatives were launched. Humanitarian aid requires rapid, large-scale and diverse assistance. The problems where humanitarian aid is needed arise as a result of, for example, environmental disasters such as an earthquake or a flood or of a war such as Russia's war of aggression on Ukraine. What further characterizes this aid is that the aid structures often have to emerge within a short period of time. Racist practices, selective solidarity and anti-Ukrainian rhetoric occur at the same time as a voluntary commitment to the refugees. The issue of social protection becomes concrete with aid initiatives in the local social environment.

The aim of the paper is to identify the normative conditions that are needed for a certain order of humanitarian assistance. The expression "the order of aid" implies that aid is a political project. It is a product of social negotiations and an expression of brutal relations of dominance. The order of humanitarian aid for refugees in Poland can be circumscribed along three normative presuppositions: the methods of perceiving the needs of refugee parents and their children, the attitude of gratitude, and the "minimalist" school. The interaction of these three normative presuppositions constitutes this order.

The presentation is based on a qualitative study that examined voluntary parental involvement for refugees. Recommendations for action for community work with refugee families beyond Poland are derived from the findings.

Care Burden Avoidance Awareness Among the Baby Boomer Generation: A Qualitative Comparison between Japan and the United States

This study explores the concept of "care burden avoidance awareness" among the baby boomer generation in Japan and the United States, focusing on how cultural, familial, and social factors shape their approach to caregiving and end-of-life decisions. Drawing from qualitative interviews, the research highlights how traditional Japanese family systems and the American individual-centered approach impact the formation of attitudes towards caregiving. The study compares how both generations, once caregivers themselves, now confront their own aging and the prospect of becoming care recipients. By examining shared themes such as the desire to avoid burdening family members, this research offers insights into the sociocultural differences in end-of-life decision-making and the emotional and practical challenges faced by aging populations in both countries.

KATO, GENTARO* (Otemon Gakuin University, Japan)

Trusting Pseudoscience in Contemporary Japan

Pseudoscience refers to ideas and claims that look like science but are not actually based on scientific methods or evidence. Fortune-telling and the existence of UFOs are well known as pseudo-science because they are difficult to verify using scientific methods. In addition, health-related findings often include claims that are not scientifically proven but are presented as if they were scientific findings.

The question of how to set the demarcation between science and pseudo-science has been addressed in philosophy of science since Karl Popper (1963), but there does not seem to have been much sociological discussion on the subject. In Japan, a phenomenon has occurred whereby the name of a chemical substance is pushed to the fore to gain publicity; for example, collagen is a protein known to be effective in bone and muscle formation, joint lubrication and skin moisture; many cosmetics and beauty products are sold as containing collagen, and there is even a discourse about chicken hot pots with a lot of fat in them, saying that they are full of collagen and good for the skin.

"Scientific" discourses are trusted without examining their contents only because they look scientific. This is thought to be related to one's image of and attitude towards science. Furthermore, a cognitive bias that people are more likely to trust what they want the world to be like may also contribute to it. In other words, health-conscious people tend to trust the discourse on health benefits without examining the specific scientific content. On the other hand, a certain number of people are skeptical about the findings provided by the government, which could be explained in the same way. In this presentation, attitudes towards pseudoscience will be argued using the Japanese examples.

KATOELE, NANDO* (Erasmus University, Netherlands)

Everyday Organisation of Care in Times of Workforce Shortages

Healthcare systems across the Global North are struggling to meet increasing healthcare demands whilst also trying to overcome structural workforce shortages. Policy solutions are often framed in terms of digitalisation and more efficient collaboration between healthcare organisations. In this line of thought, digitalisation can help to replace healthcare work and/or to provide 'care at a distance', whilst improved collaboration between healthcare providers should help to overcome fragmentation and streamline individual healthcare trajectories. But in a system where collaboration between care institutions is becoming more important, professional interdependencies extend beyond disciplinary and organisational boundaries. In this context, all sorts of competing value orientations exist that impact the accessibility and continuity of healthcare for individual patients. In this study, I explore the everyday organisation of care by asking how healthcare workers organise, provide and account for individual care trajectories in daily practice and across organisational boundaries.

Insights are drawn from ongoing ethnographic research in which I have shadowed healthcare professionals at the critical entry- and exit-points of a hospital, including the emergency care unit and discharge unit, in a medium-sized town of the Netherlands. In doing so, I shed light on the intricate and micro political practices through which healthcare workers organise care on a daily basis. I show how healthcare workers need to make situated, timely, and sometimes difficult decisions, such as who to provide care to, transfer to other providers, or strategically ignore – which can be based on very different value orientations. This does not only have consequences for individual healthcare trajectories but can also undermine the self-regard of healthcare professionals involved in making and executing these decisions. Therefore, in the light of current challenges, developing empirical insights that capture the consequences of structural workforce shortages for healthcare professionals and their profession is critical.

Bare Shelter: Hostile Architecture of Migrant Accommodation within and Outside the City

The Bibby Stockholm migrant barge accommodating asylum seekers in Portland Port since August 2023, marked a new low in the UK's hostile immigration environment. The vessel, re-designed to accommodate over 500 people – double the number it was originally designed for – was immediately rejected by the local population and council, condemned as an affront to human dignity by several charities and church groups, and deemed unsafe by firefighters. The barge was immediately closed due to a legionella bacteria

found in the water system, and after it was reopened an Albanian asylum seeker was found dead on board after taking his own life. Hostile spaces make part of migrant accommodation within and outside cities in the UK and beyond. Across the globe, migrants are pushed to inhabit both makeshift and institutional forms of inadequate accommodation, such as urban industrial spaces and abandoned sites, which are also targeted by the violent in/actions of the authorities.

This paper invokes the concept of 'bare shelter' as the uninhabitable and hostile spaces produced for migrant accommodation within and outside the city. While the notion of 'shelter' is related to spaces of minimal protection, 'bare shelter' is exposed to enhanced degrees of violence and precariousness. The amplification of bare shelter in cities worldwide illuminates the intensification of urban colonial relations, particularly along the colonial-based borderlines of the global apartheid and its borderzone departure cities and points of arrival. The process is illustrated by highlighting three key dimensions of spatial articulation: inadequate living conditions; excluded locations within and outside the city; and violence of containment and evictions. These dynamics underscore the need for a revised definition of shelter that furthers the scope of spatial-social critique and refers to uninhabitable urban realities, for a better understanding of the relations between migrant accommodation, hostility, and oppression.

Queering Wedding Rituals

Weddings are rituals that involve the unification of two individuals, often with the support and presence of family and friends. Building on Finch's (2007) concept of 'displaying families' and Mamali and Stevens' (2020) concept of 'display work' in weddings, we examine wedding rituals of same-sex couples following marriage equality in the United States. The study is based on semi-structured interviews conducted in 2022-2024 with 50 LGBTQ+ individuals across the US. Participants identify with various gender (cis man, cis woman, trans, nonbinary) and sexual identities (gay, lesbian, bisexual, pansexual, queer) and range in age from 18 to 85 years old. Findings focus on engagement, wedding planning, and wedding ceremonies. LGBTQ+ individuals often talk about engagement as a process that involves discussions about life goals and the future. While some like the idea of a grand proposal, others feel this important decision should be a mutual discussion and in some cases a mutual proposal so neither partner misses out. Most individuals tried to find queer-friendly businesses as they planned their weddings. Those who were planning weddings in locales where marriage equality was recent sometimes found confusion, resistance, or unfriendly responses. Some followed the 'heterosexual model' of a wedding and its accompanying rituals. Others challenged these norms and made efforts to make their wedding 'gay'. Some eschewed a formal wedding ceremony, choosing instead to create their own celebration, whether with a handful of friends or scores of people at a festival. We discuss the implications of this 'display work' in queer wedding rituals for changing norms around gender, sexuality, and family.

Indigenous Women Leaders: Environmental and Economic Care in the Peruvian Amazon and Andes

This study explores the biographies of Kichwa and Quechua women from the Peruvian Amazon and Andes, focusing on their roles as leaders within Indigenous economies deeply intertwined with environmental stewardship. We focus on women leaders committed to the protection of water, forests, and grasslands, who earn their livelihoods through the sustainable use of these resources. They achieve this by intelligently linking artisanal production—such as chocolate, *majambo*, *vicuña* fiber, and jewelry—to global consumers and solidarity networks.

By drawing on longitudinal ethnographic research, interviews, conversations and close accompaniment of these women in their struggles for territorial and family well-being, the study highlights the emergence of leadership rooted in the care of forests or *punas* (high-altitude grasslands) and local economies. Despite facing significant cultural and structural challenges, these leaders drive change by building strategic networks among women across diverse landscapes and forging collaborations with national and international NGOs. The analysis provides insight into the dynamics of Indigenous women's leadership and the potential for sustainable development that centers on community and environmental harmony. This work contributes to the broader understanding of how women's biographies are shaped by and, in turn, shape the territories and economies in which they are embedded, extending beyond their immediate surroundings.

KAUR, KIRANDEEP* (University of Warwick, United Kingdom)

Exploring the Role of Reflexive Regulation in Attaining Fair Wages for Public Sector Refuse Collectors in the Anthropocene.

This paper examines the critical role of reflexive regulation in achieving equitable wages for public sector refuse collectors in the context of the Anthropocene, a term denoting the current geological epoch characterised by significant human impact on the Earth's geology and ecosystems. The study explores the complexities of labour dynamics within the waste management sector, where environmental degradation, economic inequality, and social justice intersect. Reflexive regulation, which involves ongoing self-evaluation and adaptation of policies and practices, is posited as a transformative approach to address wage disparities faced by refuse collectors, who are often undervalued despite their essential contributions to urban sustainability and public health.

Through a qualitative analysis of case studies, interviews, and policy documents, the research demonstrates how traditional regulatory frameworks fall short in ensuring fair compensation due to their static nature and lack of responsiveness to the evolving socio-environmental context. In contrast, reflexive regulation emphasises stakeholder engagement, promoting dialogue between workers, policymakers, and the community to co-create fair wage standards that reflect the true societal value of refuse collection work.

The findings suggest that by integrating principles of reflexivity into wage setting and labour practices, public sector authorities can create more just and equitable labour conditions. Furthermore, the study highlights how such regulatory approaches not only enhance workers' rights and livelihoods but also contribute to broader ecological resilience in the face of environmental challenges. Ultimately, this research advocates for a paradigm shift towards reflexive regulatory mechanisms as a means to foster social equity and environmental stewardship, aiming to galvanise support for fair wages for refuse collectors in a rapidly changing Anthropocene context.

Patterns of Social Media Usage Among Indian Women in the Era of Globalization

In the era of globalization, social media is an important platform for modernization and empowerment of women with their increased public involvement and recognition of their voice in contemporary society. Social media serving as an easy, available tool for women to participate in discussions and enhancing their knowledge in health, education, life-style and cultural change, business and politics.

Women are much more active on social media platforms and have stronger attachment towards social network. The patterns of usage are different among the housewives, working women and the female students on whom the present study is focussed. For housewives, social media is used to keep in touch with others, to get updates on news, socialise, making reels on TikTok and Instagram, online business, financial freedom and gain knowledge on WhatsApp group about the home-work from their children's school teacher. They have strengthened relationships, emotional support, side online business and income, support system, and knowledge enrichment. For working women, job opportunities have increased, community development, opened new possibilities of accelerating the process of upliftment of women but at the same time it affects mental health, job crafting, online abuse, body image which increased anxiety in adolescents.

Cyber stalking which involves following a person's movements across the Internet by posting messages, sometimes become threatening too. For students, it has increased communication, sharing of information, educational opportunities and network opportunities. However, social media is also causing several negative impacts on students which is affecting their emotional and social health. Women are more conscious of privacy risks. More time spent on social media is associated with an increase in depressive symptoms. Factors include lack of high-quality sleep, online harassment, low self-esteem and negative body image. These changes are the characteristic features of reflexive modernity in contemporary Indian society.

Gender Roles in Waste Management: Women's Participation in Delhi

Mahatma Gandhi said that Earth provides enough to satisfy every man's needs, but not every man's greed." Human population are concentrating in cities due to urbanization which gives a easy & comfortable life on one hand for few while on other hand it deteriorates the environment and this can be seen in almost every city of world which leads to significant environmental and public health issues. This research paper investigates the role of gender in waste management in Delhi. We know that in Indian families and even in other countries, women are informal waste worker and play a very important role in waste management ecosystem, but their contribution is mostly overlooked in formal discussion about waste management and sustainability of environment.

In this research, we have employed a mixed approach including both quantitative as well as qualitative methods to collect data to analyse women's experience in waste management across different socio-economic background. The Data was collected by interviewing 100 women's involvement in the work of waste management in which they collect, sort and recycle the waste. We have focuses on women's perspective, as research focuses to showcase the complex realities that are faced by women's in this sector

Initial finding explores and states that the women are involved in waste management due to their financial needs, still they face several issues like no access to formal employment, no safe working conditions etc., The study also explored other dimensions such as intersection of gender, class, and caste in shaping women's experience in this sector. The study also finds how gender, social status, and family background influence what women go through in this job.

Welfare Reform and Characteristics of Authoritarian Rule in Sisi's Egypt

This study examines how the welfare regime in (republic) authoritarian states in the Middle East and North Africa (MENA) transformed after the 2011 Arab Spring uprising. Therefore, it primarily focuses on poverty alleviation programmes undertaken in Egypt by Abdel Fattah al-Sisi's administration. The Arab Spring resulted in Egypt's democratisation but the fledgling democratic state was fragile and was almost immediately overthrown by Sisi's coup in 2013. The country then experienced a return to (much harsher) authoritarian rule under Sisi, who strictly controlled elections and suppressed social movements. Sisi's rule can be also characterised as the era of welfare reform or welfare retrenchment to some extent. Egypt's food subsidy programme was criticised before the Arab Spring for its ineffectiveness as a poverty alleviation measure. It is now better rationalised by introducing a smart card system and the programme excludes the middle classes and higher strata. Sisi also introduced a direct cash transfer programme (*takaful wa karama*) in December 2014, which comprises two schemes targeting distinct social groups. The *takaful* scheme represents a conditional cash transfer meant for families with children in poverty. The *karama* scheme denotes unconditional cash transfers for the elderly and the severely handicapped. Sisi's Egyptian government also introduced the *forsa* programme intended to graduate beneficiaries of the cash transfer programme (*takaful wa karama*) to economic self-reliance by enabling them to engage in wage employment or sustainable economic enterprises. Notably, such drastic changes had not been observed before the Arab Spring uprising. This study analyses the features of the current welfare reforms accomplished by the Sisi administration. It will also examine how the Arab Spring of 2011 inspired changes in the characteristics of Egypt's subsequent authoritarian government and impacted current welfare reforms focusing predominantly on poverty alleviation programmes.

Re-Evaluating Occupational Safety and Health Paradigms: Bridging Western and Eastern Perspectives for the Global Majority

Mainstream occupational health and safety (OHS) paradigms primarily originate from the global north, resulting in a western-centric approach in OHS practices and policies. This has engendered a disconnect with the realities faced by the global majority, particularly in regions such as Asia, Africa, and Latin America. This paper employs network theory and social network analysis to investigate the epistemological foundations of global OHS, contrasting Western and Eastern approaches. The study delineates the connections among key OHS organizations, including EU-OSHA, IOSH, APOSHO, and Japan-Asia Networking. The findings indicate that Western paradigms prioritize project management, goal-oriented strategies, and rapid dissemination of ideas, whereas Eastern paradigms adopt a more process-oriented approach, emphasizing diverse socio-economic systems, linguistic plurality, and intercountry collaboration. The predominance of Western paradigms has culminated in a "one-size-fits-all" methodology, frequently overlooking the complex realities of the Global Majority. This paper advocates for the reconfiguration of OHS discourse to incorporate the voices and experiences of workers from diverse backgrounds, particularly those in the Global South. By examining opinion leaders within international OHS networks, the study offers insights into how global initiatives projected for 2025 may influence future policies, underscoring the necessity for collaborative, culturally responsive strategies. With the ongoing digital transformation and the rise of technologies like 10G and Industry 6.0, OHS faces new challenges. Increased reliance on technology for safety monitoring introduces psychosocial stressors, such as job strain and anxiety, particularly among generations X, Y, and Z. Climate change further intensifies occupational risks, including heat stress and nutritional deficiencies, necessitating a shift toward nature-based solutions. This research has been funded by the Committee of Science of the Ministry of Science and Higher Education of the Republic of Kazakhstan (Grant No. BR21882302 "Kazakhstan's society in the context of digital transformation: prospects and risks").

The Projection of the Present into the Past: The Emergence of a Reactive Historiography in the Post-1979-Revolutionary Iran

Up until very recently, the biggest threat to a realistic and honest historiography of the past was the state-based, official, narratives of history. Thanks to the expansion of the digital media and Internet-based social sites, a new threat has now emerged -- what I have called the 'reactive historiography'. In an effort to counter the official narratives, this line of historical thinking tries to create an exact opposite of the former. The result is an equally misleading narrative of history, except in the opposite direction of the formal narrative. In this study, I have explored this new phenomenon in the case of Iran in the aftermath of its 1979 "Islamic Revolution". The clash of the 'official' and 'reactive' narratives in Iran is fed by the misreading, by both parties, of the following nine concepts: 1) the positive/negative roles of religion in society and politics; 2) the influence of 'zeitgeist' in informing social developments and social movements; 3) the (in)distinction between 'reason-based' and 'cause-based' explanations; 4) the (im)possibility of achieving competing societal goals; 5) the single/multiple causes of a social revolution; 6) the multiple dimensions of the national identities and the ways in which national identities are formed; 7) the confusion about the role and experiences of colonialism; 8) the ignorance of the life-cycles of revolutions; 9) the illusory -- backward/forward-looking -- bases of the 'projects of hope'. Based on an analysis of these nine themes, the contours of the emerging reactive historiography in today's Iran are drawn. The study highlights the significant role that sociological analysis can play in settling these misinformations, and discusses the broader implications of the findings for cases beyond Iran.

Madibeng Local Municipality: Towards an Ethical Rejuvenation of South Africa's Municipalities

This qualitative study explores residents' perceptions of water service delivery challenges in the Madibeng Local Municipality (MLM), South Africa. The study reveals deep dissatisfaction with the MLM's water services, stemming from insufficient water quantity and concerns about water quality. Residents attributed these issues to five key factors: corruption and financial mismanagement, particularly through *tenderpreneurship* in water tankering; ageing and derelict infrastructure; human resource issues in the water sector; erratic power supply; and poor communication from the municipality. These factors contribute to a violation of the *Batho Pele* Principles, designed to ensure citizen-centred service delivery. The paper argues that ethical renewal is critical within the water sector in South Africa. By exposing the ethical crisis of *tenderpreneurship* and mismanagement, the study aims to inform discussions on potential solutions and reforms towards a more transparent, accountable, and ethical water sector.

"Does It Actually Make Any Sense?" Contemporary (Un)Religious Experiences of the Young Generation

Researches conducted in recent years on the religiousness of Poles, with particular emphasis on young people, point to very noticeable process of abandoning religious practices and declarations of faith. So far, in Poland, the majority of research on religion and faith are based on quantitative approach. In the project "Post-transformation in the perspective of biographical experiences of people born between 1980-2005. A sociological analysis" we conducted 80 autobiographical narrative interviews with people born in the 80., 90., 2000-2005. The interviews were focused on the individuals' overall life experience. In the third part of the interview all the narrators were asked about their attitude to faith and religion. These answers can be analysed in the context of narrators autobiographical stories what shows various backgrounds of their contemporary experiencing of faith, and especially spirituality. Family background, (social)media discourses and the dynamics of social and political events appear to be the most crucial in this process. In the presentation I will discuss the results of analysis of this phenomena.

The Role of School in Fostering Children's Generalized Trust: A Multilevel Analysis of Japanese Elementary and Junior High School Data

The importance of generalized trust has been noted in various fields. How, then, is generalized trust generated? When considering this question, the role of school can be seen as crucial. This is because school is the place where children encounter people outside their family: friends, teachers, and community members. A crucial role of schools is to foster generalized trust in children through their interactions with trustworthy individuals. Specifically, it is vital for educational institutions to cultivate in students the understanding that while society comprises both trustworthy and untrustworthy individuals, the majority of people are kind, helpful, and deserving of trust. However, few studies have analyzed generalized trust among school-aged children. Therefore, this study uses data from a "Questionnaire Survey on Social Capital of Elementary and Junior High School Students" conducted in a region of Japan to clarify how children's generalized trust is nurtured. Specifically, I examine the role of school education by analyzing the relationship between children's personal networks and generalized trust. To identify the determinants of generalized trust, I employ a multilevel modeling approach. In this analysis, generalized trust among elementary and junior high school students is the dependent variable, while various aspects of students' personal networks—including relationship with family, friends, teachers, and community members—are independent variables. This study indicates that personal networks significantly contribute to the development of generalized trust, with relationships involving community members and teachers emerging as particularly influential factors.

Understanding the Heterogeneity of Young Caregivers' Lives and Experiences in China

Young caregivers are children who provide unpaid, long-term care to parents and/or other family members who have chronic illnesses or disabilities. When worldwide studies demonstrate how adult women's unpaid care at home compromised their well-being, career, and other aspects of their lives, there is a gender-related gap in the young caregiver literature. Meanwhile, compared to profound research and policies in many countries, young caregivers in China have yet to be recognised and studied, leaving these children unsupported. This exploratory study uses an intersectional approach to understand the heterogeneity of these children's caregiving experiences, drawing unique insights that the number of hours spent on caregiving cannot provide. From Nov 2022 to Jan 2024, I carried out participant observations with young carer families in urban and rural China; I also interviewed 30 young carers aged 12 to 17, and 30 care recipients, respectively. The findings show evident gendered distribution of children's caregiving in different family structures under a persistent patriarchal hierarchy in China. For example, adults generally loved their children and were aware that children's caregiving might compromise their education; they still believed that sons and daughters occupy different positions in family and society according to their gender obligations, especially in rural areas. Meanwhile, young male carers were more willing to help with gender-appropriate caregiving tasks instead of doing 'feminine' tasks which may impose resistance in constructing their masculinity. Also, when mothers' buffers at home were unavailable, girls were more likely than boys to act as 'natural substitutes' by compensating for their mothers' deficiencies in providing care, and they were inclined to imitate mothers' caregiving behaviour. In summary, this study argues that young carer families serve as the primary site of gender socialisation and reproduction of gender inequality, and children's gender and age (i.e., childhood) would further cause their vulnerability.

KELESOGLU, ALIYE NUR* (University of Malaya, Malaysia)

Countering Ethnocentrism: The Discursive Strategies of Malaysia's Islamic Movements

Malaysia's political landscape has long oscillated between the ethnocentric vision of a "Malay's Malaysia" and the multicultural ideal of a "Malaysian's Malaysia". The former vision, which ignores and excludes the non-Malay and non-Muslim groups that make up almost 40% of the total population, has gained more ground in the last two consecutive elections. This shift poses significant risks to the country's democratic system and threatens both ethnic and national unity. In this changing context, two Islamic movements with thousands of members have played a central role in shaping Malaysia's political discourse. This paper examines how the Malaysian Islamic Youth Movement (Angkatan Belia Islam Malaysia, ABIM) and the Malaysia Ikram Movement (Pertubuhan Ikram Malaysia, IKRAM), two major Islamic movements in Malaysia, have collaborated to resist the growing ethnocentric trend through their discursive strategies.

Using Ernesto Laclau and Chantal Mouffe's discourse analysis, this paper examines how both sides of this political spectrum strategically use Islamic concepts and references to advance competing visions for Malaysia. The analysis focuses on the meaning-making processes of ABIM and IKRAM, which use these concepts to promote a multicultural vision and counter the ethnocentric appropriation of the same Islamic concepts. Drawing on the case of the ABIM and IKRAM movements in the Malaysian context, this paper will reveal the meaning-making dynamics in the complex interplay between religion, politics and identity.

Serving the Poor or Serving the State? - The Ambiguities of Co-Optation in Poverty Governance in Authoritarian Hungary

In recent decades, nonprofit organizations have increasingly become involved in welfare service delivery for marginalized populations across Europe. This trend aligns with the spread of neoliberal governance in transformed welfare states, where neoliberal economic policies have undermined democratic principles. Authoritarian neoliberalism, which

combines political authoritarianism with economic marketization, has shifted civic space toward nonprofit organizations in service delivery while restricting their public discourse. These organizations often become co-opted by authoritarian states, supporting conservative agendas and legitimizing neoliberal policies rather than advocating for structural change.

Since 2010, Hungary has exemplified de-democratization, marking it as the first undemocratic member state of the EU. The Hungarian state has employed sector-specific strategies against civil society organizations, depending on their political alignment with the neoconservative discourse. This has led to the "religionization of the welfare state" (Lendvai-Bainton and Szelewa 2021), where churches and faith-based organizations (FBOs) have become the state's preferred partners in delivering social services to the poor.

A notable example is the Hungarian Charity Service of the Order of Malta (Málta), which has taken on the role of providing complex services in rural, marginalized communities abandoned by the state. Over time, Málta has gained significant power, shaping policies, advancing a large-scale social integration programme, directing its resource distribution, and determining the list of implementing organisations and the methodology for service delivery. Málta's operations have been marked by a tension between co-optation and progressive experimentation with institutional changes aimed at tackling poverty. This presentation will explore whether Málta, embedded in the governing elite, can introduce alternative approaches to addressing inequalities and marginalization within Hungary's authoritarian political system. We will examine this on three levels: welfare policy discourse, the institutional system of social integration, and local-level practices.

RC28-441.3

KELLER, TAMAS* (Hungarian Academy of Sciences, Hungary)

Biased Behavior Assessments and the Gender Gap in School Grades

The behavioral explanation for the gender gap in school grades suggests that girls receive better grades than boys because of their behavior, which is often more school-conforming than boys' school behavior. This well-established explanation in sociology implicitly assumes that students' school behavior can be objectively assessed. However, in reality, students' school behavior is assessed by teachers whose observations about students' school behavior may be biased. For example, teachers may perceive the same school (mis)behavior more favorably when exhibited by a girl rather than a boy, leading to more positive evaluations of girls' behavior even when girls and boys exhibit similar levels of school (mis)conduct. As a result, gender bias in behavior *assessment*, rather than actual differences in school behavior, could influence the gender gap in school grades.

Drawing on the theoretical frameworks provided by the halo effect and labeling theory, the study hypothesizes that students' biased behavior assessments by their teachers correlate with—and potentially contribute to—the gender gap in their GPA. Data from 123 classrooms in rural Hungarian primary schools support this hypothesis. The study finds that classrooms where teachers give girls better behavior grades than boys for the same level of disruptive behavior, tend to exhibit a larger female-favoring gender gap in GPA from the key subjects. Furthermore, the study argues for a potential causal link between teachers' biased behavior assessments and the GPA gap by leveraging quasi-random student allocation across classrooms in the sample and instrumental variable estimations. The results indicate that a significant portion of the gender gap in GPA is explained by teachers' biased behavior ratings favoring girls. Thus, this study extends previous research by suggesting that the gender gap in GPA is influenced not only by behavioral differences between girls and boys but also by differential teacher assessments of their behavior.

KELLMER, ARIANA* (University of Duisburg-Essen, Germany)

Transnational Upward Social Mobility in the Course of South-North Migration

Social mobility is rarely studied with a transnational scope. But, especially in the Global South, upward mobility is connected with geographic mobility and, very often, migration. Given global inequalities and significant differences in income (Milanović 2020), South-North migration seems to be attractive even for people from low-income families. At the same time, achieving social mobility through migration appears particularly unlikely for this group of people: (Poor) people from the 'Global South' rarely have the necessary resources to migrate to the 'North', and migrants often enter the most precarious segments of Northern labour markets (Krings 2020).

In my paper, I focus on rare cases of migrants who - despite these improbabilities - migrated to Germany from countries of the 'Global South' and established themselves on the labour market in positions similar to the

German middle classes. The empirical basis is formed by 17 biographical-narrative interviews with people who grew up in various countries in the South and less privileged families.

My empirical findings trace the strategies (Bourdieu 1979) and orientations (Mannheim 1980) in the migration and upward mobility process and contextualise them in global structures of inequality. Despite their different countries of origin, the upwardly mobile share similar experiences. Viewed through the lens of individual trajectories, I can show how migration laws, educational institutions, organisations and family orientations interact and channel migration in a way that makes educational migration attractive.

I conclude with a critical discussion of the extent to which ideas and concepts of 'social advancement' can be applied to South-North migration. In my study, social mobility appears as a family project, which questions the assumptions of mobility research on individualisation and conflicts between parents and the child generation.

KELLY, KRISTY* (Drexel University and Columbia University, USA)

Chasing Shadows: Untangling the Gender-Education-Corruption Nexus in Vietnam

Corruption continues to be a main obstacle to development, reducing the efficiency of resource use, slowing down economic growth and setting the stage for human rights violations. Although corruption has a negative impact on all communities, empirical evidence suggests that men and women perceive its manifestations and outcomes differently. Similarly, they encounter different forms of corruption and demonstrate different attitudes towards combating corruption. At the global level, there is increased recognition that the promotion of gender equality, empowerment of women, and implementation of anti-corruption programs are mutually reinforcing development strategies. In Asia, corruption is on the rise, and it is increasingly reported in education settings, both impacting student advancement, but also driving school dropouts among marginalized populations. For the most privileged, study abroad offers a way out from navigating local corruption schemes impacting access to higher education. While international development and humanitarian aid organizations have begun focusing attention on anti-corruption work in education settings, the scholarly literature on its relationship to gender equality and education progress has yet to emerge. This paper aims to fill that gap, first through an exploration of literature on education and corruption, gender and corruption, and gender and education in Southeast Asia, and then presenting empirical data collected through ethnographic methods in Vietnam from 2014-2024.

Findings reveal that to women, petty corruption, or the everyday abuse of entrusted power by low- and mid-level public officials and community leaders, is most visible as they try to access basic goods or services in places like hospitals, schools, police departments, land management agencies, and when they apply for jobs. Managing petty corruption – or what many call "chasing shadows" – is rarely captured in formal measures of corruption, or in anti-corruption campaigns, yet it is women's work requiring tremendous social and political capital to navigate to avoid corruption.

Youth Arts As Popular Education: Young People Learning through Art at the Edges of the Creative Industries

Youth arts is a form of education that operates primarily through affect and, perhaps because of this, has not received attention in terms of its capacity to develop young people's employability. In this paper we draw on new empirical data from our Australian Research Council funded industry linkage project 'VITAL ARTS: Skilling young people for their futures'. We identify and discuss the highly desirable '21st century skills' learnt in youth arts settings. Drawing on resources from sociology of youth, arts and British cultural studies, we show that while 21st century skills are learnt through affect, the processes through which this learning proceeds also produces skills that need to be seen as valuable commodities. Taking the everyday seriously as a site for learning, we explore youth arts projects as a site for skills development and argue for a framing of micro-credentials that at once recognizes and problematizes this modality of training. We do so by outlining how our reading of interdisciplinary approaches to scholarship on art as a means of learning and site of social change. This approach can provide a foundation for understanding the everyday spaces of youth arts as critical

sites of knowledge production. Examining the intersections of identity, being and culture as pedagogical, we outline how the everyday experiences of diverse youth participating in arts might be captured so as to build pathways into the future based on their competency in 'the now'.

KENNY, BRIDGET* (University of the Witwatersrand, South Africa)

The Infrastructural Labour of Relationality: Solidarity in 'Troubling Times'

My engagement with Jennifer Chun's new book *Against Abandonment* will focus on the key words of affect and infrastructure. In *The Inconvenience of Other People*, Lauren Berlant defines infrastructure as the 'lifeworld' of structure, the sets of relations and affects that make worlds, the 'activity of poesis'. I will examine the ambivalences and proximities involved with fomenting, holding and letting go of forms of solidarity through the lens of infrastructure. My perspective will be influenced by my first book on the generation and reproduction of the attachments of retail workers in South Africa over decades to the collective political subject of 'abasebenzi' [workers], and what new forms of relation emerged and ruptured, and what these processes portended for labour politics. I will also reflect on Chun's research through my current book project, *Lift Stories*, in which I examine elevators as affective urban infrastructure in Johannesburg, constituted through different forms of labour to make intimate space into sites of political contest.

KERN, ALEXANDER* (Institute for Social Research and Goethe University Frankfurt, Germany)

Melilla's Decada Negra: How Spain's Incorporation into the Core of the Capitalist World System after Franco's Dead Shaped the Gendered and Racialized Inequality in the Spanish-Moroccan Borderscape

Drawing on ethnographic and qualitative material collected during fieldwork between 2021 and 2023 in the Spanish exclave of Melilla, I explore how Spain's integration into the core of the capitalist world system (Wallerstein) has shaped the social reproduction in the Spanish-Moroccan border region and how capitalism continues to shape inequality in the city to this day. I proceed in two steps. First, I examine the historical changes that took place in Melilla and the neighboring region of Nador between Franco's death 1975 and Spain's integration into the EU 1986. This phase is remembered in Spain as the peaceful *Trasición* to democracy, but is referred to in Melilla as the *Decada Negra* and even as a phase of *Apartheid Light*. Based on interviews with contemporary witnesses and historical documents, I show how violence and quasi-colonial oppression shaped the birth of Spanish democracy in Melilla. The core of the struggle at the time was whether the Muslim *Melillenses* should be granted access to Spanish citizenship and thus to the advantages associated with EU membership.

Secondly, the legacy of this phase is traced up to the present. Today, the border regime that came hand in hand with democratic capitalism shapes life in the exclave and the Nador region. The concrete form of urban inequality along the lines of gender, race and religion is directly related to capitalist accumulation. My research shows that the exploitation of the rural Moroccan population as well as the exploitation of the Muslim *Melillenses* in the labor markets of Melilla and southern Spain leads to socioeconomic inequalities that are compensated in *female led care networks*. By reconstructing these, I show how the implementation of modern capitalism both produced a certain form of gendered inequality and led to a racial segregation even more rigorous than under Franco's rule.

KESKIN, DERYA* (Kocaeli University, Turkey)

Brain Drain in the Age of Polycrisis: The Case of Turkey

Turkey has been losing highly educated and qualified professionals in various fields through migration. While thousands of doctors, engineers, IT specialists and academics immigrate by finding jobs abroad, many others want to leave the country. The economic crisis, with its impoverishing impact on the middle class, and difficult working conditions are making people dissatisfied and unhappy. Undemocratic political environment in the country, with the increasingly authoritarian government of the last 22 years, is worsening people's lives. The transition from a parliamentary to a presidential system in 2018 further accelerated this economic-political process. The constant violation of the boundaries between the legislative, executive and

judicial systems has rendered both the Turkish Grand National Assembly and the legal system dysfunctional. Decree laws issued arbitrarily in line with the ideology and needs of the political power undermine the credibility of institutions and make the country insecure and unstable for its people. While the economic crisis is an important reason for the migration of highly qualified labor force, the political climate in the country increases people's anxiety and strengthens their desire to migrate. Moreover, the mass influx of migrants to Turkey following the outbreak of war in Syria in 2011 has added to existing socio-economic problems. Turkey hosts about 4 million refugees officially, however, unofficial numbers are believed to be at least twice as much due to unregistered migrants. Already divided by the polarizing discourse and practices of the government, mass migration to Turkey has exacerbated the social crisis in the country. Building on semi-structured interviews with those who have already migrated from Turkey, this study aims to shed light on the economic, political and social conditions that create a polycrisis environment in Turkey and the consequences that give way to the migration of qualified labor force.

Contactos Dorados y Reproducción De La Desigualdad Social En Argentina

En el marco de una investigación sobre capital social en Argentina, preguntamos sobre la posibilidad de pedir ayudas a perfiles específicos –director de empresa, funcionario estatal, profesional de la salud, sindicalista, líder social o político, periodista de medio importante–, a quienes hemos llamado “contactos dorados”. Si la fórmula de capital social es recursos X relaciones, son importante entonces estos contactos que, siendo escasos, tienen acceso a una serie de bienes y servicios de gran valor por su posición organizacional y/o personal. Estas preguntas fueron utilizadas para construir una escala (0-10) de capital social (ECS), a partir de una adaptación de la propuesta de Lin et al (2001) y de la aplicación de Rey (2023a, 2023b) al caso uruguayo. Para la asignación de puntajes hemos recurrido al Índice Socioeconómico Internacional de Estatus Ocupacional (ISEI), desarrollado por Ganzeboom et al (1992), en su versión ISEI-08. Un primer hallazgo significativo es que el 42% de la muestra obtuvo 0 puntos en la ECS, es decir que no tienen ningún contacto con personas de los perfiles analizados, mientras que 9,1% obtuvieron el puntaje correspondiente al máximo capital social posible (10 puntos). Por otra parte, en la escala 0-10, el 76,4% obtuvo valores por debajo de 5, y agrupando los valores en niveles bajo, medio y alto, se observa la mayor prevalencia de egos con niveles bajos de capital social (30,3%) y una progresiva disminución de la frecuencia de registros a medida que éste aumenta. Por otra parte, analizamos las diferencias en capital social “dorado” a partir de variables de estratificación social como el género, la edad, el nivel educativo y de ingresos, y el lugar de residencia. También damos cuenta de la relación entre capital social “dorado” y el tipo de redes personales y la homofilia de los vínculos cercanos

Breaking Barriers: The Role of Counseling Practices in First-Generation Student Enrollment at Private Universities

German universities are competing for prospective students. Private universities, especially universities of applied sciences, have seen a steady increase in student numbers, while public universities have recorded a decline. Notably, 70% of first-semester students at a popular German private university of applied sciences are first-generation students (FGS). In the “FIPHo” research project, we explore support practices for FGS during enrollment and study periods at this private university. Our subproject analyzes student advisors' counseling practices. Contrary to our presumption, family education background is not a relevant category in counseling, meaning FGS are not explicitly supported in a special way. Nevertheless, FGS enroll in high numbers.

We investigate which addressing practices support or at least do not hinder high enrollment of FGS and how these practices are embedded in the organization's goals. To answer these questions, we conducted 4 group discussions, observed 13 counseling situations, and analyzed the university's website using the documentary method (Bohnsack, 2014). The website uses personalized addressing and the slogan “Education for all” promises to accept all prospective students without restrictions based on school grades or entrance qualifications. This inclusive approach may appeal to students who have little contact with universities.

Student advisors face a diverse group of prospective students, making it challenging to meet individual needs during consultations. Despite one-on-one sessions, organizational requirements lead to differentiation. Prospective students are grouped by characteristics and suitability for dual study programs, resulting in poorer advice for uncommitted students. Initially, advisors support all students in becoming engaged applicants. Generally, there is no social selection in the advisory service at the private university. Research highlights that advisors are crucial for undecided or changing-major students (Tinto, 2024), and strategic language in consultations can aid marginalized groups like FGS (Buchanan et al., 2022). We discuss if social blindness and preferential advice for committed students benefit FGS.

KETTENBACH, JOHANNA* (University of Oslo, Norway)

The Family As a Political Tool: Divergent Post-Islamist Women's Rights Discourses in Morocco

Women's rights have long been a source of religious and political contention, a matter that is particularly pronounced in post-colonial contexts where religion and gender matters are heavily politicized. In these settings, attempts to legislate and implement women's rights can present a challenge as these processes are often met with opposition from politically active religious actors. This paper focuses on the Moroccan case, where the state is in the process of reforming the religiously sanctioned family code (Moudawana). This paper seeks to analyze how different Islamist actors, namely individuals active in the Justice and Development Party (PJD) and the Justice and Charity Movement (JCM), as well as the movements as a whole, react to the ongoing reform, to shed light on post-Islamist reactions to nationalized religious regulation. As such, it seeks to examine how women's rights are utilized by such religious movements to present and to maintain a politically relevant religious identity, and to review how the movements instrumentalize the emerging points of contention to signal their opposition to religious regime-policies and to reinforce their ideological stance. Furthermore, this study aims to understand how Islamist movements engage in oppositional politics on gender matters to regain or to maintain their Islamist appeal to a larger followership or constituency. Accordingly, this study critically engages with the notion of the post-Islamism paradigm, by elucidating the different ways in which post-Islamist movements navigate gender politics, and by shedding light on instances in which they may even return to more conservative ideology in an attempt to maintain their political relevance. This analysis is based on qualitative data drawn from social media and from interview and document data gathered through fieldwork conducted over several months in Morocco.

KETTIOUI, ABDELMJID* (University Moulay Ismail (Meknes), Morocco)

The Neoliberal Cul-De-Sac of Moroccan Atheist Activism: Striving for Cultural Catch-up, Not for Social Justice

This paper argues that Moroccan atheist activism is rooted in a discourse of cultural catch-up, modeled on European enlightenment ideals of reason, rationalism and secularism. For enlightenment and freedom of belief to take place in Muslim soil, Muslims need to “kill their own God,” too. A key activist frames his project thus: “I'll do with the Quran what Martin Luther did with the bible.” This cultural project falls prey to ethnocentrism, language determinism and the modernity/coloniality matrix of enlightenment. As such, it remains reticent to issues of social justice, increasing authoritarian politics, and racial and epistemic injustice in the age of genocide. This paper explores the potential of a double critique to reframe atheist activism as a radical positionality, capable of addressing social, political, and epistemic injustices in both semi-authoritarian ecologies and colonial/ genocidal contexts.

KEUHO TCHOFFO, AGNES* (University of Douala, Cameroon)

Feminism “from below” in Sub-Saharan Africa

Despite an effort to contextualize and decolonize, “African feminism” continues to be the object of stigmatization and mistrust on the part of public opinion on the continent. Moreover, any women's demands that appear to challenge patriarchal norms and practices, which are deeply rooted in African cultures, are considered dangerous, labelled as extroversion and pose a high risk of social and political exclusion. While this situation seemed to improve somewhat in the 1990s, the new pan-Africanist, African Renaissance and neo-sovereignist currents, which use social networks to distil their often reactionary ideas, raise fears of a certain regression in the rights and freedoms obtained.

In this context, the new generations of African feminists, while keeping a “low profile” to escape multifaceted violence, are implementing forms of creativity to embody their struggle and achieve their aspirations. This can sometimes inhibit and blur the message.

KGATLA, LESEDI* (Fort Hare University, South Africa)

Online Self-Expression: Learn from My Crying

This paper addresses the prevalent misconceptions surrounding depression and challenges stereotypical perceptions of how it should manifest. Through the lens of social media, participants have the freedom to express their experiences of depression in unique and creative ways, allowing for a more personalised, and authentic representation. This paper explores alternative ways in which depression is represented by individuals on social media to provide a more accurate and nuanced portrayal of the illness. The data collection process involved gathering information from nine participants' diverse social media platforms, which were further supplemented by semi-structured interviews to gain deeper insights into their experiences. Thematic analysis was employed to analyse the collected data, allowing for the identification and interpretation of recurring themes that emerged from the participants' narratives. The study revealed two themes: okay, not okay, and real representations. By examining how young people present themselves online to cope with depression, this study highlights the importance of self-expression on social media platforms. These platforms offer individuals the opportunity to represent depression in a manner that resonates with their experiences and identities. This diversity in representation promotes relatability among individuals experiencing depression, demonstrating that it does not conform to a singular, rigid image.

Corps, Médecine Et Don Entre Continuité Et Discontinuité

Cette intervention est une contribution au débat scientifique à propos de la relation de l'humain au cosmos où il naît, évolue, donne, souffre, guérit, meurt et continue d'exister comme un être qui habite le corps de ses continuités, une valeur dans l'imaginaire religieux de ses proches, une mémoire de la personne qu'il était et une figure d'une interaction spirituelle entre le cosmos et l'au delà du cosmos.

C'est en fait, un essai de déconstruction reconstruction du concept du corps et du don à partir d'une expérience réflexive d'une part et d'une exploration sociologique de la chaîne du don en contexte de mort et de la trajectoire du corps humain comme objet et sujet de prélèvement et transplantation d'organes en contexte de soin.

Au delà d'un confinement du corps entre nature et culture, cette intervention se focalisera sur les aspects identitaires du corps greffé et du corps prélevé, le cadre normatif et éthique où ils sont approchés et les interactions sociales et liens spirituelles qu'ils révèlent au sein de la communauté médicale et entre la communauté des donneurs et des receveurs.

Remittances and Economic Justice: Alternatives Beyond the Migration-Development Nexus

Remittances, as one of the significant drivers of recent Migration-Development Regimes (MDRs), have emerged as a crucial aspect of the financial landscape of developing countries especially in the global south. At times, remittances have even been considered a quantitative measure of brain gain to the home economy, justifiably compensating for the brain drain. Asia has been the largest remittance receiving continent in the world with more than half of it flowing to South Asia from the six Gulf Cooperation Council (GCC) countries, the US, UK, Canada, Australia and the European Union. From the perspective of wealth redistribution, migration accompanied by remittances, serves to redistribute considerable wealth from wealthy to poor countries. This article is an attempt to explore the intricate relationship of migration, development and economic justice through the lens of remittances keeping sending countries on the focal point. Millions of migrants send financial support back to their home countries which contributes in their socio-economic development. However, these benefits of remittances are unevenly distributed, reflecting the prevailing inequalities and need of

redistribution. Through selective case studies of Asian countries and using data from World Bank, UN-DESA and Asian Development Bank, the article highlights the complexities of economic justice and equitable approach to remittance flows and migration management in developing countries. While addressing the governance issues relating to the changing migration and remittance management of countries involved and the consequent economic and political challenges, it examines the strengthening “audibility” of what Khadria had elsewhere called the “silent backwash of reverse remittances”. The paper uses its findings to discuss the prospective policy recommendations for innovations in multilateral negotiations between the stakeholders comprising the “whole of society” and the “whole of government” in pursuit of economic justice across nations.

Resisting the Anti-Democratic Tide: Sudan's Grassroots Movements in a Counterrevolutionary War

In Sudan, a revolution initiated a democratic transition in 2019, which was subsequently disrupted by a military coup in 2021, culminating in a full-scale violent conflict in 2023. A year and a half since the outbreak of the war, prevailing analyses of Sudan's war predominantly frame it as either a power struggle between military factions or a proxy war. However, there is a critical need for more nuanced, non-elite analyses of the situation in Sudan. The ongoing war represents an extension of an anti-democratic project that has been in development since the revolution and was set in motion by the military coup. The war transcends the simplistic categorizations of an internal power struggle or a proxy war orchestrated by regional or global powers. Instead, it constitutes a multi-scalar counterrevolutionary war, supported by both internal and external actors bound by shared capital interests and a desire to preserve the authoritarian, extractive, and postcolonial Sudanese state.

Centring the counterrevolutionary and anti-democratic aspects in the analysis of Sudan's war is essential in underscoring the struggles of Sudan's pro-democracy grassroots movements. Throughout Sudan's revolution and the subsequent democratic transition, these grassroots movements have played instrumental roles in mobilising for democracy and demonstrating a bottom-up approach to democratic transitions. The powerful mobilization of these movements threatened the interests of the elite Sudanese military and political class, as well as regional and global powers. In the aftermath of the military coup and the war, these movements have continually adapted their roles to resist anti-democratic endeavours. This paper will present a case for understanding the Sudan's war as a counterrevolutionary one and will analyse the tactics employed by grassroots movements in resisting democratic backsliding. By doing so, it aims to contribute to a more comprehensive understanding of the complex dynamics at play in Sudan's struggle for democracy.

Ties That Sustain: Social Network Analysis of Water Governance and Conservation in Rural India

Water scarcity in India, driven by increasing demand and changing agricultural practices, poses a growing challenge, particularly in drought-prone regions like Marathwada, Maharashtra. The shift to cash crops has intensified the crisis, straining water resources and threatening rural livelihoods and food security. This study explores the socio economic impacts of localized water conservation efforts using Social Network Analysis (SNA) to examine the interactions between Governmental, non-governmental and community based-within the local multi-actor governance structures. Data from 120 households across four villages were collected through structured interviews. The findings reveal that well connected social networks significantly enhance water availability, improve household income and foster community cohesion. Water conservative programs as a collaborative action, including creating of infrastructure, have made a positive impact on rural livelihoods. The study underscores the importance of integrating local knowledge, empowering civil society and fostering equitable governance to ensure sustainable water management in rural India.

Psychosocial Challenges Faced By International Students in Developing Friendships

This study investigates the psychosocial challenges faced by international students in forming friendships while adapting to life in the UK. A qualitative research approach was employed, with data collected through eight semi-structured interviews with students who reported experiencing difficulties in establishing friendships. The interviews were recorded, transcribed, and analysed using thematic analysis. The findings revealed several unique obstacles international students face, including challenges related to adjusting to the host community, culture, educational system, and the psychological and behavioural changes required for successful integration. The results of the study were grouped into key thematic categories based on their relevance to academic, social, and cultural dimensions. Five major themes emerged: academic challenges, psychological difficulties, socio-cultural barriers, language limitations, and interpersonal dynamics. Academic challenges included issues such as limited interaction with classmates, feelings of isolation, and language barriers. Psychological difficulties were characterised by mood problems, homesickness, and adjustment struggles. Socio-cultural challenges involved cultural differences, experiences of prejudice, and unfamiliar communication patterns. Furthermore, interpersonal dynamics, such as the absence of pre-established social networks and difficulties in interpreting social cues, were significant obstacles. These findings provide valuable insights that can inform UK universities in offering better support and resources to enhance the social integration of international students.

Franchising the Common Language - an Analysis of Coke Studio's Business Model

Coke Studio (CS), a known international music franchise, is growing with its strategy of melodic cultural synthesis by producing musical fusion and cross-cultural hybrids. This study examines how cultural fusion influences identity and revives old music genres, providing insights into CS's franchise model and its global impact. This discussion will help to comprehend the nature of cultural exchange, identity formation, and creating a shared language of music between nations. The research observes how CS is mainstreaming subculture music genres into popular culture discourses and converting this integration into a diverse but unified musical community. The study will include an assessment of digital platforms and the globalization of CS, focusing on its economic and business character. The research is qualitative, which will include content analysis to systematically examine the themes, cultural elements, and genres. Interviews and focus groups will provide an essential understanding of subjective experience of cultural fusion and its reception by diverse audiences. To understand CS's business success as a cultural model, digital ethnography will be used to explore how CS operates in the online space. Concerning this, the study seeks to examine user comments, likes, shares, and social media trends to know how digital platforms contribute to CS's triumph. This study expects to uncover new avenues of digital ethnography and present CS's business model to the music industry through empirical evidence.

Soft Power for International Diplomacy through K-Pop Lens

K-pop, or Korean popular music, has spread throughout South Korea and the world in recent decades. Due to the constant expansion of K-pop in many countries, there is a growing scholarly debate about its potential as a soft power instrument of foreign policy. This paper looks to define the concept of K-pop music diplomacy, and the strategies and measures put into practice. It explains how the Korean government has instrumentalized K-pop and supported its foreign promotion as part of a wider public diplomacy strategy aimed at increasing the country's power and prestige. It assesses the areas that contributed to K-pop's internationalization. In approaching the topic from the perspective of K-pop, the paper therefore highlights contemporary methods of soft power in popular cultural diplomacy. The paper shows how state and non-state actors use cultural industries such as K-pop to promote national interests, interact with foreign audiences, and foster the growth of the creative economy. The author analyzed the change, success, and usefulness of music diplomacy as exemplified by K-pop and found best practices for cultural diplomacy.

Religion behind Bars: Faith-Based Programmes in the Rehabilitation of Offenders in the Medium B Westville Correctional Service, Durban

There is adequate evidence to suggest that religion is an important factor in maintaining social order and control. Almost all societies support and respect religious practices as a fundamental human right. A rapid decline in religious conformity is perceived to erode the moral fabric of society and hence perceive its decline to contribute to social degeneration leaving society in a state of disarray. Deviation from religious norms and values at an individual level is known to result in anomic behavior resulting in coming into conflict with the law. On the contrary religious fundamentalism is also known to be contributing to hostility, violence, lawlessness, harmful behavior and social instability. It is in this context that this article reviews religious practices and beliefs amongst offenders and its role in rehabilitating their deviant behavior in the South African context. There is a paucity of research between the religion-rehabilitation nexus, in hypothesizing the role religion plays in promoting pro-social behavior. The services of chaplains have become an important facet of the rehabilitation programme with offenders based on the belief that repentance can provide salvation from one's deviant behavior. This study highlights contrary to the assertion that individuals who come into conflict with the law have low levels of religiosity, they in fact do practice their religion. The study provides very little support to the notion that correctional centres inspired by faith based programmes indeed impacts on prosocial behavior as offenders engage with their respective religious belief systems as individuals. This finding refutes the assertions contained in the literature study that correctional centres do in fact impact on their spirituality due to the fact that before incarceration they practiced some form of religion.

KHAN, ZOHEB* (Brazilian Center of Analysis and Planning, Brazil)

Beyond Redistribution: The Role of Recognition and Participation in South Africa's Renewable Energy Trusts

South Africa's Renewable Energy Independent Power Producer Procurement Programme (REIPPPP), designed to reduce the economy's reliance on coal, mandates that private developers allocate a share of ownership in new energy projects to local communities through the establishment of community trusts. This model addresses the historical lack of recognition of the rights of rural, black communities dispossessed under apartheid to participate in economic development, as well as these communities' ongoing material deprivation. However, based on qualitative interviews with over 100 representatives from affected communities, trusts, local governments, and developers, this paper shows that REIPPPP's redistributive potential is undermined by failures to properly recognise communities' rights to meaningful participation in policy processes. The flawed, top-down process of establishing community trusts often excludes local actors, depriving them of procedural justice and reinforcing a sense of alienation. Trustees, often appointed without proper consultation, are frequently seen as illegitimate and lack the necessary skills for financial and project management. Additionally, the absence of government support and the burden of debt repayment further stifle the trusts' potential to redistribute wealth meaningfully. The resulting tensions reveal how inadequate recognition of community agency perpetuates existing inequalities, despite redistributive efforts. This paper argues that while the recognition of past and present injustices faced by specific groups and of their rights to a stake in the energy transition is critical to the development of effective policy, this must be complemented by the pursuit of procedural justice to achieve an equitable distribution of the benefits of the transition. South Africa's experience contributes to the debates about how policies, in their design and implementation, can balance recognition and redistribution, underscoring the need for inclusive, well-resourced participatory processes in addressing contemporary inequalities.

The Fate of Foreign Literature in Contemporary China

Transnational flows of culture, including literature, can help facilitate communication across social, political, and cultural contexts. In the recent decade, the government in China increasingly places value on traditional Chinese culture as opposed to foreign culture. In the context of a tightening political climate, this paper investigates how literature by foreign authors reaches readers in mainland China. In particular, it studies how Chinese

editors select foreign literary works for translation and publication in China. The paper relies on 10-month field research conducted primarily in Beijing and Shanghai in 2023-2024, which included semi-structured interviews with book editors, literary agents, censors, and other intermediaries, as well as participant observations at book fairs, book launches and at other venues. It shows that alongside symbolic and economic value of a foreign literary work, its political aspects are seriously considered by the editors. The paper reveals how the broader environment of cultural control, which is not welcoming to foreign influences, as well as how contemporary diplomatic conflicts between nations, and the trade war between China and the US impact transnational flows of literature into China.

The Role of Cultural, Social, and Individual Beliefs in the Normalisation and Perpetuation of Femicide: A Narrative Review

Femicide, the intentional killing of women due to their gender, continues to be a critical issue worldwide, often driven by entrenched cultural, social, and individual beliefs that legitimise and normalise violence against women. This narrative review aimed to analyse how these belief systems contribute to the perpetuation and normalisation of femicide. A thorough literature search was conducted using databases such as PubMed, PsycINFO, Scopus, and Web of Science. The analysis included studies published over the last 20 years that examined the influence of cultural, social, and individual attitudes on gender violence.

The review identified several key factors: patriarchal cultural traditions, societal gender norms, and misogynistic individual attitudes, all of which contribute to the persistence of femicide. Regional differences in the acceptance of violence against women were also explored, demonstrating the significance of contextual factors. Gaps in the current literature were highlighted, particularly regarding the need for more research on interventions that target harmful beliefs.

The findings suggest that addressing the cultural and individual beliefs that support femicide is critical for reducing gender-based violence. This review provides insights for social workers, policy-makers, and activists in developing targeted interventions to combat these destructive ideologies and promote gender equality.

KHATIB, MARWA* (PhD student, Israel)

Religious Texts and Practices As Tools of Resistance in Occupied Palestine 1948

Following the collapse of the "dreams of Arab unity" due to the June 1967 war, political Islam movements emerged, establishing social and economic institutions under the banner "Islam is the solution." Among these was the Islamic movement in Israel, which gained momentum from the broader Islamic awakening and was officially founded in 1996, targeting Palestinians in the occupied territories who possess Israeli citizenship. Unlike its counterparts in the Palestinian territories, such as Hamas and Islamic Jihad, this movement did not engage in armed resistance. Instead, it has consistently rejected the legitimacy of the occupation since its inception in 1996. Its commitment to peaceful resistance ultimately led to its prohibition and classification as an outlaw group in November 2015.

Sociologist Christian Smith notes that religion fosters a common identity among its adherents, which can be utilized not only to legitimize existing social, political, and economic systems but also to challenge and dismantle them. Smith asserts that "religion can actually help keep everything in its right place. But it can also turn the world upside down."

This study will examine how Israel perceives the activities of the Islamic movement as a threat to national security and a disruptor of the status quo at Al-Aqsa Mosque. The movement aligns with religious groups that resist colonial oppression by rejecting the occupier's authority. It argues that its challenge and non-violent resistance are rooted in Islamic principles. Furthermore, it organizes civil society initiatives that address various aspects -religious, social, educational, intellectual, economic -of Palestinian life based on Sheikh Raed Salah's concept of a "self-made society," introduced after the Second Intifada in 2000. This research will trace the development of the Islamic Movement while focusing on its religious activities and practices that serve as forms of resistance against its colonial circumstances.

KHATIB, SAFAA* (Artist and researcher, Israel)

The Braids Rebellion: Artistic Recreation of Palestinian Girls' Acts of Resistance in Israeli Prisons

As the artist of "The Braids Rebellion," I present an artistic project that recreates 25 scenes depicting Palestinian girls under the age of 18, who were imprisoned by Israeli authorities between 2015 and 2016. These scenes, often ignored as fleeting news items, capture acts of resistance within the prison system. The project is inspired by a 2017 event in Hasharon prison, where Palestinian prisoners cut off their braids and donated them to cancer patients after hearing a radio appeal for hair donations. This symbolic gesture of solidarity, made under harsh incarceration conditions, reflects life's continuity and defiance within oppressive spaces.

"The Braids Rebellion" demonstrates the concept of "life as origin," where the imprisoned reject their victimisation and use their bodies as instruments of rebellion. Smuggling their braids out of prison, these girls resist isolation and contribute to life beyond the prison walls. Through photography, audio, and repetition, the project magnifies these scenes, compelling viewers to confront forgotten narratives and question societal apathy toward such acts of resistance.

This paper discusses how art serves as a medium to memorialise marginalised voices and resurrect overlooked stories. By merging historical events with artistic representation, "The Braids Rebellion" challenges audiences to engage with complex political realities and the resilience exhibited within the carceral system under occupation.

Note:

Since its inception, "The Braids Rebellion" has been showcased in prominent exhibitions across various esteemed institutions:

- **May 2024 - October 2024:** Featured at the Middle East Institute, Washington D.C.
- **May 2023 - December 2023:** Displayed at the Institut du Monde Arabe, Paris.
- **November - December 2018:** Exhibited at Qattan Gallery, Ramallah, marking one of its early presentations.

How to Conduct Ethnographies of Resistance in Off-Limits Zones?

Calls have been made for a relocation of theory building to and from the Global South in order to decolonise academic knowledge production on social movements. However, an important range of methodologies such as ethnographic fieldwork remain difficult in some contexts, known as "off-limits zones", such as national territories under authoritarian regimes. In this communication I will reflect on alternative research designs to conduct fieldwork on social movements in off-limits zones. I will specifically discuss possibilities and challenges of constructing an interdisciplinary toolbox to overcome some of those difficulties related to accessibility, ethics, and risk and safety of research participants and researchers. The case of political activist ethnography, derived from the classical feminist institutional ethnography, methods of "counter-archive" from historical ethnography and possibilities of online data collection offered by digital ethnography will be considered.

Young People's Experiences of Social Mixing in Regenerated Mixed-Tenure Neighbourhoods: A London Case Study

This paper examines young people's (13-18 years) experiences and perceptions of social mixing and community relations in a mixed-tenure neighbourhood in London. It draws on fieldwork and participatory research with more than 40 teenagers from lower-income and ethnically diverse backgrounds, whose social housing estate has been demolished and replaced with a mix of social, intermediate, and market-rate housing. The findings generally align with previous evidence that highlights a lack of social mixing between residents in different housing tenures. However, they provide new insights into the unique experiences of young people, whose perspectives have been relatively absent from the literature.

The paper demonstrates how developer-led regeneration reinforces the social exclusion of disadvantaged young people, further deepening their

social and economic marginalisation. Study participants were stigmatised, racialised, policed, and deliberately excluded from public spaces, limiting opportunities for interactions with their more affluent neighbours. The social distance between the two groups was exacerbated by disparities in socio-economic status, as well as differences in housing design and amenities between social and market-rate housing. Additionally, residents in the private housing were predominantly young professionals and families with small children, reducing the likelihood of social mixing in schools.

Perceptions of inferiority, fuelled by stark contrasts in socio-economic status, living conditions, and neighbourhood experiences between young people and their wealthier neighbours, combined with a lack of social interaction, led to feelings of jealousy and resentment among some young people.

The findings provide further evidence that contradicts the policy expectation that mixed-tenure neighbourhoods foster inclusive communities or expand young people's social networks and access to job opportunities through mixing with their wealthier neighbours. The paper concludes that without addressing the wider processes of urban injustice, social exclusion, and inequality affecting disadvantaged young people, mixed-tenure neighbourhoods risk reinforcing their marginalisation.

"I Just Wanted to Leave School and Get a Job": Improving Transitions for Young People Leaving Education Early

This paper examines the post-16 transitions of young people (aged 16-20 years) who choose to look for paid employment or apprenticeships after year 11 (when aged 16), instead of staying on at school or going to a further education college. We examine: i) the factors that drive their decisions; and ii) the inequalities in their access to vocational education and training opportunities, employment and the resources available to help them make and exercise career and employment choices that are meaningful to them.

It draws on data produced as part of 'Young Lives, Young Futures', an ESRC mixed-methods longitudinal study of the school-to-work transitions of young people in England who do not attend university. The study comprises a three-wave survey of approximately 10,000 young people, longitudinal interviews with 123 young people in four contrasting local authority areas, and interviews with local policymakers and practitioners working in the same four local authority areas. We use a subset of the data for this paper: specifically, two waves of qualitative interviews with 21 young people and 1,352 survey respondents (22% of our survey sample) who have left full-time education at 16. They have diverse class, gender, sexuality, racial, ethnic, (dis)ability and health characteristics and are located in different parts of England. We also draw on insights from interviews with policy makers and practitioners involved in supporting youth transitions.

While the particular group of young people with which this paper is concerned are united in their aversion towards continuing in education and the majority are considered 'low attainers', they are not a homogeneous group. Adopting an ecologies-inequalities framework, our findings illustrate how their post-16 trajectories differ significantly based on intersections of school experiences, class, 'race', ethnicity, gender, learning disabilities, mental and physical health conditions, and the available support and opportunities in their local areas.

RC09-JS-112.3

KHOO, SU-MING* (University of Galway, Ireland)

Humane Security: Towards Transformative Solidarities in Policy and Practice

The 2022 UNDP Special Report: *Human Insecurity in the Anthropocene* and the 2023-24 Human Development Report: *Breaking the Gridlock – Reimagining Cooperation in a Polarized World* point to a global moment of critical multi-crisis. While the 'Anthropocene' has been rejected as a geological concept (Witze 2024), it retains its major significance as a critical sociological concept

pointing to urgent needs for global system change, integrating vital questions of ecological degradation, human insecurity, technological threats, socio-political polarization, and contested ("post-normal") science (Funtowicz and Ravetz 1993).

This paper responds to these two reports: the UNDP 2022 Special Report concerning human security in the Anthropocene (hereafter 'UNDP Special Report', UNDP 2022), and the 2023-24 Human Development Report 2023-24's (hereafter HDR 2023-24, UNDP 2024), which calls to urgently 'break the gridlock' of multi-crisis. It returns to the concept of human security first proposed in the 1990s, integrating recent conversations on the 'soul' of the concept and 'humane security' (Khoo 2023).

Following an earlier policy forum contribution (Khoo 2023), this paper considers six integrative suggestions for practical ways to operationalize human security ideas and principles: i) recalling the Stockholm Conference's agenda for global solidarity; ii) drawing on emancipatory legacies of established social movements; iii) applying differentiated measures to address vulnerability; iv) learning from indigenous and local insights on 'coordination' that emphasize ethical relationality; v) decentralizing policy and practice; and, vi) adopting an integrative perspective deepening the vital and 'humane' interpretations of human security and global cooperation, taking on the Ogata-Sen recommendations for integrated policies that jointly emphasise survival, livelihood and dignity.

The paper argues that these integrative discussions on human and humane security offer a response to the combined Research Committees' call to converge thinking about economic and environmental crises, inequalities, social transformations, and futures.

RC09-JS-247.2

KHOO, SU-MING* (University of Galway, Ireland)

Rethinking Social Metabolism – Towards Decolonial Relational Ecologies in Times of Crisis

This paper rethinks the concept of social metabolism, a concept currently weighted towards aggregative 'green' thinking. This accounts for common problems of planetary destruction and accumulation on a world scale (Moore 2015), but does not adequately integrate 'red' social dimensions, inadequately accounting for differentiated burdens and vulnerabilities (Sultana 2022; 2025) and necropolitics - power relations that enable some to live, but others to die (Mbembe, 2015).

Green Marxism, materials flow analysis, and world-ecology are the leading strands of 'green' thinking about social metabolism. Green Marxism is the starting point, while the dialectical world-ecological concept of *oikeios* is fruitful for thinking about the Anthropocene as a scene of a shared global problem. However, the *oikeios* nevertheless remains an over-universalizing, under-differentiated 'green' idea.

A decolonial emancipatory rethinking of social metabolism draws on insurgent anti-colonial and decolonial ecologies (Hickel 2021; Ferdinand 2022) and emerging thinking about solidarity (Khader 2019; UNDP 2022) to overcome over-generalizing, uncritical assumptions about ecological crises as undifferentiated 'societal-level' problems (Fischer-Kowalski and Hütterm 1998, 120). The flip side of this over-generalization is the resort to individual therapeutic learning instead of political and social redistributions of environmental goods and harms. A more 'social' global metabolism points to degrowth, redistribution and reparation for past and current unjust harms, confronting the claim that current levels of resource use cannot be sustainably extended to all people globally (Fanning et al 2020).

Rethinking social metabolism requires the 'red' lenses of social struggle to recognise and accommodate diverse demands, counterbalancing common concerns for aggregate planetary sustainability with differentiated struggles for survival, livelihoods and dignity, loss-and-damage reparations and ecological restoration. Social metabolism involves complex, pluralistic relationalities, since a diversity of paths exist to respond to crises and bring different communities towards justice, ecological health, and sustainable transformations.

Reflecting on a First-Year Sociology Module'S Transition to Hybrid, Hyflex Teaching and Learning Practices: A Case Study

The adverse of the Covid-19 pandemic have changed life as "normal," forcing rapid transitions in our everyday life. As a result, the higher education sector was confronted with the transition from traditional contact to online teaching and learning. This transition created havoc for academic staff and

students when the transition forced them to examine their pedagogy and strategies for merging the use of technology into their teaching and learning. However, this shift to online learning and teaching was challenging and slow for third world countries due to their many economic challenges. It is for this reason that this study reflects on the transition process and challenges of academic staff from traditional contact to online teaching and learning. The study focuses on the SOCY 121 module during and post-Covid-19 pandemic.

The study is guided by the Replacement, Amplification and Transformation (RAT) model used to examine the implementation and use of technology in the transition from contact to online teaching and learning by students and academic staff teaching the SOCY 121 module. The study using qualitative approach will use document analysis examined the SOCY 121 study guide, NWU policies, and the Efundu LMS tool used by the University. It will also use in-depth interviews and focus group discussions. The study is on-going and is part of the NWU SOTL.

RC31-493.2

KHROUZ, NADIA* (Center for Global Studies (CGS) - International University of Rabat, Morocco)

Opportunities and Restrictions in the Moroccan Immigration and Asylum Policy: Ambivalence, Sovereignty, Caution and Constraints.

The dynamic of the New Immigration and Asylum Policy (NPIA), launched in 2013, positioned Morocco as the initiator of an ambitious programme of reforms to its immigration policy and calls for the construction of new paradigms on international and African migration. More than ten years later, a review of the effects of the reforms undertaken, the evolution of discourse on immigration to and from Morocco, and the perspectives for access to residency, particularly for foreign workers, those involved in family migration or refugees, challenges the Kingdom's position as a country of immigration. Most immigrants and refugees have little access to the procedures for obtaining residency and asylum in the country. Although immigration is limited, the focus is still largely on so-called transit migration to Europe. However, despite the constraints, procedures do exist and are accessible, under certain conditions, to certain categories of foreigners, who are thus authorised to settle in the country. Looking at the issues of access to rights and procedures will give us a better understanding of the constraints, opportunities and changes in immigration and asylum policy in Morocco in recent years. By moving away from the view that Moroccan migration policy is the result of the externalisation of European policies, or that there is a lack of governance, this paper seeks, from a Moroccan perspective, to look beyond the publicised policy, the procedures as they are deployed in an ordinary and more discreet way to highlight certain orientations of immigration governance, constraints or issues of access to residency on the territory which imply the admission of certain categories of foreigners and the exclusion of others, the stabilisation for some or maintenance in the precariousness of residency for others.

TG04-975.1

KHROUZ, NADIA* (Center for Global Studies (CGS) - International University of Rabat, Morocco)

Uncertainty through Family Migration Laws and Regulations in Morocco

Family is a major driver of migration to Northern countries but also to other sides of the world. Family migration policies have been little studied in the African context. Family migration is particularly interesting to study in the Moroccan context, insofar as Morocco has driven a new immigration and asylum policy since 2013 and is now positioning itself as an immigration country. Focusing on family migration and its policy making, this communication's aim is to provide insights into how family migration laws and procedures are producing uncertainty for the spouse of a Moroccan citizen or of a foreign national legally established in the country who wish to join his or her spouse. Criteria based on gender, nationality, religion, length of stay on the territory or income are building a stratification amongst foreigners regarding the rights of access to the territory, to marriage or to recognition of marriage, to family reunification, to residence, and, de facto, to the right to family unity in Morocco. Considering these cumulative criteria established by the law and regulations, but also clarity or lack of clarity in the law, the interdependency of procedures, the discretion given to the administration by legal texts, and so on, this communication will explore how the relevant legislation and regulations are building an uncertainty that feeds the management of migration through the figure of the "good migrant", of the "good spouse" and moreover the one allowed to stabilise its staying on the territory and through this stabilisation have access to the right to family unity.

KHUNOU, GRACE* (University of South Africa, South Africa)

Marginalized Gendered Histories: Murder By Necklacing during Apartheid

There has been an unsuccessful attempt to water down the place of Black women in the South African liberation struggle. This was done during the struggle itself and it continues in contemporary efforts to capture liberation history. It is therefore the intention of this paper to show how necklacing (the public execution of Black women by use of burning tyre placed over their neck, with their hands chopped off or bound) was used to create a narrative of mistrust around women. Although the act of necklacing was used to murder both women and men, who were suspected of collaborating with the police this paper shows that its use was also gendered. In cases where it was used to kill women these were mostly women who were defiant in more ways than not. These women acted out of character and needed to be used as a lesson for others who might want to do the same. Through an analysis of how families of these women and their communities experienced these events, this paper argues that the violence of apartheid like a ghost, continues to haunt the presents. Necklacing continues as a form of mob justice in contemporary democratic South Africa. Some questions that the paper grapples with is how do we heal these communities? Is clinical sociology equipped to do this healing work?

Sociological Study of Wellness Tourism: With Special Focus on Yoga

This sociological study explores the relationship between globalisation and wellness tourism, particularly Yoga. The globalisation of wellness tourism, with a focus on yoga, reflects broader trends in the commodification and internationalisation of cultural practices. This phenomenon raises important sociological questions about identity, cultural exchange, authenticity, and sustainability. As wellness tourism continues to grow, understanding these dynamics is essential for fostering a more inclusive, respectful, and sustainable approach to global tourism. The paper encompasses all the key aspects of wellness tourism that are impacting the society.

Well-Being in Older People: Various Forms Are Interlinked with Societal Aging

In 2050, 80% of older people will be living in low and middle-income countries. The pace of population ageing is much faster than in the past. (WHO). Societal ageing can affect economic growth, patterns of work and retirement, the way that families function, the ability of governments and communities to provide adequate resources for older adults and prevalence of chronic diseases and disability (www.nia.nih.gov). The paper will deal with all aspects of well-being that affects societal ageing. The objective is to find how various forms of well-being are interlinked with societal ageing.

Applied Sociology: Bringing Theory into Practice and Practice into Theory III

Sociology is at core a science of the social. From the earliest formation of the discipline, sociologists have sought to make sense of complex social realities and to find solutions to injustices, problems, and inequities encountered in the worlds that they study. Ours is therefore a practical academic pursuit, one that creates new knowledge in the pursuit of better ways of living together in ever more complex societies.

Yet there remains a tendency both within and beyond the discipline to understand applied sociology or social 'practice' as inherently outcomes oriented and lacking theoretical rigour. At the same time, social theory is often imagined as esoteric and arcane, untethered from practical solutions to 'real world' problems.

This professional development session disputes both assumptions. Our presenters demonstrate the value of applied sociologies that draw on theoretical concepts to creatively address wicked problems, while also exploring the generative potential of engaged intersectoral research to generate new insights that enrich social theory.

Prof Nazli Kibria's current work involves the Global Siblings and Inequalities Project, a research initiative that aims to bring global and sociological perspectives to the study of families and siblings. Sibling relationships (or "sibships") are long lasting family ties with important consequences for health and well-being yet receive less attention than other family relationships, such as those between spouses and between parents and children. Sibship research has overwhelmingly focused on psychological dynamics and Eurocentric assumptions and models of family life. Kibria explores sibships in different parts of the world and in relation to larger social forces, finding that, like other family relationships, those between siblings are a *potential* source of intimacy and support. What are the conditions that support this potential and what are those that erode it? She brings theory and fieldwork into conversation with concerns about family resilience and well-being.

Acts of Datafication: Reimagining the Right to Public Security in Favelas through Citizen-Generated Data

This paper introduces the concept of "acts of datafication"—a novel framework to capture the deliberate production of data from the bottom-up as a means to foster new forms of social and political inclusion. In the age of datafication, scholars have repeatedly shown that data is shaping the world we live in and the way we perceive it. Yet, data produced by governments is often biased or fails to accurately represent the realities of marginalized populations, reinforcing social inequalities. As a result, grassroots movements and marginalized populations are increasingly generating their own numbers to fill these data gaps, leveraging bottom-up datafication as a form of political and social resistance. This paper employs an ethnographic approach to examine *De Olho na Maré*, a citizen-driven and favela-based data initiative that monitors the impacts of police special operations across 15 favelas in Rio de Janeiro. It explores how favela residents systematically produce data on human rights violations in combination with demographic data of affected communities. Drawing on Actor-Network Theory and the theory of affect, this paper conceptualizes bottom-up datafication as a socio-technical phenomenon in which data functions as an actant, actively shaping human experiences and social relations. Utilizing qualitative mixed methods, the paper examines the data infrastructures, ethical considerations, political dynamics, and affective narratives generated by those engaged in the production of their own data. This approach highlights the complex interplay between data and social agency, revealing how marginalized groups use data to redefine power structures and societal frameworks. Finally, building on the concept of "acts of citizenship" and drawing from nine months of fieldwork in the favelas of Maré, this paper introduces the concept of "acts of datafication," emphasizing the growing role of data as a critical means of empowerment for marginalized communities in their struggle for recognition and rights.

Impact of Socio-Cultural Discursive Construction of Mental Illness on Diagnosis and Management: Insights from Kenya

A report by the WHO states that 1 out of every 4 people seeking medical attention in Kenya has a mental illness. This stark outlook is shared by the Taskforce on Mental Health 2020 whose report showed that mental disorders account for 13% of the burden of disease in Kenya. Yet any attempt to understand these statistics needs to take into account the social context in which the mentally sick in Kenya live. Mental illnesses attract a lot of religious and cultural stigma. This is because mental illness afflicts the brain – a culturally and socially constructed organ. Consequently, the mentally sick are labeled as 'possessed', 'bewitched' or 'cursed' and are therefore believed to be in need of religious and/or cultural rites to end their affliction. Yet, Kenya boasts of a well-established training in psychiatry medicine based on Western bio-psycho explanatory model for mental illness. This paper sought to tease out the socio-culturally situated health narratives that psychiatrists have to deal with as they diagnose and manage patients with mental conditions. The data were narratives by the practitioners about their experiences in dealing with mentally ill patients and their relatives. The data reveal the competing discourses on mental health. The explanations and expectations of patients and family members can be incompatible with the discourse of modern medicine. We sought to understand the place of the psychiatrist in a context that labels disease and treatment from a viewpoint of culture and religion. Our preliminary analysis reveals that whereas psychiatrists remain faithful to their training, many are also conscious of the fact that socio-cultural factors cannot be divorced from the diagnosis and management of mental disorder. However, the analysis reveals varied views on the degree to which a bio-psycho-socio-cultural explanatory model to mental illness can work in modern medicine.

Moral Discourses and Judgments across 36 Countries: A Comparative Analysis Using European Values Study

This paper examines how moral discourses influence moral judgments across 36 European countries, utilizing Richard Shweder et al.'s (1997) theory of three types of morality—justice-based, duty-based, and religion-based morality. Building on the data from the Morally Debatable Behaviors Scale (MDBS) in the European Values Study (EVS) and constructed country profiles, this study groups countries based on their legal codes and social policies concerning homosexuality, prostitution, abortion, suicide, euthanasia, and divorce. The paper explores how these issues are understood differently across countries, reflecting on whether they are viewed as acceptable behaviors, crimes, deviant acts, or sins, depending on the dominant cultural moral framework. To do so, it investigates how religion, media, and the state shape public discourses on morally debatable issues, using qualitative comparative approach (QCA) and critical discourse analysis (CDA). Preliminary findings suggest that moral discourses are culturally shaped, with different ethical principles guiding judgments of moral but illegal or legal but immoral behaviors. This paper demonstrates how diverse methods—combining survey data with discourse and text analysis—can be used to compare moral values and their discursive framing across countries and visualize value differences across Europe.

Modes of Public Intimacies and Attachment to a Place

Based on an ethnographic fieldwork, this study delves into daily life on a recently transformed urban coast in Samsun, Turkey and investigates the modes of public intimacies and attachments on this brand-new public place. While Atakum Coast was a less attended beach with tobacco fields covering its hinterland around 20 years ago, it gradually became a popular socialization place firstly after the settlement of the university at this district, and the municipality project that attempted to change the coastline to a much demanded summer resort like Mediterranean coasts of the country after the gradual decline of tobacco industry within the city. As municipality covered the area with several facilities like sidewalk, bike road, etc. for the project, the population of the district and the number of places like café, bar, restaurants on the coastline has increased tremendously. While it was planned to be a tourism paradise initially, the coastline turned out to be an urban park with the surrounding of people's daily rhythms. It became a shiny and glamorous urban public place where recently upper middle class of city dwellers settled down and urban common attracting visitors from all over the city and cities nearby. By this, it also became a place for encounters of city dwellers from different backgrounds. The data collected through participant observation and go-alongs throughout the study shows that there are three main modes of being at the coast; aloneness, familiarity and friendship. Although seemingly it turned out to be a place for all, the coast does not promise a new form of neighborhood, a cohesive togetherness. Rather it is dissociated from the other parts of the city through abjection of other parts' residents in daily discourses.

The War on the Young: Perceptions of Economic Fragility, Alienation, and Wellbeing Among Youth Living in Urban Japan.

In the context of Japan's super-aging society, Gen Z face increasing uncertainty about their future prospects. Rising costs of living, stagnant wages, and a political structure that prioritizes the needs of older generations over those of younger people may foster a growing sense of alienation among the youth. This research project explores how university students situated in urban Japan perceive the so called "war on the young" where their financial futures and social prospects seem limited, and the existing social structures seem skewed against them in favor of the old. Drawing on interviews with students, this study finds purchase in applying alienation theory, toward exploring gen Z disconnect in areas of economy, technology, social policy, and mental health. By investigating the problem and solutions as voiced by young adults this project contributes to a broader understanding of how alienation shapes the imagined futures of younger generations in a super aging society. The session offers critical insights into the intersection of alienation research and futures studies, shedding light on the sociopolitical and economic challenges faced by Japan's youth and their implications for the nation's future.

Vulnerability and Precarity of Single Parenting, Cases of Migrant Women in South Korea

Government policies and social discourses concerning international migration and 'multiculturalism' in South Korea tend to remain predominantly anchored in state-led perspectives of 'social integration' or assimilation. Migrants are often excluded from the policymaking processes that directly impact their lives, which can be interpreted as a deficit in democratic representation. Within this context, evaluating migration policies through the articulations of migrants themselves is imperative not only for academia but also for policymakers.

Existing research paradigms primarily focus on immigrant women's experiences through the lens of specific incidents such as familial conflicts or domestic violence, and subsequently seek policy alternatives for these individual occurrences. It is crucial to comprehensively analyze the underlying conditions of 'vulnerability', 'precarity', and 'intersectionality' that form the backdrop for these individual incidents in immigrant women's lives, and to examine how these conditions are contextualized within broader social structures.

This study aims to elucidate the circumstances of vulnerability and precarity experienced by single-parent immigrant women residing in Korea, and to identify the socio-structural conditions that engender these situations. Specifically, the research seeks to achieve this objective by analyzing how not only economic and social conditions, but also institutional frameworks at the local government level, influence the lived experiences of immigrant women.

The Impact of Community Environment on Mortality Disparities of Older Adults in South Korea

In Korea, rapidly changing community environment including gentrification adversely affect the health of older adults, who have a strong place attachment to their long-term residences. As their physical functions decline and social roles reduce, they spend more time within their local community, becoming increasingly sensitive to changes in the environment. Older adults with low socioeconomic status face greater difficulties in adapting to this social environmental changes. Accordingly, this study aims to analyze the differential impact of the local social environment on the mortality of older adults with disparate socioeconomic status. We utilized administrative big data from the National Health Insurance Service (NHIS), which contain information on date of death, income, and assets of approximately 18% of the entire older adults in Korea. In an exploratory analysis, we calculated age-standardized mortality rates by province, gender, and income level. We compared the gaps in age-standardized mortality rates between the lower 33% and upper 33% income levels. The mortality disparities by income level for each gender showed statistically significant regional differences. Drawing on these findings, this study seeks to identify specific community level factors which have impact on income-based mortality disparities among older adults. We particularly plan to analyze the effects of community environment such as degrees of urbanization, intensities of gentrification, density of social networks on income-based mortality disparities. Spatial regression approach will be used. It is anticipated that higher level of urbanization, greater degree of gentrification, and lower level of social network will be related to income-based mortality disparities among older men and women, with considerable spatial correlation. This study is expected to contribute to the importance of community environments for older adults and provides region-specific policy basis.

Researching Media Figures As Constructions of Digital Archives

This study explores methods for investigating media figures whose public personas are primarily perceived and interpreted through their identity traits as presented in the digital media sphere. With the rapid development of digital and social media technologies, well-known figures have emerged whose fame originates mostly from the Internet. These individuals, often referred to as Internet celebrities or influencers, have become prominent due to their online presence.

In this study, I propose an operational definition of a *media figure*: a constructed persona whose identity traits, accumulated and disseminated across digital media platforms, are selectively appraised by the anonymous collective at a specific point in time. This definition is based on the idea that the Internet, as a field for ethnographic research, necessitates an archival approach (Kozinets 2010, 104-105). Internet users, through their everyday practices, already engage in forms of archival studies, as they continually construct, deconstruct, and reconstruct the personas of media figures (Kim 2024, 68).

This study introduces a Netnographic approach to investigating the trajectories of media figures' persona (re)construction by combining traditional digital ethnographic methods with visual archival techniques, including the analysis of *gestures* (Kim 2022, 5-6). Several case studies, including foreign figures who have either succeeded or failed in the Korean-centric media sphere, as well as digital vigilantes who position themselves as extralegal agents of justice, will be examined through this archival lens.

KIM, HARRIS HYUN-SOO* (Ewha Womans University, South Korea)

Rugged Individualism and Suicide: Findings from the U.S.

Since the classic work by Durkheim, suicide has occupied a central place in the sociological imagination. In the Durkheimian spirit, a great deal of theoretical work has emphasized the concepts of social integration and social regulation. Relatedly, much empirical findings have emerged illustrating the relationships between the dual forces of integration and regulation and suicidality. In this study, I reorient the analytic focus to the role of culture, more specifically, rugged individualism. What is the relationship between individualistic cultural values and norms and lethal self-harm? According to Frederick Turner's controversial 'frontier thesis,' the western expansion (1790 - 1890) has historically nurtured a culture of individualism that quintessentially defines the U.S. By merging historical data on the frontier experience and contemporary administrative data on suicide rates, I investigate how and to what extent culture of individualism associated with the western frontier is related to age-adjusted suicide rates across the U.S. counties. Adjusting for a battery of pre-treatment, i.e., geoclimatic, controls, I show that counties that experienced a longer exposure to the frontier line (proximity to the geographic area with less than 2 people per square mile) more than 130 years ago demonstrate higher suicide rates today. Results are robust to adding state fixed effects and accounting for spatial autocorrelation with clustered standard errors. In addition to running fixed effects models, I applied sequential G-estimation (designed to estimate average controlled direct effects) by including post-treatment covariates such as racial makeup, poverty rate, job growth, social capital, and family instability. This sensitivity analysis yields qualitatively identical findings. Implications are discussed concerning the enduring legacy of rugged individualism on contemporary suicide rates.

Building a Roof Above Contested Knowledge: Public Epistemic Practices to Figure out Unexpected Vaccine Side Effects in South Korea

This study examines the recognition movement of the victims who have suffered from COVID-19 vaccine side effects and particularly focuses on their knowledge-making practices to represent as many side effects as possible. Using ethnography and in-depth interview methods, I analyze how they brought conflicting actors together by setting a unified destination where all the different interests and diverse facts converged. The victims could not prove their cases and were denied reparations since it would take 8-10 years to verify the causality between vaccination and the side effects. To move away from its dependence on scientific verification that bogs them down, they didn't get involved in the debate around who deserves the reparation, but they deduced

collective facts from the controversy. First, they framed their uncertainty as a common human vulnerability that indicates our shortage of knowledge as human beings. They inferred this from the scene in which scientific research progresses, and the criteria for proven causality continue to change and expand. Second, They questioned the purpose of reparations. They argued that the reparation system should serve not only to compensate individuals but also to encourage people to receive vaccinations during other upcoming pandemics. Given this, the criteria for causality should be relieved so that people can rely on the national public health system. In this framework, their uncertainties became our limitations, and their damages became our vulnerabilities and risks. The victim's contextualized and specific knowledge demanding social responses to themselves has become general knowledge of how to take care of epistemic uncertainties and human vulnerabilities, which have been redefined as a persistent order of the world, not a temporary issue. Their approach highlights how societies can live with controversial knowledge and what kinds of justice or decisions could be made until the debate reaches an agreement.

Harnessing Spirituality and Science: The Impact of Diverse Epistemic Frameworks on Climate Action

Mainstream attempts to enhance climate concern and action often identify non-scientific, spiritual, or otherwise non-empirical perceptions of climate change as a key hindrance to progress. Yet while scientific knowledge has consolidated an extensive understanding of environmental changes, there has been growing recognition of indigenous knowledge systems at the international level through initiatives such as the UN Permanent Forum on Indigenous Issues and by environmentalist movements and academics. Indigenous knowledge, which is deeply rooted in local ecosystems and long-term observations, provides insights into sustainable practices and resilience strategies that are typically overlooked and marginalized by dominant scientific paradigms. In our study, we challenge this notion, arguing that an awareness of these different knowledge frameworks is essential to understanding and motivating attitudes and actions towards the climate crisis. Drawing upon an original, representative 2023 survey of climate attitudes in the Philippines, we use multiple regression to investigate how four different epistemic frameworks relating to climate attribution (pro-scientific, religious, spiritual, or denialist anti-climate science) impact motivation to take pro-climate action (e.g., voting, protesting, changing behaviors). Findings suggest that although all three pro-climate frames are linked to increased overall action, individuals who interpret extreme weather by drawing upon spiritual and religious frameworks—specifically, the belief that humans are disrupting the natural balance of “Mother Earth,” or that climate change is a punishment from God—are the most likely to engage in pro-climate protests. Thus, emotional and spiritual connections, such as the reverence for Mother Earth and God may be even more powerful motivators for collective climate action than scientific facts alone. Robust to social, political, and economic demographics, as well as objective climate exposure, results underscore the need to acknowledge and integrate multiple epistemologies in times of the Anthropocene in support of more inclusive and effective climate action across diverse communities.

KIM, JI HYE* (Sogang University, Republic of Korea)

Multiple Value Circles: The Moderating Role of Value Schemas in Cross-Cultural Contexts

Schwartz's value indicators have been widely used as either a measure of 'personal identity' or a proxy for measuring 'culture' focusing on general psychological tendencies. Since values are shaped by interactions between personal (but socially constructed) characteristics and shared cultural understandings, there is a critical need to improve quantitative modeling of these values that engage the two different levels – individual and collective. Using Schwartz's value indicators (e.g., self-enhancement, self-transcendence, openness to change, conservation), this research conducts Correlational Class Analysis to inductively identify value schemas, which I suggest as a proper unit of culture, different from simple ratings on these indicators. Analyzing the samples of World Value Survey from the South Korea and the United States, the findings show that (1) there are three distinct types of value schemas in each country with some cross-cultural similarities and differences; (2) value indicators are generally associated with attitudinal and behavioral outcomes, but more importantly, such associations vary by the types of value schemas that individuals hold; (3) the patterns of the moderating effects of value schemas are different between the two countries. With distinct measures of identity and culture, this study proposes a fuller model of values at two different levels to effectively address cross-cultural similarities and differences in their associations with stratification and attitudinal/behavioral outcomes.

Using CRISPR to Gene-Edit Cell Lines to Model Indigeneity: Unpacking the Genomic-Racial Tensions of Emerging Organoid Research

Organoids are three-dimensional cell culture models that have emerged as a tool for researchers investigating disease modeling, drug discovery, and organ development. However, absent cell lines from Indigenous peoples—who have expressed cultural concerns related to the extraction of biospecimen materials from their bodies—researchers are looking to CRISPR-Cas9 gene editing approaches to “diversify” their in vitro experimental models in the pursuit of “inclusion”. Specifically, some researchers are introducing gene variants that are highly prevalent in Indigenous populations into cell lines procured from non-Indigenous persons to replicate artificially a biological state meant to represent Indigenous peoples genomic background. Notwithstanding persistent issues related to the categorization of race, eugenics, and representation in synthetic biology research, Indigeneity is not a biological construct. In fact, the literal artificial construction of Indigeneity and race can further lead to false assumptions of Indigenous populations and the bypassing of Indigenous data sovereignty and consent. Extraction of cell lines from Indigenous populations as well as the ability to reproduce, modify and codify cell lines can represent a new form of control and exploitation of Indigenous genomic bodily autonomy and consent. Hence, the reiteration of the importance of Indigenous Data Sovereignty (IDSov) onto the emerging science of organoid research will be important to guide researchers and communities from repeating past colonial harms of biomedical research. We must resolve colonial articulations of Indigeneity and genomic racial identity if we are to ensure that Indigenous peoples rights and representation are ethically and equitably reflected into this space of diversity research.

The Construction of an Interdisciplinary Field: The Case of Digital Agriculture in France

This paper investigates whether a strategically organized, regionally focused investment in higher education can accelerate both the promotion of an innovative socio-technological field and the stabilization of its research community. It focuses on a Convergence Institute for Digital Agriculture (DA Institute), launched in 2017 to advance digital agriculture in Montpellier, France. Known for its interdisciplinary approach, the DA Institute united multiple universities and research institutions and funded around 70 doctoral theses, all requiring interdisciplinary collaborations. These efforts aim to foster innovation in digital agriculture, a field that integrates technology with traditional farming practices to address current societal challenges.

The study aims to assess whether the DA Institute has successfully shaped digital agriculture into a distinct research field centered in the region and fostered collaborative networks that extend beyond formal co-supervision relationships. Additionally, it explores if this initiative has contributed to establishing a unique identity for digital agriculture, distinct from similar efforts in other countries. Furthermore, the research examines the broader impact of the DA Institute on the scientific landscape and interdisciplinary collaborations in the region, comparing research funded by the DA Institute with independent research projects. The central question is whether this strategic investment has accelerated the development of the field and contributed to a stable research community.

To explore these questions, this paper draws on a qualitative documentary analysis of policy documents related to the DA Institute and interviews with participating researchers and PhD students. Additionally, a bibliometric study of publications produced by these researchers will track the evolution of keywords and scientific collaborations. This combination of qualitative and bibliometric approaches will provide a comprehensive evaluation of the effects of the DA Institute's strategic investment on the development of digital agriculture and the construction of a cohesive research community.

The Impact of European AI Regulation: Governance and Strategic Responses in Switzerland and South Korea

This research project explores how the EU AI Act and its related measures are influencing the development of AI governance, regulation, and strategy in non-European countries, with a focus on Switzerland and South Korea. Both nations are at the forefront of IT innovation. Switzerland, despite not being an EU member, maintains close ties with the EU through bilateral agreements and partial access to the single market, while South Korea, though geographically and politically distant, engages with the EU through strategic partnerships and trade relations.

The project seeks to understand how the EU AI Act impacts national AI discourses in these two countries. It will analyze the discourses and imaginaries being shaped around AI governance, identify the key proponents of these discourses, such as government agencies, advisory bodies, and private industry leaders, and compare the strategies employed to adapt to or diverge from the EU's regulatory framework. In terms of temporality, it distinguishes three periods: before 2019, 2019-2023 (marked by the Coronavirus outbreak and the subsequent economic recovery plans), and after 2024 (characterized by the emergence of AI services based on Large Language Models and the endorsement of the European AI Act).

The methodology involves qualitative documentary analysis of policy documents, white papers, reports published by government bodies and advisory institutions, and media coverage of these elements. This will be conducted both manually and through computational textual analysis techniques such as text mining and topic modeling. These methods will help identify recurring themes, dominant narratives, and strategic differences between Switzerland and South Korea in their adaptation to or divergence from EU AI regulations, offering insights into how the EU's regulatory influence affects AI governance in regions both near and far.

Bodies in Flow with Drugs: A Case Study of Life Histories of Women Taking Anorectic Agents

This study explores the life histories of women who have taken anorectic agents, classified as psychotropic substances in South Korea. It aims to answer the question: "What compels women to exceed the recommended dosage and duration of anorectic agents as imposed by pharmacological institutions?" To address this, I conducted life-history interviews with 10 women who have been taking these agents for more than three years. Using "Bodily Sociology"—an analytical framework synthesizing theories on the body and materiality from Gilles Deleuze, Félix Guattari, Karen Barad, and Bruno Latour—this study conceptualizes human and nonhuman bodies as dynamic entities that transform through encounters, tracing these transformations as "matter-flows." The consumption of anorectic agents is viewed as an event where women's bodies, shaped by decades of experience, intersect with the pharmacological bodies of drugs, which have undergone research, clinical trials, marketing, and even market withdrawal. Women's bodies do not passively react to drugs, nor are the drugs predetermined in their effects. Rather, through these encounters, both the women's lives and the drugs themselves are transformed, altering the drugs' meanings and physical effects. Anorectic agents may serve as stimulants, tools to achieve personal goals, or aids in sexual relationships, depending on the life-historical context. Conversely, the drugs reshape women's lives by reorganizing their routines around medical appointments and prescriptions, while guiding their life trajectories through affective experiences such as pleasure from weight loss and anxiety from dependence. This study contributes to the Sociology of the body and Science Technology Studies by rethinking human and nonhuman bodies and emphasizes that agents are also patients who undergo continuous transformation through intra-actions that can be found amid bodily historical networks.

KIM, JUNGJIN* (Ewha Womans University, Republic of Korea)

KIM, MINZEE (Ewha Woman's University, Republic of Korea)
CHOI, SETBYOL* (Ewha Womans University, South Korea)*Do People Still Perceive Korea As Meritocratic Society? Changes of Meritocratic Perception Among South Korean Youth, 2009-2021*

For a long time, Korean society has had meritocratic perception toward success, which implies people can get ahead by their individual merits. However, due to the exacerbation and adhesion of economic inequality and triggered people to perceive that background factors, such as family's wealth, are being more important to get ahead, even though some studies show economic inequalities haven't been worsened seriously. In addition, perceptions of structural discrimination also has been arisen, which were overlooked by meritocratic ideology, showing not only meritocratic factors are important for economic triumph, but also other dimensions. But however other factors matters, it doesn't suggests the fall of meritocratic perception. Rather, it can be said that all of the dimensions are becoming important to get ahead. This matters for entire society, and especially for the youth because it has a possibility of deep correlation of people's motive to economic activities, which can become a base of society being dynamic or static.

From according background, this study aims to answer two questions focused on the youth: A. How the perception of getting ahead in Korea has been changed? and B. What variables do affect? Using Korean General Social Survey data(KGSS) during 2009, 2014, and 2021, this study tries to answer the questions by following strategies. First, to define the classes of getting ahead perceptions and investigate their characteristics, the study classifies five types of perception of getting ahead using factor analysis and cluster analysis. Chi-square analysis is used to check whether some socio-demographic variables are distributed notably different, thus explaining each cluster's feature. After, it analyzes what variables affect the possibility of being affiliated to each clusters using multi-logistic regression. The study analyzes significant insights and discuss conclusions.

Prison Abolition, Transformative Justice, and the Work of Radical Care

Prison abolitionist proponents in the United States have turned their attention to responses to social problems such as food insecurity, housing insecurity, and interpersonal violence through mutual aid networks and community-based interventions. In recent years, these have been defined as mutual aid and radical care. As a critique of neoliberal social welfare practices and policies in the United States and condemnation of the rapidly escalating use of criminal legal interventions to address an expanding scope of social problems, abolitionists have reclaimed "community-based" responses as more effective and liberatory than those offered by the state. Transformative justice as a practice developing non-state collective responses to domestic and sexual violence has emerged as an explicitly anti-carceral frame and practice for violence intervention. Often dominated by female or femme labor, interventions to violence, however, have not been overtly defined as forms of care. This paper looks at the growing theoretical and empirical literature on care to discern the ways in the transformative justice may be included in and can even shape the growing discourse on radical care as a productive framework for envisioning more human-centered and sustainable approaches to social reproduction.

KIM, MINHYE (Changwon National University, South Korea)
KIM, EUN JEONG (Changwon National University, South Korea)*Income and Health Inequalities Utilizing Administrative Big Data: An Analysis of National Health Insurance Service Database in South Korea*

This study aims to analyze income and health inequalities in the Southeastern region of Korea using administrative big data from the National Health Insurance Service (NHIS). As non-Seoul regions in Korea face severe aging and a high risk of depopulation, it is crucial to calculate local

indicators of poverty and inequality to implement effective policies. Previous studies on health inequality at the local level in South Korea mainly relied on income deciles based on health insurance premiums, which do not accurately represent income. Additionally, household surveys designed for inequality research often have insufficient number of respondents for local-level analysis, leading to underrepresentation of high-income groups and inaccurate inequality estimates. To overcome these limitations, we secured an administrative big data from the NHIS, which includes detailed income and asset data transferred from the National Tax Service. Our analysis focused on income and health inequality in the Southeastern non-metropolitan region, examining spatial distribution and correlation of income and health inequality at a local level. Preliminary exploratory analysis using hotspot techniques revealed distinct spatial patterns of income and health inequality in the region. Based on these findings, we will further examine the effect of social and environmental factors such as green spaces to provide a more comprehensive analysis of regional inequalities and their correlates. Through the utilization of administrative big data in inequality research, this study will make significant contributions to the qualitative advancement in the field of social stratification.

Analysis of Marriage Intentions Among Seoul Youth

In Korean society, the decline in marriage rates and fertility is a social phenomenon that continues to be observed. Under traditional values, it was once common to marry and have children at a certain stage in life, but these values have collapsed. Various surveys show a growing sentiment that marriage is not necessarily required. To understand this shift, it is essential to grasp the changing context of family formation among young people. The decline in marriage intentions may be influenced by broader socio-economic factors, not just individual choices. Additionally, satisfaction with one's current life and anxiety about the future may lead young people to make more "secure" life choices.

This study analyzes attitudes toward family formation using data from the Seoul Youth Panel. I examined socio-economic background variables, life satisfaction, and depression, which could affect young people's intentions to marry. Furthermore, we explored how marriage intentions have changed in relation to the socio-economic circumstances surrounding youth. Through this analysis, I aim to better understand the underlying causes affecting decisions about marriage and childbirth.

KIM, SUNHAN* (Sogang University, South Korea)

Governing through Affect: Sense of Inevitability

This paper explores the complex relationship between neoliberalism and affect, arguing that neoliberalism functions not only as an economic and political system but also as a form of governance that organizes both social and emotional life. Drawing on Michel Foucault's theory of governmentality and insights from Gabriel Tarde's affect theory, the paper demonstrates how neoliberalism fosters a "sense of inevitability." This sense frames neoliberalism as the only viable system for organizing contemporary society, effectively suppressing the imagination of alternatives. Furthermore, the paper examines how neoliberalism adopts religious-like attributes by sacralizing the market and promoting post-truth politics, in which knowledge and information become commodified, undermining objective truths. The sacralization of the market allows neoliberalism to conceal its power under the guise of rationality while perpetuating a system of fatalism and disempowerment. This commodification of truth not only weakens critical engagement but also reshapes public discourse, limiting individuals' and communities' ability to challenge the status quo. Through this lens, the paper reveals how neoliberalism maintains its dominance by managing affective atmospheres—channeling feelings of resignation, anxiety, and inevitability—while simultaneously weakening democratic participation and diminishing the public sphere. In essence, neoliberalism operates through and within the realm of affect, governing, exploiting, and dismantling the emotional domain. It is not merely the domain of representation or symbol; it also encompasses latent social energies and spectral flows. This research contributes to ongoing debates about the definition of neoliberalism, the resilience of neoliberalism, its ability to adapt to crises, and its profound impact on both individual subjectivity and collective social life.

The Conflict between Religion and Modern Self: Anti-Protestantism in South Korea

This study delves into anti-Protestantism in Korean society, offering a historical and comprehensive interpretation of the phenomenon. It is conceptualized as a structural emotional habitus rooted in Korea's religious field and shaped by historical processes. The study introduces the concept of "expansionary absoluteness" to describe the historical character of Korean Protestantism, reflecting not only its fundamentalistic tendencies but also its materialistic orientation and external expansion, particularly after the 1960s. This concept encompasses outwardly expressed absoluteness in material, spatial, and doctrinal dimensions. The study links this expansionary absoluteness to the modernization of Korean society, analyzing how Protestantism's outward orientation clashes with the modern self. By utilizing Giddens' reflexive self-concept and Bourdieu's sense of practice, the study addresses the limitations of existing epistemological frameworks and combines the two approaches for a more comprehensive view. Giddens' concept of existential anxiety is key to developing the "sense of self," divided into collective and individual aspects. The modern self, shaped by internal reference to individual self-sense, is destabilized by the expansionary nature of Protestantism, which invades personal boundaries of identity. This intrusion leads to a re-emergence of existential anxiety, threatening the beliefs that support the modern self, which perceives itself as freely autonomous. As a result, an anti-Protestant habitus is structured, where deep antipathy is created and reinforced through various mediators. The study reveals a reversal of symbolic power within Korea's religious field, noting the paradox that Protestantism, once emblematic of modernity, now creates discord with it. Traditional religions like Buddhism, once seen as outdated, are increasingly viewed as compatible with modern values. This analysis suggests that, in South Korea, secularization theory remains controversial and needs examination through diverse dimensions.

Migration Patterns: The Complex Roles of Poverty and Weather Extremes

Migration, driven by global forces such as poverty, population growth, conflict, and climate change, is transforming societies worldwide. This study investigates the socio-economic and environmental determinants of migration, with Kyrgyzstan serving as an illustrative case due to its heavy reliance on labor migration. Between 1990 and 2020, the number of Kyrgyz citizens living abroad increased by 48%, reflecting migration's critical role in sustaining livelihoods. Remittances, which constitute nearly a third of the nation's GDP, place Kyrgyzstan among the top five countries globally in remittance dependence, highlighting migration's importance for economic stability.

Building on established theoretical frameworks, we adapt Stark and Bloom's (1985) labor allocation model and Guriev and Vakulenko's (2015) exploration of non-monotonic income-migration relationships. Our analysis examines both socio-economic factors, such as multidimensional poverty (MPI), and environmental stressors, including hot summers, cold winters, excessive rainfall, and dry spells. We calculate MPI and weather variables at the district level using data from the Kyrgyz Integrated Household Survey (2013–2022) and climate indices from the ERA5-Land reanalysis.

We apply a Spatial Multinomial Logit model to explore different migration outcomes—domestic, international, combined, and no migration—addressing spatial endogeneity to capture the intricate dynamics at play. The results demonstrate that a complex, non-linear interaction between poverty, weather extremes, and socio-economic conditions shapes migration decisions. Significant variations are observed across different poverty levels, reflecting the nuanced ways in which these drivers influence migration behavior.

This research contributes to the broader understanding of global migration by offering a long-term, quantitative analysis of how socio-economic and environmental factors jointly shape migration flows. It provides valuable insights into the multifaceted nature of migration, enhancing our understanding of the forces driving people to move both within and across borders.

KIMURA, ERIKO* (Otsuma Women's University, Japan)

Reconsidering Intimacy for a Post-Capitalist Society: Insights from the Debates on Social Media

Recently, debates have frequently arisen on social media in Japan regarding whether men should pay for dates. This debate about 'treating/being treated' by an intimate partner is a struggle over gender role norms in intimate relationships. In this report, we aim to analyze the content of these online debates and examine the features of intimacy in a post-capitalist society.

I have previously examined the actual state of gender norm awareness (Kimura 2024). I would like to explore the normative consciousness, mainly imposed on men, that includes paying for dates and asserts that 'men should lead on dates.' According to an analysis using data from unmarried individuals aged 16 to 39, conducted by the Japan Youth Study Group in 2022, 46.8% support the idea that 'men should lead on dates' ('agree' + 'somewhat agree'), while 53.2% do not support it ('disagree somewhat' + 'disagree'). The opinions are roughly split between supporters and non-supporters. Furthermore, among the survey respondents, those who support this norm were more likely to have experience in romantic relationships, currently have a partner, and have had a greater number of relationships compared to those who do not support it. In other words, practicing this norm is thought to provide an advantage in that it makes it easier to find a partner.

Then, as mentioned at the beginning, why does the debate about whether men should pay for dates frequently arise on social media? As society moves toward post-capitalist ideals, where economic roles and contributions are viewed through a different lens, the debates around gender role norms, such as who should pay on dates, take on new dimensions. In this report, based on the analysis of the debate about 'treating/being treated' by an intimate partner, I would like to examine the concept of 'satisfying intimacy' in a post-capitalist society.

RC45-705.4

KIMURA, KUNIHITO* (Tohoku University, Japan)

The Logic of Tsunami-Tendenko: Super-Rationality in the Altruist's Dilemma

This paper examines decision making in disasters. I constructed a two-person game (with two alternatives) of evacuation, which is formulated as the Altruist's Dilemma (Schelling 1968). I would like to show that "tsunami-tendenko" (Yamashita 2005) is the super-rationality solution to the game.

"Tsunami-tendenko" is a reformulation of a moral handed down in Sanriku area (the northeastern side of the main island) of Japan. It says that we should evacuate from tsunami separately, starting as early as possible, in haste, and without caring for others. The principle is to help yourself based on a tacit agreement and avoid mutual destruction. Sociologists, psychologists, and philosophers (e.g., Arce, et al. 2017; Goltz 2017; Kodama 2015; Yamori 2014) examined (and some of them criticized) tsunami-tendenko. There was no study, however, that described the evacuation decision as the Altruist's Dilemma.

Super-rationality is the rationality that depends on the others' rationality, which depends on their dependence on everyone's rationality, and so on (Hofstadter 1985). Previous studies applied the concept of super-rationality to the Prisoner's Dilemma (e.g., Fourny 2020; Shafir & Tversky 1992; Wang, et al. 2021) and to the Volunteer's Dilemma (Diekmann 1985). Super-rationality has not been discussed, however, in the context of the Altruist's Dilemma.

The evacuation game assumes two types for the players: own payoff watcher and the other's payoff watcher. If both players rely upon super-rationality, regardless of their types, they separately evacuate without caring for each other. This Pareto-efficient equilibrium is, however, vulnerable to doubt about the other's rationality. The other's gesture of a helping hand may become a signal that triggers doubt.

Note that this game does not assume family or community ties. In this sense, the super-rationality solution implies the importance of generalized trust rather than trust in family members, neighbors, or local community that Yamori (2014) emphasized.

KIPÇAK, NUR* (Ph.D. Graduate, Department of Sociology, Mimar Sinan Fine Arts University., Turkey)

Gender Experiences and Forms of Resistance in Mosques

This paper examines the exclusion of women from mosques in Turkey, along with the resistance strategies they develop in response to harassment. Women's exclusion is perpetuated through mechanisms rooted in religious doctrine, the concept of *fitna*, *harem* practices, and spatial segregation. In male-dominated mosque spaces, these exclusionary practices derive symbolic power from doctrine and *fatwas*, reinforcing women's marginalization. Beyond legal prohibitions, women are associated with *fitna*, a notion implying an inherent tendency toward seduction, legitimizing their exclusion. The private space emerges as a realm for unseen labor and biological reproduction, while the mosque becomes a site of gendered conflict and competition.

Yet, resistance emerges wherever there is domination. One form of resistance arises through "cultural encounters" facilitated by mobility. Encounters with alternative cultural practices expose women to new religious experiences. For instance, diverse mosque practices brought by North African and South Asian women to Istanbul, cultural diversity encountered during Hajj or Umrah pilgrimages, and the experiences gained by women traveling across regions shape Istanbul women's understanding of worship, including their approaches to Friday and Eid prayers. Another form of resistance is "*metis*"—cunning strategies. Women employ *metis* tactics to challenge exclusionary actions by religious authorities, such as imams, and the spatial boundaries enforced by male congregants and security personnel. Finally, both organized and dispersed struggles emerge among diverse women's groups.

The data for this presentation are derived from ethnographic research conducted in Istanbul mosques between 2019 and 2024 as part of my doctoral dissertation. The findings are based on in-depth interviews with 30 individuals, highlighting women's experiences and forms of resistance across 26 mosques. Methodologically, rather than positing a theory of the subject, the study draws connections between empirical findings and social structures, as well as historical and cultural representations.

The Unfolding Meitei-Kuki Conflict in India's Manipur State and the Demand for a Separate Homeland

At least 185 people have been killed, 200 villages burned, 360 churches destroyed, and sixty thousand displaced since early May 2023 in ethnic violence in Manipur state in northeast India. The ongoing violent clashes, triggered by a protest organised by the All Tribal Student Union (ATSUM) in opposition to the Meiteis' demand for Scheduled Tribe (ST) status, expose the deep-rooted divisions and tensions between the hill and valley people. The Hindu Meitei majority predominantly inhabits the valley in Manipur, while tribal groups, mainly the Christian Kuki-Zo tribal, dominate the surrounding hills. The current impasse is not just a matter of opposition to Meitei ST's demand—it is a complex interplay of several factors that have long simmered beneath the surface, threatening to erupt at any moment. The hill people's fear and suspicion are further aggravated by the recent state sponsored ('institutionalised riot system') ethnic cleansing unleashed against the Kuki-Zo people. Against this backdrop, this paper argues that the state machinery has been systematically depriving the indigenous people of their rights and subjecting them to years of socio-cultural, economic, and political discrimination through a variety of covert laws, plans, and policies. Under such circumstances, the Kuki-Zo people have demanded a separate administration in the form of homeland under the Constitution of India to safeguard their rights and ownership of land and identity in response to a significant existential threat.

KIRCHBERG, VOLKER* (Leuphana University Lüneburg, Germany)

Networking the Arts – Social Network Theory As Appropriate Theory for Studying the Liquid Organization of Arts

Social Network Theory, together with semantic network analysis, is the most promising way to advance theory about the social organization of arts. The reason for this claim is twofold. First, the production of arts and culture is a bundle of various changing activities and thus a fluid process, as captured by the metaphor of liquidity (Bauman 2000). Many arts organizations are now understood as temporary entities that are neither strongly established in a hierarchical or bureaucratic sense, nor pursuing orderliness as a sign

of efficiency. Especially, when they are in their emerging and most creative phase, they organize in a liquid manner. Social networks are prone to depict such dynamic organizations.

Second, the network principle is not only the epitome for a general "new spirit of capitalism" (Boltanski & Chiapello 2005) but this spirit has been prototypically developed out of the fluid, short-term, and project-oriented nature of artistic work. In the "gig economy" (Crouch 2019), artists are overwhelmingly not permanent employees. Creative, arts-producing organizations such as experimental theatre groups and music bands, or visual arts collectives, are projects with changing creative personnel and limited existence. Most arts organizations in late capitalism are not established institutions, although this is still a common view.

The presentation will present the theoretical foundations of arts organizations as such liquid social networks. Through a comparative view on already published empirical studies, it will also connect quantitative relational network analysis with qualitative semantic network analysis. This quantitative and qualitative hybrid theory of arts networks is a promising way of advancing the study of dynamics in organizing the arts.

KIRIYA, SHIENE* (University of Tsukuba, Japan)

The Dynamic Transformation of Discouraging Emotion into the Foundation of Political Solidarity: Hesitation in Joining the Street Protest in Tokyo in 1960

In 1960, a huge crowd of organized protestors occupied the boulevards of central Tokyo and surrounded the National Diet Building to protest against the forcible ratification of the military alliance treaty between the US and Japan ("Anpo"). Most of the demonstration marches in those days were planned and held by movement organizations such as unions and associations. Although some bystanders and onlookers along the street inwardly supported the antiwar message of the demonstration, they felt alienated from the procession because they did not belong to any movement organization. They felt "hesitation" in joining the political movement.

Eventually, however, the bystanders jumped in the protest one after another and commingled with the organized participants. How could they overcome the hesitation and participate in the demonstration, and was this emotion a mere hindrance to the political mobilization? Previous studies have mainly focused on the emotions useful for encouraging or mobilizing people and overlooked the creative aspects of seemingly discouraging feelings. This presentation elucidates how "hesitation" can be transformed into the foundation of political solidarity through the spatial encounter between the activists and bystanders (Jalili 2022).

The existence of onlookers hesitating on the sidewalk actually cheered up the walk-in entrants who also initially had shied away from joining the protest. Sharing the same experience of hesitation, they could sympathize with each other and convince themselves that they were not alone to oppose the government. The bystanders actually played a critical role in generating the political solidarity. Finally, the inclusive atmosphere based on the shared experience empowered other onlookers to join the march.

By focusing on the spatial and corporeal communication between the inside and outside of the protest, this presentation would argue how the dynamics of social movements transforms the discouraging emotion into the political ground of solidarity among people with diverse backgrounds.

KIRK, GABI* (California Polytechnic State University, Humboldt, USA)

Ecological Crisis As Structure, Not Event: Lessons from Jenin, Palestine

Long considered the "breadbasket" of Palestine, Jenin's role in agrarian production for local and global markets has been shifted and constrained by a series of imperial and settler colonial powers. Before and after October 7, 2023, the villages and hinterlands of the Jenin Governorate in the northern West Bank were and remain under siege from Israel's occupation. However, the daily life of farmers and rural dwellers under siege rarely makes headlines. Critical scholars must resist separating the daily violence of ecological crisis from the moments of horror that draw international condemnation, such as the destruction wrought on Jenin in July 2024 which was called in many media outlets the "second siege of Jenin" (after the 2002 siege). The crisis and genocide Palestinians have faced in the past year, as Palestinian scholars and activists around the world have cried out, must be put in the *longue durée* of the ongoing *Nakba*. Drawing on ethnographic fieldwork and historical archival research, I ask, what can Jenin teach us about environmental crises when they do not fit into "a notion of 'crisis' as an instance of short-lived, spectacular

devastation" (Kirk and Lawson, 2022)? Jenin, due to its agrarian importance, physical geography, and cultural and political history of resistance, offers to both local and global studies of political ecological crisis an understanding of how multiple systems have impacted agrarian livelihoods over time.

KIRS, ESZTER* (associate professor, Hungary)

University Youth Activism in the Hungarian Illiberal Political Context – a Comparison of the 2012-13 Student Network Protests and the 2020 Freeszfe University Blockade

Under long-lasting illiberal governance, like the post-2010 Orbán regime in Hungary, instrumentalizing law for political purposes, capturing judicial institutions, active civil society and autonomous universities nurturing critical thinking and a politically plural society are preconditions to maintaining the rule of law and public demands of justice. The paper, based on qualitative, interview-based research, explores the identity and operation of two university student movements, the Student Network (Hallgatói Hálózat, HaHa, 2012–13) and the FreeSZFE (SZFE: Színház- és Filmművészeti Egyetem, University of Theatre and Film Arts, 2020) aimed at the defense of university autonomy as opposed to illiberal governmental measures. In 2013, following a mass demonstration in downtown Budapest, the protesting crowd led by the HaHa marched to the building of the ELTE Faculty of Humanities and occupied it. For 45 days, they stayed in one of the lecture halls, which provided the base for forums of democratic debate and the preparation of protests, flash mobs, and other collective demonstrative acts. This university blockade-kind of action was a predecessor to the more radical university blockade of the FreeSZFE movement. The 2020 blockade of the central building of the University of Theatre and Film Arts lasted for 71 days, until November 9, 2020, when the government closed the university buildings due to the COVID pandemic, which decision the protesters complied with based on public health considerations. Both movements addressed illiberal governmental policies in higher education but were also embedded in a political context of civil society's struggle to challenge democratic decay through collective protest actions. I compare the two movements from the following perspectives: (1) structure and forms of organization, (2) protest actions, (3) motivations of movement members, (4) governmental responses, including the marginalizing techniques applied by government-dependent media outlets, (5) impact on governmental policies and society.

"Let Them Help You, They Too Want to Touch the Seams of the Gown of This Majestic Act": Motives of Non-Direct (altruistic) Kidney Donors

Non-direct kidney (altruistic) donations are a medically recommended therapeutic method for those suffering from end-stage renal failure, with significant benefits for both the recipient and the health system. Worldwide, this type of donation is scarce, thus constituting a rare solution for an increasing health challenge. Israel ranks highest in non-direct kidney donations, with the majority of donors belonging to the various Jewish orthodox communities. To better understand the motives of these donors, we conducted qualitative research delving into the social constructs and shared meanings that shape donors' perspectives and experiences.

A thematic analysis was conducted, including 69 articles from 31 biannual magazines published by Matnat Chaim, an organization promoting altruistic kidney donations in Israel. Each article depicting the story of a donor was sampled from different periods since the establishment of the organization, and considering the different editions geared towards various relevant audiences.

The findings align with previous studies on donor motivations, highlighting two primary themes: the desire to help others in distress, and religious/spiritual motivations. Albeit less overt, an additional major theme was identified relating to social relationships and environmental factors as motivators for donation. The relational aspects from the donors' point of experience encompass a spectrum of relationships nospanning from that with the recipient, through the relationship with the donors' bonding social capital and with divinity. This insight suggests that donors' social networks and their position within broader societal structures, play a crucial role in their decision to donate.

This research's novel insights of the motives of non-direct kidney donors imply that their decision is not solely based on an altruistic discourse, but also shaped by social forces and deeper relational factors. Health systems can benefit from the understanding of the complexity of donor motives, and better support them throughout the donation process.

Knowing Justice in the Anthropocene. Using Life Story Narratives in Socio-Legal Research

The focus of my poster is the use of biographical methods and narratives in socio-legal research, but the broader question I want to arise with my contribution is the need of enhancing methodological consciousness in socio-legal research in general. In the context of Anthropocene societies and legal systems face specific challenges regarding justice. Socio-legal scholarship need to be inventive, open and reflexive when it comes to methodological choices in order to find answers or, even more importantly, ask the right questions about the relationship between law and society, especially subordinated groups in this historical context.

In my poster I would like to introduce the use of narrative life story interviews in socio-legal research from this perspective. Since 2013, I have participated in three studies that examined questions related to legal consciousness and the relationship to law using the method of narrative life-history interviews. The latter two of these studies addressed the issue of social change. In my poster, I will present our interviewing experiences and address questions that arose during the analysis.

All three studies encountered challenges and provided insights into approaching interviewee recruitment and conducting interviews. Regarding analysis, issues arose in the first study, suggesting that we should not exclusively approach the resulting empirical material using the hermeneutic case reconstruction method. In my poster, I will outline the concept of horizontal analysis we have developed, its possible methodological foundations, and the challenges it presents..

The Hungarian Notariat and the Challenges of the 21st Century

The topic of our presentation is how people working in the Hungarian legal professions, especially the notariat, reflect on the social challenges and turning points of the late modernity, including global challenges such as technological developments, the possibilities of using artificial intelligence, or the specific Hungarian, regional, post-socialist societal and vocational challenges.

Our presentation will be based on the analysis of narrative career story interviews conducted in the research project *Women in the legal professions in Hungary*, in which 17 notaries were interviewed. In the presentation we will discuss the turning points in the history of the Hungarian notarial profession, which is important for understanding how it follows political changes like a "litmus paper". In this respect the introduction (reintroduction) of private notariat from 1992 and its impact on people working as notaries is of particular importance.

In our presentation, we will focus on the types of career paths and generations of notaries that have emerged since 1992, and we will examine how the above mentioned challenges are interpreted in the narratives and constructions of professional identity of people belonging to different types and generations.

KITAMURA, TAKANORI* (Tokai University, Japan)

Jury Deliberation As a Site of Intersection between the Legal and Ordinary Consciousness: Interaction Analysis of Judges' Management of Deliberation and the Phenomenon of 'Alienation'

Japan's Lay Judge System, introduced in 2009, was designed to adjudicate serious criminal cases. The panel, composed of three professional judges and six ordinary citizens, determines not only the guilt or innocence of the accused but also the severity of punishment in cases of guilt.

This study focuses on one aspect of the phenomenon of "legal alienation" through a detailed interaction analysis of jury deliberations within this criminal justice system. It examines how the everyday consciousness of lay citizens intersects, aligns, conflicts, and compromises with the legal consciousness of professionals at the micro-level of social interaction.

Previous studies have explored how lay people's actions and consciousness in legal contexts become alienated through the technical rationality, specialized terminology, and procedures inherent in legal settings. While discourse-level analyses have been conducted, few studies have specifically examined such phenomena within the context of jury deliberations.

We collaborated with legal professionals to conduct realistic simulated trials and jury deliberations. All interactions were video-recorded and analyzed using conversation analysis. Our study identified several specific practices employed by professional judges to manage deliberations. Among these, the practice of "formulating"—which involves ostensibly summarizing and paraphrasing lay judges' contributions while subtly reshaping and altering certain aspects—played a crucial role. These practices subtly, but accountably, steer the discussion toward a legally relevant framework at critical points in the deliberation.

Such practices address a core dilemma faced by professional judges: balancing the need to provide lay judges with ample opportunities to express their views while simultaneously guiding the deliberation within the bounds of legal standards of evidence and proof.

By highlighting these micro-level interactional practices, this research offers new insights into how legal professionals navigate the tension between lay participation and legal relevance, shedding light on previously overlooked aspects of the intricate phenomenon of "legal alienation."

Who Drives the Transition to a More Sustainable Future? Temporal Dynamics of Environmental Attitudes and Behavior in Japan from 1993 to 2020

Governmental policies that drive large-scale systemic changes are crucial in the struggle to combat the climate crisis. Their success depends on public compliance, especially in democracies, where voters can impact government agendas. Therefore, it is important to understand how individuals perceive climate change and, in turn, under what conditions these perceptions drive behavior. This is especially relevant in Japan, where political engagement at the individual level has been historically weak, even on issues of societal significance.

Given this context, we investigate the evolution of environmental attitudes, self-efficacy, willingness to make sacrifices, and actual behavior in Japan between 1993 and 2020. Using survey data from the International Social Survey Programme (ISSP) Environment module for the years 1993, 2000, 2010, and 2020, and applying year fixed effects regression, we analyze how perceptions and responses to environmental issues have shifted over time and identify the primary trends. We focus on strength and determinants of pro-environmental attitudes, the willingness to make sacrifices to protect the climate, environmental self-efficacy, and beliefs in external solutions to the climate crisis, as well as how these factors interrelate with pro-environmental behavior. We examine how these factors differ across various social groups and test which specific factors shape the translation of attitudes into action.

Our findings suggest that while pro-environmental attitudes in Japan have slightly increased over time, both the general willingness to make personal sacrifices for environmental benefits and environmental self-efficacy have declined. Similarly, engagement in various pro-environmental behaviors has also decreased. These patterns appear consistent across different sociodemographic groups, indicating an absence of significant divides by social class or generation within the Japanese population. This indicates that the population still subscribes to the government's promise of economic growth and is unlikely to act as a corrective to lead Japan onto a greener path.

KIZILOVA, KSENIYA* (Leuphana University, Germany)

Information Environment, Media Use, and Political Trust

This paper aims to implement a comprehensive analysis of the information environment in the societies across the EU to assess the openness of information flows (monitored by proxy measures of freedom of expression) which serves an important mediator of political trustworthiness assessment and hence trust-building. Societies with one-sided information flows (in closed information societies) display greater trust in political authorities than

those living in contexts with two-sided information flows. The free press is commonly regarded as an essential condition for an enlightened public. Thus, more informed decisions about trustworthy political leaders, political parties, civil service officials, and state authorities are likely to be maximized in open societies with freedom of expression, media pluralism, and accountability mechanisms, all closely associated with the type of democratic or autocratic regime governing each state, combined with levels of human development, expanding literacy, schooling, and media access in each society. Some of the most troubling indications of democratic backsliding in recent decades concern increasing restrictions on freedom of expression and civil liberties, including through state censorship of the independent media, unofficial government harassment of critical journalists, and expanded libel or defamation laws, illustrated in cases such as Hungary, Turkey, and Poland. This paper uses secondary population (EVS/ WVS, ESS, EB) and expert (Freedom House, V-Dem) survey data to provide a comparative cross-country overview of media use patterns and information environments in European and selected world countries to examine the causal links between the media and information environment, on our side, and the types of trust widespread in the society, including rational sceptical vs credulous trust and cynical mistrust.

Current Versus Past Migration: Which Matters More for Migration in Nepal?

This project will examine how different measures of migration exposure within households and communities impact individual's probability of out-migration from those contexts, using data from the Chitwan Valley Family Study (CVFS) in Nepal. Particularly, I will focus on how present exposure to out- and return-migration within these contexts matters, as opposed to accumulated or historical migration exposure. Empirical studies of migrant networks and migration social capital have thus far primarily focused on accumulated social capital, whereby the experience of past migrants is equally weighted with the experience of current migrants. While advances have been made in understanding the accessibility of this social capital and potential for translation of this capital across trans-local contexts, such as through assessing the number of migration trips (and thus contact with the origin context), studies have largely failed to incorporate the recentness of migration experience in differentiating migration social capital. As migration is a dynamic process, changing origins and destinations with its occurrence, distinguishing between migration social capital from the past and present (especially as conditions in destinations change overtime) helps advance a better understanding of how potential migrants in origin contexts react to more recent migration information, and extends theories on migration social capital and networks, especially the diffusion of migration within contexts through the quality (or recentness) of information.

The Intergenerational Transmission of Parental Reading Involvement: Evidence from the 1970 British Cohort Study

Parental reading involvement has a significant impact on many child outcomes, including linguistic skills, reading proficiency, cognitive skills, and attitudes towards reading. In cultural reproduction literature, reading behaviour is attributed to cultural knowledge or cultural capital reflecting attitudes and preferences beneficial in various ways for the reproduction of social advantages. In this paper, we link this scholarship to psychological research on intergenerational transmission of parenting behaviour, which shows that parents often replicate their parents' parenting styles, such as harsh parenting, attachment, and father's involvement. This replication occurs through two main mechanisms. The direct mechanism involves social learning and identification, in which parents model their behaviour after their parents. The indirect mechanism suggests that certain types of parenting (e.g., constructive parenting) improve academic skills, self-esteem, or peer relationships, increasing the likelihood that people will engage in similar parenting when they become parents themselves.

Given these psychological arguments and the continuous interest in determinants and outcomes of parental reading to/with their children, our paper asks (1) if parental reading to their children is transmitted across generations and (2) whether the intergenerational transmission of reading varies according to the socioeconomic status of generation 1 (parent's parents)?

We use data from the 1970 British Cohort Study, which tracks children born in 1970 throughout their lives. We use information from Wave 1975 when children were five years old and mothers reported the frequency with which they read to their child. Our dependent variable is from Wave 2004 when participants were 34 years old and those with children shared information about reading to their child. The data set also provides rich information on socioeconomic status and other relevant parent and child factors at several time points. Preliminary results indicate that there is a strong relationship between parental reading in one generation and the next.

Review of the Scientific Literature on Online Dating Services

The use of online dating services has significantly increased in recent years. This growth has prompted an expanding body of scientific literature examining the demographic and social implications of using these platforms. This study explores the evolving research landscape of online dating services (based on a bibliographic database of 528 scientific publications retrieved from 5 scholarly publishers from 2010 to 2022).

Using content analysis, 9 primary research themes were identified:

- Online dating platforms and methods (social networks and specialized online dating services).
- Traditional (offline) dating methods (comparative aspects of online and offline dating).
- User actions and interactions.
- Dating goals.
- External characteristics of romantic partners.
- Internal characteristics of romantic partners.
- Risks and disadvantages of online dating.
- Marital status and relationship dynamics.
- Thin Markets.

The bibliographic database provides valuable insights into the trajectory of research on online dating over the past decade. Key findings emerged from the analysis:

1. Growing research interest: the study reveals a significant increase in publications related to online dating in recent years. This trend is partially attributed to the impact of the COVID-19 pandemic, which accelerated the adoption of online dating.
2. Focus on thin markets: the analysis highlights the growing attention paid to the experiences of individuals within limited marriage markets: LGBTQ+ community, racial and ethnic groups.
3. Emphasis on risks and problems: the study reveals a consistent focus on the risks and challenges associated with online dating.
4. Dominance of Tinder as a case study: Notably, nearly 80% of the analyzed publications focus solely on the use of Tinder as a subject of study.

The findings suggest a continued growth in research on online dating services in the coming years. The declining popularity of offline communication among younger generations, coupled with the increasing accessibility and use of online platforms, are expected to further fuel this trend.

Socio-Demographic Determinants of Online Dating Practices Among Russian Students

Dating phenomena hold significant interest for researchers because of direct influence on the predicted level of marriage and birth rates. Key aspects of this analysis include dating methods, goals, and preferred characteristics in a romantic partner. Despite the significance of these factors, dating remains under-explored within the scientific discourse in Russia, particularly regarding statistical data on these key aspects.

This study aims to analyze the influence of socio-demographic characteristics on dating practices among Russian students who have experience using online dating methods. A survey was conducted involving 3,838 students from 164 universities across various specializations in 46 regions of the Russian Federation. Approximately 80% of the respondents reported experience with online dating through social networks and specialized online dating services, forming the basis for the subsequent analysis.

The initial phase of the study involved the development of a probabilistic model incorporating eight dating goals and eleven key characteristics. Subsequently, factor analysis was employed to categorize these aspects.

Dating goals were clustered into four groups: family formation, finding friends, long-term and short-term relationships. Key characteristics were grouped into three categories: internal and external characteristics, as well as minimum requirements for a partner. Influence models were constructed based on these categorizations.

The following findings emerged:

1. Male students demonstrated a higher likelihood of engaging in dating for both short-term and long-term romantic relationships.
2. The popularity of short-term relationships within the online dating increased with the age of the student.
3. Marriage and children were not the primary goals of student dating; however, long-term relationships were more common among this group.
4. Female students exhibited a higher degree of partner selectivity, placing greater emphasis on both internal and external characteristics.
5. Male students demonstrated a preference for physical attractiveness.
6. The significance of internal characteristics tended to decrease with age.

KLINGEMANN, JUSTYNA* (Military Institute of Medicine – National Research Institute, Poland)

Peer Support Workers: A Qualitative Exploration of Emotional Burden, Moral Distress and Strategies to Reduce the Risk of Mental Health Crisis.

The demand to base the Polish psychiatric reform on the personal recovery paradigm as a principle and *conditio sine qua non* of patient-centred psychiatric care has led to the emergence of peer support workers (PSWs) as one of the elements of the new mental health care system.

This research aimed to explore the experience of emotional burden among peer support workers (PSWs) in mental health care in Poland. In addition, we explored the issue of moral distress in relation to this professional group and identified good practice in institutional sources of support for the well-being of PSWs in the workplace and to reduce the risk of mental crisis.

The research sample consisted of 14 PSWs recruited from four mental health centers (MHCs) located in different parts of Poland. The MHCs were selected to represent not only a range of geographical locations but also a diversity of organisational structures, including those run within psychiatric hospitals, general hospitals, research institutes with clinical base, and non-governmental organisations.

The narratives of PSWs revealed several experiences that could be considered to be moral distress. The inability to assist patients was found to be associated with both individual and institutional barriers. Furthermore, our findings suggest that organisations can implement a number of specific practices to ensure the wellbeing of PSWs. Dissemination of these strategies to teams employing PSWs would be beneficial, as they are not only practical but also align with common sense institutional strategies, such as building self-awareness and a supportive working environment, which include informal team relationships.

KNUDSEN, HANNE* (Aarhus University, Denmark)

Educational Transformation As Business

The paper explores the dynamics and interactions between private corporate foundations and University colleges. The hypothesis is that such partnerships may be described as “co-transformation”: The transformation of education becomes a medium for transformation of business and the transformation of business becomes a medium for transformation of education. The case is Playful Learning (LEGO) and the partnerships with the Danish University Colleges, thus the education of all teachers and pedagogues in Denmark. The Danish University Colleges describe Playful Learning as a “paradigm shift” from traditional teaching to playful learning. The hypothesis is that LEGO also uses the partnership for transformation – namely self-transformation of LEGO from being in the toy-business to being in the learning-business.

The aim for educational paradigm shift is in line with the tendency that private corporate foundations increasingly reposition themselves as “change-makers”. A tendency termed in the research as “new philanthropy” (Lubienski, Olmedo), where corporate foundations seek to disrupt existing educational aims, forms and mindsets rather than back up existing political ambitions.

LEGO is an interesting case, having engaged in partnerships with Danish universities, UCs, schools, libraries, museums, hospitals, and municipalities

since 2018. The theoretical approach is systems theoretical with concepts of transformation and potentialisation (Luhmann, Andersen). The empirical material stems from the LEGO foundations annual reports and other documents, interviews with employees in the LEGO Group (company and foundation), written materials on Playful Learning and interviews with employees in the University Colleges.

Investigating Sense of Control Among Older Australians in Community Dwellings and Aged-Care Facilities

Objective: Low sense of control can negatively impact mental well-being in late life. This study examines factors influencing personal control among older adults relying on government-subsidized services or residing in elderly homes in Australia.

Hypotheses: Based on existential inequality research on loneliness among institutionalized older adults, we hypothesized that loneliness predicts a lower sense of personal control. Incorporating life-course perspectives, we examined the associations of sociodemographic factors and family support with sense of control. Additionally, we tested the impact of the disablement process, including mobility issues and chronic conditions, on personal control.

Methods: We applied logistic regression models to data from 485 older Australians (aged 65 or over) collected in a nationwide survey conducted between October 2023 and July 2024. We also tested the equality of coefficients for covariates when comparing older adults in nursing homes to those living in communities.

Results: Preliminary results indicate that loneliness is associated with a lower sense of personal control in both residential types. Moderate or severe mobility issues increase the likelihood of a low sense of control among community-dwelling older adults. Social interactions, such as social contact and group participation, reduce the likelihood of a low sense of control for older adults in aged-care facilities, but not for those living in communities.

Discussion: Our findings confirm that loneliness is linked to a lower sense of personal control among older adults receiving governmental support and those in nursing homes. Mobility problems are relevant to a low sense of control. Social interaction is crucial for reducing the sense of control issues in nursing homes, although the association between loneliness and lower sense of control persists. The findings imply that the social interactions and contact in the institutional care setting is crucial.

KO, PEI-CHUN* (Monash University, Australia)

Productive Aging and Wellbeing Among Older Australians

Building on the framework of productive aging, this study delves into the relationships among various forms of productive engagement, such as paid work, volunteering, and housework, and their effects on the mental well-being of middle-aged and older Australians (aged 50 and above). By integrating theoretical perspectives on household division attitudes and time availability, the research initially examines the extent of unpaid work in conjunction with paid work and retirement. Subsequently, it assesses how unpaid engagement correlates with mental well-being.

The study will utilize multiple waves of the Household, Income, and Labour Dynamics in Australia (HILDA) surveys to create analytical samples of older Australians. Fixed-effect models will be employed to control for unobserved heterogeneity, ensuring more accurate estimations. The anticipated findings are expected to highlight the significant role that volunteering and housework play in the lives of older Australians, particularly those who are still working and those who have retired. Preliminary findings based on cross-sectional data indicate that hours of volunteering increase with the amount of housework for older workers and retirees, but not for those who were never in the labor market or sought employment later in life. For older workers, volunteering boosts life satisfaction.

This research aims to provide a deeper understanding of how engagement in these activities impacts well-being in later life. It will offer valuable insights for policymakers looking to design programs that support healthy and active aging, emphasizing the importance of both productive engagement and equitable distribution of household responsibilities in promoting mental well-being among older adults. Through this, the study seeks to contribute to a more comprehensive understanding of the social factors that bolster mental health in the later stages of life.

DAMELANG, ANDREAS (Friedrich-Alexander University Erlangen-Nuremberg, Germany)

The Value Foundation of Chatgpt

The objective of this research paper is to analyse and differentiate the value foundation of the large language model ChatGPT in more detail. Previous studies on this topic assume a rather progressive value foundation of ChatGPT, which is caused by the training data used to train the LLM. In order to investigate the value foundation in more detail, a vignette experiment was conducted with ChatGPT in which the programme was asked to evaluate a statement on the division of labour in the household in the role of different people with varying socio-demographic characteristics. In order to show a concrete value foundation and thus indirectly a bias of ChatGPT, the results of the experiment are compared both descriptively and by means of multivariate linear regressions with real survey results of the International Social Survey Programme from 2012. The results of this paper suggest that ChatGPT is subject to a progressive bias. Furthermore, it could be shown that ChatGPT is neither able to correctly predict other value foundations nor to differentiate attitudes within the progressive value stance. Thus, this paper shows that ChatGPT does not objectively evaluate all values and attitudes equally, which results in the user being influenced by the programme.

Is Violence Ever Justifiable? an Examination of Self-Defence Cases in India and Kurdistan

This paper examines the extent to which violence used by the oppressed can disrupt patriarchal and capitalist systems and racist regimes. Theories of violence are highly polarised. Advocates of non-violent civil rights movements argue that any use of violence, even for the sake of liberation, perpetuates a more violent world and fosters an escalating cycle of violence that is difficult to break (Arendt, King, Butler, Walby, Frazer and Hutchings). In contrast, proponents of violent self-defence emphasise the inevitability of violence and its multifaceted accomplishments (Fanon, Sartre, Marx, Williams, Dorlin, and Vergès). In the context of this debate, this paper asks: how can we evaluate the effectiveness of violence utilised by the oppressed?

The use of violence by the oppressed can produce diverse outcomes, necessitating a nuanced analysis. For example, we should consider: 1) the impact of self-defence on the consciousness of the oppressed; 2) the possibility and impossibility of non-violence 3) the different effects of violence on gender, class- and race-based oppressed and exploited groups and 4) the ways in which violent resistance shapes the critiques and demands of the oppressed. Focusing on case studies from India and Kurdistan, this paper proposes an analytical framework for assessing the effectiveness of violent resistance. The selected cases provide a valuable context for examining the multifaceted outcomes of violence and its gendered, class- and caste-based, and racial implications.

Within current national and international legal frameworks, the concept of self-defence is largely confined to interpersonal violence or used to legitimise inter-state, often imperialist, aggression. At the same time, the varied impacts of violence on different groups are frequently disregarded. This research has the potential to broaden the understanding of self-defence in the context of feminist, anti-racist, socialist, and anti-imperialist struggles.

Aligning Science and Politics: A 40-Year Analysis of Resource Allocation and Policy Priorities in Chilean Science (1982–2021)

In an era of growing inter- and transnationalization of scientific activity, national frameworks remain crucial in shaping the organization of science. Balancing the need for scientific autonomy with the alignment of research and state politics presents a complex challenge, especially in countries that have adopted competitive, project-based funding mechanisms. This paper investigates the intersection of political and scientific priorities at the national level by analyzing the evolution of political interest and resource allocation for science in Chile over a 40-year period (1982–2021). Drawing from publicly available data, including presidential speeches, institutional documents, and funding outcomes from the National Agency for Research and Development (ANID), the study examines a broad range of funding instruments across

various disciplines, including social sciences, humanities, natural sciences, and technology. The findings highlight significant transformations over time, such as a gradual yet steady shift toward greater equity in fund distribution, notable differences between disciplinary areas, and evolving thematic priorities. These insights offer a deeper understanding of the mechanisms that align political agendas with scientific research in the context of competitive, project-based funding.

Transnational Life - Imposition or Gain for Children?

Our paper draws from the results of a German-Polish research project, focussing on the question of how children in Poland perceive and evaluate transnational family arrangements. The data is based on a grounded theory analysis of 27 group discussions with children aged 12 - 14 (with and without personal experience of migrating parents).

While in the Polish media the (temporary) labour migration of mothers in particular is dubbed with the neologism 'Euro-orphans', thus marking the non-existence of a family, the children interpret temporary migration under specific conditions as a legitimate family strategy. In addition to the impositions that transnational family life presents from the child's perspective and the possible family strategies for dealing with them, our analysis also shows how transnational family life can be understood as a resource. We want to work out the latter in our presentation with a focus on two aspects: 1) Transnational families are spaces in which images and knowledge of abroad are conveyed and shaped, for example through parents' stories, the stayer children's own experiences of mobility, or the things parents bring with them. 2) Transnational family experiences are relevant for children's „emotional geographies“, which play into their construction of current as well as future self-positionings and perspectives. We interpret our findings in light of the specific structure of the transnational space in Europe, including the legal framework within the EU, the geographical proximity between Poland and the country of work, and the generational and gender-specific orders of their societies of origin. These structures shape transnational family life and, as a result, the images of abroad and the location of children in the transnational space. Our paper wishes to expand the research on the implications of growing up transnationally and offers a differentiated analysis of its costs and benefits for children.

KOENIG, CHRISTINA* (Goethe University Frankfurt / Frankfurt University of Applied Sciences, Germany)

Social Work and Violence - Relativizing Extreme Right Youth Violence in Germany

“There was a teenager who was a Nazi... In a bomber jacket, bald head and combat boots and all that. [...] And at some point he actually poured petrol over himself in front of our youth club, set himself on fire and ran into our crowded club, claiming that the Zecken [derogatory term for leftists] had set him on fire. And died burning in the club. And he ran towards me and I saw his eyes burst open” (Maik, 2022)

Social work faces a dilemma when addressing extreme right youth, one that reveals both ethical and practical boundaries. In line with the profession's self-conception, these young individuals are entitled to support. At the same time these teenagers espouse fundamentally opposing the humanistic values that underpin social work. This conflict creates a central paradox, presenting challenges for professionals in their day-to-day practice.

In my biographical research, it became evident that not only the young individuals affected by extreme right violence suffer from it within the youth centre, but the social workers themselves as well. The data further reveal that young people impacted by extreme right-wing violence often eventually avoid the youth centre, whereas the social workers remain and endure the situation. In recounting their experiences, social workers tend to downplay the violence they face or normalise it as part of their everyday working life.

In my talk, I aim to specifically address the often overlooked violence experienced by social workers in youth centres when working with right extremist youths. Through an analysis of biographical interviews with social workers, I intend to highlight the internal 'I' factors within them that result in this violence being insufficiently acknowledged or addressed. This, in turn, leads me to pose the question: why, for these social workers, is too much still not enough?

Unlocking Potential: Exploring the Impact of Dual Study Programs on Knowledge Transfer in Germany

The number of dual study programs is steadily increasing in Germany, linking university education with practical work to close the gap between higher education and practical requirements. The Wissenschaftsrat, Germany's central science policy advisory body, expects these programs to better meet the "high demand for young professionals who can carry out such a transfer into practice and bring both theoretical competencies for more complex requirements and practical work experience" (Wissenschaftsrat 2013:5).

However, the suitability of these programs for bridging the gap between theory and practice has hardly been investigated. Research has focused on the university's role in knowledge transfer, but how this knowledge is applied in practice remains largely unknown. With around 20,000 students, IU International University is one of the largest providers of dual study programs in Germany, where students regularly alternate between practical work and university learning within one week.

We conducted an exploratory study to investigate how students and companies experience the transfer of knowledge in practice. A total of 16 group discussions were analyzed using the documentary method (Bohnsack 2014), and underlying implicit orientations were reconstructed. With this contribution, we want to share insights. The analysis reveals a very heterogeneous field, with large discrepancies described in the types of knowledge learned and required. For example, practice partners and students often expect application-oriented practical knowledge, which is sometimes not available in the university context because it relates to specific processes within the practice. In contrast, abstract theoretical knowledge is hardly valued, especially at the beginning of the study program. Only in individual cases are students and practice partners aware of the necessity of more abstract theoretical models to further develop practice. Nevertheless, in some instances, it is possible to establish students in practice as 'ambassadors of theory,' thereby introducing new perspectives into professional practices.

KOERNER, ELSA* (Le Mans Université, France)

Public Gardeners As Care Workers

The profession of municipal gardener is undergoing a number of changes linked both to the greening of practices and to the reduction in resources allocated to local authorities in France. To compensate for the lack of attractiveness of public-sector green space services compared with private landscape contractors, recruitment methods are evolving. The sociological profile of municipal gardeners is changing, but the profession remains largely male-dominated. However, following on from maintenance studies, I see it as a care profession. The role of the gardener is to reproduce living conditions and care for nature. Furthermore, the profession suffers from a devaluation similar to that of feminized care professions (invisibilization and disqualification of professional techniques, casualization).

This paper is based on a qualitative study of a team of municipal gardeners in the city of Rennes, in western France, conducted from May to July, 2024. The research material is drawn from eight weeks of participant observation and ten semi-structured interviews with the team members. I will analyze the discourse on professional norms in the interviews and the interactions between agents.

In this paper, I will discuss the gender dimension in the differentiated appreciation of maintenance tasks such as weeding, as opposed to the maintenance of working machines or higher-volume operations. The greening of practices modifies the type of technical skills expected. What kind of masculinity do municipal gardeners express through their professional practices? How do they integrate care for residents in their daily living spaces into their professional standards? How does this specific case inform the debate on professionalization in the care professions?

 JÜRSS, SEBASTIAN (University of Bremen, Germany)

"and When I've Worked for Two Years, I Will be a Bit Higher up" - Discrepant Self-Classifications through the Lens of Subjective Interpretations of Inequality, Social Mobility Expectations and Experiences.

Our study investigates the relationship between subjective interpretations of social inequality and experiences of social mobility, focusing on individuals in Germany who identify as middle class despite objectively belonging to either the upper or lower socioeconomic classes. This phenomenon of discrepant self-classifications is well-documented, yet the specific arguments individuals use to justify these classifications remain underexplored. Using qualitative interview data from a longitudinal study, we analyze three key questions:

1. How do individuals from the upper and lower margins reconcile their perceptions of inequality with their self-positioning as middle class?
2. How do expectations and experiences of social mobility shape perceptions of social position?
3. How do these self-classifications evolve over time, enhancing our understanding of the dynamics between subjective interpretations of inequality and social mobility?

We conducted qualitative interviews with respondents from various social backgrounds as part of a large-scale longitudinal study in Germany. Our analysis draws on 90 biographical interviews (first wave) and approximately 90 problem-centered group interviews (second wave), focusing on responses to graphic elicitation techniques that capture participants' subjective class affiliations in a semi-standardized manner, which we then compare to their objective social positions. Additionally, we examine respondents' biographical trajectories of upward and downward mobility across different societal systems (former GDR/East Germany and the Federal Republic/West Germany). Our findings indicate that discrepant middle-class self-classifications are essential to identity work, employing various strategies of stigma management. This suggests individuals cope with both "shameful poverty" and "shameful wealth." Furthermore, counterfactual self-classifications into the middle class can serve as mechanisms for maintaining or restoring agency when objective positions diverge from subjective feelings of belonging.

KOFMAN, ELEONORE* (Middlesex University, United Kingdom)

WEISS, ANJA (University of Duisburg-Essen, Germany)

Skills, Migrants and Cross-Border Labour Markets

Policymakers and many migration scholars sustain the idea that highly skilled migrants are a better kind of migrant and should be privileged in migration programmes. Furthermore, the possession of desirable skills seems to be restricted to labour migrants and not ascribed to family migrants or asylum seekers and refugees. However, it is unclear what high skills mean and how they can be assessed, particularly within transnational and cross-border contexts.

The paper offers a framework for understanding and researching the labour-market-related knowledge of migrants. Prevalent political approaches equate high skill with labour market success, especially the ability to earn a high income, hence the imposition of income thresholds to enter through skilled migration routes in many OECD countries. However, this simple equation of the value of labour fails to investigate what makes up transferable knowledge.

We argue for three approaches that take knowledge seriously. Firstly, knowledge should be seen as politically contested within regimes of legal-technical recognition as well as race and gender (Bourdieu). Recognition regimes de-couple from what we term the use-value of knowledge in the second aspect: non-recognized knowledge, including embodied, may still contribute to the solution of socio-material problems (Dewey). Thirdly, knowledge is not only situated but also embedded in (post) colonial geographies and networks of (non-)trust (Raghuram, Sommer).

Our paper builds on and engages with the pertinent debate on skills and migration and uses examples from our own published and ongoing research (Kofman 2014; Nohl et al. 2014). We identify research lacunae and provide sensitising concepts for further study.

Building a Tax Justice Movement in Times of Climate Crisis

The tax justice movement has slowly emerged as a significant social movement actor in the context of a growing climate crisis. This paper explores the history of the tax justice movement from the perspective of an insider and an activist, who has been an actor in this field. The paper explores the initial motivations to build a movement to close tax havens, tax the wealthy and large corporates in times of a "race to the bottom" in terms of tax rates, and progressivity of taxation. Social movements confronted this by linking tax justice to pressing social concerns in different contexts from development financing, climate financing in the Global South, to fighting kleptocracy or State capture in the Global North and especially in tax havens that facilitate this race to the bottom and effectively sell their sovereignty to enablers such as lawyers, bankers, accountants, real estate agents and other professionals who help the wealthy and large corporates hide their money and profits. This allows for the rich and powerful to effectively make an exit from their social obligations and duties towards other citizens in the form of taxation.. We explore here the growth of the tax justice movement from 2002 onwards to 2024 through participant observation, and key informant interviews to map out how the movement has responded to various challenges including the Climate Crisis, Global Financial Crisis, Covid-19 and built through these crisis an ever wider narrative of why we need to close down tax havens, and work towards progressive taxation. This paper looks at potential turning points of the movement from initial focus on development financing, to shifting to climate financing and climate repated topics, as well as creating a more holistic understanding of human rights and gender responsiveness in taxation over the two decades.

Financing Care Economies in Times of Austerity

Progressive fiscal policies play a crucial role in responding to ongoing multiple global crises in mobilising revenue and spending it towards a care-responsive and just transition. Care economies have gained recognition after the COVID-19 pandemic, and some governments in the Global South have created new frameworks and policies to promote them. However, funding is clearly lacking in this sector. To deepen the care crisis, the economic crisis after Covid-19 International Financial Institutions (IFIs) like the IMF have established strict measures that required public expenditure cuts as a condition to receive emergency pandemic response funds. As a result, frameworks will not be implemented, and there is a danger of financializaion, tax exemptions to care providers and customers driving the implementation, along with private sector involvements making it a profit driven sector, that doesn't address the most acute care needs. The paper assesses trends care economy financing from progressive taxation sources in 16 countries in the Global South

KOLIOPANOS, YAGOS* (Observatoire du sida et des sexualités, Université Libre de Bruxelles, Belgium)

Queer People over 50 Living with HIV in Belgium during the so-Called "End of AIDS" Era

The first part of this paper presents the various challenges (in terms of recruitment, methodology and analysis) of a qualitative sociological survey of people over 50 living with HIV (PLHIV50+) in Belgium, independently of their gender identity and sexual orientation. The research focuses on a subject that, paradoxically, is both unthought of (insofar as no research exists on the subject in Belgium, unlike in other countries, particularly French-speaking countries such as France and Canada) and an increasingly significant reality (while PLHIV50+ represented only 19% of all patients in Belgium in 2006, they account for 49% in 2022). This poses a number of questions, firstly as far as the subjects themselves are concerned: in terms of health status (co-morbidities, long-term treatment side-effects, disability, etc.), quality of life (access to

institutions, mental and sexual health, relationship with family, etc.) and the fight against inequality and discrimination.

The second part of the paper focuses on queer over 50 living with HIV (PLHIV50+) in a time of what I have coined as "seronormativity", i.e., a medical, social and institutional "normalisation" of the virus whereby however intersecting sexual, racial and gender stigmas still very much prevail. Based on observations and interviews with various informants (QPLHIV50+ as well as various stakeholders in the Belgian HIV sector), I will try and show that older age can be both a handicap and an advantage, as it intersects with other social characteristics, in this case non-heterosexual and non-cis identities, but also social class, race and religion.

This paper presents the challenges (in terms of recruitment, methodology and analysis) of a qualitative sociological survey of people over 50 living with HIV (PLHIV50+) in Belgium. The research focuses on a subject that, paradoxically, is both unthought of (insofar as no research exists on the subject in Belgium, unlike in other countries, particularly French-speaking countries such as France and Canada) and an increasingly significant reality (while PLHIV50+ represented only 19% of all patients in Belgium in 2006, they account for 49% in 2022).

This poses a number of questions, firstly for the subjects themselves: in terms of health status (co-morbidities, long-term treatment side-effects, disability, etc.), quality of life (access to institutions, mental and sexual health, relationship with family, etc.) and the fight against inequality and discrimination.

Secondly, in terms of theoretical framing, since this research is being carried out at the Observatoire du sida et des sexualités, a resolutely multi-disciplinary research center (psychology, anthropology, sociology).

Finally, in terms of the co-construction of knowledge with the agents concerned, whose older age is likely to turn into "expert patients", but also with political stakeholders in a context of medical hegemony where the fight against HIV/AIDS is very largely reclassified as a sector of the promotion of sexual health.

Wealth and Childbearing – Fertility By Parity According to Own and Parental Wealth in Swedish Administrative Taxation Data

The relationship between wealth and fertility has rarely been studied in high-income societies, in contrast to other dimensions of socioeconomic status. This study provides novel evidence of an association between wealth and fertility in contemporary Sweden by examining administrative taxation data for all Swedish men and women born in 1940 and 1960. The study considers both personal wealth and parental wealth and examines differences by parity and across the wealth distribution. Overall, the relationship between wealth and fertility in Sweden is relatively modest, with little difference in average fertility between the very wealthy and those with no wealth. The relationships are similar for men and women, but is more negative for women and attenuates for the later cohort. The largest differences were found when examining how average wealth differs by parity, as the childless have greater wealth than women – and, to a lesser extent, men – with children. This finding contrasts with emerging positive associations between fertility and other dimensions of socioeconomic status, such as income, in Sweden and other high-income countries.

Exaptive Resilience: Reconceptualizing Resilience As a Catalyst for Transformative Social Change

This paper argues for a reconceptualization of resilience that emphasizes its transformative potential, grounded in the concept of exaptive resilience. Drawing on an extensive review of the literature, it challenges dominant critiques that frame resilience as a neoliberal governance strategy. Instead, the

paper posits that a proper understanding of resilience, particularly through the lens of exaptive resilience, reveals its power as a catalyst for emancipatory social change. The concept of exaptive resilience, as developed by Kollár and Kollár (2020), refers to the creative repurposing of existing resources and capacities to generate novel, transformative responses to crises. In contrast to adaptive resilience, which focuses on incremental improvements to existing solutions, exaptive resilience involves a fundamental reconfiguration of the system towards new, more desirable equilibria. The paper illustrates how exaptive resilience emerges from the inherent capacities of communities to self-organize and innovate in the face of adversity. It demonstrates how local actors, drawing on their own knowledge, values, and resources, can creatively transform their circumstances. Building on these insights, the paper argues that nurturing exaptive resilience should be a central goal of international aid and development efforts. However, this requires a fundamental paradigm shift away from top-down, technocratic interventions aimed at engineering resilience from the outside. Instead, the focus should be on fostering the conditions for exaptive resilience to emerge organically from local contexts. Theoretically, the paper contributes to resilience studies by offering a more, transformative, and politically empowering conception of resilience, centered on the concept of exaptive resilience. In conclusion, the paper invites a reimagining of resilience as a powerful catalyst for transformative social change. By harnessing the exaptive potential of communities to creatively reinvent themselves and their worlds, resilience can serve as a pathway towards more just, sustainable, and flourishing futures.

Ideologies in Europe – Evidence from 38 Countries

During the 20th century, it became popular in Europe to believe that the age of ideologies had ended. However, recent evidence suggests that ideologies still play a significant role in shaping political discourse and public opinion. This study aims to empirically examine the values and beliefs associated with liberal and conservative ideologies among the European public. More specifically, it seeks to identify the values and ideas that Europeans associate with liberal and conservative labels, and the factors that influence these associations. The analysis is based on survey data from 38 European countries and measures assessments of 20 values and ideological elements. Multi-level regression models were used to analyse the influence of individual-level variables, such as ideological self-position and demographic characteristics, and macro-level factors, such as country's ideological orientation and level of development. The results reveal that while some values strongly align with liberal (e.g. gender equality, cultural diversity) or conservative (e.g. strict laws, military spending) ideologies, many like freedom, equality and environmental protection, are considered applicable to both. The results also highlight that individuals tend to evaluate statements based on their own ideological beliefs. That is, liberals systematically evaluated all values as more liberal and conservatives as more conservative. Overall, the findings suggest that ideologies in Europe contain overlapping liberal and conservative elements. While there are identifiable ideological values, their boundaries are flexible, and contextual factors heavily influence whether these values are perceived as liberal or conservative.

Intergenerational Dialogues: South Asian Parents' Approaches to Discussing Race, Culture, and Racism with Their Children in Canada

Selecting strategies for navigating intercultural spaces is an ongoing challenge facing migrants and racialized groups in diverse societies such as Canada. A particular challenge for parents is deciding how to socialize their children about the possibility of facing racism or stigmatization and about how to engage with both their cultural roots and other groups in their society. Conversations surrounding race, culture, and racism are often difficult for parents to have with their children, and current parental ethnic-racial socialisation research demonstrates a diversity of ways that parents may or may not approach these subjects. Contributing to this area of research, this project explores how South Asian parents in Canada engage with their children on the topics of race, culture, and racism. In particular, three questions are examined:

1. How do parents engage with their children about their own race or culture?
2. How do parents engage with their children about other races or cultures?
3. How do parents engage with their children about racism that their own or other races/cultures may face?

These questions are explored through semi-structured interviews (n=27) and a Likert-scale survey adapted from a study by Hughes & Chen (1997) (n=164). Preliminary results of the survey have shown that messages of cultural socialisation are used more than messages of preparation against bias or promotion of mistrust. Moreover, grounded theory analysis of the interviews suggests four themes:

1. A parental focus on culture instead of race
2. Parents conveying explicit anti-racist messaging to their children
3. Parents believing that multiculturalism is a protective factor against racial or cultural discrimination
4. Racism being a difficult topic to discuss

As a whole, this research aims to understand how South Asian Canadians are navigating parenting in regard to interculturality, while additionally hoping to give guiding examples to present and future parents.

KOMAROV, NIKITA* (Russian State University for the Humanities, Russian Federation)

The Role of Population Surveys in Updating the Social Contract: Can Artificial Intelligence Replace Public Opinion?

The social contract is ensured by well-established communication between the state and citizens. Regular population surveys allow obtaining data that reflect the needs and assessments of the work of state institutions. It is sociological research that is the main tool for obtaining feedback from citizens.

Currently, almost all surveys are conducted using digital technologies. Different time zones, a large number of regions, cultural norms, and linguistic diversity complicate the collection of information from citizens. To make management decisions, it is important to conduct surveys simultaneously and in a short time. At the same time, there are areas where collecting information from the population is especially difficult, especially settlements harsh climatic conditions or located far from transport routes.

The spread of online surveys allows us to solve such problems. The main advantages of online surveys are speed, low cost, and independent completion of the questionnaire by the respondent. But there are also problems. The most important problem is the lack of precise evidence that the questionnaire was filled out by a person with the necessary characteristics. Imitation of answers can be done both by people and by artificial intelligence. The capabilities of artificial intelligence are growing every day.

Today, it is already possible to obtain fairly plausible distributions of responses to many topics that interest sociologists. Questions related to the rights and obligations of citizens, requests from the population addressed to the state, and assessments of the activities of government bodies are too sensitive to be entrusted to the generation of responses by artificial intelligence. How can the process of collecting data on the Internet be controlled? How accurately does artificial intelligence reflect public opinion? How can we resist speculation in the research support of the social contract? These pressing issues require discussion by the professional community in the near future.

Is Using Public Transportation Considered As Pro-Environmental Behavior? : Maybe Yes, but There Might be Some Differences between Them.

Using public transportation is environmentally friendly compared to using cars. But there is not always just one reason for choosing a particular behavior. Using public transportation might not be chosen for environmental reasons.

The purpose of this paper is to see whether the factors selecting public transportation are different from those of pro-environmental behaviors.

In 2024, we conducted survey research in Japan. 1,500 people were randomly selected from across Japan. We outsourced mailing and collection of questionnaires to a reliable research institute. Response rate is 55.4 percent.

Findings are as follows: first, we found that different variables correlated with two behaviors. As for pro-environmental behaviors, the highest score of Spearman's rho was 0.340 for "I want to do whatever I can that would be good for the environment." Eight out of the top ten correlated variables were

environmentally related. But as for using public transportation, only two out of the top ten correlated variables were environmentally related. The highest rho score was 0.259 for "Using public transportation helps to solve global warming."

Second, we found that women were more likely to do pro-environmental behaviors. But, as for using public transportation, there was no relation with gender. In Japan, there is still a tendency for women to do housework. And we found that for overall respondents, there was a relation with housework sharing rate and pro-environmental behaviors. High-rate sharing (60-80 percent) respondents tend to do more pro-environmental behaviors than low-rate sharing (0-20 percent) respondents. But controlling by gender, we found this relation only in female respondents. And, as for using public transportation, there was no relation with housework sharing rate.

These findings suggest that public transportation is not chosen solely for environmental reasons. And we might need to consider the influence of traditional Japanese gender roles on pro-environmental behaviors.

Working for Idea Rather for Salary: Differentiation of Work Motivation between Orthodox Christians and Non-Believers in the Context of War (Case of Russian Design Engineers in Defense Industry)

We view work today as a place where transformations in the motivation and meaning of work occur under the influence of global cultural and geopolitical shifts. Over the past decades, the motivation of engineers at Russian defence industry has increasingly tended towards their materialistic model of remuneration. This opposite tendency replaced the Soviet work ethic of selfless service to society through socialist labor. Since the beginning of the special military operation in Ukraine, this trend has begun to change. Design engineers who work in defense industry find in their work Christian Orthodox ethics, which prescribes avoiding the increase of wealth through labor and viewing labor as selfless self-sacrifice. This work ethic is diametrically opposed to Protestant ethic of capitalism described by Max Weber. While Protestant ethic exploits purely rational abilities to calculate the profit for one's labor, the Orthodox work ethic is an example of value-rational action in which the idealistic goal is embodied (condensed). This reverse logic of labor seems to be more characteristic of non-Western societies today and will intensify over time. We present the results of a qualitative study of the work of design engineers from two Russian enterprises of the defense industry, as well as their colleagues from a private Russian plant. Based on natural sociological experiment, differences in the influence of the Special Military Operation on the transformation of labor regimes of teams, on the structure of motives of design engineers from enterprises with different forms of ownership are figured out. Despite the largely similar content of working activities, the differentiation of attitudes of engineers to various aspects of work and social significance of work is primarily due to contrasting value consciousnesses and the difference in ideologies, and only then belonging to different age cohorts and previous experience of labor relations.

Educational Workshop: How to Teach Students about Social Polarisation?

Where is our planet heading if democracies fail? Severe polarisation correlates with serious democratic decline, it can paralyse communities and countries in their attempt to make political decisions and it cripples a healthy discourse and dialogue. We aim to help tackle this challenge by educating young people about the cognitive and social mechanisms that lead to polarisation (e.g. confirmation bias, stereotyping) and by equipping them with some skills to deal with the problem. Within an international Erasmus+ project Action for Interactive Anti-Polarisation Learning Experiences for a Better Democracy we are preparing educational experiences for various audiences and formats: offline and online, and including social simulations of the process. During the workshop at the ISA Forum we would like to share and discuss an interactive game-based workshop format designed for students.

Workshop participants will first get an opportunity to play an educational game on polarisation themselves; the best way to see it from their students' perspective. The second part would be a co-creation workshop as we would like the participating teachers to discuss their experience and help us refine the format and adapt to their needs in a form of 'case clinics' session. Together we will help guide them through the process of how such a game can work in the classroom, so they get an understanding of how this educational method can be implemented. In this way, their students will be able to experience how easily polarisation evolves without delving into existing polarities as our topics are completely abstract.

LE Repas EN Pays Nordique De Côte D'Ivoire : Quel Apport De Socialisation ET De Moralisation DES Sociétés Traditionnelles ET DES Systèmes D'éducation Moderne

L'Afrique est la seule région du monde où les modèles auxquels les enfants sont exposés lors de leurs années de formation appartiennent tous à une autre culture que la leur. Pourtant elle a des modèles, des méthodes, des outils d'éducation qui avec la colonisation ont été progressivement déconstruits, nous mettant face à de nombreux problèmes d'éducation. Cet article s'intéresse à l'un de ces outils qui donnait à l'éducation en Afrique un caractère global, profond et particulier : le repas et particulièrement le repas au nord de la Côte d'Ivoire. Qu'est-ce que le repas au nord de la Côte d'Ivoire ? Comment contribue-t-il à l'éducation des populations ? Comment peut-il contribuer à l'éducation des populations dans un contexte scolaire ? Il ressort de ce questionnement conduit à travers un guide d'entretien et l'observation participante, que le repas en Afrique est un outil d'éducation qui contribue fortement à la socialisation et à la moralisation de la société. Organisé de manière particulière avec des objectifs précis, il peut contribuer à l'éducation des populations dans le contexte scolaire à travers l'EDHC.

Shifting Professionalism: Navigating Patient-Centred Care and Professional Authority in Japanese Trans Medicine

In early medical sociology, Eliot Freidson was a key figure in discussing the dominance of healthcare professionals. However, as Freidson acknowledged in his later work, the traditional concept of professional dominance has become less tenable since the late 20th century due to shifts toward consumerism, managerialism, and changes in industrial structures. While these changes have introduced signs of de-professionalisation and patient-centred care, they do not signify the resolution of professional dominance. Rather, professional authority persists in more flexible and resilient forms.

Trans medicine, series of healthcare for medical transition and gender affirmation, historically rooted in practices of pathologisation, gatekeeping, and paternalism, has seen significant shifts. Guidelines increasingly emphasise patient autonomy and decision-making. However, despite these changes, traditional medical frameworks and the authority of healthcare professionals continue to shape clinical practice. For instance, studies have shown that “risk” and “uncertainty” are often invoked by professionals of trans medicine to justify their control over medical decisions, reflecting ongoing tensions between patient agency and professional authority.

This study draws on interviews with 21 healthcare professionals involved in trans medicine in Japan, focusing their assertion of their roles within their medical practices, to examine how they navigate their roles within this evolving landscape. While some professionals advocate for a more collaborative relationship with patients, their roles remain unsettled as they balance traditional gatekeeping with emerging expectations for patient empowerment. By situating trans medicine within broader debates about professional dominance and patient-centred care, this study offers a nuanced understanding of the shifting but persistent authority of healthcare professionals in contemporary healthcare.

KONNO, MINAKO* (Tokyo Woman's Christian University, Japan)

New Social Realism for a Sociological Concept of Resilience

The concept of resilience poses theoretical challenges that are inextricably linked to both empirical and normative sociology, forcing us to reconsider our understanding of society and societal health. Social realism is a particularly relevant theoretical position in this context. Although it has been relegated to the status of a relic of the past since the establishment of methodological individualism, whether behaviorist or constructionist, with associated social nominalism, social realism provides us with an important theoretical orientation as we reexamine this fundamental problem. This paper suggests three viewpoints that might offer valuable insights for envisioning new social realism that could form a basis of a sociological conceptualization of resilience. The first are the sociological theories emerged in the early twentieth century, most notably those of Charles H. Cooley and Emile Durkheim. These theorists may have been considered as pioneers of constructionist sociology, but their work, which expanded upon the legacy of organismic understanding of society, suggests the importance of social realism that goes beyond any strands of nominalist thought. The second is the way that various disciplines have recently approached the ontological modality of the social. Along with other sciences such as neuroscience and physics, biology, which has historically had a significant impact on sociological thinking, is offering particularly notable viewpoints that can be useful for our purpose. The third is the field concept of societal embodiment that theorizes the relationship between society and individuals in a new light. It enables us to view society as the effects and components of a certain energy field that organizes individuals, groups, and the entire physical/biological environment, providing a means of conceptualizing societal health in a way that is relevant to both empirical and normative theory construction in sociology.

Civil Society in the Conditions of Political Transformation in Kazakhstan

The years 2022-2024 were marked by changes in power in Kazakhstan. After a long period of rule, the regime of Nursultan Nazarbayev, the first president of Kazakhstan, gave way to Kassym-Jomart Tokayev. As Nazarbayev's successor, Tokayev, despite the authoritarian nature of his predecessor, had a more democratic reputation and was well-known in the international community, given his long diplomatic career.

After being mass protests in January 2022, Kazakhstan's long-standing power duumvirate fell. Tokayev held on to power by promising sweeping political reforms and greater freedoms for civil society. It looked like the truth, because was such as social mood and rising hope to change from authoritarian pattern to the real democracy. It was a great chance for become others.

Subsequent events, including Russia's aggression in Ukraine, significantly narrowed the potential for democratic transition in Kazakhstan and Central Asia. Most of the countries in the region succumbed to the new authoritarian wave and rolled back reforms. Experts called this period “democracy delayed.”

Meanwhile, an analysis of the Kazakhstani political space has revealed that there is a basis for civil society. However, civic practices have not developed. For a long time, the state dominated and most citizens got used to living under the conditions of state paternalism.

After the public contract of power in exchange for reforms was tacitly accepted, Tokayev's presidency is gradually drifting towards the priority of security. The government is trying to start new reforms through the development of public advising and elections of local authorities. However, the lack of a systemic efforts and weakened personnel potential against the background of the “brain drain” do not allow jumping out of the trap of authoritarianism.

The question is at what cost they will occur and to what extent Tokayev will be able to steer the political transition towards true democracy.

Experience of Applying the OECD Methodology in Assessing the Quality of Life of the Population in Kazakhstan

Kazakhstan is still a transit state. Despite the availability of significant resources, the standard of living of the population lags significantly behind the standards though for middle-income countries.

At the same time, Kazakhstan faces methodological difficulties in measuring the standard of living. Quality of life statistics do not fully reflect international measurements, including those of the OECD.

In order to build the capability of Kazakhstan's statistics, a comprehensive sociological study was undertaken in 2024 using the OECD Better Life Index methodology.

The study concluded that human capital in Kazakhstan is underfunded. Housing per capita is not improving due to demographic growth and large migration from rural areas to cities. The labor market is weak. Demand for education and skills development is not high among the adult population.

There is people's concern about the mental health of youth in the context of rapid digitalization. We can also observe a low level of trust among citizens in others and political institutions.

Significant concern about security, as measured by the indicator “Do you feel safe walking home alone at night?” Threats include fraud, natural disasters, poverty, war, and the collapse of democracy.

Among the positive aspects, one can note the high social optimism of the population and solidarity within ethnic communities.

The results of the study were presented at the international conference in Astana on May 15, 2024 “Challenges of the current global uncertainty for transit states”.

The research is also available in the open scientific library at Academia.edu.

The survey was also sent to the Government of Kazakhstan and there was a response to it, including holding special events and the decision to strengthen dialogue with NGO.

The experience of assessing the quality of life using the OECD methodology was continued within the framework of the study on the level of trust.

*Imagining Ageing in AI-Based Technologies for Long-Term Care
– What Technology for Whom?*

The present is shaped by demographic change and an ageing population, leading to what has been termed the care crisis. Meanwhile, an increasingly wide array of AI-based technologies for long-term care (LTC) settings is being developed. These trends are framed and interlinked discursively in a particular manner: ageing is a problem and technology the solution. Drawing on empirical findings from three multi-perspective case studies of AI-based technologies for LTC settings, this contribution seeks to both elicit and trouble the images of ageing and technology that characterize this narrative. The intent of this endeavor is twofold: firstly, we aim to critically explore the implications of these images for the development and deployment of these systems and the resulting consequences for LTC residents. Secondly, we aspire to unveil mechanisms of exclusion, which leave LTC residents as mere bystanders to changes that may fundamentally impact their lives.

Our empirical inquiry nospans AI-based fall detection and prevention, social robots and automated emotion and pain recognition. Specific negative images of ageing such as frailty, loneliness, pain and incompetence influenced these technologies from initial conception to large-scale deployment: they were inscribed into the technologies and predisposed who could participate to what extent. Conversely, positive images of technology based on an assumption of functionality were employed to legitimize the use of these systems, serving as means to provide safety, security, sociality or happiness for older adults, although they often fell short of what they had promised to achieve. When technologies that fail to serve their official beneficiaries – the LTC residents – are deployed nonetheless, this raises the question of who these technologies really serve and how, especially when chosen over auspicious non-technological alternatives.

*Legal Geographies of a City in Distress: Climate Emergency,
Urban Revitalization Projects and the Fight for Spatial Justice in
Porto Alegre, Brazil*

There is a growing awareness of the global climate emergency and its impact on cities in the Global South. However, little is known about the legal geographies of cities where economic and political challenges are compounded by environmental distress.

This paper aims to contribute to the socio-legal literature on law and urban space, focusing on conflicts over the regulation of public space and struggles for spatial justice in Porto Alegre, Brazil. Categories from the subfield of legal geography served as the theoretical framework for designing a qualitative study as part of a project supported by the Brazilian National Council for Scientific and Technological Development (CNPq).

In May 2024, Porto Alegre experienced severe flooding after unprecedented torrential rains affected large areas of the State of Rio Grande do Sul in southern Brazil. The waters of Lake Guaíba took weeks to recede, leaving several neighborhoods submerged and impacting key urban infrastructure, with lasting consequences for residents.

Among the directly affected areas were emblematic waterfront public spaces: the Mauá Pier, Moacyr Scliar Park, and Marinha do Brasil Park, where urban revitalization projects were being implemented through public-private partnerships, albeit not without dispute. These locations also housed crucial components of Porto Alegre's flood protection system—walls, floodgates, dikes, and pump houses—that partially failed during the flooding due to a lack of maintenance.

In this context, despite the efforts of authorities at various levels, major media, and actors involved in delivering justice to maintain political consensus, controversial issues regarding the regulation of urban public space emerged, particularly concerning the protection of rights and the well-being of present and future generations. This paper seeks to illustrate the importance of norms and normative practices in addressing these new challenges and demands for spatial justice.

*Does Institutional Stratification Matter? the Meaning and Value
of a Tertiary Degree for Disadvantaged Students in Professional
Training Programmes*

Social stratification in mass higher education, in terms of a persistent class differential in accessing higher levels of programmes and different types of tertiary institutes, has received increasing attention worldwide. Increasing number of studies have point out that the expanded or more inclusive higher education systems do not necessarily narrow the social inequalities in educational and occupational attainment. Sociologists of education have explored the internal stratification within the higher education sector, in terms of the types and levels of qualification offered, institutional and degree prestige, and student composition, leads to differential occupational outcomes of their graduates. Findings from their research reveal that despite the anticipation of greater inclusion, students from privileged classes have retained their relative advantages in entering elite universities nearly in all nations. However, researchers have directed little attention to working-class students' intentions or motivations of getting valuable qualifications in new types/ less reputable tertiary institutions. Using in-depth interviews with students who enrol in different levels and types of accredited nursing programmes in the expanded tertiary education sector, this paper examines how students from less advantaged background make their educational choices in the increasingly stratified higher education system. I argue that choosing a programme that have a strong record on graduates' jobs and pays, despite their being offered by low-ranking institutions, is their strategy of acquiring a stable and proper employment at a lower cost in a shorter timeframe. This paper contributes to theories of institutional stratification and offers an alternative approach to understand young people's educational decisions and learning experiences in an expanded education system.

*Transformation of Hei's Three Missions in the German Social
Innovation Ecosystem: A Survey-Based Description of the Status
Quo, Its Challenges and Development Perspectives*

The recognition of the importance of and engagement with social innovation has increased considerably in Germany in recent years across all sectors and policy fields. In terms of innovation policy, the recognition of the potential to effectively tackle social problems and societal challenges was accompanied by the intention to create suitable framework conditions and funding instruments to foster SI. The German 'National Strategy for Social Innovation and Social Enterprises'[1] represents a milestone in this development. The implementation of the strategy is based on a large number of participatory, strategically and practically oriented activities and a corresponding process of networking relevant stakeholders, which are bundled through a digital platform[2]. A central pillar of the communication and interaction architecture in this process are HEIs, which as central actor of the quadruple helix approach can play a vital role in social innovation, as several case studies reveal.

Against this background, TU Dortmund University is coordinating the development of a national scientific network in the field of social innovation. [3] A key element of this process is a quantitative desk research and qualitative interviews on the current state of SI at HEIs, including their research, teaching and transfer activities as well as cooperation with societal stakeholders. While the quantitative survey provides an overview of how widespread SI is in the German HEI landscape, the qualitative interviews dive deeper into the question of SI's structural anchoring in HEI's strategies.

The presentation provides insights into the current activities and future challenges of HEIs in the German social innovation ecosystem. Furthermore, excerpts from position paper developed collaboratively by the scientific network will be provided for discussion.

Hidden Families: Prevalence and Disadvantage of Large Families in Germany

Large families in Germany are hidden in the public realm and more so the children living in these large families. This article takes a child perspective on large families by utilising the National Educational Panel Study (NEPS). While micro census and general household survey data focus on families, the NEPS data allows to explore the attributes of children and their parents such as educational achievement and economic position, when growing up in large families. With a focus on 12-year-olds, we capture the point in the life course at which family size is likely to be largest. Moreover, we estimate two models for three and four plus child families. Our findings show that children growing up in three child families are relatively common (18%). In contrast to other Western countries, families with four children and more are indeed rare in Germany (8%). We find that children in large families are not disadvantaged by income, but rather by educational opportunities. The German welfare state buffers the economic pressures for large families, but does not provide equal educational opportunities. These inequities intersect with a higher likelihood that children in large families have a migrant background. Other factors are religiousness, but not denomination. The article concludes with a discussion of the policy and institutional settings that shape large family life in Germany.

The Reproduction of Resistance in the Context of Body, Space and Temporality in the Anthropocene: Negentropy

In the Anthropocene, spaces are used as tools by the capitalism and power holders to preserve their existence and ensure their continuity. However, from a dialectical perspective, spaces are not only under oppression, control and domination; they also embody the possibilities and potential for resistance and the struggle for change, and provide a ground for social movements. The state of resistance allows individuals and communities to concretize their demands for rights by combining the search for justice against hegemony with spatial dimensions. Bodies, which interact with spaces, play a critical role as they mediate the emergence of these possibilities and potentials; the state of action and resistance is realized by bodies in the projection of space.

The state of resistance is not only an action against authority, it is also a spatial and temporal expression of the search for justice. In this context, resistance is determined as a strategy that ensures the temporal continuity of justice. The research examines the dialectic of body-space from a temporal perspective and focuses on how the state of resistance can be sustained and reproduced over time, beyond a specific moment. Based on this aim, the research is designed to answer the following question: Can the state of resistance in the dialectic of body-space in the Anthropocene be reproduced independently of time and space?

Based on the research question, an experimental cube was designed as a representative space to observe the spatial and mental effects of the resistance of bodies by taking action together against an obstacle. This experiment, named Negentropy, allows the participants to embody the collective state of resistance through physical and mental unity. Participants practiced resistance strategies by acting together against an obstacle. The findings reveal that individuals reproduce resistance in the dialectic of body-space in a temporal process and reinterpret space.

A Two-Sided Mirror of Integration: Migrant and Host Society Relations in Latvia

Numerous studies consistently indicate that citizens of Eastern and Central European countries exhibit some of the strongest anti-immigration sentiments in Europe. These attitudes are deeply rooted in historical experiences and

shaped by geopolitical factors. Following Russia's invasion of Ukraine, Latvia, like many European nations, has experienced an unprecedented influx of Ukrainian refugees. This shift has transformed Latvia from a primarily "sending country" to one grappling with the challenges of being a "receiving country". Neither society nor its institutions were fully prepared for such a dramatic change. While attitudes toward Ukrainian refugees have generally been overwhelmingly positive, perceptions of migrants from third countries remain largely negative.

This paper aims to analyze the integration process in Latvia by examining both perspectives: the experiences of immigrants, highlighting their concerns, and the viewpoints of the local population. The analysis draws on multiple quantitative migration studies conducted in Latvia during the last years, as well as the ongoing project on migrants reception, which provides qualitative data: in-depth interviews with immigrants and natives across five different localities.

Biographical in-depth interviews with refugees and migrants reveal various aspects of their social inclusion and well-being in Latvia, while also offering insights into how migrants' social and cultural capital can either facilitate or hinder the integration process. This data is interpreted in conjunction with results from quantitative surveys with Latvian residents. Typological groups based on locals' perspective, estimated by cluster analysis, are explained according to different theoretical models of attitudes toward immigrants. Such a juxtaposition of data allows for a deeper understanding of the reciprocal nature of migrant integration, where both migrants and the host society evolve through their interactions.

This paper is supported by projects "Migrants Reception in Times of Uncertainty: Governance and Local Inclusion" (No. Nr. LZP-2023/1-0227) and SRP project "Vectors of societal cohesion" (No. VPP-KM-SPASA-2023/1-0002).

KOROTAYEV, ANDREY* (HSE University & Institute for African Studies, Russian Academy of Sciences Moscow, Russian Federation)

Revolutions and "Maximalist Campaigns". a Reconsideration

In recent years, we could see a sort of "Berlin Wall" between the studies of revolutions and "maximalist campaigns". Though the researchers of revolutions and "maximalist campaigns" tend to study (as we will demonstrate) essentially the same phenomenon, they appear to ignore each other's work (in our paper we present a few salient examples).

Is this a coincidence that the study of revolutions and "maximalist campaigns" yields so similar results (as we show in our paper)? Of course, this is not a coincidence, as both kinds of research study essentially the same processes. As we demonstrate, Erica Chenoweth, the creator of the Nonviolent And Violent Campaigns and Outcomes (NAVCO) relies on a definition of "maximalist campaign" that is virtually indistinguishable from the present-day definitions of revolution.

Note also that the NAVCO contains mostly the same events as the present-day most advanced database of revolutionary episodes, the one developed by Mark Beissinger. Thus, the researchers of revolutions and "maximalist campaigns" study essentially the same phenomenon. However, the "Berlin Wall" separating them negatively affects both camps. On the one hand, this leads to the dismissal of accomplishments of all four preceding generations of revolutionary theory by the students of "maximalist campaigns"/"organized resistance"/"civil resistance"/"dissident campaigns"/"civilian revolts", without any justifiable rationale, which leads to the fact that those studies tend to produce rather theoretically shallow results. Meanwhile, the revolution students' ignorance of the findings of the "maximalist campaign" research does not let them to understand how well the 21st century revolutions have already been studied empirically.

We believe that both streams of the modern revolution research should be merged, which could lead to a real breakthrough in our understanding of revolutions and finalize the formation of the fifth generation of revolution theories.

Legal Intervention to Defend and Protect Syrian Refugees in Lebanon

This study falls within the framework of a fragile environment. It aims to shed light on what Syrian refugees in Lebanon face at governmental and political levels and their exit from Lebanon by illegal migration. First, after presenting the Lebanese context, this report will attempt to describe the different legal and illegal discrimination patterns and violations among Syrians in Lebanon.

The study will show that achieving some concrete steps to help improve the social conditions of Syrians requires a commitment from everyone, such as international community, non-governmental organisations, and the Lebanese government. The report concludes with recommendations to combat the abuse of Syrian refugees in Lebanon and the growth of hate speech on the one hand, and, on the other, the possibility of effectively reducing illegal migration through protection measures and a renewed Euro-Lebanese strategy focused on circular migration, investments, and creative cooperation.

KORTAM, MARIE* (Institut français du Proche-orient, Lebanon)

Palestinian Armed Group from Nationalism to Islamism

On a religious level, some camps are stigmatised as "Islamist heaven." More specifically, Nahr Al-Bared camp and Ein El-Helwe (EEH). EEH is still the unique camp governed by three bloc forces: PLO (Palestine Liberation Organisations) factions, Syrian aligned factions called the Alliance *Tahaluf*, and Islamic factions. In addition to unofficial governance and control of some squares by Islamist-jihadist unofficial groups such as *Al-Shabab Al-Muslim* and other jihadist movements.

This paper focuses on the head of *Al-Shabab Al-Muslim* armed group, Sheikh Usama Al-Shahabi, in the Palestinian refugee camp of Ein El-Helwe in Lebanon and seeks to understand the dialectic relation between nationalism and Islamism among this group. I use the terms and concepts of agentivity, socialisation, and social identity to analyse the local factors of shifting from nationalism to Islamism and jihadism in a political vacuum, in the first section. In the second one, I examine the division of the Sunni sphere and the rise of united Iranian Islamist ideology, which influenced the change of ideology of Al-Shahabi and his jihadist group.

EEH camp is the concern of this study, as the capital of the Palestinian diaspora and, what the Lebanese press has dubbed an "island of insecurity". More specifically the paper will focus on the head of *Al-Shabab Al-Muslim* group, Sheikh Usama Al-Shahabi, to understand the dialectic relation between nationalism and Islamism among this group. I seek, through the analysis of a single trajectory, to bring to light this experience as the actor defines and constructs it, accepting the absence of statistical representativeness in favour of a more precise and detailed analysis that will focus on the relationships between social categories rather than on the categories themselves (Granger, 1988).

Experiences of the RC51 Open Online Activity - Conceptual Discussions in the Sociocybernetic Framework

RC51 open online activity at regular intervals started in September 2024. The main idea is to stay connected and to have a chance to share conceptual discussions in the sociocybernetic framework also in between the annual conferences. The choice of concepts to discuss will be made during the process taking into consideration the interests of the participants. To launch this kind of activity is based on ideas of co-learning and co-innovation. The first concept chosen for discussion was TIME. Thoughts, questions, and literature shedding light to the chosen concepts are welcome. The sessions are initiated, led, and facilitated, also in form of collaborative documentation of the discussions by Finnish RC51 members, Mikael Kivelä and Raija Koskinen

All together three online meetings (90 minutes each) will be organised in the autumn and three in the spring 2025. The preliminary plan is to continue with this activity during the period of the RC51 board 2023 – 2027. The times for further meetings will be decided based on experiences gained and feedback received from the participants and those with interest to join.

In this invited session experiences gained of this online activity are reflected upon with those who have been involved in the RC51 online activity during the term 2024 – 2024, and who volunteer to participate in the panel discussion during the 5th ISA Forum of Sociology in Rabat, Morocco on July 6-11, 2025. The discussion focusing on the conference theme *Knowing Justice in the Anthropocene* is led by Raija Koskinen and Mikael Kivelä.

Strengthening Social Justice in the Digital Era in the Educational Institutions

Digitalization has influenced in multifaceted ways the lives of the individuals as well as communities and societies locally, regionally, and globally. The impact has been felt in numerous ways, such as providing new opportunities, demand for renewal, and in various forms of acceleration. Also, the representatives of the public authorities have faced need to take a stand on this digital transformation.

Even though painfully recognising the numerous forms of violating and oppressing use of authoritative power, the institutions representing public authority may also have a positive function in the society. Hence, regarding social justice in the digital era, it is of importance to identify such constructive elements and to nurture these to strengthen positive developments. We apply sociocybernetics in this endeavour focusing on the field of education.

Many of the choices for how social justice is understood in various settings and communities are made in the practical encounters of teaching and learning, teachers interacting with their students and with others associates in their community. In this paper we bring perspectives of Finnish & Indian social work education with respect to social justice in the digital era: through curriculum, experiential learning, field practicum, service learning, community camp and research projects.

KOST, MIRIAM* (Technische Universität Berlin, Germany)

From Positive to Negative: Dynamics of Talking with Children about Well-Being at School

The positive (re)definition of well-being represents one of the "major shifts" (Ben-Arieh, 2006, p. 1) in child well-being research over recent decades. It is based on the recognition that well-being is more than the absence of harm (Ben-Arieh, 2005; Moore et al., 2004; Aber/Jones, 1997) and has led to a research practice that asks children to give information about positive aspects of their lives and „good news“ (Ben-Arieh/Goerge, 2005). In terms of school well-being, this change in perspective "From Negative to Positive" (Ben-Arieh et al. 2014: 14) can currently be observed, for example, in the OECD PISA studies, which, for the third consecutive time, have also concentrated on student well-being. While the initial focus was primarily on issues such as bullying, which negatively impact children's well-being, there is now a greater emphasis on positive aspects that contribute to the quality of students' lives, such as openness to diversity, social relationships, and resilience (OECD, 2023, p. 65). The presentation will draw on initial findings from an ongoing PhD project that empirically show a reverse shift emerging in qualitative interviews on school well-being, which ask about positive factors for children's well-being. Children 'use' these interviews to address and draw attention to problems and circumstances at their schools that make them feel *unwell*. The presentation will theoretically and methodologically reflect on these findings.

KOSTET, IMANE* (University of Antwerp, Belgium)

Cultural Boundaries and Symbolic Markers of Autism: How Cultural Sociology Enhances Understanding of Ethnic and Racial Inequalities in Autism Prevalence Rates

Ethnic and racial minoritised groups in Global North countries are significantly less likely to be identified and diagnosed as autistic compared to the majority group. To explain these disparities, much of the current research focuses on the so-called "ethnic and racial cultures" of minoritised groups. This approach often results in essentialist views and frames minoritised families in terms of deficit. In this paper presentation, I argue for the urgent need to broaden the concept of culture in autism research and to examine culture as the social construction of frames, cultural repertoires, identities, cultural categorizations, and symbolic boundaries created through processes of meaning-making. Building on such a cultural sociological framework, I critically explore how ethnicity and race become (in)visibilized in the construction and representation of autism, both as a medical category and as an identity. Using qualitative methods and building on the concept of symbolic boundaries, this research sheds light on how autism becomes "ethnicized" or "racialized" through a) autobiographical books, blogs, and vlogs; b) the narratives of diagnosticians; and c) the lived experiences of ethnically and racially minoritised autistic adults. By addressing these issues, this study aims to contribute to broader

efforts to rethink both academic and lay understandings of disability and neurodiversity as deeply embedded in socio-culturally situated processes of meaning-making, and to examine how this knowledge is influenced by the rhetorical aspects of disability.

KOTAMRAJU, PRIYANKA* (University of Cambridge, United Kingdom)

Fieldnotes of a Feminist Killjoy

Following feminist visions for a feminist ethnography, I threw myself into fieldwork last year as a woman ethnographer deeply listening to women's voices, writing thickly about women's experiences in the everyday social marked by violent, intersecting caste, class and gender inequalities in a "non-dominating way", with care and attachment, bringing into focus the particular *not* the general, more participant than observer. I carried feminist dilemmas around positionality and objectivity with me into the field. However, I did not anticipate the feelings that tagged along with the acts of participation and observation - the waves of rage, bursts of anger, and spells of madness. I followed Dalit women at work, watching them wage daily battles for survival and safety, continually negotiate for freedoms, agency and dignity, and struggle endlessly against multiple interlocking oppressions. How could I not be consumed with fury even as a dislocated witness to these lived lives? How could I live with this anger (beside it, beneath it and top of it as Audre Lorde wrote) and then turn into a palatable ethnography of "close-in contact with far-out lives"? Could this even be a feminist ethnography? In this paper, I offer an excavation of my fieldnotes to reveal the workings of a researcher who became a feminist killjoy in the field - an intervening, interfering, interrupting, interrogating participant. I rolled my eyes too hard, argued too loudly, ranted too freely, questioned incessantly, and laughed too openly. I recorded my own dissidence even as I documented the dissident lives of others. My objective with this paper is to articulate what takes place when we, the feminist researcher, are in fact at work; what happens within us as observers who are in the process (business even) of observing others. Does feminist anger have epistemic value in ethnography?

WG08-915.5

KOTIGANAHALLIRAMAIAH RAJESHWARI, DISHA* (Indian Institute of Technology, Bombay, India)

Food and Love: Navigating Intimacy, Cultural Practices and Social Hierarchies

In India, food is a significant marker of social distinction and hierarchy, tightly governed by caste, as it serves as an important site for intimacy. The regulation of intimacy, central to the endogamous caste structure, enforces strict rules around bodily contact - both direct (through touch) and indirect (through food). This policing dictates who one can physically touch and with whom one can dine. Inter-caste intimacies, by crossing these boundaries of bodily contact, challenge the caste order. In this paper, I explore such inter-caste intimacies, particularly between Dalits and members of the other castes, to examine the relationship between food and love. Using ethnographic data, I delve into how young couples from different caste backgrounds, specifically in rural South India, decipher food and navigate their different food tastes and cultural practices. The paper also looks at how non-Dalit partners perceive the caste-based division of food, which relegates and stigmatises Dalit food as 'polluted' and how these relationships challenge the hierarchy of caste through their intimate bonds. In doing so, the paper highlights emerging possibilities for inclusivity, both in the private and social spheres.

KOTNAROWSKI, MICHAŁ* (Institute of Philosophy and Sociology Polish Academy of Sciences, Poland)

The Struggle for Democracy - Views and Evaluations of Democracy As Elements of Political Competition.

In European countries and many places outside Europe, there is almost universal declarative support for democracy. Actors openly describing themselves as opponents of democracy are marginal among both political parties and citizens. On the other hand, the quality of democracy varies across countries, and processes of democratic backsliding are observed in certain places. The combination of these phenomena means that politicians who implement anti-democratic policies and the voters of such parties also consider themselves democrats. The question arises here: if they are all democrats, do they all mean the same thing when they talk about democracy? In this article, we are interested in citizens' perspectives. From this point of view, an important question is what supporters of parties responsible for

democratic backsliding think about democracy? This raises another question: to what extent do views of democracy fit into the axes of political competition? To what extent do the electorates of different parties agree on the importance of certain features of democracy? This question is fundamental regarding how deep the political dispute is and how political competition is defined. A second issue is whether electorates differ in assessing how democracy works. Here, the question is: to what extent do the evaluations of the same political reality depend on political preferences? Differences in evaluations of democracy may, in turn, influence how the stakes of an election are defined - is it the implementation of specific sectoral policies or the constitutional shape of the state? The paper analyses data from the European Social Survey, mainly from the Understandings and Evaluations of Democracy module carried out in 2012 and 2021/2. The analysis will focus on Hungary and Poland, which are considered as cases of a high degree of democratic backsliding. However, citizens' attitudes from these countries will be analysed from a comparative perspective.

Doing Digital Families: Exploring the Intersection of Digitalization and Family Life

The increasing digitalization of everyday life is reshaping the family in profound ways. Historically, the Industrial Revolution marked a shift from families as units of production to spaces of care and intimacy. Today, however, with the rise of digital technologies, families are evolving into hybrids of production, care and intimacy, due to digitalization and a growing increase of social functions performed digitally, from the home or from a distance. These changes have significant implications for family practices on individual, structural, and institutional levels.

In this paper, we explore the digitally driven transformations of families and how these shifts challenge traditional understandings of the family, both as a concept and as a lived socio-cultural practice. By reviewing studies from the last 15 years, we examine how digital technologies are shaping family dynamics and ask how these studies are extending our theoretical knowledge of family as practice, addressing new forms of family sovereignty as well as vulnerabilities in and for the family.

While digitalization is often viewed as a global phenomenon, its effects are not experienced uniformly. Social changes brought about by digital technologies are gendered, can vary across socio-cultural and geographical contexts, and manifest themselves differently in contexts of migration and (im)mobility, for example. Therefore, this paper proposes a comparative framework that aims to enhance our theoretical knowledge of how digitalization is transforming the family in diverse settings.

Finally, this paper serves as a foundation for a future anthology, inviting contributions from scholars presenting at the ISA Conference 2023 and ISA Forum 2025, to further explore the complex and evolving relationship between digitalization and family life.

KOTZEVA, TATYANA* (Bulgarian Academy of Sciences Institute for Population and Human Studies, Bulgaria)
KUZDOVA DIMITROVA, ELITSA (Bulgarian Academy of Sciences Institute for Population and Human Studies, Bulgaria)
GEORGIEVA, IRENA (Bulgarian Academy of Sciences Institute for Population and Human Studies, Bulgaria)
ILIEVA, KALINA (Bulgarian Academy of Sciences Institute for Population and Human Studies, Bulgaria)

(New) Fathers in Bulgaria: Towards More Equal Participation in Childcare and More Shared Parental Leave

Parental leave is considered the main instrument of social policy to provide a better family-work balance for young people. Bulgarian legislation states different types of paid paternal leave if a man has paid social insurance: 15 days leave after the child's birth and leave transferred by the mother to the father after the 6th month of the child until the child's second birthday, which is taken by less than 1% of the fathers.

The study is based on research that aims to answer the following questions within the Bulgarian social context: How do fathers reproduce or challenge

the traditional gender role models when they are endowed with the right to take paternal leave? Do women's and men's attitudes and practices toward childcare and parental leave involvement differ according to demographic and social status characteristics (age, education, socio-economic status and job position)? What are the barriers that hinder more equal participation of fathers in childcare and what are the drivers that might encourage more involved fatherhood?

The analysis is based on a mixed-methods study with 2000 parents with children up to 7th age and in-depth interviews with young mothers and fathers. The study's theoretical framework is based on the concept of (social) sustainability and its gendered nature.

The main conclusions are that there are generational and social status differences in fathers' involvement in childcare and their participation in household tasks. The new fathers belong to the younger generation, taking also high social status positions (e.g. higher education), having more egalitarian gender attitudes and more permissive attitudes towards the use of parental leave. These generational and social status differences bring about (dis) continuities in the reproduction of gender (in)equalities in the private sphere and influence also social sustainability on a macro-level.

Connaissances, Attitudes Et Pratiques Des Vendeurs Informels De Médicaments à L'égard Des Antibiotiques Dans Le District Sanitaire De Nanoro Au Burkina Faso

Introduction

Au Burkina Faso le phénomène de la résistance aux antimicrobiens est présent et préoccupant. Une étude réalisée dans le pays montre que la consommation des antibiotiques est fréquente et inappropriée avec des tendances. Ainsi, cette consommation était de 54,8% à l'hôpital, 26,2% en pharmacie et 26,9% chez les vendeurs informels de médicaments. Par ailleurs, le Burkina Faso possède un vaste secteur illicite de médicaments et d'antibiotiques et représente 80% du marché, faisant de lui, le premier recours d'achat de médicament et d'antibiotiques. Même si des raisons économiques, géographiques, sociales et culturelles justifient le rôle important des vendeurs informels de médicaments pour la communauté, il faut toutefois reconnaître la contribution de ces raisons à la résistance aux antibiotiques dans les communautés à travers, la vente d'antibiotiques de moindre qualité, la vente sans prescription et la non maîtrise des contre-indication

Matériel et méthode

Cette étude qualitative s'est déroulée dans le District Sanitaire de Nanoro de mai-décembre 2022. A l'issue, vingt-trois (23) entretiens individuels approfondis ont été réalisés à l'aide d'un guide d'entretien semi-structuré avec des vendeurs informels de médicaments; et aussi des observations directes simulées. Les données ont été analysées avec le logiciel n'vivo, version 14.

Résultats

Les vendeurs informels de médicament ignorent la plupart du temps le terme « antibiotique » et « résistance à l'antibiotique ». Ils attribuent puissance et force aux antibiotiques, louant leur polyvalence dans le traitement des maladies. Par ailleurs, il existe des fluctuations inappropriées des posologies et du mode d'emploi des antibiotiques qui se matérialisent par des prises uniques d'antibiotiques.

Conclusion

Les vendeurs informels de médicaments possèdent des connaissances vagues sur la notion d'« antibiotique » et de « résistance aux antibiotiques ». Les antibiotiques occupent la première place dans la vente si bien qu'ils les assimilent à des médicaments miraculeux.

KOUKI, HARA* (University of Crete, Greece)

MALAMIDIS, HARIS (National and Kapodistrian University of Athens, Greece)

From Anti Austerity Protests to Gender-Based Mobilizations: Identifying Continuities and Ruptures in Social Movements in Greece during Crisis

The feminist movement in Greece hasn't always been a front-page issue; quite the opposite. However, since the rise of the #MeToo movement in 2017 and the sexual abuse allegations by an Olympic athlete in 2020, things changed radically. Artists, journalists, and athletes now speak about sexual misconduct; mainstream media report cases of femicide and rape; feminist collectives have multiplied; and demonstrations protest state policies on women's rights and systemic patriarchy in the judiciary and everyday life. In just a few years, gender-based mobilizations emerged at the forefront of collective activism in the country.

This paper attempts to unravel continuities and ruptures in social movements in Greece over the last decade, situating the rise of gender-based mobilizations within a broader context. First, drawing on previous research on Greek social movements during the protracted poly-crisis of the last fifteen years, we explore the reorientation away from traditional forms of protest politics into solidarity movements that foreground care and vulnerability. During the economic, refugee, and pandemic crises, this transformation in resisting austerity and injustice challenged traditional divisions of labor within movements and dominant modes of masculine militant organizing. Second, based on secondary sources and qualitative field research with movement initiatives in Crete, we aim to re-read movement activities through a gender-based lens while considering their interconnectedness with regional feminist movements. This helps us investigate the roles of reproductive politics, affect, and intersectionality in how broader social movements evolved during crisis and their impact on the discourses and practices of gender-based mobilizations. Ultimately, we seek to illuminate the unique trajectories and transformations of gender-based mobilizations in the Mediterranean during this period, highlighting how community struggles, local territories, and lived spaces in the region inform peripheral feminisms that challenge hegemonic understandings of resistance and contribute to the decolonization of feminism.

Green Transitions and Socioecological Imaginaries: Mobilizations Against Renewable Energy Projects in Crete's Hinterland

Crete, a strategic island at the crossroads of three continents, has become a focal point for large-scale, infrastructure projects targeting energy, environment, transport, digitization, and tourism. Together, these projects construct a vision of sociotechnical and economic development that seeks to alleviate the long-standing austerity and uncertainty that have defined Greece's recent history. Central to these efforts is the promotion of a 'green' transition, particularly in the energy sector, through the deployment of Renewable Energy Sources (RES).

This study critically examines the local impact of these national and transnational investments, focusing on how they affect the already fragile social cohesion and ecological balance in Crete. Specifically, we explore how communities across the island respond to the framing of 'green' and 'energy transition' in two interconnected ways. First, to unravel the broader context shaping transition expectations, on the one hand we outline the major infrastructural projects, and the socioecological narratives of progress promoted by key stakeholders identifying also historical precedents; on the other, we explore local groups and grassroots movements grappling with this development trajectory, arguing that it depletes community resources, landscapes, and cultural heritage. Second, we focus on communities that have mobilized against industrial-scale renewable energy resources (RES) in southern Crete. Drawing on participant observation and interviews, this qualitative research highlights community narratives, organizational strategies, and action repertoires in response to wind energy projects promoted by state, EU and transnational governance. In reframing ecological claims, local identities tied to a sense of belonging are (re)invented, revealing tensions within local and environmental groups and organizations, as well as both continuities and disruptions within environmental movements in the face of ecological crisis. The communities' alternative visions question the prevailing 'green transition' paradigm, highlighting how local populations navigate and contest broader socioecological transitions.

WG01-882.4

KOUNDAL, PAWAN* (Indian Institute of Mass Communication, India)

Digital Democracy: Unraveling Global Trends through Hashtag Analysis

In the era of globalization, hashtags have become powerful tools for shaping public discourse, particularly around democracy. This study proposes a quantitative analysis of hashtags used on social media platforms to examine how they reflect and influence public perceptions of democracy in the global context.

Focusing on popular global hashtags related to democracy, governance, and civic participation, the research will analyze the frequency, reach, and engagement levels of these hashtags over a one-month period. The study will identify trending themes and topics associated with these hashtags and assess how they are used in different regions to promote democratic values.

By collecting a dataset of hashtags from social media platform Twitter (now X) within the designated month, the research will use statistical tools to analyze patterns in hashtag usage. Key variables such as frequency of use, geographic origin, and user engagement will be examined to identify correlations between hashtag trends and regional democratic contexts.

This study will provide insights into how digital platforms, through the use of hashtags, contribute to global conversations on democracy. The findings will contribute to understanding the role of social media in promoting democratic participation in a globalized world, offering implications for digital literacy and civic engagement in modern democracies.

WG01-883.1

KOUNDAL, PAWAN* (Indian Institute of Mass Communication, India)

Digital Media at the Crossroads: Balancing Inclusivity, Civic Engagement, and Regulatory Challenges in the Age of Disinformation

The rapid transformation of digital media has transformed the means of communication into one that has unprecedented benefits and challenges in access, inclusivity, and regulation. This paper digs into how, on the one hand, digital platforms democratize access to media while also posing significant issues concerning algorithmic biases and the spread of disinformation. The two main themes highlight the potential of the platform in two ways: first, through concerns of accessibility and inclusivity, analyzing content consumption and public participation in democratic processes.

The paper, therefore, will spotlight digital platforms as influencers in relation to the shaping of a profile of civic engagement through social media and citizen journalism in order to draw out their dual potential in the enhancement or inhibition of democratic participation. With the growing influence of digital media in public discourse, more than at any other time, understanding its role in providing or blocking access to credible information has become important.

A mixed methods research approach will be adopted, combining the qualitative aspects of user perceptions regarding media credibility and engagement with quantitative analysis of algorithmic recommendation systems. Data-driven analysis will be conducted on how algorithmic systems influence the visibility of content and the ways users make their way around these systems to engage with different types of content. Surveys will further probe experiences and perceptions of user relationships regarding the credibility and inclusivity of digital media.

The paper will also delve into how regulatory frameworks of the future are shaping digital media. It will discuss global undertakings in balancing freedom of speech with regulation for the dangerous content, as well as new trends such as decentralized networks and blockchain verification with promises to redefine global media landscapes.

RC38-624.5

KOUTSIOUMPA, ELEFThERIA* (Institut Convergences Migrations Fellow, France)

Doing Biographical Interviews with Refugees As a Young European Scientist: from Data Extractivism to Care Work

Since 2015, refugee camps in Greece's border islands have attracted both media's and social researchers' attention. In over-researched communities (Sukkarieh, Tannock 2013) such as EU's refugee camps, people are often left

with the feeling of being "used" by researchers' extractivist methods. Whilst emerging research calls for qualitative research methods' decolonization (Davis and Walsh 2020, Kinsella 2021, Kinkaïd 2020, Cheng 2019, Smith 2012), most discussion focuses on the analysis and knowledge production process and dissemination rather than practices in the fieldwork. In this paper, based on an ethnographic research (observations, in-depth interviews) conducted in the Moria refugee camp (Greece) in 2020-2021, and an ongoing (2021-today) ethnographic research (participant observations, biographical interviews) on refugees living in Paris/Berlin but have lived in Greek camps, I shall explore concrete ways that conducting interviews, more than a mere means to data collection, can become spaces of care and identification of socially excluded groups' needs. In order to avoid reproducing existing power structures between me as a young European researcher and my study participants as non-European refugees, as well as further traumatization of a socially excluded group that has experienced State violence and social injustice, I have firstly found important to begin the interview process by emphasizing consent, providing a detailed explanation of my research process, and coming to an agreement on our emotions' management method. Secondly, active listening and applying self-reflection during the fieldwork has made evident that the inherently problematic effort to maintain scientific neutrality and objectivity, can be replaced with intellectual honesty. I thus hope that this paper contributes to the discussion on social research's decolonization, through the effort to transform biographical interviews into spaces where people are able to tell their stories to simply be understood, listened to, to exist.

Social Media Comment Sections As Spaces of Religious Learning, Counseling, and Dissent

For many Christians, the internet has become an integral part of their religious lives. Believers use Bible or prayer apps, browse products in Christian online shops, or watch sermon live streams when they cannot make it to church. Many of them, moreover, turn not only to online offers by established religious authorities but additionally or exclusively to Christian influencers. These accounts, some of which reach hundreds of thousands of followers, share insights into their religious practice, give advice on Christian living, or take stances in theological discussions.

In recent years, however, research on digital religion has often centered around how the internet has enabled new actors to disrupt conventional religious authority. Christian influencers, who are more often than not laypeople, are an example of such new or unconventional authorities, whom followers turn to for advice and whom some of them perceive as more authentic or trustworthy than representatives of religious institutions. Many of those who consume religious content online are not quiet followers but actively engage with what they see. Especially on video platforms such as TikTok and YouTube, comment sections are buzzing.

In my presentation, I will examine the potential of religious social media influencers' comment sections for digital religion research. Focusing on the video platforms YouTube and TikTok, I will show how their comment sections function as spaces of, in the case of TikTok, learning, and, in the case of YouTube, counseling, but also of dissent and boundary work. I will put particular emphasis on the role of confessional or denominational identities and cleavages in these discursive spaces. Moreover, I will present suitable digital humanities methods to scrape and analyze large corpora of comments, discuss methodical differences between platforms, and point to the limitations of DH methods in research on digital phenomena on social media.

KOVAC, ARIANE* (Ruhr University Bochum, Germany)

"We Aren't Playing Politics." How a U.S. Megachurch Manages to Present Itself As "Apolitical" amid the Culture Wars

At least since Donald Trump's presidency, the intensified societal polarization in the USA has not only run along political but also along religious and denominational lines. Not only do white evangelicals predominantly vote Republican, but studies also show that more and more Trump supporters have started to identify as evangelical and "born-again" over the course of his presidency. In the increasingly polarized U.S. society, Christian Right actors present their views as the only viable interpretation of the Bible and question the self-designation as "evangelical" or even "Christian" of more progressive or moderate believers.

In my presentation, I explore how U.S. evangelicals who do not form part of the Christian Right deal with societal and religious polarization. I focus on a moderate non-denominational megachurch that promotes a socially conservative stance but distances itself from the Christian Right. This church

has managed to believably present itself as “apolitical” amid the U.S. culture wars and even attracted members who had been put off by the politicized rhetoric of their previous church. As a church with members spread over the globe, it also manages to integrate a range of different political views and cultures.

Between 2021 and 2024, I conducted 20 interviews with members and pastors, analyzed about 100 sermons preached in the church, and observed worship services, Bible study groups, and other church events digitally and in person in Seattle and Los Angeles. Through this material, I will show how my case study positions itself in a polarized public sphere and what strategies it uses to evade political appropriation and distance itself from the Christian Right. By turning to how religious actors deal with polarization, I add a perspective to research on culture wars that transcends binary ways of viewing religious groups as either divisive or reconciliatory.

Posthumous Belongings: Choosing Disposal in Vaynakh Communities in Europe

For this panel, I propose an analyses of burying strategies and choices among the Vaynakh (Chechen and Ingush) communities in Europe (France, Belgium and Switzerland). These people mostly moved to Europe after the two Chechen wars (1994-1996 and 1999-2009), many of them, but not all, have received asylum. The link between Vaynakh refugees and their native soil is quite strong in terms of imagined geographies that push these people to act in certain ways and not others. At the moment of death of a member of community, the extended family should decide of the destiny of the dead body. Indeed, there is a possibility to bury relatives in Muslim slots of the European cemeteries, but since the place at the cemetery should be paid every 15 years (in France) and the idea of return is crucial, at least for the first generation of migrants, families prefer to invest into body repatriation. This procedure is quite expensive and slow down the process. However, inspite this delay, which is undesirable for Muslims, the Vaynakh communities often prefer this way of burying. This procedure has many constraints and represents a huge charge for the families of the deceased, accompanied by a whole transnational economy of death abroad and repatriation which shed light on the belonging priorities, the evolution of religious practices in mobility and the complex range of spatial and symbolical belongings. This paper is based on my empirical research (interviews and observations, monitoring of the digital sphere) in France (Paris, Nice, Strasbourg, Nantes), Belgium (Brussels) and Switzerland (Bern, Fribourg) in 2022-2024, which is still going and funded by the Institut Convergences Migrations in Paris.

No Longer Sacred: Social Mobility and Professional Identity in the Teaching Profession

The teaching profession constitutes a large group of around 1 million 200 thousand people in Türkiye as of 2024. For this very reason, it corresponds to a heterogeneous middle class position and constitutes a transition point in intergenerational mobility patterns. What kind of social mobility do teachers experience in relation to their parents and how does this relate to their relationship with their profession? In pursuit of this main question, this quantitative research is based on a survey of 1028 teachers from different branches and ages in Istanbul. Research sample has been created through quota sampling in accordance with the population, and the survey was applied in schools. The main hypothesis of the research is as follows: Teachers who experience upward social mobility also have higher expectations and aspirations for their profession. This brings with it debates and dissatisfaction with the traditional “sacred” image and prestige of the profession. The study analyzes teachers’ age, gender, experience and field via regression models, as well as a genuine scale of value attributed to the profession, and measures how they evaluate the image of their profession in relation to other professions. Thus, the research explores how the social status and prestige of the teaching profession are evaluated by teachers themselves in a relational view with other professional positions. In addition, questions about teachers’ lifestyles allow for a multiple correspondence analysis that maps their social origins, life chances and cultural capital together.

What the Faculty Lacks: Social Inequalities Among Law Students and Their Implications

In modern societies, legal professions have been associated with relatively high status, income and power. Until recently, the legal profession in Turkey both represented public power and constituted an advantaged elite. However, with the expansion of legal education, the stratification of those who join the profession is relatively recent. The opening of a large number of new law faculties in Turkey in the last 20 years has brought hierarchies such as public-private and old-new among faculties. The transformation of legal education into a heterogeneous field changes the meaning of the law degree, which has long provided high social position in Turkey. Based on a quantitative survey on a representative sample of students from 9 different law faculties, this study investigates how the field of legal education sets the stage for gender and class differences and how the former reproduces the latter. The research focuses on students from relatively low social backgrounds in faculties of different prestige. How do the professional skills, predispositions and forms of capital that law schools are expected to provide to future professionals differ? In pursuit of this question, the findings reveal that social stratification seeps through the cracks of newly observed stratification in legal education, and that inequalities in gender, class and cultural capital that students bring with them from their social backgrounds are transmitted to professional pathways. Most importantly, the fact that faculties lag behind the specific skills and attainments required by the professional labor market affects disadvantaged students the most. However, students’ attempts and orientations to compensate for this situation develop independently of the curriculum and instruction at the faculty.

A Short Exploration of Turkey's Moral Landscape through a TV Series: Red Buds

A Short Exploration of Turkey's Moral Landscape Through a TV Series: Red Buds

Red Buds is a television series that has been airing on a national channel in Turkey for the past year. The show is rooted in the well-known socio-political and cultural cleavage within Turkish society, offering a narrative that unfolds between a devout family belonging to an Islamist sect and a pro-secular republican family. On the one hand, the series highlights the common clichés associated with this divide, but on the other, it attempts to provide a platform for mutual understanding. This shared ground is shaped by a series of moral discussions on key themes such as life, death, love, family, gender, motherhood, money, and professional ethics.

Moral references are often a key element in defining in-groups, and nation-states frequently promote common moral frameworks to build and sustain a sense of national identity. As such, these moral references become indicators of national belonging, closely intertwined with the power dynamics of the nation-state. The socio-political and cultural conflict that has been part of Turkey's nation-building process encompasses this moral domain and continues to be reflected in today's political debates, where opposing sides often accuse each other of being immoral. The dominance of moral discourse in political discussions presents an interesting opportunity to examine how socio-political and cultural cleavages influence perceptions, attitudes, and expressions of morality.

This research seeks to use Red Buds as a shared platform to explore how various ethical issues presented in the series are perceived and articulated by its audience, focusing on their socio-political positioning through a series of in-depth interviews. It aims to understand how individuals navigate their moral landscape within the context of their socio-political identities in Turkey. Simultaneously, it explores the hidden potential for dialogue and reciprocal understanding through this exploration.

Challenges for Left-Wing Theory in Mexico in the 1990s

Some 30 years ago, very intensive theoretical debates took place in the social sciences and particularly in sociology. This paper will focus on debates in Mexico that are attempting to reorient left-wing theories. The decisive factors here are above all: 1) The criticism of dogmatic forms of Marxism, which are articulating in this country since the 1960s. 2) The so-called end of "real-existing socialism", which intensifies the criticism of Marxism. 3) The opening towards non-Marxist social theories, especially the systematic reading of classical social theory. 4) The need for theoretical tools compatible with concrete political and social challenges, especially that of democratization. 5) The economic transformations from an industrial capitalism based on national production to a globalized financial capitalism and the important theoretical challenges that these transformations entail. 6) The consolidation and "academization" of the social sciences and the humanities in the university system.

The lecture gives an overview of various attempts to reorient left-wing theories against the background of the above-mentioned topics. The focus will be on four large-scale individual projects which, although they do not originate in sociology, have had an impact on sociological thought and especially social theory that can hardly be overlooked. The names related with these projects are Enrique Dussel, Bolívar Echeverría, Carlos Pereyra and Luis Villoro.

Algorithmic Clientelism. How News Aggregators Favor Corporate Media Outlets While Acting As Agenda Setters - a Case Study on Google News

The emergence of technologies enabling sophisticated feedback loops between users and media, combined with users' active participation within modern news infrastructures, has led to a proliferation of new concepts in classical gatekeeping and agenda-setting theories — such as network gatekeeping, decentralized gatekeeping, reverse agenda-setting, and agenda melding (Kim & Lee, 2006; Vargo et al., 2014; Guo, 2017). These emphasize the user's influence on news presentation, effectively shifting the responsibility for constructing social reality from the media to the consumers.

However, empirical studies and analyses of corporate materials reveal that, even in algorithmic media, user influence on news presentation remains limited. For example, Google News, both a popular news app and a search engine, continues to present the same "Top Stories" to all users with the same language settings within a given country, highlighting the constraints of user impact on hierarchy of issue salience in news coverage.

In our study, we examined Google as an agenda-setter and a non-human actor in social communication. Specifically, we asked: How does Google News (Polish language version) frame the news on its Home Page? We operationalized framing as the preferential selection of specific news sources over others. To investigate this, we collected data by web scraping information from the Top Stories section over a 30-day period, capturing data sixteen times each day.

Our findings indicate that Google News favors content produced by large news corporations. This research contributes to modern agenda-setting literature, highlighting the interplay between the agendas of different types of media. We argue that Google's relationship with big media corporations resembles a form of clientelism, as the aggregator rewards partners who submit to its stringent visibility guidelines. In this sense, despite its mission to "make the world's information universally accessible and useful," Google operates like a Weberian bureaucracy, reinforcing hierarchies and concentrating power.

Geographical Imaginaries of America: Biographical Experience, Migration, and the Habitus of Polish Intellectuals across Three Centuries

Florian Znaniecki and William Thomas remain two of the most prominent figures in the development of Polish social thought. In their collaboration on *The Polish Peasant in Europe and America*, they pioneered the use of personal

documents, such as diaries, as a sociological research method. This approach has since become a hallmark of the Polish qualitative research tradition, particularly in studies of migration and social change.

While the image of the West in the diaries of the working class has been well-studied, there is a notable gap in understanding how it is perceived by the Polish elite, particularly the migrating intelligentsia, including academics, writers, and diplomats. Our project, *Biography & Academic Imaginary: Polish Intellectual Diaspora in the Autobiographies of Migrant Scholars*, seeks to address this gap by collecting and analyzing the diaries and biographical narratives of Polish intellectuals. The aim is to explore their geographic imaginaries of the West and how these perceptions are confronted by reality.

In our presentation, we will compare the images of America as perceived by Polish intellectuals at three pivotal moments in time: in *Letters from a Journey to America* by Nobel Prize-winning author Henryk Sienkiewicz at the end of the 19th century; in *Skyscrapers and Dumpster* by Aleksander Szczepański, PhD in economics and Polish Consul General in Chicago from 1929 to 1930; and in the works of contemporary academics who migrated to the U.S. between 1970 and 2004. Our aim is to conduct a comparative analysis of these three representations within the context of the memoirs of intellectuals and their geographical imaginaries. Following Znaniecki's method, we will examine how specific preconceptions influenced the migration trajectories of Polish intellectuals in America and how their mobility experiences shaped these imaginaries.

'Nezlamna Kalyna' – Biographical Processes of Becoming a Ukrainian Activist in Forced Exile

War generates profound insecurity, especially when the aggressor is a country with which the victims share deep cultural, political, and economic ties. This rupture leads to significant changes and losses in both public and private life. Such is the case with the Russian invasion of Ukraine on February 24, 2022. The consequences of this war are particularly harsh for older individuals born and raised in the USSR. They were socialized into fraternal relations with Russia, often have family there, and speak Russian.

Since August 2023, I have been conducting narrative biographical interviews with older Ukrainian women in forced exile in Poland. For many, the loss of stability leads to disorientation and withdrawal from active life, focusing solely on survival. However, some women stand out as exceptions, actively engaging in their new environment.

In my presentation, I will explore the experiences of Kalyna, a 60-year-old Ukrainian teacher, folk poet, and singer, who fled her village due to the Russian invasion. Now living in Warsaw, Kalyna fully embodies her Ukrainian identity and actively promotes Ukrainian culture and patriotism among exiled Ukrainians in Poland. She engages in grassroots initiatives and social media, supporting Ukraine's fight.

What differentiates Kalyna from other older Ukrainian women who ended up in Poland? Where does she find the energy and conviction that her actions matter, and that Ukraine's victory is in her hands? My analysis will explore her earlier biographical experiences to seek answers to these questions.

KRAMARICS, SZANDRA* (Eötvös Loránd University, Hungary)

Loans As Tools of Social Policy

Numerous studies examine the connections between credit systems and social policy. The researchers came to the conclusion that the borrowing habits of the population depend significantly on the welfare system of the state. According to this, a higher level of public redistribution can reduce the indebtedness of the population, and otherwise increase it. If there are large inequalities in a society, it can be observed that citizens take out various loans to improve and maintain their standard of living, with which they replace social policy.

My research consists of two parts. In the first part, I examine the connections between loans and social policy at the international level based on the available literature and data. The most relevant in this field are the 'limited' welfare states, such as the USA, but the relationship between loans and social policy is also present in conservative welfare models (e.g. Germany).

The second half of my research would focus on Hungary, where loans as a social policy tool are becoming more and more widespread. Of these, state-supported, demographically targeted loans stand out. The special feature of these is that the framework rules are established by the state, but the banks are responsible for the implementation. However, banks have different rules,

so it can easily happen that under the same conditions, one bank will grant a loan, but the other will not. All of this suggests that banks are not only intermediaries in this process, but active shapers of social policy.

My research is looking for the answer to what is the role of loans in social policy today, who has access to these schemes, who are the winners, and how important is the role of banks. The research is carried out by analyzing legislation, document analysis, and secondary analysis of interviews.

Endogenous and Exogenous Barriers the Reasons for Tokenism of Women Academics in the Upper Echelon of the Ivory Tower

Diachronically there has been an increase in the number of women academics, however, this is not present in the upper ranks of the ivory tower. As of March 2024, women headed a quarter of the top universities around the globe, an increase of 82% in the last nine years. This is a grim picture and a lot worse as far as the rest of the universities are concerned. In Cyprus, for example, there are 13 universities and only 2 of 39 rectorate positions (1 Rector and 2 Vice Rectors) are held by women. Similarly, in the UK, (Jones, 2024) women make up 54% of the higher education workforce and occupy 45% of academic positions but only 28% of academic leaders are women in the positions of Vice Chancellors.

The authors of this paper surveyed the academic personnel of Cyprus's universities to find whether, and if so, what holds women academics back from holding leadership roles. The research device was an online questionnaire with closed-ended questions administered to all academic staff of the 13 universities in Cyprus.

The analysis of the data indicated that a higher percentage of females (63.8%) felt encouraged by their families to take leadership roles, compared to only 47.2% of males. However, a higher proportion of males (38.9%) than females (24.6%) did not discuss with their families their intention to seek leadership positions. This finding does set the scene for the androgenic societal status quo. Other statistically significant findings point to the endogenous and exogenous factors creating barriers for women to voice their interest in seeking leadership positions in the higher echelons of the ivory tower.

The authors of the paper make recommendations to address this inequality.

Carbon Farming – for Whom? Analyzing Unintended Consequences of the European Union's Carbon Removal Certification Framework Using Fuzzy Cognitive Mapping

In November 2019, the European Parliament formally declared a climate and environmental emergency. In this context, several pieces of legislation were published, laying the foundation for the Carbon Removal Certification Framework (CRCF). This framework sets out to certify net carbon removals, including through land-based "carbon farming", and thereby stimulate financing through public and private sources. Yet the complexities of both the voluntary carbon market and land-based carbon sequestration raise the question – in whose interests is this framework designed, and how will the framework affect small and micro-sized farmers? This research used 'fuzzy cognitive mapping', a tool that analyses complex systems by turning qualitative information into a quantitative model, to study the EU's envisioned regulation on carbon farming. This in turn allowed for the discovery of unintended consequences in the system. The results revealed seven concepts that the EU perceives to be instrumental in the frameworks success: access to knowledge, costs, demand for removals, GHG emissions, participation, revenue, and trust. Further analysis revealed a trade-off between administrative burden and accuracy of quantification, entailing consequences for both inter- and intragenerational justice. Unintentional side effects like a potential decrease in long term food security and a trade-off between quantity and quality of removals were also discovered. The research highlights potential systemic issues regarding the real-world implications of these findings and discusses how the EU may risk their long-term climate goals and the environmental integrity of the policy by underrepresenting small and micro-sized farmers, and placing economic benefits above climate benefits.

KRAMKOWSKA, EMILIA* (University of Białystok, Faculty of Sociology, Poland)

Social Determinants of Dependency and Autonomy in Family Care Relationships for Older Person As Perceived By Representatives of Different Generations. the Case of Poland

The social perception of old age as a stage of life with its inherent qualities is significantly shaped by social factors that are unique to a given society. As societies evolve and economic, political and cultural contexts shift, the perception of old age and the social and familial position of older persons also undergoes change. However, the perception of old age is still often characterised as a stage of life marked by a multitude of losses, including those pertaining to health, memory, social support networks and independence. This implies a responsibility on the part of the immediate environment to provide assistance to a dependent older person. In Polish society, there is still a strong conviction (reinforced by legislative solutions) that this obligation rests with the family. However, there are also indications of gradual changes in this area.

The aim of this paper is to examine the social factors that have shaped the quality of family care relationships for the older persons in recent decades in Poland, with a particular focus on the period between the 1930s and the 1990s. Special attention will be given to the social determinants of dependency and autonomy of the older people. This paper is based on the findings of a qualitative study conducted among individuals representing four generations - the Traditionalist generation, the Baby Boomers, Generation X and Generation Y. Respondents were asked to recall how old age was perceived in the family during their childhood and to share their views on the role of older individuals in the modern family. The comparative analysis of generational perspectives will elucidate the similarities and differences in perceptions of the social factors that, according to interviewees, have altered the nature and quality of family care relationships for older people.

RC11-168.6

KRAMKOWSKA, EMILIA* (University of Białystok; Faculty of Sociology | Department of Sociology of Knowledge and Education, Poland)

The Trajectory of Intergenerational Family Relationships and Its Determinants from the Perspective of Representatives of Four Generations. the Case of Poland

Intergenerational solidarity can be defined as a sense of mutual responsibility among individuals belonging to different generations, manifested in their willingness to support each other. The existence of solidarity is contingent upon the prior existence of intergenerational ties, which may be defined as a sense of biological, cultural, or economic connectivity with individuals belonging to other generations (Szukalski, 2017). The nature of intergenerational relations is subject to change (Sztompka, 2007), which is conditioned by the social, economic and political processes occurring within individual societies.

This paper will present the trajectory of intergenerational family relations based on the results of qualitative research conducted in 2022 among representatives of four generations: the Traditionalist generation, the Baby Boomers, Generation X and Generation Y. Using the memories of old age as recalled by respondents from their childhood, the paper will discuss how intergenerational relations have changed over the years (from the 1930s-40s, when the oldest respondents were children, to the 1990s). In particular, attention will be paid to the issue of the duty/ responsibility to provide care for dependent older family members. I will highlight the factors that, according to the respondents, have led to a transformation in intergenerational relations, as shaped by the distinctive socio-political context of Poland.

The paper will also present an analysis of the respondents' perceptions of the current state of intergenerational solidarity in Poland. To what extent do younger generations perceive a responsibility and willingness to provide care for dependent older family members? Does this responsibility/obligation give rise to potential tensions which strain intergenerational relations? What are the respondents' views on the institutions responsible for the care of dependents, such as nursing homes?

The aim of the paper is therefore to discuss the issue of intergenerational solidarity and its historical and current conditions, using the example of Polish society.

Patterns and Prevalence of Transnationalism Among Refugees: Comparing Gender and Origins

This contribution provides a systematic overview of the prevalence and heterogeneity of transnationalism among different groups of refugees. While there is a substantial body of research on transnationalism among other migrant groups, such as migrant workers, research on forced migrants remains fragmentary. Refugees often have less agency, greater vulnerability, and fewer resources compared to other migrants, raising questions about their transnational behaviours. We explore how gender and country of origin shape transnational practices, acknowledging that international migration affects men and women differently, yet systematic knowledge of gendered differences is still scarce.

Empirically, the study focuses on refugees in Germany, a country that has experienced a sharp increase in refugee numbers over the last decade. Specifically, we examine the transnational practices of refugees from Ukraine, Syria, and Eritrea—key countries of origin in recent forced migration flows to Germany. We draw on two original data sources: the *BiB/ReDA Survey of Ukrainian Refugees* (2023) and the *TransFAR study of Eritrean and Syrian refugees in Germany* (2020). Both datasets include several items on the whereabouts of nuclear and extended family members, as well as their mutual transnational support and activities. By focusing on transnational domains such as family ties, emotional support, and instrumental and practical support, we provide descriptive insights into the prevalence and forms of cross-border support across groups. Furthermore, we apply multivariate regression techniques to estimate variations by country of origin and gender.

Preliminary results indicate that most Syrian and Eritrean refugees—more men than women—sent goods or provided financial support to their families, while receiving support from family members abroad was rare. In contrast, Ukrainian refugees report mutual support in both directions. These differences highlight the importance of the conditions surrounding forced migration in shaping the types of transnational activities and ties that can be sustained across borders.

How to “Read” Family: Tackling Understandings through Translational Research

What do future kindergarten teachers understand by ‘families’? How do they construct or de/re-construct family relationships? What ideas of ‘family’ emerge in linguistic interaction with children?

The proposed article draws on visualizations based on an ethnographic protocol by students in a kindergarten training program in Austria. Asked to consider the importance of a child’s narration, the students used it to visualize the narrated family relationships. It is the child’s narrative that serves the students as a basis for their individual exploration of family relationships and their translation into a drawing. As future professionals, they should hold back their own ideas about family and turn to the narrative in its possible interpretations. The suspension of rash ‘understandings’ and identifying thinking is a necessary approach in this context.

In theorizing the insights from ethnographic data, the article will discuss selected categories of professionalization and question their dominant interpretations. In particular, the categories ‘knowledge’ and ‘understanding’ will be challenged to find suitable re-formulations that work with expanded narratives and diversified knowers. We will ask how dominant discourses in verbal interactions can be broken up through ‘translations’ into other media, thus enabling new discourses and narratives. We can also question the role of the (hierarchical) academic knowledge production in participatory research settings.

Storying the Good Life - Ghost Stories As Moral Medium

Theravad Buddhist tales remain one of the main media to navigate a good life in Thailand. Traditional stories are being re-imagined and retold, to a certain extent translated to different audiences. Ghost stories, in particular the tale of Mae Nak, has served as explaining matters of a balance of devotion and letting go over generations and despite technological turns. The story has been shared and retold in many variations, spaces of worship remain spaces of actual scenery and inspiration. Only recently has the importance of collaborative practices of storysharing been uncovered as counter- or detoxed narrative to colonial mainstreamed forms of storytelling/genre. Recent trends in technological shifts have enabled new forms of sharing stories beyond restricted communal spaces.

This contribution questions what happens to storylines in case a supposedly ‘neutral’ AI re-creates stories? So, what happens when AI is being prompted to recount (cultural) narrative that is aimed to convey guidance to a moral sound life? Which storylines are being invented, which emphasized or omitted and why?

We combine research on (participatory) storytelling and narratives (Krause et al. 2019) with explorative research on the use of AI across (cultural and geographical) borders to scrutinize how ghostly narratives and reality become entangled (Chubb et al. 2024). By comparing digitized and ‘traditional’ modes, the transnational research team questions how automated “storytellers” provide access to different stories and how tales are being reshaped in order to cater to a global (aka Northern) audience?

We will explore whether it is possible to detect biased narrations as little has been reported about “missing” story-sharers’ re-producing stories (Chubb et al. 2024), specifically outside dominating Northern discourses.

By discussing the importance of authentic voices and perspectives, this contribution aims to amplify so far ignored, underestimated or unheard stories and their bearers (Krause et al. 2019, Shell-Weiss 2019).

Ukrainian Social Entrepreneurs: Creating a Better Future Despite the War

Social entrepreneurship in times of war faces many challenges as financial support is redirected to higher priorities because, in the turbulent state of war, society consolidates around innovations focused on achieving military advantage. However, victory also requires that everyday and innovative social activities are not interrupted, forming a sustainable rear and providing growth potential. Our research focuses on successful social entrepreneurship cases that have gained recognition and crowdfunding support. These companies’ projects were supported by ordinary Ukrainians and philanthropists during a full-scale war, despite the significant financial and tax burden the Ukrainian population is under.

The empirical basis of the study was 5 in-depth interviews with social entrepreneurs, including representatives of such types of businesses as the production of tourist equipment; the board games development; the preservation of folk weaving; the glass bottles recycling, and confectionery at the center of social care for women. In their activities, these companies adhere to the principles of social responsibility and building a more just society, empowering women and children, implementing a win-win approach, and focusing on social inclusion and justice. During the interviews we looked at the whole process of creating each social enterprise step-by-step: the emergence of an idea, test (initial) launch, business project development, mentorship, creation and maintenance of a crowdfunding campaign, the business reaching its first plateau - ensuring self-sustainability and stable positive social impact. In conclusion, we focus on social success factors, organizational solutions, and promotion methods that have demonstrated their effectiveness even in times of war and, therefore, can be adapted and also used to promote social innovations in peacetime and other countries.

Comparing Emotional Dynamics in Narratives of Ukrainian and Non-Ukrainian Beneficiaries of Temporary Protection in the EU

The Council of the EU Implementing Decision 2022/382 of 4 March 2022 introducing temporary protection (TP) for Ukraine residents after Russia's full-scale invasion has covered not only Ukraine nationals, but also nationals of other countries who resided in Ukraine. According to Eurostat, approximately 2% of beneficiaries of TP in the EU are non-Ukraine nationals. At the same time, in some countries, like Portugal, this share is much higher, reaching 13%, with TP beneficiaries being from Nigeria, Morocco, India, Russia, and Algeria (AIMA). Still, the perspective and experiences of non-Ukrainian beneficiaries of TP are less explored in contemporary academic research.

This paper proposes to compare emotional dynamics in narratives of Ukrainian and non-Ukrainian beneficiaries of TP, using data of around 30 semi-structured interviews with Ukrainian refugees in Portugal in Italy, and 3 to 5 interviews with non-Ukrainian beneficiaries of TP. This comparison will serve to better investigate and understand implications of the unique policy framework created by launching the EU's TP Directive, in terms of responding to individuals' emotional needs, provoking emotional reactions, (re)building the sense of ontological security and belonging in the context of forced migration.

KRAWATZEK, FELIX* (Centre for East European and International Studies (ZOIS), Germany)

How History Explains Intergenerational Agreement on Political Views in Germany

This paper examines how historical attitudes and agreements within families on the interpretation of history contribute to the convergence of political views, specifically focusing on families with migratory backgrounds. The political socialization literature has underscored the significance of parental political agreement, family politicization, family history, and personal experiences of children, but often overlooks the crucial influence of views on history for understanding family dynamics. My study aims to fill this gap by investigating the relation between parent-offspring similarity in historical views and intergenerational political convergence on the hugely salient questions of support for the populist right in Germany and attitudes towards the Russian war in Ukraine. The research explores various family-related characteristics, such as migratory background, family composition, religion, and engagement in transnational activities. Leveraging my own unique online survey, I explore the attitudes of young adults with a Russian migratory background in comparison to the national reference population across two generations, focusing on Germany. The innovative sampling design involves dyads, capturing both young adults and their parents from the same family, creating a multigenerational sample of 2,000 respondents.

KRAWCZYK, STANISŁAW* (University of Wrocław, Poland)

"Witcher 3: The Wild Hunt": Video Games between the Global and the National

Video games are sold and bought in the global market but they also have local characteristics – e.g., they may draw from national cultural heritage (Eklund et al., 2024). Therefore, video games are hybrid media texts, shaped by global flows and local contexts (Šisler et al., 2017). This perspective is in line with the current work in social theory that questions the binary opposition of globalization and nation-states (Billig, 2023; Schmitz et al., 2023).

I will use this framework to examine the success of "Witcher 3: The Wild Hunt" (2015), one of the most acclaimed and best-selling video games (over 250 game of the year awards, over 50 million copies sold). Basing on previous studies (Drewniak, 2018; Majkowski, 2018) and my own research, I will show that the game's popularity results from an interplay of the global and the national, for example:

1. The game adapts the prose of Andrzej Sapkowski, who became successful partly because he had been able to read English-language fantasy fiction before other Polish writers.
2. The company that developed the game – CD Projekt – had distributed and translated foreign video games in Poland before producing its own titles for the regional and ultimately global market.
3. The game is known for its references to Slavic music, Polish literature, etc., but it also employs global game conventions (e.g., following a

tradition of computer role-playing games established by the Canadian company BioWare).

4. The game's setting (e.g., smaller states under threat of invasion by an empire) corresponds with Poland's position in European history.

The Biosocial Construction of Age: On the Circulation and Legitimization of the Concept of Biological Age during Covid-19

The concept of biological age is defined in research in various ways but can generally be understood as an assumption that there is a reliable, measurable, and generalizable correlation between biological and chronological age. Based on such a definition, it can be noted that these processes have been explored across studies of different age groups, but with varying concepts. In Sweden, the political and social use of biological age gained prominence during Covid-19, when the National Board of Health and Welfare issued guidance that healthcare resource prioritization should not be based on chronological age, as this would constitute age discrimination. Instead, it was recommended, at both regional and national levels, that healthcare prioritization should be guided by the concept of biological age. This paper discusses how the concept of biological age was used in the Swedish context during Covid-19.

The empirical material is twofold, consisting of regional and national policies on healthcare during the pandemic, as well as qualitative interviews with 16 individuals who participated in the drafting of guidance documents on the use of biological age in prioritization processes at the national or regional level. The results show that the concept, without definition or problematization, circulated from the national level to regional contexts such as hospital care and medical care in nursing homes. They also highlight variations in the legitimization of the concept biological age among the informants. Overall, the results move biological age from being a concept reserved for medical and epidemiological research to having a place in critical age studies.

Conspiracy Theory Legal Meaning Making As a Form of Legal Alienation: Exploring the Sovereign Citizen Movement

Members of the sovereign citizen movement worldwide deny that the state they live in exists, and with it, they explicitly deny its applicable law (e.g. by writing extensive letters to authorities in which they dispute the bureaucracies' or the states' legitimacy). Against a world that seem to have conspired against them, they nevertheless hold in common an affinity for an alternative law: Self-made legal code and constitutions, identity cards, personal seals and coats of arms, court proceedings or set borders along one's own property testify to the desire to own law-making as against the backdrop of (legal) alienation. The paper discusses how and why sovereign citizens establish such alternative laws and legal practices by taking the German so-called "citizens of the Reich" as an example. Based on an ethnographic study, the paper argues that the movement copies legal procedures, forms, and aesthetics to appropriate the authority and legitimacy that characterizes the applicable law to their own law. Thus, in this way law not only becomes entangled for lending strength to the group's ongoing conspiracy theoretical search for truth. Drawn upon in a fragmented and incoherent way, it becomes a form of conspiracy theory meaning making.

Indigenous Universities As Comunal Public Sociology: Decolonial Challenges to Sociological Knowledge Production

In Latin America, the emergence of Indigenous Universities marks a historical step towards autonomous and alternative knowledge production that challenges Western discourses of epistemic decolonisation. This paper shows how Indigenous Universities can reframe sociological concepts by grounding their knowledge production in the lived experiences of indigenous anticolonial resistance.

The paper first traces the dual history of Indigenous education policies in Mexico as strategies to "civilize" Indigenous populations and a nation-state tool for modernization to demonstrate that these efforts are connected to broader processes of racialisation, colonisation, and patriarchisation, revealing how the suppression of Indigenous knowledge became foundational to global knowledge hierarchies that shape sociological thought.

Secondly, it examines the *Universidad Autónoma Comunal de Oaxaca* as Indigenous Universities that navigates silenced histories and disrupts hegemonic academic practices. Centring on indigenous discourses of *Comunalidad* (Communality) through their horizontal organizational structures, communal learning, and research grounded in local fights for indigenous rights, they offer a new vision of academic knowledge production grounded in indigenous cosmologies.

Thirdly, drawing on pluritopic hermeneutics as a place of negotiation between different forms of knowing, it advocates for understanding Indigenous Universities as Comunal Public Sociology that put epistemic decolonisation into practice by using the locally emerged indigenous reality of *Comunalidad* to re-signify Western sociological concepts. Additionally, it highlights the necessity of epistemic humility in professionalised sociological discourses and emphasises that recognising the practices of anticolonial movements as theories in their own right is crucial to engage meaningfully with historically absent and invisible forms of knowledge.

Lastly, the paper maintains that by engaging in a systematic dialogue with Indigenous Universities, the discipline can contribute to new forms of thinking and imagining sociological terminologies, the dynamics of academic knowledge production, and in broader terms, much-needed societal transformation.

RC56-JS-172.3

KRETSCHMER CALDERÓN, VINCENT* (University of Vienna, Mexico)

Unsilencing Indigenous Knowledge: Decolonial Challenges to Sociological Knowledge Production through Indigenous Universities.

Indigenous knowledge systems have historically been erased through processes of epistemicide and systematic epistemic oppression. This paper explores how Indigenous Universities in Mexico challenge these silences and propose a transformative approach to sociological knowledge production. Through anticolonial epistemic resistance, these universities disrupt Western systems of knowledge by foregrounding local histories and alternative epistemologies.

Firstly, this paper traces the dual history of indigenous education policies as both a strategy for "civilizing" indigenous populations and a nation-state tool for modernization. It connects these efforts with processes of racialisation, colonisation, and patriarchisation, arguing that the suppression of indigenous knowledge constituted a foundational core to global knowledge hierarchies that shape sociological knowledge production.

Secondly, it explores how the *Universidad Autónoma Comunal de Oaxaca* and *Universidad Campesina Indígena en Red* in Mexico navigate silenced histories, disrupt hegemonic academic practices and centre Indigenous knowledge systems. They offer a critique of the predominant academic model through their horizontal organizational structures, communal learning, and research grounded in local fights for indigenous rights, territory and the recognition of ancestral and oral knowledge.

Thirdly, drawing on pluritopic hermeneutics, it advocates for understanding the rise of Indigenous Universities as insurrection of subjugated knowledge. By centring marginalized voices, they engage in epistemic decolonization, highlighting the necessity of epistemic humility in sociological knowledge production and emphasise that recognising the practices of anticolonial movements as theories in their own right is crucial to engage with historically silenced and invisible forms of knowledge.

Finally, this paper maintains that Indigenous Universities and their decolonial practices serve as a model for rethinking the foundations of sociological inquiry. Engaging with these institutions decolonizes the discipline and contributes to reimagining sociological terminologies, academic hierarchies, and societal transformation, answering Trouillot's call to "unsilence" the past.

KREUTZ, SIMONE* (Humboldt University Berlin / University of Kassel, Germany)

Rethinking Justice - Social Movements in the Aftermath of Sexualized Violence

The dominant legal framework often defines justice after sexualized violence in narrow, binary terms: conviction or acquittal. In contrast, feminist scholars have argued for a more expansive understanding of justice, one that reflects the diverse and complex needs of victim-survivors. One example is McGlynn and Westmarland's (2019) concept of *kaleidoscopic justice*. It challenges the conventional legal lens by suggesting that justice is not a singular outcome, but rather a fluid, multifaceted process. This model offers offering a more holistic approach to addressing harm by emphasizing the importance of consequences, recognition, voice, dignity, prevention, and connectedness. It aligns with McLeod's (2019) concept of *grounded justice*, an alternative framework that is rooted in the everyday experiences of those seeking resolution.

Drawing on interviews from my doctoral research at the *University of Kassel*, the presentation will explore how victim-survivors from social movements perceive and experience justice in the aftermath of sexualized violence. While many of my interviewees addressed the aforementioned aspects – consequences, recognition, voice, dignity, prevention, and connectedness –, they struggled extremely with the idea of justice; rejecting the notion of justice as an unattainable »illusion«. This despair is related to the utopianization of social movements and the shattered hope that social movements could be safe(er) spaces. Nevertheless, I argue for keeping justice as a (utopian) concept and using these experiences from social movements for a broader debate on justice after sexualized violence – following Dilts (2017) that the only chance to archive justice is to recognize its incompleteness.

Mapping the Boundaries of Support Provision: A Cross-Sector Analysis of Frontline Workers' Experience Supporting Insecure-Migrant Women Affected By Border Harms and Gendered Violence in Post-Brexit Britain

This paper will present the preliminary findings of a doctoral research project on the intersection of harm to migrants and violence against women following Brexit, drawing on qualitative insights from practitioners working with women with insecure migration status. Victim-survivors of violence with insecure migration status, predominantly women, are largely excluded from access to mainstream support and protection. Dramatic changes to the national immigration and asylum regime coming into force after 2020 have exacerbated exclusionary support mechanisms for non-citizens with temporary status in England and Wales. These legislative changes created new structural insecurities in an immigration system characterised by classed, gendered, and racialised mobility inequalities. However, the practical implications for the heterogeneous group of insecure migrant women accessing vital support services post-Brexit remain largely unknown to date. This analysis of expert interviews with a range of practitioners from both the migrant support and the domestic abuse sectors aims to address this gap. Using contemporary grounded theory methodology, I will map the perspectives of frontline workers on navigating socio-legal barriers in contexts of harm and violence against insecure migrant women in both two sectors. In doing so, I will explore some of the situational effects of an emerging post-Brexit hostile environment on practices of help-seeking and support provision, as well as strategies for mitigating barriers and disadvantages. By combining empirical findings with theoretical concepts from the sociology of Brexit, feminist victimology, border zemiology, and critical migration studies, this research will contribute to the emerging field of sociology of violence. Preliminary findings will shed light on how bordering practices and violence against women interventions interfere with the post-Brexit immigration regime. Consequently, this study seeks to contribute to the sociological understanding of bordering mechanisms within support provision with a critical focus on the translation of national policy into local practice.

Depression and Hegemonic Masculinity - an Extension of the Conceptual Framework in Mental Health Research

Connell's concept of hegemonic masculinity represents a pivotal theoretical point of reference in the mental health research and health behavior of men. In this context, health behavior is understood as an everyday practice through which masculinity is produced. The concept of hegemonic masculinity is frequently employed in research practice as a means of capturing a particular form of masculinity, which is also referred to as traditional masculinity. Health behavior associated with the concept of traditional masculinity is characterized by compensation through aggression or substance consumption, delayed or absent utilization of treatment, and nondisclosure. However, some aspects of Connell's concept of hegemonic masculinity remain unexamined in the context of research on men with depression. This contribution aims to expand and enhance the concept of hegemonic masculinity based on interviews with men who experience depression. The aim of the analysis is to address the ambivalence inherent to the construction of masculinity, that arises from the diagnosis and treatment of depression. This is exemplified by the fact that orientation towards hegemonic masculinity can have both detrimental and beneficial effects on health. Furthermore, constructions of masculinity can be adapted to depression in a dynamic manner, such as when men make the active and self-determined decision to seek treatment. Similarly, hegemonic masculinity is analyzed in relation to other forms of masculinity and femininity in the context of health behavior. This leads to the conclusion that Connell's concept of hegemonic masculinity should be applied more comprehensively in research on mental health. By this means, a more nuanced understanding of health behavior and masculinity can evolve, as well as alternative conceptualizations of masculinity.

Exploring Climate Anxiety in Young Creatives through Research-Based Filmmaking

This research investigates climate anxiety and its manifestations in the daily lives and creative practices of art students, using a research-based arts approach. The conceptual framework is rooted in student-centred research principles, addressing social and individual issues, primarily mental health and climate change, which were identified as significant concerns for students at the Latvian Academy of Culture during a preliminary study.

Through collaboration with students from the fields of audiovisual art, cultural sociology and cultural and arts studies, this research uses art-making as both a method of inquiry and a form of data production. The research integrates qualitative methods such as focus group discussions on climate anxiety, creative self-reflection, and ethnographic analysis of the filmmaking process, not only gathering data but transforming it into short films. The creative process itself becomes a tool to express and reflect upon how young people experience the emotional impacts of climate change.

One of the key features of this research is the ethnographic documentation of the filmmaking process, which captures the students' creative practices and their reflections on the theme of climate anxiety. The films serve as both artistic outputs and analytic tools, enabling an in-depth exploration of how future film professionals and artists internalize, articulate, and respond to environmental instability. These audiovisual works provide rich, visual evidence of the intersection between mental health, creativity, and climate concerns, showing how art can serve as data and illuminate complex emotional responses to global challenges.

This paper aims to highlight how creative processes can deepen our understanding of climate anxiety and the instrumentality of a research-based arts approach. It emphasizes the value of arts-based approaches and contributes to methodological discussions on the research of complex emotional responses, global challenges and creative lives of young people.

Double Burden: The Intersection of Mental Illness and Criminal History in Public Stigma

Social scientists have long been interested in the intersection of stigma surrounding mental illness and other socially deviant behaviors, such as crime. While mental illness alone has been heavily stigmatized, individuals with a history of criminal behavior often face compounded stigma, which can hinder their reintegration into society. Using data from the 2024 Icelandic Stigma Study, this research examines how the combination of mental illness and criminal behavior influences public attitudes across multiple domains of stigma, including social distance, exclusionary sentiments, perceived dangerousness, and beliefs about treatment. Specifically, the study focuses on individuals with diagnoses of schizophrenia, depression and drug abuse, and compares how stigma differs between those with a criminal record and those without. It also explores whether certain mental health conditions are more likely to exacerbate the stigma of criminal behavior. The analysis further investigates the role of causal attributions—whether the public believes mental illness or crime is a result of personal choice or external factors—in shaping levels of stigma. The results offer critical insights into how mental illness and criminal history interact to intensify public stigmatization, providing a nuanced understanding of the challenges faced by individuals with both mental illness and a criminal background. These findings have significant implications for stigma reduction strategies and reintegration policies, as they highlight the need for tailored interventions that address the dual stigmatization of mental illness and crime.

Strong Gender Contract, Weak Institutions: Gender Pay Gap in Slovenia and Czechia

This paper investigates the dynamics of the gender pay gap (GPG) in two post-socialist economies, Czechia and Slovenia, during their capitalist transition and EU membership. Using regression analysis on large samples of linked employer-employee data from 2002 - 2015 to estimate the total GPG and within-job GPG and institutional analysis we find that in both countries women earn significantly less than men for the same work. We argue that this is mainly due to institutions, policies, and practices, including gender inequalities in the division of unpaid work and domestic care, which result in different but strong gender contracts in the two countries. The segregation of women and men into differently paid occupations, jobs, or workplaces does not explain much of the total GPG in Slovenia. In contrast, it explains about half of the total GPG in Czechia. We argue that this is due to weak labor market institutions in Czechia, that are recently weakening in Slovenia.

Unwanted Pregnancies Among Women with Mental Health Problems: Exploring the Impact of Mental Health When Dealing with an Unwanted Pregnancy.

Background: International studies show that women with mental health issues are more likely to experience unplanned or unwanted pregnancies. Conversely, dealing with an unwanted pregnancy might negatively impact mental health: carrying an unwanted pregnancy to term may raise the risk of perinatal and postpartum depression in vulnerable women, while abortion can add stress for those with pre-existing mental health problems. This reciprocal relationship underscores the need to better understand how affected women subjectively cope with and evaluate these experiences

Methods: We conducted 40 narrative-biographical interviews with women who were in treatment for a mental illness and who had either carried an unplanned pregnancy to term or terminated it. In our analysis, we aimed to develop 1.) case structure hypotheses and 2.) a typology regarding the particular impact of mental health when dealing with an unplanned pregnancy.

Results: Based on women's biographical narratives, we developed five types concerning the significance of mental health when dealing with an unwanted pregnancy including 1) "healing," 2) "stabilizing," 3) "conformity," 4) "rationalizing," and 5) "passivity."

Discussion: The findings of our reconstructive analysis highlight the significance of biographical approaches in treating and supporting women, offering insights into the personal significance of reproductive events and enabling more tailored support in psychiatric treatment and psychosocial care. A holistic perspective on reproductive experiences—nospanning from the desire for children through pregnancy (or termination) to parenthood—can significantly contribute to the potential of parenthood to foster social participation.

Community Response to State-Created Environmental Crisis: A Transdisciplinary Participatory Action Research on Alternative Development in Rural China

Rural revitalisation is a key state development strategy that was announced by the Chinese central government in 2017 and further promoted in 2021. It recognises that rural sustainability is foundational to China's development and targets to ensure rural revitalisation by 2050. However, capital forces mediated by the state commodified rural lands and landscapes, demolished traditional buildings, repetitively produced symbols of post-modern nostalgia landscapes, and drew in businesses to serve the tourism market. Repercussions accompanied by this "spectacle of prosperity" destroyed local traditions and ecology, marginalised villagers, and reproduced unequal relations and the hegemony of development. We also discovered that the mainstream revitalisation project caused a cultural and environmental crisis.

In response to this trend, a transdisciplinary team comprised of sociologists, NGO practitioners, and architectural designers attempted to fight for villagers' right to rural space through culturally specific and locally based democratic participation from below. By adopting the design idea of co-creation and place-making, the research team endeavours to build up the subjectivity of local people in rural development, raise people's awareness of cultural and environmental protection, and transform the local participants from passive construction workers to community co-creators.

Since 2017, the authors and local partners have spearheaded the "House of Dream" project, successfully preserving the traditional cave dwelling houses in a village in the Henan province of China. In this research, we conclude that "alternative development" implies a radical departure from mainstream developmentalism through social empowerment, which values building the capacity of the local community and transforming local actors into the subject of development. We argued that local villagers are not passive service recipients of development interventions but active co-creators in rebuilding communities. This transdisciplinary participatory action research project has developed common practice frameworks for tackling environmental and cultural crises, as well as facilitating long-term sustainable community development.

KU, JANE* (University of Windsor, Canada)

Challenging Violence: Decolonial and Anti-Imperial Feminist Imaginary of "Disrespectable" Feminism

This paper proposes an anti-imperial transnational feminist intervention of the violence engendered by racial neoliberal capitalism and neo-imperialism aligned with the global securitization and militarization. Taking lessons from scholars on pluriverse and multiple worlds (Blaser 2009; 2013; de la Caldena 2010; Fitzgerald 2024; Ling 2014; Mignolo 2021; Rojas 2016) who question the political ontology of modernist Westphalian world that imposes the universality of human/nature, male/female and other essentialist binaries that have normalized scarcity thinking, competition, militarism, surveillance, extractivism, labour and sex exploitation and marginalization of beings that are deemed less than human, the paper proposes an alternative relationality of care, reciprocity and accountability, and map linkages of power.

This paper demonstrates the connections between for example, racisms against Muslims and Asians stemming from colonialism and imperialism that also dispossessed Indigenous peoples and enslaved Blacks Africans. It names the way racialized, colonized diasporic peoples are flattened into "migrants" and outsiders through the historical amnesia underlying nation building and settler colonialism, along with the distortion or the general lack of knowledge about our collective imperial histories that continue to exalt white European subjects and Christian superiority (Thobani 2007) while demarcating racialized diasporics as beings from undemocratic and authoritarian spaces of Communism, Islamic Fundamentalism, Terrorism and Underdevelopment. Such discourses and ahistoricized views have justified and produced racial violence in various parts of the world. The paper explores popular and progressive social movement discourses to identify the activation of relationality and pluriversal care built upon ontological parity of multiple worlds and articulating a discursive and actual solidarity among, by and for diversity of peoples.

KUBAL, AGNIESZKA* (University of Oxford, United Kingdom)

We Are the 99% - Comparative Legal Culture of the Denied Claimants before the European Court of Human Rights

The popularity of the ECHR among Eastern European and Russian citizens, who have taken to heart the right to individual petition is unprecedented. Yet a great majority of these individual petitions – over 90% – fail to reach a judgment or are declared inadmissible by the Court. This leads to a fundamental question – if human rights claims are made, but never materialize, what are the consequences? What does it mean for the individuals mobilising human rights in Eastern Europe and Russia – the lawyers, applicants, judges, NGO activists, state legal counsels – and the broader development of these societies? What issues are being marginalized by the Court through rejecting claims, which reflect the function of law as a power mechanism? Who are the applicants and what are their causes that are ultimately silenced by a legal venue which often represents the last resort for seeking justice? Grappling with these questions comparatively and examining the consequences of the miscarriages of human rights justice for the actors involved, the paper relies on the framework of relational legal consciousness (Chua and Engel 2019) highlighting the law's potential to simultaneously empower and alienate (Hertogh 2018, Kubal 2023, 2024).

KUBICKI, PAWEŁ* (Jagiellonian University, Poland)

Difficult Heritage. the Case of German Urban Heritage in Polish Cities

In my presentation I will discuss the issue of difficult heritage by means of the example of the German legacy in Polish cities. Central European cities, due to their location under German town law (Magdeburg rights) were strongly influenced by German urban culture. Over the centuries, however, different strategies have been taken towards this heritage. After the Second World War many German cities became Polish as a result of border changes. Poland after the Yalta Treaty lost its mostly rural eastern provinces but acquired ex-German urbanized provinces in exchange. After the displacement of the German inhabitants, these cities were settled by a new population, coming mainly from typically rural areas. Poles as new inhabitants of these cities felt a double alienation. Firstly, because of an urban environment which was completely the opposite of their native one and there was no one from whom they could learn new urban patterns of culture. Secondly, because these cities were German, and despite the official propaganda, most of them had nothing in common with Polish culture. This all meant that the inhabitants of these cities lived for a long time with a sense of temporariness in "Unwanted Cities".

Since the beginning of the 21st century, and especially after Poland's accession to the EU, a distinct change in attitudes towards the German legacy in Polish cities can be observed. This heritage is beginning to be used in various promotional strategies for cities, but also to create new urban identities. In practice, however, depending on the specific city, these strategies take different forms. Therefore, using three ex-German cities as an example: Gdańsk (Danzig), Szczecin (Stettin) and Wrocław (Breslau), I will analyse the different strategies towards German urban heritage.

RC48-765.1

KUBINA, LUKAS* (Palacky University Olomouc, Czech Republic)

Authenticity and Radicalization: Cultural Shifts in Environmental Activism

This paper examines why contemporary environmental movements increasingly adopt radical tactics, arguing that this shift stems not only from perceived failures of non-violent protests but also from deeper cultural and theoretical influences. Using performative theory and works by John Austin, Jacques Derrida, and Judith Butler, the study views protest as a performative act within social movements' tactical repertoire. It emphasizes protests' embodied nature, performative effects, emotional resonance, and ritualistic aspects. Butler's concept of performativity—as shaping individuals and transforming norms—frames protest as active contestation.

Drawing on ideas from Teemu Paavolainen and David Graeber, the paper explores the tension between the political ontology of violence—where states and corporations maintain structures through force—and the political ontology of imagination, enabling envisioning alternative worlds. It posits that this tension drives the shift toward radical tactics.

A key factor in this transformation is anti-theatrical prejudice—a scepticism toward choreographed actions perceived as inauthentic. Drawing on Julia Peetz's analysis of populism's counter-theatricality, the paper examines how populist movements reject traditional theatricality to project authenticity and challenge established norms. Similarly, the perceived ineffectiveness of imaginative, non-violent protests may be linked to cultural shifts favouring directness and authenticity.

This change in protest forms mirrors populist politics by seeking greater authenticity and directness. Less choreographed, more intuitive actions express genuine emotions and urgency, rejecting conventional performances orchestrated by others. These grassroots protests aim to appear organic and bottom-up.

To test this hypothesis, the paper analyzes current ecological movements in Eastern Europe. It focuses on how cultural perceptions of authenticity and directness influence environmental activists' tactical choices. By exploring the impact of anti-theatrical prejudices and incorporating Peetz's insights on populism's counter-theatricality, the study sheds light on the increasing adoption of radical tactics and discusses broader implications for social movements seeking effective strategies for change.

Performing Utopia: Contemporary Eastern European Theatres As Agents of Collective Action

This paper examines the role of utopian theatrical projects in collective action and the public sphere, focusing on contemporary Eastern and Southeastern Europe. Drawing from Marianne DeKoven's *Utopia Limited*, it analyses the 1960s transition from modernism to postmodernism, where the rejection of grand narratives led to the decentralization of power and the emergence of pluralistic perspectives.

However, the current Eastern European context differs significantly. The rise of populism and distrust toward institutions suggests that postmodern fragmentation can have unintended consequences. Political figures like Viktor Orbán in Hungary, Robert Fico in Slovakia, and the Freedom Party of Austria exemplify this trend, as people seek alternatives to established structures, strengthening populist movements that exploit emotional and identity-driven impulses.

Drawing on David Graeber's *Possibilities: Essays on Hierarchy, Rebellion, and Desire* (2007), I explore the possibilities and limitations of contemporary theatre as a space of imagination, capable of fostering collectives and revealing norms. My research focuses on select theatres in the region that aim to create social movements and have utopian potential—such as the Czech HaDivadlo with its Degrowth Season, the Hungarian Krétakör Foundation, and other artistic groups. I analyse their tactics and strategies in confronting

current challenges, with special attention to theatre's performative impact—its ability not only to reflect social issues but also to actively influence them and contribute to social change.

The aim is to understand how contemporary theatre can function as a tool of collective action when the public sphere is affected by rising populism and distrust. Drawing on Judith Butler's performative theory and Jeffrey Alexander's cultural pragmatics, I discuss effective tactics in this context, the obstacles theatres face, and how they might overcome limitations imposed by the current cultural and political climate.

Discourse on the (Im)Possibility of Male-Female Friendships: An Analysis of Japanese General Magazines from the 1980s to the 2020s

Friendship, alongside romantic love, has been considered a major component of modern emotional life, especially among youths. Prior to the emotional and sexual revolution that foregrounded love in modernity, friendship between men had historically been an important form of social connection associated with class, politics, and military service.

Notably, friendship has been understood as a connection between people of the same sex, whereas romantic love, which is strongly related with heteronormative marriage, has been understood in the context of opposite-sexes. Moreover, friendship between a man and a woman has been viewed with suspicion, owing to the notion that romantic feelings and sexual desire will possibly or inevitably disturb it. This is sometimes expressed by the cliché, "Can a friendship between a man and a woman last or even exist?"

What then is the logical structure of the discourse on male-female friendships and how has this discourse changed over the years? It is important to explore the social construct of love and friendship by examining how social attitudes toward male-female friendships have changed, especially against the backdrop of the significant transition in the social understanding of love and partnership, including debates over same-sex relationships from the 1990s in Japan.

Therefore, this research examines how the discourse on the (im)possibility of male-female friendships has been constructed and has evolved in Japan by analyzing 212 articles from an online database of general magazine articles published in the country from the 1980s to the 2020s.

The results show that male-female friendships have shifted in focus from 'post-romance' to 'pre-romance' and finally to 'para-romance' friendships. Moreover, logical presumptions have shifted from biological and instinctive to social and relational. This shift may indicate that the popular understanding of the relationship between love and friendship has changed significantly over the past four decades in Japan.

Spontaneous Volunteering Motivations and Experiences after Disasters: The Case of Turkey Earthquake

In times of extraordinary and unexpected crises such as earthquakes, many different areas of need emerge, and demand arises for the rapid solution of these needs. The speed and capability of organizing major disasters to respond to the demands of all areas of the affected region may exceed the speed and capability of regular civil society organizations or government agencies. At this point, "spontaneous and unprepared" volunteerism, which is not associated with a governmental or civil society organization and proceeds in an unsystematic manner, becomes active. *Spontaneous volunteerism* is an important force that has the potential to act rapidly and respond to different requirements. However, sometimes-spontaneous volunteers may also turn into factors that do not benefit the disaster area and cause different problems by causing troubles in the processes as they come to the area only as observers.

This study explores the emergence of spontaneous volunteerism during disasters, along with its main motivations and experiences. Field research on the problem area of the study; After the 6 February 2023 earthquake in Kahramanmaraş, it included people (spontaneous volunteers, volunteers affiliated with civil society organizations and public administrators) who attended rescue and other activities in the region. The research method was determined to be qualitative, and 61 people were interviewed. Observation and semi-structured interview techniques were used as data collection techniques. Finally, the qualitative data analysis software Maxqda-2022 was used for comprehensive and in-depth data analysis.

The Image of Democracy in the Context of Authoritarian Manifestations of the Modern Political Regime in Russia

The democracy in various states, the dynamics of democratization processes and authoritarian tendencies cause discussions in the socio-political sciences, due to their volatility, risks and opportunities for social well-being and individual quality of citizens' lives. Western research centers write about the decline of the 3rd global wave of democratization, the degradation of democratic institutions, and the strengthening of authoritarian tendencies in dozens of countries.

Russia is a transitional country, moreover, many political scientists interpret it as a country that is rolling back from a democratic form of government. We will present the results of our quantitative and qualitative content analysis of the Russian media for the period 2003-2023. We revealed how the structure of the image of democracy represented by the Russian media changed, as well as the emotional tone of the articles – from the predominance of positive connotations at the beginning of the period to the predominance of negative ones at the end. Support or criticism of the democratization processes in the period under study were updated in accordance with the current domestic and foreign policy situation. The studied period started with the prevailed groups of "voting", "legal guarantees" and "socio-political stability" discourses; further, groups of "social well-being" and "interparty competition" discourses were added; since the middle of the period, the discourses of "socio-political stability" and "voting" have become predominant. At the end, only the groups of "socio-political stability" and "freedom of expression" prevail. At the same time, the number of publications related to the political system has gradually decreased in the studied period; currently, the discussion of democratization is definitely not among the leading topics in the informational agenda in Russia.

KUENZLER, DANIEL* (University of Fribourg, Switzerland)

Thin Explanations of Cash Transfers in Sub-Saharan Africa or the Methodological Limits of Case Study and Comparative Research

Case and comparative studies are key methodological instruments in social policy research with undisputed merits. However, this paper argues that in some instances the selection of the case(s) to be studied is weakly justified, thus limiting the knowledge gained through the study. This becomes evident when looking at the literature on the political drivers of cash transfers in sub-Saharan Africa, a literature that is particularly interested in the influence of international donors and organizations and of national actors and their priorities. The methodological literature would suggest a theoretical informed case selection, but this is rarely done in practice. There is a strong bias towards bigger English-speaking countries, thus ignoring countries with a different colonial heritage, especially in terms of economic structure. A second strong bias is towards positive cases. One consequence is that what is supposed to explain a policy in the case(s) researched (e.g., donors and national actors with certain priorities) does not lead to the same policy in other cases not researched. Another consequence is that it does not become clear that there might be various explanations for similar policies. A similar problem arises regarding the selection of the social policy field. What is supposed to explain processes in one socio-political field (e.g., cash transfers) might not explain them in another socio-political field in the same country (e.g., health care policies). All this points to thin explanations that have one thing in common: the need for a more refined explanation. This paper does not argue against the use of case and comparative studies, on the contrary: it argues in favour of a careful selection of cases, which is informed by a broader understanding of the dissemination of certain actor constellations and policies.

Beauty Standards As Cultural Capital: A Contextual-Comparative Study of Beauty and Symbolic Boundaries in Accra, Brussels, Buenos Aires, Hong Kong and Tehran

A growing body of research shows that physical appearance or 'aesthetic capital' is an important resource in today's media-saturated, service-oriented, consumer societies. However, most of this research assumes a wide consensus on beauty standards, arguing that 'objective' beauty brings economic and social rewards. This paper investigates if and how beauty standards function as cultural capital: variable cultural standards that mark symbolic boundaries and social status. Moreover, we investigate how this varies across contexts, hypothesizing that beauty standards are more likely to function as status-related boundary markers in more diverse contexts.

In this presentation, we first explain the construction and design of a context-specific instrument for studying beauty standards in five global cities on four continents: Accra, Brussels, Buenos Aires, Hong Kong and Tehran. In close collaboration and using a strictly defined set of criteria, we have designed five sets of visual Q-sort decks that allows us to trace variations (and similarities) in beauty standards for bodies and faces of women and men in each city. These Q-decks will form the basis of interviews, simultaneously providing quantitative mapping of standards across social categories, and qualitative analysis of repertoires of evaluating beauty.

Second, we will present the results of these studies, which will be carried out between March and November 2024. For every city we will present: the degree of consensus or variation in beauty standards; the main repertoires of evaluation of beauty; the main taste patterns, and how they are related to social divisions in each city.

Objects in Motion: Rethinking Archives and Memory-Making Practices through the Trajectories of Protest Artifacts

Inspired by Trouillot's call to investigate how history works and his belief that "history begins with bodies and artifacts" (Trouillot 1995:29), this paper focuses on the archives of protest and the material objects found within them. It explores the role these objects (e.g. photographs, pamphlets, banners, personal items) play in archiving and memory-making practices by following their trajectories. Drawing on interviews with Polish and German activists, curators, and archivists who co-create institutions and initiatives that archive various forms of resistance and grassroots opposition, it sheds more light on (1) what happens to these objects within these institutions and archival initiatives, (2) their journey before and into the archive, and (3) their paths beyond these spaces.

The study reveals that protest artifacts do not simply "rest in archives." Instead, they continue to circulate, both physically and symbolically, contributing to ongoing memory production and linking various acts of resistance. Furthermore, it indicates that these objects are crucial to relationships with/within civil society networks: through practices such as gifting, borrowing, exchanging, and buying/selling, these artifacts initiate, sustain, and negotiate connections, at times also creating opportunities for archives to become more dynamic and inclusive. These findings challenge the traditional view of archives as static repositories, repositioning them as active nodes within broader networks of contentious politics. Additionally, they highlight the fluid nature of memory production, revealing the connections and tensions inherent in the ways protest is remembered and reinterpreted.

This paper is based on interviews conducted as part of the project 'Activism and Knowledge Production. Archives and Protest Data in Contentious Politics Field,' funded by the National Science Center in Poland.

KUJUNDZIC, JANA* (Northumbria University, United Kingdom)

Femicide and the Limits of Carceral Feminism in Croatia

This paper will critically explore the need for abolition feminism in Croatia drawing on recent introduction of the new, separate criminal offence of femicide, expanding the grounds for the arrest and increasing the sentences for rape. This recent development comes a year after unsuccessful lobbying by the women's organisation and centre-left political parties. The overlap of interests between the centre-right ruling party and a celebrity-led initiative against domestic and sexual violence culminated in criminal justice reform. I argue that this should not be seen as a victory for victims of gendered violence but an expansion of the carceral powers coupled with neoliberal ideology. Drawing on abolition feminist theories as well as decolonial feminism, this paper will problematise the overreliance on the criminal punishment system as the main tool for preventing gendered violence alongside the current underfunded welfare and educational system and the democratic backsliding in post-conflict, post-socialist Croatia. While feminist debates around the carceral solutions for gendered violence have been prominent in the so-called Global North, it is time to reevaluate these so-called solutions for South-Eastern Europe as well. Drawing on in-depth interviews conducted with a wide range of gender-based violence experts and analysing socio-legal commentaries on femicide I problematise the mainstreaming of gender-based violence articulated by the 'older' generations of feminists in Croatia. I argue that their specific kind of feminism heavily relies on 'Western' liberal articulations of carceral solutions and private donors while leaving the social and community landscape unchanged. There is emerging space for a 'new' generation of abolition feminists across the ex-Yugoslav space addressing the issue of gender-based violence and community responsibility.

Political Perspectives of Adivasi Women: A Study of Piparbanda Village, Jharkhand

The experience of Jharkhand in Panchayati Raj System is different from other states as it was newly formed in the year 2000 with predominant tribal population under the fifth schedule of the Indian Constitution. It has contrast of changes in the governing system and different political reforms over the years. The state has experienced an active participation of women in the local governing bodies after the 73rd CAA and implementation of PESA. But Adivasi communities have lagged as a part of a larger democratic structure in political participation and representation. Additional, in case of Adivasi women the status is even showing less improvement with less involvement in the political sphere. It is against this backdrop the paper focuses on Adivasi women in the Panchayati Raj system in Jharkhand and its variegated manifestations and analyses women's empowerment in the local governing systems. The study deals with Piparbanda Village, Ranchi. To understand the village settings, perspective of women in politics, accessibility to political structures, their understanding on the local democracy, and their status in the community the paper incorporates the Village Study Method and to comprehend the embedded role of intersectionality and marginality in the political structures. The key findings are that though the PESA law is fully implemented in the district, which was supposed to create a medium for the women from schedule areas to voice their difficulties has also not addressed the questions of participation and representation effectively.

The role of Adivasi women in the Panchayati system is necessary as they are the backbone of the community. The data found explains the women participation in the Panchayati systems but the involvement of women from Adivasi community is still not effectual. But with the help of the community and governing authorities Adivasi women can be empowered and strengthen the Adivasi communities.

The Struggle for Recognition and Polarized Society in Poland

The current polarization of Polish society can be interpreted as the struggle for recognition represented by the United Right and its main adversary, the Coalition (consisting of liberal and left parties), the two most important rivalrous camps struggling for power in Poland.

The United Right claims to represent groups of people and cultural values neglected, misrepresented, and deprived of access to cultural circulation for years. According to the right-wing narrative, most Poles have become "strangers in their own land", ridiculed by the big-city and paternalistic elite. The right-wing version of the populist recognition underlines the idea of a familiar Polishness consisting of ordinary people.

The Coalition in turn upholds that right-wing recognition policy generates contempt for categories of social and politically constructed enemies: critical elites, a large part of the intelligentsia, professionals, sexual and ethnic minorities, and women. The leaders of the liberal-left camp assure their support for these groups. They were struggling for power under the slogan of reconciling the divided society, but the obligations to their electorate and the resentment towards right-wing elites seemed too strong to seek consensus and abandon the logic of the struggle for recognition.

In the concluding remarks, I show how forms of misrecognition experienced by people ease the way to support one camp or the other and add to the ongoing polarization. The struggle for recognition became part of the consciously constructed projects of both camps and their political agendas. It seems a zero-sum game: respect can only be earned at the cost of contempt for the other side.

The presentation is based on a mixed-method study, drawing data from two surveys conducted on a representative sample of Polish society and 96 in-depth qualitative interviews. It also draws on other sources, such as the content analysis of the press and political programs.

The Role of Gender in Influencing the Perception of Fair Wages and Job Suitability in Italy

This article focuses on Italy and studies how people's perceptions of fair wages and suitability for jobs depend on the gender of the future employees. Gender remains a key factor in unequal pay, largely due to associated stereotypes and expectations. According to the status construction theory, gender serves as a status characteristic, influencing performance expectations and reward allocation. These unequal expectations shape perceptions of fair pay, which are often reflected in behaviours like decisions about promotions and raises, perpetuating inequality. As the allocation of rewards tends to align with status expectations, individuals with lower status (such as women) are seen as deserving of lower earnings compared to similarly qualified individuals with higher status (such as men). This argument is tested in our article. Moreover, the article examines how perceptions of fair wages depend on the interaction between gender of the employees with other relevant individual characteristics such as one's qualification and competence, and socio-demographic features including motherhood, ethnicity and social class. Although the perception of fair wages has been studied in the literature, this is one of the first studies to address Italy. For this purpose, we design a vignette experiment on 2000 respondents within a survey that is representative of Italian population. In the experiment, respondents evaluate candidates' curriculum vitae for a job opportunity and assess their suitability and the pay for three occupations which can be defined as feminine (high school professor), gender-balanced (product manager), and masculine (business consultant).

The experiment is pre-registered and administered by Dynata in November 2024 as a part of a larger project. The presentation will provide the results of the experiment for the whole population of respondents and by specific subgroups such as female and male respondents.

Educational Assortative Mating: Exploring Gendered Patterns and Role of Mode of Entry Among Legal Immigrants in the United States

Marital partnering choices are predictors of social structure, stratification, generation and sustenance of social inequality, intergenerational effects, gender relations, marital stability, fertility preferences and children's well-being. At the same time, one of the enduring concerns of a high immigrant society such as the United States is not only the question of how many to admit, but also who to admit, the latter having implications on both labor market prospects as well in the process of family formation. Hence and not surprisingly, there is a growing interest in the marital partnering-family formation aspects of immigration. Previous research on assortative mating patterns has tended to focus on intermarriages along the lines of racial, ethnic, nativity statuses. Present study employing the New Immigrant Survey (NIS) data explores marital partnering based on educational attainment with a focus on gendered patterns as it relates to the mode of entry to legal permanent residency status. NIS is the only data set that documents in detail the process of securing legal permanent residency. Given that gender role attitudes still vary between men and women, there exist gender asymmetries in evaluation of traits documented in literature. The asymmetry has particularly found to be noticeable in the immigrant marriage market applicable to those moving from traditional-developing to modern-developed countries. Marriage migration of women to developed countries can arguably be seen as a manifestation of a kind of the exchange theory. Women exchange admittance to living in economically developed countries with their ascribed characteristics such as physical looks and parental socioeconomic status. Higher educated immigrant women are more likely to marry homogamously or hypergamously relative to their male counterparts. Since educational attainment is directly related to the likelihood of acquiring permanent residency via merit-based-employer sponsorship, there exists a gendered dimension to marital choices and procuring the legal permanent residency.

Tracing the Evolution of India's Emigration Governance Institutions: Legal-Institutionalist Stickiness in Post-Colonial Contexts

This paper looks at the institutional evolution of emigration governance in India from the nineteenth century to the present. Building from Agarwala's (2022) "Migration Development Regime" framework of emigration governance based on class, I extend it to an analysis of the formation and evolution of emigration institutions through a qualitative study of archival and secondary sources. The data is primarily drawn from the emigration legislation in India, with primary sources being the Emigration Acts of 1864 to 1983 as well as the Draft Emigration Bills of 2019 and 2021. I also use allied secondary sources to emphasize my findings. Analytically, I use a historical-institutionalist framework, hitherto used in the study of immigration policy governance (Tichenor, 2002; Collbern and Ramakrishnan, 2021). I find that legislation and the creation of emigration institutions in the country have roughly followed the migration development regime eras put forward by Agarwala. I classify eras of governance into three distinct iterations. The first two eras follow a class-based demarcation in emigration governance while the proposed management era of governance looks to remove class distinctions while increasing state control of emigration- through the rhetoric of "skill-upgradation". The study supports findings by Sadiq and Tsourapas (2023) who find distinct continuities in commodification of labour in pre and post-colonial contexts. The study highlights the role of the institutional rationale of protection leading to institutional stickiness, which leads to varied labour migrant outcomes in different eras. I find that while emigration governance has changed in form over these three distinct iterations, the logic of state intervention in emigration regulation through the language of protection has endured. In doing so, I also highlight how legal-institutional stickiness is vital to understanding migration outcomes in post-colonial contexts around the world.

KAUSHIK, DEEPTI* (Ismail National Mahila PG College
Meerut Uttar Pradesh, India, India)*"Pilgrims' Perceptions of Environmental Responsibility at Kumbh Mela"*

The Kumbha Mela is a huge Hindu pilgrimage and festival that attracts millions of devotees. It is held on banks of river Ganga and Yamuna, organized by Government, police and local authorities. We can consider it as greatest gathering on the planet. This event doesn't need any marketing or invitation for participation, it is open for all. The emphasis is mostly given to spiritual significant of this event leaving behind less attention to environmental impact and pilgrims' attitude towards ecological responsibility. This study tries to dive deep into the complex relationship between environmental awareness and religious practices at kumbha mela, with special focus on how pilgrims perceive their role in preserving the surrounding of the mela space.

We will be conduct interviews over 100 pilgrims at 2025 Kumbha Mela in Prayagraj with addition to on site observation and surveys. The theme of our interviews will be the tension between individual and collective responsibility. We will be collecting samples and datas from different age group pilgrims so that we can get a comprehensive output from our research that can give us better understanding. The implication of this study is not only limited to Kumbha Mela, rather it offers insights into how religious events can act as tool for environmental awareness and action.

RC49-772.1KUMAR, SHUBHAM* (International Institute for Population
Sciences, India)*Work Satisfaction Among Indian Cross-Border Workers in Nepal: A Comparative Study with Domestic Mobile Workers*

Many nations have experienced a rise in international migration over the last few decades, and as a result, their population are now culturally diverse. Nepal is also not far behind; as Indian residents of the Indo-Nepal border region are migrating there in search of potential employment. This study has utilized primary data collected in Raxaul, which is the key exit point between India and Nepal. The sample size estimation has been done using coefficient of variation technique. The estimated sample is 400, including 200 cross-border mobile workers employed in Nepal and 200 Indian mobile workers (Domestic mobile workers). The principal component analysis (PCA) method has been applied to estimate the work environment and work satisfaction. Moreover, Fairlie decomposition technique has been utilized to estimate the percent contribution of work satisfaction by different factors. Compared to domestic mobile workers (13%), the households of cross-border mobile workers (22%), had "good" housing condition. Additionally, 76 percent of the families of cross-border workers use improved toilets facility than the 24 percent of families of domestic mobile workers. Therefore, the monthly per capita expenditure (MPCE) of cross-border workers' families is higher (2460 Rs) than that of cross-border workers' families (2001 Rs). Moreover, the study found cross-border workers have a more labor-conducive environment, greater per capita earning, and work satisfaction than domestic mobile workers. Age, living arrangement, and occupation positively contribute to work satisfaction in terms of differences among both type of workers. The India-Nepal border stands as a dynamic crossroads were transnational mobility coverages. Within this context, this study explores the unique economic opportunities available to residents of the Indo-Nepal border region, located within the cross-border enclave. In conclusion, this comprehensive study offers valuable insights into the complex dynamics of cross-border mobility along the India-Nepal border.

WG01-883.4KUMAR GOSWAMI, RAKESH* (Indian Institute of Mass
Communication, India)*Navigating Online Journalism Ethics and Regulation in the Digital Era*

In an age characterized by the rapid evolution of digital media, the ethical landscape of online journalism faces significant challenges that require urgent attention. This study investigates the ethical dilemmas confronting online journalists, emphasizing the critical responsibilities of maintaining credibility, transparency, and accountability amidst the overwhelming flow of information. The rise of social media platforms has transformed how news is produced and consumed, often blurring the lines between professional journalism and user-generated content.

Moreover, this research examines the regulatory frameworks governing online journalism, spotlighting the ongoing tensions between free expression and the necessity for responsible reporting. With various jurisdictions implementing different regulations, the study aims to explore how these legal frameworks impact journalistic practices and ethical standards.

By analyzing contemporary case studies and existing regulations, this paper seeks to identify best practices that enhance ethical conduct while fostering a regulatory environment that supports journalistic integrity. Key areas of focus include the role of media literacy in informing ethical journalism, the implications of technology on reporting standards, and the significance of establishing accountability mechanisms in the digital sphere. Ultimately, this study contributes to the broader discourse on the future of online journalism, advocating for a balanced approach that promotes ethical practices while safeguarding freedom of the press in a rapidly changing media landscape.

KUMRAL, SEFIKA* (University of North Carolina Greensboro, USA)

Global Crises and the Right-Wing Populism in Turkey

This paper aims to provide a relational and critical analysis of the rise and transformation of the right-wing populist regime in Turkey over the past two decades from a global perspective. Drawing on critical studies of Gramscian organic crisis of the *international* system, it examines the interplay between global crises and local dynamics to understand the class base, political discourse, and transformation of the Erdogan regime. The paper demonstrates that Erdogan's first decade in power was primarily driven by neoliberal developmentalism, whereby the regime relied on economic growth and redistribution to garner public support. It then details the regime's transition to authoritarian militarism in its second decade, a period marked by escalating geopolitical crises that have arisen alongside the decline of U.S. hegemony since the early 21st century. More specifically, the paper analyzes the regime's increasingly aggressive foreign policy and its involvement in proxy and civil wars in the MENA region, aimed at securing continued popular and elite support in Turkey. It also highlights how authoritarian militarization is intertwined with the regime's new accumulation strategies, particularly through the dronization and reconstruction of war zones through mega construction projects across borders. This new political economy of war-making aligns with Erdogan's neo-Ottoman revivalist rhetoric, further intensifying this specific form of nationalism. Ultimately, the paper explores the implications of the shift from neoliberal developmentalism to enhanced militarization, discussing its impact on the regime's further radicalization and authoritarianism.

Families and Mental Health: Insights from the 2023 Nigeria General Elections

Nigeria became the world's fourth largest democracy in May 1999, and since then, six national elections have been conducted. Nigerians are generally seen as happy and resilient people who often laugh at their troubles, as evidenced by social media accounts and memes. The recent World Happiness Report ranked Nigeria 102 out of 143 countries, indicating a low level of happiness. The 2023 elections were marred by irregularities, failing to reflect the true mandate of the majority of voters, including first-time voters. This led to reports of poor sleeping patterns, lack of appetite, anxiety, and distrust in the government. Despite these issues, many people continue their daily activities as if nothing happened. Family life has also been affected, as political discussions and participation can impact mental health when election outcomes are unfavourable. All family members, regardless of age often share values and hopes, influencing their political preferences. A preferred candidate's victory is seen as validation of the family's values and foresight. The chosen leader's success becomes a source of inspiration and hope, aligning with family shared values. To study the effects of the election's conduct and outcome on the wellbeing and resilience of Nigerian families, a pragmatic paradigm with an embedded design was used. This approach included quantitative data from a cross-sectional online survey and qualitative data from in-depth interviews with active voters, heads of families, medical doctors, and spiritual leaders. Social media memes, which often display humour, were also analysed. Current observations suggest families may be displaying atypical behaviours, masking potential election-related trauma.

The study proposes that families and the broader population could benefit from mental health first aid, emphasizing empathy, non-judgmental listening, and other interpersonal skills. This approach could help families process their true feelings about the election outcomes more healthily with the emergence of a truly happy people.

RC41-667.3

KUMSWA, SAHMICIT* (University of Jos, Nigeria)

Fertility Motivations in Plateau State, Nigeria

Global trends show that motivations for childbearing have been influenced by various factors, including deadly pandemics, economic recessions, and geopolitical tensions. Plateau State, Nigeria, presents a unique case study in this context. Known for its cultural diversity, the state encompasses 17 Local Government Areas, each with distinct ethnic identities, languages, and customs. Plateau State, particularly its capital Jos, has experienced recurring ethno-religious crises that may have impacted fertility rates. However, the influence of these crises on childbearing decisions is potentially intertwined with other factors such as age, socioeconomic status, and religious beliefs. This study aims to investigate whether the ethno-religious conflicts in Jos serve as a fertility determinant and to identify other variables affecting fertility in the region. The research employed qualitative methods, including focus group discussions with two women's groups and key informant interviews with religious leaders. Findings reveal that fertility decisions in Plateau State are shaped by a complex interplay of socio-cultural norms, marriage customs, and family values. These factors are further influenced by religious beliefs, educational attainment, and socioeconomic status across the state's diverse population. Notably, the study uncovered a shift in attitudes towards family size in response to the ongoing conflicts. Prior to the escalation of crises, there was openness to discussing the benefits of smaller families. However, as conflicts became more frequent, a trend towards larger families emerged. This shift appears to be driven by an ideological aim to increase population numbers as a means of protecting land from perceived threats by crisis perpetrators. The research highlights the dynamic nature of fertility motivations in Plateau State, demonstrating how societal values regarding childbearing can evolve in response to external pressures and perceived threats to community security and identity.

KURCZEWSKI, JACEK* (Sociology and Anthropology of Custom and Law, IASS, University of Warsaw, Poland)

FUSZARA, MALGORZATA* (Sociology and Anthropology of Custom and Law, IASS, University of Warsaw, Poland)

Global Ethics and Legal Policy

A, Podgórecki, starting from the concept of the scientific politics of law by Leon Petrażycki and the related sociology of law arrived at the concept of mega-sociology combining the issue of social engineering with the normative dimension of "global ethics" and legal structure of societies. We point out that within this theory, in legal experiences and legal acts, the scope of subjects of rights and obligations goes beyond the scope of human beings and "legal persons", including primarily animals, but also other non-human subjects. Global ethics taking into account the surrounding environment of which humans are just a part is thus the third element of the triad beginning with human-individualistic ethics passing into the ethics of pro-social duties, which is inadequate to contemporary challenges. Podgórecki believes that the new ethics is becoming independent of traditional myths and religions, and the world of science is its representative. We point out that this adaptation of Petrażycki's theory allows for the construction of a program of legal policy that will go beyond the boundaries of the human species, and we give examples such as the rights of apes and the laws of rivers that go beyond these wondering to what extent the implementation of the program can free itself from natural (human) intelligence and human monopoly of power (the State). This new ethics, however, requires a new politics, precisely global and intersecting with hierarchical models of power-based legal policies. We wonder then to what degree global ethics does involve mutual aid principle interacting with politics of trans-political solidarity of ethically emancipated social movements and environments.

KURIAKOSE, MELEDATHU THOMAS* (Indian Institute of Technology Guwahati, India)

Colonialism, Trans-Regionalism and Vernacularization of Christianity in Late Nineteenth Century Travancore.

This paper explores how the identity dynamics of Nazranis, a pre-European caste Christian community, contributed towards the vernacularization of Christianity in the princely state of Travancore during the late nineteenth century. In 1886, Nazranis convened a 'caste assembly' at Mulanthuruthy near Kochi with the stated objective of resisting the increasing influence of British-aided Protestantism within the community. Going against the conventions, they invited the Patriarch of Antioch – from Turkey – to preside over this assembly. The Mulanthuruthy assembly, the paper observes, reoriented the Nazrani caste collective as a religious collective and restructured its organisational structure into a clearly defined administrative hierarchy. Despite restructuring against protestant influence, the community simultaneously attempted to prevent the 'Arabisation' attempts by the patriarch, and a 'nativistic' position was articulated as one of its foundational principles. The Mulanthuruthy assembly entailed a vernacularized account of Christianity gaining traction among the Nazranis as their mark of distinction from other forms of Christianity practised in the region of Travancore. The paper argues that this vernacularized Christian identity, emerging out of a trans-regional imagination, needs to be seen in the context of the community's response to competing sovereignties of European colonisers in India and the princely state of Travancore. In doing so, the paper seeks to address (a) to what extent vernacularization is a modern process, (b) how the particular nature of colonialism in Travancore – a princely state with autonomous political structure – influenced the nature of vernacularization of Christianity in the region and (c) what were the theological considerations that guided this process if there were any. The paper concludes by arguing the need to understand the process of vernacularization as occurring in a liminal space, in this case, constituted by the complex interaction between colonialism and anti-colonialism, and as being a manifestation of secularization within that context.

Navigating Uncertainty: The Role of Fortune-Telling in Contemporary Japanese Society

Fortune-telling has become increasingly popular in contemporary Japan. According to a fixed-point survey, the proportion of people who "believe in fortune-telling" has continued to rise from the 1970s to the present. As of 2020, the percentage was 21.5% for men, 43.7% for women, the further rose to 66.3% among women in their twenties, indicating an affinity between fortune-telling and these demographics.

Anthony Giddens has argued that while early modernity was characterized by the "politics of emancipation," which emphasized the expanding individual potential, late modernity is marked by "life politics," where individuals must select and realize their identities from an expanded range of possibilities. Despite its supernatural and unscientific nature, fortune-telling serves as a key reference point for individuals navigating the uncertainties and risks associated with these decisions. This study examines contemporary Japanese fortune-telling as an empirical case with broader sociological implications for understanding the dynamics of late modernity.

Previous research has focused particularly on young women's consumption of fortune-telling magazines, revealing that they consume fortune-telling materials to deal with anxiety. However, existing research has not clearly elucidated why people, in addressing their anxieties, choose to rely on fortune-telling instead of seeking scientifically based counseling.

To bridge this gap, this paper focuses on the interpersonal service of "fortune-telling assessments," wherein individuals seek personalized readings from fortune-tellers. Through a series of in-depth interviews with clients, this paper aims to uncover how individuals' needs for dealing with uncertainty are fulfilled by fortune-telling, specifically addressing why they opt for this practice over other forms of assistance.

This paper concludes that in contemporary Japan, "fortune-telling assessments" function as a form of interpersonal support invoking supernatural or unscientific elements. Furthermore, these consultations fulfill needs that scientifically based counseling cannot, meeting the demands of late-modern individuals.

Exploring Student Housing Struggles: In-Depth Interviews with Polish Student Dormitory Occupation Strike Participants

Since the fall of communism in 1989, Poland went through a neoliberal shift. It introduced a new type of higher education institutions [HEIs]: private HEIs. While the guarantees of free access to public higher education were kept, they are being increasingly challenged by the growing massification of higher education. Growing processes led to various negative consequences, visible for instance in the financial support for students, such as scholarships and university-owned student housing.

In the last nearly 20 years, the number of beds in student dormitories has been steadily decreasing. This, along with rising prices in private rental, significantly worsened the social situation of students, imposing additional burdens, especially on those from less privileged backgrounds. The additional problems that the students had to overcome to be able to obtain higher education resulted in social dissatisfaction. This displayed itself through various forms of protests. In recent years, Polish universities started to experience student occupation strikes that point to issues of lack of adequate social support from the universities.

We examine the effects of aforementioned processes using in-depth individual interviews carried out on participants of a student occupation strike against the closure of Jowita student dormitory in December 2023 in Poznań, Poland. Occupants' stories present patterns of struggles that they as students have to endure in order to secure housing during university and, simultaneously, be able to obtain higher education.

The results show their difficult housing situation and the ways in which it affects their ability to study, establish interpersonal relationships, and make a living. Ways of coping with difficult housing conditions will also be presented, as well as participant's understanding of the general social situation of students.

KUROWSKA, ZUZANNA* (Adam Mickiewicz University, Poland)

How Is Thermal Comfort of the Elderly Simulated, and How Should It be Simulated? Exploring Models of Thermal Comfort and Adaptation Behaviors

Elderly living in urban areas experience a plethora of problems in areas of life such as social, physical, mental and financial, which effectively hinder their adaptation to a changing climate. High temperatures can result in preventing them from aging-in-place, or cause them to use behavioral thermal maladaptations. With more heat waves affecting cities, it is important to explore the effects of extreme temperatures on the individuals.

Understanding mechanisms of thermal comfort and forms of thermal adaptation is crucial to prepare appropriate policies and strategies focused on supporting elderly in combating the effects of extreme temperatures. One of the research methods used for explanation, description or prediction of social effects of heat waves is social simulation. Simulation allows modelling mechanisms behind human perception, sensations or interactions, which are all crucial in understanding how humans behave in light of extreme weather conditions. Although modelling has already been used for simulating thermal perception, previous models experienced limitations such as overly simplifying thermal perception through the use of transverse data, and thus simplifying modelled agents, without fully accounting for people's individual lifestyle factors.

The goal of this presentation is to present a plan for a novel model for simulating thermal perception and adaptation methods. In order to prepare the model, a literature review is conducted with the goal of reviewing models of human thermal comfort. The review will answer the questions such as: what aspects of human thermal comfort are mostly modelled, especially in the elderly populations? How are agents modelled, and what qualities do they present? How is the data gathered and used in models? What are the gaps and weaknesses of previous models?

This model adds to the current existing body of knowledge by systematically reviewing models of human thermal comfort and presenting a new approach to simulating human thermal comfort.

Undesirable Heritage. Kashubian Memory of the Death March 1945 from the Educational Project's Perspective

The places we live in influence our identity the monuments we pass every day, the names of the streets shape our vision of the world from a young age. Similarly, the stories of our grandparents, their memories, the shared recollections impact who we are. Heritage exists across multiple interpretative dimensions and may refer to memorials, various types of objects including mass graves, memory sites or a museum of the former Nazi concentration camp Stutthof. The presentation will show how Kashubs, the regional minority residing today in Northern Poland perceive and value „undesireble heritage“ and examine how its remembrance is reconstructed and preserved, influencing contemporary identity and community cohesion on the example of educational projects for youth and adults *From the past generation let our voice go to all generation*, linking generation in collective remembering, denying and glorifying various memories and action revolving around the Death March 1945 (evacuation of the Stutthof Concentration Camp). The presentation will offer an overview of certain parts of the memory project based on Pedagogy of Place and Memory (M. Mendel, D. Demetrio) highlighting its multifaceted impact on society and local memory politics.

KURT, MASHUQ* (Royal Holloway, University of London, United Kingdom)

Palestinian and Kurdish Childhoods: Radical Habitus and Political Violence in the Middle East

How and why youth in the Middle East adapt radical ideas and actions? How can we understand contemporary phenomenon of youth radicalisation across secular and religious trajectories? How can we conceptualise childhood in cases when political violence shapes every aspect of daily life across generations? Radicalisation scholarship is often concerned with ideological factors and the immediate social circles of radicalised individuals while underplaying the macrolevel hegemonic forces that shape their lived reality and habitus. Drawing on 18 months of ethnographic research, conducted between 2015 and 2018 in Turkish-Syrian border cities, in Istanbul, and in a refugee camp in Greece – as well as a desk-based research on political violence and conflict in Palestine and Kurdistan – this presentation offers an intervention in the study of radicalisation by investigating trajectories and sociopolitical drivers of youth radicalization across the Middle East, with a particular focus on Palestine and Kurdistan. I argue that we must examine power relations, structural inequalities, perceived injustices, and young people's political subjectivities in order to better understand what propels radicalisation. I propose that radicalisation is a relational and gradual process triggered by a set of complex power relations between state and substate actors across religious, sectarian, ethnonational, and class lines, the interactions of which shape what I call a radical habitus.

The Undoing of Comforting and Beautifying Spells: A Qualitative Analysis on the Transformation of Love Relationships in the Film "Innocence" within the Concept of Modernity

In understanding modernity, the doubts we encounter include the Enlightenment experience, the development of capitalism, and secularism. The ongoing debate about whether these concepts are causes or consequences of the emergence of modernity confirms this doubt. Moreover, it can be said that modernity awakens people from dreams that make the pains in their lives more tolerable. The emotional turmoil of the subject, who constantly loses and regains its object in the modern era, has become the focus of many studies examining how it relates to power dynamics in social life. Love, as a passion that connects a person to another object, is one of the emotions that emerge in these relationships. In this context, this study analyzes the transformation of romantic love discourse in the film *Masumiyet*, directed by Zeki Demirkubuz in the 1990s in Turkey, guided by a post-structuralist approach. In the film, love as an emotion that cannot find a stable object forms the identity of the subjects as social actors, and the phenomenon of power in social relationships finds expression in this shared identity. The aim is to understand the power dynamics in the love experiences of the characters in the film in the context of inequality and prejudice. The film has been analyzed, and the data obtained has been evaluated through critical discourse analysis.

The research results show that in the context of inequality, the masculinity-femininity relationships in the love experiences of characters differ from the dominant role distribution in the modern era, while economic relationships reinforce the discourse of marriage based on joint property in the modern period. Finally, love relationships, in the context of social status, differ from the discourse aimed at achieving the promised social status in the modern era, leading to a narrative of status loss.

Creative Destruction? Precarious Works and Precarity in Creative Industries in Turkey

Creativity has been not only attributed to human species as their distinctive faculty, but also turned into a specialised field of work during and after the industrial revolution. Current revolutions, namely the digital and the AI, taking place in the neo-liberal era, produce further existing precarious conditions and wage new challenges for creative works. The proposed paper deals with jobs in creative industries, including arts and crafts, and aims to delve into the division of labour, settings and organisations of those industries to analyse both the existing conditions of precarity reinforced by neoliberal economic policies and the conditions both emerged aftermath of the digital revolution and emerging due to the AI revolution. The aim of the study is to make employment conditions in creative industries more visible to open more space for a debate on those conditions to foresee the future of creative jobs and human creativity in these jobs. Against the backdrop, the paper will be divided into three parts. In the first part, the impacts of both the digital and the AI revolution on selected three types of professional creative works, namely theatre, cinema and music and three types of arts works, namely quilt making, tailoring and carpentry. In the second part, experiences and predictions of men and women working in these jobs will be both presented and discussed. The last part is devoted to a discussion on the future of those works and what can be done for the removal of the economic, social, legal and political insecurity in these works.

Refuge, Riskscape or Both: Reflections on the Relations of Care and Gendered Experiences in Spaces of Forced Migration

While migration is inherently both spatial and social, forced migration is spatial and social with added vulnerabilities, hazards and risks. Yet, the nature of risks, hazards and vulnerabilities at a space are not given, but are constructed and experienced differently by gendered subjects depending on what the nature of space is, how temporal the space is and where the relations of care are located. As the concept of riskscape (Müller-Mahn et al., 2018) denotes, spaces of risk exist in relation to practice. Hence, the concept of riskscapes encompasses both sites of risks and their social construction, and helps understanding the links between practices and meanings formed by social relationships. The concept of riskscape, as formulated by Müller-Mahn et al. (2018), has six components: Temporalities, subjectivities and social groups, spatiality, plurality, power relations, and practice. By drawing on this concept, the proposed paper incorporates gender and relations of care as the key factors explaining the tension between perceived and politically constructed riskscapes. The proposed paper is based on a study on eight women at different stages of the life course experiencing forced migration due to the conflicts in the Middle East and temporarily staying in Turkey. The paper first introduces the historical backgrounds and types of forced migrations experienced by those women. Secondly, the paper presents spaces of risks and safety as constructed by the international and national laws, and introduces the meaning of and practices relating to the so-called/constructed risk spaces and safe spaces for them, and discusses whether a safe space is a space of safety, risk of both for forced migrant women. The paper concludes that the social construction of a space for women is through their relations of care. Hence a politically constructed risk space can be a safespace as well as riskscape, for women or vice versa.

KURUSHIMA, KEI* (Institute for Global Environmental Strategies, Japan)

Food Sovereignty and Community Land Rights

In this presentation, I will explore the concept of food sovereignty, which prioritizes the rights and needs of those who produce food, particularly small-scale farmers. Food sovereignty emphasizes sustainable agricultural practices, ensuring that producers have control over the land and resources they rely on. This approach advocates for an inclusive food system that respects the rights of local farmers, allowing them to maintain autonomy over their agricultural lands. Such control is essential for promoting food security, especially in the face of multiple stressors, such as climate change, economic instability, and social inequality, that contribute to both food insecurity and human insecurity.

The presentation will highlight the importance of community-based approaches to land management, drawing on case studies from Thailand and the Philippines. In these examples, people's organizations have successfully managed agricultural land through community land rights, enabling more equitable access to resources and fostering local resilience. By securing land tenure and promoting sustainable agricultural practices, these communities have mitigated some of the challenges associated with food insecurity. The case studies will demonstrate how local knowledge, when combined with land rights, can lead to more sustainable and secure food systems, providing a model for other regions facing similar challenges.

RC40-655.3

KURUSHIMA, KEI* (Institute for Global Environmental Strategies, Japan)

Impacts of Climate Change on Local Agriculture on Food Sovereignty

In this presentation, I will explore the concept of food sovereignty, emphasizing how climate change directly impacts the rights and needs of those who produce food, particularly small-scale farmers. Food sovereignty prioritizes sustainable agricultural practices by the local communities, which are increasingly threatened by shifting weather patterns, extreme climate events, and environmental degradation. Producers' control over the land and resources they rely on is essential for building resilience against these climate-driven challenges. This approach advocates for an inclusive food system that empowers local farmers to adapt to climate impacts, ensuring they maintain autonomy over their agricultural lands. Such control is crucial for promoting food security in the face of multiple stressors, such as climate change, economic instability, and social inequality, which together exacerbate both food insecurity and human insecurity.

It will also highlight the importance of community-based approaches to land management, focusing on case studies from Thailand and the Philippines. In these examples, local communities have adapted to climate challenges by managing agricultural land through community land rights, enabling more equitable access to resources and fostering local resilience. By securing land tenure and integrating sustainable agricultural practices, these communities have addressed some of the impacts of climate change on food insecurity. The case studies will demonstrate how local knowledge, when combined with land rights and climate-adaptive strategies, can lead to more sustainable and secure food systems, offering a model for other regions facing similar climate-related challenges.

Defacing Banksy? Understanding "Street Art Vandalism" As Local Practice

In 2006, based on a public survey expressing overwhelming support, the Bristol (UK) City Council retroactively legalized a stencil-based artwork by Banksy and has since restored it several times after it was "defaced". Considered just another form of vandalism in the 1990s, over the past 20 years, the cultural practice and social understanding of street art has fundamentally evolved. Today, (legal) street art, promoted in countless community arts programs and festivals around the world, is popular with most urban publics. On the other hand, street art's profound transformation has led some to critically associate it with capitalism, touristification, gentrification, and other forms of urban exclusion. Some festivals vie for rankings and reputation by prioritizing the participation of big-name international artists over the inclusion of local artists and community actors. In this contested space, certain expressions on walls are seen as "street art vandalism", a particular type of protest graffiti.

Why is it that in some cities, some legal murals painted within festivals are "crossed" by graffiti writers as soon as they go up, while similar works in other places and cities remain largely untouched? What are graffiti writers seeking to communicate and how do festival organizers and street artists respond? What does "street art vandalism" mean in a quickly transforming urban and cultural landscape? In this talk, I draw on (ongoing) ethnographic fieldwork of street art festivals and scenes conducted in several European and North American cities. I compare findings from Montreal (Canada), St. Petersburg (USA), Vienna (Austria), Bristol and Aberdeen (UK) to highlight expressive nuances and contextual differences in the ongoing visual "conversations" enacted by various creative actors across different urban settings. Generally speaking, the paper engages with interpretive and critical theoretical concepts to investigate cultural, urban productions of meaning while emphasizing the underlying politics of place-making.

KUSUMOTO, TOSHIYUKI* (St. Andrew's University, Japan)

The Relationship between Lawyers' Working Conditions and Their Subjective Welfare

If lawyers, who play important public roles in legal dispute resolution, can feel fulfilled in their work and improve their subjective welfare, it is believed that this will lead to improved social contributions from lawyers' public roles. Therefore, we conducted a web-based survey of Japanese lawyers to investigate the relationship between lawyers' employment status, work content including some social insurance coverage status, working environment and conditions, and subjective welfare, such as in what situations or under what working conditions lawyers feel a sense of fulfillment and happiness in various duties and work, and their enthusiasm for contributing to their work increases. Statistical analysis of the survey results revealed that there is a significant correlation between employment status, some social insurance coverage status, and subjective welfare. Although the social role and mission of lawyers is emphasized, it can be said that improving the working environment and conditions increases the satisfaction and enthusiasm for their activities. Furthermore, it can be said that the results are suggestive of what employment status and working conditions contribute to human subjective welfare for workers in general.

Navigating Contradictions: The Zafer Partisi, Social Movements, and the Normalization of Far-Right Discourses in Turkey

Far right politics has gained strength and proliferated in diverse political contexts across Europe and elsewhere. Far right parties have become prominent political actors and won several national elections, gaining legitimacy and public trust. This growth has led far right discourses to be normalised and increasingly become integral to mainstream politics. The mainstreaming of these discourses has considerably challenged progressive social movement as they enhance resonances with the wider public of illiberalism, anti-immigrant sentiments and acts, racism and ultra-nationalism, and an anti-gender and anti-LGBTI+ position. Despite sharing major commonalities, far right political parties need to be under scrutiny for any context-specific deviating features for a more nuanced understanding of agenda setting of the far right.

Against this backdrop, this paper focuses on the secular ultra-nationalist *Zafer Partisi* (ZP) (Victory Party) as a newly established movement party in far right political landscape in Turkey. ZP stands out with its position against the Islamic governance of the leading Justice and Development Party (AKP), diverging in issues such as gender equality, withdrawal from the Istanbul Convention (The Council of Europe Convention on Preventing and Combating Violence Against Women and Domestic Violence, also known as "the Istanbul Convention"), and immigration policies. Based on media coverage of ZP statements, electoral manifesto, local election materials, and ethnographic observation carried out during the electoral cycle, this paper investigates the dynamics of mainstreaming of selected ZP discourses. Focusing on two significant political moments – the 2024 local elections and withdrawal from the Istanbul Convention, the paper points out conflicting positions of the ZP vis-à-vis the leading AKP in mainstreaming challenging issues for the various progressive social movement actors.

Reframing Wartime Society: Resistance and the Risks of Resilience in Ukraine

The protracted societal resistance of Ukraine against Russia's invasion has not only brought profound transformations within Ukrainian society but has also revealed distinctive characteristics of a wartime society and the foundations of its resilience in the liberative struggle against an external aggressor. What features strengthen a society's resilience in wartime? What societal risks (threatening social cleavages, demographic changes, institutional crises etc.) might emerge at the end of the war as consequences of wartime challenges and ongoing radical societal changes? In searching for answers to these questions, we apply a synthetic theoretical framework grounded in a structural-agency approach, enhanced by cultural and historical sociology lenses. This framework allows us, first, to differentiate the deeply-rooted manifestations of the phenomenon of society at war from the short-term trends in its dynamics by considering the factor of time. Secondly, it focuses on the synergy of subjective (emotional and value-driven) and objective (socio-structural and agentic) factors and risks of societal resilience against external aggression.

The empirical analysis of societal resilience factors and risks is conducted across six dynamic dimensions that reflect the proposed theoretical framework: (1) perceptions of threats, meanings of war, and possible outcomes of its conclusion; (2) core socio-cultural values directly linked to the situation of anti-imperial liberative warfare (national independence, freedom, democracy); (3) national and civic identity; (4) sociogroup solidarities and tensions; (5) willingness to resist the enemy and defend national independence; and (6) civic activism and volunteerism. The empirical analysis draws on publicly available data from international and national sociological monitoring studies conducted in Ukraine during the full-scale war and the preceding period.

The Power of Sociology in Wartime: Shaping Resilience and Knowledge in Ukraine

This presentation examines the challenges and resilience factors shaping Ukrainian sociology during the war and its role in producing knowledge, shaping discourse, and influencing practices in a time of national crisis. The Russian war against Ukraine has drastically reshaped the operational capacities of sociology across three critical domains: knowledge production, sociological discourse, and its practical utility. Yet, Ukrainian sociology has maintained its proactive role in supporting national resilience and addressing both immediate wartime challenges and post-war societal reconstruction.

The ongoing conflict in Ukraine offers a unique case study for exploring sociology's function in times of war. This paper analyzes how Ukrainian sociology has adapted to fulfill its scientific and civic duties amidst the war's disruptions. Drawing on the experiences of Ukrainian sociologists, the discussion highlights how research activism, theoretical and methodological innovations, and engagement with civil society have emerged as essential responses to wartime conditions.

As a direct effect of the war, the role of Ukrainian sociology has evolved from serving as a catalyst for nation-building, democratization, and social justice to now bolstering national resilience and resistance against Russia's invasion and neo-imperial ambitions. This shift in focus is reflected in the practices of knowledge production, the framing of sociological discourse, and the collaborative efforts of the sociological community within Ukraine and internationally.

The multi-layered impact of Ukrainian sociology, both in fostering societal resilience under the extraordinary pressures of war and in informing post-war recovery, underscores the enduring power of sociology as both a science and a profession. This case demonstrates how sociology, when engaged with pressing social realities, can serve as a vital tool for navigating national crises and building pathways to recovery and renewal.

How Do Consumers Handle Old Digital Devices?

Technological development contributes to the regular updating of digital devices, programs and other apps designed for them. Increased consumption of smartphones and other gadgets is followed by various negative environmental effects, including an increase in electronic waste. This problem is often addressed at the global level. The 12th UN Sustainable Development Goal is related to ensuring a transition to sustainable consumption and production patterns. Target 12.5 suggests global waste generation to be substantially reduced via prevention, reuse and recycling by 2030.

In this paper we outline the consumer behaviour towards the end of devices' useful life and differences in approaches based on socio-demographic factors, innovativeness, and social conscience. Individuals may continue to store them at home, act in a constructive (extending the life cycle or recycling of unnecessary gadgets) or destructive way (throwing them away in the trash). Current study employs data from two nationally representative surveys conducted in 2023 (N=6079, 18+) and 2024 (N=10038, 14+). Analysis includes descriptive statistics and multinomial logistic regression with practices of handling old digital devices as dependent variable.

The results show that half of smartphone replacements are due to breakage; 8% – due to external damage. Many face the problem of devices becoming obsolete, forcing them to buy new ones. More than a quarter of respondents replaced their smartphone because the old one didn't support the necessary apps, lacked memory or didn't have the features that appeared on new models. In most cases old smartphones, computers and tablets continue are kept at home (40% of all respondents). Less frequently devices are given a second life: they are given away (22%) or sold (16%). About one in five gets rid of them, either by throwing them in the household garbage (12%) or via recycling (6%).

KWIATKOWSKA, AGNIESZKA* (SWPS University, Poland)

Redistribute and Divide: The Narratives of Poland's Right-Wing Populism

Between 2015 and 2023, the radical right populist Law and Justice party gradually eroded democratic institutions in Poland. The party's electoral successes have been attributed to rising inequality and the inability of mainstream political parties to implement effective economic redistribution—echoing populist patterns across Europe. Law and Justice capitalised on long-standing economic grievances, a by-product of the rapid transformation from a centrally planned to a free market economy, which produced a large social group of 'losers of transformation'. Although these grievances had existed for some time, they were largely ignored by successive governments, and the sense of economic injustice was further exacerbated by the economic and migration crises within the European Union. Law and Justice effectively addressed the needs of social groups who felt both economically and culturally excluded from the political community following the democratic transition. They combined a narrative that emphasised the economic divide between 'liberal Poland' and 'solidarity Poland' with social conservatism, a close relationship with the Catholic Church, Euroscepticism, and a strong anti-immigration campaign.

In this study, we analyse the narratives of Law and Justice that link the articulation of class grievances with anti-elite resentment, welfare chauvinism, and an illiberal backlash. We demonstrate that their broad redistributive policies were not accompanied by a more egalitarian vision of democracy. Instead, the party deliberately fostered divisions among economically disadvantaged groups (based on their political orientation) by exploiting xenophobic and anti-liberal narratives, using redistribution as a form of conditional charity targeted at selected social and occupational groups, rather than as a step towards economically inclusive democracy.

KWIATKOWSKA, AGNIESZKA* (SWPS University, Poland)

Resisting the Conservative Swing - Gender Mobilisation and Halting Democratic Backsliding in Poland

The 2023 Polish parliamentary elections are widely regarded as a critical juncture and an exceptional instance of an alliance between social movements and the political opposition successfully removing a radical right populist party from power. This study examines the social mobilisation we term 'the revolution of the politically disinterested', as the unprecedented voter turnout and the victory of democratic opposition parties were largely driven by groups

typically disengaged from politics, particularly young women, who emerged in 2023 as a decisive force, displaying voting preferences significantly different from the broader electorate.

During the rule of the radical right populist Law and Justice party (2015-2023), particularly following the 2020 Constitutional Tribunal ruling that severely restricted women's reproductive rights—which prompted the largest protests in democratic Poland's history, organised by the National Women's Strike—there was notable political mobilisation among young women. This shift was evident in high voter turnout during the 2020 presidential elections and an immediate radical shift towards left-wing positions. This surge in political engagement, alongside alliances between progressive movements (women's, LGBTQI, environmental, and human rights), resulted in a strong emphasis on women's rights within the agendas of opposition parties.

Drawing on a representative survey conducted one month after the 2023 parliamentary elections, this study analyses shifts in political views and narratives surrounding women's rights, and the role of social mobilisation around gender issues as central to the election outcome. The research reveals a reversal of the conservative trends established during the Law and Justice rule, particularly in attitudes towards women's reproductive rights and political representation.

At the same time, the study underscores the conditionality of the alliances between progressive social movements and democratic parties—the current failure of the government to fulfil its promises regarding women's, LGBTQI and human rights enables the possibility of a return of the populist right to power.

KWON, HEE EUN* (The University of Tokyo, Japan)

Trespassing the Boundaries: Migrants and Tourists in Dubai

This research investigates how religious identities shape everyday experiences of belonging in the Al Fahidi District of Dubai, United Arab Emirates (UAE), with a focus on understanding the boundaries between migrants and tourists. Drawing on 32 months of ethnographic fieldwork, the study explores how Dubai's residents—both nationals and non-nationals—navigate religious identities in a city where 89% of the population consists of temporary migrants. Religion thus becomes a critical lens through which these migrants make sense of “the other,” especially in a context where Islam is the majority religion but religious diversity is officially embraced under principles of tolerance and cosmopolitanism.

Al Fahidi District, a historical neighborhood, offers a unique space where the boundaries between nationals, migrants, and tourists intersect. Home to both government offices and major tourist sites, the district attracts visitors who engage in a form of orientalist flânerie. Meanwhile, migrants, particularly those recruited for labor, use religious identity as a tool to connect with the host community and establish a sense of belonging. This creates a complex interplay of religious and social boundaries, where migrants demonstrate religiosity to foster social cohesion, while tourists remain on the outskirts of these boundaries as observers. The religious dynamic thus helps to create a shared cosmopolitan space for migrants while reinforcing the boundaries between them and tourists—until moments arise when tourists cross these boundaries, engaging in performative acts of religiosity and momentarily blurring the lines between outsider and insider among the non-nationals in Dubai's diverse social fabric. This work explores where the boundaries between migrants and tourists are drawn within segregated contexts of migration, and when these boundaries become blurred.

The Multidimensionality of Meritocratic Beliefs in Korea: Evidence from the Issp 2009 Data

In the rise of neoliberalism and populism, meritocracy is one of the concepts that has been actively discussed in public discourse across countries. Public and scholarly attention has been heavily focused on popular beliefs in effort-based meritocracy (i.e., “Hard work will bring success”). The present study directs scholarly attention toward a multifaceted definition of meritocratic beliefs. Building on prior studies that heavily focused on a few countries such as the United States, China, and European countries (Kwon and Pandian 2024; Reynolds and Xian 2014; Zhu 2024), I analyzed the Korean data from the ISSP 2009 with latent class analysis (LCA) and demonstrated the multidimensionality of meritocratic beliefs among Koreans. Three configurations of meritocratic beliefs are found in South Korea: (1) *ambivalent dual consciousness*, where respondents strongly endorse three meritocratic elements (hard work, ambition, and one's educational qualification) while moderately endorsing the three non-meritocratic, structuralist elements (wealthy family, well-educated parents, and political connection), (2) *instrumental dual consciousness*, where respondents strongly attribute one's success to both meritocratic elements

and non-meritocratic elements, and (3) *effort-focused meritocratic beliefs*, where individuals attribute success to personal hard work and ambition but do not endorse other elements. In addition, the membership in each group is related to one's level of education and subjective social class: compared to those with lower education and who identify with the lower class, those with a college degree and who identify with the middle class are more likely to hold *dual consciousness* than *effort-focused meritocratic beliefs*. This finding suggests the need for a more nuanced understanding of Koreans' meritocratic beliefs.

Bringing Algorithms to the Bargaining Table: Strategies but Setbacks in Sociotechnical Negotiations for Unions in the Korean Platform Economy

As AI and data-driven digital technologies continue to reshape the nature of work in the platform economy, unions encounter heightened challenges of negotiating the use of technologies that often lack transparency.

What strategies could unions adopt, particularly in societal contexts with limited support for addressing workplace technologies? How might they engage in effective negotiations about **algorithms** in their workplaces? This study explores these questions in a particular context where unions generally lack the institutional support for bargaining and critical public discourse to facilitate their intervention in firms' technological decisions. We focus particularly on the case of South Korea, which is unique in the sense that technology is rarely negotiated, while the emergence of unions in the platform economy is significant.

The country's rapid development has historically fostered a narrative that equates technological advancement with successful growth of the nation and its firms. As a result, labor unions are left with limited avenues to critically address the impact of technology on working conditions. In recent years, two emerging labor unions—the National Chauffeur Union and the Riders' Union—have identified the lack of transparency in platform algorithms used for call distributions as a significant concern. Nevertheless, persistent opposition from dominant platforms has led these unions to shift their focus towards more conventional issues, such as securing entitlement to national minimum wages for platform workers. As concerns about algorithms have receded in priority, the unions have sought to elevate the agenda by linking it to broader public concerns, such as road safety. This paper examines the agenda-setting processes of two unions to shed light on how platforms' resistance to negotiating over technology constrains unions' ability to integrate technology-related issues into collective bargaining and to navigate alternative strategies, particularly in the context of limited institutional and discursive support at the societal level.

On Measuring Political Consumerism: An Exploratory Study Among Young People in the UK and in Greece

Political consumerism consists of boycotting and boycotting and refers to the conscious and consistent use of the market for ethical, environmental and eventually political considerations. Nevertheless, at present there is no academic consensus about how best to conceptualise and empirically measure this form of political participation. The aim of this article is to address this gap by constructing a comprehensive survey instrument to measure political consumerism, in the form of the 'Political Consumerism Index' (PCI). This PCI is tested for validity and reliability and applied to a primary sample of young people in the UK and Greece, to shed light on the differing underlying motivations of young political consumers in the two countries. A combination of linear regression analysis and a series of non-parametric tests reveal the distinct advantages of this PCI over the commonly-used dichotomous behavioural measures of political consumerism. Our analysis reveals that political consumerism in both the UK and Greece is driven by young people's conviction about the effectiveness of their consumer behaviour, their environmental motivations and their willingness to sign online petitions or join protests. There are also important differences across the two groups. Young UK political consumers are more likely to be female, relatively older, with a stronger local community outlook and postmaterialist sensitivities. Instead, young political consumers in Greece demonstrate both a generalised rejection of partisan politics and believe that market competition brings out the worst in people, while they perceive political consumerism as a means to support their national economy.

Crafting Perceptions. Travel Influencers and the Affective Power of Public Transit Narratives in Milan and New York City

The rise of travel influencers in the digital age has redefined how reputation is built, managed, and monetised in the tourism industry. However, we still know little about the role of these figures' affective labour in urban transformation processes. Building on Gary Alan Fine's concept of *reputational entrepreneurship* (Fine, 1996; 2019), this research explores how these influencers actively shape public perceptions and trust in urban transit services. Reputational entrepreneurs are individuals or groups who construct and manage reputations by strategically navigating social and moral landscapes. In this context, travel influencers function as critical actors in promoting or devaluing public transport, crafting narratives that evoke affective responses toward the transit systems of global cities. Drawing on Fine and Keller's (2021) exploration of *social worlds*, this study positions travel influencers as key figures within digital micro-publics, particularly those concerned with urban depiction. These influencers build trust and authority through their reputational work, showcasing the efficiency, unreliability, convenience, and dangerousness of public transport. Their affective labour shapes consumer perceptions and guide travel behaviour, particularly among tourists and urban residents who rely on public transportation for their mobility needs (Pop et al., 2022). Through a hybrid ethnography of public transport in Milan (Italy) and New York City (New York, USA), the current research will focus on travel influencers who contribute to the reputational landscape of each city's transit network. Particularly, it will investigate the ways public transport influencers take part in the construction of collective memories and affective imaginaries of ATM (Azienda Trasporti Milanese) and MTA (Metropolitan Transportation Authority). Finally, this research will offer valuable insights into the role of these influencers in the broader city's transformative processes of eventification, touristification, and marginalisation.

Epistemological Diffractions: Obsessive-Compulsive Disorder and the Limits of Reflexivity in Ethnography

This research presents a critique of reflexivity in ethnography based on my personal experience of being diagnosed with obsessive-compulsive disorder (OCD) and conducting ethnography during my doctoral studies. Literature shows that sensory processing in OCD can amplify stimuli or result in distrust of the senses, often leading to discomfort or distress. This different sensory and emotional experience challenges the ethnographic process, which requires the researcher's immersion in the material dimensions of everyday life. While traditional reflexivity focuses on the self-analysis of sensory and cognitive biases in relation to a normative standard, in this contribution – following the path illuminated by Enrico Petrilli in his studies on nightlife – I employ Karen Barad's neo-materialist and feminist perspective, which transcends the subject-object dichotomy, suggesting that both emerge together through intra-actions. The application of this method involves re-examining the material produced during my doctoral research on the many facets of social distancing on public transport, considering the sensory and emotional alterations associated with my condition as epistemic opportunities, as part of the intra-action process that co-constitutes the subject (the researcher) and the object of study. By exploring how a researcher with divergent sensitivities perceives the field and navigates methodological and analytical processes, this work highlights the role of embodied, lived experiences in shaping knowledge. The diffractive approach calls for greater epistemological inclusivity, challenging normative models of objectivity and recognizing neurodivergence as a resource for generating knowledge. This shift promotes a broader understanding of how perception and cognition contribute to the co-construction of research findings and offer alternative perspectives on the spaces and practices we study.

Reclaiming Food Insecurity As a Critical Domain in European Urban Food Policies: Lessons from Public and Community-Based Initiatives

Cities are at the forefront of current socio-ecological challenges. Despite key advancements, such as the development of hundreds of urban food policies across the globe, recent evidence shows increasing numbers of food insecure people in urban areas, rising inequalities and further environmental degradation affecting both low and high-income countries. However, food insecurity remains low in the political agendas of European cities and narrow conceptualisations of the phenomenon limit effective interventions that combine ensuring availability and access to food with sustainability and empowerment outcomes.

This paper aims to address this gap by studying current mechanisms to address urban food insecurity in European cities, using Barcelona as a case study. For that purpose, we mapped food and nutrition insecurity initiatives and mobilised a socio-ecological perspective built on the HLPE six-dimensional framework of food and nutrition insecurity to analyse them, mainly Availability, Access, Utilisation, Stability, Agency, and Sustainability. The analysis showcases a wide number of initiatives and a diversity of approaches to tackle urban food insecurity. Among them, there are initiatives that incorporate elements of food justice, political ecology, and community-based efforts alongside considerations of sustainability and resilience, addressing not only environmental challenges but also economic and public health issues. These food innovations with higher socio-ecological impacts should warrant prioritisation in policies and funding schemes. Furthermore, their capacity to address multiple urban challenges provides opportunities to reinforce adopting a food-sensitive perspective in urban policies, reinforcing multisectoral and long-term food governance interventions in cities.

Ecologies of Friction in Digital Platform Investment

Digital platforms are underpinned by the ideal of a frictionless market, obscuring the simultaneous practices of market monopolisation and the restriction of consumer choice and movement. This concurrent removal and erection of barriers to participation triggers ecosystemic responses such as individual adaptations and establishing alternative organisations to counter the progression of these 'walled gardens'. In this article, we contribute to theorising *ecologies of friction* in the platform economy, drawing on Tsing's friction in the creation of global connections, Orbach's friction paradox, and Bateson's ecological epistemology. Analysing a European short-term rental platform cooperative's difficult launch, we ask: *How do frictions emerge on alternative platforms in the digital economy, and what effect do they have on prefiguring the platform business?* Frictions become apparent in *platform investment*, a complex resource-allocating relationship binding together multiple stakeholders, laden with expectations about the future. We highlight the interconnected frictions of individual investment into platform work, collective investment into platform participation, and resource investment into the business model. These are bound with platform organising, community development, and managing scale as the cooperative tries to prefigure a future platform economy in establishing its current practice. We contribute by extending the concept of ecologies of friction in connecting individual and collective investment with ideas around platform growth. We illustrate how all platform economy actors – participants and platforms alike – are entangled in frictions. We suggest that alternative platforms' struggles are largely caused by the impossibility of escaping the broader ecosystemic dynamics established by dominant platform imaginaries.

University As a Multifunctional Organization: A Comparative Case Analysis from Finland

In recent decades, universities have transformed from institutions focused primarily on education and research into entrepreneurial organizations with increasingly diverse missions, including scientific research, higher education and economic development. In this study, we apply social systems theory to analyze this entrepreneurial shift, conceptualizing universities as multifunctional organizations that strategically engage with various institutional logics in their internal decision-making processes.

Through a longitudinal qualitative case analysis of decision-making related to the establishment of two student entrepreneurship hubs in Finnish research universities, our findings reveal that these institutions navigate their multifunctionality by selectively engaging with, or deliberately avoiding, specific functions throughout their decision-making programs. This strategic management of multifunctionality allows the case universities to respond flexibly to rising external pressures without undermining their core educational and scientific missions.

A key insight from our study is the concept of "strategic undecidability"—the deliberate abstention from making definitive decisions when faced with external economic expectations. Rather than prioritizing economic objectives over educational and scientific ones, the universities we analyzed created internal flexibility, enabling them to become more responsive to external demands while maintaining their traditional roles.

In conclusion, we argue that universities can adopt entrepreneurial practices while preserving their core identities as institutions of higher education and research. The strategic use of non-decision-making, or the conscious suspension of certain decisions, plays a critical role in maintaining this delicate balance between competing organizational missions.

Convergence in the Coast: Examining the Interplay between Mangroves and Local Communities in Disaster Preparedness and Response in Prieto Diaz, Sorsogon, the Philippines

In the coastal town of Prieto Diaz, Sorsogon, the Philippines, the relationship between the mangrove forests and the local community demonstrates resilience and mutual protection. While the mangroves provide a natural shield against storms and erosion, safeguarding the community's homes and livelihoods, the local community recognizes the value of these forests and actively participates in their preservation.

This study delves into mangroves' vital role in shielding communities from the destructive forces of natural disasters, particularly typhoons and sheds light on the collective efforts of fisherfolk people's organizations and individuals dedicated to safeguarding mangrove forests.

Employing the concept of convergence in disaster studies, the research advocates for a collaborative approach among diverse stakeholders to effectively tackle the multifaceted challenges in disaster management. It emphasizes the reciprocal impact of disasters on mangroves and the proactive role of community organizations in their conservation. After typhoons, these organizations often mobilize community members to engage in restoration efforts, demonstrating the strong bond between their ecology and community well-being. This relationship signifies how adversity can further collective action and foster a deeper connection to mangrove forests.

Furthermore, the study highlights the importance of recognizing and enhancing the interconnectedness between mangrove ecosystems and community responses to disasters. By examining the effects of disasters on both natural environments and local communities, the research aims to contribute to more effective disaster preparedness strategies. It calls for a sustainable approach to disaster risk reduction that incorporates the roles of both nature and human societies in promoting resilience.

Defining the AI App Economy: A Quantitative Analysis of Generative Artificial Intelligence Applications

The recent uproar in generative artificial intelligence (AI) increasingly poses the need to study these emerging technologies. A first step is to analyse the economic structure, which echoes the structures of the app economy that emerged with the advent of smartphones and digital platforms in the late 2000s. Although the app economy revolutionised interaction with technology, it also revealed critical issues such as market saturation and uncertain profitability due to fierce competition and the proliferation of applications with low practical utility. Similarly, today's AI app economy is characterised by a rapid proliferation of AI applications, many of which lack a clear business model or significant added value for the end-user, but with a major economic, energy and social impact.

This study aims to define the AI app economy as a research field through a quantitative analysis of its economic characteristics. Data from 2023 to 2024 were collected from the three main aggregators of generative AI applications, using descriptive analysis and text mining techniques on application descriptions to obtain data on the type of economic model. This made it possible to identify application sectors, specific uses and service types.

The results provide insights into the distribution of applications across sectors and the prevalence of specific use cases. By mapping the landscape of the economics of artificial intelligence applications, it contributes to understanding how emerging technologies are reshaping economic and, consequently, social structures.

This analysis addresses the methodological challenges in the study of emerging technologies and provides a basis for future research on the implications of AI applications in society, so as to develop an environment in which to analyse the uses and impacts of generative artificial intelligence.

Review of Participatory Approaches Implemented in Different Countries to Manage Groundwater

Deep confined aquifers (CAq) are strategic resources for the supply of drinking water, mainly due to protection against pollution offered by overlying geological layers and their hydrological inertia which reduces their sensitivity to climatic change. This presentation investigates how to develop a shared understanding of those complex aquifers, a pre-requisite to involving stakeholders in the definition of management objectives and rules. Such participation ensures that various knowledge are taken into account and that principles of justice, equity and sustainability are discussed. But actively involving stakeholders, and especially citizens, in CAq management poses specific challenges. Because of its invisible and complex nature, CAq are less known and less appropriated than surface water. This is even truer for CAq which are the focus of the DEESAC project (Sustainability and Exploitability of Groundwater in CAq). Building knowledge about these resources requires technical and scientific mediation and tools. It also requires to mobilize and articulate different types of knowledge and expertise in order to develop common knowledge and build communities of interest around these resources. A second challenge is to support stakeholders in the construction of long-term management strategies by identifying indicators of "good status" which can ensure sustainability of the resources over the long term. Our intervention will present the results of a literature review on participatory approaches implemented in France and in different countries (i) to define indicators of "good status" for CAq, (ii) to set objective values for these indicators and (iii) to determine associated withdrawal thresholds, with a view to sustainable resource management. The aim is to identify the different ways in which stakeholders were involved in defining these elements: which stakeholders were involved, how and at what stages of the decision-making process? What data and/or tools were used, in what format and according to what principles of use?

LAGERSPETZ, MIKKO* (Åbo Akademi University, Finland)

Sociology and Sociologists during the 30 Years of Estonia's Post-Socialist Transformation

Sociology, as it emerged in the Estonian Soviet Socialist Republic (SSR) during the Khrushchev Thaw of the 1960s, was assigned to give decision-makers numerical feedback about the population's attitudes and living conditions. It functioned as a substitute for the feedback mechanisms that in the West were provided by markets, political democracy, and civil society. With the glasnost policies initiated in 1986, possibilities of criticising the system were opened, but scientists also continued to be held in high esteem in the new situation. For a few years during and immediately after the revolutionary period, sociologists played a visible role in politics. Since the early 1990s, they have rather avoided taking party political stances and acted as experts on certain policy areas, such as social policies and ethnic minority integration. Sociologists have generally shared the political elite's quest for modernisation and Westernisation, but they have reacted against growing inequality. Some of their political initiatives gained moderate success when they highlighted issues potentially jeopardising

Estonia's membership in the European Union. In recent years, a right-wing populism has been emerging that is less concerned about the previously prevailing modernising and Westernising agenda and directly questions the need for evidence-based politics.

RC34-572.2LAGUNA, ELMA* (University of the Philippines, Philippines)
PAQUIBOT, JESUSA (University of the Philippines, Philippines)*The Future They Envision: The Changing Work Aspirations of Filipino Children*

This paper investigates the work aspirations of Filipino children when they were 10 years old, and how it changes as they grow older by analyzing their answer to the question: "what do you want to be when you grow up?". It also looks at the factors that influence, or limit, work aspirations of children. Specifically, the paper answers the following research questions:

1. What are the work aspirations of Filipino children, and do they vary by sex, family circumstances (i.e., household income, membership in conditional cash transfer program, having family member working abroad, etc), parent's education and urban residence?
2. Does work aspiration change as children grow older?
3. What jobs remain consistently within their horizons of possibilities?

The analysis is based on the Longitudinal Cohort Study on the Filipino Child (LCSFC), a 15-year prospective longitudinal cohort study (2016-2030) launched by the United Nations Population fund (UNFPA-Philippines) in 2016. The multi-level study collected individual (index child and caregiver), household and community-level data using surveys, focus group discussions and in-depth interviews. The LCSFC addresses 13 of the 17 Sustainable Development Goals (SDGs) and aims to understand how the SDG agenda contributes to the welfare of the young population in the course of its 15-year implementation. The analysis will use the baseline data (2016/17 when children were 10/11 years), Wave 2 (2018), Wave 3 (2019), Wave 6 (2022) and Wave 7 (2024). We categorized work aspirations of children using the Philippine Standard Occupational Classification.

Analysis of baseline data shows that factors such as residence, having a family member working abroad are significantly associated with children's work aspirations but sex was the most predictive variable with girls tending toward artistic and social jobs while boys toward realistic and enterprising jobs.

Sex Work in the Age of Robots: Israeli Sex Workers on Autonomy, Competition, and Ethical Dilemmas

Artificial Intelligence (AI)-powered products are increasingly permeating various spheres of life, including some of the most controversial—such as sex robots. These AI-integrated robots, designed for human sexual gratification, are anatomically correct, human-like devices meant to enhance sexual arousal and pleasure in both solo and partnered contexts. As sex robots become part of intimate life, they have sparked significant debate, not just as sexual facilitators but as triggers for broader discussions about technology, sexuality, commerce, and human-human and human-machine connections.

This paper presents preliminary findings from an ongoing research project aimed at informing the regulation of sex robots by incorporating the views of

a key stakeholder group—sex workers. While there is research on sex robots' effects on areas like prostitution, sex tourism, and human trafficking, the perspectives of sex workers themselves—despite being a primary stakeholder group—remain underrepresented in these discussions.

Based on semi-structured interviews with Israeli sex workers in various indoor venues, this research highlights a range of views on sex robots. Some see them as potential competition, while others view them as complementary, suggesting the technology could reshape the dynamics of their work, autonomy, and safety. Ethical concerns were also raised regarding the use of sex robots in sexual therapy, particularly their impact on clientele and the boundaries of therapeutic relationships. Sex workers' insights contribute to a broader understanding of how sex robots might influence the sex industry and the evolving concept of digisexuality, as well as shape the future of human-AI interactions.

Indigenous Art Detours in the Modern Biennale Assemblages: A Case Study of Taiwan International Austronesian Art Triennial

Indigenous art has received recognition in the recent art world, for instance, Canadian and Australian museums house indigenous artworks, art biennials also value indigenous art from Venice to Liverpool. This paper examines one indigenous art biennial, Taiwan International Austronesian Art Triennial (TIAAT) to explore how indigenous art negotiates when being represented in the art biennial as modern assemblages. TIAAT was held in Autumn 2023 at Taiwan Indigenous People Culture Park situated at the mountain area in Taitung, with rebuilt indigenous ancestor houses and modern museums with outdoor spaces, surrounded by indigenous residents with artist studios and craft centers nearby as tourist destinations. The exhibition's theme was Ramis (Root), curated by two Taiwanese indigenous curators. Drawing upon Latour's and Deleuze's assemblage concepts to explore art biennials, this research explores government's culture policy as 'abstract machine' that created the assemblage connecting Taiwanese indigenous art with Austronesian network of international indigenous art as political strategies. Second, it considers the exhibition assemblage through the curating theme RamisS (root) to connect art exhibits from different indigenous groups from Austronesian network while link indigenous art, craft, culture and tourism in Taitung area. Third, different milieus of mountain area, rebuilt ancestor houses, modern museums, artist studios and heritage centres provide different 'affordances' for display then evokes multiple 'affects' for participants. Finally, the exhibition milieus with conflicting 'desiring machines' from indigenous artworks' cosmos strongly connect with ecological environment, religious ritual with ancestor genealogy, and art-craft continuous format that detour the artistic imagination into multiple directions. This research uses multiple methods from analyzing exhibitions, onsite visit, interviewing curators and artists, comparing artworks in the studios, ancient homes, modern museums in the art biennial. This research discusses how the indigenous cosmos negotiate with the topology of modern museum through story-telling, ritual calming ancestors, challenge the biennales as modern assemblages.

Caregiving Experience and Perception of Aging: Preliminary Findings from Middle-Aged Never-Married Chinese Adults in Hong Kong

Eldercare has been well-documented as a stressful experience for caregivers, negatively impacting their physical and mental well-being. Women and childless individuals are found to be more likely than their counterparts to provide care to elderly family members. The caregiving process connects the lives of caregivers, care recipients, and other members of family networks. As suggested by the life course perspective, interlinked lives can significantly impact individual life chances and experiences across various life domains. However, the impacts of elderly caregiving on caregivers' life experiences beyond health are not well understood. The present paper aims to examine how eldercare experiences influence the perceptions of aging and old-age preparation among middle-aged never-married adults.

Data were collected through semi-structured in-depth interviews with 25 Chinese never-married adults aged 40 to 59 in Hong Kong between January and May 2024. The sample achieved a good balance in terms of gender and education. Informants were asked about their relationships with family, work, and friends, as well as their elderly care experiences, meanings of aging, anticipated needs for old age, perceived social support, and plans for a secure later life.

Preliminary findings show that 15 informants have experience caring for older family members, while two work in elderly care services. Many

caregivers reported unpleasant experiences, including perceived unfairness in caregiving responsibilities, conflicts with family members, and difficulties in dealing with government offices for elderly services. Those with caregiving experience tend to hold more negative views on aging and are pessimistic about old-age support from siblings. However, these experiences often lead them to adopt a proactive approach to old-age preparation. These findings suggest that elderly caregiving serves as a learning process, helping caregivers anticipate their future aging experiences.

Envisioning Transformative Resilience through the Ethics of Care: Care Collectives Among Precarious Families Living in Informal Subdivided Homes

Over the past two decades, while global inequalities between countries have declined, there has been a sharp rise in within-country inequalities. This often manifests in the growing precariousness of employment and housing faced by disadvantaged groups across both developed and developing societies. In response, policymakers have emphasized resilience building as a key institutional intervention to enable individuals—especially families—to adapt positively to adversities. However, the resilience framework has been criticized for its conservative tendency to retain existing systems and the status quo, rather than creating more equitable socio-political structures and relations. Building upon this criticism, this study draws on the theory of the ethics of care to rethink the concept of resilience in the context of vulnerable families. The study focuses on Hong Kong, an example of developmental welfare capitalism, and investigates precarious families living in informal subdivided homes—tiny and substandard dwellings subdivided from larger domestic quarters—to examine the complex interactions between families, communities, and social policies in the process of resilience building. Data was collected through ethnographic observation since January 2021 and in-depth interviews with 53 families living in subdivided units and community workers supporting these families. The findings illustrate various strategies employed by tenants at both individual and familial levels to cope with everyday precarity, including devising spatio-material arrangements within their homes, mobilizing familial and community resources, and utilizing cross-border spatio-temporal mobility. The study demonstrates that resilience is a relational process created collectively on multiple levels and is intimately structured by the policy regime and its underlying political-economic configurations. It argues that an individualistic framing of resilience may reinforce the neoliberal social policy script, which defines the family as a self-responsible socio-economic unit. In contrast, understanding resilience as collectives working towards maximizing care capacities can foster transformative politics for institutional changes, particularly in the post-pandemic era.

The Hidden Consequences of Gender-Based Street Sexual Harassment: The Case of Public Ejaculation and Emission

As the global #MeToo movement evolves, scholars have extended their focus beyond the private domain to include sexual harassment in public spaces. Although street harassment is not a new phenomenon, it is often trivialized as minor nuisances that do not warrant legal and institutional interventions. This study aims to challenge such dismissive views of street harassment by defining it as a multidimensional social problem that necessitates systematic and collective measures. Specifically, it investigates a relatively unexplored form of street harassment: public ejaculation and emission (PEE), where strangers ejaculate semen or splash liquid on victims' private body parts in public places. Through content analysis of over 170 online testimonies and in-depth interviews with survivors of PEE and campaigners in Hong Kong, the study explores individuals' experiences, the socio-psychological consequences, and the coping strategies employed by survivors. The findings reveal that although all survivors felt violated, they struggled to articulate and categorize their experiences as sexual harassment due to limited social awareness and understanding of PEE as a form of sexual violence. The concept of "synchronization lag" is introduced to describe the disconnection between victims' cognitive understanding of their experiences and the emotional aftermath of sexual violence. This lag creates confusion for victims and impedes collective actions to combat sexual harassment. The study argues that the trivialization and hegemonic silence surrounding street sexual harassment have reinforced this synchronization lag, leaving many forms of sexual violence unrecognized and unaddressed. The negligence of street harassment has serious consequences, especially when such incidents are often filmed, circulated, and commodified through online platforms and social media. This study sheds light on the profound impacts of street harassment and illustrates how it is perpetuated by and, at the same time, reinforcing a gendered and sexual culture that continues to objectify women and girls.

GARCÍA-DEL MORAL, PAULINA (University of Guelph, Canada)

From Carcerality to Impunity: Rethinking State Violence As Gendered Governance in India and Mexico.

Through our collaborative work on gender-based violence in India and Mexico we develop a framework to think through impunity as a form of gendered governance. Whereas critiques of carceral feminism—heavy reliance on punishment and punitive solutions for gender-based violence—have clarified how feminist projects can also embolden the carceral state (Bernstein 2010, 2012), these critiques are primarily focused on the U.S state practices. By focusing on impunity as a form of gendered governance, we suggest the need to examine state complicity in perpetuating gender-based violence, as well as extrajudicial, and extralegal violence deployed by states to normalize and legitimize gender inequalities.

In contrast to anthropological and sociological understanding of impunity as state "inaction" and a lack of state accountability, we theorize impunity as a form of state governance that heavily relies on everyday legality to undo and repackage violence. For example, state actors and institutions go as far as simulating due process and justice with the expectation that those affected by gender-based violence be satisfied with farcical legal or extralegal outcomes or processes. Our analysis of two cases of gender-based violence from India and Mexico sheds light on different mechanisms of state impunity as gendered governance and how feminist activists use law to not only counter impunity but also to counter ethical effects of state's inaction and neglect.

Which Forms of Capital Play a Role in Retirement Decision-Making?

The prominence of prolonging working careers in European policies raises a need for a better understanding of the factors shaping the actual retirement timing. This paper applies the theory of Bourdieu's capitals as a framework for understanding how resources (economic, social, and cultural capital, including their dimensions) impact retirement behaviour over time. The presented study uses panel data from SHARE to examine how forms of capital help older workers to keep working for three consecutive time points. The results show that the wider community social capital as well as human, health and digital capital (domains of cultural capital) indeed help older adults to work longer. The effect of other forms of capital became negligible after including relevant control variables, and all the findings are robust irrespective of the used time nospan. Moreover, the variability of the European context is reflected in separate models for four regions, which identified several context-specific distinctions. Generally, Bourdieu's framework remains valid in the current situation of population ageing and the digitalisation of economies. The paper argues that policymakers should reflect on the inequalities in resources when forming measures enabling longer careers for those who can work and offering alternative options for those facing significant barriers.

Labour, Caste, Brick Kilns, and the Social Psychology of Oppression: The Experiences of Labour Migrants

This paper explores the intricate relationship between caste and labour migration, focusing on the experiences of Dalit migrants from Odisha seeking employment across India. Grounded in social psychology, it examines how entrenched caste structures shape access to labor markets, job assignments, and upward mobility for Dalit workers. Drawing on Ambedkar's framework of "undoing caste" through migration, the research investigates whether leaving the village can help Dalits break free from caste-based identities. Through 20 qualitative case studies, the research delves into caste-based discrimination in brick kiln sectors, perpetuating socio-economic disparities and hindering financial progress.

The study also examines Dalit aspirations for a caste-free society and their efforts to dismantle these oppressive structures through migration.

By analyzing both Dalit and non-Dalit perspectives, the research highlights the challenges of social stigma, exploitation, and economic barriers that Dalit migrants face, while also acknowledging their resilience and resistance. The findings reveal how caste continues to shape labor economies and underscore the need for policies that address caste-driven inequalities in the migration and employment sectors.

Redefining Labour's Role: Claiming a Fair Share of Profits Beyond the Means of Production

This study critically examines the evolving role of labour in modern organisations, arguing for labour's fair share of profits beyond its traditional role as a mere means of production. Drawing from theories of labour value and organisational justice, this research explores the power dynamics between labour and capital, focusing on how workers can claim a greater stake in the value they help create. Through a mixed-methods approach, including a survey of 200 employees across various industries and 15 case studies of worker-led initiatives, the research analyses how organisational structures often limit workers' ability to influence profit distribution. The study also investigates labour's potential to negotiate space within organisations, challenging existing hierarchies and advocating for profit-sharing models that promote fairness and equity. By integrating quantitative data with qualitative narratives of worker experiences, the research offers a comprehensive understanding of how labour can transcend its role as a passive contributor to production and assert its claim to a more equitable share of organisational profits. The findings highlight the need for new organisational frameworks that recognise labour as a central force in value creation and ensure workers benefit proportionately from the profits they generate.

Sustaining Sites of Learning Beyond the University: Pedagogical Reflections from lihs' Inclusive Housing Programme

Discussions on the role of the university for public good place emphasis on the need for universities to engage in processes of knowledge co-production and co-learning, and to expand learning beyond the classroom. Other discussions draw attention to the need to unsettle the form of the university as the privileged site of knowledge production, and to engage beyond with other sites of learnings, with diverse learners that face systemic barriers to enter sites of higher education. In this paper we ask how such academic-community interventions sustain over time, where thinking about the sustenance of practice beyond the site of the university is also a question of equity and the public role of the university.

Since 2015, lihs has been co-teaching and co-learning with housing rights activists across Indian cities, to build curricula, develop teaching tools and also co-produce research. This initiative seeks to expand the role of higher education to build capacity and learn from networks of community activists, researchers, and practitioners, who live and work within communities on housing and allied rights. This pedagogic experimentation has evolved incrementally over the years, and in its most recent form has been further structured to support the learning needs of cohorts of community activists who are working within their own communities on critical challenges of housing, planning, infrastructure and access to basic services.

This paper reflects from the recent-most iterations of this training initiative, as a series of workshops structured over 9 months with cohorts of community activists- in Delhi (2023-24) and Indore (ongoing 2024-25) in India. We reflect from the recent iterations in both cities and from our own experience of designing, co-teaching and implementing this program. We seek to share ways in which universities can meaningfully engage with diverse learners, who are engaged in critical practices to transform urban inequalities.

LALLIOT, MANON* (UPEC / Lab'Urba, France)

Luttes Pour Une Alimentation Durable Et Accessible En France : Vers Une « Alliance De Classes » ?

En France, 16 % de la population est aujourd'hui en situation de précarité alimentaire (CREDOC, 2022). Cette précarité touche particulièrement les classes populaires, déjà confrontées à une augmentation des problèmes de santé liés aux habitudes alimentaires, comme l'obésité ou les maladies cardiovasculaires. Parallèlement, les initiatives agroalimentaires alternatives, comme les AMAP, sont principalement adoptées par les classes moyennes et supérieures dotées d'un capital culturel élevé (Montrieux, 2013; Parathoën, 2013; Lamine, 2008).

En réaction à cette inégalité d'accès, certains acteurs de la société civile, critiques du modèle d'aide alimentaire classique, cherchent à démocratiser l'accès à une alimentation durable et de qualité (Scherer, 2022; Pareul, Ndiaye, 2020). Cependant, les sciences sociales critique et les concepts d'intersectionnalité montrent qu'il est important de dépasser les seuls rapports de classe pour intégrer les dimensions de race et de genre dans la justice alimentaire. En effet, les enquêtes de terrain révèlent que les personnes les plus investies dans ces initiatives sont souvent issues des catégories privilégiées (blanches, avec un fort capital économique et culturel), qui tentent, avec des succès variables, de mobiliser des personnes des classes populaires, racisées et des femmes. Ces acteurs sont parfois accusés de gentrifier ou coloniser les quartiers populaires (Guthman, 2008), et de déposséder les classes populaires des enjeux écologiques (Comby, 2015; Ouassak, 2023).

Cette communication s'appuie sur des entretiens exploratoires avec des acteurs de la solidarité alimentaire en France et sur un terrain spécifique à Marseille. L'objectif est d'interroger les mobilisations autour de l'alimentation durable à la lumière des inégalités sociales et environnementales, et d'explorer dans quelle mesure ces initiatives peuvent favoriser une alliance entre classes ou reproduire des formes d'exclusion.

Countering Systemic and Hidden Forms of Violence Against Migrant Domestic Workers in Singapore

Present in nearly one in every five households in Singapore, female migrant domestic workers (MDWs) are heavily relied upon to support the everyday routines of social reproduction in the household whilst freeing other women in Singapore to participate in the workforce. Being legally bound to live at their employers' residence in Singapore, MDWs are fully dependent on their employers' goodwill in providing their daily necessities, food and lodging whilst being subjected to their acts of 'soft violence', mental and/or even physical abuse (Lam, 2023; Parreñas, Kantachote & Silvey, 2020; Wong, 2024). Abuses of any kind against MDWs are often difficult to detect as they live and work in a "paradoxical [domestic] space" that is relatively hidden from public and state scrutiny (Huang and Yeoh, 2007). In this vein, this paper is concerned with both the systemic and hidden forms of 'violence' MDWs experienced during the COVID-19 pandemic where issues surrounding overwork, inadequate accommodation, constrained mobility and food insecurity were then spotlighted in popular media. Drawing on a study involving interviews with Burmese, Indonesian and Filipino MDWs in Singapore, the paper explores the opportunities and constraints they experienced under restrictive employment conditions, focusing especially on the food (in)securities they encountered. More importantly, the paper aims to highlight their agency in countering the various abuses they have suffered and the various ways in which they resist their position as menial subjects in the household (Tan, 2023). This paper hopes to contribute to the multivocality and complexity of care, and agency among transient migrant workers in Singapore.

LAMONTAGNE, MARJOLAINE* (McGill University, Canada)

"We Are the State": Subnational Governments' Quest for a Distinct Status in Global Environmental Governance

The Paris Agreement of 2015 ushered in a new era of polycentricity and hybrid multilateralism, creating fresh opportunities for mayors, governors, and city network representatives to assert local and subnational governments' status as emerging global actors. Notably, the constituency of subnational governments within the UN system has endeavored to develop its agency within and across the interconnected fields of climate, biodiversity, and SDG governance by employing a unique set of "hybrid" diplomatic practices. They

have achieved this by emulating many strategies and behaviors of other “non-state” observer constituencies at the UN, while also striving to distinguish themselves from civil society and business actors by gradually gaining recognition of their distinct status as “state” actors from UN institutions and sovereign governments.

The present research builds on sociological theories of sovereignty and practice theory in International Political Sociology to analyze and theorize the nature of subnational actorness and its implications for the evolution of world order in this era of ideological polarization, politicization of global governance, and crises of multilateralism. Empirically, it relies on interviews, ethnographic observation, and discourse analysis to examine how the constituency of local governments promotes new practices of “multilevel governance” and “multilevel diplomacy” within multilateral diplomatic spaces such as UN conferences (e.g., climate and biodiversity COPs). It argues that the constituency navigates between promoting “best” governance practices in an apparently apolitical manner and advocating for a politically radical redefinition of the boundaries between “high” and “low” politics, functional governance fields, domestic policy realms, and transnational and global governance spaces. In doing so, the constituency simultaneously defers to and disrupts the existing inter-national political order by redrawing local to global relations in a manner that can either reinforce or disrupt the nation-state’s political “voice” and international subjectivity.

LAMPREDI, GIACOMO* (University of Milan, Italy)

Cultivating Hope: Caring for a Collective Emotion in the Ultima Generazione Movement

This article aims to explore hope as an object of care in times of climate change-related fear, focusing on the ‘Ultima Generazione’ (UG) movement in Italy. Despite their frequent use of apocalyptic rhetoric, UG activists are driven not merely by predictions of the end of the world but by the cultivation of ‘radical’ hopes that challenge prevailing climate narratives. This study uses ethnographic research, including semi-structured interviews and direct observations, to analyze how UG manages both individual and collective emotions. In particular, the movement’s activities examined here aim to transform fear and (eco)anxiety into a responsive hope toward future threats. The research reveals two primary practices of UG concerning hope: the establishment of a supportive, grassroots community, and the dramatic staging of disruptive actions, such as traffic blockades, vandalizing museum artworks, defacing historic buildings, and other demonstrative acts. These activities, while diverse, are united by a shared objective: the cultivation of hope as a form of care.

Addictions Et Violence : Impact Du Programme Psycho-Éducatif Sur Les Jeunes Issus De Milieux Socio-Économiques Défavorisés

Les établissements scolaires sont souvent confrontés à des phénomènes sociaux alarmants tels que la violence, la consommation de drogues et l’abandon scolaire.

L’adolescence et le début de l’âge adulte sont souvent des périodes de prise de risque, d’impulsivité et d’expérimentations diverses.

La corrélation entre la consommation de substances psychoactives et les comportements violents chez les jeunes issus de niveaux socio-économiques défavorisés n’est plus à prouver, en effet, le modèle psychopharmacologique confirme que certaines substances altèrent le contrôle des impulsions et augmentent l’agressivité, le modèle économique-compulsif, quant à lui démontre que les besoins financiers pour soutenir une dépendance peuvent conduire à des comportements criminels.

Les antécédents familiaux et sociaux sont aussi fortement incriminés dans le développement de la consommation de substances et des comportements violents chez les jeunes.

L’intervention psycho-éducative trouve tout son intérêt pour identifier les personnes à risque et les impliquer dans des programmes de prévention et d’éducation à l’instar de « **Good Behavior Game** » dont l’objet est d’améliorer les comportements prosociaux et de réduire les consommations de substances.

Ces interventions se veulent être collaboratives faisant ainsi appel à la contribution des éducateurs, des parents et divers experts (sociologues, psychologues) pour la réduction des facteurs de risque et une prise en charge optimale.

- Quelles sont alors les stratégies psycho-éducatives et sociales susceptibles de prévenir et de s’opposer aux comportements addictifs et violents ?

- Comment expliquer la coexistence de violence et de consommation de drogues chez les jeunes issus des niveaux socio-économiques défavorables ?

L’objectif de cette investigation est de dégager de futures pistes de réflexions adaptées au contexte marocain.

RC31-JS-170.1

LAN, PEI-CHIA* (National Taiwan University, Taiwan)

Transnational Bridges or Multicultural Tokens? Navigating Multicultural Policies and Second-Generation Identity

Based on forty interviews with adult children of Southeast Asian immigrant mothers and Taiwanese fathers, this paper explores how these youngsters of mixed heritages navigate multicultural programs and second-generation identity. Bolstered by Taiwan’s New Southbound policy, the emerging regime of “geopolitical multiculturalism” (Lan 2023) reframes immigrant background and transnational links as assets, rather than liabilities, that can advance national development and diplomatic relations. The government has provided resources and opportunities for the second generation to cultivate linguistic skills and social ties related to their mothers’ home countries, including fellowships, internships, and travel grants to visit their grandparents in Southeast Asia. Second-generation individuals react to these programs differently—across the spectrum of *resistance*, *indifference*, *ambivalence*, and *embracing*. Some embrace a claim of bicultural identity to enhance their life chances and social recognition, by accumulating transnational ethnic capital or strategically displaying ethnicity across situations. Some feel indifferent to the new policy due to lack of access or relevance, and some criticize the programs for tokenism and patronism. The others develop ambivalent feelings while accessing multicultural dividends. Growing up with earlier assimilation measures, most second-generation children have only a limited grasp of their mother’s home language and culture. They face questions about their cultural authenticity and even feel like imposters. I also argue that social positions, including gender, educational achievement, family socioeconomic status, and transnational experience, shape their uneven orientations toward these programs.

Whiteness of a Different Color?: The Racialization of Russian English Teachers in China’s Private ELT Industry

China’s private English Language Teaching (ELT) industry is notorious for its fetishization of white native speaker teachers and racism against black teachers. Yet little academic attention has been given to white non-native speaker teachers, who are often paid less yet frequently hired in second and third-tier cities to perform native speaker whiteness in front of Chinese clients. Due to the commodification of white looks in China’s profit-driven ELT industry, many schools and job recruitment agents find it more cost effective to hire Russians as English teachers. Positioned between white native speaker teachers and black teachers in the ELT job market, Russians are subjected to multiple layers of racialization based on their skin color, nationality, non-native speaker status, gender, and Chinese language proficiency. Based on semi-structured interviews, this paper examines the racialized experiences of Russian English teachers in three Chinese cities: Beijing, Chongqing, and Zhengzhou. I argue that the Russian case study exposes the gaps and fissures in whiteness as a racialized identity in China due to the marginalization of Russian teachers in the white category. Yet their stigmatization as less white or second-class white people also reinforces hegemonic whiteness as a transnational power structure. This research adds nuances to whiteness studies by interrogating the geographically specific ways of white racial formation and the tension between homogenization and differentiation in the contested process of the reproduction of white hegemony in China’s neoliberal consumer culture.

Constructing Alternative Epistemes of Development from Gender Perspective: An Ethnographic Study on a Social Experiment in Northern China

Gender perspective is an approach of adopting feminist values to redefine and reconstruct development. By "gender perspective", we imply a way of seeing and thinking grounded in feminine values such as receptivity, non-violence, living on and tenderness stemming from the nature of "life-protecting". Rather than adopting an essentialist understanding, we align with Dai Jinhua's proposal to regard "feminism" as a search for alternative possibilities other than global capitalism. This research, through an ethnographic study, will illustrate how a local NGO explored an alternative development of a rural community in North China based on gender perspective.

Since the marketization reforms of the 1980s, while developmentalism has led to China's rapid rise, rural areas have experienced declined and rural women have been marginalized. In 2017, a women-based NGO in Henan Province, with the aim of promoting rural gender equality, collaborating with a transdisciplinary team, mobilized villagers in Z Village to renovate abandoned dwelling caves as public space to explore alternative development. This initiative, named the "House of Dreams", represents a social process of social reconstruction and empowerment, driving by epistemes developed from gender perspective. Our study will unpack four aspects of the epistemic content that underpins this process: 1) *Humanization*, which encompasses humane care, prioritization of human needs, and community education; 2) *Relational philosophy*, emphasizing the crucial role of emotion and social bonds; 3) *Preservation orientation*, which fosters actions such as small-scale and building with upcycled materials; 4) *Inner radical struggle*, reflecting the inherent resistance of gender-based development.

Through understanding and reworking development from gender perspective, this experiment challenged the conceptual roots of development in practice and demonstrated the possibility of an alternative development. By placing this research within the gender localisation of global context, we will further discuss the implication of this localized and gender-based case beyond China.

Tuning to Shapeshifting Bodies and Bodying Chronologies in Childhood Studies

In a mediation on maturation, diarist Anaïs Nin (1971) avows that "we do not grow absolutely, chronologically...We grow partially. We are relative" (p. 127). Holding that bodied human subjects confront growth in its patchiness - its unsteady and conditional cadences - we stand against the assertion that childhood must subscribe to or articulate a chronology consistent with Euro-Western colonial logics of linearity. We follow critical childhood studies scholars who make clear how arranging and containing childhood's trajectories within the grammar of the white Anthropocene purposefully produces child subjects and bodies built to thrive in the rhythms and pace of neoliberal capitalism. These sanctioned chronologies position the human (child) body as a living archive of linearity; the fleshed reference point that anchors chronology becomes the child's skeleton. In this paper, we work with the problematic of how we might attune to the rhythms and trajectories of the ever-shapeshifting human body without reiterating the human-centered chronological categories that organize the Anthropocene. Working with documentation from pedagogical inquiry research with young children and early childhood educators, we take up Anaïs Nin's contention that "we are made up of layers, cells, constellations" (p. 127) as we work to figure out how to tune into bodied growth beyond human-centric chronological logics, referents, and prescriptions. We wrestle with a necessarily irresolvable contradiction: we want to think beyond human bodies while it is with our bodied hands that we grasp this proposal. How, we ask, can we understand bodied growth as particular responses, experiments, and processes of worldly immersion - as relentless, risky, and recuperative world-making - while resisting taken-for-granted formulations of growing larger and older within an already known world? Our intention is to follow what becomes possible for experiencing bodies and their permeability, excess, and contagion when growth is evacuated from anthropocentric ontologies of chronology.

The Role of Forests for Wellbeing Improvement: Ecosystem Services, Health, and Economic Revitalization of Inner Areas

The contribution of forests and other natural and semi-natural ecosystems to improving human health and mental wellbeing is increasingly recognized in literature. Contact with forests may improve well-being mainly by reducing exposure to noise and air pollution, reducing stress, promoting mental and physiological recovery, strengthening the immune system, increasing physical activity and reducing obesity rates, and improving social contacts and relationships. In recent years, concepts such as "forest bathing" and "forest therapy" have emerged, referring to the positive effects of interaction with the forest environment on human mental and physical health. These activities are now being considered for their potential to contribute to a wider economic and social revitalization of areas "left behind" by development processes, promoting tourism and economic regeneration in areas that have long been disadvantaged by demographic decline and economic shrinkage.

In Italy, about 95% of forests are located in mountainous regions, which overlap significantly with the geography of the so-called "inner areas" (according to the classification produced by the National Strategy for Inner Areas), municipalities that are distant from essential services of mobility, health, and education, experiencing processes of depopulation, population ageing, and environmental fragility. New place-based development processes, based on the enhancement of local experiences, resources, and preferences, require a renewed attention to the complex web of vulnerabilities present in these territories.

Based on the first results of the PRIN project "The role of forests for wellbeing improvement: advances from psycho-physiological analysis and technologies", our contribute explores the relationship between forest ecosystem services, health, and the prospects for economic and social regeneration in Italy's most marginalized and fragile regions.

LANDINI, TATIANA* (Universidade Federal de São Paulo, Brazil)

Discussing the Importance of Historical Sociology for Public Policy

Child sexual exploitation has been a topic of international concern for at least a century. In the 1920s, it appeared as the "white slave trade" in some agreements established by the League of Nations. But it was only in the 1980s and 1990s that the issue resurfaced in a different and stronger light. Driven by international agreements, such as the Optional Protocol on the Sale of Children, Child Prostitution and Child Pornography, and also by international social movements, such as ECPAT International, it became a major concern in many countries around the world.

The presentation aims to highlight the similarities and differences in the development of legislation and public policies directed at minors involved in sexual exploitation in two different countries - Brazil and Canada. It is interesting to note the central place occupied by the media and the spectacularization of crimes in this process, leading to important differences in the laws and public policies adopted by each country. Based on these processes, the final objective of the presentation is to discuss the importance of historical sociology for understanding and possibly evaluating current public policies.

Historical Plaques in the Inner Suburbs of Toronto: Commemorating Settler-Colonial Histories in a Multicultural Landscape

This paper examines how historical plaques in Toronto's inner suburb of Scarborough contribute to the construction of a settler-colonial narrative, disavow and obscure ongoing colonial violence. Through an intertextual analysis of these plaques, I explore how they frame belonging and identity in a diverse, immigrant-rich suburban landscape. Plaques function as symbolic texts that invite global migrants into a color-blind settlerhood, offering a celebration of white settler perseverance and success while erasing the violent processes of Indigenous displacement and contemporary dynamics of racial marginalization. Drawing on anti-colonial cartographic methods and Black critical geographies, I analyze the physical locations of plaques, their texts, and their interactions with the built environment to uncover two dynamics: 1) how they perpetuate racialized narratives of differential inclusion; and 2) how they gesture to white settler anxieties.

My analysis highlights the ways in which plaques sanitize colonial histories, downplaying or ignoring the conquest and displacement of Indigenous peoples, and glossing over the labor exploitation and resistance of racialized communities. These commemorative markers serve to maintain a settler-colonial logic, embedding power structures into the landscape while offering a frail invitation to racialized newcomers, contingent on their assimilation into a white-centric national narrative of neoliberal multiculturalism. In doing so, these plaques reflect the underlying anxieties of the liberal settler state, which seeks to control the narratives of space, race, and history.

This research contributes to broader discussions about the role of public history in shaping collective memory and the politics of belonging in suburban spaces. By re-reading the plaques of Scarborough, I argue for a critical engagement with the ways public commemorations erase resistance, perpetuate colonial mythologies, and manage racial inclusion in contemporary multicultural cities.

Mutations Familiales ET Solidarités Intra ET Intergénérationnelles AU Sénégal

Il convient de souligner la difficulté d'aborder dans la généralité, les questions relatives aux mutations familiales et à la solidarité tant les termes sont multidimensionnels et les comportements des individus variant en fonction de l'ethnie, de la religion, de la culture, du contexte économique et social, etc.

Au Sénégal, la famille est par tradition, de type communautaire. Une panoplie de mécanismes caractérise son fonctionnement d'une communauté (ethnique ou religieuse) à une autre. La famille est généralement constituée de plusieurs ménages ou noyaux et chaque noyau a son chef. L'ensemble des chefs de noyau est le plus souvent, sous la gouvernance d'un responsable (ou patriarche) qui incarne le pouvoir suprême sur tout le reste de la famille. Ce responsable peut, soit être le plus âgé, soit le plus nanti financièrement. Toutefois, il faut noter qu'à ce niveau, l'importance de la séniorité dans la définition des responsabilités et des pouvoirs, est souvent indéniable.

Les besoins et les ressources sont le plus souvent, mutualisés et la solidarité entre les membres de la famille communautaire est mécanique (pour reprendre l'expression d'Emile Durkheim).

Toutes les personnes censées être vulnérables dans la famille communautaire, sont prises en charge.

Aujourd'hui, ce type de famille est beaucoup plus perceptible en campagne que dans les centres urbains où on assiste à une nucléarisation progressive de la famille remettant en cause les systèmes de solidarité intergénérationnelle et intra-générationnelle dans un contexte économique de moins en moins reluisant.

What Constitutes the Blue Economy? Antagonism and Clumsy Solutions

The Blue Economy concept combines the views of oceans as areas of economic growth and development, on the one hand, and as vulnerable and unique environmental ecosystems that need to be protected, on the other hand. The current practices of industrializing the oceans not only decrease "the ability of marine environments to provide livelihoods for those who depend on the sea" (Clausen & Clark, 2005, p. 423) but pose an increasingly pertinent existential risk to life on Earth (Bansal, 2019). So far, little is known about organizations' roles in addressing this risk (Carton & Parigot, 2024). The paucity of management research focusing on SDG 14 is a case in point (Berrone et al., 2023).

We adopt an abductive approach (Saetre & Van de Ven, 2021) to exploring a concept driven by managerial practice in ocean-related industries and policymakers (e.g., Bennett et al., 2021; Mallin & Barbesgaard, 2020). First, we establish the Blue Economy as a novel research context. Second, we

describe it based on three dominant themes in the existing literature – placelessness, development, and sustainability (e.g., Campling & Colás, 2018; Germond-Duret, 2022; Midlen, 2021). That also entails how technological developments have enhanced access to critical marine resources and related conflicting interests. Third, we ground the Blue Economy in reality. Narrations (e.g., from executives and managers in maritime industries, scholars, policymakers, and conservationists) are extracted from data collected during four interdisciplinary online workshops and linked to the dominant themes. Finally, the application of grid-group cultural theory (Douglas, 1999) to evaluate the narrations lays bare stakeholders' antagonistic perspectives. We discover cross-sector collaboration, public-private partnerships, and legally binding governance systems across geographies and jurisdictions as potential responses (so-called 'clumsy solutions') to antagonism.

Negotiating (Im)Possible Life Stories - Collaborative Storytelling in (Post)Conflict Contexts

Child soldiers in post-conflict societies are among the most vulnerable groups, marked by experiences of extreme violence and subsequent social exclusion. Their voices are often silenced, limiting their ability to participate socially. The dual experience of trauma, both as victims and perpetrators of violence, disrupts their capacity to tell their life stories, while social stigmatization in post-conflict societies reinforces this dynamic of silence.

In an exploratory qualitative research project with former child soldiers of the Islamic State (IS) in Iraq, we developed a participatory, trauma-sensitive, and culturally attuned approach to address these challenges. Using collaborative storytelling, a group of former IS child soldiers co-created a fictional life story of a child soldier over a sustained period. This method aimed to support both biographical articulation and collective meaning-making.

Our presentation introduces the project, outlines the methodology, and presents key findings, by highlighting how mechanisms of biographization intertwine with collaborative storytelling processes. While individual biographical experiences are negotiated within the group's fictional narrative, they are simultaneously distanced through the process of fictionalization. This method also reveals the boundaries of what can be thematized, pointing to the limitations of socially acceptable biographical work.

Additionally, we explore the potential of art-based methods, particularly collaborative drawing, as a means to visually express and counter this enforced silence. We argue that these creative methods provide a space for articulating trauma in a way that is both socially transformative and emotionally sensitive.

Collaborative storytelling is presented as an innovative biographical research method to methodologically translate and socio-politically transform trauma into testimony. We see their particular strength in the production of counter-narratives to socially powerful attributions and practices of silencing. They open up spaces for discourse that make biographical work possible in the first place.

Transforming Civil Society Engagement into Democratic Action: Political Socialization Dynamics of Rural Youths in Germany

Research on democratic transitions highlights concerning trends, including declining political participation, rising populism, and reduced trust in institutions. These studies often focus on nation-state levels or urban/metropolitan areas as paradigmatic places of the political. In contrast, our research centers on young people aged 18-27 in remote rural areas—an overlooked but democratically crucial population. This group plays a vital role as future social actors and thought leaders.

Recent elections in the European Union (EU) and its member states show that rural youth are particularly responsive to societal transformations and often considered vulnerable to anti-democratic rhetoric. However, they also contribute significantly to their communities through local civic engagement. Our study explores how and why youth in remote German border regions develop meaningful social commitments and how this civic engagement translates into political participation responsive to democratic challenges and social transformation.

We present initial findings from a "politography," an innovative interdisciplinary approach combining ethnographic observations, narrative interviews, group discussions, and participatory methods like photo-voice. This approach offers a comprehensive view of how rural youth perceive political issues, their community roles, and the influence of digital and in-person interactions on their democratic engagement. From a socio-psychological perspective, we investigate the emotional appeal of democratic participation, asking what makes everyday democratic engagement emotionally compelling.

By focusing on (often ambivalent) emotional experiences that can strengthen (or threaten) democratic life, we aim to move beyond discussions of democratic discomfort. Our presentation contributes to current debates on the role of local, regional, and global factors in political socialization and addresses knowledge gaps regarding these processes in rural contexts.

LANGMAN, LAUREN* (Loyola University, USA)

Alienation and Human Nature

For Marx, alienation, estrangement and objectification, consequences of workers selling their labor power to produce commodities exchanged for wages. But, alienation from what? Rousseau, that for premodern societies, social stratification by class or gender was unknown, people emphasized caring, sharing, mutual support, living in harmony with each other and with Nature. When someone built a fence around his land and said keep out, things went astray- humans were "born free, but everywhere in chains" how do we understand this? **Marx did have a view of human nature**, implicit in his 1844 *Manuscripts*. He died too soon- at least to be informed by psychoanalysis that illuminated the psychological/emotional nature of capitalist modernity. That task would befall the Frankfurt school- especially the work of Fromm and Marcuse, among the very first to read the heretofore unknown 1844 manuscripts. That early exposure shaped the subsequent views of each theorist. Yes, they had were major differences, rejected the biologically based drive theories of Freud and moved toward a relational psychoanalysis based on emotional needs to belong, creative self-fulfillment, transcendence, a meaningful value orientation. Marcuse retained an orthodox Freudian view. But what is essential is that both theorists, understood a social revolution would require more than collective means of production and democratic, popular governance, **but changing underlying emotionally based social character, restoring a benevolent society**. For Fromm that meant realizing a "productive social character" while Marcuse, it meant a "new aesthetic/libidinal sensibility." In both cases the basic point is that 1) with elements of such characters spearheading progressive social mobilizations, "great refusals", 2) realizing humanistic socialism, 3) the more traditional elements of human nature, "biophilia" lost under the conditions of the dominating social structures of modern capital, authoritarian "necrophilia", might again become the normative values of the humanistic social order.

LANGMAN, LAUREN* (Loyola University, USA)

Generational Change Meets Climate Change:

The logic of capitalist modernity privileged "efficient" capitalist production **regardless of the human consequences**. Marx, influenced by Humbolt's travels- devastated the soil, the factories of Manchester polluted the water and the air- this was the "metabolic rift", or, the dialectic of Enlightenment. This had two major consequences the rationale of abstract wage labor which meant the exploitation, alienation, and impoverishment of workers to gain profits, and willful blindness to the externalities of capitalist accumulation- namely environmental despoliation, endangering health, especially of workers and today, the very viability of humanity now facing a "sixth extinction". This, rationality, first evident in the factories of Manchester and had become fully rationalized with Fordism/Taylorism, and now, an age of mass consumption- profitable for fossil capitalism enabling as much surplus value as possible. Nevertheless, a Hegelian Marxist understanding of the dialectical nature of social movements has told us that the progressive reaction to the adversities of the Anthropocene are evident especially in the various progressive mobilizations. The current generation of youth, generation Z, clearly impacted by the economic adversities of neoliberalism, whose progressive social values regarding race, gender/LGBT, ethnicity, having mobilized various reactionary movements, is clearly become the spearhead of progressive social change regarding the inequality and precarity of neoliberal capital, the environmental devastation as seen in more frequent and devastating hurricanes, flooding,

droughts, forest fires etc. in the reactionary attempts to preserve essentialist, hierarchical, privilege granting identities. Across the globe the environmental movements of today, are attempting to change the very nature of production and distribution- any major aspect of which is moving away from consumerism that is for long time privilege the accumulation of material goods- considerably above any possible necessity- toward being fully human in terms of creative self-realization, equality, democracy, freedom, harmony between people living in meaningful communities and in harmony with Nature.

"Cowboy" a Connected Bike Brand for Men? Gendered Representations and Uses

Connected e-bikes operate from a smartphone and provide access to various options to 'facilitate' cycling and tools for self-quantification (McArthur et al., 2019, Piramuthu 2016). These e-bikes are part of a continuum of "masculine" imaginaries linked to bicycles (Spinney, 2024, Bonham et al. 2015), cars (Norton, 2021) and digital technologies (Jouët 2003). Our research focuses on studying a brand called "Cowboy" Brussel-based, named one of the best inventions of 2022 by TIME magazine. After several years of selling a single model of a black-connected e-bike described as "sporty" and "powerful", the brand faced criticism for featuring only white men in its communication (Lapeyroux et al., forthcoming). From 2021, the brand modified its communication to include women and racialized people to expand its marketing target. Cowboy launched a new, less sporty range of e-bikes, in different colors and evolved its gendered discourse.

To capture the new gendered imaginaries conveyed by this brand (De Lauretis, 1987), we carried out a socio-semiotic analysis (Julliard, 2013) of the gender performance of cyclists (Butler, 1990) in the representations of the Cowboy brand's website and Instagram page. Then, to analyze how changes in the brand's communication have impacted gendered uses, we conducted fifteen interviews with users of the brand's bicycles with diverse profiles (gender, sex, age race) circulating in Brussels with different models of Cowboy bicycles. This research is conducted at the intersection of gender, class, ethno-racial and age relations (Crenshaw, 2005). We will see that, Cowboy's digital communication focuses on a "trendy", ultra-connected, design, urban e-bike for young professionals (men and women) with diverse racial backgrounds among cyclists and ambivalent gender performances. Uses are predominantly gendered, despite the resistance strategies put in place by cyclists, most of whom are active, wealthy white people between the ages of 22 and 65.

Linguistic Acculturation Preferences, Conflict, and Cultural Enrichment: The Case of Preservice Teachers in Catalonia

One of the main objectives of the educational system in Catalonia (Spain) is to strengthen social cohesion, promote intercultural education, and advance the use of the regional language (Catalan) within a multilingual framework.

To achieve this, it is essential for preservice teachers to develop multilingual linguistic acculturation preferences towards the descendants of migrants that move away from assimilationist stances. These assimilationist perspectives tend to perceive disruptive behavior more readily in these students, hold lower educational expectations for them, and often exclude them from discussions about the "ideal student."

Within this context, and situated in Catalonia (Spain), the aim of this paper is to analyze the linguistic acculturation preferences of preservice teachers toward the descendants of Moroccans and Latin Americans. Subsequently, it seeks to compare these preferences and explore their influence on the perceived levels of conflict and cultural enrichment.

The results are based on a survey administered to 654 preservice teachers in Catalonia. Descriptive statistics, analysis of variance, and logistic regressions were used for the analysis.

The main findings suggest that linguistic acculturation preferences are predominantly multilingual towards both the descendants of Moroccans and Latin Americans, although there are more assimilationist tendencies in the case of Moroccans. The study also reveals how the perceived level of conflict and cultural enrichment is mediated by these acculturation preferences.

How Outdoor Sports Are Socializing Nature

The increasing popularity of outdoor sports where natural spaces serve as the “playground” reflects a paradigm shift in human-nature relationships, emblematic of the transition from modern to hyper-modern society. Sociologists identify this transition as a shift from a productive or extractive relationship with nature to a recreational and ludic one, characteristic of hyper-modern society, shaped by information overload, rampant consumerism, and individualism.

This study focuses on “trail running” as a case to analyse how individuals socializing nature through sports activities. Fifteen in-depth interviews with trail running practitioners and one discussion groups with people engaged in productive activities was useful to get an exploratory analyse to identify main items to implement alongside surveys targeting trail runners and non-nature sports participants. The survey consisted in 1.200 responses to a questionnaire submitted to runners on trail running and road running from Spanish Athletics Federation. The study explores how outdoor sports practitioners’ socialization of nature influences their behaviours within hyper-modern society. The findings reveal two behavioural patterns: hyper-individualism, characterized by competitiveness, and holistic individualism, characterized by an eco-recreational approach. This dual analysis underscores the impact of nature socialization on pro-environmental behavior, offering insights into the contemporary dynamics between individuals and their natural environment.

The explanation model is composed by four elements: Nature Relatedness, Pro-environmental Behaviour and Sense of Place, and how their relationships are influenced by Outdoor sports experience.

This research provides a theoretical and methodological framework for public managers and event organizers to understand, measure, and predict attitudes and behaviours of outdoor sports practitioners, aiding in identifying behaviour profiles and informing sustainable management strategies for natural spaces.

LAROCHE, MANON* (Centre Thucydide, France)

Shaping the “War on Terrorism” in Foreign Policy Discourses: A Rent-Seeking Strategy for Egypt Since 2013.

This presentation aims to study how the Egyptian regime, since Abdel Fattah al-Sissi’s official rise to power in 2014, has successively employed expressions that invoke notions of risk and threat to describe the country’s security situation. The expression “war on terrorism” has been particularly prominent from around 2013 to 2020, especially in statements of cooperation directed towards Western partner states (the United States, France), Gulf countries (Saudi Arabia, the United Arab Emirates), and the region, at a time when the international coalition against the jihadist group ISIS was being formed. Responding to the security needs of its partners, Egypt has employed, particularly in foreign policy speeches, a vocabulary centered around these threats in order to make itself indispensable and to legitimize both external and internal actions. In this sense, what interests us in the formulation of this foreign policy is the link between national identity and the fact that it is threatened, as well as the export of this identity on an international scale to defend a strong position as the region’s leading country.

This study is based on an empirical analysis combining interviews conducted with diplomats from these partner countries regarding the reception of such discourse from 2019 to 2024, as well as an analysis of statements produced by the Egyptian presidency aimed at these partners.

This research will be interested in the performativity of such discourses mobilizing the risk, both in a process of formulation and staging (Alberg 2017) of foreign policy.

Les « Vrais » Hommes Et Les Autres : Stratégies Discursives D’un Contre-Public Antiféministe Dans L’espace Numérique

La montée en visibilité des violences faites aux femmes et des revendications féministes au sein de la sphère publique grecque a été accompagnée par l’émergence d’un contre-public antiféministe. Dans une démarche compréhensive, en se basant sur une analyse critique du discours ainsi que sur une observation ethnographique en ligne, nous analysons les

stratégies discursives que ce groupe mobilise pour discréditer le féminisme ainsi que les représentations des rapports sociaux de genre véhiculées par le discours de ce contre-public. Les membres de ce contre-public s’auto-définissent comme des « combattants » qui luttent contre les féministes et leurs alliés. Se désignant comme de « vrais » hommes, en opposition aux alliés des féministes, et censés représenter une masculinité idéalisée et héroïque, ils mènent un combat qui vise notamment à donner accès à la « vraie » connaissance, supposée dissimulée par les féministes et les « pseudosciences » que celles-ci promeuvent, et à contrer les discriminations systémiques que subiraient les hommes. Le déni des discriminations, l’association du féminisme au totalitarisme, la délégitimation des expériences des femmes, la pathologisation du féminisme et l’utilisation de l’humour sont certaines des stratégies employées par les membres de ce groupe pour discréditer le féminisme. Cette étude de cas souligne la nature transnationale de l’antiféminisme et démontre que la lutte pour l’égalité des genres demeure un défi constant à l’échelle internationale.

Platformization and Counter-Hegemonic Strategies: The Experience of Francophone Young Adults with VOD Platforms

The platformization of the audiovisual industry has facilitated the transnational circulation of serial fiction produced outside the USA. However, the global dominance of American platforms such as Netflix and Amazon Prime, with their extensive catalogs and high production budgets, has marginalized local platforms. Additionally, the recommendation algorithms of these platforms tend to favor popular American and British series, exacerbating the issue of discoverability for French-language content. In response to this trend, counter-hegemonic strategies are emerging to promote alternative content. Given that television series play a key role in constructing, mediating, and defining social identities, I propose to present the results of my study on how young adults (18-22 years old) living in Montreal, whose first language is French, experience French-language VOD platforms (e.g., TV5MONDEplus, ICI TOU.TV, Club Illico, etc.). Based on audience ethnography, this study revealed that watching French-language series is often a continuation of family tradition and, in most cases, a conscious choice by the young adults surveyed, who wish to support the Quebec serial industry and frequently resist the “Americanization” of cultural industries. However, several factors appear to hinder the consumption of serial fiction on French-language platforms, including the socializing potential of major platforms like Netflix—whose audiences are larger than those of local platforms—and the limited features offered by local platforms compared to international ones.

LATORRE MARTÍNEZ, RAQUEL* (Universidad de Almería, Spain)

La Sexualidad De Las Mujeres Con Discapacidad y Las Injusticias Epistémicas Que La Atraviesan

La sexualidad femenina y su investigación científica ha estado tradicionalmente ligada a la sexualidad de los hombres y a sus demandas (Angel, 2021). Las cuestiones más relacionadas con aquello que les produce bienestar, disfrute, goce, ... ha permanecido infrarrepresentado e infranalizado. En el caso de las mujeres con discapacidad, el capacitismo, además, ha relegado sus cuerpos a lugares deslegitimados dentro de la jerarquía corporal y social, puesto que considerar la integridad corporal como inherente al ser humano ignora los condicionantes estructurales que cuestionan los espacios y los modos de actuar, pensar o generar conocimiento (injusticia epistémica) que quedan fuera de la norma, así como las violencias que se ejercen contra dichos cuerpos.

La discapacidad encarnada, como no podría ser de otra forma, se vuelve entidad física que sufre la dominación de los sistemas de opresión que interseccionan, como el género, la etnia, la orientación sexual, etc. En este marco, “la capacidad corporal obligatoria” confronta la corporalidad no normativa. La cuestionada e invisibilizada sexualidad de las mujeres con discapacidad desafía la sexualidad normativa y plantea nuevos esquemas no solo corporales, sino también interaccionales. Lo que es aceptado es puesto en duda y esto genera tensiones.

En esta línea, la erótica y la sexualidad de las mujeres con discapacidad contribuyen a esa puesta en entredicho de un orden sexual y su investigación científica, de una manera concreta de entender la sexualidad, las relaciones sexuales y la corporalidad.

Esta investigación pretende conocer cómo experimentan la relación con sus cuerpos y su sexualidad las mujeres con discapacidad a través de sus discursos, colocando sus vivencias en un primer plano.

Knowledge and Technology Transfer in Higher Education and Science: From Transfer Concepts to Transfer Practice

While research and teaching are considered the traditional missions of universities, knowledge transfer as a third mission has become firmly established in recent decades. This has been accompanied by growing expectations and demands placed on universities by stakeholders from policy, industry and society, which in turn lead to increasing pressure and a potential mission overload (cf. Compagnucci / Spigarelli 2020). What are the implications of these developments for the conceptualisation of knowledge transfer in higher education, and how are these put into practice?

This contribution addresses knowledge and technology transfer in higher education and science from two empirical perspectives, examining both the concepts of transfer used in the scientific literature and the transfer practices carried out within higher education institutions.

The first step is to elaborate on the notions of transfer, based on a meta-review of literature reviews on knowledge and technology transfer in higher education. The aim is to develop a conceptual understanding of knowledge transfer in higher education and to empirically demonstrate its evolution over time (cf. Ankrah / AL-Tabbaa 2015).

In a second step, these empirical findings are complemented by the perspective of technology transfer officers at selected German universities, providing further insights into relevant transfer structures and processes. Results are discussed from an institutional perspective within the field of organisational sociology. (cf. Krücken 2003).

Focused Ethnography in Medicalized Spaces: Analyzing NICU Social Dynamics and Their Impact on Preterm Care

Preterm birth affects not only the clinical condition of the infant but also the well-being and functioning of families, presenting challenges during the critical NICU phase and the transition home.

In this study, we examine the complex networks of social interactions within the NICU environment and their impact on clinical practice and the well-being of preterm parents. Our research employs a combination of narrative interviews with medical staff and a multi-situated focused ethnography conducted in NICU and sub-NICU units across five Italian hospitals.

We argue that this methodological combination is particularly effective for analyzing highly medicalized environments with a clear hierarchical structure and established formal and informal practices that shape specific social interactions.

Focused ethnography allows us to narrow the broad scope of qualitative observations, filter out "background noise," and focus on specific interactions, such as those between parents and NICU staff, as well as skill-intensive NICU practices. This approach yields nuanced insight even after a relatively short observation period.

Combining ethnographic techniques with interviews also enables us to explore the context of the observations and understand participants' experiences of being observed. In our study, we constructed a maximum variation sample to include diverse staff profiles, striving to capture the full social network that supports preterm parents during their NICU stay.

The proposed research design is flexible and well suited to accessing complex fields such as hospital environments. The short duration of focused ethnography allows to reduce the impact of the researcher's presence on a difficult environment such as NICU wards, and the interviews complement the shortcomings of the reduced observation time.

This combination of techniques could be replicated in the study of other complex medical institutions as it balances the invasive role of the researcher in a closed environment and the necessity to produce significant scientific results.

Considering Leaving a Job, Sector or Profession at the Start of a Career Path: The Case of Young Public Service Workers in Quebec

Public services in Quebec (Canada) are facing significant workforce challenges. This is due to many retirements, a lack of students in related educational fields, and career bifurcations that sometimes occur early among young workers on the job market. This complex situation creates a labour shortage, undermining essential public services for an increasingly aging population that requires more services. The paper we are proposing relates to our doctoral project, which looked at the working quality and the intentions of young workers under 35 to stay or quit public health and education services. To this end, we conducted 48 semi-structured interviews with workers in three professions: primary school teachers, early childhood educators and nurses. All the people we met mentioned that they were considering either 1) leaving their job for another job in the same sector, 2) leaving their professional sector for another sector (e.g., the public sector for the private sector), or 3) leaving their profession for another profession. The results we present will focus on the main reasons they are considering leaving (is it more to do with employment and working conditions, the various crises that have arisen over the last fifteen years (COVID-19, recession, negotiation of collective agreements), or other factors?) Is there a turning point in their story? How do these young workers see their professional future soon? The comparison of these three professions will be based on the axes of working conditions, qualifications, and relationship to working life.

Long-Term Characteristics of Poverty in Slovenia (poverty, socialism and transition)

After the Second World War, the communist authorities in Slovenia based their legitimacy on the premise of social justice. To their surprise, they were soon confronted with various problems arising from the social and economic structure of society. The authorities were surprised that the rapid growth of the gross domestic product did not translate into a better quality of life for all parts of society. They were confronted with the consequences of different types of social, economic and regional inequality as a historical legacy, with poverty being a central part of the discussions. The aim of the presentation is to show how the authorities responded to the economic and social inequalities, how the inequalities were incorporated into the ideology and how they were managed, what kind of social and economic policies were introduced and what long-term effects they had on poverty. In the second part, the long-term situation of the peasant population in the second half of the 20th century is presented as an example of the systematic creation of poverty. This poverty then continued throughout the life cycle into the older stages of people's lives. Broader social and political context shaped old-age poverty at the turn of the 20th and 21st centuries. Only long term perspective explains the roots and extent of old-age poverty in Slovenia today.

LAZDINA, SOLVITA* (University of Latvia, Latvia)

The Impact of Neoliberal Education Policy on Teacher Autonomy and School Practices in Latvia

Neoliberal education policy in Latvia has created a space for various types of practices aimed at measuring the efficiency of schools and teachers. Their implementation is required by state and municipal policies, which also involve private organizations that compile school ratings and award the best-performing institutions. Public money earmarked for educational research partially funds research institutes, which create tools for assessing quality and effectiveness. Thus, researchers legitimize and support the direction of education policy.

Schools adapt to the requirements set by the policy. They not only seek to subordinate all their work to the established criteria, but they also create new practices that reproduce the required control and performativity. One such practice is the measurement of the quality of teachers' work by observing whether teacher-led lessons meet the "good practice" criteria set by policy. Schools are developing their own quality control systems for evaluating teacher-led lessons; in some cities, these systems are standardized across all schools, creating a special infrastructure to support them.

The limited understanding of what constitutes a "good lesson," as defined by education policy, leads to a uniform learning process — all the lessons observed begin and end in the same way, as required by the set quality criteria. Despite the fact that teachers criticize the practice of lesson observations as humiliating, which incentivizes them to pretend, schools cannot refuse to participate, as these actions affect the assessment of the school by the State Service for Education Quality.

The broader consequences of neoliberalism include the oversimplification of the complex nature of teaching and learning. Teachers are starting to believe that the uniform actions demanded by education policy and supervised by school management represent good teaching and learning, thereby depriving them of their professional agency.

Conceptualising Globalised Workplaces and Fragmentation of Youth Subjectivities and Experiences in Them – Theorising from the Global South Perspectives

This conceptual and theoretical paper is a part of the broader anti-colonial comparative research project (under review) that aims to investigate how young people in the Global South and peripheries of the Global North are formed as workers, and therefore as subjects that are produced, valorised, and revalorised as part of the labour force, in the process of globalisation. This is to be achieved through analysis of media and national and international policy discourses that underpin the global movements of capital and labour and shape the ways different young people are valued or devalued as part of the labour force. Secondly, the second aim is to investigate experiences, subjectivities, and imaginaries of the young people themselves, in particular the youth working in the interconnected globalised workspaces. These are the workplaces created by (i) practices of offshoring the production of goods and services; (ii) through franchising and (iii) because of the development of global digital platforms and media. The key question asked here is to what extent global forces, interconnections, and imaginaries inherent in the expansion and design of globalised workspaces create global workers as uniformed subjects, similar regardless of locality and to what extent and how are youth subjectivities and processes of subjectification as workers are localised in the local network of norms, traditions, and social structures. The paper firstly conceptualises the differences between globalised workspaces in Global South and their local traditional counterparts that is useful conceptual differentiation for studies of youth and work in the global context. Lastly, the paper explores the theoretical contributions from the Global South especially theory of fragmentation by the Mexican anthropologist Gonzalo Saravi as the one of the ways how the research about young people in the world of work can be explored.

Exploring Future Imaginaries: A Comparative Study of Student Perspectives from England and Spain

This comparative paper delves into the future imaginaries of higher education students in England and Spain, with a specific focus on those pursuing studies in different disciplines. Employing a qualitative research approach that combines creative visual methods with usual focus group approach, we conducted focus groups to delve into students' core values, aspirations, and visions of the future. As contemporary higher education increasingly positions students as human capital and future workers, societal narratives emphasize career trajectories, employability, and work as paramount life aspirations (Brooks et al, 2022), little emphasis in research and policy is given to students themselves and their voices. Simultaneously, generational stereotypes depict them as hedonistic, with questionable work ethics and limited aspirations. This key value of this article is comparative as the unique and divergent social, policy and institutional contexts of England and Spain shape value and future imaginaries influenced for example by distinct hegemonic discourses in these societies.

This paper adopts the concept of "orientations" from Sarah Ahmed's work adapting it to explore how individuals navigate the complexities of envisioning

their future. We investigate how young people approach their lives, the core values that shape their navigation and future life imaginaries and how they how they envisage reaching their destinations. These imaginaries also shape students in the institutional university environment in relation to the teaching staff and fellow students.

The findings present the stances, discourse and visual representations that reveal diverse ways in which young participants engage with the idea of the future, both personal and societal. Ultimately, this research contributes to a nuanced understanding of the intricate processes involved in shaping future imaginaries among students in England and Spain.

LAZNIJAK, JASMINKA* (University in Zagreb, Croatia)

Sociology in Post-Transition Transformations of Croatian Society

The objective of this analysis is to explore the possible role of sociology in post-transition transformations of Croatian society in terms of scientific and professional expertise production that would influence or shape the dominant transition discourses that have been insignificant in Croatian sociology. The analysis draws on the institutional perspective using the concept of path dependency in disciplinary development and cultural political economy.

After a short historical outline of the development of sociology, the role of sociology in several phases of development is explored from the analyses based on content analysis of sociological publications and publicly financed research projects. Some examples of post-transitional studies and their possible impact on dominant discourses are given. The marginal position of sociology in post-transition is explained as the result of a series of specific social and historical circumstances in which it developed. The legacy of the previous period marked sociology in transition as a leftist, Marxist science, but also as insufficiently nationally oriented, resulting in its marginal position in terms of political and social power. After a first decade of crisis, sociology has been transformed from a parochial, poorly financed discipline to a more methodologically and theoretically mature and more internationally oriented in research project and publications.

LAZZARINO, MLE ALIZEE* (Université Paris 1 Panthéon-Sorbonne, France)

Negotiating One's Place in Public Space through Squatting: The Activist Trajectory of a Female Sex Workers' Collective in the Raval Neighborhood, Barcelona

Since 2005, the City Council of Barcelona has implemented legal measures sanctioning sex workers' presence in public spaces and has deployed various strategies to exclude them from the city center (Hubbard, 2017).

In response to the municipality's punitive strategies, sex workers from the Raval neighborhood, located in the highly touristic old city, formed a collective in 2006 still active today. The collective's purpose is to fight against institutional attempts to exclude the practice of prostitution from public spaces (Motteler, 2018). These women's activist trajectories are remarkable for the diversity of the repertoires of action they use, the evolution of the recognition of their protest by municipal actors, and the longevity of their mobilization, especially given the limited resources with which they initially began their protest.

Drawing on a reflection on citizenship, this presentation focuses on a particular mode of collective action used by these sex workers: the practice of squatting alongside other local residents (Isin, 2008 ; Dadusc, 2019).

An ethnographic study conducted in squats in the Raval neighborhood, complemented by archival analysis and participatory methods involving the collective's sex workers, shows how these women find in these illegally occupied spaces an opportunity to express themselves, to value their skills, and to build alliances with local actors despite the criminalization of their presence in the city. In their repertoire of action, squatting emerges as a tool to negotiate their social recognition both as political subjects and as citizens. I will demonstrate that sex workers' involvement in squats contributed to their progressive integration into municipal decision-making processes concerning prostitution, from which they were initially excluded, and to legitimate their presence in public space.

Prenotafacile ? the Naples Prefecture Website, Administrative Limbos and "Paper Careers"

The legal status of an immigrant, regulated by national laws, results from a "bureaucratic domination relationship" (Spire, 2005), that often leads to administrative limbos in the contemporary context of tightening immigration policies in Europe and in Italy in this case. Over the long term, these "paper careers" (op.cit.) are also urban journeys, influenced by mobility, spatial centralization, and distance dynamics. Through this doctoral research, I aim to analyze these regularization paths in their urban and spatial dimensions, focusing on the prefecture of Naples (Italy).

The Neapolitan context offers a particular lens: most rental and employment relationships in Naples are not formalized by contracts. This informality affects all residents of Naples, yet foreign individuals are required to provide multiple official documents, such as work contracts or residency status, to obtain a residence permit. Is informality a producer of administrative limbos? Yet, how do foreigners navigate their "paper careers" in Naples? Following one of my hypotheses, I will focus on the effects of digital tools on the urban trajectories of rights holders in Naples. The rise of digital tools and telecommunications has transformed social relations and people's interaction with distance. As more administrations require online appointments for accessing services, how does the digitalization of administrative procedures reshape the spatiality of paper careers? This research will confront the universality of social benefits with the socio-spatial constraints that govern access to rights. How do digital tools contribute to administrative limbos in a context of urban informality?

These questions emerged after several months of volunteer work in a legal aid association in Naples and this paper will present the initial results of the fieldwork carried out in the spring of 2025, including in-depth interviews with right-holders on their ordinary practices with administrative counters, participant observation and interviews with private and public actors involved in Naples.

LE BRIS, ANNE* (Rennes 2, France)

GOFFRE, NORA (Rennes 2, France)

Between Discretion and Discredit: Thinking the Materiality of Alternative and Feminist Pedagogies for First-Year Bachelor Sociology Students

This presentation aims to shed light on ways to (re)think the teaching of sociology for first-year undergraduate students, through an approach at the crossroads of feminist pedagogies and popular education, notably the Theatre of the Oppressed. These workshops have been designed to address the needs of new generations of students who enter university with unequal preparation: a growing proportion of working-class children and/or holders of technical baccalaureates marks the arrival of new audiences.

These workshops put into question the conventional and/or dominant forms of knowledge transmission where theoretical abstraction and implicitness are the academic norm, requiring a conceptual and lexical background that can be exclusive. These dialogic workshops aim to create reflective situations that are no longer independent of lived experiences and the associated emotions, nor of the structural power relations in which they are situated. Rethinking these alternative forms of teaching also means accepting the unpredictability of exchanges and reconsidering the pedagogical relationship from both a politicized and politicizing perspective.

Moreover, these pedagogical stances cannot be considered without referencing the frameworks that make them possible. We will also question "academic care" and more broadly the sexual division of academic labor. Indeed, these alternative feminist pedagogical practices are often marginalized both within universities and in the recognition of academic careers, sometimes even discredited. They often involve women at the bottom of the academic ladder and/or in precarious positions, and this discredit harms their careers.

We propose a descriptive audiovisual analysis of the implementation of the workshops (based on a corpus of photographs, audio recordings, and narrative writings from students during first-year university workshops) where the sociological corpus serves as a specific resource for teaching sociology. Additionally, we will present a quantitative analysis articulating a reflective examination of our classroom practice, moving beyond mere experience to theorize actions and experiences.

French Upper Middle Classes in London: Illusions, Circulations and Rootedness

Upper middle classes in London had everythingso they thought : prestige and recognition from the British population, professional success, the amenities of the British cosmopolitan city... and a French way of life in particular enclaves.

The analysis of three waves of original interviews in London (2017, 2019, 2004) reveals 1) the trauma of Brexit and the adaptation strategy of this group both transnationally and within London and 2) a more differentiated pattern between those who take London as one destination among a professional trajectory that brings them also to New York, HK and Singapore and those French whose experience in London is the only transnational experience, organising their life between Paris and London. The research also contrasts those who stay in the traditional enclave of Kensington and those who followed the opening of about 10 French schools in the greater London with more disperse and diverse way of life.

The paper is a contribution to the hypothesis about the making of a transnational upper middle class between Paris and London and the game of distance and proximity they play in London with other social and ethnic groups.

LE MOING, SÉBASTIEN* (Sciences Po Bordeaux, France)

Anticolonialism and Shifting Racial Sensitivities: A Case Study on a Controversial Lecture at the École Coloniale in Early Twentieth-Century France

While the process by which "things once allowed are now reproved" can be empirically tracked through longitudinal studies of educational materials (Elias, 1939) or declared values (Inglehart & Norris, 2003), the social forces driving these shifts are often more postulated than demonstrated. In particular, more inclusive sensitivities toward subaltern groups are frequently explained through theories of cultural change that sometimes under-examine the role of contingent emancipatory struggles and actions (Linklater, 2016).

Drawing on the investigation of the increasingly contested "French Colonization" class at the École Coloniale from 1890 to 1927, this communication sheds light on how less unequal power dynamics and collective action from *outsiders* led to a fragile yet existing *constraint towards self-constraint* when addressing racialized and colonized people from the 1900s onwards. First, I present the contextual elements that led the known racist Louis Vignon to lecture at the École Coloniale. This higher education institution, aimed at training future colonial administrators (Collier, 2018), welcomed a diverse student body from the Antilles, West Africa, Indochina and Metropolitan France, who recurrently opposed the course content, both for its reliance on racist theories and its overtly anti-assimilationist stance on the colonial project. Based on the available archives of the "Vignon incident", I then explore how these protests took shape up until 1927, and how both the administration and the professor navigated these critiques.

In sum, I highlight how shifting power dynamics and growing interdependence with colonized elites, even at the heart of the colonial project, exerted ongoing pressure on socially acceptable attitudes and discourse. However, this example of extra-European influences creating new demands for affective regulation reveals more about European cultural mutations than on the brutal reality of the colonial order, which was increasingly masked by a modernized vocabulary.

LE MOING, SÉBASTIEN* (Sciences Po Bordeaux, France)

From "Boche" to German: Civilizing Nationalism in Interwar French Primary Education

Historians and education scholars have extensively examined the moderation of salient nationalist education during the interwar period. In the wake of the First World War, grassroots teachers' movements (Le Bars, 2005) and, to a lesser extent, initiatives from the League of Nations (Hofstetter & Riondet, 2018) gradually toned down the content of curricula, textbooks (Siegel, 2004), and daily lessons (Loubes, 2001). While the emerging pressures to respect national sensitivities—particularly those of recent wartime adversaries—are well-documented, there has been limited application of Eliasian concepts to understand how educators and pupils navigated what may be interpreted as a civilizing dynamic.

This communication argues that articulating concepts such as national habitus and civilizing process can provide insight into how nationalist rhetoric and attitudes were gradually codified into stricter forms of emotional management. First, building on an analysis of the French teachers' boycott campaign against "hateful" schoolbooks, I propose framing this movement as a "civilizing offensive" that led to increased constraints on expressing overt national pride. But to what extent did this offensive shape the socialization of children growing up in this era? To address this, I then examine a 1929 survey that asked a socially diverse sample of 350 French pupils the following question: "You hear of the Germans and the *boches*. Which of these two words do you prefer? Try to explain why." Through the findings of this survey, I highlight how children conveyed emotional concerns that extended beyond national boundaries.

In conclusion, I argue that the new codification of nationalism did not coincide with a post-national agenda, even in the most activist spaces. Rather, the encouraged identification remained racially limited to European nations, while the protection of national sensitivities paradoxically reinforced a socio-political order in which national affiliation never ceases to be a latent identity, a second nature.

Invisible Resources Versus Visible Inequalities: Informational Justice in Groundwater Protection ?

In the Anthropocene, the long-term sustainability of groundwater resources faces significant threats from human activities, including increased water demand, extensive pollution emissions, and the current and future impacts of climate change (Maréchal et al., 2019). In response to these challenges, ecosystem-based programs are being developed, including Nature-based Solutions (NBS). These initiatives emerge in a context characterized by limited knowledge of aquifers (Hérivaux and Rinaudo, 2016), largely due to the hidden nature of groundwater and its complexity. This invisibility also implies that interactions between surface ecosystems and groundwater are still not fully understood and considered (Hérivaux and Maréchal, 2019). The production and accessibility of these knowledge, essential for implementing effective programs, raise critical issues of justice. In fact, acquiring this knowledge often requires expertise, advanced scientific tools and financial resources, leading to concerns about informational justice (Cuadrado-Quesada and Gupta, 2019) and disparities among stakeholders in accessing this information and bearing the associated costs. Yet, engaging stakeholders is particularly crucial when commitment concerning protection is challenged by this hidden nature (Baldwin et al., 2012). In this perspective, the recognition and integration of diverse forms of knowledge in the construction of protection programs is a central concern of justice. The presentation will explore these challenges through an analysis of two French territories where protection programs mobilizing NBS have been implemented. We will describe initial findings from a qualitative investigation, based on semi-directive interviews with a diverse range of stakeholders, including local authority representatives and employees, farmers and agricultural representatives, landowners, and local residents.

LE ROUX-KEMP, ANDRA* (University of Lincoln, Lincoln Law School, United Kingdom)

A Systematic Review of the Digital Turn in Socio-Legal Studies: Beyond (or Towards New) Identities and Contexts in Law and Life

The development of socio-legal studies (including law and society and the sociology of law) cannot be presented in terms of a simple historical evolution in the study of law and legal systems. Its history is, and its current practice remains multifarious: nospanning distinct developments and focal areas across different continents; including a wide variety of intellectual traditions, theoretical perspectives, and methodological approaches; and attracting an equally diverse range of scholars. Yet, socio-legal studies (and its other manifestations), have always been concerned – whether directly or indirectly – with making sense of the law in terms of specific *contexts* and with reference to specific individual or collective *identities*. These various *contexts* and *identities*, however, are increasingly and fundamentally being altered by the progressive uptake and integration of advanced digital technologies in all aspects of our daily lives, including in law and legal practice. This digital turn is also apparent in socio-legal scholarship et al., where digital contexts and disembodied or representational identities are increasingly the foci of investigation. In this paper, through a systematic review of literature and with due regard to the multifarious nature of the undertaking, the impact of this digital turn will be

traced, theorised, and projected with reference to the essential categories of *context* and *identity* in socio-legal scholarship at large. While this digital turn is also not susceptible to a simple, linear proclamation through which its arrival, development, and future course can be traced and explained, this paper will offer the first known comprehensive exposition and critical analysis.

LE ROUX-KEMP, ANDRA* (University of Lincoln, Lincoln Law School, United Kingdom)

Re-Re-Branding Hong Kong: Of Brands, Laws, and Public Diplomacy

The idea of "branding" Hong Kong was first conceptualised in 1996, shortly before the UK retroceded Hong Kong to the People's Republic of China. This need for a Hong Kong brand stemmed from a general anxiety that the city would lose its distinct identity after reunification, and policies were subsequently put in place to frame the new Hong Kong Special Administrative Region as an international hub for finance, trade, investment, tourism, transport, and communications. Hong Kong was thus positioned as "Asia's world city" and the "gateway city [for the West] to the East". Since then, however, the visual imagery news agencies have brought to our screens have painted a different picture of Hong Kong in our mind's eye. The bright coloured umbrellas and sit-in street protests of 2014 have rendered Hong Kong synonymous with the so-called "umbrella movement" and the more violent protests of 2019/20 with its teargas filled streets and standoffs between students and riot police on campuses signalled to the rest of the world that this is a city in crisis. Against this background, the distinct role that law and the Hong Kong legal system have played in the branding, nation-building, and public diplomacy of Hong Kong will be explored. It will be shown that rule of law discourse has, and continuous to be invoked as a distinguishing feature of Hong Kong. Also, claims about core values representing the "true identity" of Hong Kong and its people are often premised on Hong Kong's laws and legal system. How did the laws and legal system of Hong Kong come to represent its identity and the basis upon which much of its branding and public diplomacy are built? What does this say about the brand of this nation, and what does it mean for its laws and legal system?

Green Jobs and Female Poverty in Agriculture the Case of Female Farm Workers in Morocco

For a greener economy, Morocco is involved in an ecological transition that promises a new dynamism in the labor market and displays a real challenge regarding the role of women within the paradigms of sustainable development and the greening of employment. However, the disparities between women and men in the agricultural sector call into question the paradigm of green jobs, which promises to improve traditional jobs and the emergence of new ones.

In fact, the dynamism of green jobs can be an opportunity for female agricultural workers, who are lacking access to decent working conditions and social protection, find themselves under the clutches of both the poor working conditions and the climate change. Threatened with being marginalized in the ecological transition, this group of women risks exacerbating gender inequalities and living on the fringes of sustainable development.

The aim of this research is to adopt a gendered approach to female agricultural employment in light of the green jobs paradigm. The rationale behind is to assess whether green jobs are dominated by men or they are opening a new horizon for the empowerment of women. It seeks really to analyze the real challenges facing a gender-sensitive greening of agriculture in Morocco.

Gender-sensitive green jobs display an opportunity to scrutinize gender relations, carry on the dynamism of women's empowerment, and pave the way toward reducing female poverty, which deeply affects female agricultural workers.

Victims of Abuses in Ecclesial Surroundings: A Tortuous Path from Confusion and Despair Toward Survival.

The method of various in-depth interviews, as developed by the scholars, specialists of Lived religion (Ammermann, 2014; Morello et al., 2017; Morello, 2020) cannot be applied directly with victims of abuses in ecclesial surroundings. Out of respect for the situation and the suffering involved, interviews cannot be directed. The use of spiritual manipulations in the process of abuses and the later intents to overcome the trauma imply great transformations and upheavals in faith and ways of living religion on a daily basis.

This presentation, based on two research projects developed in Argentina and Peru, delves on some of the religious path transited by victims. We analyze two contexts. First women religious abuse; that is, religious sisters that suffered from clergy abuse, or were victims of another sister abuse. Second, we delve in the context of poor parishes where minors were abused by a priest.

Through the narrative of victims in these two contexts, we analyze what the abuse meant in their lives, how they dealt with the trauma, the resources they had to cope with their suffering, and how the experience framed their spirituality. We argue that lived religious acquires specific characteristics when believers suffer sexual abuse in ecclesiastical settings.

L'antifascisme Radical : Adversaire Et Reflet De L'extrême-Droite ? Approche Géographique De L'activisme Antifasciste En France

L'antifascisme radical est un courant antifasciste autonome privilégiant l'action directe, apparu dans les scènes antiracistes et punks des années 1980 face à la montée de l'extrême-droite (Copsey, 2018). Cette communication propose d'explorer comment ce courant, perçu comme un adversaire idéologique frontal de l'extrême-droite, en est également un reflet stratégique. Ma recherche s'inscrit dans la géographie des mouvements sociaux analysant l'espace comme cadre, moyen et enjeu de lutte (Hmed, 2008). Je m'intéresse à la dimension spatiale du travail militant et de l'action antifasciste i.e. lieux d'organisation, tactiques spatiales, échelles d'action, moyens de communication et de déplacement, réseaux transnationaux. J'étudie les groupes antifascistes français en mobilisant une méthodologie mixte (entretiens, observations participantes, *social network analysis*).

Sans tomber dans la *horseshoe theory*, je montrerai que les transformations contemporaines de l'antifascisme reflètent les dynamiques de l'action identitaire, jusqu'à observer une convergence des répertoires d'actions et des modes d'organisation et de communication. Si cette convergence s'explique par la répression étatique, elle révèle aussi une coévolution des deux mouvements, marquée par des transferts d'un camp à l'autre e.g. techniques de combat, styles vestimentaires, contre-cultures musicales. En même temps, l'antifascisme est indissociable des autres mouvements sociaux – il s'inscrit dans un ensemble de luttes locales, qu'il soutient directement et dont il dépend pour subsister (Ince, 2019). On observe alors un décalage entre des adversaires perçus à l'échelle nationale (Etat, extrême-droite) et des actions inter-luttes souvent limitées à l'échelle locale (entre-aide, contre-manifestation, affrontements). En présentant les premiers résultats issus de différents terrains français, cette communication ouvre une discussion sur l'évolution des stratégies antifascistes et leur rôle dans les luttes contemporaines contre l'extrême-droite.

Applying the Concept of Cultural Inclusion Based on Empathy and Relational Practices

This study aims to expand the implications of urban inclusion by adding relationality along with territoriality, and to present a conceptualization model of "cultural inclusion" that is organically linked to social inclusion. This will help to present a conceptualization model of "cultural inclusion" that expands the idea of urban inclusion by comparing it to social inclusion,

which is a conceptualization model of "cultural inclusion" that expands the idea of urban inclusion. Cultural inclusion can be linked to the need for relationships, the connection of spaces, the formation of organic and learning relationships based on the process of action through deeds, the creation of openness centered on public spaces, and the practice of various actors. This will help us to see how cultural inclusion, which is organically linked to social inclusion, is differentiated by its connection to the theme of empathy and how it is expressed in public spaces. Specifically, I will apply the concept of cultural inclusion to the case of South Korea. For example, I will apply the concept of cultural inclusion to the case of Hongdae-ap in Seoul, South Korea, where many young people gather. In recent years, Hongdae-ap has been characterized by the creation of an environment that protects the diversity of individual actors and groups (artists, residents, pavilions, students, cultural activists, citizens, tourists, etc.), the formation of public spaces such as 'Hongdae-ap Playground,' 'Walkable Street,' and 'Gyeongui-seon Book Street,' and social network services and horizontal networks and access to each other. This will allow us to explore how open spaces, horizontal networks, and social relationships contribute to inclusive urban environments. This research is significant because it explores the impact of urbanization, social exclusion, and cultural practices on community interactions, while highlighting the importance of empathy and relationship dynamics in overcoming social barriers.

LEE, DASOM* (University of California San Diego, USA)

International Marriage As a Gendered Racial Project: Vietnamese Migrants, Korean Husbands, and Brokers

This paper examines how Vietnamese-Korean international marriages become a gendered racial project orchestrated by Korean husbands and marriage brokers, associating "Vietnamese" with illegality but invoking it differently along gender lines. Based on interviews and textual analysis, I find that the internationally brokered marriages between Vietnamese brides and South Korean husbands are structured to satisfy the marital desires of the paying customers, the Korean men, while offering rare pathways to permanent settlement for marriage migrants. While the broader Vietnamese ethnic community, represented by male migrant laborers, is racialized as embodying masculine illegality and posing a threat to stable marriages, the marriage process itself is shaped by efforts to exclude deceitful Vietnamese women who use spousal status for immigration, while preserving and infantilizing the feminine innocence of the "genuine" Vietnamese wife, curated by the civilized and mature South Korean husband.

During the matchmaking process, South Korean men experience a sense of masculine racial superiority, as their ethnoracial identity comes to the forefront in their encounters with Vietnamese women, typically seeking younger, attractive brides. Brokers play a key role in mitigating perceived risks of "scams" by encouraging men to choose more modest brides, thereby reinforcing the male desire for respect as household leaders. Throughout the months of paperwork, when couples are often separated, brokers surveil the women on behalf of the husbands, particularly to protect them from potential contamination by their male co-ethnics. Once in South Korea, husbands may feel increasingly insecure as their wives become more social with Vietnamese peers, especially the younger male migrant workers. Although husbands attempt to feel secure by treating and caring for their wives as "daughters," racial discourses surrounding immigrant illegality continue to exacerbate their emotional fragility. This study demonstrates how various interests and positionalities around migration shape the construction of "the Vietnamese" as a racialized group.

Learning to Become a Migrant: Migrant Pre-Arrival Trainings for Vietnamese Migrant Workers and Marriage Migrants to South Korea

Marriage migration and labor migration are key pathways of human mobility in Asia. While popular destination countries in East Asia adopt strict immigration policies, some receiving states adopt the pre-arrival training for the migrants to facilitate a smooth immigrant incorporation. In this paper, I ask how migrant training before departure to the receiving country shapes migrant understandings of themselves and the destination countries. With the case of marriage migrants and temporary migrant workers from Vietnam to South Korea, I also analyze the similarities and differences between the training organized for each group. The findings of this paper come from 18 months of qualitative fieldwork in Vietnam and South Korea, with 87 interviews with both marriage and labor migrants in various stages of their migration journey, instructors of these trainings, as well as various migrant intermediaries who take part in the process. Training materials as well as some observations were also analyzed.

The training first teaches the marriage migrants and migrant workers to embrace their Vietnamese national identity in relation to the new destination. While the workers as a representatives of the Vietnamese nation are encouraged to perform the task as an employee well, marriage migrants become subjected to their gender roles. The migrant workers are trained to prepare for return migration, while the focus during the marriage migrant training is on them planning the permanent settlement. The return to Vietnam is framed as contingencies for the brides and the concrete steps to take upon return are vaguely mentioned. This research sheds light on the immigrant integration efforts before migrants reach their destination, and how immigrant categories shape the types of pre-arrival training that shape their migrant subjectivities along with their expected roles in the host society.

Intergenerational Social Mobility and Marriage Formation in South Korea: How Does Relative and Absolute Social Mobility Matter?

Since the turn of the 21st century, South Korea has exhibited lowest-low fertility rates and the persistent downward trend in marriage. However, we know little about what role its social stratification processes play in such drastic demographic change. This study seeks to fill this gap by examining how patterns of intergenerational social mobility are linked with the likelihood of marriage entrance. Specifically, this research develops a theoretical framework in which individuals' decision making on marriage formation is a function of assessing their experience on relative and absolute social mobility. Here, relative mobility refers to how an individual's socioeconomic position in his/her generation compares to his/her parents' socioeconomic position in their generation, whereas absolute mobility to how an individual's socioeconomic position directly compares with his/her parents' socioeconomic position. Therefore, relative and absolute social mobility signifies the extent of social fluidity and overall socioeconomic upgrading, respectively, in a society in which individuals live. This study contends that a higher level of relative mobility should have a fostering impact on family formation, but that it can also have a constraining impact if it engenders more uncertainty and competition. A higher level of absolute mobility, meanwhile, is generally thought to increase individuals' likelihood of entering marriage. To empirically investigate these expectations, this research uses data from the Korean Labor and Income Panel Study ($N = 4,988$; 2,702 men and 2,286 women born between 1977 and 1991) and conducts an event history analysis. The analysis measures age at first marriage as the outcome; birth cohort-specific intergenerational rank-rank correlation of socioeconomic index (SEI) and difference between own and parents' SEI scores as relative and absolute mobility, respectively; and an array of sociodemographics as covariates. The findings of this study will contribute to better understanding the social stratification of family formation and its implications for socioeconomic inequality.

CHOO, JOOHEE (Jeonbuk National University, South Korea)

A Study on the Determinants of Employment Migration Among Female College Graduates in South Korea

With the decline in population and the acceleration of youth outmigration from regions in South Korea, the crisis of regional extinction has emerged as a significant issue. Since 2000, the net outmigration rate of the youth population in non-metropolitan areas had been gradually decreasing; however, this trend reversed sharply after 2015. Notably, young women are more likely than young men to move from non-metropolitan areas to the metropolitan area for further education or employment. Regional brain drain has been identified as a factor exacerbating regional imbalances in South Korean society. However, the transition of regional university graduates into the labor market exhibits greater volatility and instability compared to graduates from metropolitan universities. Moreover, female youth are in a more disadvantaged position in the labor market than their male counterparts, facing intense competition for decent jobs. Hence, this study examines the decisions of young female regional university graduates to move or stay for decent job opportunities, taking into account the socioeconomic inequality structure and individual job value perceptions. With data from the 2020 "Graduate Occupational Mobility Survey," we apply a sample selection bivariate probit model to analyze young female regional university graduates' entry into the labor market and their regional migration. The results show that regional young women actively move in search of decent jobs. It is found that female youth's outmigration is promoted by the preference for large-scale enterprises, a local job shortages and high reservation wages. In addition, the effect of employment-oriented major selection and household wealth effect are detected to play a role in securing decent jobs in the region. These findings suggest that disparities in job availability and wealth inequality may contribute to the reproduction of inequality in South Korean society.

Revitalizing the Just Transition Discourse: Historical Experiences from the U.S. and Germany

'Just Transition' emerged as a central issue in addressing climate change after its inclusion in the Paris Agreement (2015). Essentially, 'Just Transition' embodies the idea that during rapid industrial restructuring in specific regions or industries in response to the climate crisis, the process and outcomes should be 'just' for all, ensuring that neither the results nor the responsibilities of this transition are unilaterally imposed on workers and local communities. The concept of 'Just Transition' has been widely adopted across various policy frameworks, particularly in efforts to transition to a carbon-free society. However, its aims and strategies have become increasingly contested, with recent narratives often reducing the concept to 'job creation' and 'green jobs programs.' Consequently, the deeper, original meaning of 'Just Transition' is often oversimplified, focusing narrowly on green job creation while neglecting broader structural, historical, and social dimensions.

Recognizing the essentially contested nature of 'Just Transition', this study aims to examine the conceptual origins, historical context, and development process of 'Just Transition' through historical case studies. In doing so, it seeks to broaden our conceptual and theoretical understanding and draw implications from historical perspective on the current discourse on 'Just Transition.' This paper compares cases from the U.S., such as labor movements like the Oil, Chemical, and Atomic Workers (OCAW) in the 1970s-80s, with successful instances of 'Just Transition' achieved through the co-determination system during Germany's coal phase-out in the Ruhr region during the same period.

As countries navigate the challenges of transitioning to low-carbon societies, insights from these historical examples can help guide policies that balance economic, social, and environmental goals, ensuring no group is left behind.

Empowering Message or Marketing Gimmick? Japanese Consumers' Engagement with Femvertising

Gender inequality remains a deeply rooted issue in Japan, with the country ranking 118th out of 146 countries in terms of gender equality, according to the recent Global Gender Gap Report. Media play a dual role as powerful agents of socialization that both perpetuate and challenge traditional gender norms. While often reinforcing stereotypes, media also serve as platforms for deconstructing and redefining gender norms, particularly in the digital age where media production and consumption have become more decentralized.

The global rise of femvertising—advertising that promotes female empowerment—has also gained significant attention in Japan. While femvertising can contribute to social change by raising awareness of gender issues, it can also backfire if its messaging is seen as superficial, vague, or contradictory. In Japan, femvertising has sometimes sparked controversy or backlash, particularly online, as consumers question the authenticity of brands' claims to support gender equality.

Based on an online survey, this research explores Japanese consumers' engagement with femvertising and the factors influencing their responses. It seeks to address the following key research questions: How do Japanese consumers' views on gender roles correlate with their support for femvertising? To what extent does discomfort with traditional gender portrayals in advertising affect their preference for femvertising campaigns? What are the levels of skepticism among Japanese consumers regarding the authenticity of brands' commitment to gender equality in femvertising? Additionally, how do Japanese consumers perceive the recent online backlash against femvertising, and how does this perception affect their engagement with gender issues in media and advertising? Through a comprehensive online survey targeting a diverse sample of Japanese consumers, the study aims to provide insights into the complex dynamics between femvertising and consumer engagement within the Japanese context.

LEE, JINSOL* (Korea University Department of Sociology, South Korea)

SHIM, JAE-MAHN (Korea University, South Korea)

Meanings of Giving: Hometown Love Donation Campaign in S. Korea

In 2023, South Korea launched the "Hometown Love Donation Campaign" to promote balanced regional development by allowing individuals to donate to municipalities of their choice. The Campaign enables citizens contribute to areas outside their residence, offering tax deductions and thank-you gifts in return. This initiative evolved from the 2007 "hometown tax" idea, which faced early challenges over tax revenue concerns. Over time, it transitioned from a tax-based to a donation-based model, fostering stronger relationships between donors and local governments.

The Campaign aligns with Marcel Mauss's theory of gifts, which highlights how giving and receiving create networks of moral obligations and strengthen community ties. The Hometown Love Donation Campaign embodies this principle by facilitating exchanges that range from altruistic gestures to actions driven by personal interests, based on the needs of the communities involved. As a result, the Campaign is expected to take diverse forms in different local areas.

This study aims to explore how local governments, the recipients of these donations, portray and engage with the Hometown Love Donation Campaign. While much research has focused on donor motivations, less attention has been given to the strategies local governments use to build relationships with donors. This study seeks to address that gap by analyzing promotional materials from local governments—such as advertisements, texts, and media like songs—to understand how they communicate the value of the Campaign. Through qualitative content analysis, the research aims to uncover how local governments frame the concept of donation and the strategies they employ to engage the public and promote sustainable donation practices.

Fixing Families: How Street-Level Bureaucrats Deal with Relational Citizenship of Marriage Migrants in South Korea

Intra-Asia marriage migration has attracted attention from scholarly communities, as marriage migrants' legal and substantive citizenship in destination countries is largely dependent on their family ties with citizens. The South Korean state has viewed these transnational marriages as a solution to address family-level reproductive needs, particularly in response to a 'bachelor surplus' and the country's declining marriage and fertility rates. Drawing on in-depth interviews with South Korea's street-level bureaucrats working in state-led welfare agencies, this study explores how frontline welfare workers navigate the intimate sphere of citizenship-making for marriage migrants. Contrary to the mainstream understanding of state actors as detached bureaucrats, this study reveals that street-level bureaucrats, embedded in broader gender inequalities affecting both citizens and non-citizens, mobilize themselves to extend beyond the state's focus on marriage migrant women's maternal roles. By identifying the root causes of marriage migrants' struggles within native-born citizens, these frontline workers bring marriage migrants' native-born spouses and in-laws back into view. This suggests the bridging role that gender plays between migrants and frontline state workers, although the paper also highlights how class divides between them can obstruct this effect. The study further shows that street-level bureaucrats themselves are gendered, demonstrating how frontline state actors' own gender serves as both capital and a barrier in navigating the intimate sphere of citizenship-making. Ultimately, the paper calls for a more nuanced understanding of the role state actors play in immigrant integration and encourages further analysis of how they are embedded in the social institution of gender.

LEE, JIYEON* (Jeonbuk National University, Republic of Korea)

CHO, EUNJOO (Jeonbuk National University, South Korea)

From Barracks to Bytes: Military Service, Memes, and the Construction of Digital Masculinity in South Korean Online Communities

This study examines the intersection of internet memes, hate speech, and political tribalism in South Korean male-dominated online communities, focusing on how military service experiences shape collective identity. The study investigates how online communities construct experiences through

specific frames, centering on a shared sense of victimhood from mandatory military service. These frames shape the community's worldview, influencing interpretations of societal issues, particularly those related to gender and social equity.

Analyzing hateful memes and discourse, the research explores how these elements perpetuate power structures and reinforce dominant narratives. It argues that derogatory memes and hate speech act as symbolic violence, maintaining hierarchies and excluding perceived out-groups, particularly feminists and women. This process legitimizes existing power relations within the community and broader society. Furthermore, the study examines how identity is constructed through the repetitive use of memes and hate speech. It posits that these online performances actively shape community members' identities, with ritualistic use of certain memes and phrases becoming a way of performing and reaffirming group membership. Employing online ethnography, discourse analysis and in-depth interviews, the research provides contextual insights into these dynamics. It situates the phenomenon within broader societal changes in South Korea, including shifting gender dynamics and evolving perceptions of military service.

This study contributes to understanding online hate speech as an interplay of framing, symbolic violence, and performative acts that construct group identities in a polarized online landscape. It highlights the need for nuanced approaches to addressing online hate, considering multifaceted social, cultural, and psychological factors. By examining how victim narratives and hateful memes intersect online, this research offers insights into political polarization and identity formation in the digital age, with implications beyond the South Korean context.

Sanitized Love: Exploring the Idealization of the Urban Middle-Class Dating Culture in South Korea

Korean society is currently facing delayed marriages, non-marriages, and a severe drop in fertility. Various factors have been identified as contributing to this situation, including socio-economic insecurity among the younger generation, gender inequality in employment and income, and imbalanced gender roles in housework and childcare. In addition, we believe that the changes in "dating culture," along with these socio-economic factors, may be accelerating "romance inequality" among young people, which further complicates the social reproduction of South Korea. Based on survey data, this study will explore the link between the idealized dating culture and social inequality.

The romantic reality TV shows that have recently gained unprecedented popularity are of particular interest. Due to their claim to "reality," these shows may exert more significant influence than other media formats in shaping perceptions and expectations of dating cultures and norms that are prevalent and socially desirable in real life. Through our prior visual analysis of the Korean dating reality show "*Heart Signal 4*," we identified that the program represents an "urban middle-class sanitized love." The dating show stages romance in stylish, comfortable urban settings in Seoul, deliberately insulated from the hardships and messiness of everyday life. It presents polite, well-mannered, and restrained romantic interactions, with physical contact and sexual desires minimized. This depiction promotes what we describe as the "gamification of romance"—encouraging viewers to enjoy the endless anticipation of the excitement of dating without goals like commitment to relationships or marriage.

We hypothesize that these idealized portrayals may instill feelings of deprivation or resignation about love among socioeconomically disadvantaged youth, especially those who might perceive such forms of romance as unattainable. In this presentation, we will further show the reality shows' representations of dating and examine how they intersect with the Korean young generations' social insecurities and inequalities based on survey results.

The Ethics and Politics of Representation in Researching with Social Movement Activists in the Social Media Age

Sociological research on social movements has increasingly been conducted online, not only because online activism has become prevalent in recent years across multiple geographies, but also because researchers have innovated their fieldwork methodologies with the pioneering arrival of new methods such as netnography (Kozinets, 2019). While there has been a corresponding research ethics literature in recent years on grappling with

issues that arise from social media research (e.g. Hunter et al, 2018), as well as on the ethics in researching under repressive conditions (Glasius et al, 2018; Cox et al, 2024), relatively little attention has been paid to the ethics and politics of conducting social movements research in the social media age. In particular, we would like to focus on the issue of representation, both in terms of our research participants who are social movement activists, as well as ourselves in our positionality as researcher-activists. In this paper, we will draw upon the fieldwork experiences of both authors who conduct online research with anti-racist activists in Finland and pro-democracy activists from Hong Kong, and highlight some of the ethical challenges we have faced and how we are dealing with them. The issues we will discuss include: how researchers' online and offline identities may impact on fieldwork encounters -- how social movement members may make certain assumptions about, and interact differently with, researchers who emphasize their researcher versus activist positionalities; how relational distance, rather than rapport, may be more helpful in eliciting engagement from our social movement participants; and finally, on the ethics of disclosure where we tease out the difficulties and risks of identification for both researcher-activists as well as the social movement activists, and where we advocate allowing both the researchers and the researched to be empowered in deciding how their identities are to be represented in sociological research.

LEE, MANDY* (Trinity College Dublin, Ireland)

Towards a Conceptual Model of Resilience As Dynamic, Communal and Political: Exploring the Links between Resilience and Resistance in Repressive Social Contexts.

Resilience research is a multidisciplinary, multidimensional field of scholarship entailing different theoretical models and assumptions at different levels of analysis. Nevertheless, Reich et al (2010) noted there has been two dominant themes central to the meaning of the resilience concept: (i) recovery, the ability to rebound from stress, a capacity to regain equilibrium and to return to a state of health; (ii) sustainability, the continuation of the recovery trajectory, and even growth and enhancement of function as a result of healthy reactions to stressful experience. Such a twin foci on recovery and sustainability lend themselves to addressing critiques raised by postcolonial authors regarding the need to move beyond "malaise and melancholia, with their connotations of submissiveness and inaction, as the inevitable outcome of traumatization" (Visser, 2015 in Andermahr, 2016). There has also been a growing consensus to broaden the concept of resilience as "positive adaptation" to focus on resilience as dynamic outcomes (Bonanno 2015; Kunzler et al, 2020), and to study resilience as a communal phenomenon, with researchers investigating post-traumatic growth and adaptive responses that occurred after adverse communal phenomena (Moscardino, 2007; Meili, 2020). It is no longer required for adversity to be defined as a singular event, nor for resilience to be examined only at the level of the individual. It is also important to understand that resilience "is a *distinct* process, independent of illness dimensions" (Reich, Zuztra and Hall, 2010). This opens up possibilities to explore "the creative and the political" rather than "the pathological and negative" that have been much deplored in trauma studies (Visser, 2015 in Andermahr, 2016). In this paper, I shall build on the above conceptual advancements to look at how resilience could be linked to resistance in a communal context in populations that have suffered from collective social trauma due to authoritarian repression.

I Am Pro Divorce but Wouldn't Marry a Divorced Person: Educational Differences in Willingness to Marry a Divorce Person in South Korea

Research on assortative mating based on individuals' marital history (i.e., marriages between never-married and divorced) remains sparse. The extent to which never-married individuals marry divorced people may reveal society's openness toward divorce. Although people in many societies have increasingly become open to divorce, it is not clear whether such open attitudes toward divorce in general reflect increased willingness to marry a divorced person. Investigating educational differences in the overall attitudes toward divorce and willingness to marry a divorced person can highlight the potential disparity between the two. College-educated people may display more open attitudes toward divorce as such attitudes may be considered as a desirable norm. However, give strong tendency of homogamy by various factors including education among college-educated individuals, it remains to be seen to what extent college-educated people are willing to marry a divorced person consistently with their generally open attitudes toward

divorce. Utilizing data from the 2018 National Fertility and Family Health and Welfare Survey, complemented by another online survey conducted in 2022, this study examines educational differentials in attitudes toward divorce and willingness to marry a divorced person among never-married people in South Korea. Our findings reveal that while college-educated individuals are more open to the general idea of divorce, they are less inclined to marry divorced individuals, especially those with children. This result suggests potential persistence of assortative mating based on marital history, particularly among the highly educated, indicating that underlying perceptions and stigma associated with divorce continue to influence marital partner choices in Korea. We discuss the results in connection with the broad literature of assortative mating and inequality.

Organizing As the Youth, for the Youth: How the Youth Are Taking on the Old Urban Housing Problem

This presentation explores how organizing as the youth and utilizing the shared experience of a generation can reinvigorate social movements. In particular, I analyze how youth organizing can elevate old intractable issues of urban housing unaffordability, weak tenants' rights, and outright extortion of tenants' lump-sum deposits by landlords. In South Korea, a youth social movement organization (SMO) known as the "Unshelled Snail Union" is bringing renewed awareness to these longstanding issues by refracting them through the lens of generational injustice and inequality. By centering the holistic lived experience of the youth, the SMO also situates the housing problem within the "polycrisis." For example, from the perspective of the youth, the crisis of housing unaffordability is compounded by the crisis of youth unemployment. In addition, the government's neoliberal response to these problems—expanding access to debt—has served only to layer a crisis of youth indebtedness on top of the existing crises. This relational perspective pushes the youth-led SMO to criticize stopgap measures and effectively advocate for structural fixes. Through this case study, I analyze how youth activism that began one decade ago by foregrounding college students as a particularly vulnerable housing class has not only expanded its agenda to speak to a wider and more general audience but is now leading the charge to claim housing as a human right. Much has been written on the ability of youth activists—as digital natives—to capitalize on their savviness in connecting and amplifying their voices through social networks. I build on such scholarship and others that theorize the unique power of the youth-led activism by further analyzing how the youth, by leaning into their generational experience and offering distinctive articulations of deep-seated social problems, can be an effective engine for change.

Organizing Everyday Spaces of Solidarity for Defending Livelihoods in Urban Korea

Based on ethnographic research, my presentation highlights the politics of solidarity that emerge from acts of spatialized civil disobedience. In particular, I study the tenant shopkeepers organizing against the displacement and precaritization of their urban livelihoods by occupying their shops against eviction orders. I engage with the insights of *Against Abandonment* by highlighting how "care infrastructures" for organizing can grow and morph through everyday spatialized practices at a time when heightened speculation on urban spaces is threatening the very prospect of sustaining an enduring relationship with space in urban Korea.

LEE, YOUNG HEE* (The Catholic University of Korea, South Korea)

Beyond Medical-Scientific Fix: Searching for a Social Solution for the Humidifier Disinfectant Disaster in Korea

In November 1994, South Korean firm Yugong began selling a humidifier disinfectant on the domestic market that it claimed was "capable of completely eradicating bacteria in humidifiers". However South Korean government's medical agency officially announced in 2011 that the fatal lung diseases found in some hospitals mainly among children and young mothers were caused by chemical disinfectants used in household humidifiers, marking the start of the humidifier disinfectant disaster in Korea. Over the past twelve years almost 8,000 people have claimed themselves as victims of the disaster, and a medical-scientific approach has been taken by the Korean government in its efforts to solve the problems in terms of relief of and compensation for the potential victims. One of the unintended consequence of this approach

has been the fact that the number of “official victims” recognized by the government is quite small compared to the total number of applicants who claim to be suffering from the humidifier disinfectant disaster. This is mainly due to the fact that the medical-scientific approach relies on excessively strict, rigid, and narrow medical-scientific criteria provided by medical experts for judging the degree of applicants’ bodily damage from the use of humidifier disinfectants. As a result, this medical-scientific approach is becoming increasingly criticized by patients’ organizations mainly composed of rejected applicants. Based on the analysis of the limits of this medical-scientific fix approach and after clarifying the social implications of the disaster from a sociological perspective, this paper proposes certain social approaches focused on participatory governance as a means of sustainable solution to the problem. Finally, the paper emphasizes that the act of taking social responses to the humidifier disinfectant disaster should also be considered a process of enlarging and deepening democracy in Korea.

Micro-Fragmenting Gig Workers: Solidarity Under Tensions

The gig worker group is highly heterogeneous due to low entry barriers and platforms’ preference for recruiting non-committed workers. My study explores the ‘micro-fragmentation’ among gig workers—varied by workers’ economic dependence, platform loyalty, and means of labor—and its impact on worker solidarity. Through 21 months of comparative ethnography in Seoul and Toronto, I examine how micro-fragmentation weakens solidarity conditioned by commonalities, by creating complex layers of heterogeneity among workers. Baemin, Seoul’s largest food delivery company, implemented a two-track system distinguishing full-time motorbike ‘riders’ from part-time ‘connectors’ (couriers using bikes, e-bikes, kickboards, cars, or walking) and penalized and rewarded them differently. In Toronto, before Foodora exited the Canadian market, they recruited both bicycle couriers downtown and car couriers in the suburbs, which created boundaries among workers due to differing conditions. This micro-fragmentation generated tensions among gig workers, including unionized workers. Despite ongoing tensions, gig worker unions strive to organize these diverse groups into an industrial union, promoting collective class consciousness and addressing each group’s specific demands. I highlight the complex heterogeneity among gig workers as a result of platforms’ control regimes to undermine worker solidarity and the challenges unions face in organizing highly heterogeneous workers.

E Petitions and Mobilisation Dynamics : The Case of Environmental Engagement of Citizens

Petitions are, like demonstrations and boycotts, a form of political action arising from the people with the aim of issuing a challenge to power (Tiberj, 2017). E-petitions are increasingly recognised as another way for citizens to make their voices heard and/or influence the political agenda. The main aim of this research is to investigate electronically enabled forms of participation and their mobilisation dynamics in three environmental e-petitions. We focus on the local and global dynamics associated with online/offline forms of engagement, and look at the actual behaviour of e-petitioners. We then show how e petition may be seen as an entanglement of on line-offline and global-local dynamics, and explain which factors influence the level of success that a collective movement may achieve in the policy making process.

Our results highlight the benefits of localized engagement in mobilizing citizens and fostering collective action by examining specific case studies in France and Belgium. We also delve into the mechanisms and processes through which e-petitions can trigger mobilization, ranging from social network effects to emotional resonance and issue salience. Last, we analyze how e-petitions can effectively serve as a catalyst for change in environmental policy and promote sustainable practices.

Access to a database on the website lapetition.be, provides the opportunity to overcome a certain number of limitations that are associated with traditional methods of studying political participation, since this allows us to focus on the reality of the signatories’ behaviour rather than on their declarations.

Our research presents a comprehensive case study conducted in France and Belgium, analyzing the dynamics and outcomes of e-petitions focused on environmental concerns. We examine the impact of local engagement, considering geographical, social, and cultural factors that influence the success and effectiveness of online mobilization efforts.

ALMEKINDERS, CONNY (Wageningen University, Netherlands)

Crop-Making: Plant Breeding, Botany, and Political Economies of Production

The role of plant breeding in mediating the relationships between the botanical-reproductive dynamics of plants and the demands of commodity systems has been a quiet recurring thread in the agrifood studies literature on crops (for example Soluri (2005) for bananas, Guthman (2019) for strawberries, Legun (2015) on apples). In this paper, we focus centrally on plant breeding as a socially situated activity that materially integrates the botanical reproductive functions of plants with the demands of commodity chains and global production systems and the local cultural and political contexts. Breeding programs define a crop’s botany, geography, and (re-)production politics at the same time through specific practices and socio-cultural relations. Through empirical explorations and comparisons of breeding and (re-)production politics in wheat, potatoes, maize and apples, we advance crop-making as an entry point to better understanding how breeding invests plants with power in the context of the global political economy of agrifood commodity chains.

What Are Games Good for? Exploring Opportunities and Limitations to Using Board Games in Research

There is a growing interest in the use of serious games for sustainability education or to explore trade-offs in decision-making. Board games are a subset of these serious games, and have the advantage of face-to-face interaction and more seemingly malleable components and rules. In this paper, we consider the opportunities board games present for thinking through the rules that organize actions and the informal modes of interaction encouraged by platforms. We emphasize the role of discussion, debriefing and the potentials of game re-design as an entry-point, generating insights into motivations for actions and strategies for change in the domain of sustainability. We elaborate on the use of board games drawing from a boardgame workshop event held in Indonesia with members of the local government, farmers and PhD candidates. The game was designed to explore tradeoffs and decision-making related to food safety, nutrition, yield, and environmental management, and was designed by an interdisciplinary team of scientists at Wageningen University in the Netherlands. In exploring the use of board games in this context, we also caution against the use of gameplaying itself as a source of data and insight, and consider the ethical implications of doing so.

Amenity Spaces As Sites for New Community Building and Civic Engagement?

With the proliferation of high-rise condo towers throughout Toronto, we see a new phenomenon: while the provision of amenity spaces is mandatory, due to specific planning regulations for multi-unit buildings (Perrott, et al., forthcoming), these spaces have the potential to become places for community building and civic engagement. Amenity spaces, which take the form of gyms, BBQ places, roof terraces, children’s play areas, rock climbing walls etc., are sites of contact with neighbors within the same buildings, fostering not only a sense of belonging but also allow the possibility to organize. In this context they might become enablers of what John Friedmann had called the “Good Society” (Friedmann, 1979; Lehrer, 2016). However, these spaces come with a lot of contradictions.

In this paper, we will look at these amenity spaces, and will raise questions about marketization and financialization. While amenity spaces usually are part of the condominium, these spaces are managed and maintained through an extra layer of private administration. We will use a case study approach where we will conduct interviews with residents in 30 buildings throughout Toronto. Of particular interest is here the role that amenity spaces play, from the inhabitants’ perspective, in community buildings and political action. We also will interview concierge and management of selected buildings to better

understand the logistics around these spaces. We want to address how much these private spaces are taking on the role of public spaces, and if by making them mandatory in the first place, the City of Toronto might undermine the political willingness of the inhabitants to pay for public amenities throughout the city. It is assumed that the outcome of the study will contribute to a worldwide phenomenon, where we see entire neighborhoods internalizing amenity space, which might lead to less civic engagement in the wider realm.

LEINOT, CLAIRE* (Ceped, Université Paris Cité, Institut Convergences Migrations, France)

Faire Sa Place Dans La Prise En Charge Du Cancer Au Bénin : Dynamiques De Professionnalisation Des Oncologues De Retour Au Pays.

Au Bénin, en 2019, seuls douze médecins béninois étaient formés à l'une des quatre spécialités de l'oncologie (chirurgie, radiothérapie, oncologie médicale, anatomopathologie). Alors que l'incidence des cancers augmente rapidement, le manque de personnel de santé spécialisé et l'absence de formation en oncologie dans le pays constituent des enjeux majeurs pour la prise en charge de cette maladie. Ces deux problèmes sont liés par un mécanisme de cause à effet : les médecins béninois doivent partir à l'étranger pour se former, et l'expérience à l'étranger constitue un espace-temps de recrutement lié à la socialisation professionnelle y ayant cours, ce qui empêche – en cas de non-retour – le développement d'un corps professoral au Bénin.

Cette communication s'intéresse pour autant bien à ceux qui sont rentrés et ont tenté de se faire une place dans la prise en charge du cancer au Bénin. Partant d'un cadre théorique liant sociologie des migrations internationales et sociologie des groupes professionnels, nous proposons à partir de la notion de « projet » d'interroger les tensions professionnelles au retour au pays. Ces tensions sont de trois ordres non exclusifs : l'insertion professionnelle, la pratique professionnelle et la reconnaissance professionnelle. C'est à propos de ce dernier type de tension que nous nous attacherons à développer l'argumentation. La reconnaissance professionnelle est ici envisagée dans sa perspective interactionnelle en prenant en compte les différents acteurs du secteur spécifique de la prise en charge du cancer au Bénin, ainsi que l'État.

À partir d'un corpus de trente et un entretiens approfondis réalisés entre 2022 et 2024 avec des médecins s'identifiant comme « vrais » oncologues et des médecins « spécialistes d'organes » traitant le cancer, il s'agira d'interroger les lignes de clivage et les dynamiques en cours, qui semblent mener à la constitution d'un nouveau segment professionnel.

LEINOT, CLAIRE* (Ceped, Université Paris Cité, Institut Convergences Migrations, France)

Professional (Im)Mobilities of Nurses Trained Outside the EU: Challenges and Trajectories in France.

In recent times, the discourse surrounding the migration of health professionals has undergone a significant shift, particularly in light of the ongoing global pandemic. This shift has been widely disseminated in the media, particularly in comparison to the discourse that emerged during the 2000s. For example, in the communication materials of institutions such as the WHO and the IOM, there is a notable shift in focus towards elevating the profile of this population, emphasising its significance and indispensable role in managing health crises.

However, in France, nurses from outside the EU remain an invisible professional population, both in the public debate and in the eyes of the institutions. This is due to the fact that the non-recognition of their nursing qualifications, under legislation protecting regulated professions, effectively precludes any possibility of working in the healthcare system without a French state nursing diploma. Furthermore, while there is a pathway for those seeking to obtain a French nursing qualification, namely by undertaking further studies at a French training institute, this is constrained by the limited availability of places for nurses trained outside the EU.

The research is based on a series of interviews with these nurses. The objective was to gain insight into their biographical, migratory and professional backgrounds. These encounters with people from disparate countries and socioeconomic backgrounds, all of whom are excluded by law from the French healthcare system, prompted us to examine the relationship between objective and subjective downgrading. The period of deskilling that results from the non-recognition of the diploma obtained in the country of origin is an unavoidable stage in the migratory journey of these nurses to France. The length of this period varies considerably, but it is characterised by uncertainty, psychological suffering, adjustments to the migration project and a temporary or permanent change of career.

Circular Care and Emotions in a Border Area in the Global South

In border areas between Chile and Bolivia, circular care is developed through the circular mobility of Bolivian domestic workers in Chile. By circular care, we refer to the care practices carried out by Bolivian nationals with regard to their children left behind in Bolivia. Carrying out domestic work without a labour contract and highly precarious, Bolivian women carry out a circular mobility, taking advantage of the opportunity to care for their children in person, complementing the care practices that they carry out from a distance. In the background, there are multiple inequalities among Bolivian circular domestic workers, as they carry out their work in a structural framework of domination. Thus, their emotions are gendered, racialised, and their status as foreign nationals is added to this. In this way, they experience discrimination and inferiorisation marked by inequalities of class, ethnicity, nationality and migratory status. How the emotions related to the care of these domestic workers are constructed in a context of circular mobility is what we propose to elucidate in this paper.

GARCÉS, CAROLINA (Universidad Católica de San Pablo, Bolivia)

LIBERONA, NANETTE (Universidad de Tarapacá, Chile)

PIÑONES, CARLOS (Universidad de Tarapacá, Chile)

Cross-Border Care in the Global South

In borders areas between Chile and Bolivia there is a movement of Bolivian domestic workers coming and going that has been categorized by social science as circular migration or mobility. Their job is to perform care work in Chile, a country that lacks sufficient public policies aimed at caring for both children and the elderly. Circular mobility is possible thanks to the geographical proximity and bilateral agreements between both countries. Although there are legal tools to obtain a visa that would allow them to settle in the country and work legally, many Bolivian women opt for permanent circular mobility, which implies highly precarious work without adequate protection. In this context, cross-border care work takes on particular characteristics, highly precarious and racialized. Despite the precarious conditions, Bolivian domestic workers remain in these jobs, caring for children who are not their own, transferring affection and attention, in a structural framework of discrimination, domination and inferiorization, anchored in colonial practices of servility and racialization.

LELIS, ROMULO* (Brazilian Center of Analysis and Planning, Brazil)

Rethinking Colonialism in Durkheim's Sociology

It has been widely assumed that Durkheimian sociology contributed to creating a sharp distinction between traditional and modern societies based on a Eurocentric bias that presents the latter as an exception to the former. Yet, a close examination of Durkheim's work may challenge this assumption. Through an in-depth analysis of his posthumously published lectures alongside *Les Formes Élémentaires de la Vie Religieuse* (1912), this paper demonstrates how Durkheim sought to make use of the model developed for studying Aboriginal Australians in his lectures in order to reevaluate European history. The topics covered include the genesis of property in Ancient Rome, the Crusades in the Middle Ages, the French Revolution and the role of mythical truths in the Modern Era. In doing so, the paper reveals how Durkheim reversed the equation by establishing Aboriginal Australians as the model from which Europeans are understood as an outcome rather than a departure from it. It concludes by suggesting that Durkheim's encounter with colonial ethnography led to a critical reimagination of Europe through his reverse methodology.

From Big Farms to Big Pharma? Problematising Science-Related Populism from a Study of Vaccination Policy Criticism and Environmentalism

Scepticism about health/vaccination policies during Covid-19 has been considered a key example of 'science-related populism' (Mede and Schäfer, 2020) in the academic literature, which is mainly based on far-right case studies. However, criticism has also spread to various left-wing and especially environmental milieus, which is an under-studied phenomenon. By bringing together different strands of scholarly literature (mainly on vaccine hesitancy, Science and Technology Studies, and Political Sociology/ Science on the relationship between populism and democracy) and relying on a qualitative research design that aims both to take account of the political heterogeneity within this heterogeneous critical field and to deepen its links with environmentalism, we aim to highlight the limits and normative implications of interpreting this criticism solely as populism, and to contribute to the elaboration of an alternative interpretive model. Qualitative research and the analysis of frame-bridging operations (Snow et al. 2018) between environmental and health claims - *from Big Farms to Big Pharma*, echoing the paper's title - have led us to propose a different interpretive key, which proves useful in understanding why some environmentalist networks provided fertile ground for opposition to pandemic policies. The analysis highlighted the consolidation of worldviews in clear opposition to hegemonic values, where the critique of science finds a more appropriate explanation in a denunciation of the intrusiveness of capitalism in the production of science and the aporias of the growing scientization of politics, as well as in a rejection of 'reductivism' and a claim to self-determination that extend from the issues of food and the ecology to include the issue of health. The results of our research have significant theoretical and policy implications and are useful for rethinking operationalisation processes in quantitative research.

Discursive Negotiations of Difficult Heritage: The Case of a "Contentious Monument"

This paper explores the sociological dimensions of discourse surrounding difficult heritage, focusing on the controversial monument in Olsztyn, Poland. Monuments, as physical embodiments of historical memory, often become focal points of contestation in public discourse, reflecting broader struggles over collective identity, historical responsibility, and national narratives. The monument in Olsztyn, commemorating Soviet soldiers, has sparked heated debates in both local and national contexts. This study aims to unpack the competing discourses that shape public perceptions of the monument, with attention to how different social actors—politicians, media, civil society, and local communities—mobilize historical narratives to legitimize or challenge its presence. By conducting a critical discourse analysis of media coverage, political statements, and public forums between 2020 and 2023, this research examines the evolving debates on what the monument represents. The findings of this study reveal that the discourse around the monument is not merely about the past, but about contemporary identity politics, struggles over historical interpretation, and the role of public space in negotiating difficult heritage. By analyzing the sociopolitical context of these debates, this paper contributes to our understanding of how monuments serve as discursive battlegrounds in post-socialist societies, where the past remains a contested terrain of memory and identity formation.

Polish Academy of Sciences (Warsaw), Poland)

Repressing Memory and Rewriting Histories: Post-War Camps for Germans in Poland in Polish and German Politics of Memory

This paper examines the politics of memory in Poland and Germany concerning the camps for Germans in post-war Poland (1945-1949), recognising that the politics of memory is a narrower aspect of a broader historical politics. In both countries, the memory of these camps has been largely marginalised or silenced, albeit for different political reasons. The memory of the camps plays an important role in both generating political capital and shaping the identities of members of the contemporary German minority and borderland groups e.g. Upper Silesians, many of whom are

descendants of internees. Through qualitative research conducted between 2022 and 2023 in Poland and Germany alike, this study investigates how these camps have been remembered, forgotten and instrumentalised in different contexts. Drawing on interviews with so-called guardians of memory (i.e. politicians and members of the aforementioned groups), the research reveals the complex intersections between the politics of memory, political agendas and minority identities. The findings reveal not only the contestation of memory narratives, but also the significant emotional and psychological impact of repression on communities.

LEMKE, THOMAS* (Goethe University Frankfurt am Main,
Germany)

Anticipating and Deferring. Elements of a Politics of Suspension

The talk brings together two disparate and hitherto largely unconnected strands of research: the critical analysis of cryopreservation technologies – the storage of organic material at very low temperatures – and the debate on modes of anticipation. Focusing on the cryobanking of organic material from animal and plant species for biodiversity conservation, I argue that cryopreservation practices are part of contemporary technologies of anticipation. They are linked to a politics of suspension by mobilising a liminal biological state in which vital materials are neither fully alive nor ultimately dead.

The politics of suspension promises to keep future options open in order to address the existential threats of the present. Following this imagination, de-extinction scientists and biologists dream of restoring ancient ecosystems and resurrecting extinct species as a way of responding to the climate crisis. However, this politics of suspension may also contribute to tendencies to preserve the status quo by putting on hold the political and social transformations needed to respond effectively to the climate crisis and biodiversity loss.

WG11-945.3

LEMPEREUR-CASTELLI, ORIAN* (PSL - EHESS, France)

Commemorating Police Racism Violence's Victims: A Comparative Case-Study of Memorial Practices in French Anti-Police Violence Movements

This oral communication examines the entanglement of memorial practices within collective protest actions against police violence in France. It focuses on two case studies of victim family collectives in Île-de-France: Zyed Benna and Bouna Traoré (died in 2005) and Lamine Dieng (died in 2007).

The comparative analysis explores how mnemonic practices circulate in protest contexts and become part of collective action repertoires. From a relational perspective, the study investigates memorial practices linked to police violence within a competitive memorial space. The circulation of these practices across activist, political, and media fields—particularly at different levels of the state (municipal, regional, national)—is essential, as collective memory is co-constructed (Bouzama, 2019).

Attention is also given to the role of activists as *memory activists* or *entrepreneurs* (Gutman and Wüstenberg 2023). This analysis, focused on the associative and collective levels, explores interactions between individuals, social actors, and public institutions. A key question is whether past mobilizations are shared by all activists or specific to certain groups. The aim is to understand who mobilizes these references within the movement against police violence, based on their position in activist spaces and factors like gender and class. Existing research highlights gendered power dynamics within activism, even though women often lead the fight against police violence in France. The paper also considers race and class to examine the trajectories of activists, particularly descendants of immigrants and those from working-class neighborhoods.

In conclusion, this paper addresses how the memory of victims of state racism and violence is commemorated and how counter hegemonic narratives are constructed in the French context.

The Meaning of a Junk Drawer – Kitchen Architecture, Organization, and Efficiency

This chapter explores the adoption of “scientific management” principles by home designers and domestic advice manuals, which yielded the modern galley kitchen and its junk drawer. We show how the affordances of our homes and a disciplined labor force of housekeepers achieved efficiency, minimizing the amount of time and number of steps it took to do “house work.” Depicted as circuits within home spaces, these labor pathways are expedited by access to a fully stocked, conveniently located junk drawer. We hope the paradox of this is immediately clear and eventually resolved: a drawer full of “et cetera” plays a critical role in maintaining a highly organized, maximally efficient home. We argue that viewing junk drawers through the lens of household labor and interior architecture draws our analytical attention to all the work and activity that is necessary to bring junk drawers into existence and to maintain them. And because people complete very similar tasks at home, and junk drawers facilitate shorter circuits, the contents of our drawers are similar. It is our lifestyles and the structures of our homes that best explain the contents of our junk drawers, not our individual idiosyncrasies.

Is This the Dawn of a New Era? Fragilities and Opportunities on the Transformative Path to Shared Public-Collective Governance in the Brussels Capital Region.

The experimentation with shared forms of public-collective governance is probably one of the most well-known and widely acknowledged contributions of urban commons to tackling many societal challenges —urban commons being understood here as a specific form of community spaces, thus excluding community spaces initiated and managed by public or private actors. This opportunity is now recognised by the local administration in the Brussels Capital Region as well, with a focus not so much on preventing privatisation but on reinventing how resources are managed, protected, and re-generated. Following a publicly funded study on the state of urban commons in the BCR (2022-2023), some local administrative entities are making efforts on various fronts to promote shared governance for community spaces and beyond, in what I describe as Brussels’ molecular landscape of commons.

Drawing on my extensive experience with the Brussels commoning scene, this paper aims to briefly depict the efforts, potentials, and milestones achieved, as well as the uncertainties, fragilities, and hesitations—on the part of both commoners and the administration—that may continue to delay this new chapter for urban governance in the Capital of Europe. Written in dialogue with local actors during what appears to be a liminal phase, just before the dawn of a new era of shared public-collective governance in Brussels, the paper seeks to contribute to the reflection on the transformative dynamics of urban governance under the sign of the commons, navigating between resilience and resistance.

LENNHAMMER, EMMA* (Lund University, Sweden)

Temporal Inequalities and International Human Rights Law

The presentation aims to shed light on the need to consider colonial temporalities when researching international human rights law, especially in relation to indigenous peoples. Temporal concepts are integral to the language, function, and monitoring of human rights treaties. In the context of economic, social, and cultural rights, the role of time is particularly significant. The notion of progressive rights-realisation, as outlined in the International Covenant on Economic, Social and Cultural Rights, creates a temporal space where subjects of rights need to remain until it is their turn to have their rights fully realised. The timing of this realisation is influenced by a variety of constantly changing factors: for example, how different actors – states, civil society organisations, and the United Nations Committee on Economic, Social and Cultural Rights – use time in imagining human rights.

Despite the Sámi people’s long-lasting presence in the area which is currently recognised as Norway, Sweden, Finland, and Russia, their recognised presence in the realm of economic, social, and cultural human rights is quite recent. In the context of Sweden, it was not until the mid-1990s that the Sámi were explicitly mentioned during the review process of Sweden’s implementation of the ICESCR. Moving from being made invisible in the earlier years, to being included in brief statements, the Sámi people’s rights-concerns are becoming increasingly centred. Similarly, various actors engaging with

international human rights law are increasingly invoking time. However, the uses of and control over time in the context of the Sámi people are impacted by the colonial legacies in the region. Thus, the focus of this presentation is to reflect on the way (legal) times operate in relation to the use of power within the context of Nordic states and the Sámi people’s human rights.

The Girl Next Door? Childhood Cross-Group Exposure and Inter-Ethnic Marriage

How does exposure to individuals from different ethnic backgrounds during childhood affect interethnic relations in adulthood?

Set in late 19th century America, a period of peak immigration of German and Irish families, we analyze the impact of childhood cross-ethnic exposure on later-life decisions to marry an outgroup partner. Using full-count U.S. census data from 1880 and 1900, the initial sample includes over 370,000 American, German, and Irish boys up to the age of 18 across 40 cities.

Our analytical strategy includes identification of next-door neighbors based on census entry order and georeferenced data, construction of organic neighborhoods using an innovative machine learning algorithm (Ostermann, 2024), and the linkage of boys in the 1880 U.S. census with their respective entry in the 1900 U.S. census. We create samples of matched boys who are identical in terms of socioeconomic and demographic factors and differ only in whether they grow up next to an ethnic outgroup neighbor or solely next to ethnic ingroup neighbors.

The findings reveal significant increases in the predicted probability of interethnic marriage for individuals exposed to neighbors of a different ethnicity during childhood. The effect varies across the three ethnic groups, with American boys showing the most consistent positive effects. Further analysis demonstrates that the impact of interethnic exposure on marriage decisions is moderated by neighborhood ethnic composition. For American boys, the effect decreases as the share of Americans in the neighborhood increases, while patterns for German and Irish boys are more complex. These results contribute to our understanding of how early-life intergroup contact shapes long-term social cohesion, offering insights into the role of spatial proximity in fostering interethnic relationships.

LANDI, ALESSANDRA (University of Bologna, Italy)

Applying a Situated Intersectional Methodology to Gendered Mobility

In recent years, the intersectional approach has been largely used to study social, economic, and political inequalities. In the framework of feminist studies, it might be considered the most important theoretical contribution to analysing social stratification and the distribution of power in social life. Initially elaborated to highlight the “triple oppression” of gender, race and class, the concept of intersectionality has progressively become a lens to analyse how multiple social oppressions and disadvantages shape different subjects’ daily experiences. Within this framework, this contribution aims to apply the concept of intersectionality to urban mobility and gender inequalities. It is largely acknowledged that men and women do not move in the same way and persistent socio-spatial constraints, cultural norms, and unequal power distribution prevent women from being equally socially and spatially mobile. However, studies of female mobility often rely on a homogeneous conceptualization of gender identities, neglecting the intersection of their multiple positions in society. The present research involves about 40 women living in different areas of Bologna (Italy), through semi-structured interviews. Adopting a “situated” approach to intersectionality (Yuval-Davis, 2015), the study explores women’s spatial mobility considering their social, territorial and temporal locations along different axes of disadvantages, such as age, ethnic origins, family status and ability. Based on feminist epistemological perspective, our work combines “intracategorical” and “intercategorical” methodologies (McCall, 2005) to reveal social inequalities reproduced by existing analytical categories on urban mobility. Delving into personal narratives, the intracategorical analysis situates subjects within the network of

relationships defining their social locations, while the intercategory analysis allows the study to shed light on the relationships of inequality along multiple dimensions. The results unveil the different nodes of oppression shaping women's mobility and the interplay of space and gender in defining women's subjective identities.

Projects, Routes, Returns: Activists' Networks That Support Voluntary Return Projects for Migrant Women in Italy

From 2011 to 2023, the European Commission introduced new tools to enhance the European Union's approach to migration, focusing particularly on the practice of assisted voluntary return. However, there is a gap in the literature concerning the social networks that support migration and voluntary return projects, especially in the Mediterranean region (Anis and Chka, 2020).

This paper aims to mix the results of 30 interviews with migrant women in Italy from Tunisia and Morocco with the outcomes of focus groups with pro-migrant associations from field research conducted for the PRIN PNRR *WePropose* project, with a particular focus on investigating the role of "pro-social associationism" in support of migrant women (Boccacin, 2012).

How have associations and movements acted in supporting women in their desire for social/professional inclusion or the possible return to their home country? Is there an organised system of support networks in place for migrant women or are they helped on an informal basis by individuals or the association group? Recent studies have described some forms of pro-social activism dedicated to practical and humanitarian support for people who are discriminated against or in a condition of financial hardship, with the ultimate aim of guaranteeing a democratic and equalitarian society (Evers and Johan, 2019; Bartolotta, 2016).

The aim of the research and data collection, based on a mixed qualitative approach and the theoretical framework of gendered migration, is to investigate the intentions of the various associations that defend migrant women; specifically, the question is whether they are purely pro-social or if they have hidden motives that seek to achieve results that are not directly related to the defence of the rights of people in difficulties, or of human rights in general.

LEONORA, ANNA MARIA* (University of Catania, Italy)

Who Helps Women? Job, Family and Social Justice in the Migration Stories of Moroccan and Tunisian Women in MENA Countries

The socio-political shifts of the so-called "Arab Spring" (Castells, 2012), have catalyzed greater recognition within social research (Bouzekraoui & Ferhane, 2017) towards the support networks for women engaged in gender equality in the MENA region (Sadiqi, 2014). These networks, primarily composed of NGOs and civil society associations, are committed to securing the rights and safety of migrants while simultaneously maintaining crucial ties between host and origin countries. This work presents the findings from field research conducted for the Next-Generation EU funded project *WePropose*, focusing on interviews with 30 migrant women in Italy from Tunisia and Morocco. The data collection - grounded in a qualitative approach within the broader empirical framework of gender migration - illuminated the complexity and heterogeneity of migratory experiences, highlighting the significant challenges posed by linguistic and cultural differences or traumatic memories. Moreover, data underscores the paramount importance of individual economic autonomy and personal security in long-term migratory projects, which include aspirations for social and professional integration. Additionally, the indispensable role of INGOs and civil associations becomes evident in light of the marked differentiation in individual life in terms of agency: while positive experiences of social and professional integration in host countries do not always translate into a desire for changes in the country of origin. These results provoke critical reflections on the resilience and adaptive strategies employed by migrant women within complex and often hostile environments, both in their homelands and host countries. Through the collaboration of NGOs and civil society organizations, these women develop a heightened sense of awareness, though not always with a collective dimension, thereby sometimes interrupting the virtuous cycle of reproducibility of civic engagement. This limitation raises important questions about how to foster a broader sustained commitment to social change, both for the individual and for the collective.

LESZCZAK, ELODIE* (Ecole Normale Supérieure de Lyon, France)

A Quiet Claim to Expertise: School Canteen Workers, a Feminised Care Activity

In French nursery and primary schools, staff accompany the children to the school canteen. They chat with them, calm conflicts, encourage them to eat, cut their meat, teach them how to use their cutlery. From washing their hands to clearing away their trays, these workers are essential to the smooth running of the children's lunchtime. However, they are rarely the subject of attention, recognition or academic study.

The aim of this communication is to explore the issue of professionalism in this low-skilled group, which consists mainly of women – and in large cities, of ethnic minority women. I will draw on an ongoing qualitative study that I have been conducting since October 2023 in two canteens, one in a working-class district of Paris and the other in a rural school of average socio-economic status in the Auvergne-Rhône-Alpes region.

Far from being a job that requires no skills or that simply reactivates skills from the domestic sphere, repeated observation of their daily activity reveals all the specific competences needed to carry it out. Feeding one's own child is not the same as ensuring the safety, wellbeing and satiety of dozens or even hundreds of children, with all the associated noise and constraints such as time pressure. The workers are aware that a form of expertise gained through practical experience on the job enables them to carry out demanding tasks effectively, but they have internalised a sense of subservience both to the educational professionals alongside whom they work in the school and to the professionals who prepare the meals, who are more qualified and more likely to be male. Although the group has professionalised since its emergence in the last century, this process therefore remains incomplete due to obstacles stemming from their work situation and the (gendered) representations associated with their job.

WG08-915.4

LESZCZAK, ELODIE* (Laboratoire Triangle, France)

More Than a Lunch Tray: The Emotional Dimensions of Feeding Pupils and Eating at School

In France, the school canteen is still tainted by stereotypes: noisy, bland, serving up industrially produced food. On closer inspection, however, this institution does more than fulfil the mechanical objective of providing children with the food they need to concentrate on their next lessons. Relationships are formed and interactions take place between the children, among the canteen staff and between these two groups. The children laugh, give each other food as a token of affection, sometimes some cry. The staff express their pride or disappointment at the daily behaviour of the children, some of whom they have known for years; they are happy or upset at the reception of the food they have prepared. The school canteen is a break, a hybrid space, not quite classroom time, but not quite separate from school either. It offers more freedom, while at the same time being part of the socialisation process that teaches children which emotions are acceptable and which should not be shown or felt in a group setting.

Since 2023, I have been conducting a qualitative study in two school canteens, one in a working-class district of Paris and the other in a rural school. In both contexts, the preparation and serving of food is emotionally charged for the staff, and the moment of eating can evoke feelings of affection and comfort, but also frustration or repulsion in the children. Based on repeated observations of the preparation and consumption of the school meals, I aim to show how even an eating context that is perceived as impersonal (as opposed to family meals in particular) is a setting for emotions and social interactions – some of which re-enact more general power dynamics (of boys over girls, of adults over children, etc.), while others are specific to the context of communal eating.

RC24-388.2

LETOURNEAU, ANGELINE* (University of Alberta, Canada)

Indigenous Land, Labour, and an Anticolonial Just Transition

Calls for a just transition have emerged as one of several responses to the Anthropocene. Canada's just transition policy, the Sustainable Jobs Plan, explicitly calls for the inclusion of Indigenous peoples, but the plan assumes a particular framing of the ecological crisis and appropriate solutions. This framing inhibits the ability of Indigenous to fully participate in defining a sustainable future for their communities and humanity more broadly.

The Tlicho, an Indigenous people in Northern Canada, face a range of compounding challenges, including the impacts of climate change, the

environmental and social legacy of mining, and the ongoing effects of colonialism. They are victims of the colonial and industrial processes that have shaped the ecological conditions of the Anthropocene. Despite this, like many other Indigenous groups, they have had limited opportunities to meaningfully participate in defining the Anthropocene or in determining appropriate responses to it.

This paper explores how the Tlcho assert their autonomy during a “just transition,” focusing on community identity and meaning-making as sources of strength. It outlines the lessons learned from the Tlcho context, which can inform anticolonial responses to the Anthropocene. The paper emerges from a commitment to move beyond stereotypes about Indigenous peoples and their relationship to the land, seeking to foster avenues for contextually situated Indigenous definitions of environmental justice.

LETOURNEAU, ANGELINE* (Colorado School of Mines, USA)

Reproductive Resistance: Gendered Power Dynamics and Climate Change in the (M)Anthropocene

Climate change is increasingly factored into reproductive decision making. However, little work has employed a critical examination of gendered structures of power to understand reproductive decision making as a site of resistance to the (m)Anthropocene.

There is an established body of literature devoted to reproductive decision making and the increase in voluntary childlessness in recent decades. Among this has been research on the relationship between environmental concern and fertility intentions, demonstrating a correlation between perceived ecological decline and anti-reproductive attitudes. Across many cultural and ethnic groups, women are more likely to express concern for environmental decline than their male counterparts and bear a larger proportion of household sustainability and reproductive labour. Women are also much more vulnerable to the climate crisis but remain excluded from the male-dominated systems of power that have created this planetary crisis to being with. These systems depend upon the ongoing reproductive labor of women to sustain the robust workforce and tax base necessary for their ongoing hegemony. While this reproductive labour has long been undervalued in patriarchal systems, as more women are making the choice not to have children at all, the importance of this labour is increasingly felt. The message from many women, made by collective movements such as Birthstrike, is clear: we will not have children who are doomed to suffer due to climate inaction.

Reproduction is an extremely personal choice, yet the threats reduced birth rates pose to existing structures of power make climate-induced reproductive anxiety a contentious site of resistance to the (M)Anthropocene. This paper seeks to explore these gendered relations of power, examining the tensions between personal agency, climate emotions, and the external forces that seek to limit or control reproductive freedoms.

Knowledge Transfer through Artistic Means. Scientific and Artistic Approaches in the Context of International Cultural Policies

The presentation explores knowledge transfer through artistic means, emphasizing its role in fostering democratic, participatory formats that create dialogue. Coessens highlights the complexity of knowledge embedded in art, communicated through sensory and embodied experiences (Coessens 2016). The Arab region is known for innovative forms of knowledge production and transfer emerging out of the need to counter postcolonial legacies. Scholar and artist Jas critiques the Global North's view of knowledge “as a goal to be achieved” (Jas 2024). In contrast, she argues for formats of knowledge transfer that focus on communities and social cohesion, and embrace procedural uncertainty and open-endedness (Jas 2024).

The presentation addresses three key research questions: (1) How can knowledge transfer through artistic means be conceptualized? (2) What socio-political dimensions of artistic work to knowledge transfer can be identified in the WANA region? (3) How can knowledge production and transfer be conducted justly in times of transformation and crisis?

The analysis is based on the case study of the “*لصاوت [Tawasol] Cultural Production and Policy Network*” (2023-2025), an academic training program, that examines artistic expression as means of knowledge transfer and their socio-political dimensions. The network connects partners in Germany, Tunisia, Lebanon, and Egypt and is funded by the German Academic Exchange Service (DAAD). The analysis draws on three selected examples from Egypt and Tunisia: autonomous, and collectively driven socio-political artistic and creative practices, the role of emerging female artists in socio-political transitions, as well as independent music production and distribution cycles.

The presentation aims to analyse knowledge production under the lens of how social and cultural practices inform academic discourse, and how these knowledges are made accessible. Overall, the presentation discusses international cultural and academic collaboration, using concepts such as ‘Fair Cooperation’ (Hampel 2015), drawn from cultural policy studies, thus contributing to interdisciplinary debates in sociology.

LEVI, TSAMIYAH* (UNICAMP, Brazil)

FONSECA DE ALMEIDA, ANA MARIA (University of Campinas, Brazil)

Institutionalizing Diversity: How Universities Are Promoting Equity, Diversity and Inclusion

How are universities addressing the growing concerns about equal opportunities in higher education? This study examines the actions taken by 156 universities in different regions to improve opportunities for historically underrepresented groups. The research highlights a significant investment in institutionalizing initiatives to promote equity, diversity, and inclusion across multiple aspects of university life.

Focusing on 23 key institutions, the study identifies the dominant diversity models adopted by universities from different regions. It examines how these diversity initiatives are integrated into the university's organizational framework, the specific issues and demographic groups targeted, and the tools and actions used to achieve their goals.

Despite regional differences, our study reveals a widespread global diffusion of diversity initiatives in higher education. In particular, the leading universities in each country share a common approach to structuring these efforts. This approach typically involves the establishment of an autonomous office dedicated to diversity that is positioned high within the university's governance structure. This office is often led by a faculty or staff member with significant expertise and supported by a committee or board representing various university stakeholders.

Our findings indicate that many of these diversity initiatives reflect a recent shift from earlier efforts focused primarily on gender inequality to a broader emphasis on diversity and inclusion. In addition, almost all of the diversity statements emphasize excellence as the primary goal of the university's initiatives, suggesting that excellence can be a driver and justification for institutional change toward diversity.

LEWINS, KEZIA* (University of the Witwatersrand, South Africa)

Exceptionalism As a Means to Inclusion: Academic Labour in Select South African Universities [before-2014]

Post-apartheid, legislative and workplace-based efforts to transform the composition of the academic labour market to meet social justice imperatives and better reflect South African demographics have proved lackluster.

In 2014, the reignited student movement called the higher education sector and institutions out for their collective failure to uproot coloniality. This paper looks at the period proceeding this defining movement to critically examine the perspectives and experiences of Black and White academics as they consider and negotiate the salience of ‘race’ as mediator of inclusion or exclusion as employees, within their workplace contexts.

The outcome of indepth interviews reveals distinctively racialised patterns although academics self-identify along a spectrum of inclusion/exclusion. In particular, the continuity of structural violence, as well as participants’ double consciousness indicates that Black academics have been incorporated into the case study institutions through being exceptional, in a context where they are still the exception.

The paper ends with a consideration of the significance and Implications of these findings in light of more recent institutional workplace changes.

LEWINS, KEZIA* (University of the Witwatersrand, South Africa)

Questions of Assimilation Vs Autonomy: Reflections on Ambiguity in 20 Years of Teaching Medical Students Sociology in South Africa.

This paper provides an account of the curricula, content, and pedagogical changes that have occurred in the teaching of Sociology to medical students, at the case study institution in South Africa, over the last 20 years.

The context, rationale, and author's evaluations of these changes are also presented. This is accompanied by a discussion of the strengths and challenges faced at each critical juncture.

This paper is primarily reflective in nature, drawing on the author's 20 year career of teaching first year medical students. The author's reflections are supplemented by interview data with five colleagues also working in the field.

At the core of the changes within the case study institution, is the mainstreaming of social science content within the Medical School. This raises key questions such as: should one expect to do one's self out of a job if that job has been done well?

As Sociology staff, we find ourselves experiencing the classic dilemma of whether we are becoming complicit in our own exclusion as mainstreaming has effectively moved the Department's offerings from a Sociology of Medicine to a Sociology in Medicine.

Such changes have also led us to reassess the qualitative impact of our continued participation in such courses. As medical pedagogies do not lend themselves to our subject matter and at times we question whether "a little knowledge does more harm than good".

All the while, our own department tries to hold all sub-disciplines in equal standing, and thus, does not aim to reallocate our speciality internally. As such, this causes doubt, loss of a role, and institutional turnover of academics committed to the sub-discipline.

The author also questions the significance and implications of these changes within an institutional and national context beset by austerity and that drives a STEM [Science, Technology, Engineering and Medicine] agenda.

WILLIS, KAREN (Victoria University, Australia)

SMITH, LORRAINE (University of Sydney, Australia)

Lonely Care: How Is Loneliness Implicated in Relationships of Care in Chronic Illness

Living with chronic conditions can be extremely lonely but how such loneliness is implicated in relationships of being cared for or providing care is less well known. While some researchers have explored loneliness for people who experience chronic ill-health, with some attention to those around them, particularly their informal carers, less explored is how loneliness emerges and/or flows within carer and/or cared-for relationships. Drawing on Mol's work on the logic of care, and the sociology of affective relations, we examine how loneliness is relational for people with chronic conditions and those who support them. Using data from qualitative interviews with people with chronic conditions experiencing loneliness and those who care for them, our analysis reveals the various interdependencies and moral expectations within these care relationships that are implicated in experiences of loneliness. Findings reveal how fear of being a burden on others, expectations to 'fix' loneliness (in themselves or in the other person), and discomfort talking about loneliness circulate within these care relationships, illuminating similarities and differences across different kinds of care relationships (e.g. child/parent, intimate partner, siblings). We argue for the importance of understanding and responding to loneliness as relational and co-created, and discuss the wider implications for the care economy, and care societies.

LEWIS BROWN, ROBYN* (University of Kentucky, USA)

Status Value Theory and Diseases of Despair

Research has linked perceived deprivation with mental health and substance use trends that have disproportionately affected middle-aged non-Hispanic whites without a college degree in the U.S. However, the role of subjective aspects of deprivation in explaining variation by race and educational attainment remains understudied compared to traditional indicators of economic hardship.

This study integrates status value theory to provide a deeper understanding of the social and cultural roots of diseases of despair. The theory's emphasis on the consensual nature of status beliefs illuminates why feelings of despair can become widespread within certain communities. Its consideration of the self-reinforcing nature of beliefs also helps contextualize why, for people in lower-valued status positions experiencing diminished opportunities, negative societal valuations may seem confirmed and strengthened and potentially exacerbate despair-related health issues.

This study extends research by examining the effects of perceived downward mobility alongside economic hardship indicators. Using data from the Life Experiences and Well-Being in Adults Study (N=1,343), we analyzed the impact of these factors on three key diseases of despair among middle-aged adults in the U.S.

Findings revealed that perceived downward mobility disproportionately affects middle-aged White Americans without a college degree across all outcomes. Additionally, greater economic stressor exposure was associated with each outcome and exacerbated symptoms among White Americans without a college degree compared to their Black American counterparts, but only in the context of higher perceived downward mobility.

This study advances previous work by demonstrating that subjective aspects of relative deprivation, understood through the lens of status value theory, play a crucial role in understanding the relationship between race, education, and despair-related health outcomes. Status value theory helps explain the findings by highlighting how the internalization of lower status valuations can lead to heightened feelings of worthlessness and despair.

LEYTON, DANIEL* (University of Exeter, United Kingdom)

Biopolitical Neuroscience and New Education Professional Subjectivities in Chile

We are in the presence of the return of biology in social sciences and society (Brubaker, 2016; Meloni, 2019). Within it, neuroscience locates the brain as the biological underpinning of culture, citizenship, and society (Damasio et al., 2007). In education, this comprises a new biopolitical rationality seducing educational actors' subjectivities and guiding new problematisations of their professional selves (Haye et al., 2018). Neuroscience has expanded into the realm of education through the mobilisation of numerous actors, funds, research, journals, markets, mass media, books, and their unrelenting efforts to draw out its implications for teaching, learning, and policy (Vidal & Ortega, 2017).

Drawing on extensive mapping of actors, programmes and discourses of neurosciences in education and on 18 interviews with educators actively participating in the emerging field of neuro-education in Chile, we developed a post-Foucauldian approach to explore the influence and subjectifying force of neuroscience's translation into the professional field of education. We extend Foucauldian scholarship by developing a distinction between expertise and professionalisation and the concept of pedagogies of brain awareness (Rose, 2013).

We demonstrate empirically how neuroscience discourses have expanded and attracted education professionals via a privatisation process of 'organisational recalibration' (Ball, 2009) oriented to selling policy solutions and improvements for schools and educational professionals in order to make them amenable to performativity demands. We also identify the historical displacement of the centrality of psychological discourses of the self in the formation and lifelong learning projects and of educators by a new centrality of the medical professions and gazes into the education professional field. Through our interviews, we point out neuro-educational discourses' capacity to become a puissant regime of professional subjectification by reconfiguring the language, thinking and feeling of education, pedagogy, and responsibility and expanding educators' sense of agentic capacity amidst the production of epistemic unequal relationships.

Digital Authenticity: Negotiating Subcultural Identity in Chinese Skateboarding Videos

This study examines the construction and performance of cultural identities among Chinese skateboarders through the lens of digital content production, focusing specifically on skateboarding videos. Employing a mixed-methods approach combining in-depth interviews and content analysis across various digital platforms, we investigate the dialectical relationship between video format, content, and the self-conceptualization of cultural identity within this urban subculture. Our findings illuminate how the form and content of skateboarding videos significantly shape the processes of identity formation and subcultural affiliation. Core members of the skateboarding community

often articulate their central identity through participation in collective “team videos,” a format that reinforces group solidarity and subcultural authenticity, serving as a medium for establishing cultural capital within the field of skateboarding culture. Conversely, individualized trick demonstrations on platforms like Douyin (TikTok) are perceived within the community as a less authentic form of identity performance, framed by skateboarders as a strategic adaptation to the “rules of the game” in the attention economy of digital media. This tension between subcultural authenticity and digital visibility underscores the complex negotiation of identity that Chinese skateboarders navigate in the contemporary mediascape. Our research contributes to the sociological understanding of how digital platforms and their inherent structures shape the performance and perception of subcultural identities, offering insights into the broader implications of digital media on youth subcultures in China and illustrating how traditional notions of authenticity are challenged and redefined in the digital age.

LI, JING* (University of Osaka, Japan)

Gender, Empowerment, and Community: The Role of Self-Help Networks Among Female Evacuees Post-Fukushima

The Fukushima Daiichi Nuclear Power Plant Accident led to a massive evacuation. As of May 2011, approximately 170,000 people had been evacuated. However, even 13 years after the accident, as of March 2024, approximately 29,000 people are still living far from their homes. Evacuations can be broadly categorized as mandatory or voluntary, with voluntary evacuees often facing limited public support for housing and livelihood assistance.

This research focuses on female voluntary evacuees who participated in self-help communities in their ‘New Hometowns’, and the activities of the self-help communities. The study utilized a qualitative research approach, conducting semi-structured interviews to collect life stories from female voluntary evacuees and involved participant observation of the self-help communities’ activities.

This research analyzes the post-disaster lives and transformations of affected women from the perspectives of feminist geography, women’s studies, and disaster sociology.

The results of the study indicate that some of the female voluntary evacuees who participated in self-help communities experienced a transformation in their identity as disaster victims, gained empowerment through their involvement, and navigated the challenges brought by the life of evacuation. However, the realization of this empowerment was limited and conditional. This empowerment was closely associated with the evacuees’ own educational level and marital status, the social capital provided by these communities, and the broader changes in gender equality taking place in Japanese society.

LI, RUN* (ENS de Lyon, France)

Identity, Precarity and Youths in China and France

In the era of capitalist globalization, the intensified circulation and global allocation of capital have made the precarity of wages, employment, and individual livelihoods more pronounced. Simultaneously, there is a growing demand among individuals for authentic self-expression. In China, a discourse of “lying-flat” (Tangping, 躺平) has gained traction among the youth, gradually becoming a part of their lived experiences. In France, a similar discourse of despair and meaninglessness is emerging among young people, who either resist authority and reality or engage in apathy. Within both social systems, the individualization and self-narratives among youth are undergoing changes. However, the tight interconnection of the global economy links local contexts, leading both China and France to witness a reconstruction of social relationships. This study combines digital ethnography and local ethnography, conducting interviews with government officials, labor intermediaries, informal economy participants, and precarious youths in Shenzhen (China) and Lyon (France). Additionally, in-depth interviews were carried out with 30 young individuals in situations of precarity. This research employs an interdisciplinary perspective to explore the interplay between local contexts and global dimensions, examining how global capital abstracts itself from familial, religious, and community relationships to construct industrial chains and resource allocations worldwide. This process generates precarious work and life trajectories, ultimately reshaping youth subjectivity. Analysis of the research materials reveals that the identity formation of precarious Chinese youths is rooted in ruptures between urban and rural experiences, while the identity of precarious French youths is influenced by divisions in urban spaces, educational experiences, and cultural contexts. Young people in precarious situations in both countries exhibit fractured and discontinuous identities, reflecting the coexistence of individualism and insecurity, alongside efforts and limitations in forging collective identities.

Interpreting Community Solidarity in Response to Social Crises: A Case Study of T Community in T City of China

The expansion of urban territory has absorbed the original rural regions, which might leave the original villagers insecure in the face of life-changing shifts. In China, the community is the most fundamental urban governing unit, a platform for residents to participate in self-governance, ensuring the practice and operation of social policies at the grassroots level. Relocation communities are unique products amid urbanization by rebuilding villages into communities for the original people to live in. The original residents’ experiences and efforts to cope with challenges and crises during the demolition, relocation, and return procedures, are academically valuable in researching community formation.

This paper takes the T community in T City of China as an example of a relocation community. Semi-structured interviews were conducted with seven original villagers who witnessed the community’s formation and five staff members participated in community construction and future planning. This paper reproduces the process of T Community uniting residents, jointly solving crises, and enhancing individuals’ capacity to deal with social crises over the previous 30 years of China’s urbanization. It demonstrates how the community, as a fundamental component of social order, binds people to society; and how residents shape the new community. This paper found that the solidarity generated between the community and its inhabitants appears in three areas: economic rewards, cultural concepts, and social engagement. Residents participate in community governance and take the subjective initiative to shape the community form, which is critical for overcoming the insecurity caused by crises and future development. Further, this study discussed how to leverage the value of community solidarity to cope with foreseeable social risks in future-oriented practices.

Intertextuality without Clear Source in Population-Environment Debates within Digital Public Sphere in Social Medias

This presentation explores the phenomenon of intertextuality without clear source in public debates concerning population and environmental issues within digital public spheres in social medias. As digital platforms increasingly serve as venues for discourse on pressing global challenges, the role of intertextuality — the incorporation of elements from other texts within a new text — becomes pivotal. However, the prevalence of intertextuality without explicit attribution in these debates poses significant implications for the accuracy, credibility, and influence of online conversations.

Traditional intertextuality theory often emphasizes citation forms over sources, limiting its application in social science research. Yet, intertextuality is crucial in linguistic turns of micro-social studies, revealing deep social, cultural, and historical interconnections. Intertextuality with ambiguous sources poses risks to knowledge reproduction in electronic public spheres. Ambiguously citing views from one’s own coalition leads to norm violations in knowledge production, while obscure references to opponents’ arguments exacerbate polarization, intensifying conflicts and divisions. This study aims to bridge this gap.

Drawing on a comprehensive analysis of social media posts, online forums, and blog entries related to population growth and environmental sustainability, this study identifies instances where arguments, data, and narratives are reused, adapted, or referenced without clear indication of their original source. This pattern not only undermines the transparency and traceability of information but also fuels misinformation and polarization, particularly in complex and emotionally charged debates about population dynamics and their environmental impacts. By shedding light on this overlooked aspect of digital discourse, the study calls for heightened awareness and stricter norms around sourcing in electronic public spheres, ensuring that debates on population and the environment are grounded in accurate, verifiable, and attributed information.

Young Adults Thinking about Their Childhood: Evolving Practices of "Tiger Parenting" Among Chinese Migrants

Traditional Asian parenting, often characterized as a "double-edged sword," can deeply influence both childhood development and the parent-child relationship. This study investigates the practices of parenting within Chinese migrant families in Portugal, examining how parental expectations and understanding of "tiger parenting" have shifted among younger generations.

The narratives on Asian European childhoods were collected in the context of a broader qualitative sociological study focusing Chinese migrants living in Portugal. Using semi-structured and in-depth interviews, 25 participants were involved in this research to achieve two main objectives. First, the exploration of how the socio-economic and cultural context of migration shapes the parenting perceptions and strategies of Chinese parents, particularly in comparison to older generations. Second, it assesses the impact of "tiger parenting" on children's development and their intimate relationships with their parents, delving into whether such practices foster close bonds or create distance.

The findings are expected to provide insights into how migration and exposure to Western ideologies influence parenting behaviors and child-rearing practices, contributing to a broader understanding of the changing dynamics, tensions, paradoxes and opportunities of Chinese parenting behaviors in the European society.

Exploring Inequalities in Cross-Border Education: A Case Study of Cross-Border Schooling and Housing Decisions between Shenzhen and Hong Kong

Education and housing choices are intertwined, contributing to simultaneous wealth accumulation and social reproduction inequalities. A significant body of research has used Bourdieu's concept of capital to explore how parents make strategic schooling and housing choices. However, how such intersected dynamics play out in cross-border education has thus far been neglected despite its growing importance. Particularly, how are different types of capital converted to each other across borders at the intersection of housing and education? How to secure social reproduction through such circular migration? This paper explores these questions using the case of Cross-Border Students (CBS) between Hong Kong and Shenzhen, drawing on the concept of Bourdiesian capital and border studies.

This paper examines these questions through qualitative analysis of 28 semi-structured interviews collected from CBS families, supplemented with other public data, including official reports, policy documents and social media. The anticipated outcomes include two aspects – spatial behaviour and inequality. Economic capital demonstrates higher transferability across the border, enabling CBS families to offset spatial disadvantages by leveraging economic capital to school districts in Hong Kong through property rental and investments. However, mainland families with substantial economic capital later opt to enrol their children in expensive mainland international institutions, dropping the housing decisions in Hong Kong. This shift arises as school allocation in Hong Kong integrates privileged students with other peers, weakening the original advantages linked to economic capital. Consequently, wealthy families returned to an environment where social capital easily converted to "better education". The affluent families secure schooling and housing advantages, and the economically disadvantaged group settle for affordable public schools in Hong Kong, enduring geographic difficulties of longer commutes and reduced social interactions with peers. This study reveals inequality among CBS with different backgrounds, contributing to a more resilient educational distribution.

A Sociological Analysis of Bride Price in Chinese Marriage: Focusing on the Evolution of Women's Property Rights

The guarantee of female rights and interests requires more complicated strategies than ever in the context of weakening property rights in marriage. With the change in Chinese marriage law, the devaluation of domestic labor and the imbalance of interest at the time of divorce have made women re-evaluate their marriage behavior. The purpose of this study is to examine the marriage culture in China. In particular, this essay focuses on the mode of female behavior regarding the 'bride price,' which functions as 'dowry' in a traditional marriage. What are the conditions under which some Chinese women request a high bride price? Or what factors make Chinese women prefer to choose marriage without a bride price?

This study delves into the evolving role of bride price in Chinese marriage culture, positioning it as a complex social phenomenon intertwined with shifting gender dynamics. Through an analysis of historical records, legal codes, and internet ethnography, the research examines changing perceptions of bride price and its impact on marital negotiations. The findings reveal that bride price has increasingly become a tool for women to evaluate the sincerity and financial capacity of potential spouses, reflecting broader socio-economic transformations and shifts in property rights. Furthermore, the study highlights how bride price negotiations contribute to growing gender distrust, exacerbated by evolving economic roles and legal structures. While serving as a protective measure for women in patriarchal contexts, bride price also reinforces existing gender inequalities, making it a point of both cultural significance and societal debate.

Comparative Study on Young Adults' Dating and Spousal Selection between Online and Traditional Matchmaking Market

As marriage dynamics in modern China evolve, spousal selection requires more nuanced strategies, particularly with the rapid growth of digital platforms. As delayed marriage becomes more common, matchmaking has emerged as a key method for young adults to find potential partners. This trend has significantly impacted the formation of intimate relationships. This study explores two key questions: (1) How do young Chinese adults perceive the limitations of traditional matchmaking, and what value do they attribute to online matchmaking as an alternative? (2) How do young adults' experiences with either online or traditional matchmaking influence their expectations regarding spousal selection criteria and intimate relationships?

The research is based on a survey of 800 participants aged 20-35, all of whom have experience with either online or traditional matchmaking. The survey captures their perspectives on the effectiveness of these approaches, particularly in relation to spousal selection criteria and emotional involvement. Through a comparative analysis, the study aims to reveal whether online matchmaking offers greater flexibility and emotional depth compared to traditional practices, and how each method impacts relationship formation and stability. This research contributes to a broader understanding of how evolving matchmaking practices are reshaping relationship dynamics and marriage expectations in contemporary Chinese society.

Gender Gap in Access to Justice: The Role of Lawyers and Courts

Previous research indicates that in labor litigation, women workers in China are awarded significantly less compensation than men for the same amount of claim, a pattern that exacerbates the already dire gender inequality in the workplace. This paper examines whether the legal profession and legal institutions can mediate this gender gap. Using more than 90,000 legal decisions issued in 2019 across China, we found that while men and women do not differ in their likelihood of using legal presentation in litigation, women are more likely to utilize legal aid services and men are more likely to use private lawyers. While the presence of both legal aid agents and private lawyers significantly increases the number of evidence presented in a case, which in turn increases the rate of compensation awarded towards the worker, legal aid's effect is significantly smaller in comparison to that of a lawyer, suggesting that women might benefit less from legal presentation. Additionally, we found that in courts where special gender-focused training

program is implemented, the gender gap between compensation rate is non-existent, suggesting the courts' awareness of and action towards gender dynamics in law suits are consequential in their legal decision-making. These findings have implications for understanding how legal profession and institution can shape the gendered access to justice and provide important insights for policy makers who aspire to design and implement policies that promote gender equality through the law.

New Data Spaces for Social Sciences

In order to more precisely research the major societal challenges of the coming decades, including digitization, climate change, and war- and pandemic-related societal changes, and to be able to identify the need for political action on this basis, the social sciences need innovative research data and methods. The German Research Foundation (DFG) has established the long-term infrastructure priority programme "New Data Spaces" (SPP 2431) (<https://www.new-data-spaces.de/en-us/>) to open up and develop such new data spaces. In the first funding phase 16 projects aim to expand the analytical potential of existing longitudinal survey data, to achieve substantial progress in expanding the scope and strength of panel studies in Germany through various disciplinary perspectives, foci, and approaches, and to address the theoretical and methodological challenges of integrating different data types, modes of data acquisition, and respondent-driven designs. The projects are located in four research areas (1) exploration and integration of different data types, (2) respondent-driven designs, (3) Instrument validity, and (4) Multimodal data acquisition. A key feature of the projects is that representatives of the social sciences and computer science work together here,

In this paper we describe in more detail the challenges related to measurement quality in surveys identified by the SPP 2431 "New Data Spaces", present the research questions and the methodological and technical approaches of the projects that address measurement quality issues, and show how the methodological results and the technical solutions developed within the four research areas may affect data collection and measurement quality in standardised surveys.

LIETAR, MAXIME* (CURAPP-ESS - Université de Picardie Jules Verne, France)

A "Participative Washing" ? Local Political Order and Democratic Innovation.

How and why does the political order invest participative modes at local level? Based on an ethnographic study carried out in a rural area in the Hauts-de-France, this paper will show how the agents who dominate the local field – councillors and high-ranking officials – define the roles of the members of participatory innovations, in order to stabilize the state of the field in which they are dominant. We focus on the relationships between the members of participatory workshops (residents, parents, teachers), set up to draft the social and educational policy objectives of a territorial project, and inter-municipal councillors of this territory. These latter, dominants, ignore or reclaim the participants' activities, which reinforces their dominant position, fix positions in the local field and, at the same time, define the roles of each agent.

The proposal will emphasize the value of local social capital and of symbolic capital in the local production of public policies, expressed in re-appropriation of the work of participatory workshop members by local councillors. The degree of insertion of agents in the local order offers the possibility of putting certain policies on the political agenda -or not. For example, some parents and education professionals intend to prioritize the inclusion and support of disabled people. As members of a participatory workshop, they introduce this project to the assembly of local councillors. However, these dominants ignored the request as soon as the exchange was over, preferring to give an economic direction to the agenda that they manage, rather than the social branch outlined by the participants. Nonetheless, elected officials indicate that they use the democratic innovation to build their policies and, in other cases, they reinvest the proposals in reminding that they've initiated the participatory initiative. This paper will finally propose to interpret these practices as "Participative Washing".

"Education Au Développement Durable": The Meaning and Scope of the Depoliticization of French School Curricula

In France, "Education au Développement Durable" (EDD) defines a set of issues based on the sustainable development objectives promoted by the UN in 2015, and invites to think about the global civic education. This type of education is promoted by the instituted order and produced by the Ministry of National Education; so it fits into the existing relationships of the economic, social, political and cultural fields. Based on an analysis of the content of these curricula, this proposed communication asks the following research question. What kind of ecological education is proposed in French curricula, and what compromises and tensions emerge from this content that respects the instituted order?

Our analysis focuses on the discourse used in curricula : what action verbs are used, what actions are targeted, what changes are defined. In order to verify the effects of this lexicon on youth, this paper will focus on examples taken from an ethnographic survey of eighteen schools and five camp holidays located in an intercommunality in the Hauts-de-France region. It reveals the school's acceptance of the capitalist order. Indeed, EDD promotes an ecology based on the individual responsibility of practices, which ruling out the overhaul of a productivist system. Every child is encouraged to think about sorting waste or watching his energy consumption ; in contrast, the consequences of capitalism are never approached. We'll emphasize the inadequacy of lessons that respects the capitalist order, which is trumping the ecological emergency, all the more so as the representatives of local authorities involved in transposing these public policies to the local level adopt a posture of maintaining their position in the field of local power. EDD praises a posture that strengthen discriminations between humans and non-humans, maintaining Nature as a domesticated space but, ironically, a space that we should exploit more virtuously.

Ongoing Traversing Boundaries Dance: AI Strategizing and Real-World Deployment in Healthcare Experts Dynamics

As Artificial Intelligence (AI) is integrated into healthcare, aligning implementation with evolving regulatory strategies of those working on as well as those working with AI is critical. However, limited research explores the link between AI regulatory strategizing and in situ deployment, as well as the impact on healthcare professionals. Our study addresses this gap by analyzing policy reports and conducting 78 in-depth interviews (2022-2024) with managers, expert users, and policymakers professionals. We first explore how Israeli government bodies deliberate the 'sandbox regulation' of AI in healthcare. Next, we conduct an inductive field study on the bottom-up boundary work involved in AI deployment within a public healthcare organization. Our findings highlight the "sandbox" use of AI as manifested by collaborative and configurational boundary work by middle managers professionals confronting challenges of flexing the boundaries, disrupted knowledge transfer, and selective integration as dynamic boundary work for strategizing and deployment of AI in healthcare settings. We conclude by discussing the gap between AI strategy regulations and real-world implementation and the role of healthcare professionals as shaping and potentially bridging this disparity.

LIM, WOONTAEK* (Keimyung University, South Korea)

Transformation of Work in Postgrowth Society: Focusing on the Case of Dual Transformation in the Korean Auto Parts Suppliers

As in other countries, the dual transformation of the manufacturing industry in Korea was promoted in earnest under the name of the 'Korean New Deal' after the outbreak of COVID-19. In the case of Korea, digital transformation during this period progressed rapidly with a focus on automation. The automation rate and labor replacement rate by machines in Korea's manufacturing industry reached the world's highest level during this period. That leads in a low-growth phase is ultimately to a very profound impact on employment relations.

This research deals with the current situation and innovative strategies of auto parts suppliers and labor's counter strategy in the process of dual transformation in Korea. As demand and production of electric vehicles increase at a global level, Internal combustion engine parts manufacturers are increasingly aware of the crisis. Digital transformation offers parts manufacturers opportunities to increase productivity and reduce costs. At the same time, with the spread of platform-based production, due to digital transformation, exclusive transaction practices are gradually reduced, and the stable transaction relationship between main contractors and subcontractors may become unstable. Against this background this study analyzed the counterstrategies between local parts makers and trade unions in the process of digital transformation through a survey of auto parts makers in Daegu(which is Korea's leading auto parts production area).

The counter strategies of both sides were found to affect work organization and skill level in different ways during the digital transformation process. Furthermore, the union's response strategy was very passive. The union focused on protecting organized workers and wages while allowing contingent employment of workers.

To solve this problem, we emphasize the need for a citizen-labor solidarity strategy that strengthens the resilience of local communities and pursues social-ecological transformation instead of the existing technology-driven, cost-saving dual transformation.

LIMA COELHO, SANDRA* (University of Beira Interior, Portugal)

Health and Environmental Sustainability: Factors That Promote a Reduction of Meat Consumption in Portugal

This study investigates the motivational factors influencing the reduction of meat consumption in Portugal. The increase in meat consumption over recent decades, especially in developed countries, has raised concerns about health and environmental sustainability. The study is based on a literature review addressing global and Portuguese meat consumption, motivations, and barriers related to its reduction. A survey was conducted among Portuguese citizens aged 18 or older using Google Forms. The questionnaire, adapted from previous scales and translated into Portuguese, comprised eight sections, beginning with a question about dietary habits and meat consumption. This directed respondents to specific sections according to their answers.

Results reveal that most participants identify as omnivores, with a smaller percentage of flexitarians, pescatarians, and vegetarians. The sample mainly consists of women, with an average age of 40.6 years and high levels of institutionalized cultural capital. The key factors influencing the reduction of meat consumption include social norms, perceived benefits, perceived barriers, and environmental concerns. Social norms and the perceived benefits of reducing meat consumption—such as health improvements and contributions to environmental sustainability—are particularly significant. However, perceived barriers, like lack of information and resistance to changing dietary habits present challenges.

The study concludes that it is crucial to develop communication and education strategies addressing environmental and health concerns to promote more conscious eating. It provides insights into the factors that motivate behaviour changes regarding meat consumption, offering guidance for public policies and awareness initiatives.

RC48-757.3

LIMA COELHO, SANDRA* (Católica Porto Business School, Portugal)

The Local Currency Mor: Benefits, Obstacles, and Opportunities for Social Change

This research examines the implementation of the local currency MOR as an alternative to traditional currencies, focusing on its potential to enhance social cohesion and economic development in Montemor-o-Novo. The study aims to identify the characteristics and benefits of local currencies, understand how the MOR currency can drive social transformation, and analyze the effects of this transformation on the community.

Employing a qualitative approach, the research conducted a case study on the MOR currency, utilizing methods such as document analysis, direct observation, and semi-structured interviews with community members who use the currency. The data were organized and analyzed through content analysis, considering the context of the respondents' statements.

Findings indicate that the MOR currency has the potential to strengthen the local economy by encouraging consumption within the community and fostering partnerships among merchants. Interviewees noted that the

currency facilitates economic transactions and contributes to a network of support and solidarity among community members. For instance, merchants have collaborated to create joint offers, such as partnerships between a florist and a craftsman.

However, significant challenges in implementing the currency were also identified. These include the need for greater recognition and support from local authorities and the difficulty in persuading the community to adopt the new currency. Obstacles such as a lack of incentives and resistance to change must be addressed to ensure the currency's sustainability.

In conclusion, despite these challenges, the MOR currency presents a promising opportunity to revitalize the local economy and promote social transformation in Montemor-o-Novo. The research suggests that, with adequate support and effective communication strategies, the MOR currency's model could be replicated in other communities, contributing to more sustainable and inclusive development.

LIMA GURGEL, GIOVANNA* (Universidade Federal do Rio Grande do Sul, Brazil)

Dismantling of Public Policies: The New Reurb LAW and Its Impacts on Brazilian Social LAND Regularization Policies

The unplanned expansion of the urban fabric is the primary factor leading to land tenure irregularities, giving rise to informal urban settlements (such as slums and shantytowns), which can be easily identified across Latin America due to their non-compliance with urban, legal, social, environmental, and/or infrastructural standards. For this reason, in the 1980s, several Latin American countries began investing in land tenure regularization policies as an attempt to extend the benefits and services found in formal cities to informal urban settlements. Two main models were adopted, leading to a narrative debate on the most appropriate strategies to fully achieve land regularization. Initially, Brazil, by adopting the integrated socio-spatial regularization model, implemented effective tools to carry out land tenure regularization through interventions in various sectors within informal communities. However, the introduction of a new tool focused solely on land titling—land tenure legitimation—seems to have sparked a new trend: the dismantling of previously established urban policies. The literature addressing this subject, through an analysis of the legal framework (Law No. 13,465/2017), has speculated that the introduction of this new tool has led to a reduction in interventions; however, empirical evidence has yet to confirm this claim. Therefore, this research aims to analyze the impacts of the new regularization tool on the various dimensions of Brazil's social land regularization policies (in terms of density and intensity), focusing on the regularization processes established at Federal, State, and Municipal levels in the states of Rio Grande do Norte (RN) and Rio Grande do Sul (RS) between 2010 and 2023.

LIMA NETO, FERNANDO* (Pontifical Catholic University of Rio de Janeiro, Brazil)

Digital Public Sphere and Activism from Brazilian 'Coletivos': (Re)Defining Boundaries between Public and Private

This paper analyzes the dialogical relationship between the structural constraints regarding the increasing use of digital communication tools and the actions of activists from Brazilian 'coletivos' (collectives) who turn to these tools to impute new meanings on participation and politics. Collectives are recent forms of social and political mobilization emerging in the Brazilian public sphere through activism linked to a variety of themes and domains in everyday life. In particular, the analysis highlights the importance of building bonds of friendship and solidarity among activists that go beyond formal ties. Often, these bonds are built or reinforced through digital communication tools that function as new arenas of political socialization. The use of digital communication tools, the emphasis on personal biography as motivation for political engagement, the strengthening of friendships in political struggles, and the discourse of horizontality are some of the dimensions of these activism that indicate the redefinition of structural patterns of political culture in Brazil, such as the separation between public and private, as well as the relationship between democracy and public sphere. In general terms, the activism of collectives and the theoretical debate on public sphere in the 21st century constitute a mirror game, where the transformation of one is reflected in the other. The main conclusion of the paper points to a causal correlation between (i) the unplanned effects of the intensification of the use of digital communication tools, particularly social media, in social relationships in general and in politics specifically, and (ii) the subjective meaning aimed at by actors who politicize their daily and private lives.

LIN, CHUN-WEN* (National Chiayi University, Taiwan)

Uncovering the Missing Piece: Environmental Injustice in Taiwan's Education for Sdgs

Taiwan has made significant strides in education for sustainable development goals so much so that SDGs is said to be an integral part of our citizenship education rather than just political rhetoric. However, an important issue that remains underexplored in these efforts is environmental injustice. While Taiwan's SDGs frameworks have focused on achieving ecological sustainability, they often fail to account for the uneven distribution of environmental burdens and benefits across different communities. Marginalized populations, particularly indigenous groups and economically disadvantaged communities, are disproportionately affected by pollution, resource exploitation, and environmental degradation. These groups often have limited access to the environmental benefits resulting from corporate and governmental sustainability policies, which can exacerbate existing social inequalities.

This paper explores the missing piece in Taiwan's SDGs efforts: the lack of integration of environmental justice principles. Through a combination of literature review and interviews with scholars, policymakers, and community leaders, this research seeks to understand the specific environmental injustices faced by vulnerable populations in Taiwan and the systemic barriers that contribute to these disparities. The study also highlights the ways in which environmental justice could be incorporated into Taiwan's SDGs policies, offering more equitable approaches to sustainability that consider the social and economic impacts of environmental policies.

By shedding light on these overlooked issues, this paper aims to contribute to a more inclusive understanding of sustainability in Taiwan, where SDGs practices can be reformed to ensure that all communities benefit from environmental initiatives. Addressing environmental injustice is crucial to fulfilling the broader goals of sustainable development and ensuring that Taiwan's SDGs policies are aligned with both ecological and social equity.

RC04-66.7

LIN, MEI-LING* (National Open University, Taiwan)

A Catalyst for Change: Moving Toward Pedagogies of the Possible through Talent Development

Education is charged with the responsibility for helping students become productive members in a society. The coronavirus pandemic revealed the relative acceptance of inequality in educational opportunity and illustrated the critical role of government in creating equal opportunities, such as supplying internet access and technology to rural or low-income students. Committing to developing the talents of all students will bring about a new era in education. By treating every student as gifted, we can help students develop transformational giftedness so that they can better our society. When gifted education is envisioned as more open and accessible, it will become a force for education reform, making schools more responsive to opportunities and challenges. With the rise of information technology, especially artificial intelligence (AI), the nature of talent development may change. Gifted education should play a major role in creating innovative nations. The author begins with a review of the definitions of giftedness and creativity, highlighting the notion of talent development as an instrument in service of societal change for the better. Then, the author briefly discusses why we conceptualize pedagogies as transactional and why it is necessary to move toward more transformative pedagogies. The author then introduces the conception of "Pedagogies of the Possible" and discusses how such pedagogies represent a particular case of creative learning experiences. The author closes by discussing the core features of "Pedagogies of the Possible", and highlights the kinds of new possibilities and transformations. The author concludes with a discussion of knowledge as a means to not only develop gifted abilities but also to maximize the number of talented people who can make transformative contributions. The multimethod design was used to bring together the results from the quantitative, qualitative and policy/document analysis.

RC09-JS-164.1

LIN, REX TSUNG-WEI* (National Taiwan University, Taiwan)

Making (Queer) Kinship in a Childcare Institution in Taiwan

In 2019, Taiwan legalized same-sex marriage, marking a significant milestone in the country's LGBTQ+ rights movement. However, for LGBTQ+ youth residing in child welfare institutions due to family dysfunction or deviant behaviors, the celebration of marriage equality remains distant. While studies have explored queer families within traditional societal structures, the unique dynamics and experiences of LGBTQ+ youth in institutionalized

"family-like" settings have been less examined. This study investigates how heterosexual and LGBTQ+ staff members within these institutions engage in various forms of "doing family" and "making (queer) kinship," and also how would institutionalized LGBTQ+ youth perceive gender, sexuality, and family in relation to their institutional experiences.

The research reveals that the case in Taiwan, its institutional policies, influenced by national deinstitutionalization trends, aim to create a more family-like environment. However, the effectiveness of these policies is mediated by staff members' individual "cultural toolkits" based on their gender and sexuality. Additionally, the study highlights the complex interplay between institutional logic, individual queer identities, and the formation of queer kinship within the childcare institution. It emphasizes the queer identity itself would influence the epistemology and methodology staff members adopt to reach their professional goals. This not only reflects the relationship between practical social work and the imagination of making (queer) families/kinship, but also coins with the "stigma as coalitional politics" discussed by Heather Love.

LIN-JANUSZEWSKI, LIANG-WEN* (Paderborn University, Germany)

Symbolic Violence and Affective Practices of First-Generation Students' University Transition Experiences

This study investigates how symbolic violence manifests through affective practices during first-generation students' transitions into higher education. Drawing on Bourdieu's concepts of habitus, symbolic violence, and corresponding affective practices, this study investigates how day-to-day classifications, academic language, and pedagogical practices in the higher education field function as exclusionary mechanisms that reproduce inequality.

This research utilizes data from an ongoing longitudinal project at a regional German university, comprising 41 in-depth semi-structured interviews conducted between March 2023 and June 2024. The sample spans three cohorts of first- and second-year students, including 12 male, 16 with migrant backgrounds, and 27 first-generation students. Using reflexive thematic analysis, the study examines shared perceptions and affective struggles of first-generation students, while recognizing their heterogeneity across age, gender, ethnicity, socioeconomic status, and parental influence.

Key findings reveal, first, world-making upon university arrival, with students seeking validation through varied affective practices based on gender and migrant background. Second, mystification and classification through pedagogical practices, including academic language, misrecognized meritocratic belief, and teaching culture. Third, evolving self-perceptions are influenced by constraining or empowering affective practices throughout their higher education journey.

This research illuminates the subtle mechanisms of social exclusion via symbolic violence in higher education, contributing to our understanding of how these processes impact student transition experiences and outcomes. By examining the interplay between institutional practices and students' affective responses, the study provides insights into the reproduction of educational inequalities and potential interventions to support first-generation students' success.

LIN-JANUSZEWSKI, LIANG-WEN* (Paderborn University, Germany)

Transgressing Classed Boundaries of Gender Norms in Higher Education: A Longitudinal Study of Undergraduate Students' Experiences

This study investigates how undergraduate students navigate and challenge gender norms in their higher education trajectories, focusing on their evolving practices that transgress classed boundaries of gender norms and their resulting affective practices. Utilizing intersectionality and the Bourdieuan lens, this study examines the interplay between class, gender, symbolic violence, and the affective aspects of habitus in the higher education field. While upward mobility through higher education is often perceived as advantageous, it is essential to investigate how challenges in embracing more fluid and open-minded gender norms unequally impact students' affective practices based on their social characteristics.

The present study draws on interview data from an ongoing longitudinal project examining undergraduate students' transitions and experiences in higher education at a regional German university. The analysis includes 66 semi-structured interviews with 41 students enrolled between 2021 and 2023,

nospanning completed first and ongoing second rounds. The diverse sample, including 12 male, 16 migrant, and 27 first-generation students, enables an intersectional analysis of how students negotiate inconsistent gender norms between their original social milieu and the field of higher education.

Preliminary findings reveal a complex interplay between habitus, disciplinary culture, and students' affective experiences as they negotiate traditional gender norms, varying significantly across different socio-economic and cultural backgrounds. The study demonstrates how higher education can serve as a site for both reproducing and transforming traditional gender norms, particularly for first-generation and migrant students. This research contributes to understanding of how upward mobility through higher education impacts students' engagement with evolving gender norms and their relationships with friends and family.

The Return to the Land As a Militant Conversion

How do activists move from a revolutionary project for political regime change to the creation of an alternative farm in a rural area? This paper analyses the ways in which some activists in the 20 February 2011 movement move from a revolutionary dream to the practical implementation of a 'real utopia' (Guéguen and Jeanpierre 2022). The 20 February 2011 movement (M20F) saw the emergence of an unprecedented protest dynamic in Morocco (Bennani-Chraïbi and Jeghlal 2012). In the wake of the so-called 'Arab Springs', a section of Moroccan youth demonstrated their desire for change and their willingness to initiate a political and social revolution. Since this period of ferment, many M20F participants have turned to new forms of commitment. In addition, new networks of acquaintance and friendship have emerged from the coalitions that have been set up, bringing together activists from the left and extreme left, Islamist activists and independents (Smaoui and Wazif 2013). These encounters have given rise to new initiatives in a variety of forms: NGOs, student movement, feminist (David 2019) and environmentalist struggles, etc. In this paper, we will look back at the emergence of an eco-place, located two hours from the Moroccan capital. The initiators of this project have acquired a plot of land with European funding and are setting up the infrastructure needed to live independently. The collective draws on both local protest struggles and alternative militant experiences that have emerged in Europe. Between internationalization and a return to tradition, and through a decolonial rhetoric critical of Western domination, the actors in this project are trying to create an inclusive alternative. The paper is based on an ongoing ethnographic study, as part of a thesis on the life trajectories of participants in the 20 February 2011 movement in Morocco.

Generational Justice and the Genuine Subaltern Status of Childhood: Preliminary Considerations of a Radical Democratic Framework

This study aims to critically examine the concept of intergenerational justice through the lens of the subaltern status of childhood. Firstly, I will demonstrate how traditional theories of justice, including egalitarianism, the capability approach (cf. Sen, 2010) and John Rawls' "Theory of Justice" (1979), fail to adequately address childhood as a specific and distinct phase of life. Furthermore, these theories often reduce children to "future adults", thereby ignoring their intrinsic value in the present.

In order to understand why theories of justice fall short when it comes to childhood, I have explored the fundamental ways in which childhood is constructed. Before we can discuss justice for children, it is crucial to establish that childhood is a social construct with a subaltern status. Current concepts of intergenerational justice often focus on future generations while overlooking the immediate realities of children. This approach treats children as passive recipients of frameworks designed by adults, marginalising their experiences and needs. Consequently, this reinforces their subordination to adults within societal structures - what I refer to as the "genuine subalternity" of childhood (cf. Spivak, 1988).

This genuine subalternity must be recognised before any meaningful discussion of justice for children can take place. Childhood requires a distinct conception of justice that is not simply an extension of adult frameworks. I propose a radical democratic approach that recognises the distinct needs and experiences of children and advocates for justice that is co-created by both adults and children. Only through this framework can we ensure true intergenerational justice - a justice that takes into account not only children's future potential, but also their current agency and status, even if the subaltern status of childhood cannot be overcome.

LINDE, MARIE-CHRISTIN* (Martin-Luther-Universität Halle-Wittenberg, Germany)

The Subalternity of Childhood: A Three-Level Explanation

The research aims to apply Spivak's concept of subalternity (Spivak 1988) to the experience of childhood. It argues that childhood can be considered a genuine subaltern position within society due to the influence of social and power structures that often perceive children as subordinate actors in comparison to adults. The restricted influence and limited access to social power, coupled with structural inequalities, reinforce this subaltern status.

The research examines three ways in which subalternity can be derived in relation to childhood:

1) the necessity of education is used as a rationale for denying children full human status. Children are frequently viewed as needing guidance and instruction, and are often categorized as a distinct group.

2) the concept of productive indeterminacy in pedagogical practice is discussed, with a particular emphasis on the significance of social integration for the subjectification of children. Furthermore, the study explores the subaltern position of childhood concerning language and communication models.

3) examines the legal status of children as non-citizens, with a particular focus on the German legal system. It questions whether children are regarded as objects or subjects of legal recognition and how this contributes to their significant subaltern status.

This study thus illuminates the intersections between subalternity, childhood, and social power structures, offering a comprehensive overview of how children are marginalized in various societal contexts. It provides insights into how social, educational, and legal frameworks contribute to the subaltern position of childhood and highlights the need for a more nuanced understanding of children's roles and rights within society.

LINDINGER, KORINNA* (TU Wien, Austria)

Masculinity and Space from Children's Perspectives

The contribution presents results and methodological reflections on two qualitative research projects with nine to twelve year olds. Both are part of a multi-year grounded theory approach to study spatial appropriation from the perspective of marginalized children in a privileged district of Vienna. The analysis of their everyday geographies uncovers, how spaces of belonging are established. It also demonstrates how deprived social participation manifests spatially. In understanding space from children's points of view, several dimensions of boundary-making (see Fegter and Andresen 2019) become apparent, first and foremost gender, class, age and racism.

Talking about space is difficult (see Martina Löw 2018) and research settings with marginalized young people must make even more effort to develop shared means of communication. *Schultorparasiten* employed strategies of visual elicitation, participatory spatial interventions and group interviews to understand the interlink between formal and informal educational spaces in children's appropriation of the city. *Figures of speech* used DIY-3D technology to navigate and capture individual places of importance, enabling and empowering children to position themselves in the city beyond social attributions, an art-based alteration of a mobile interview (see Kusenbach 2018).

While practices of socio-economical exclusion have been the focus of the study, the absence of female practice and voice raised as substantial issue in the process. This paper therefore analyses how concepts of masculinity manifest in children's appropriation of space.

Play in Research. Considerations on an Involving Methodological Approach

It is a serious task in child-centered research designs to establish trustful situations in which children can express their sense-making. Building on means of interaction and communication which are part of children's everyday life and expertise often serves as key factor in regard to research validity and data quality.

Playful methodologies seemingly meet this condition. Yet, play has been rarely reflected as research method in activation, data collection, analysis and dissemination. A reason might be the several ambiguities of the magic circle (Sutton-Smith 1997), in other words the immersive power of good games or intensive play with its multilayered, frictional relations to social practices and cultural codes. Then again, play has been framed as prominent competence and means of appropriation by children, and in a cross-generational definition as self-chosen, voluntary activity, localized in time and space, constituted by rules and enabled by one's own imagination, experience and competence (Caillois 2017). In this, the author finds a lot of similarities to methodological and ethical qualitative research requirements, especially in the realm of participatory or space-related approaches.

The contribution reflects on research projects by the author with children between four to twelve years of age. It identifies potentials of play as an inclusive research strategy on the one hand and points out challenges on the other. While social-reformist, e.g. in pedagogy, social work, urban studies, have referred play as method to address social hierarchies and practices, post-colonial perspectives have stressed the power relations embedded in play (Trammel 2020). In order to engage in a differentiated debate, the paper will relate the considerations on play in empirical processes to current debates in cultural studies on play.

LINDIO MCGOVERN, LIGAYA* (Indiana University, USA)

Neoliberal Capitalism, Extractivism, and the Politics of Dispossession of Indigenous People in the Philippines and Their Resistance

Neoliberalism's constant search for new spheres for global capitalist expansion and extractivism go hand in hand. This is seen in the global expansion of corporate mining that results in the expulsions of indigenous people from their land and disrespect of their basic social, economic, political, environmental, and cultural rights necessary for their survival. Indigenous ancestral lands are the last frontiers of capitalist imperialism that destroys remaining elements of communalism in indigenous concept of land, production, and environment. In such a process, transnational capital and neoliberal nation-states allies. Extractivism in the periphery and the flow of extracted resources to the core feeds the global capitalist system, breeding global inequality and human rights violations. The Philippine case illustrates this. Embodying neoliberal policies, the Philippine Mining Act of 1995 serves the extractivist expansion of transnational capital for profit while plundering the environment, usurping the Filipino people's sovereignty, and dispossessing the indigenous people of their ancestral lands and subsistence livelihoods. But Indigenous People and other human rights defenders challenge transnational corporate power, state violence in defense of capital, and bureaucrat capitalism. Their dialectic of resistance enlightens the need for an integrated framing of human rights and sustainability in development. Applying some principles of grassroots-oriented research that begins inquiry from the marginalized people's experience, I gathered primary data by conducting fieldwork in the Philippines, visited a mining site, and interviewed indigenous people affected by corporate mining and their forms of resistance.

LINDIO MCGOVERN, LIGAYA* (Indiana University, USA)

Neoliberalism, Imperialism and Militarism and the Crisis of Human Rights in the Philippines and the People's Resistance

Weaving together primary data from fieldwork and secondary data from a collection of literature and documentations, this paper examines the crisis of human rights in the Philippines in the context of neoliberalism, imperialism and the various forms of people's resistance both within the Philippines and overseas. While many discussions on human rights rarely contextualize the occurrence of human rights violations within the regimes of neoliberalism,

imperialism and militarism this paper will examine how these various social forces intersect to suppress people's political, economic, cultural inalienable rights. The right to fight for these inalienable rights is a basic right – but such political right is suppressed to manufacture consent to neoliberal policies that seek to maintain global capitalism. Political rights (such as the right to fight for rights) and economic rights (such as the right to access basic needs) are inextricably linked. Militarism becomes the political tool of the state to violently suppress people power, to divide and rule, and to continue its counterinsurgency, which is supported by imperial powers, like the United States, through military aid. As global capitalism continually seeks cheap labor for maximum profit workers' rights get violated, and as it (capital) seeks to transnationally expand Indigenous People are dispossessed of their ancestral lands, violating their rights enshrined in UN Declaration of the Rights of Indigenous People. But various sectors of the Filipino people have persisted in their resistance and their various social movement organizations have engaged in various collective actions in defense of human rights both on the local and international scales. Their resistance is forming collective power (a form of political right) and suggest insights that achieving the universal goal of protecting human rights requires changing oppressive and exploitative political and economic systems.

Underexplored Sustainability Strategies: Sharing Goods with Friends and Family

In the pursuit of sustainable consumption, reducing acquisition and prolonging the life of household items—like clothing, appliances, and furniture—has never been more essential. Practices such as purchasing second-hand goods, borrowing, sharing, and passing items between people don't just offer environmental advantages—they build social connections too. Despite their everyday nature, these informal exchanges of goods remain under explored in sustainability and consumption research. This study draws on a unique national survey of 2,700 Australian households, shedding light on how everyday sharing of goods flows through informal networks of family and friends. We argue that these personal relationships are pivotal to both understanding and encouraging the circulation of used goods in a developed economy. Our findings reveal gendered, class-based, and life-stage differences in sharing practices and the influence of social capital, which allows more privileged groups to participate more actively. Households with children, for instance, experience faster consumption cycles, driving greater circulation of goods. Generational shifts also play a key role, as attitudes toward second-hand goods evolve. We contend that informal sharing—within families and communities—holds just as much significance as formal sharing economies in diverting goods from landfills and supporting sustainable consumption. This everyday circulation is vital to the sustainability conversation.

LINDWALL, JOHAN* (University of Gothenburg, Sweden)

Constructing Agency in Welfare Encounters: Narratives of Autonomy, Integrity, Knowledge, and Responsibility in Encounters between People Who Use Drugs and Swedish Social Services

People who use drugs have increasingly come to be portrayed as rights-bearing subjects within European welfare discourse. With some delay, this is also the case in Sweden, where they have long been positioned as legitimate objects of societal control and interventions but are increasingly spoken of as active and knowledgeable service users. Rights-based discourses that emphasize clients' autonomy, integrity, knowledge, and self-determination have gained rhetorical precedence in Western social work over authoritarian discourses that privilege professionals' knowledge and control. At the same time, such discourses can be employed by welfare organizations to responsibilize and legitimize the shifting of responsibility for clients' welfare from professionals to the clients themselves. Moreover, clients' autonomy and self-determination are in practice always conditioned by welfare organizations' mandates, knowledge, resources, policies and prevailing legislation. However, there is relatively little research on how clients who use drugs perceive and handle their encounters with professionals in welfare organizations, particularly regarding autonomy, integrity, knowledge and responsibility. The focus of this paper is on how clients narratively construct their *agency* in the encounter with professionals within social service. The material, collected in an ongoing study, consists of transcribed interviews with people who use drugs and are in contact with social services, and is analyzed by employing narrative analysis methods and analytical concepts from discursive psychology. I analyze and discuss the values, ideals and dilemmas produced

in clients' narratives, as well as how these are presented to both orient and limit clients' agency within their narrative constructions. Preliminary findings suggest that agency in clients' narratives about their encounters with social services cannot be described in terms such as 'restricted' or 'unrestricted' but is constructed as framed by tensions and dilemmas related to dimensions such as autonomy, integrity, knowledge and responsibility.

LINK, FELIPE* (Pontificia Universidad Católica de Chile, Chile)

Vertical Neighborhoods in Santiago De Chile: New Forms of Sociability in a Segregated Latin American Metropolis.

In the last two decades, Santiago de Chile has experienced a critical verticalization process promoted by financialization in the context of urban neoliberalism, which has radically transformed the built environment in central areas, the sociodemographic composition, and the social practices and interactions of its inhabitants. This paper proposes considering the importance of daily encounters in the public space in everyday practices, thus expanding the notion of local sociability besides the traditional urban community. Three vertical neighborhoods in Santiago, Chile, were analyzed through secondary data about their urban environment and primary data collected through surveys and qualitative interviews with residents of high-rise buildings. Although densification by verticalization inhibits social interactions, the results indicate differences between urban practices regarding urban vitality at a neighborhood scale. So, despite structural conditions such as segregation, the daily use of public space and local commerce favors the emergence of social ties, which are not considered personal networks but valuable in terms of public familiarity and recognition, transforming the traditional idea of neighborhood community. We seek to discuss the influence of the built environment of three different high-rise new buildings on the formation of social relations in urban space.

Mental Health Reform and Social Inclusion for Those with Mental Disorders and Developmental Disabilities in the United States, Brazil and Chile

In the second half of the 20th century, mental health reform beginning with the deinstitutionalization of patients who had severe mental disorders, and later including individuals with developmental disabilities was a major structural change which facilitated greater social inclusion of these patients in the United States and countries of Latin America. This process occurred as a result of the following factors: the development of psychiatric medications which could successfully treat psychotic episodes and eliminate the need for confinement or restraint; the political influence of several social movements in the United States and the Americas which demanded freedom and social participation of patients; the rising cost of staffing and maintaining large Psychiatric hospitals. Also, some countries in Latin America including Brazil and Chile were substantially impacted by the Caracas Declaration of 1990 which called for a transformation of a mental patient care system from large mental health hospitals to community services. The integration of persons with severe mental disorders and individuals with serious developmental problems was measured against the following criteria: (1) Have a well-paying personally fulfilling full-time job; (2) Form a committed relationship or family with a spouse or partner; (3) Live in your own apartment or house (Chuaqui, 2017). This presentation will include a critique of the current mental health care systems which exist in the United States, Brazil and Chile. These systems will be assessed using the theoretical framework of intersectionality which assumes that multiple marginal or disadvantaged social statuses interact at the micro level of patients lived experience (Bowleg, 2012).

Migrant Background Youth and Sensemaking of Place, Community and Belonging through Intergenerational Oral Histories in Jordan's Industrial Heartland

Place-based community histories are complex navigations of differing perspectives and lived experiences which can be underpinned by traumatic, celebratory and/or claim-based narratives. These accounts offer multiple avenues to build a sense of ownership and belonging to place – particularly for migrant and refugee background communities who are looking to construct and forge new lives and to make sense of displacement and (re) settlement. Engaging and understanding the history of a place from the lived experiences of different (migrant) communities across multiple generations can provide a rich opportunity to understand how societies are shaped, and cities developed, by transnational and transcultural encounters.

This paper examines the work of the British Academy funded project *Surfacing Zarqa*, which trains young people living in Zarqa, Jordan's industrial capital, to conduct oral history interviews with diverse communities that reside in the city. Zarqa has long been a home to refugee and migrant communities: it was founded by Chechen forced migrants in the early 20th century, rapidly developed with the establishment of a Palestinian refugee camp in 1946 and ballooned with industry and the arrival of South Asian migrant workers from the 1970's onward. Despite this rich and complex past, there is a significant lacuna of public and lived histories of the communities that consider the city 'home'.

This paper considers three interconnected themes which centre around the communication of memories and sense of belonging within this diverse urban community: 1) How transcultural, transnational and transgenerational biographical histories intersect in an 'overlooked' industrial and refugee-receiving city. 2) How such histories and experiences are surfaced, communicated or silenced and 3) how critical engagement with these memories allow young people to situate their own sense of belonging, and to reimagine and reexamine their aspirations in, and beyond, the city of Zarqa and the Kingdom of Jordan.

Changing Choices? Primary and Secondary Effects through Times of Educational Contraction

This paper explores how inequality of educational opportunity (IEO) evolves in the context of educational contraction. Using Finnish register data (StatFin), the study examines the transition to secondary school for complete birth cohorts born between 1975 and 1997 through nonlinear probability models and the KHB decomposition. It decomposes the upper secondary school transitions into primary and secondary effects by gender, cohort, and parental socioeconomic status (EGP). The results show increased horizontal stratification and stabilizing overall inequality after an initial decrease for earlier cohorts, driven by a decrease in secondary effects. Notably, the trends differed by gender. Females continued to experience a constant increase in inequality driven by increased primary effects, while males from the V-VII classes experienced a modest decrease in inequality. The findings point towards possible mechanisms at the intersection of class, gender, and IEO. These results challenge traditional assumptions that IEO operates predominantly through secondary effects. The polarization between vocational and general secondary education and the stagnation of secondary effects may be one of the reasons behind educational contraction. The findings highlight the importance of re-examining the mechanisms behind IEO in societies facing educational contraction, suggesting that traditional stratification theories may only partially capture the dynamics at play.

Where Does the Pipe Leak? Educational Contraction and the Role of Educational Transitions in Finland

This study employs Multiple Sequential Pathways Logit Models (Härkönen & Sirniö, 2020) to examine the role of timing of educational transitions and the phenomenon of educational contraction in Finland, a country known for its historically equitable educational opportunities. Cohorts born from the 1980s onwards are achieving lower education levels than previous cohorts and the association between parental and filial education has strengthened. This trend contrasts with the broader European context and OECD countries, which have generally experienced an increase in tertiary education attainment since the 2000s. We decompose timing and cohort differences in completing transitions for full birth cohorts born between 1960 and 2005. The role of timing is important as it may result in stratified delays in educational completion and lifetime educational attainment. Previous evidence suggests that the observed decline in university degree attainment by age 30 may be partially attributed to the increase in the age at entry to higher education. One possible reason behind this decline is increased selectivity in admission to higher education requiring multiple years of reapplication to enter university. To account for the delay in educational careers, we have expanded the analysis to cover university attainment at the age of 35. The preliminary analysis shows a slight delay in both entering university and graduation. However, if we measure the final educational attainment at age 35 the level of highly educated working-age population has not contracted as drastically as suggested by previous studies. The most interesting finding seems to be that after the educational expansion stalled, academic secondary schools have become increasingly middle-classed resulting in increasingly stratified final educational attainment.

From Protesting the State to Protecting the Nation: Gendered Forms of Nonviolent Resistance in Israel's Pro-Democracy Protest and War

Triggered by the planned judicial overhaul of the current (far) right government, a massive nonviolent protest movement emerged in December 2022 to fight for Israel's democracy and social justice. Women's groups seeking social transformation have reached unprecedented visibility in light of their creative practices and embodied performances, most notably through the performative adaptation of the dystopian "Handmaid's" imagery. Through a variety of practices, they managed to highlight the government's explicit attack on women's rights. Women in Israel have historically both participated in social activism and developed their own, women-led/-only practices, thereby often finding a way to voice their interests while mostly being sidelined from official decision-making processes and leadership positions. Our research comparatively investigates gendered, embodied, intersectional and symbolic expressions of resistance of five different women's groups, namely Building an alternative [*Bonot alternativa*], Mothers On Guard [*Imahot al hamishmar*], Breaking Walls [*Shovrot kirof*], Mothers Against Violence [*Imahot neged alimut*] - as well as the peace movement Women Wage Peace [*Nashim osot shalom*]. Following the October 7th outbreak of the still ongoing Israel-Gaza war, these groups adapted their activism to address the urgent needs of affected communities, further underscoring the resilience and adaptability of women-led civic resistance in times of crisis. This study draws on qualitative methodologies, namely feminist ethnographic research (in person and digital) and interviews conducted from January 2023 to 2024. It answers current calls in social movement research for more nuanced intersectional analyses and particularly emphasizes an embodied perspective. Our paper highlights the different ways these women's groups employ their bodies in relation to their intersectional positionalities within the complex power structures of a democracy in decline and growing social cleavages within the context of war.

Inquiring Student Agency in Secondary Education: Key Challenges for an Exploratory Research

Student activism in secondary education has received limited attention in social and political studies, and it is consequently almost absent from the relative academic literature. The distance from learning centres and from organising happening there represents a clear limit to the understanding of political action of the youngest, with implications on analyses related to the education sector and to broader societal issues. This paper would like to expose the challenges that I am experiencing in my studies on student agency in secondary education. Ethical and safety issues related to the under-age of research participants, mixed with the high public exposure of some school student leaders and to the changing tools and rationales of repression in European countries, all have an impact on the methodological challenges of my qualitative study. The importance of a participant observation that is truly immersive, getting the adequate trust of participants, but at the same time not resulting intrusive gets evident in the attempt of studying agency and how school students organise it. Political challenges are just around the corner, given my personal and political story that positions me as a researcher which is at the same time an activist and a former school student leader. It is essential to make boundaries clear, without hiding the opportunities of restitution that such a study gives to the movement, finding a good balance between the acceptance of suggestions to avoid any harm and the need for trustable and accurate analysis. The paper will examine the existing similarities to my previous work on university student unions, getting inspiration from my most recent fieldwork activities in Italy and the Netherlands, with the goal of producing a reflection useful to my next studies on the field and more broadly to future inquiries on school student politics.

Modernization and Politics of Sensibilities in China and Latin America: A Theoretical Review

Theories of modernization in Latin America sought to explain the standard deviation of the evolution of the societies of the region, in relation to the forms of development of European societies. Among the variables that were used to investigate the subject are: the level of economic growth and industrialization, the degree of incorporation of "modern" patterns in social relations and the mode of political organization. In this context, the transformations in consumption, expectations and beliefs around the pattern of predominantly "archaic" societies marked by "traditional" features implied various diagnoses of the politics of the sensitivities in force in those societies.

For many Chinese researchers the achievement of Chinese-style modernization presents significant historical and global impacts. From the 1970s until the late 1990s, China's swift economic expansion was acclaimed by the global community as a remarkable phenomenon. In recent decades, China's advancement in modernization surpasses its remarkable GDP growth rates. As a late-developing nation, China achieved industrialization within decades, unlike the centuries required by developed countries. Unparalleled economic growth has coincided with enduring social stability. It is in this horizon that many maintain que Chinese-style modernization signifies a "novel paradigm for human civilization".

This proposal seeks to investigate and point out the main coincidences and differences between the Latin American and Chinese theoretical perspectives to explain and evaluate the modernization processes.

LIU, BONAN* (University of Muenster, China)

Inhabiting in a Forest of Early Childhood Education and Care: Entangled with Grass, Ants, and Grasshoppers

As the impacts of climate change gain increasing attention, natural elements have become a significant focus in the field of Early Childhood Education and Care (ECEC). Two main trends have emerged: one involves bringing nature into kindergartens, such as nature corners in classrooms, more plant decorations, and classroom pets; the other involves taking children out into natural environments, such as hiking, camping, and forest schools. Drawing on ethnographic fieldwork from a private kindergarten in China, which rents a small forest for the children, this paper explores what it means to inhabit a forest in the context of ECEC. While a 3-year-old boy was catching grasshoppers, he was accidentally bitten by a red ant, causing

his hand to swell. Although the teachers initially worried it might be a more serious bite from a leafcutter ant, they later concluded it was likely an allergic reaction to a local red ant. Despite the concern raised by the incident, the boy's parents were understanding and believed it was not a serious issue, allowing him to stay at the kindergarten for the rest of the day. At first glance, this story appears to be about child safety in kindergartens. However, from a posthuman perspective, humans and more-than-human entities are entangled, and the ant's bite can be seen as a form of boundary-making from the more-than-human. In the context of the Anthropocene, this paper may contribute to the broader conversation on posthumanism in education, advocating for a more inclusive understanding of ECEC that acknowledges the significance of more-than-human actors.

Performing Expertise without Experts: Barefoot Doctor Program and Medical Expertise in Rural China

During China's Cultural Revolution (1966-1976), a large number of lay medical workers—the “barefoot doctors”—were trained and worked in the rural areas as semi-doctors “to provide elements of environmental sanitation, health education, preventive medicine, first aid, and primary medical care while continuing their farmwork” (Sidel and Sidel 1982: 37). American sociologists and public health scholars, who visited China during the 1970s have analyzed its health care delivery quality, focusing on comparing health care systems of China and the U.S. (Sidel and Sidel 1982; Blendon 1979; Rosenthal and Greiner 1982). Recent scholarship has examined the role of the barefoot doctor program in establishing the rural medical system and in introducing western medicine in rural China (Fang 2012; Pang 2017). However, these literatures are often less engaged with the meaning making and interactions among various actors in the barefoot doctor program, and their insights have yet to be brought into theorizing the establishment of the barefoot doctor program as a new network of medical expertise in rural China.

Drawing on the model of “boundary objects” proposed by Star and Griesemer (1989) and the theory of expertise by Gil Eyal (2013), this paper investigates how the barefoot doctor program emerged as a new network of medical expertise in rural China during the Cultural Revolution, with a focus on the collaboration between experts and lay people in the network, as well as the role of the boundary object—A Barefoot Doctors' Manual. I argue that the success of the barefoot doctor program is a social outcome of the cooperative work among the “alliance” of the heterogeneous participants of the barefoot doctor program, consisting of the state, professional medical doctors, and rural residents. In this network of medical expertise, barefoot doctors work as a key node, bridging rural residents and professional doctors together.

Romantic Dystopia: Dating Narratives and Relationship Bloggers on a Chinese Female Online Platform

In Cold Intimacies, Illouz (2007: 5) analyzes emotional capitalism as a contemporary American culture, “in which emotional and economic discourse and practices mutually shape each other, thus producing...a broad, sweeping movement in which emotional life...follows the logic of economic relations and exchange.” Likewise, a large group of female relationship bloggers in China have developed a set of their own narratives to rationalize romance and intimate relationships as well, by using the language of business and even “games”. Their dating narratives are same popular in the overseas Chinese female online community in the Western society, where the digital-based dating culture is prevalent among the younger generations. This research project examines the notion of “emotional capitalism” through an investigation of how overseas Chinese relationship bloggers produce their dating narratives, with a focus on a female-oriented social media platform Xiaohongshu, also known as “Red”.

Based on in-depth interviews with the relationship bloggers and their followers on Red, I argue that Chinese female relationship bloggers are producing a gendered dating narrative with two major features: First, the dating narrative has a significant commodification logic which commodifies romantic relationships, objectifies potential partners, and represents the dating process as a gambling game. Second, this narrative has a gendered perspective that emphasizes a strong female selfhood in relationships, while downplaying the importance of romance and romantic love for women. In the meantime, men are portrayed as players in the dating game who do not share the same interests with women and are often seen as adversaries.

Residential Segregation in New Asian Destinations in the United States: A Spatial Perspective

Residential segregation is an important aspect of spatial inequality that shapes minoritized groups' life chances. In the past decades, there has been a rise in the share of immigrants settling down in new destinations that have limited prior exposure to immigrants. To assess how this spatial diffusion of immigrants is leading to new patterns of integration and assimilation, many studies have assessed residential segregation between White and different immigrant groups, but their findings are not conclusive. Aiming at addressing this inconsistency in the literature, this study explores how spatial connectedness to traditional gateways is associated with White-Asian segregation in new destinations.

With county-level data from the US Census and the American Community Survey, we will first construct a population-weighted spatial measure to quantify the extent to which each new Asian destination is connected to traditional gateways. This spatial measure essentially establishes a continuum between two Weberian ideal types of new destinations, with the first type being ethnoburbs arising from the natural expansion of traditional gateways and the second type being new destinations developed out of changing labor demands. In the second step, we will use two-way fixed-effects models to test whether our spatial measure can explain the heterogeneity in segregation among new Asian destinations between 2000 and 2020. In addition to White-Asian segregation, we will also conduct group-specific analysis for six major sub-groups: Japanese, Chinese, Filipino, Korean, Asian Indian, and Vietnamese. In the final step, we will further decompose the effect of spatial connectedness into compositional differences of immigrants across locales (e.g., differences in nativity, income, etc.) and remaining effects that can be potentially attributed to discrimination and exclusion. Findings from this study will shed new light on segregation in new immigrant destinations from a spatial perspective and may inform policies aiming at improving immigrants' integration, assimilation, and well-being.

Residential Segregation in New Hispanic Destinations in the United States: The Effect of Spatial Connectedness to Traditional Gateways

Residential segregation is an important indicator of spatial inequality that shapes minoritized groups' life chances and well-being. Over the past three decades, as an increasing share of the Hinospanic population in the US has settled down in new destinations that do not have a strong historical presence of their co-ethnics, researchers also got interested in assessing segregation patterns in these new destinations. However, results from prior research are not conclusive. While some studies documented segregation levels to be lower in new than in traditional destinations, others found the opposite pattern. Aiming at addressing this inconsistency in prior research, we evaluate how spatial connectedness to traditional gateways may moderate White-Hinospanic segregation in new destinations.

Our unique spatial perspective is rooted in the theorization of heterogeneity among new Hinospanic destinations. By analyzing different socioeconomic forces behind the spatial diffusion of the Hinospanic population, we identify two Weberian ideal types of new destinations, with the first type being those arising from the natural expansion of traditional gateways and the second type being those developed out from the changing labor demands. With this theoretical typology, we then propose that spatial connectedness to traditional gateways is a unique indicator that can be used to establish a continuum between the two ideal types.

We will test the significance of this spatial perspective with county-level data from the US Decennial Census and the American Community Survey. Firstly, we will construct a population-weighted spatial measure to quantify the extent to which each new destination is connected to traditional gateways. Then, we can use this measure to explain heterogeneity in segregation among new Hinospanic destinations between 2000 and 2020. In the final step, we will incorporate a comparative approach into the study by replicating the analysis on three major Hinospanic sub-groups: Mexicans, Puerto Ricans, and Cubans.

Uncertainties, Risks or Hope? Managing Embryos in a Multidisciplinary Team of PGT

Preimplantation Genetic Testing (PGT) is a globally expanding selective reproductive technology, offering the chance to identify embryos without specific genetic abnormalities, thereby increasing the likelihood of livebirths and healthy infants.

While existing qualitative research on PGT's clinical decision-making process primarily focuses on patients and their families, less attention has been paid to the perspectives of the medical specialists, particularly in the context of mainland China.

Drawing on ethnographic observations conducted between 2021 and 2024 at an assisted reproductive clinic in Shanghai, China, and in-depth semi-structured interviews with 16 PGT providers (genetic counselors, geneticists, IVF doctors, nurses, etc.) and users, we explore how this multidisciplinary team of PGT negotiates the selection of PGT embryos for transfer in medical contexts. Especially, how providers from various backgrounds perceive and frame these PGT embryos as clinical uncertainties or even risks, often in contrast to the promise of this technology.

Through close interactions with the multidisciplinary team of PGT, we offer a deep understanding of the production and interpretation of PGT embryos' uncertainty. On the landscape of uncertainty, PGT providers with distinct professional standpoints and decision-making resources often hold varying perspectives on PGT embryos and offer different recommendations, contributing to dilemmas faced by PGT users. The divergence in decision-making among PGT providers serves as a lens to explore how China's family planning policy originated in the 1980s continue to influence the practice of reproductive experts in the genomics era.

Becoming Americanized: The Generational Shift of Chinese Americans' Linguistic Construction of Their Ethnicity

Ethnicity is widely understood as a social construct in contemporary social science research, yet how the collective meaning and boundary of a given ethnic group shifts over generations remains elusive. Taking a conversation analytic approach, this study explores the generational shift of how Chinese Americans approach their ethnic groups in everyday language use.

This study utilizes data collected for a focus group study involving Chinese Americans. To address the underrepresentation of Chinese Americans in the evaluation of new medications, 12 focus groups were conducted among foreign-born and US-born Chinese Americans to investigate their perspectives on clinical trial participation. Drawing on the audio recordings of the focus groups, the present study performs a secondary analysis with a focus on how Chinese Americans construct their ethnic identities, memberships, and practices through their language use.

The analysis reveals three key differences between foreign-born and US-born speakers, suggesting a generational shift toward these aspects: 1) heterogeneity: foreign-born speakers tend to portray Chinese people as a homogeneous entity, whereas US-born speakers orient to heterogeneity within the group; 2) membership: foreign-born speakers do not reference their individual identity and background, whereas US-born speakers often establish their membership within the Chinese community; 3) the broader context: foreign-born speakers focus their discussions solely on Chinese, whereas US-born speakers tend to expand their discussions to include the broader Asian community and other minority groups in the US.

These differences highlight the intricate interplay between cultural background, generational influences, and societal contexts in shaping linguistic practices among Chinese Americans. I argue that the observed generational shift in these aspects reflects how the process of Americanization is manifested in everyday language use. This study also makes a novel methodological contribution by showcasing how secondary analysis affords insights into interactional research, which has traditionally relied on primary data analysis.

Menstrual Hygiene Technology and the Modern Body: A Study on Tampon Use Among Female University Students in China

While tampons are widely used in Western markets, only a small number of women in China use them for menstrual hygiene management. Both social media and academic literature often portray tampons as a healthy and modern product. However, this narrative overlooks the lived experiences of tampon users and potential health concerns. Drawing on Sara Ahmed's concept of "sweaty concepts" and McDonnell's theory of "cultural objects," this study explores how tampons intersect with women's menstrual experiences and their understanding of their bodies. It highlights both the physical practice of tampon use and the cultural significance of the product itself. Based on interviews with 16 tampon users from a university in Shanghai and an analysis of tampon-related content on social media, this study examines these dynamics.

The findings follow three main lines of inquiry: (1) As a form of menstrual hygiene technology, tampons help women conceal menstrual blood more effectively and support the transition to a body perceived as unaffected by menstruation, thus more aligned with productivity; (2) As a relatively new product in menstrual hygiene, tampons challenge traditional taboos surrounding the "hymen" while introducing new health concerns; (3) As a commodity, tampons carry symbolic value, and their purchase involves consuming the associated knowledge and imagery, with the market shaping a vision of the "modern" woman. These findings suggest that power dynamics are embedded in the study of cultural objects. Menstrual hygiene products, along with the knowledge and social meanings attached to them, are continually shaped by mothers, schools, media, experts, and businesses. Women's agency is closely intertwined with these power structures.

Justice Interrupted: How Platformed Narrative Strictures Failed Chinese Domestic Violence Survivors' Online Evidence Presentation

Existing studies indicate that digital technologies facilitate informal justice outside the state (Powell, 2015). Chinese domestic violence survivors, for example, leveraged platform affordances to seek visibility and validation through *evidence presentation*. Yet they found that they failed to bring about informal justice despite the fact that such narrative tactics align with prevailing legal standards on evidentiary fidelity and public expectations for vulnerable survivors. Why were these seemingly convincing narrative strategies counterproductive in the digital sphere?

Drawing on 38 formal and informal interviews with survivors, anti-DV workers, and platform moderators as well as participatory observation, this study shows how the interaction between platformed constraints imposed narrative strictures on survivors' evidence presentation.

First, while survivors tried to present evidence of suffering, platforms' business imperatives prompted them to suppress such content to make users upbeat and sustain their digital engagements. Specifically, by censoring "violence and negative content," survivors who showed their physical and mental harm to elicit public sympathy were silenced for "violating community standards."

Furthermore, as survivors attempted to disclose the details of domestic violence to lend veracity to their stories, platforms removed such evidence in the name of protecting user privacy. Indeed, abuse-referencing narratives, were removed automatically upon perpetrators' reports under the platform's enforcement of legal rules.

Lastly, when survivors exposed official documents to prove official misconduct, platforms—in accordance with state mandates—purposely aided state-engineered misinformation to discredit survivors and mislead the public through platforms' recommendation algorithms.

In all, platformed constraints—shaped by market demands, legal frameworks, and official policies—imposed narrative strictures that rendered survivors' experiences invisible and ultimately thwarted their pursuit of informal justice.

*Caregiving Experience of Unpaid Carers of People with
Schizophrenia in Taiwan: A Qualitative Study*

The Carer Support Centre (CSC) was established under the Ten-Year Long-Term Care Project 2.0 to provide multiple support services to carers. Based on the carer referral mechanism, long-term care case managers, who primarily conduct needs assessments for care recipients, will refer carers to the CSC for support if they recognise that the carers are experiencing significant burdens. However, the CSC faced challenges in better supporting carers of people with mental health issues, as it primarily assisted carers of individuals aged 65 or older with physical disabilities before the implementation of LTC 2.0.

Therefore, this study draws on the concept of carer burden to understand the challenges faced by carers of people with schizophrenia (PWS). The findings help contextualize carers' experiences within the framework of carer support policy. Insights were gathered from thirty carers through semi-structured interviews.

The subjective burden experienced by carers of PWS was identified as "the experience of frustration." Many carers expressed a strong sense of self-blame, coupled with guilt and regret for not providing enough attention to the PWS in earlier life. Furthermore, carers often felt undermined and devalued by the negative perceptions of other family members or practitioners. In terms of objective burden, "the impacts of caregiving on carers' lives and well-being" were also identified. Many carers reported self-withdrawing from social interactions to avoid unhelpful or intrusive conversations. Most notably, carers experienced severe mental health issues, including suicide attempts, especially before their relative was officially diagnosed, and lacked adequate social care support during this period.

Based on these findings, the CSC could implement interventions to strengthen carers' confidence and belief in their roles, including support groups exclusively for carers of PWS to enhance social participation. Additionally, CSC services should extend to carers whose relatives have not yet received a confirmed diagnosis.

LIU, YU-CHING* (Department of Social & Policy Sciences,
University of Bath, United Kingdom)

*The Unheard Voices of Unpaid Carers within the Long-Term
Care System in Taiwan*

The model of carers offers policy perspectives on informal carers in the long-term care (LTC) system, focusing on whether they are seen as co-workers or co-clients. Taiwan's Long-Term Care Services Act adopts the co-client perspective, highlighting that carers' rights are equally important as those of LTC recipients. This perspective is reflected in the Ten-Year LTC Project 2.0 (LTC 2.0), which has provided social care for individuals with mental health conditions and their carers since 2017. For example, respite care is offered to carers under LTC 2.0.

This study examines unpaid carers' decision-making processes regarding various LTC services, utilising the models of carers. Insights from thirty carers of people with schizophrenia (PWS) were gathered through semi-structured interviews.

The findings revealed that carers using LTC 2.0, and non-LTC 2.0 services had differing preferences, shaped by their perceptions of PWS needs. Non-LTC 2.0 carers prioritized the independence of PWS, while LTC 2.0 carers were more concerned with health deterioration, leading them to choose LTC 2.0. Many carers were worried about their ability to sustain caregiving, driving them to seek LTC support. Additionally, access to respite care for carers was tied to whether their care recipient was an LTC 2.0 user, rather than being considered independently. As a result, carers' voices were often overlooked in the needs assessment process.

Based on the model of carers, Taiwan's LTC system has not adequately integrated carers. The system primarily focuses on the needs of care recipients and still views carers as co-workers, acknowledging but not fully addressing the potential conflicts of interest between them. Greater attention should be given to the broader impact of LTC on carers and how the caregiving relationship affects their well-being. The needs of both service users and carers are interconnected and should not be treated separately within the social care system.

*Education-Centered Family Life: How Parents Conduct
Boundary Work in Economically Advanced Rural Areas of China*

Existing research on rural families and their offspring's education, a subject that has not yet garnered sufficient academic focus, often adopts a deficit model predicated on Pierre Bourdieu's cultural reproduction theory. However, as China's modernization progresses, certain rural regions are increasingly moving beyond the narrative of resource scarcity. The relationship between families in economically advanced rural China and their children's education has been minimally investigated. This study explores how parents orient towards their children's education in one of China's most developed rural areas through the lens of 'boundary work', drawing on in-depth interviews with 15 parents with school-aged children. The analysis shows that, contrary to the largely deficit model in previous research on Chinese rural parents and their children's education, the parents in this study typically put their children's education at the center of the family life, navigating complex internal familial boundaries along generational, gender, spatial, and temporal dimensions, in the hope to maximally support their children's educational performance and achievement. By presenting family life centered on education in economically advanced rural China, this paper adds a local contextual nuance to the analysis of educational aspirations among Chinese rural families, offering a perspective that transcends the conventional deficit model. The findings enhance our understanding of the intricate dynamics of boundary work and the strategic educational engagements of parents in the context of rural modernization. This paper also discusses how the typically instrumental boundary work parents conduct around and for their children's education may alienate both themselves and their children from the family daily life (which is supposed to be) featuring relaxation, communication, warmth and love.

*Understanding Internal Migration to Urban Areas in Developing
Countries: Differences and Consistencies across Urbanization
Stages and Historical Periods*

The literature on internal migration presents ambivalent measures of migration. The "migration-defining" spatial boundaries and time periods are often inconsistent among data collected in different countries which hinders meaningful cross-national comparisons, as well as among censuses and surveys collected for the same country which prevents consistent urban in-migration estimations useful for urban population estimation and projection over time. Meanwhile, the measures of urbanization also vary across countries and data sources. This paper attempts to compare and consolidate various census microdata and surveys for urban in-migration and population estimates, as well as satellite data for consistent measurement of urban development. Using hundreds of millions of records from 152 census microdata samples from the International Integrated Public Use Microdata Samples (IPUMS-I) and 208 Demographic and Health Surveys (DHS) for 84 developing countries in Africa, Asia and Latin America collected from 1970s to 2022, as well as satellite data that measures built-up areas based on the Global Human Layers (GHS-L) from 1975 to present, this paper seeks to provide a comprehensive overview of historical trends in urban in-migration patterns by age, gender, education as well as its correlation with urbanization (in terms of both population change and urban development measured by built-up levels) at both the subnational and national level. Using mixed-effects regression models that controls for subnational and national-level population and economic conditions, as well as varied migration-defining spatial units, this paper also presents empirical evidence on how prevalence of migration to urban areas changes along urbanization stages, as well as how the relative role of migration in contributing to urban population and urban development shifts over time. Lastly, with datasets available before and after Covid-19 for 21 selected countries, this paper also attempts to show migration to urban areas might have changed due to large-scale public crises.

From Local Heroes to National Symbols: A Comparative Analysis of Local Media's Roles in Disaster Response

"Don't be afraid, we're all here." Chengdu Broadcasting Host Jing Sun, braving aftershocks, rushed into the studio after the Wenchuan earthquake, with her colleagues launching a 232-hour continuous live broadcast. Due to the longstanding perception of disaster news as a taboo, this case represents an unprecedented spontaneous information broadcast initiated by a local radio station. Similarly, Genie Chance, a radio reporter at local radio station KENI, who'd hustled to the police station to report within minutes of the Alaska earthquake, and she became a symbolic center for the community. How do local media seize opportunities to produce information, promote community solidarity, and gain legitimacy? How these individual charismas serve as catalysts in the local sphere, facilitating the transformation of powerful symbolic processes into institutional responses? What differences does this reflect between the media systems and disaster management systems of China and the United States?

Informed by relevant literature on disaster management and media systems, we conducted a textual analysis of media reports and policy documents from both China and the United States. We found that disasters create a unique opportunity for the emergence of charismatic individuals. This study examines the ritualistic and ceremonial nature of media representations of disasters, contrasting them with practical and informational functions. The informational role of the media elevates them to a sacred status, positioning it as a bearer of community identity. In China, this charisma is typically subsumed into the collective, and Jing Sun being transformed into exemplary models or cadres that embody the state's charismatic authority. In contrast, the United States places greater emphasis on the individual heroism, prioritizing personal autonomy. The findings highlight the local ritual processes through which the media generates both information and solidarity during disasters.

False Consciousness or Rational Choice? RURAL Families Aspiring for Their Offspring's Higher Education in China's Remote Areas

This study explores rural (grand)parents' conceptions and practices concerning their offspring's education, drawing on in-depth interviews with parents/caretakers in 30 households and participant observation in 6 families in a remote area in 2023. The participants typically argue that *shangdaxue* (going to college/university) is of paramount importance for their children's future welfare, or 'the only way out'. They are doing all they can to support their offspring to achieve as much education as possible from a university/college as prestigious as possible, which entails constant toiling, self-denial, health problems, and anxiety about their children's school performance and higher education prospects. These findings indicate that present-day rural families in remote areas typically show strong educational desire and intense educational anxiety—no less than urban (middle-class) families do—contrary to the 'deficit discourse' dominating previous research which highlights rural parents' lack of higher education expectations and support for their children due to low levels of cultural, economic and social capital.

We argue that on the one hand, the remote rural families' firm belief in higher education seems to reflect a false consciousness in the Marxist sense about social mobility in contemporary China, where it is increasing difficult, if not impossible, to achieve social mobility through educational accomplishment, especially for disadvantaged groups. On the other hand, however, it is firmly grounded in their rational conclusion that among the multiple choices seemingly available to rural youth, striving for higher education is after all the most effective way to change fate, despite the opportunity costs and slim chance to get into a good-enough university. This rational choice derives from their lived experiences of the deep-rooted rural-urban disparities. The latter perspective also allows for a much-needed actor-oriented approach to complement the deficit model.

Building the Channels, Keeping the Gates: The Role of Intermediaries in Shaping Differentiated Transnational Labor Mobilities out of Indonesia

Indonesia is one of the largest labor sending countries in Asia. While Indonesian workers are seen in many different countries and different occupations, there are salient regional patterns of labor migration: Domestic workers often come from East and Central Java; Workers bound for Malaysia primarily hail from North Sumatra and West Nusa Tenggara. Moreover, while workers from North Sumatra are more likely to work in factories, those from West Nusa Tenggara mostly work in palm oil plantations. Women from Lombok, on the other hand, often work as domestic workers in Hong Kong and Taiwan instead of Malaysia. Meanwhile, some regions' outbound labor mobilities are more diverse and the destinations have also changed over the time, such as West Java. How can we understand such regional patterns and changes? Sociologists explain the mechanisms for shaping transnational migration trajectories and patterns by emphasizing accumulative causation, especially the effects of social networks (Massey 1993). Recently, researchers have introduced more feedback mechanisms in the explanation of migration corridors, bringing in influences of social media as well as the changing economic conditions in sending and receiving countries (Bakewell et al. 2016). This literature misses the role of intermediaries. This paper investigates the shaping mechanisms of such transnational labor mobility patterns from the vantage point of the intermediaries. Using national labor mobility data as well as interviews with sending companies in different regions of Indonesia between 2022 and 2024, this paper shows how the intersection of ethnicity, religion, gender and class create historical patterns of regional inequality in Indonesia, and such inequality has shaped regional patterns of migration and sustained and reproduced by intermediaries.

Barriers to Improving Climate-Related Disasters Preparedness in Rural Malawi through the "Agent, Host, and Environmental Actors" Model

Introduction: Recently, Malawi has been severely affected by climate-related disasters, including three cyclones since 2019. The study examines how multiple actors shape disaster vulnerabilities among rural populations in Malawi and analyzes the factors contributing to rural populations' vulnerabilities to extreme weather events.

Aim: This study aims to identify barriers to improving preparedness levels and reducing disaster vulnerabilities. Drawing on Parrish's (1964) epidemiological triangle and Blaikie et al.'s (2004) disaster vulnerabilities

concept, the study explores the interplay between natural and built environments, rural and urban communities, and resource use amid extreme poverty and climate-related disasters.

Methods: Participant observations and 40 in-depth interviews were conducted in Neno District, Malawi, in 2021, supplemented by additional observations and policy desk review in 2023 and 2024. This study was part of a collaboration between Ben-Gurion University of the Negev and Partners in Health Malawi/Abwenzi Pa Za Umoyo.

Results: The study's results highlight the pathways in which overexploitation of natural resources contributes to multiple disaster vulnerabilities among rural communities. In this context, increased urbanization has led to higher wood energy demands, resulting in deforestation in rural areas. Rural households, already facing poverty, underdeveloped infrastructures, and climate variability, often resort to charcoal production, which provides insufficient income to improve preparedness while exacerbating environmental hazards that increase the same communities' vulnerabilities to climate-related events. With insufficient investment in preparedness, rural communities remain at risk as extreme weather events, intensified by global factors, continue to strike the country.

Conclusions: The relationship between climate-related disasters and human-environment interactions is multi-directional. Environmental protection alone may inadvertently harm rural livelihoods without improving emergency preparedness. Similarly, physical protective measures will be limited if they do not address rural-urban disparities. Therefore, human-environment interactions must be incorporated into disaster risk reduction frameworks and include community engagement to improve preparedness while addressing broader societal changes.

Expanding Feasibility: Public-NGO Partnerships in Designing and Implementing Disaster Management Plans in Southern Malawi

Introduction: Recurrent climate disasters, disease outbreaks, and the COVID-19 pandemic have driven the development of district-level disaster management plans in Malawi. However, extremely limited resources and centralized state structures hinder their implementation. The study examines the complex interplay between health, welfare, and disaster management stakeholders from NGO and public sector in designing and implementing disaster management plans in Southern Malawi.

Aim: The study examines strategies employed by district-level public officers to develop disaster management plans amid recurrent emergencies and resource constraints, as well as the relationships and negotiations between public and NGO stakeholders surrounding preparedness priorities.

Methods: As part of a collaboration between Ben-Gurion University of the Negev and Partners in Health Malawi/Abwenzi Pa Za Umoyo, data were collected through in-depth interviews with 28 stakeholders in Neno and Chikwawa Districts, Malawi, during August-September 2024, supplemented by document analysis of policy papers related to Cyclones Idai, Ana, and Freddy.

Results: Both public and NGO stakeholders prioritize *feasible* interventions in low-resource settings while negotiating with the central government and donors for more costly, infrastructure-focused investments. Public servants

promote "open-source" disaster management plans, creating a pool of shared priorities and resources, including systems, staff, and data. They build networks and long-term relationships with NGOs and multi-sectoral actors to enhance program implementation *feasibility* through the establishment of permanent and ad-hoc committees and training.

Conclusions: Disaster management plans in Malawi are subject to neoliberal policies advocating for selective services based on *feasibility* and cost-effectiveness with limited resources, echoing similar approaches for other public services in the country. However, public servants' focus on long-term relationships creates spaces of imaginaries of what could be *feasible* in disaster preparedness and management. All the while, challenging the notion of *the feasible* by negotiating for infrastructure-focused investments.

LLANOS HERNÁNDEZ, LUIS* (Universidad Autónoma Chapingo, Km 38.5 Carretera Federal México-Texcoco, Mexico)

Sociología y Sistemas Complejos: El Estudio De La Agricultura Campesina En El Emergente Contexto De Un Estado De Intervención Económica En México

La sociología enfrenta el reto de asociarse con otras disciplinas del ámbito de las ciencias sociales, de las ciencias experimentales e incluso con las disciplinas relacionadas con las ingenierías para abordar problemas que afectan a la naturaleza y la sociedad. La vía que posibilita la conjunción de las diversas disciplinas es el enfoque de los sistemas complejos, una perspectiva multidimensional que debe ser articulada sobre la base de la formación de un marco epistémico común que articule a las disciplinas que intervienen en el abordaje y búsqueda de solución de un problema de la sociedad y la naturaleza. A partir de este marco epistémico común se pueden formular las preguntas que se derivan del campo de la sociología y que deben ser abarcativas para que todas las disciplinas participantes se vean identificadas con el problema a atender. Las grandes interrogantes del análisis social son de carácter sociológico, pero estas conjeturas deben armonizar a los conceptos y metodologías propias de cada una de las disciplinas. En el caso de la agricultura campesina, la biología, la geografía, la agronomía, la economía, la sociología y la historia, entre otras disciplinas, pueden dar forma a las dimensiones o campos de estudio que posibilitan adentrarse a la problemática campesina. Estos procesos de investigación e incidencia social deben considerar el contexto social y político de la nueva realidad nacional en México, donde emerge un nuevo sistema económico y político que orienta el curso de las investigaciones más allá de los retos teóricos y las metodologías de los sistemas complejos.

Childhood and the Unequal Distribution of Futures

Sociology of childhood has, from the outset, distinguished itself as intent on understanding children as agents in the present – not simply human beings. In the last decade, however, some have called for a revision of the field's relationship with temporality, not least by signalling children's own preoccupations with the future. Yet some of this scholarship, despite its focus on children's climate activism, breeds a sense that there is no future at all, and certainly no common horizon, be this for the planet or for children in 'edge' populations. In this paper, we respond to the diffuse problems posed by this literature examining the ways the young make futures in difficult and uncertain circumstances. We enter this debate with an ethnographic approach to the everyday lives of children in *villas* in Argentina and unaccompanied migrant children in England with two goals. First, we consider the complex emotional, moral, and material texture of futures which animate life from the point of view of our young interlocutors. Second, we argue that there is at once a profoundly unequal distribution of futures in late capitalist, neo-colonial contexts but that imaginaries and futuring practices are complexly articulated, such that while futures are overdetermined, transformations cannot be precluded. Our goal is to avoid the binarism of either a radically open future or a futureless apocalyptic horizon, while keeping alive ethnographic insights about the relationship between hope, aspirational normativity, and the materiality of the reproduction of life in contexts fraught with inequality. While pointing to the unequal distribution of futures, we nonetheless hold on to the possibility of a future at all, where such futures may be different from the grossly unequal present, instead of condemning political imaginaries and practices to a repetition or degradation of present-day conditions.

What Is Critical in Critical Children's Rights?

Children's rights have gained an important position in research in recent decades. Certainly, with the adoption of the United Nations Convention on the Rights of the Child (hereafter: UNCRC), a significant incentive was created 'to do' children's rights research (Bendo, 2019; Quennerstedt, 2013; Reynaert, 2009). It resulted in both a quantitative increase in the number of published research articles in scientific databases and a qualitative expansion of the object of study in terms of themes, approaches, disciplines, etc. (Quennerstedt, 2013). Today, children's rights research seems to be an 'established and legitimate field of study' (Quennerstedt, 2013: 233), even to the extent that increasingly this field is referred to as 'Children's Rights Studies'. With this, it presents itself in the academic landscape alongside other research fields such as childhood studies, human rights studies, welfare studies, development studies. Notwithstanding this slow evolution of a research field's 'coming of age', more and more critical questions have been raised in recent years about the central object of study, that is to say children's rights. These critical questions are very diverse in nature and originate from different disciplines. However, the common thread that underpins them all is that they do not seek to disqualify the concept of children's rights; instead, they strive for a more profound and nuanced understanding of children's rights, *beyond* the UNCRC. Although these critical issues mostly start from a critique of mainstream children's rights discourses, the stakes are primarily a search for providing alternative pathways to understanding and enacting children's rights. This book approaches this issues.

"Maricón El Último": La Experiencia Escolar Del Alumnado LGTBIQ+ En La Educación Secundaria En Cataluña.

Aunque la experiencia escolar representa un eje fundamental en la producción y reproducción de desigualdades en el sistema educativo, tradicionalmente ha ocupado menos espacio en la literatura que otras dimensiones de análisis como el acceso, los resultados académicos o los recursos. Siguiendo a Reay (2010), incorporar las experiencias escolares como eje analítico en el estudio de las desigualdades educativas implica comprender la escuela no solo como una institución que transmite conocimientos, sino como generadora de identidades sociales. En este sentido, la presente investigación propone que de la misma forma que una institución educativa clasifica, premia y expulsa sujetos por sus resultados académicos, gustos y aptitudes para el aprendizaje, también lo hace por sus cuerpos, deseos e identidades. Para ello, se analizan los malestares y bienestar del alumnado LGTBIQ+ en la Educación Secundaria Obligatoria en Cataluña. Así, al situar la dimensión emocional de la experiencia escolar en el centro del análisis, se pretende complejizar el estudio de las desigualdades educativas explorando cómo la escuela representa un espacio narrativo privilegiado para algunas identidades y uno de subordinación para otras (Elizalde, 2014).

La investigación se centra en las experiencias de 81 jóvenes LGTBIQ+ de 16 centros educativos y emplea una metodología de métodos mixtos con predominio cualitativo, utilizando como técnicas la herramienta digital *Relief Maps* y grupos de discusión. Los resultados muestran que el alumnado LGTBIQ+ sufre malestar y violencia en la escuela, con desigualdades significativas entre las experiencias debido a factores como el rol del profesorado frente a la violencia, la configuración de los espacios escolares y la articulación de la masculinidad hegemónica. El estudio concluye que es crucial convertir la escuela en un espacio de protección emocional para las personas jóvenes. También sugiere repensar la victimización del alumnado LGTBIQ+ y reconocer su capacidad de resistencia frente a la cisheteronorma.

Phantoms of Diversity: Reclaiming Multicultural Pasts through More-Than-Human Alliances in Urban Voids

Before World War II, Poznań was home to a vibrant Jewish community that significantly shaped the city's cultural and social fabric. Like many cities in Central and Eastern Europe, its multicultural character was deeply altered by the war, leading to the near-erasure of its Jewish heritage. While traces of this multicultural past still linger in the urban environment, these sites remain abandoned and largely uncommemorated. Threatened by the forces of capitalist urban transformation, these urban voids reflect a process of forgetting Poznań's diverse heritage rather than preserving its memory.

In this context, the paper explores how urban voids can foster more-than-human alliances, offering opportunities to reclaim forgotten multicultural

pasts and construct progressive futures. Urban voids are liminal spaces in contemporary cities, caught between obsolete past functions and future redevelopments. Simultaneously, their material degradation gives rise to new qualities that can contribute to the development of new urban imaginaries. The analysis focuses on the case of the Edmund Szyk Stadium in Poznań. Once appropriated as a forced labor camp for Jews during the German occupation, the now-abandoned stadium has become a habitat for an emergent ecosystem, lacking any material acknowledgment of its past. By engaging with the more-than-human elements of the space, the paper argues that urban voids like the Edmund Szyk Stadium can serve as catalysts for re-engaging with forgotten cultural diversity. In doing so, they offer an alternative approach to commemorating the multicultural histories of cities like Poznań, challenging dominant memory politics and proposing new practices of urban ecology and remembrance.

Emotional Dynamics in Digital Learning during the Covid-19 Era: Exploring Generative AI Technologies in Social Research

The widespread adoption of artificial intelligence (AI) tools offers new analytical capabilities that enhance our understanding of social phenomena (Airoldi, 2022). In particular, certain AI models facilitate the identification of trends and patterns in emotions, which are valuable for investigating the mechanisms underlying social structures and group dynamics. The significant integration of digital tools in pedagogical practices, accelerated by the Covid-19 pandemic (Fasanella A., Lo Presti V., Parziale F., 2020), presents both challenges and opportunities for research on emotions and learning within digital environments. Indeed, recent studies in neuroscience demonstrate that human cognitive processes, including attention (Vuilleumier, 2005), learning and memory (Phelps, 2004; Um et al., 2012), and reasoning (Jung et al., 2014), are shaped by emotions. Consequently, it is essential to consider the capacity of educational technologies to influence emotional experiences, with potential implications for learning outcomes (Chai M. Tyng et al., 2017). Based on data collected from the research project "The Evaluation of the Social Impact of Distance Learning after Covid-19" conducted by Sapienza University of Rome, this study aims to analyze the emotional responses of teachers and students in digital learning spaces during the Covid-19 pandemic. This analysis will be conducted using the textual content of interviews and focus groups, transcribed in Italian, and examined through textual analysis techniques employing generative AI. Specifically, the umBERTo AI model, which is derived from the BERT architecture, will be used to conduct sentiment and emotion analysis on Italian-language texts. In light of the findings, this research further seeks to explore the opportunities, limitations and ethical considerations inherent in the application of AI technologies in social research.

The Failure of the South African Family Law System in Custody Battles: A Father's Perspective

This article examines the experiences of four non-resident fathers in child custody battles in South Africa. These fathers have been in constant legal battles and have concluded that the South African family law system has failed them. The system, according to these fathers, refers to the various laws related to the maintenance court system and the children's court, as well as the people who implement them, including social workers from the Department of Social Development, court-appointed psychologists, and family lawyers, and all the other organisations tasked with ensuring that the best interests of a child in custody cases are upheld. The interviewed participants maintained this view based on what they perceived as the barriers that the system places before fathers. Participants in this study also believed that in child custody cases, the courts tend to be biased against men, and they lament the slow manner in which the children's court handles and resolves child custody cases. The narratives of the four participants presented in this article shed light on an important aspect of parental relations in South Africa. The study recommends a coordinated effort by the government, the South African court system and organisations advocating for fathers' rights to encourage the involvement of non-resident fathers, and commends the recent court judgements in favour of fathers in parental alienation cases. The article emphasises that the systems should promote positive and active father involvement with their children with the same vehemence as financial provision by fathers for mothers and their children.

LOCKIE, STEWART* (James Cook University, Australia)

Is Nature Conservation Possible in the Anthropocene?

Earth system processes summed up in the idea of the Anthropocene are forcing profound change in how we humans produce food, energy, etc., prepare for natural hazards, and conceive the goals of nature conservation. Rapidly escalating climate impacts demand anticipatory action, according to proponents of resilience-based ecosystem management, to expand the protected area estate, intensify ecosystem restoration, improve habitat connectivity, reduce anthropogenic pressures, and accelerate the adaptation of ecological communities. While each of these options have potential for regressive social impacts, assisted ecosystem adaptation attracts particular criticism over the alleged risks of unintended ecological impacts and legitimization of continued greenhouse gas emissions. Drawing on experience in the Great Barrier Reef, this presentation considers possibilities for solidarity, empowerment, and community-building through the development of new conservation paradigms including assisted ecosystem management. In doing so, it asks how nature conservation might be different when considered in relation not only to biological but to cultural, linguistic and social diversity.

Can Value be Created for Neglected and Underutilized Crops? the Importance of Consumption Influencers in Europe

Can value be created for food if their seeds are neglected or underutilized? The scientific literature highlights two entry points that can help us to better understand how value might be created: through the creation of enabling food environments and through the diversification of value chains. We explored this relationship between enabling food environments and diversified value chains by conducting an online survey of over 1000 actors that are involved in the selling or in the valorization of neglected or underutilized cereals and legumes (NUCs) in seven EU countries (Denmark, France, Hungary, Italy, Portugal, Sweden and Switzerland). We identified an important role for 'consumption influencers', who are intermediary actors between producers and consumers who shape consumption practices within food environments. By exploring the organization of these value chains and the types of ecosystem benefits created from the sale or use of NUCs, we can explain how a sub-sample of actors (72) position themselves primarily around environmental concerns, which the majority actively promote through social media and by word-of-mouth. The social missions of these actors are more concerned with the model of agriculture that is unfair to both the agroecosystems and farmers, than with the nutritional benefits of NUCs. The sector relies heavily on organic certification and the perceived benefits from selling NUCs is mainly environmental. The NUCs sellers have a rather loyal customer base. We look across these initiatives in order to find themes in value creation that are distinguished based on the transparency and communication of ecosystem benefits along the value chain.

LODI, LORENZO* (Scuola Normale Superiore, Italy)

De-Fetishising Unions in Global Production: Scrutinising Workers' Power and Labour Weakness in the Automotive Global Value Chain in Morocco and Tunisia.

This paper examines the contradiction between the disruptive power of workers in Global Value Chains (GVCs) and union strategies that often perpetuate their vulnerability. Mainstream industrial relations analyses typically focus on GVC workers' limited structural power—due to informality, precarity, and gender-based oppression. These conditions, combined with State and managerial despotism, challenge unionization/associational power as well.

Yet, in GVCs, weak labour-market power could be counterbalanced by strong workplace-disruptive power rooted in the synchronization needs of just-in-time production. Historically, the labour movement did not emerge from a scenario of secure jobs and established "social dialogue"; thus, objective conditions cannot be exaggerated as reasons for labour weakness in global production.

Drawing on extensive fieldwork experience and a critical approach to global labour studies (Ness 2015, Atzeni 2021, Nowak 2021), this paper underscores the disconnect between workers' exploitation within GVCs and the corporatist or social-democratic strategies of unions. This disjunction perpetuates labour vulnerability, complicating efforts to (1) consolidate grassroots organization and (2) effectively leverage workplace power through strike actions.

Morocco and Tunisia as peripheral, yet increasingly important nodes of the global automotive industry, serve as a case study. The weakness of Moroccan labour associations in this industry is aggravated by prioritizing institutional recognition over support to militant actions, despite efforts by grassroots workers to organise and mobilise. In Tunisia, relatively strong unions in the car-component sector have often divided and demobilized workers in critical labour disputes.

I attribute the moderate approach of Morocco and Tunisia's unions to two factors: (1) their fundamental acceptance of a low-wage and "dependent" accumulation model in exchange for institutional and material concessions from the state to their key constituency (public sector workers); (2) the influence of Global North labour bureaucracies, which promote a corporatist agenda under the guise of "social dialogue" through training programs targeting Global South unions.

LOIS LIAO, LOIS LIAO* (Cardiff University, Brazil)

Exploring Identity and Mental Health through Creative Methods and Food-Related Events: A Methodological Approach for Understanding Youth of Global Majority Background

Understanding how young people from global majority cultures navigate their identity and mental health is a complex task, particularly in the context of rising racism and cultural marginalisation. This paper proposes a methodological framework that utilises **creative methods** (such as participatory arts and storytelling) and **food-related events** as key tools for researching these sensitive issues. By providing youth with alternative means of self-expression, creative methods allow participants to engage more deeply with their cultural heritage and articulate their emotional experiences in ways that traditional research methods may not capture. Food-related events, as culturally significant and socially interactive settings, create an accessible and comfortable space for exploring connections to home culture and identity.

This paper will argue that these methods offer a unique advantage in addressing the needs of ethnic minority youth, particularly those attending youth drop-in centres, by fostering meaningful discussions in a non-threatening, creative environment. The study design will be tested in Wales, where youth from global majority cultures are increasingly facing challenges to their sense of belonging and mental wellbeing in light of recent social tensions.

The aim is to demonstrate how creative, culturally relevant approaches can lead to more nuanced and authentic data collection, allowing researchers to gain deeper insights into how ethnic minority youth perceive their identity and well-being. This paper contributes to the growing recognition of relational wellbeing as a socially and culturally embedded concept, positioning creative and food-based methodologies as effective tools for future research in this area.

The Body without Organs: How a Chinese Youth Community Becomes Decentralized and De-Organized Using Web3

In their seminal work *A Thousand Plateaus*, Deleuze and Guattari introduced a new social imagination: "Be rhizomes, not trees; be minority, not majority; and be a body without organs (BwO)." They challenged traditional modes of organizing communities and social movements. Decades later, we have observed changes in how social collectives have been organized in China, in the example of 706 Youth Community. Since its inception, "decentralization" has been a central theme for 706 Youth Community, although they initially adopted a "tree" structure, in Deleuzian terms. However, various events—such as urban management policies in Beijing, the Covid-19 pandemic, and cryptocurrency restrictions in China—have propelled the community to abandon the "tree" and embrace a rhizomatic structure. Additionally, the rise of Dali (Yunnan) as a "nomad's heaven" and advancements in Web3 and blockchain technology have further enabled the community to approach the ideal of a BwO.

This paper, through document analysis, ethnography and interviews, examines the evolution of 706, the largest Chinese youth community, to understand its transformation over the years. In particular, the research focuses on understanding how Web3 and crypto became the facilitating tool of its organizational change.

But how close are they to the ideal BwO as envisioned by Deleuze and Guattari? This paper seeks to explore this question, shedding light on the complex and dynamic nature of contemporary Chinese youth communities.

Justice Work - Sisters (having to) Do It for Themselves

This paper outlines findings from our research which sought to explore the lived experiences of victim/survivors of stalking and/or coercive control as they navigated their way through the Scottish Criminal Justice System (SCJS), commissioned by the Scottish Government. Building on the work of Acker (1990), Hochschild (1983), Fishman (1978), Kelly (2016) and Vera-Gray (2018; 2020) our findings show that women's involvement as victim-survivors with the criminal justice system insists they perform elements of both hidden (behind the scenes) and visible (but unacknowledged) work. These types of work replicate already identified elements of emotional, safety and violence work. In addition, however, we uncovered a new form of work that women must undertake when seeking justice which we have conceptualized as 'Justice Work'. The 'Justice Work' performed by victim-survivors had varying degrees of visibility and prominence but was essential for the progression of their case within the criminal justice system. Our analysis found that 'Justice Work' could take the form of three types of labour:

- Self-Education, Educating Others and Advocacy
- Identity Negotiation and Performance
- Investigation and Evidence Gathering

This presentation will give an overview of each form of 'justice work'. We argue that such work is wholly gendered and should not be deemed necessary in a system where it is the responsibility and role of the criminal justice system to collate evidence of a crime. Women were juggling multiple roles and responsibilities during their criminal justice journeys, many of which added to the stress, trauma and disempowerment they felt.

Preventing Violence Against Women through the Digital Media: Reflections on the Role and the User Interface Designs of Mobile Applications

The study of the relationship between the media and gender-based violence has revealed a potential risk: the media system may contribute to the legitimisation of gender stereotypes, which are the underlying causes of gender discrimination and male violence against women (Suárez-Villegas, 2020). This study examines the representation of violence against women in

television advertisements. The findings of international studies indicate that media coverage of this issue tends to frame violence against women in two mutually reinforcing ways: *victim blaming* and *perpetrator excusing* (Lamb, 1996; Nettleton, 2011; Taylor, 2020).

This paper presents a further development of research on narrative strategies and gender roles in institutional communication on gender-based violence (Lombardi, 2023). This study compares the digital communication strategies of the Italian government and other private organisations in relation to violence against women. The study examines digital tools and platforms for the prevention of gender-based violence, with a particular focus on mobile apps (Eisenhut et al., 2019).

A systematic search was conducted on two app distribution platforms (*App Store* and *Google Play*) with the objective of identifying available apps and collecting descriptive information on these tools. This information included details on the owners, target audience, functions, conditions of use, dissemination, and user interface design development, including registration and entry, everyday use, and suspension (Light, Burgess, Duguay, 2016).

The findings permit a comparison of the Italian government's utilisation of digital platforms with those of private entities. They may indicate the potential for extending novel communication modalities to institutions and offer the opportunity to evaluate the risks to privacy posed by these platforms in addressing gender-based violence.

LOMBARDO, CARMELO* (Sapienza University of Rome, Italy)

PUOTI, MATTEO* (Sapienza University of Rome, Italy)

The Intellectual Function and Its Fields: Organizational and Connecting Activities, Degrees of Organicity, Hegemonic Agenda Extensions.

This paper offers a reconsideration of the "intellectual function", showing the potential of its connotation in an extended sense, applying it to multiple social fields and subfields.

Organizational and connecting functions of cultural intermediation and entrepreneurship, set in continuums and varying combinations between strictly cognitive and material work, are those Gramsci had considered necessary to reach a "concrete approximation of the reality" of the roles and strategies proper to those who (organically) act in relation to a trend or group which seeks to be hegemonic – and do so, either by leading and complying with new conformities, or by behaving according to social space portions that produced them and professional trajectories that mark them.

If the methodological fallacy of seeking the nature of intellectuality through degree differences between cognitive and material labor should be avoided, conversely, all activities of those who provide connections of various kinds, within civil society, between profane/public/popular instances and identities, and those of experts/leaders/producers, are to be included; activities that tend both to encompass instances and values that already socially widespread (common sense and conformity) and to thicken the links between different groups, individuals, ideas, institutions.

Agents who carry out such activities in a minute, occasional and inaccurate way should also be included, in order to track both their position-takings and strategies within their own recognized and elected fields as specific/autonomous, as well as their position in the broader power and economic fields. All those ranging from the "creators" of the various sciences, philosophy, art, politics, literature, to provincial teachers and journalists, to the "humblest administrators and disseminators", can thus be included in the object of study. The distinctive feature of the intellectual, in short, is to be sought in the relations system in which intellectual activity, or the "grouping that personifies it," is placed.

Youth Narratives on Violence in the Indian State of Manipur

Violent clashes over land and political resources among the ethnic communities of Manipur have been recurring themes in its history for the last few decades. Profoundly different in 2023, however, was the widespread usage of *instant-messaging* Social Media platforms, such as WhatsApp and Instagram, in disseminating information at breakneck speeds. The spread of the *spectacles of violence* and bloodshed, accompanied frequently with the political mobilization of youths within *digital spaces*, led to spontaneous constructions of narratives of violence.

Our research paper will focus on the changing nature of violence in India as a developing country - the role of technology in the intensification of violence, and how digital media implies the growing importance of emotional *proximity* to conflict as transcending traditional physical limitations. We shall highlight the perspective of youth on the origin of violence, its continuation, and their visions for the future, along with their views on the (in)actions of the State in the violence.

We adopt a mixed methods approach incorporating in depth interviews (n=50), surveys (n=300), and content analysis across popular social media platforms like YouTube and Instagram to understand in detail the narrative construction, knowledge production and sense-making of the violence by Youth.

Findings from our pilot reveal sharp differences in how events are interpreted by stakeholders from different vantage points. Crucially, all youth interviewed in the pilot project have expressed critical views on the State Government's acts of omission and commission during the duration of the conflict. They have also expressed the need for structural transformations. We have also found very different views on the initial impetus for the conflict among those interviewed. Our findings will have implications for stakeholders of the conflicts including policy makers and civil society at large through its ability to inform possible reconciliation and/or conflict resolution strategies.

LONGLANDS, HELEN* (UCL, United Kingdom)

Re-Envisage Education for Gender Equality and Green Transformation in the Age of a Digital Society?

This paper explores opportunities, challenges and potential threats linked with digital technologies for supporting women activists' engagement and leadership in processes for gender equality, social justice and green transformation in education in South Africa drawing on research conducted in three neighbourhoods where acute effects of climate change, environmental degradation and gender inequalities in education intersect.

Literature highlights the importance of understanding how climate change, gender, education, poverty and other social divisions intersect and are localised in different contexts (Pankhurst, 2023), the necessity of addressing intersecting inequalities in education in ways that engage with long-standing strategic, feminist issues around gender equality, empowerment, social justice and countering misogyny, actively involving women most affected by these issues in processes of change (Moletsane et al., 2021), and the need for better data (Longlands et al., 2024). Studies also discuss how digital technologies can support women, especially poor and/or marginalised women, to access information, develop greater awareness of rights, have their voices heard and facilitate or enhance participation in different forums, share knowledge, ideas and information and build solidarity and networks (UNESCO 2024; UN Women 2024; Barrera Yañez et al. 2023). But studies also highlight how digital technologies, and rapid technological change, can mask, reinforce, deepen and lead to new forms of gender inequality, discrimination, silencing, distortion and misinformation, enabling practices and narratives to spread that further marginalise and discriminate (Galloway 2024; Di Meco & Wilfore 2021).

This paper considers this dilemma. The research draws on the AGEE Framework and participatory approach (www.gendereddata.org), both informed by the capability approach, to consider local insights on gender, education and climate, how connections can be built to ensure women's increased access to information and social capital can support their leadership in climate activism, and how better data can inform effective policymaking and practice in this area.

Rest As Resistance in the Feminist Classroom

This paper presents an autoethnographic reflection on the challenges and learning experiences I encountered in feminist teaching, including the establishment of a Gender and Diversity Studies Master's program in North Belgium, which has been running for a decade. The conditions for higher education and critical thinking have been increasingly constrained, reflecting broader global trends. Despite attacks on fields such as gender, postcolonial, and migration studies, these disciplines have gained popularity among students, coinciding with broader initiatives to diversify curricula and implement diversity action plans in the neoliberal university.

Within Gender and Diversity Studies, this growth has brought both opportunities and challenges. While the student body is slowly diversifying in terms of backgrounds, motivations, and political engagement, whiteness and cis-women remain overrepresented among both students and faculty. This raises important questions about how to address these imbalances in feminist education and work toward more inclusive teaching practices. Furthermore, the increasing diversity among students creates unique demands for flexibility

and accommodation, particularly for those who are neurodiverse, disabled, or working. The push for digitalization—accelerated by the Covid-19 pandemic—has led to requests for live streaming, recorded lectures, and flexible and individualized learning options, alongside in-person teaching.

This paper explores how these accommodations intersect with the feminist classroom, which aspires to be a space of safety, bravery, accountability, and often vulnerable, embodied, and affective pedagogies. Following a leave of absence from academia due to burnout and personal crisis, I reflect on my return to teaching. Through concrete pedagogical examples, I discuss how I introduced "rest as resistance," creativity, joy, and mutual care into my teaching while navigating the evolving complexities of feminist pedagogy within changing academic and institutional landscapes.

LONGO, GINA MARIE* (Virginia Commonwealth University, USA)

The Internet As an Institution: Reconceptualizing the Digital for Sociology As a Discipline

Within the last twenty years, a new generation of up-and-coming social science scholars has pursued their research agenda using digital spaces and data to investigate our social world. Like other previously burgeoning sub-disciplines within social sciences, digital sociology is still subject to more mainstream disciplinary criticism, especially when publishing and disseminating peer-reviewed work. To integrate digital sociology into the mainstream, we must move forward methodologically and theoretically towards more integrated research, so that non-digital scholars do not treat digital spaces as ad hoc proxies for "real" (i.e., more traditional) data or as mutually exclusive from "real life." But how? For digital sociologists, a necessary first step is reconceptualization of the digital spaces we study. What are the Internet and its digital spaces therein? I argue that social scientists study the Internet as a social institution. Patricia Yancey Martin (2004) once conducted a comprehensive review of the conceptual development of the institution throughout twentieth-century social theory to argue that sociologists should study gender as such. Extending her argument, the first part of this article draws on Martin's twelve criteria for categorizing any phenomenon as a social institution to make a case for the Internet. I use examples of prior digital scholarship to demonstrate how the Internet represents a new social institution worthy of inquiry through "its twelve defining characteristics" of endurance (persistence over time), social practices, conflicts, power struggles, identity formation, and change, among other criteria (Martin 2004; 1256). This approach can enrich the evaluation of peer-reviewed digital research, expand social theory, deepen our understanding of the Internet's social nature, and stimulate more critical investigations into the interconnections of the Internet and other social institutions that could reshape the landscape of digital sociology and open up exciting new avenues for research.

The Subjective Experience of Uncertainty, Justice and Risks in Times of Crisis: New and Old Forms of Inequalities in Work in Quebec

In addition to health issues, the pandemic crises has had short-term social impacts of an unprecedented magnitude on employment, education, future plans and family and social activities. These shocks have been amply documented but long-term repercussions on subjectivity are much less well

understood. This presentation will present results from a mixed methods project analysing the impacts of disruptions in work and employment due to the pandemic and discussing the nature and subjective experiences of uncertainty and longer-term consequences on workers' pathways. It focuses on some of the most brutally affected occupations (nurses; cashiers; delivery people; high-tech and IT professionals; cultural workers; university students in employment). Data was built from seven focus groups (totalling 54 participants) conducted in Québec between 2020 and 2022.

Firstly, results reveal two dimensions which lastingly mark individual pathways foreseeable objective changes in workplace and activity (exit and retention, increase of worked hours, etc.), but also the singular conditions of these changes (e.g. an exit by dismissal vs. by resignation; continuity in the same job vs. a radical employment turning point, etc.), showing a complex continuum of uncertainty and perceptions of justice. Secondly, we observe that workers who remained in labour market during the crisis experienced specific difficulties and opportunities, highlighting stable tendencies towards the exacerbation of advantages and disadvantages regarding qualification and gender (career and income opportunities for the more qualified; violent workplace conditions for less qualified workers; intensification, emotional stress, burnout for female workers; etc.). Thirdly, the data shows that the perception of risks was unevenly distributed for people in employment, less related to physical health than to relational, financial, emotional, and mental health outcomes. In conclusion, beyond the objective changes in activity resulting from the pandemic, workers' stories show the subjective experiences and impacts of these changes, revealing new and pre-existing inequalities at work.

Latinos and Their Music in a Nation of Immigrants: The Social Imaginary in the U.S.

This paper focuses on how trans-national migration and immigration generates new forms of popular culture. The focus is on the migration of individuals from Mexico and the Spanish-Speaking Caribbean to the mainland United States and their creation and consumption of music. It looks at the *borderlands* of the Latino experience in the United States and how Latinos in this country must navigate a variety of borders – geographic, cultural, artistic, market, and psychic – in their music-making and music-consumption. It emphasizes how the dominant racial imagination in the United States effects this navigation as Latinos confront a state of being a “perpetual immigrant” or what Thomas (2010) calls a “citizen-immigrant.” I use Flores (2000) concept of the Latino imaginary to conceptualize the process of navigating the various borders of the Latino experience using a number of case studies of Latino music and Latino artists. I end with Macia's (2019) argument that a new *cultura panamericana* or hemispheric imaginary – a transnational imaginary – is emerging not only in the U.S. but across the America's that works against the older borders of national identity and the racial imaginary.

“Empowering School Communities: Navigating Ethical-Political-Suffering through Engaged Multiliteracies”

This research is embedded in the extension project “BRINCADAS: BUILDING INVESTIGATION AND ACTION GROUPS,” coordinated by Professor Fernanda Coelho Liberali. It takes place at CEU EMEF Perus school, where I serve as a principal/trainer that aims a center educational school management. The project was initiated in response to the ethical-political-suffering experienced by the school community, using engaged multiliteracy practices (Liberali, 2023) and playful activities as tools to foster agency and empowerment among its members. The primary aim of this project is to stimulate the agency of various actors within the school community, promoting the development of an anti-racist and inclusive educational environment that upholds diversity as a core principle. Specifically, the project seeks to encourage active community participation in creating intersectional strategies (Akotirene, 2018) to address various forms of ethical-political suffering. The research is deeply rooted in the theoretical frameworks of Critical Literacy of Race, Gender, Sexuality, and Class (Ferreira, 2012, 2014, 2015) and is informed by critical discussions on race, inequality, and power dynamics, as articulated by scholars such as Carneiro (2012) and Fanon (2022). The methodology employed is Critical Collaborative Research (PCCol) (Magalhães, 2009, 2011), which emphasizes the creation of contexts that promote active participation and foster collective transformation. Throughout the research process, the school community identified significant challenges, such as waste accumulation and improper disposal. These issues were exacerbated by an insufficient number of cleaning staff, who were predominantly Black women and men. In response, the community implemented several initiatives, including lectures on proper waste disposal, recycled toy workshops led by older students, and

advocacy efforts directed at public officials, which successfully resulted in improvements to the school's waste management infrastructure. This year, the school actors are working on build a relationship with other schools and public representatives to build what is being called: “Perus Green Belt”.

The Evangelical Churches in Brazil and the Environmental Crisis

Our paper presents the potential strength of the religious phenomenon to face the emergence of environmental issues in the public sphere, with particular focus on how the involvement of the evangelical churches, of the most different classifications, had been with those issues, in this typical peripheral urban neighborhood of Felipe Camarão in Natal, Northeast Brazil. The planet suffers with problems of anthropogenic origin that affect not only human beings but non-humans by the environmental crisis and the New Climate Regime. Increasingly extreme catastrophic events have occurred across the planet and those events have reached this researched neighborhood. To reflect on this problem, we resort to the theoretical contribution of Bruno Latour with the “Sociology of Associations”. The research had been carried out since 2021, with interviews, site visits and participation in activities related to the issue. We analyzed the data qualitatively and found out that, even the churches do not have any proactive collective or individual initiative on the environmental issues, they are not opposite to the New Climate Regime, and it is possible that they would become an important factor of environmental conscientization. At present, we are testing this possibility and we will bring our findings in the presentation.

Musical Sociology: A Sociology That Is Inspired By Music

According to literature about music and sociology, the Sociology of Music is defined as the sociological analysis of Music, that is, the study of musical behavior and its role in society. Musical Sociology is defined as the Sociology inspired by the art of the muses, that is, music. To our knowledge, this is the first work that presents and differentiates Musical Sociology from the Sociology of Music. For this work, we have developed an extensive literature review that includes the reading and commenting of works of both Sociology of Music and Musical Sociology in public gatherings and debates since 1995. As a result, it has been seen that the Sociology of Music includes excellent works that explore music's role in society and even social changes, including the analyses of Verdi's influence in the Italian unification or music's role in fostering social cohesion, among other topics. However, it also englobes works that show a remarkable ignorance about music and have perpetuated social inequalities.

An example is ‘The Distinction’ by Bourdieu, where, besides the elementary mistake of confusing correlation with a causal relationship, he denotes his musical ignorance in the examples he exposes of musical works that show distinction among social classes. He depicts the ‘Well-Tempered Clavier’ by Bach as a music oeuvre unknown by popular classes, ignoring that such music is so popular among citizens that it even appears in Hollywood movies. On the other hand, Musical Sociology is exemplified by the Dialogic Society theory, inspired by the nine muses, which guide the orientations to achieve a sociology that citizens like and use. It also overcomes social inequalities by giving people the right to access and enjoy music, leaving behind cultural elitism, as in the case of Dialogic Music Gatherings.

Development of Academic Language Among Vulnerable Children

Scientific literature highlights the importance of children's proficiency in academic language, i.e., the language used at school, necessary for learning and educational success. However, children from low Socioeconomic Status (SES) are found to be the least exposed to academic texts and discourses outside the school setting and, therefore, have fewer chances to develop such skills. Hence, this paper aims to provide evidence of Dialogic Literary Gatherings' promotion of children's academic language skills by analyzing a classroom from a school located in a marginalized neighborhood in Spain, where 90% of students are of immigrant origin. The methodology of this study is based on the communicative methodology, which is the pioneer in current scientific priorities: co-creation and social impact. Two DLG sessions were observed in which 11-13-year-old students read and debated Homer's *The Iliad*. Researchers found the emergence of six elements that the scientific literature categorizes as academic language and literacy skills: Nominalization, Connectives, Morphologically Derived Words, Referential Links, Construction of Judgement and Value, and Arguments. Indeed, 58 of the 167 student interactions contained a judgment, value, or argument.

Contrary to some reproductionist ideas that have had great popularity in the Sociology of Education, DLGs have offered in this context children from low SES and minority backgrounds the possibility to access high-quality books and engage in high-quality interactions in which judgments, arguments, critical reflections, or values prevail. They have been given access to books they could not approach before, as classic books are linked to particular social barriers (such as cultural elitism) fostered by many authors like Bourdieu. Further research should determine whether the development of these skills during the DLG is transferred to other school subjects. However, these findings show that the analyzed children have developed some academic language skills that the scientific literature defined as essential for school success.

The Role of the European Union Regulation on Business Activity with Regard to the Climate Crisis, Environmental Sustainability and Economic and Social Justice

The social sciences have received criticism for leaving institutional, political and economic aspects understudied, despite the fact that the forces leading to global climate change are incorporated into social structures. One of the social institutions insufficiently analyzed for its capacity for transformation towards a more sustainable society is the Enterprise.

The significant investments that mitigation of and adaptation to climate change require to fight against a transformation that accentuates inequalities demand measures to guide capital flows with specific environmental, but also economic and social, objectives. In this sense, the evolution of the reflections that various institutions have been developing around the measures leading to the transformation mentioned shows a growing role given to the private sector (along with the public) and its capacity for environmental, social and economic transformation.

This communication analyzes the extent to which collective action that generates knowledge, awareness and social context, which has resulted in increasingly strict European and Spanish regulation of business activity and governance, is conditioning business practices.

To this end, the triple impact of the sustainability metrics (non-financial information) that listed companies are required to report in Spain since 2019 has been studied: (1) the corporate strategy, (2) the relationship between the company and the different stakeholders and (3) the awareness of the people who are part of the business project. Subsequently, through interviews, the results of the analysis have been contrasted with identified key agents, analyzing the discourse and social practices generated in the field of large Spanish companies.

It can be concluded that regulation is becoming an accelerator of corporate transformation, despite the fact that the strategic orientation of its activity towards sustainable practices was already taking place.

Devastación Eco-Territorial, Angustia Ecológica y Re-Existencias En Bolivia: Impactos Del Ecocidio y Respuestas a Las Violencias Múltiples En América Latina

En América Latina, la actual crisis socio-ecológica planetaria está estrechamente relacionada con el modelo económico neoextractivista, que continúa expandiendo y exacerbando su alcance e impactos hacia nuevos territorios, generando los llamados "territorios de sacrificio". En la reciente y aun actual fase post pandemia esta dimensión de la crisis ha estado marcada; por un lado, por la acentuación de los múltiples despojos y formas interseccionales de violencias en los territorios y ecosistemas, de manera particular en la región Andina-Amazónica, como se evidencia de modo dramático con los recientes mega incendios forestales de los últimos años, que acaso sintetizan algunas de las modalidades de ecocidio actuales y dan cuenta de las múltiples violencias y de los efectos eco-sociales y/o de las formas de angustia ecológica en los territorios, por la devastación eco-territorial en curso; por otro lado, se asiste a la proliferación e intensificación de conflictos socio-ecológicos, disputas territoriales y formas de resistencias y re-existencias, de parte de sujetos socio-territoriales y comunitarios, que no solo están proponiendo visiones alternativas hacia o más allá del marco de la sustentabilidad sino también propuestas de recuperación y recreación de prácticas comunitarias, que no solo tienen el potencial de potenciar la resiliencia de las comunidades, sino que también la posibilidad de recuperación y "sanación" socioecológica de los territorios impactados por el extractivismo. Se propone analizar algunos de los actuales procesos de devastación socio-territorial y de modalidades de ecocidio en la región Andina-Amazónica, particularmente en Bolivia, y sus efectos sociales de angustia ecológica, así como experiencias de disputas de territorialidades y de defensa eco-comunitarias, frente a los modelos extractivistas en América Latina. En particular, recorro a experiencias de conflicto y re-existencia para desarrollar un enfoque teórico que vincula el amplio debate sobre el neoextractivismo en América Latina con los debates en torno al antropoceno y el capitaloceno.

Territorios De Sacrificio, Re-Existencia Comunitaria En Bolivia. La Contioap y La Actual Rearticulación Indígena-Campesina En Las Luchas Por Lo Común

La denominación *territorios de sacrificio*, al igual que la noción de re-existencia, se posicionan como expresiones recientes y más o menos generalizada, asociada a sujetos territoriales en conflicto socio-ecológico y movimientos de justicia ambiental de América del Sur, así como para designar territorios y geografías sobre las que se despliegan emprendimientos extractivistas y despojos múltiples con impactos por daños y riesgos ambientales, sintetizan y expresan en cierta medida una forma de nombrar y problematizar la situación que atraviesan varios territorios en la región, en los que se manifiestan conflictos socioambientales, des-reterritorialización y transformación socio-ecológica, sociopolítica e identitaria. Este trabajo se propone abordar algunos de los conflictos socio-ambientales y movimientos socioterritoriales en la región Andina-Amazonica, a partir del análisis de la tensión y disputas de territorialidades en algunas 'territorios de sacrificio' en Bolivia, dando cuenta, a su vez, del rol protagónico de las mujeres en las luchas y resistencias socioterritoriales, es decir de procesos que podrían (o no) identificarse como de ecofeminización territorial, específicamente en las tierras bajas de Bolivia, como en la experiencia de la Coordinadora de Defensa de Territorios Indígenas, Originario, Campesino y Áreas Protegidas CONTIOCAP, como una actual estrategia de rearticulación socioterritorial de lucha anti-extractivista en este país andino-amazónico. Asimismo, se plantea analizar y problematizar las reivindicaciones de movimientos comunitarios en la defensa de sus territorialidades y entornos socio-ecológicos y productivos frente al hiperextractivismo, como experiencias de re-existencia comunitaria que disputa los sentidos de transición y/o transformación socio-ecológica.

 HOCASAR DE BLAS, AARÓN (Universitat de València, Spain)
 RUIZ PÉREZ, MARCO ANTONIO (Universidad de Granada, Spain)

La Dimensión Emocional Del Antifeminismo En La Extrema Derecha Digitalmente Mediada: El Caso De Alvisé Pérez En Telegram

Alvisé Pérez, líder emergente de extrema derecha en España, ha construido su liderazgo desde el campo digital utilizando un canal de Telegram, donde despliega una narrativa contra las instituciones y que le ha llevado a irrumpir con éxito en las elecciones europeas con su candidatura *Se Acabó la Fiesta (SALF)*. En su discurso adquiere especial fuerza el mensaje antifeminista y una exaltación de valores de masculinidad tradicional que, reproduciendo mensajes de la manófera, construye su comunidad de seguidores. Este trabajo busca hacer emerger las emociones subyacentes en su estrategia discursiva y comprender cómo estas participan en la construcción del discurso antifeminista.

El diseño metodológico mixto combina técnicas de minería de texto con análisis del discurso a muestras del corpus, así pretende abordarse desde una mirada multidimensional que señale tanto las dimensiones manifiestas del discurso enunciado por el líder de la formación de extrema derecha como aquellas más latentes relativas a las emociones apeladas a través de este. Así, desde este diseño metodológico, pretende explorar la adecuación del campo digital como medio y dispositivo de medición de cara al estudio de las emociones intrincadas en los discursos de la extrema derecha. Este trabajo camina a doble camino entre la sociología digital y la sociología de las emociones y pretende aportar hallazgos y propuestas en esta dirección.

Los resultados apuntan a un centralidad del antifeminismo en el discurso del líder de *SALF* y a la vinculación de la violencia hacia las mujeres como un fenómeno provocado por varones racializados, desplazando el debate desde el plano del género a la cuestión migratoria. En este sentido, se observa una vinculación de estas líneas discursivas con el miedo y la incertidumbre.

Access to Justice and Failure to Identify Women Victims of Trafficking for Criminal Exploitation, Especially Drug Trafficking

Women trafficking is an international issue. The first step in order to provide basic services to their victims is their identification. However, when it comes to criminal exploitation, the failure to identify the victims interferes with these women's access to justice. In Spain, the failure to identify victims of women's trafficking for criminal exploitation, especially drug trafficking, has denied access to justice to many women, finding them in prison for drug trafficking judgements, even if the victim is fulfilling all the indicators and protocols for trafficking. This is the case in STS6008/2023, a Sentence carried out on a women victim of human trafficking for criminal exploitation in drug trafficking, charged with prison even with the fulfillment of the indicators for human trafficking. We will expose and analyze the problematic based on the obstacles encountered by this woman in their access to justice in Spain, having the mentioned Sentence already adopted as jurisprudence, which will close the door on the identification of victims of human trafficking, punishing and denying access to justice. Instead, they are being criminalized and punished for a crime they were forced to perpetrate due to their situation of vulnerability. The STS6008/2023 is a set of appeals in which they expose that the characteristics of the woman judged meet the criteria to identify her as victim. However, the decision is based on her not being judged for human trafficking, but for a crime against public health. Both international and domestic protocols outline the importance of the identification of victims by professionals, as many of the victims are not aware of their situation or are afraid and would not speak up. This failure to identify victims by the justice lands a benchmark to deny access to justice to women victims of human trafficking for criminal exploitation, especially drug trafficking.

LOPEZ MARTIN, ALEJANDRA* (Universitat de Barcelona, Spain)

Discourses and Local Initiatives in the Face of the Ecosocial Crisis. the Case of the District of Sant Andreu in the City of Barcelona.

Climate change and ecological issues have gained prominence in european cities agendas. Nowadays, the debate on the limits to growth is increasingly present, although still secondary in international and urban policies, despite the urgent need to address the climate crisis. In the european context, urban, social and ecological movements focus on the need to transform local economic growth models to tackle the ecological crisis, often defined as ecosocial crisis as a result of simultaneously addressing climate and social agendas, making ecological justice central. These movements and grassroots organizations are not only calling for change, but also propose transformative solutions to the crisis, based on degrowth, everyday environmentalism, and the defense of commons through socio-ecological practices. From an urban governance perspective, there is a call to co-produce climate resilience policies, fostering collaboration between different types of local stakeholders.

Departing from urban sociology and urban sustainability perspectives, this paper aims to understand how public, cooperative and community/civil groups, organizations and initiatives articulate socio-ecological discourses and practices to address the climate crisis and move towards a just socio-ecological transition. Our empirical work focuses on the Sant Andreu district, a peripheral area of Barcelona where social and ecological justice criteria converge in these responses. We conduct a qualitative analysis of discourses and initiatives through interviews and focus groups with public and community stakeholders to examine how these initiatives are articulated.

Our preliminary findings reveal that bottom-up and bottom-linked initiatives for socio-ecological transition, led by grassroots actors, emphasize a transformative discourse that views social issues through an ecological lens. They defense that in peripheral neighborhoods, community action is key to addressing socio-ecological problems, offering collective responses to both ecological and economic challenges that address real everyday needs, through object-sharing networks, energy efficiency workshops, and urban gardens, among other initiatives.

LOPEZ RUIZ, JOSE A.* (Universidad Pontificia Comillas, Spain)

Discrimination, Social Trust and Solidarity: Comparing Southern European Nations

In line with discussions on empathy and social love, the study offers a critical perspective on how discrimination and other factors can affect solidarity relations and social cohesion. In contemporary societies, discrimination against certain social groups and collectives, particularly the immigrant population, as well as differences in political ideology, educational level, and social class, play a crucial role in shaping social trust and solidarity. Utilizing data from the European Social Survey (Round 11, 2023), we propose to analyze how these factors influence social trust in the European context, focusing on the comparison between Spain, Portugal, Italy, and France. The methodology includes a multiple regression analysis, where social trust is taken as the dependent variable and discrimination, political ideology, educational level, and social class as independent variables, to identify the main determinants of social trust in these countries. Additionally, a cluster analysis is employed to explore perceptions and experiences of discrimination (especially towards the immigrant population), allowing us to observe how different discrimination profiles group together based on sociocultural and economic contexts.

This research aims to contribute to understanding how political, educational, and social class differences can be both sources of division and bridges toward a more solidary society. By analyzing how social trust and discrimination are configured in Southern Europe, this work seeks to provide insights into the dynamics that can foster or inhibit solidarity and empathy, challenging traditional conceptions of these values in a European context.

Temporal Inequality in the Gig Economy: How Immigrant Generation, Gender, and Algorithmic Management Shape Time Poverty

This study investigates how temporal inequality and autonomy manifest for first- and second-generation immigrant workers in platform economies, focusing on unincorporated self-employment. Employing a mixed-methods approach that integrates quantitative data from the American Time Use Survey (ATUS) with 96 in-depth interviews, this research examines how migration status, algorithmic management, and gender norms shape workers' control over their time. The findings reveal substantial temporal disparities between first- and second-generation immigrants. First-generation workers in unincorporated self-employment, experience severe time poverty, driven by fragmented work schedules, unpaid waiting periods, and caregiving responsibilities. In contrast, second-generation immigrants report lower levels of time poverty, prioritizing personal well-being and exercising greater temporal autonomy in navigating the gig economy. Drawing on Wajcman's (2020) theory of temporal inequality and Cottom's (2020) racial capitalism, this study argues that platform economies intensify temporal exploitation through algorithmic management, disproportionately affecting racialized Latino immigrant workers. This research contributes to the literature by theorizing how temporal exploitation intersects with race, gender, and migration status, demonstrating that platform labor reinforces, rather than mitigates, existing inequalities. These findings highlight the critical need to examine how time is commodified and controlled in the gig economy, especially for marginalized immigrant workers on the periphery of the labor market.

Worker Responses to Racial Capitalism and Job Displacement in Immigrant Labor Markets

This study, grounded in racial capitalism theory, investigates worker responses to undocumented immigrant exploitation and racialization in South Carolina. Using ethnographic methods and interviews, it examines alignment or divergence in worker and employer perspectives on immigrant labor as complementary or competitive. It uncovers a transition from a white/Black to a Black/Non-Black racial schema, introducing "categorical displacement" as a mechanism of oppression. The study emphasizes racialization's role in job displacement, showing employers replacing Black and white workers with undocumented Hispanics under the guise of colorblindness. It provides insights into the intersections of race, gender, and immigration within racial capitalism.

Purchasing Organic Food: Social Heterogeneity in the Mean Effects of Drivers

We explore how social heterogeneity shapes the mean effects of drivers of organic food purchase behaviours, incorporating social practice theory regarding the psychological model underpinning those purchases. However, we extend the model beyond individual motivations to address broader social influences. Using a representative Spanish population sample, we developed a holistic model that uncovered the extent to which social practices shape heterogeneity in the drivers' effects. We identified four social organic food purchase practices that differed in the mean effects of the sequential determinants, with age and family lifecycle stage, more than social position, better explaining differences. The results underscore the need for policy interventions sensitive to the heterogeneous determinants of organic food purchase behaviors, and targeted approaches based on more effective and inclusive sustainable consumption policies.

Digital Research Infrastructures As a Scientific Reform Movement: Leveraging Sociological Resources for More Equitable and Sustainable Scientific Futures

Digital research infrastructures (DRI) have transformed the field and potentials of scientific research, embedding increasing amounts of data and computation, whilst changing what it means to do science. Though policy and practice is taking note of the reformational influence of DRI, sociological accounts of this phenomena remain scarce. This is unsurprising. Whilst DRI has changed the contours of the social sciences, it is – arguably – in the natural and physical sciences that the most transformational changes have occurred. Given that it is already well established that the social cannot be separated from the technical, the current lack of involvement of the social sciences in this reform could prove detrimental to resulting policies and interventions.

We attend to this gap, reporting the results and implications of two projects which are embracing social scientific approaches to better understand this reformational movement. The first (ARINZKIT) mobilises theories of practice as a framing mechanism to understand the changing role and significance of DRI in scientific research, using interviews and practice-based concepts to understand this change. The second (FAIR Data Accelerator Project) zooms in specifically to data sharing, understanding this in the context of astronomy; using digital ethnology (interviews, mobile ethnography, online participant observation) to make visible the hidden cultural barriers to data sharing. By engaging both a broad and specific view, this paper recognises the potential pitfalls of omitting social approaches to a movement which not only technological, but also cultural. We argue, here, that we must embrace this topic to ensure that the policies that are being designed to catch up with the rapid changes to scientific practice, are not only sustainable but also equitable. Finally, we discuss how social science approaches that already permeate existing policy discourses around sustainability and equity should be leveraged to challenge monolithic views of science.

LORENTE LABRADO, PATRICIA* (Universidad Carlos III de Madrid, Spain)

Exploring Gender Differences in Persistence: Analyzing Test-Taking Behaviors in High-Stakes Assessments

Effort and persistence are critical determinants of students' academic success, skill acquisition, and future life outcomes. As such, these non-cognitive factors play a key role in discussions of social mobility. Research on gender differences in effort and persistence has shown that female students tend to be more self-disciplined and exhibit traits like conscientiousness. Studies on cognitive endurance in low-stakes tests, such as PISA, have also found that female students generally outperform males in persistence, regardless of the subject. However, research on student effort remains limited due to challenges in methodology and data availability, particularly in measuring effort accurately. Additionally, most existing studies on effort rely on low-stakes tests, which may not accurately reflect how students perform when real incentives are present. This study addresses those limitations by using a novel measure of effort from economics—test persistence. In tests where question order is randomized, the difficulty remains constant on average, allowing performance to be separated into cognitive and non-cognitive components. Initial performance reflects cognitive skills, while a decline in performance throughout the test signals persistence.

Focusing on gender differences, this study uses data from online exams conducted during the 2019/2020 academic year at Universidad Carlos III de Madrid. By leveraging the platform's ability to randomize questions, the research provides a bias-free measure of persistence. The objective is to explore gender differences in both test performance and persistence in high-stakes university exams, where real incentives to sustain effort exist, thus addressing the gaps left by previous studies that relied on low-stakes contexts.

LOUNA, HASSAINI MOUSSAOUI* (Aix-Marseille University, France)

"Open the Doors, the Martyrs Are Coming". Analysis and Contrast of the Memorial Construction Process of the 2001 Black Spring in National and Diasporic Contexts

The Kabyle Black Spring is a series of collective actions against *tamheqranit* or *hogra* launched in 2001, following the murder of a schoolboy in a gendarmerie post in Kabylia.

Based on a fieldwork carried out in Algeria and France with activists, movement delegates and rioters, this abstract analyzes the processes of memory construction of the Black Spring in the given contexts, questioning the existence of a transnational memory of 2001.

The gains of the Black Spring – mainly the official recognition of Amazigh language – are minors considering human losses : State repression left 126 people dead, 5000 injured, including 200 permanently disabled. Such a toll, questions the place of these events in the lives of the « wounded of Kabylia ». For those remaining in Algeria, indicators suggest *hogra* is still going on. Commemorations seem hopeless in a post-*Hirak* context while they are multiplying in diaspora and relayed by social media. They allow former rioters to denounce the violence of a regime still unpunished, and to draw attention on the challenges associated with migration, revealing the reconfiguration of ties with Algeria and the creation of diasporic communities around 2001. Restoring the trajectories of these wounded allows to understand the long-term effects of violence and how living context affect the recovery of people, and the place this memory may have in their life.

Hence, the urge to focus on the place this memory holds within Kabyle communities, by exploring memorial supports used to build and maintain this memory. This mirrors the impossibility of commemorating 2001 in Algeria, where authorities have reduced the possibilities of political self-organization. To describe memory entrepreneurs and to distinguish narratives about 2001 in the studied contexts can better help us understanding the role of 2001 events in collective memory of democratic activists.

LOUWES, FREDA* (Karl Franzens Universität Graz, Austria)

From Muslim to Trans "Predators" – How Right-Winged Media Is Constructing a New Discourse on the Endangerment of the "German Woman"

On New Year's Eve 2015 Germany was shocked when several hundred migrants from North Africa rioted in Cologne. This horrendous event where many people were harmed and women sexually assaulted gave rise to radical anti-migrant and anti-Muslim discourses, promoted by the far right. A common enemy was constructed: Muslim male migrants. For many years the image of racialized predators was refined and scholars have taken on the challenge to analyse the lines of arguments, concluding with the concept of *femonationalism*. Albeit anti-migration and anti-Muslim perspectives are still dominant in German media, especially in right-winged media, a new group has emerged that challenges this traditioned belief.

When the German parliament passed the novel *Self-Determination Law with Regard to Gender Registration*, anti-transgender sentiments gained unprecedented popularity. How does this relate to femonationalism? A Critical Discourse Analysis of German populist media sites showed that the lines of argument presented in femonationalist anti-migrant discourses are applied in the context of transgender rights. Both migrants and transgender persons are being *othered* and by that constructed outside of the *normal population*. While migrants are not recognized as part of German society and hence *othered* as the *unreal* population, transgender persons are denied their gender identity and depreciated as *unreal* genders. Each group is presented as predators, endangering women and society by dismantling established *cultural norms*. The alleged dangers emanating from transgender persons resemble the idea of Muslim migrants attempting to *Islamise* the Western European world. Furthermore, male migrants and transwomen are constructed as predators to white European women albeit the evidence only has cloud when *rationalization* and *mythopoiesis* are applied. The concept of *femonationalism* allows for in-depth analysis of various contexts and need not be reduced to anti-migration discourse as the issue of transgender and queerness in general will gain more attention in coming years.

Asserting "Digital Sovereignty" to Rein in Platform Power? European Regulatory Instruments and Their Limitations

In the context of a growing debate on adequate policy responses to Big Tech dominance (Moore & Tambini, 2022), the enactment of the Digital Services Act (DSA) and the Digital Markets Act (DMA) highlight the European Union's political efforts to regulate major digital platforms (Bietti, 2021). While the DMA focuses on ensuring fair competition in digital markets, the DSA aims to regulate digital public spaces by addressing the responsibilities of platforms in managing online content.

The EU is thus actively engaged in a global race for "digital sovereignty" – a concept that, while somewhat vague, has been widely discussed (Florida, 2020; Roberts et al., 2021). In a bid to protect its citizens and promote the emergence of European tech champions, the EU is developing a framework of "digital constitutionalism" (Suzor, 2010, 2018; de Gregorio, 2021; Celeste, 2023). This approach involves a comprehensive legislative arsenal and new investigative and sanctioning powers aimed at regulating digital platforms.

Our research focuses specifically on the regulation of digital public spaces, through the lens of DSA negotiations and implementation. Key questions include: What policy approach underpins the DSA? What regulatory instruments does it offer? At what level should they be applied and what are their limitations? Ultimately, does the DSA empower European states to counterbalance the influence of Big Tech?

To address these questions, we carried out documentary analysis and qualitative fieldwork. We conducted 19 interviews with members of the administrations involved in negotiating and implementing the DSA, and with stakeholders active in shaping the legislation. Our analysis delves into the origins of the DSA at national and international levels. We then assess the DSA's regulatory instruments to understand their impact on the division of powers within the digital regulation chain, involving the European Commission, EU Member States, social media platforms and citizens.

Creating Sovereign Indigenous Data in Australia: A Guide for Indigenous Communities

Indigenous communities and nations in Australia have a right to data and information to determine their priorities, to make decisions and to monitor progress against their priorities. Indigenous Data Sovereignty (IDSov), offers a philosophical approach, while Indigenous Data Governance (IDGov) offers practical considerations to achieving IDSov (Taylor & Kukutai, 2016). To date there are few community driven IDSov projects have defined and applied IDSov principles in a way that operationalises Indigenous nation (re) building. This presentation outlines the development of a practical guide for Indigenous nations and communities in Australia to use in their own data journey. It outlines four key stages of the Indigenous nation/community data project of (1) Governance, agreement making and policy, (2) Priority setting, (3) Data design, collection, compilation, management and reporting, and (4) Partnerships and translation.

We will outline the elements of each stage, and provide an applied example from an Indigenous community in Australia identifying key lessons learned. The model and guide are presented in a way so other Indigenous communities can pick it up and implement it within their respective communities/organisations.

Human-Animal Relations As Sensory Phenomena

Human-animal presences in city life is neither a novel nor recent phenomenon. I approach different sites of urban encounters as contact zones between humans and animals. In reflecting on how such multispecies co-presences and encounters surface boundaries and parameters of spatial use and sensory governance, the paper engages with the following queries:

What sources or avenues of urban sensory governance are there, and how are they invoked, contested, and altered over time in relation to heightened presences of nonhuman actors in urbanity? Through what methodologies can we ascertain and conceptualise urban density and sensory contexts vis-à-vis sensorial proximity, identified transgression, and spatial limits? By outlining human-animal relations in the city as sensory phenomena, a range of methodological approaches and data generation on human-animal encounters and urban dwelling are illustrated. These will elucidate upon how such co-presences require further reflections and urban planning and governance to manage human-animal relations and urban sensescape.

Ideas Sobre La Nación y El Estado En Javier Milei: Sentidos y Segregaciones Detrás Del Concepto De Argentinos De Bien

En 2023, luego de una fuerte campaña mediática, Javier Milei ganó las elecciones presidenciales de Argentina. Sus mensajes provocadores y su tono agresivo causaron tanta sorpresa como sus propuestas de derribar la institucionalidad estatal argentina, de las cuales se declaró un férreo opositor y destructor. Sus mensajes sobre la historia de la nación y sus ideas sobre el funcionamiento de sus instituciones nos convocan a pensar sobre la idea de nación que se propone difundir, y las adhesiones que logra. En sus discursos encontramos alusiones conservadoras en términos de valores y amenazas contemporáneas a la nación (la Agenda 2023, el progresismo, etc), consideraciones negativas del Estado en tanto organismo opresor sobre las libertades individuales. La nación, en Milei, es una herramienta del Estado para transmitir ideas específicas sobre la sociedad que cumplen una función ordenadora y opresora. No encontramos apelaciones a la nación en tanto comunidad, exacerbado por ideas que refuerzan la división interna como la categoría de argentinos de bien. Esa idea de lo distintivo como aglutinador rompe con el instalado discurso de la nación integradora y homogeneizadora, como entramado político que organiza la diversidad, bajo principios de horizontalidad y solidaridad.

Este trabajo analiza las perspectivas sobre nación, Estado y patria en los discursos oficiales de Javier Milei. Tomaremos también algunas de sus presentaciones en eventos de lo que se ha llamado la nueva derecha global. Nos interesa profundizar en la categoría de argentinos de bien, que distingue categorías internas en la sociedad nacional. A través del análisis de contenido, buscamos comprender estas dinámicas políticas, que distan de ser espontáneas y responden a lógicas de distribución de poder global. Nos interesa explorar ideas de nación contemporáneas que tienen amplia difusión en los países latinoamericanos, vinculándolas con un contexto transnacional que las fomenta, robustece y disemina.

Movilidad Científica. Trayectorias Profesionales En Tres Sistemas Científicos Nacionales.

La movilidad científica está condicionada por la disposición de infraestructuras materiales y por el prestigio de los sistemas científicos de los países, pero la decisión de migrar no es automática; implica la percepción de las diferencias derivada de esas condiciones y de sus implicancias para la trayectoria propia.

Los estudios sobre migración altamente calificada y éxodo científico destacan la confluencia de las dimensiones estructural y psicosocial para explicar la decisión de migrar. Mediante la reconstrucción de trayectorias científicas internacionales, esta contribución analiza los factores estructurales y psicosociales relativos a la decisión de migrar en dos momentos: 1) la percepción inicial del migrante de las diferencias entre la situación del país de origen y del país de destino, así como del impacto potencial de la movilidad internacional en su trayectoria profesional; y 2) con posterioridad al establecimiento (temporal, permanente o recursivo), la comparación de sus perspectivas de desarrollo en distintos países. La rememoración y la discusión de las perspectivas de desarrollo reveló la centralidad que adquieren las relaciones de dependencia y la interconexión con el entorno más amplio -familiar, social, político- y las contingencias, tanto en el país de origen o retorno.

Se abordará cómo los ideales compartidos sobre la labor científica configuran de manera persistente disímiles controversias en torno a la movilidad científica internacional. Se focalizará en las trayectorias de cinco científicas y un científico originarios de Argentina que desarrollaron actividades de investigación y docencia en dos o más sistemas científicos, particularmente los sistemas argentino, alemán y español y más puntualmente, norteamericano.

Los relatos recogidos destacan la necesidad de reducir y manejar la incertidumbre y el temor que infunden las transiciones entre posiciones institucionales y sus efectos en la vida académica y personal en un contexto de lazos sociales débiles y provisorios.

Access to Justice after the Gender Perspective. Case of México.

The year of 2009, marked the beginning of a new era in the administration of justice in Mexico, framing a reconfiguration of the activity of the legal professional, extending their powers to respond to the citizen needs. The Mexican State was declared internationally responsible by the Inter-American Court of Human Rights (2009) in accordance with the judgment in the *González et al. case (D.Cotton Field)*, laying the foundations for a comprehensive policy to overcome: violence, discrimination, impunity and inequality against women.

By recognizing those demands of the socio-cultural reality and with the aim of eliminating the obstacles that place women in a disadvantaged situation, an analytical method was incorporated into the current justice model to guarantee access to formal justice effective and equal (Suprema Corte de Justicia de la Nación [SCJN], 2020). For legal professionals involved in the creation of law, the administration, procurement and delivery of justice and who have the transformative obligation towards social change as well as substantive equality between people regardless of their gender (taking into account the varied implications of gender, without omitting the different contexts), involved them training in a huge program that will allow them to recognize the professional skills acquired.

Barriers to Stakeholder Participation in the Recovery Process of Multifamily Housing: Experiences from Condominium Reconstruction after the 2016 Meinong Earthquake in Taiwan

Many disaster studies indicate the importance of stakeholder participation in post-disaster recovery. Effective stakeholder engagement facilitates consensus-building and strengthens social capital, thereby accelerating the recovery process. However, following major disasters, the involvement of stakeholders with diverse values can present challenges that impede recovery efforts. In urban areas, buildings such as condominiums often have complex property rights, where stakeholder participation and consensus-building directly influence both the trajectory and pace of housing recovery.

This study examines the condominium reconstruction process following the 2016 Meinong earthquake in Taiwan, focusing on the perspectives, roles, and interactions of stakeholders, including homeowners, government officials, professionals, and donations. In Taiwan, condominium homeowners hold individual unit ownership, while land is jointly owned. Reconstruction decisions require collective consensus, with legal thresholds that must be met before reconstruction can proceed. In addition to financial concerns, homeowners must also reach a consensus, which often slows condominium reconstruction compared to single-family homes.

In the early post-disaster phase, the government was initially reluctant to support condominium homeowners in rebuilding on the original site. Instead, they prioritized the use of disaster relief funds and donations to assist affected residents in purchasing or renting housing elsewhere. Nevertheless, some homeowners preferred to rebuild on the original site. They collaborated with professionals to overcome challenges related to consensus-building, funding, and reconstruction barriers, ultimately leading to a shift in government attitude. Reconstruction was completed 5–6 years after the disaster.

The collaboration of professionals and the empowerment of homeowners were crucial to the successful reconstruction of the condominium cases examined in this study. The findings also highlight that current recovery policies in Taiwan lack mechanisms that promote collaboration between professionals and affected residents, hindering the recovery of condominium-type buildings after major disasters.

LU, YAO* (University of California-Davis, USA)

Colonial Bureaucracy, Post-Independent Statecraft and Social Movement in Africa: Making Racial Classification in Zambia and Zimbabwe.

This project examines why state racial classification varies in post-independent Africa. State racial classification constitutes state-making through defining the nation, legibility projects, and policy-making. How and why different forms of racial classification emerge and change in post-independent African countries is less understood. I address this gap by explaining racial classification changes in two former British colonies, Zambia and Zimbabwe. Drawing from archival, interview, and oral history data, I find that the strength and survival of colonial bureaucracy play a critical role in post-independent classification variations. Post-independent Zambia saw a classification break from its colonial racial categories, allowing the Zambian state more autonomy in shifting its legibility and policy projects around tribal identities. This was the result of nationalist projects, social movements, and a relatively weaker colonial bureaucracy in Zambia. In contrast, Zimbabwe retained racial classifications similar to those from its colonial period, largely due to the survival of a stronger colonial bureaucracy. Despite nationalist movements, this enduring colonial legacy in Zimbabwe constrained efforts at reclassification. This project contributes to the understanding of the politics of state legibility and belonging in post-independent nation-states, emphasizing the influence of colonial legacies, statecraft, and social movements. The persistence or alteration of colonial classification systems helps explain why political and economic distribution in some post-independent nations continues to mirror their colonial past. Understanding the mechanisms of colonial (dis)continuity offers insights into how these patterns can be dismantled.

LUCHETTI, LIA* (Roma Tre University, Italy)

Visual Art and Social Change: Practices of Creative Subversion in the Public Discourse

Recent research has highlighted the performative nature of the arts and the social and cognitive effects of the arts for the identity formation, the body representation, the social transformation (Hennion, Grenier 2000; Tota, De Feo 2020) and the power of the arts on social structures (Gaupp et al. 2022) and in educational settings (Tota, De Feo 2022). Different forms of art, such as visual art on which this paper aims to focus, can become resources that people use in everyday life for constructing meanings and shaping social experience (DeNora 2011). Emphasis will be on "artivism", i.e. the use of art to mobilise people and to express demands for social justice in the public sphere (Danko 2018; Trione 2022). Within this framework, this paper aims to explore the ways in which art - as arts-in-action (DeNora, Ansdell 2017) - can affect the public discourse. The focus will be on the relationship between artistic practices realised in the context of culture jamming and brandalism (Allgajer 2020; Lekakis 2017) and social imaginaries, with particular regard to the role of art in shaping the collective imaginary of migration. Starting from this approach and using the methodology of qualitative interviews with Italian subvertising activists, we will discuss the capacities of artistic practices to turn into symbolic devices capable of challenging, for example, ethnic and gender stereotypical representations (Tota et al., 2023) and contributing to articulate concepts such as democracy, equality and social inclusion in the public discourse.

Écoféministes des villes. Saisir les modalités d'une appropriation de l'identité « écoféministe » depuis l'Ile-de-France.

C'est dans l'urbanité de Paris, et plus largement de l'Ile-de-France, que j'ai « trouvé » mon terrain (Siméant-Germanos, 2012). Des militant·e·s se réclament de l'écoféminisme, manifestant contre sa réappropriation « apolitique, anhistorique, qui ne fait que recréer un entre-soi blanc de femmes cisgenres intégrées dans l'économie hétérosexuelle » (Bahaffou et Gorecki, 2020, p. 34). D'autres encore, constatant la sous-représentation des femmes dans les arènes de discussion et de décision relatives au changement climatique, créent une association pour la diversité des voix pour le climat. Ce sont les conditions et les formes de cette lutte, inscrite dans le courant théorique et politique de l'écoféminisme qui m'intéressent : comment la lutte écoféministe se déploie-t-elle depuis l'Ile-de-France ? Comment cette attention aux vulnérabilités des communautés sexisées et racisées face à la crise écologique se manifeste-t-elle depuis la ville ?

Cette communication se fonde sur une enquête, toujours en cours, à partir d'entretiens et d'observations dans le cadre d'une thèse sur la production, la circulation et les usages situés de l'écoféminisme en France (1970-2020).

Alors que l'écoféminisme terrien a déjà fait l'objet d'analyses (Rimlinger, 2021), la communication interrogera, à partir d'une étude de cas, les pratiques et discours constitutifs de cette appropriation de l'écoféminisme localisée dans un espace urbanisé.

Narrating Historical Changes in Global Academia: The Intercultural Imaginaries of Female International Professors

This paper investigates the geographical imaginaries embedded in the life stories of foreign-born professors who migrated from Poland—considered a semi-periphery in global knowledge production—to the United States. Positioned within the framework of biographical sociology, this study highlights their lived experiences of intercultural exchange while emphasizing the role of historical circumstances in shaping their narratives.

The primary focus is on the letters of Hanna Buczyńska-Garewicz, a Polish-born professor of philosophy who migrated to the U.S. in the 1980s. We examine the biographical factors that both facilitated and hindered her acculturation process, with particular attention to how cultural differences were remembered and narrated over time. Buczyńska-Garewicz's personal documents nospans from the 1960s to the 1990s, a period during which she witnessed the decline of continental Europe and the rise of the U.S. as a global hegemon. Although familiar with the Western academic tradition, she was largely surprised by the cultural patterns she observed in North America. Her experience suggests that geographical imaginaries oscillate between admiration for academic excellence and disenchantment resulting from deconstructed myths and stereotypes through direct cultural encounters.

From a decolonial perspective, this analysis uncovers the process by which the U.S. emerged as a global centre of knowledge production, contributing to the sociology of science. Through Buczyńska-Garewicz's lens, we observe the old centres (e.g., Germany, France, the U.K.) being replaced by a new hegemon, while the underlying mechanisms of domination remain largely unchanged. Additionally, we explore how cultural capital—understood as the migration-facilitating capital she accumulated during her stays abroad before relocating to the U.S.—shaped her migration trajectory. This analysis offers valuable insights into the study of female academic careers among migrants from peripheral countries to global centres.

The Role of Fathers As Kinkeepers: First Results from an Interview Study with Three-Generation Family Lines

Currently, the international literature on fatherhood focuses on 'new fatherhood' and highlights the increasing involvement of fathers in raising children and the transition of masculine social patterns towards greater emotional involvement (Bosoni et al. 2019). But it has also been shown, that in other areas of care work (e.g. housework), fathers' participation has not increased so significantly (Gerum 2021). Studies focusing on the concept of 'doing family' (Jurczyk 2018: 61) add the intrafamilial dimension: These studies suggest that women are often the 'managers of everyday life' and 'direct' the activities of other family members (Miller 2017). Moreover, they often organize family events and have the responsibility to ensure the family remains connected – also across generations or across countries (Brannen et al. 2014, Parke et al. 2021). However, what role do fathers play as kinkeepers and how has this changed over time and generations? Little attention has been paid so far to the concrete intergenerational transmission of these patterns within a family (Brown et al. 2018).

In our study, we therefore explore both past and current social conditions for fatherhood in Germany and Poland and examine the intergenerational transmission of fatherhood patterns and practices. Based on an analysis of in-depth-interviews with family lines (great-grandfathers, grandfathers and fathers in Poland and Germany), we will present which roles fathers take on as kinkeepers and which particular difficulties are faced by fathers

in challenging life situations (e.g. divorce, migration, poverty, mental or health restrictions). First results suggest that although fathers' roles in families are largely dependent on surrounding factors – above all the intra-partnership dynamic with the respective mothers – they play an active part in interconnecting family lines, for example by organizing family activities or holidays. Furthermore, they pass on family-related norms and values that has been under-highlighted so far.

Navigating Local Welfare Systems. a Comparative Study of Marginalised Migrants Accessing Welfare Resources in Stockholm, Berlin, London, and NYC.

A growing field of studies has focused on cities' making their welfare systems available to migrants (e.g. Bruzelius et al., 2023; Homberger et al., 2022; Łukasiewicz et al., 2024). Yet, little is known about migrants' experiences accessing and utilising various urban welfare resources from a comparative perspective. Using cases of four top-immigrant destination cities in the Global North, Berlin, Stockholm, London and New York, and a group of Polish migrants with varying marginalised statuses (being low-income, undocumented, experiencing homelessness), we analyse strategies they use to navigate accessing urban resources and discuss macro, mezo micro-level factors shaping the process. Our article is based on comparative qualitative research, which draws from a subsample of 62 interviews with migrants conducted between 2020 and 2024. All interviews were recorded, transcribed and analysed using the Grounded Theory Approach (Bryant and Charmaz, 2019). Our results indicate that study participants used the assistance of welfare brokers, support of familial ties, or modern technologies to navigate exclusive, punitive, bureaucratised and insufficient social assistance. Urban socio-economic characteristics and the political profile of local leadership, as well as the national-level welfare framework, shaped varying needs to utilise different strategies.

Encountering Cultural Diversity in Family and Counselling Centers: Qualitative Longitudinal Research Study on Challenges and Opportunities

Thanks to international migration, contemporary societies are experiencing demographic and societal transformations, as well as an increase in cultural diversity. To enhance mutual respect, to build bridges across cultures and to promote social cohesion, it is essential that sociological research devote attention to intercultural encounters, their ongoing challenges, intertwining dynamics, and opportunities.

Our qualitative longitudinal research investigates these challenges, dynamics, and opportunities of intercultural encounters between refugee families and social work practitioners. To this end, semi-structured in-depth expert interviews were conducted in family and counseling centers, providing informal education services for parents, in Bavaria, Germany. The same 33 centers were interviewed in three waves—in 2016, 2019, and 2023—in order to gain insights into the perceptions and repercussions of intercultural dialogue. For the analyses, a decentered research approach has been adopted, embracing our different disciplinary approaches and different ethnic, cultural and religious backgrounds.

Analyses show that encountering cultural diversity proved to be challenging due to different communication styles of high versus low context cultures and to different norms and values (e.g., regarding hospitality, punctuality, or gender roles). Further, the heterogeneity of different cultural (sub)groups and their (perceived) diverse needs are overwhelming for some practitioners. Additionally, limited resources constrain practitioners' ability to meet the high demands. Nevertheless, over the course of time, the majority of centers have implemented innovative methods to strengthen cross-cultural encounter and dialogue. These include inter-religious events, low-threshold language cafés, and cultural-sensitive parenting programs designed to enhance familial resilience, to name but a few. These strategies offer opportunities to foster intercultural awareness and understanding, connectedness between

people from different cultural backgrounds, as well as social integration and cohesion. Despite the presence of numerous cultural misunderstandings and uncertainty, we identified an increasing reciprocal empathy and cultural sensitivity which led to more perspective-taking of other individuals' backgrounds.

RC01-26.5

LUKERIA, TETIANA* (Ivan Franko National University of Lviv, Ukraine)

Restoration of Public Services in De-Occupied Communities of Ukraine

The European Charter of Local Self-Government defines that local self-government is the right and ability to manage a certain share of public affairs, under their own responsibility, in the interests of the local population. Provision of public services to residents of communities is one of the powers of local self-government bodies provided for by decentralization.

In Ukrainian legislation, a capable territorial community is one that is able to provide the appropriate level of public services, in particular in the field of education, culture, etc., taking into account different resources.

After the full-scale invasion and in the conditions of the ongoing war, the territorial communities of Ukraine faced certain difficulties in providing public services. This is due to the destroyed infrastructure, lack of personnel, availability of services.

Based on empirical data, the following main tendency can be identified:

1) the demand for social services has increased. This is due to the fact that a significant proportion of residents of de-occupied communities are socially vulnerable;

2) the system of providing administrative services was overloaded. After the de-occupation, communities adjusted the provision of administrative services in different ways. Decentralization contributed to the expansion of the network of administrative service centers, and residents of de-occupied communities have access to administrative services;

3) cooperation of communities contributes to the provision of public services in conditions of limited resources. For example, joint financing of geriatric facilities, financing for maintenance of primary medical care;

4) cooperation of territorial communities with NGO. Decentralization facilitated the opportunity to join forces with organizations. This is especially observed in the social and medical spheres.

LUKIC RADOVIC, MAJA* (University of Belgrade Faculty of Law, Serbia)

Interplay between Law and Virtualization of Modern Society in Relation to Population Ageing

Human rights law was born and has developed in the so-called Western world, and it is only in the legal systems that belong to that realm that it truly continues to be implemented. Virtualization of modern-day society, which started to transpire in the past decade and a half, originated from the Western world as well. It was there that all hardware technologies and software applications have been developed. However, the societies that form the Western world also suffer from strong ageing trends. These trends are challenging long-term viability of social insurance, pension and health systems. Many aspects of virtualization represent a response to the diminishing pool of human resources. Virtualization, however, is dehumanizing by its very nature. Not only is it alienating older individuals, who are not proficient in accessing the virtual realities, it is profoundly modifying the formation of children and adolescents. In the paper, an attempt is made to form a synthetic view on whether the values forming the core of human rights law are suitable to be regarded as a firm limitation on certain tendencies of societal virtualization, what would be a reasonably expected outcome if such limitation would have become effective, as well as what would be needed, at conceptual and/or policy level, to make them effective.

Rethinking the High Skilled Migration through the Lens of Social Class: The Case of High Skilled Migration from Turkey to Germany

There is a long history of migration from Turkey to Germany yet the migration of the highly skilled is a new phenomenon. This paper aims to discuss the new wave of migration from Turkey to Germany through the social class perspective and study it as a middle-class migration based on qualitative research of 50 in-depth interviews with young people and young adults who had migrated from Turkey to Germany during the last decade. Our research demonstrates (as already underlined by previous research) that the new wavers tend to distinguish themselves from the old wave and create boundaries between themselves and the population in Germany with a migration (particularly guest worker) history from Turkey on the basis of their education and cultural capital. It is interesting that discussions around Social class are quite invisible in this picture and the highly skilled often emphasize their educational qualification as their personal success and their parents' eagerness to give their children a good education. This way of relating to old wave migrants echoes also the hierarchization of migrant experience by migration and integration policies which categorize high skilled ones as "good and deserved" whereas the others (such as refugees or low skilled migrants) as the ones to be controlled and integrated. Tending to put themselves in a superior position, the high skilled seem to oversee the continuity and commonality of historically established social inequalities which affect both themselves and the old wave. This paper discusses the fragility of highly skilled migrants from Turkey to Germany, whose migration experiences are characterized with insecurities and difficulties, but who are unable to translate these precarious experiences into a social class and inequalities political discourse, question the injustices they are faced with from an historical perspective and skip potential moments for the solidarity of migrant struggles.

BENDOROVICZ TREVISAN, JANINE (IFRS Bento Gonçalves, Brazil)

The Relationship between the Evangelical and Agricultural Parliamentary Fronts in the Brazilian National Congress and Their Impact on the Climate Crisis

Since the Constituent Assembly of 1986, various social groups have organized to occupy seats and defend their rights and values in Brazil's new democracy. Among these, evangelicals, predominantly Pentecostals, and ruralists stand out, with their presence in Brazilian politics becoming increasingly significant at every election. Currently, 213 out of the 513 federal deputies belong to the Evangelical Parliamentary Front, and 290 to the Agropecuary Parliamentary Front, with several members integrating both. This paper analyzes the dynamics between these social actors concerning moral affinities and political engagement within the National Congress, focusing on legislation and discussions related to environmental issues and the climate crisis in Brazil. This analysis is based on searches in official websites and media outlets, examinations of the legislative process regarding environmental laws, and public statements from representatives of the both groups. It is observed that the neoliberal ideology constitutes the foundation for the union between those groups. As they gain strength through the accumulation of votes—an attractive aspect for both groups—legislative proposals such as the one that become known as "Poison Bill," as it facilitates the registration of agrochemicals in Brazil and has been criticized by Fiocruz and the UN for its potential harm to the environment and human health, have been and continue to be approved by the Chamber of deputies. Thus, evangelical parliamentarians, motivated by principles that are not necessarily religious but driven by the desire for greater societal control and the strengthening of neoliberalism, contribute to the exacerbation of both Brazilian and global environmental crises while hindering potential advances in addressing emergencies. This research contributes to the debate regarding the influence and power of religious actors in Brazilian politics and their negative impact on the environment.

LUO, JIALING* (Sichuan University, China)

Infrastructures, State, and Modernity: An Ethnographic Study of a Chinese Metropolis

An infrastructural turn has emerged in the social sciences over the past two decades (Graham & Marvin, 2022). In particular, infrastructures are increasingly seen as ethnographic sites by anthropologists and other social scientists, who explore their promises and failures (Nikhil, Gupta & Appel, 2018), social complexity (Harvey, Jensen & Morita, 2017), and coloniality (Cupers & Meier, 2020). My research, based on intensive fieldwork in the eastern suburbs of Chengdu, western China, examines planned urbanization and infrastructure development that have transformed villages into urban neighborhoods within just twenty years.

My ethnography reveals that former villagers from Wangcun have resettled in newly built apartment blocks within a gated community on their former site. This compound is situated between two massive developments: the 3rd Ring Road, part of an intricate intra-city transportation system, and the Chengdu East Railway Station, a key node in the nationwide high-speed rail network. Interviews with these former villagers indicate that while they perceive their gated community and nearby transportation networks as modern, as the state promotes, they also express frustration with living in high-rises. They find that the ring road and railway station hinder mobility, making it difficult to navigate on foot or by bike. Other issues mentioned include malfunctioning lifts, a dramatic change in lifestyle, and fatigue resulting from the rapid pace of change, as they describe it.

In China, urbanization is often viewed as an inevitable pathway to modernization, with modernity closely tied to infrastructure - historically associated with development, progress, and freedom (Appel, Anand & Gupta, 2018). This high modernist mentality (Scott, 1998) drives top-down urbanization and the proliferation of mega projects. This ethnography aims to provide new insights into the interconnectedness of infrastructure, the state, and modernity in China and beyond.

LUPOLI, MATTEO* (University of Bologna, Italy)

A Political Ecology of Coastal Tourism: Cheap Labour and Nature Appropriation in Rimini and Durrës

The proposed research investigates the model of mass coastal tourism, a historically significant sector in global tourism that has often been overlooked in debates on sustainability within tourism studies. By adopting the analytical lens of political ecology, the study applies Jason W. Moore's world-ecology perspective to offer a socio-ecological analysis of this industry. Moore's theory highlights the critical role of ecological surplus, which refers to the relationship between the levels of capitalized labour and the appropriation of cheap resources. This framework emphasizes how capitalist accumulation relies on the continuous appropriation of labour and nature at minimal or no cost and underlines that the "cheap" labour and nature must be continually defined and redefined through both symbolic operations and simultaneously violent processes.

The choice of case studies is partially motivated by the paradigmatic nature of the case of Rimini, which has served as a model and as a laboratory for the development of the coastal tourism industry in the Mediterranean area. Following Butler's tourism area life cycle, Rimini has now reached a mature stage of development. To avoid the risk of over-reliance on a single case study, the research also focuses on a context that shares similar morphological and tourism characteristics but has developed under different temporal and socio-political conditions. The Albanian coast, has only recently opened up to international tourism, offering a contrasting yet complementary case. In particular, Durrës represents an important example due to its tourism model, which, like Rimini, is based on the convenience and accessibility of services.

Empirical data is drawn from a multi-case study analysis of Rimini, Italy, and Durrës, Albania, with attention to two central "cheap" elements: labour and natural resources. The study employs qualitative methods such as semi-structured interviews, direct observation, and secondary source analysis.

Labour and Environmental Crisis: Investigating Convergence in Fossil-Dependent Regions, the Case of Ravenna

The Italian city of Ravenna, with its deep ties to the fossil fuel industry, offers a crucial lens through which to explore the intertwined crises of labour and environment. A central element in this debate is natural gas, framed by some as a "bridge fuel" necessary for a gradual transition to sustainability, while others argue that its continued use perpetuates the extractive logic at the heart of the environmental crisis. A significant player in this dynamic is Eni, the energy company that has been a cornerstone of Ravenna's economy for over 70 years. Today, Eni is grappling with the demands of the energy transition, but its most prominent proposal is the construction of a *Carbon Capture & Storage* (CCS) facility. This project aims to mitigate carbon emissions by storing CO₂ underground, yet it is facing opposition from environmental activists who argue that it perpetuates dependence on fossil fuels rather than advancing a decisive shift toward renewable energy.

This paper examines whether the evolving concept of *Just Transition*—which now reflects the convergence of labour and climate justice movements—can be translated into practical terms in a region where fossil fuels have long shaped both the economy and employment. The study investigates the perspectives of workers and unions, who have mobilized to protect jobs in the oil and gas sector, as well as environmental activists advocating for a radical departure from fossil fuels. Using a qualitative methodology, this research draws on over 30 semi-structured interviews and two focus groups with local union representatives and environmental activists, shedding light on the tensions and potential areas of convergence between these opposing groups. By focusing on Ravenna, this paper aims to contribute to the broader debate on how labour and environmental concerns can intersect in the context of energy transitions.

Radically Imagining the Feminist City: Navigating the Tension between the Present and a Radical Future

This paper examines the challenge of imagining a feminist city 100 years into the future, based on empirical insights from a participatory workshop developed through the FEM.DES network in the Urbanism Next Conference in Amsterdam (2024). A feminist city asks participants to envision beyond immediate solutions to today's issues and engage with radical imagination. However, participants often focused on mitigating current problems, raising a critical question: How do we imagine transformative futures when our imagination is shaped by oppressive systems?

The paper investigates the tension between the necessity to dream of a feminist future and the difficulty of breaking free from present realities. Central to this is an exploration of methodologies for radical spatial imagination that can transcend oppressive circumstances. The methodology aims to foster ways of thinking that are not confined to solving today's crises but instead create urban spaces for feminist ideals, liberation, and equity. This study addresses how spatializing the radical imagination can both challenge and empower participants, encouraging them to envision urban environments free from oppression. It highlights the risks of being bound to the present while also considering the power of imagining spaces where feminist values shape the built environment for future generations.

The findings suggest that while participants struggled to imagine beyond the present, developing a methodology for radical spatial imagination offers a pathway to rethinking urban landscapes and systems. By harnessing imagination as a tool for liberation, this process opens up opportunities to design cities that move beyond mitigation and into transformation.

Managerial Strategies and Policy Tools in the Process of Industrial Transformation: The Case Studies of the (former) Indesit in Campania and the B/S/H Bosch Hausgerate in Berlin

This work explores the interaction between managerial strategies and industrial policy tools in the processes of industrial transformation in two case studies on the former Indesit in Campania, Italy, and Bosch-Siemens Hausgeräte (B/S/H) in Berlin, Germany.

The analysis focuses on how firms and institutions adapt to the shifts induced by the Fourth Industrial Revolution (or Industry 4.0) and examines social dynamics that shape the transitional process. The study spans three key historical phases: industrialization (1950-1973), deindustrialization (1973-1990-2015), and reindustrialization 4.0 (2015-2022). Through these phases, the research traces the evolving relationship between entrepreneurial actions and industrial policy, providing a comparative perspective on two regions facing different socio-economic challenges. The methodology adopts a mixed-methods (MM) and integrates both quantitative and qualitative data. The quantitative analysis compares contextual and transitional variables such as GDP, unemployment, productivity, research and development, innovation, and human capital across Italy and Germany at national and regional level. The qualitative component is based on semi-structured interviews (45 in total) conducted in both countries, using Lazarsfeld's model to explore the key dimensions of firms' change (managerial strategies, policy tools, and actors' behaviors). The findings contribute to the ongoing academic debate on the resilience of manufacturing sectors in the face of deindustrialization and the transformative potential of Industry 4.0. The research suggests that, despite the challenges of deindustrialization, the manufacture has shown remarkable resilience, with entrepreneurial strategies and policy tools playing a crucial role in fostering long-term reindustrialization, even in less developed regions. The study also highlights the complementarity between digital and green transition.

Home Care for Sale. the Transnational Brokering of Senior Care in Europe

The world of senior care provision and care work is changing rapidly. Across Europe, brokering agencies for live-in care workers have become powerful players in reshaping welfare systems, transnational care chains and working conditions. This presentation draws from the recently published volume 'Home Care for Sale', which brings together the latest research on live-in home care for seniors in Europe, exploring processes of commodification and marketisation, the transnationalisation of care work, the private household as a workplace, and workers' contestation of the live-in care arrangement.

RC02-36.3

LUTZ, HELMA* (Goethe University Frankfurt, Germany, Germany)

Senior Home Care for Sale in Europe

In Europe, the trend towards forced commodification of migrant labor becomes not only evident in the increasing marketization of senior home care offered by placement agencies, but also includes accelerating transnational mobility and border regimes as part of transnational care and value chains. This development includes the return of private households as workplaces outside legal work monitoring. An exploitative mode of private care provision in seniors' homes, brokered by placement agencies, has become part of the contemporary political economy of care migration. The European East to West and South migration is now a stable pattern in closing care gaps; it derives not only from the breakdown of the economies in former state-socialist countries, but is also closely connected to gendered patterns of care provision. This trend is supported and promoted by the European Union's interventions in the health sectors of its member states, by introducing an extensive commercialization of care. This paper deals with the various facets of the care economy.

Ukrainian War Memes: Between "Folk Tales" and New Practices of Identity

One of the new features of the Russian-Ukrainian war communication, which began on 24 February 2022, is the abundance of lively, sparkling humour that fills the media discourse and especially social networks during the most difficult periods of the military campaign. Numerous studies on laughter show that it is part of a certain form of social action. This disposition gives rise to a particular culture of laughter that examines reality through the prism of laughter and comic relief. Using socio-anthropological content analysis, we plan to study the development of new humorous and visual elements on digital platforms (Telegram and FB) during the war in Ukraine, in particular war memes as archetypal elements of the Ukrainian collective imagination as well as constituents of a new identity. We understand the meme as a unit of cultural information that consciously or unconsciously transmits from one to another the idea, image, symbol, action, all cultural information, to form a model of consciousness and human behaviour; it is also the collective unconscious now of acquisition of verbal and visual forms. Formally, Ukrainian war memes are presented as short texts or texts accompanied by images, or as short comic strips. The results show how the memes developed over the period 2022 - 2024. At the beginning of the war, memes existed in the form of 'new folk tales' that identified membership of real or imagined communities. In 2023 - 2024, memes proposed means and mechanisms for recognition and understanding by others. These are elements based primarily on a set of given cultural properties: language, symbols, elements of the mind, myths, modes of perception and expression. Memes also contain mechanisms of ethnocentrism, the creation of stereotypes, the confrontation and opposition of an 'us' group and a 'them' group, and mechanisms for the creation of national identity practices.

In the Shadows of Control: Transnational Repression and the Quest for Social and Religious Protection in the Eritrean Diaspora

Transnational perspectives have shed light on the complex interplay of economic, socio-cultural, religious, and political dimensions shaping migratory cross-border links and processes. However, the phenomenon of transnational repression—defined as the exertion of state control and coercion across borders—has been underexplored, particularly concerning its religious dimensions. This article seeks to address this gap by focusing on the Eritrean diaspora, a group significantly impacted by the authoritarian regime's long reach. Central to my inquiry is the question: How do transnational repression mechanisms shape religious practices, spaces and political identities of the Eritrean diaspora in Norway, and how do Eritrean dissidents receive social and religious protection outside the framework of the nation-state? By integrating insights from transnational social protection theories, political anthropology and religious studies, this research aims to illuminate the experiences of Eritrean dissenters within the diaspora, exploring the religious spaces they navigate amid repression and the forms of social protection they seek and create. Preliminary findings indicate that religious exclusion, threats, and the formation of alternative worship spaces are common experiences, yet qualitative research on these dynamics remains scarce. This study contributes to a deeper understanding of the religious and socio-political landscape of transnational repression and protection mechanisms, emphasizing the need for bottom-up perspectives that reflect the lived realities of diaspora communities.

Migración Inversa Y Enfoque De Genero Estudio Sociologico SOBRE LOS Significados De La Estabilidad De Las Migrantes Extranjeras EN Marruecos

La migración inversa desde los países del norte hacia los países del sur representa un cambio en los patrones de migración en el contexto marroquí, reflejando así una evolución en la lógica de las relaciones económicas y sociales entre los países del norte y del sur. Esto impone nuevos desafíos para ambas partes que requieren el desarrollo de políticas inteligentes para aprovechar estos nuevos movimientos poblacionales. Marruecos ya no es solo un destino turístico preferido, sino que también se ha convertido en un destino de residencia, no solo para los países del África subsahariana que lo ven como un lugar de paso y de asentamiento, sino también para los países del norte del Mediterráneo. Según los datos del censo general de población y vivienda de 2014, el número de extranjeros que residen en Marruecos superaba los 84.000, de los cuales el 40% son de nacionalidades europeas. Esto nos lleva a preguntarnos: ¿por qué esta migración inversa y cuál es su significado desde el punto de vista sociológico?

Basándose en un enfoque de género y en una muestra de residentes europeos en Marruecos de forma definitiva o casi definitiva, el estudio tiene como objetivo comprender los significados y dimensiones de esta transformación en el proceso migratorio, así como analizar las formas de interacción entre estas migrantes y la nueva sociedad. Especialmente porque la migración ya no es solo un fenómeno económico o turístico, sino que adquiere otras dimensiones no económicas que este estudio pretende explorar.

Palabras clave: migración inversa, integración cultural, residencia, mujer, género.

The Violence of Sanctions: A Gendered Political Economy Approach

Although they helped weaken the South African apartheid regime, sanctions since then have become controversial, because of their effects on the economy and society and because they are imposed by powerful states against less-powerful ones (e.g., US sanctions against Cuba since the 1960s). Studies also document the harsh effects of the 1990s UN and US sanctions on Iraq. A large body of research has come to examine sanctions—their history, place in international law, and the power relations, effects on democracy, and broad social effects. Gendered effects, however, are under-researched. Since the 1980s and especially since 2010, Iran has experienced US sanctions, and the related literature continues to grow. In 2020, the Johns Hopkins University's School of Advanced International Studies published papers under its "Iran Under Sanctions" theme. Through a focus on the sanctions armory against Iran, I make two claims. First, I show how sanctions constitute a form of violence—specifically, state violence—directed at a country's economy, polity, and civil society, and as such should be included in what Cockburn termed "the continuum of violence." Second, I argue that a sanctions regime prevents gender equality or reverses the empowerment of women and girls through both direct and indirect mechanisms: (a) directly, by restricting trade, imports and exports that constrain the state's revenues and compel austerities and job losses, with implications for schooling, health, and employment opportunities for women and girls; and (b) indirectly, by strengthening hardliner and patriarchal state elements that respond to external threats and impositions by clamping down on civil society activists and campaigns for gender equality. Women and girls in Iran are victims of two forms of state violence: the violence of US sanctions, and the violence of their repressive state. My paper on sanctions thus elucidates the interactions of violence, political economy and gender.

M. MOGHADAM, VALENTINE* (Northeastern University, USA)

Women, Peace, and Security in the Middle East: An Agenda of Empty Promises?

I put the spotlight on the global Women, Peace, and Security (WPS) agenda, launched in October 2000 by the UN's Security Council in the form of Resolution 1325, to secure women's physical security and their participation in peacebuilding and post-reconstruction activities. Framing the discussion are theories of norm and policy diffusion through intergovernmental organizations and treaty ratification, and of the effects of a hierarchical world-system characterized by inequalities, militarized masculinities, and new rivalries. In reviewing the literature on UNSCR 1325 and its attendant National Action Plans (NAPs), I examine the NAPs that the Arab League and several MENA states have adopted, assessing strengths and weaknesses of the documents and finding them largely aspirational and symbolic. I also draw attention to those states in the region that have not adopted a NAP. I conclude that the WPS agenda has considerable potential for the MENA region and elsewhere but is undermined by the international system's growing militarization, conflicts, and wars, preventing adoption of the WPS agenda and implementation of robust NAPs in the MENA region.

Reuse of Factory Buildings for Leisure and Possible Re-Elaboration of the Meanings of Industrial Heritage through Tourism: A Study in São Paulo, Brazil

This study **focuses on three experiences of reusing factory buildings in São Paulo**: a former drum and refrigerator factory converted into a leisure equipment; a textile factory transformed into the contemporary art space; and a sugar mill, converted into a public leisure and events space. The approach is multidisciplinary, seeking to observe in each case the relevance of the factory in their socio-historical contexts of origin, the memory associated with them in their process of patrimonialization, and the processes of rehabilitation and insertion into the leisure circuit. Among **the concepts** mobilized, we used the idea of the urban *commons* - above all to interpret the meaning expressed by the factories in which generations of workers and their families have established social relations - and the idea of *cultural mediation* - taken as a reference to analyze the role of heritage sites themselves in what they connect to previous memories and meanings, but also to tourist narratives and museum exhibitions, consumer objects and events through which social groups effectively relate to, appropriate and rework the meanings of industrial heritage. **The objectives** of the study were to analyze the issues involved in reclassifying industrial heritage for tourism and leisure and to reflect on the possibilities of collective appropriation of these assets. After all, how do heritage, tourism and leisure come together in the cases observed and what are the underlying issues? **The sources** included bibliographic and documentary material, field visits accompanied by interviews with qualified interlocutors and managers of the three sites analyzed. As complementary support for measuring the projection that tourist use promotes of these three factories, we observed how each of them appears in the records that their visitors make on the digital network

For Safety and Solidarity: East and Southeast Asian Diasporic Political Mobilizations in Times of Crisis

The covid-19 pandemic laid bare a series of compounding crises, including underfunded healthcare systems, labour precarity, and global regimes of anti-Blackness. Against this backdrop, Asian diasporic communities faced specific, heightened pressures. Cast as vectors of disease and foreign agents by reactionaries and conservative elites, East and Southeast Asian (ESEA) people became hyper-visible in public space and targets of racial violence. This period of heightened vulnerability spurred a range of responses across diasporic communities. In the UK, community organisers coalesced around the acronym "ESEA" as a way of advancing political demands on behalf of an often-invisibilised group within the country.

While "Asian," in the UK context, had typically served as shorthand for South Asians and "British Chinese" excluded many of those experiencing heightened racial violence, "ESEA" emerged as a useful alternative (Yeh, 2021). The term, which has been in circulation for a decade, was brought to the fore by online activist collectives raising awareness of anti-ESEA violence and subsequently embraced by long-standing community organisations. For instance, newly-formed groups like Voice ESEA undertook data collection in 2020 through Freedom of Information requests to create a catalogue of anti-ESEA violence

in the UK (Voice ESEA, 2024). Meanwhile, in March 2024, Hackney Chinese Community Services, which has had a presence in East London since 1985, announced its rebranding as "ESEACC": East and Southeast Asian Community Centre (HackneyChinese, 2024).

This conference presentation draws on interviews with community organisers and a digital ethnography of popular Instagram accounts, to map the terrain of ESEA political activism in the UK. The presentation will highlight recurrent demands of ESEA community groups—online and off—while identifying areas of tension within this heterogeneous coalition. More broadly, it will document a contemporary process of digitally-mediated racial formation and the emergence of a racial "category in the making" (Public Data Lab, 2024).

RC40-655.2MA, HUIDI* (Chinese National Academy of Arts, China)
WAN, FANGLIANG (Chinese Academy of Sciences Chengdu
Institute of Mountain Hazards and Environment, China)*Gardening: An Initiative of Sustainable Alternative in the Time of Climate Change*

Gardening is one of the important legacies of the agricultural civilization, which still affects human life and the ecological environment. It is a 'spatial container', a bearer of natural and cultural genes, and a shelter for life and mind. Although it is a small space, it is a source of value for a range of economic formation and diverse imaginations. Today, human faces an uncertain future: "The ground is shifting under our feet. Anxiety levels are off the charts. We are in a climate meltdown. Extreme temperatures, raging fires, droughts, and epic floods are not natural disasters. We are on a wild ride, about to exceed the 1.5-degree Celsius global warming limit." (Guterres, 2024) Penalties from the Earth are worsening the crisis in grain and food production. Against this backdrop, gardening is attracting a great deal of attention as a 'micro' economic form. According to a survey conducted by Chinese academics on 'food-self provisioning', 90% of urban households interviewed were involved in this activity. A sustainable alternative is on the horizon. On the one hand, gardening encourages people to return to a natural, green and frugal way of living; on the other hand, it teaches people's de-growth, less consumption and better environment. Historical experience tells us that gardening has never far away our lives, as well as has always pushed reason and restraint oneself with its tenacity and vigor. This paper adopts an interdisciplinary perspective, based on literatures and survey data to describe the cultural history of gardening, understand the relate to the happenings of individuals, families and communities, why can it serve as an alternative in sustainable development? In what ways can it influence the present and the future? These issues will be the focus of this paper.

RC34-556.3MA, XINYI* (School of Social and Behavioral
Sciences, Nanjing University, China)*Research on the Process of Seeking 'Da Zi' and the Trend of Moderate Interaction of Young People*

Recently, a new type of Chinese social relation 'Da Zi' relationship has exploded on Chinese network platform, which means a temporary community of people with a common hobby or common purpose. Based on in-depth interviews with 12 young people of different genders, ages, identities, and regions, this study focuses on the reasons for finding the 'Da Zi' relationship, the classification and the flexibility of the 'Da Zi' relationship, the social mentality of the young people and so on, the research findings are as follows:

Firstly, in Chinese young people's eyes, the 'Da Zi' relationship can be divided into two types: an alternative of friendship or the construction of idealized relationship. And there are 3 reasons why young people seek for the 'Da Zi' relationship: accurately meet the diverse needs, quickly and time-saving achieve expectations, and seek comfortable social relations. We can consider the 'Da Zi' relationship as 2 types: the event-related Da Zi and the interest-related Da Zi, and they can be further divided.

Secondly, the 'Da Zi' relationship has good flexibility and has the potential to be transformed into friendships or stranger relationships. On the continuum of relationship strength between 'Da Zi' and other forms of social interaction, 'Da Zi' can find any position between strangers and friendship. The schematic diagram of 'the flexibility of the Da Zi relationship' is formed by the crossing of the two dimensions of the depth of the existing emotion-righteousness embedding and whether the interest demand expectation is clear.

Thirdly, the phenomenon of the 'Da Zi' relationship popularity reflects the moderate interaction social mentality of Chinese young people, which is the positive reconstruction of social relations by Chinese young people.

Navigating Cisheteronormativity in Military and Police Training: Experiences of Black Gay Male Soldiers and Police Officers in South Africa

The South African historical research proves that military training camps during apartheid were sites of cisheteronormativity which recognised cis-gendered heterosexual men and informed the ill-treatment of gay male recruits who were exposed to harsh conversion therapies. Due to limited research, little is known about gay male soldiers and police officers' encounters with cisheteronormative occupational cultures in their training experiences post-1994. This study explores how cisheteronormativity manifests and inform the negotiation and recognition of Black gay men's identities in the male-dominated military and police training spaces. Through qualitative in-depth interviews with 24 Black gay soldiers and police officers who underwent police and military trainings, the study established that Black gay male soldiers and police officers are often propelled by cisheteronormative ideologies and occupational cultures in training spaces to carefully negotiate their sexual identities. The findings contribute to our knowledge of how cisheteronormative occupational cultures operate as oppressive forces, that hinder the full recognition and integration of gay men in the police and military contexts. Consequently, I argue that it is necessary to trouble cisheteronormative male occupational cultures in order to promote and achieve the social integration of Black gay men in military and police training spaces.

From Autonomous to Abolitionist Commoning: Connected and Caring Communities and Commons in a Solidarity Neighborhood in Berlin

Prefigurative practices of commoning of urban spaces were mainly analyzed from the perspective of anarchist or autonomous Marxism in the past. This debate paper sheds light on recent imaginations and prefigurations of a radically different future which have emerged from within anti-racist and racial justice organizing in cities with large racialized and migrant communities. Based on ethnographic research in the neighborhood Kreuzberg in Berlin which has been deeply transformed by migrant and refugee movements in the last decade, the article examines to what extent an abolitionist perspective on commoning has evolved which seeks to consider and counter the ongoing and past dispossessions, displacements, and divisions in racial capitalism. In the observed racialized and marginalized communities which gather around a collective neighborhood space and kitchen, a recognition of shared vulnerability and the importance of practices of mutual aid and care are central in reacting to social crises and inequalities in a way that transports an alternative imagination of social relations and infrastructures. In the process, various activist communities and groups across different social justice struggles become connected such as around housing, migration, and queer-feminism as exemplified by the researched groups International Women* Space, Sleeping-Place-Orga and Right-2-the-City. Their formation of caring and connected communities which share spaces and spontaneous support in the everyday point to possibilities of forming local and translocal solidarity communities and neighborhoods. At the same time, the awareness, accountability, and care needed for building collective, empowering, and non-hierarchical relations is a central concern and challenge for the communities living in a context of uneven precarities, repression, and violence. Nevertheless, through their experiments with abolitionist commoning, a radically different more democratic, diverse, and de-commodified vision of urban futures is built and enacted.

MAAROUFI, MOUNA* (University Hamburg, Germany)

Infrastructures and Infrapolitics in Racial Capitalism: Refugees' Contested Inclusion and Intermediation on a German Labour Market

In the last years the central role of racialisation and racism for capitalist accumulation have become increasingly acknowledged. The heritage of the Black Radical Tradition and its theories on racial capitalism and abolitionism have been taken up and begun to inspire anti-racist activism. This paper seeks to actualize these theoretical traditions based on a concrete empirical context while connecting them to autonomous Marxist perspectives such as the autonomy of migration approach. By examining the conjuncture of racial capitalism in Germany after the 'summer of migration' in 2015, the paper offers a theoretical reading of racial capitalism based on an empirical analysis

of political-economic interests, infrastructures, and trends which are relevant for the pursued forms of refusal and resistance such as everyday infrapolitics. Through its empirical analysis of refugees' inclusion and intermediation on the labour market, it connects and reconsiders key concepts associated to theories around racial capitalism such as expropriation and coercion, refusal and fugitivity. Particularly in a recent context shaped by ever more restrictive, repressive, and racist policies towards migrants and refugees as well as attacks on critical humanities such as race and post-colonial studies, it is politically important to point to the continuous processes of racialisation – even during supposedly more 'welcoming' and liberal conjunctures – which further predominant racial divisions and discourses. At the same time, the manifold and often overlooked tactics and tools of racialised precarious workers must be emphasized more than ever and considered crucial components of a radical leftist and anti-fascist politics. These trends and transformations are not only relevant for the struggles of racialised workers, but shed light on the conditions and struggles of precarious workers more broadly.

MAASS, ELISA MARGARITA* (Universidad Nacional Autónoma de México, Mexico)

Methodology to Form Cohousing: Collaborative Housing for Young and Older Adults

In Mexico, gentrification (Ley, 2019) has modified and increased the cost of living in city neighborhoods. As a result, urban housing has become unaffordable and inaccessible (Johnson, 2021), especially for vulnerable population groups such as adults and the elderly. The problem is huge, so much so that the elderly, stressed by this new urban reality, have had to migrate to the peripheral areas of the cities and this relocation has generated low quality of life conditions.

Cohousing (Williams, 2018) appears in our country as a solution for adults and older adults to maintain their housing, their social networks and offer a process of active aging and quality of life. This paper presents a comprehensive methodology to form collective housing communities in co-ownership or housing cooperative regime. It proposes the solution in the face of the problem of unwanted loneliness, social isolation and its emotional implications, as well as poverty of economic resources and facing chronic degenerative diseases (Wilson and Hebert, 2017), -which are the three characteristics and conditions most present in this adult and older adult population in our country-. The 18 steps required and distributed in 3 stages of work, help a community of friends, neighbors, colleagues or relatives to collaboratively plan their common housing. Mutual support, solidarity, respect and trust among group members are the values that guide the way to self-design and self-manage Cohousing.

The presentation is framed within the work and research carried out by the Cohousing Mexico Network, which was born at the National Autonomous University of Mexico at the Center for Interdisciplinary Research in Sciences and Humanities. And it is in tune with the Sustainable Development Goals SDGs of the UN agenda 20-30 (United Nations, 2015), within the framework of elder-friendly cities (Jacobs, 2015), and collaborating in community solutions to protect older adults.

Are Citizens' and People's Tribunals an Efficient and Fair Means of Dispute Resolution?

Citizens' and People's Tribunals are non-traditional means of dispute resolution, and a heritage of the Russell Tribunal which aimed to investigate crimes committed in the Vietnam war (late 1960s). A quite recent example is the Tribunal having judged in 2021 China's acts violating Uyghurs' human rights.

On the one hand, the success of this relatively long-lasting practice relies on the direct involvement of different actors of the civil society such as: law practitioners, journalists, NGOs, activists, as well as members of the targeted sub-community. Such a diversity in the participants is an undeniable asset because it allows varied approaches and personal experience to be taken into consideration in the appreciation of a factual situation or series of events. This can answer some criticisms of the traditional court system where judges are excellent lawyers but may not have enough understanding of special circumstances and sometimes miss calling for expertise.

Replicating the different layers of society in a courtroom can be beneficial since opening the debate wider than a hearing exclusively reserved to law specialists will contribute to a more representative and inclusive reasoning, supposedly resulting on a more legitimate decision. Moreover, privileging Citizens' and People's Tribunals may be interesting for the parties seeking an alternative resolution of the dispute particularly in the context of court

congestion and delays. It is not certain that this option may reduce the costs borne however, since the investigation would still generate expenses.

On the other hand, Citizens' and People's Tribunals raise concerns relating to: the possible lack of consent to jurisdiction; the absence of *res judicata*; the difficulty to impose reparation; the risk of non execution of the decision, *inter alia*.

Despite these deficiencies, should Citizens' and People's Tribunals be encouraged, or more, *generalized*, as a supplementing dispute resolution mechanism?

MABER, ELIZABETH* (University of Cambridge, United Kingdom)

Learning, Justice and Atopia in Myanmar's Gender Activism Movements

Gender activism has a well-established history in Myanmar and the border regions: in the 1990s many ethnically aligned women's organisations (such as the Shan Women's Action Network or the Karen Women's Organisation) were founded, often associated with the ethnic armed struggles for auto-determination (Hedström 2016). By focusing on the needs of ethnic women and children in conflict, and attending primarily to culturally acceptable female domains such as education and healthcare, the women's organisations in ethnic regions were able to gradually establish a position for themselves that was less contested while they were viewed as operating in non-political spheres (Laungararnsri 2011). This then provided a platform from which to engage in more overtly politicised campaigns such as reporting on the systematic rape and abuse of ethnic women by the military (WLB 2014) or advocating for women's inclusion in the peace negotiations (Lahtaw & Raw 2012). As Myanmar's political and conflict landscape has shifted over the last 15 years, gender activist movements have likewise responded, with more diverse organisations emerging employing varied strategies to contest authoritarianism and the gender hierarchies implicit in militarisation.

Community education has frequently been mobilised as a way of sharing information within such movements, often reaching across Myanmar's borders, reinforcing the position of community education as occupying an alternative space for the recognition and renegotiation of identities. This paper explores the position of education and learning in the shifting dynamics of gender activist movements within Myanmar's multiple conflicts, offering a discussion of the historical and contemporary evolution of gender activism through Deleuzian conceptualisations of social space and nomadic subjectivities. The notion of *atopia*, being beyond or out of place, is offered as a way of understanding the distinctive forms of learning in these cross-border activist movements.

Visibility & Anonymity: Solidarity in Research across Conflict Borders

This paper reflects on the challenges of working in conflict-affected settings, across borders, subject positions and experiences within the shifting dynamics of armed conflicts and authoritarianism. As the presenting author, I bring together reflections from a series of dialogues and conversations held with colleagues and research partners. We ask questions of the nature of visibility and anonymity in research: who benefits from visibility and what risks these incur, especially when conflict dynamics can change so rapidly. This reflects a tension in much of my current work in the context of Myanmar's resurgent civil war. Having worked in Myanmar in education and gender since early 2009, I was working on two collaborative research projects when the military coup of February 2021 returned the country to military rule. In these two projects we adopted different strategies in reaction to the coup, in the direction of the research, the methods used and decisions around authorship and anonymity. Both projects had prioritised decolonial feminist approaches to the research. Yet the coup and ensuing civil war has reminded us of the risk and consequences associated with our different subject positions, while also bringing new priorities to the fore. Here, we reflect on these dynamics of working across borders and across cultures in conflict settings.

Challenges of University-City Relationships: Reflections from South Africa

This paper explores practices in 'doing urban research, teaching and public engagement differently', including initiatives at several institutions in different South African cities (Fort Hare in East London, Western Cape in Cape Town, Nelson Mandela in Gqeberha, Pretoria in Tshwane and Witwatersrand in Johannesburg) to forge new connections and play new roles as urban actors. Considering pedagogies, methodologies and deliberative forms, it is also concerned with institutional relationships between universities, city governments and other organisations. The purpose of the paper is to examine the challenges that face those who seek to bring institutional (and physical) relationships closer together, with illustrations from often contradictory projects and results. Human and network relationships form a key element of the context. The paper necessarily engages with varied understandings of the public role of universities. It seeks to identify factors that support success for innovative approaches and tactics within universities and beyond.

Sources of the paper include participation in practices at Wits on the part of the author (starting in 1980s Mabin 1984), secondary material (reports on relevant initiatives e.g. Bank et al. 2018, Oldfield et al. 2019, <https://www.chrflagship.uwc.ac.za/the-way-to-greatmore/>, <https://www.mistraurbanfutures.org/en/project/citylab-programme>), and select interviews. The paper intends to provide an informed account of developments in university-city relationships and to link that to wider questions on the general subject, claiming neither a definitive account nor conclusions that might be generalised but which may provoke further reflection.

Politics of Left behind Places in South Africa: Is There a Rebellion Against Metropolitan Elites?

South Africa tops the list of global inequality. The geography of inequality and unemployment is complicated. Widespread, though local and relatively small, people demonstrate and protest against public authorities. Since 'the country experienced unprecedented levels of unrest and destruction of public and private property in July 2021' whether these events relate to 'left behind places' emerged. Populist movements grew, the Economic Freedom Fighters (EFF) and Patriotic Alliance since 2013, and in 2024 national and provincial elections the new uMkhonto weSizwe Party scored 15% of the national vote, 45% in the province of KwaZulu-Natal, and majorities in some districts while EFF has continued to gain support in some left behind places.

The paper will explore spatiality of populism in South African circumstances. Do these developments parallel experiences in other parts of the world? Are 'the populations of left-behind places revolting against metropolitan elites' (Amarouche et al. 2024)? Can it be argued that 'rising territorial inequalities give rise to populism and localized dissent' (Amarouche and Nafaa 2024)? What alternative causalities can be postulated? – for example as Tups et al (2024) put it, 'hope rather than hopelessness can prevail in 'left-behind' places' – perhaps via populism but possibly via other relationships.

Exploring the Utility of the Subtractive Approach to Quality of Life Importance Weighting

This paper seeks to contribute to two inter-related debates on the measurement of Quality of Life (QoL): 1. the utility of importance weighting, and 2. the appropriate translation of the 'gap approach' to QoL. While on the one hand scholars argue for the utility of importance weighting (e.g. Hsieh, 2016), others (like Wu & Yao, 2006) argue that it is unnecessary. Relatedly is the issue of an effective approach to weighting that is both methodologically robust and intuitive. The data analysed is a sample (n=970) from a wider study on qualitative approach to QoL measure development. Respondents were undergraduate students from various disciplines and levels of study at a university in Nigeria. A survey using a battery of instruments: the Student Quality of Life Scale (SQOLS), a new, 40-item measure of importance and satisfaction with achievement and the Satisfaction with Life Scale (SWLS), was undertaken. The SQOLS domains include material, status, relational and achievement, while the SWLS is a widely used measure of global life satisfaction. Drawing on the WEDQoL Group's (Woodcock et al, 2009) approach, the analysis used an abridged, 3-point scale for satisfaction items and a 5-point scale for importance items. A composite SQOLS measure was created using the subtractive approach, in which the satisfaction scores were subtracted from the importance scores, following Roszkowski and Sprent (2010). The composite SQOLS domain scores and the SQOLS were positively correlated with the SWLS showing convergence. Based on the results, the paper argues that consistent with Hsieh (2016), importance weighting has utility and validity, especially in homogenous groups. Further, it argues for the further application and testing of the subtractive method, particularly in developing countries where people's expectations often outweigh their ability to achieve them satisfactorily.

The Role of Philanthropic Socialisation in Young Elite Giving in West Africa

Scholarship on African philanthropy, emphasising the role of culture in giving to address social and communal problems in Africa, has gained root over the past two decades. However, very little is known about whether youth, in general, or young elites (middle class and high net worth) in particular, give financially to address problems in their societies, and if so, what factors drive their giving. Drawing on the concept of political socialisation, this paper explores the impact of 'philanthropic socialisation' on giving among young elites in Nigeria and Ghana. Data for the paper derives from 16 semi-structured interviews with individuals aged 22 to 35 in Ghana (7) and Nigeria (9) conducted for a wider study on young elite philanthropy. The interviews focused on the extent to which participants gave financially to social causes and what factors influenced their giving. Findings show that a majority of the participants gave to social causes related to education, health, child development, and activism, and were willing to continue doing so. Those who did not give aimed to first attain financial security and resilience before allocating resources to communal or social issues. Willingness to give financially was expressed both in present and aspirational terms, meaning the ability to give in future was contingent on an expectation of increased income and assets. Almost all participants cited their parents' (mainly mothers') giving behaviour as influencing their giving, with only a small number mentioning religion and culture. This suggests that like political socialisation, 'philanthropic socialisation' plays a role in youths' giving behaviour, intentions and attitude. While based on a limited sample, the findings have relevance for further examining the assumptions underlying African philanthropy, particularly on the role of culture and the extent of its influence on the giving behaviours and intentions of young people.

RC26-424.1MACALUSO, MARILENA* (University of Palermo, Italy)
LETO, ANTONIO (Independent, Italy)*Artificial Intelligence in Politicians' Public Statements*

AI has got political power, containment of the risks and development of the benefits of AI could only be generated in an informed and open public debate but, warns Suleyman (2023), politicians are reticent to speak openly about the dangers ahead because they are used to a world of order and control, in a condition where the contours of the dilemma are not predictable and the levers of control do not work. Starting from the distinction between 'governance by AI' and 'governance of AI' (Erman, Furendal 2022), the paper will analyse the public speeches of the main European political leaders on

the topic of artificial intelligence, in order to identify - in an ideal-typical way - the most recurrent frames and the political and communicative strategies related to them. In particular, public statements taken from newspapers and statements on official social networks will be collected, and the positions on the influence of artificial intelligence on decision-making and on the externalisation of democratic decision-making to AI systems will be analysed, as well as on the soft law and ethical guidelines produced by private actors in relation to the question of political legitimacy. Methodologically, statements will be selected according to a reasoned choice criterion over the past two years and analysed by means of a CAQDAS.

"We Have Always Been Here": Three Generations of Leadership from the Muslim Brotherhood to the Islamic Action Front in Jordan

Women in the Muslim Brotherhood (MB) have often been seen as marginal figures within a predominantly male-dominated organization. However, their ability to carve out space and relevance reflects a significant shift among both women and men within the movement. Notably, women are gaining momentum in the Islamic Action Front, which today serves as the main opposition party in Jordan and embodies the political project of the MB.

Based on extensive ethnographic fieldwork and a diverse range of sources—including biographical interviews and archival documents—this paper aims to unearth women's history within the MB, reexamining the organisation's dynamism, debates, contrasts, and internal criticisms in light of women's contributions.

The study highlights three key figures whose different experiences in geography, class, and motivation illustrate the multifaceted and ordinary nature of the MB in Jordan. The first is Fatima Farhan (Umm Ahmad), born in the 1940s. She was a charismatic leader and founding member of the political party, actively engaged with the MB in various sectors, including *da'wa*, education, and teaching, two decades before the party's establishment in 1991. The second figure is Hayat al-Misiymi (b. 1961), who became the first woman elected as an MP within the party in 2003 and the second woman nationwide. Active since her high school years, she later solidified her commitment through student movements, syndicates, and the political party. Hayat hails from Zarqa, a densely populated and impoverished neighbourhood near the Jordanian capital. Finally, the paper examines the rise of Dima Tahboub (b. 1970s), the former spokeswoman of the party and a current MP, who is a significant figure in contemporary Jordanian politics. This study explores how these women navigate their roles as both innovators and outsiders in a complex religious, social, and political context, as well as within the holistic but ordinary movement of the MB.

"Dans Le Noir": Where the Forest Meets the City, a View from Tangier, Morocco

"It suits them [white Europeans] for us [black Africans] to live in 'le noir' [in the darkness or the black]", a longtime resident of Tangier, Morocco, who is also a familial chief in Cameroon reflected, drawing explicit links between the extra-legal policing of racialized migration through EU Partnership Agreements in North Africa and the subversion of regulatory regimes in the continent's centre. Contrasting memories of seeing the twinkling lights of European cities through his deportation flight window with the relative darkness of landing back in Cameroon after stowing away on a ship as a child, and comparing this to subsequent years living without lights in the forests of Algeria and Morocco – dressed in dark clothes to avoid detection by the police, admiring "shining" cities from a distance – another Cameroonian resident who now struggles to maintain a viable life in the city insists living in 'le noir' is "a reality for us". In this paper, I map and model key elements in the socio-spatial recomposition and affective experience of 'le noir' by focusing on a selection of moments and movements through which 'le noir' is formed and transformed: as an ultimately unknowable zone of seeming hopelessness, apparently of no apparent value, offering a perspective without perspective, and threatening an orientation of total disorientation. In reflecting on how Cameroonian interlocutors reflect (or try not to reflect too much) on the situations they inhabit in context, I show how not everyone in 'le noir' (as a socio-spatial situation) is 'noir' (as a racial identity read through skin colour) or vice versa, and yet signs and symbols of blackness and their various significations come to be associated with one another in affective material ways. I consider how this view from Tangier might inform a propositional politics of inhabitation (Lancione and Simone 2021).

MACCARRONE, VINCENZO* (Scuola Normale Superiore, Italy)

Power Resources in Global Labour Governance

Power resource theory (PRT) is experiencing a comeback. Initially devised to explain the emergence of the welfare state as a result of the growing strength of labour, PRT has been increasingly applied also by labour relations scholars. Over time scholars have increasingly expanded the taxonomy of power resources. While definitional boundaries are still somewhat blurred, there is now a certain agreement that, beyond the power that workers accrue from their position in the production process and from their collective organization, one should also look at the institutions fostering or weakening workers' rights, and to the resources that labour can gain from building broader alliances and from its influence on society at large.

Unsurprisingly, given that the original research question leading to the development of PRT was to explain the emergence of *national* welfare states, initial PRT-inspired approaches suffered of a degree of methodological nationalism. This applied also to its application to industrial relations. When the effect of transnational forces was considered, it was essentially seen as an exogenous shock that affects actors' power resources at the domestic level. Thus, for instance, Wright (2000) conceptualised globalisation as a form of external pressure that, through heightened international competition, affects negatively the power of the working class. Over time, however, scholars using the PRT have become more attentive to the politics of scale that is generated by the growing entanglement of national industrial relations within an increasingly transnationalised global economy.

In this theoretical essay, I discuss five recently published books that advance our knowledge of power resources within global labour governance. The aim of the essay is twofold. First, it shows the potentialities but also the limitations of a transnational theorization of workers' power resources. Second, it contributes to broader debates on workers' agency in global labour governance and global value chains.

Agricultural Racial Capitalism and the Refugeeization of Migration: Exploring the State-Sanctioned Entrapment of Racialized Migrant Farmworkers in the Province of Foggia.

In the past years, multiples scholarly analyses have examined the condition of liminality experienced by asylum seekers and refugees within the asylum system.

At the same time, in the past decade, migration underwent a process of "refugeeization" (Dines, Rigo 2015), whereby asylum became the only channel to obtain a regular status and waiting became a core element in defining experiences of migration in general. This transformation also affected the experience of racialized migrant farmworkers employed within Southern Italian agricultural sector who, from being mostly seasonal undocumented workers, increasingly became asylum seekers. Furthermore, following the increasing criminalization of labor exploitation and *caporalato* put in place by Italian government through the implementation of law 199/2016, a vicious circle was generated, according to which in order to be employed it is necessary not only to hold a valid permit of stay, but also other documents -such as ID card, tax revenue code, bank card- which, however, are often difficult to obtain due to the precarious legal status of asylum seekers and the widespread racism characterizing public offices' employees. As a consequence of that, the grey area between documented and undocumented migrants grew disproportionately, with a large number of people being formally documented but unable to exercise any rights.

Building on five years of ethnographic observation and grassroots activism in two of the largest informal settlements of Foggia province (Borgo Mezzanone and Torretta Antonacci) as well as in public offices of the area (such as Immigration Office, Post Office, Civil Registration Office, etc.), the present contribution intends analyzing the ways in which administrative limbos have become a tool to implement a racialized management of labor force and migrant mobility, forcing an increasing number of racialized migrant farmworkers to be entrapped within informal settlements, due to their structurally precarious legal status.

MACCIANI, CAMILLA* (University of Bergamo, Italy)
PERROTTA, DOMENICO* (University of Bergamo, Italy)

Top-Down Ecological Transition in the Automotive Sector and Labor Crisis: An Analysis of Bari Industrial Area Transformations.

In the past decade, ecological transition has become an imperative, in light of the increasingly dramatic consequences of climate change, becoming a central pillar of global and EU policy. However, ecological transition implies productive transformations that can have a negative impact on certain social issues. Literature on the topic highlighted that, while in the past environmental and social issues have often been considered as opposed to one another, more recently the concept of "just transition" has opened the space to understand them as intertwined. At the same time, literature shed light on different approaches characterizing ecological transition, to be broadly distinguished between "bottom-up" and "top-down".

Building on qualitative field study developed by the authors as part of the PRIN 2022 research group "Just transition in the factory. Workers' mobilizations and participatory innovation in emergent Italian experiences", the present contribution intends analyzing the social implication of a top-down transition by examining the consequences of EU Parliament ban on diesel and petrol cars by 2035 on the Bari-Modugno Industrial area. The district hosts some of the largest car component producers of Southern Italy, which employ various thousands of workers, offering valuable job opportunities in an area characterized by high levels of unemployment and labor exploitation. Building on in-depth interviews with workers, union representatives, as well as engineers and local managers, the paper explores how the adoption of a top-down approach to transition promotes the exacerbation of conflicts between environmental and social issues, ultimately preventing just transition to take place. In addition to that, the paper argues that top-down governmental ecological transition can be used by companies as a justification to close or resize productive sites considered as unprofitable and delocalize production.

PICANCO, FELICIA (Federal University of Rio de Janeiro, Brazil)

Dispositivos Digitales y Regulación En El Mercado Globalizado Del Cuidado: El Caso Del Programa Au Pair

En el contexto de la globalización desigual y estratificada, con la reducción de distancias impulsada por avances en transportes y tecnologías de comunicación, los flujos migratorios y la circulación de personas se han vuelto más complejos. A pesar de ello, el flujo Sur-Norte, orientado hacia la incorporación en actividades de cuidado, sigue siendo significativo. En este sentido, el programa Au Pair destaca como un importante responsable. Este programa de movilidad conecta a familias anfitrionas que buscan cuidadores de niños con jóvenes, mayoritariamente mujeres de países del Sur, que articulan expectativas de ascenso profesional y crecimiento personal a través del intercambio cultural. Este estudio analiza el programa Au Pair considerando la intersección de procesos como la diversificación migratoria, la transnacionalización del mercado de trabajo doméstico y el surgimiento de plataformas digitales. La investigación incluye análisis de las normas que regulan el programa, el funcionamiento de tres agencias-plataforma, la observación en dos redes sociales y el monitoreo de perfiles en otras tres, además de 12 entrevistas en profundidad con brasileñas candidatas a au pair. Se concluye que la regulación del programa favorece la asociación a la categoría de estudiantes, en desmedro de la categoría de trabajadoras domésticas, lo que influye en la falta de reconocimiento del trabajo realizado. Las agencias-plataformas actúan como agentes reguladores que priorizan los intereses del mercado. Por otro lado, las redes sociales funcionan como dispositivos digitales que informan y moldean las prácticas y subjetividades de los jóvenes que planean la movilidad a través del Au Pair. Ambas instancias contribuyen a la compleja frontera del programa en relación con la imagen del trabajo doméstico tradicional.

RC17-249.2

MACEDO, JOANA* (University of the State of Rio de Janeiro, Brazil)

School Managers and School Trajectories in Educational Institutions in Rio De Janeiro, Brazil.

This study analyzes the role of school administrators in combating inequalities within basic education institutions. The research focuses on the process of grouping carried out through enrollment in public high schools in Rio de Janeiro, and whose methodology is based on in-depth interviews with school administrators represented by the people who serve as high school principals in the public education system of the State of Rio de Janeiro. The interviews were carried out using a snowball selection method and allowed us to capture school principals strategies for creating an effective school that promotes educational opportunities for students, one of them through class transfers. In this study, those school principals are understood as street-level bureaucrats, as they are directly responsible for implementing the public enrollment policy inside of which the transfers are. Through the theoretical framework regarding the importance of school leadership and school climate for building an effective school, this research contributes to a deeper understanding of the role of public high school principals in Rio de Janeiro through strategies for moving students within the school institution. This movement of students within the school system is known as class transfers, in which part of them are the prerogative of the school principal to carry them out. Preliminary results indicate that school managers seek to build a democratic and inclusive school through the possibility of student transfer, while their actions indicate discretionary, and sometimes selective and stigmatizing social processes. Thus, this study does not intend to exhaust all possibilities of analysis, but to include class transfers as an object of analysis to understand the internal functioning of the school institution and the role of school principals in the formation of a fair school in combating inequalities in schools trajectories.

MACHADO, MARIANA* (University of São Paulo, Brazil)
IANNI, AUREA (University of Sao Paulo, Brazil)

Digital Society, Risk Society, and the Metamorphosis of the World: Exploring Digital Technologies through the Work of Ulrich Beck

The concept of "digital" can be understood through various contexts and disciplines, providing a range of definitions. In technology, it refers to computational systems and digital infrastructure; in economics, to the transformation of production processes and business models; in politics and ethics, to the implications for governance, privacy, and human rights; in epistemology, to new modes of knowledge production and dissemination; and in sociology, to how digital technologies reshape social practices and public spaces. Thus, the digitalization of society reflects the inherent polysemy of the concept, characterizing it as a multifaceted phenomenon.

Given that digitalization arises from scientific and technological practices developed and applied by public and private entities, Ulrich Beck's risk society theory provides a relevant theoretical framework for analyzing its implications. According to Beck, technoscientific advancements – including digitalization – aim to solve problems and promote innovation, yet simultaneously generate new types of risks. These risks are generally uncertain, invisible, incalculable, and have global reach, at least initially. This paradox of progress reflects the overlap of socio-economic vulnerabilities inherited from the 19th century and the self-produced risks of late modernity.

In the context of the global risk society, digitalization – especially through the use of algorithms, artificial intelligence, and big data – constitutes a transformation associated with the "metamorphosis of the world" suggested by Beck, an alteration in the human condition that connects the risk society with processes of cosmopolitanization, individualization, and reflexivity in modernity. Digital risks emerge as diffuse, immaterial, and difficult for individuals to grasp, undermining autonomy, privacy, and democratic institutions.

The invisibility of digital risks in this context is obscured by an ideology of technological development, perpetuating dependency and deepening the challenges posed by digitalization. For Beck, emancipation from these global risks requires the assertion of data protection and digital freedom as fundamental rights.

MACHADO DE SANTI, MARIA FLORENCIA* (Facultad de Ciencias Sociales, Uruguay)

La Construcción Punitiva Del Conflicto Social. Concepciones Acerca De Las Adolescencias En Conflicto Con La Ley Penal, En El Ámbito Jurídico y Político En Uruguay.

El presente documento surge en el marco de la elaboración de la Monografía del Diploma en Penalidad Juvenil de la Universidad de la República del Uruguay – Facultad de Ciencias Sociales. Se realiza una reflexión teórica en torno a las concepciones expertas acerca del sentido del uso del castigo que se infringe a las adolescencias que se encuentran en conflicto con la ley penal en Uruguay, centrándose en el discurso político y en las producciones normativas nacionales.

Se utilizó una estrategia de investigación cualitativa y exploratoria, en donde se estudiaron los cuerpos normativos nacionales desde el año 2004 al año 2013: Código de la Niñez y la Adolescencia (CNA), y las leyes: N° 18.777, 18.778 y 19.055 que modifican el CNA. Asimismo, se analizaron las argumentaciones realizadas en la Cámara de Senadores a la hora de aprobar las tres leyes mencionadas, durante el período 2011-2013. Se pretende desentrañar qué fundamentos teóricos, metodológicos y empíricos utilizaron las y los senadores.

Desde el año 2010 se ha generado un proceso de neopunitivismo en nuestro país con respecto a las y los adolescentes. Este está dado por el aumento de penas y la creación de nuevas figuras delictivas, que recaen sobre ellas y ellos.

Resulta pertinente problematizar los discursos que sostienen al tratamiento de las adolescencias que se encuentran en conflicto con la ley penal, teniendo en cuenta el proceso histórico que los ha construido socialmente como peligrosos. Así como también, considerar las consecuencias que esta triada legislativa genera sobre las y los adolescentes penalizados. Por último, es una temática de interés, debido a la pertinencia de reflexionar acerca del cambio de paradigma que establece el Código de la Niñez y la Adolescencia (Doctrina de la Protección Integral) con respecto al Código del Niño (Doctrina de la Situación Irregular).

STICHS, ANJA* (Bundesamt für Migration und Flüchtlinge, Germany)

Interviewing Muslims: What Role Does the Origin of the Interviewer Play in Face-to-Face Interviews?

For various reasons, Muslims in Germany are not an easy subpopulation to interview. One reason for the relatively low willingness to participate can be found in general reservations about or an unfamiliarity with social science surveys. Experiences of discrimination and a lack of German language skills can also be an obstacle for this group, which is made up of many new immigrants.

In our article, we present the design of the study Muslim Life in Germany 2020 as a best practice example for generating reliable data on Muslims. As part of the study, more than 4,500 face-to-face interviews were conducted with immigrants and their descendants from 23 Muslim-majority countries, including 3,472 Muslims. In view of the aforementioned hurdles when interviewing Muslims in Germany, additional Syrian interviewers were sent into the field. Hence, we use this data for bivariate and multivariate analyses to examine the extent to which the use of these Arabic-speaking interviewers influenced the results of the survey. 43% of the interviews with Muslims were conducted by Arabic-speaking interviewers. With regard to the investigation of interviewer effects, we focus on the following topics:

- We examine whether Syrian interviewers achieve a different participation rate than interviewers without a migration background. We further analyse whether there are differences between the groups of people that could be reached in terms of socio-demographic characteristics. For example, language barriers should be eliminated for Arabic-speaking target persons and they might have easier access to people from Muslim-majority countries due to similar migration biographical backgrounds.
- We investigate whether differences in the response behaviour of Muslim interviewees to culturally sensitive questions on religion and social cohesion exist in association with the origin of the interviewer that might suggest social desirability effects.

MADDOX, AMREI* (German Federal Office for Migration and Refugees, Germany)

The Use of Digital Religious Content Among Refugees in Germany: Frequency, Change and Relation to Communal Religious Practice

Various European studies on digital religious life among Muslims exist. These are often case studies of a certain type of digital religion, e.g., lifestyle vlogs, or focus on Islamist or Salafist contents and radicalization. However, information on the overall pervasiveness of the actual consumption of religious content online and in social media is largely missing. To gain more insight, the topic was entered into the questionnaire of the IAB-BAMF-SOEP survey of refugees – a large, representative survey of refugees in Germany – in 2021. Besides the frequency of using digital religious content, detailed information on the type of use was gathered. The frequency was surveyed again in 2023. Also information on individual religiosity, offline religious practice as well as on various demographic, socio-economic and attitudinal characteristics is available which allows for a detailed investigation of this topic at hand.

Within the present study, I investigate the following aspects: First, I examine to what extent digital religious content serves as a substitute for physical communal religious practice in 2021. On the one hand, religious events were heavily limited during this time due to the COVID19-pandemic. On the other hand, Muslim refugees less frequently attend religious events compared to Christian refugees. This is in part due to them not finding suitable events within the existing Muslim community infrastructure. Second, I investigate, to what extent changes in the frequency of using digital religious content can be observed between 2021 and 2023, i.e., between mid-pandemic and post-pandemic times. Was the use steered by restrictions put on physical meetings and the worries about the general pandemic as well as personal situation during this time? Third, I take a look at which individual factors shape the use of digital religious content. Who are the people that use them and who are less likely to do so?

MAEDA, MUGIHO* (Kokugakuin University, Japan)

A Historical Analysis of the Reappearing Teacher Shortage in Japan

The difficulty of teacher shortages has been discussed as a major obstacle to SDG 4, "Quality education for all." The problem is serious not only in countries with low-income and high-birth rates, but also in countries with high-income and low-birth rates (UNESCO et al. 2024).

Although improving teacher salaries has been highlighted as one of the promising ways to address the current teacher shortage (UNESCO et al. 2024), Japan, which is known for its relatively high teacher salaries through national legislation (Akiba and LeTendre 2009), is also facing a nationwide "teacher shortage" these days (UNESCO 2022). It is important to clarify why the "teacher shortage" problem has reappeared in Japan, because it would enable us to consider why improving teacher salaries could not solve the problem, and how we can implement it effectively. This study clarifies a historical and long-term process that teacher shortage has emerged in modern and contemporary Japan, contributing to a more holistic understanding of teacher shortage as an urgent and historical problem.

I collected newspaper articles and parliamentary records on teacher shortage, and analyzed their trends by referring to secondary sources.

As a result, the problem of teacher shortage in Japan has always been caused by exogenous factors such as population dynamics and economic changes, because the financial basis for teacher salaries was too unstable and insufficient to retain teachers and continuously attract candidates. In addition, the long-term view point for teacher supply and status has been lacking in Japan, which has resulted in the reappearance of the "teacher shortage" problem today. This study argues that it is essential not only to establish improving teacher salaries and incentives to attract high-quality candidates, which are emphasized as urgent and contemporary measures, but also to keep them stable and continuous from a long-term point of view.

MAES, HENRY* (UCLouvain, Belgium)

What You Feel, Who You Are - the Emotional Fabric of Anti-Gender Movements in Belgium

This paper examines the emotional dynamics within anti-gender movements in Belgium, with a specific focus on how emotions contribute to the formation of collective identities. Drawing on the affective turn in social sciences, I argue that emotions such as disgust, righteousness, and pity are not only mobilization tools but are also central to shaping how activists perceive themselves and their struggles. Further, I explore the "character work" (Jasper, 2018), that activists engage in, which involves assigning positive or negative emotional associations to both allies and adversaries.

Despite the significant attention to collective identities in the study of social movements, this framework has rarely been applied to anti-gender activism. Most research on these movements has focused on discourses, strategies, and opportunities (Graff & Korolczuk, 2021; Kuhar & Paternotte, 2017), often overlooking the role of emotions and identity work. This perspective surely draws from a new tradition in the study of the radical right: the necessity to understand the rationality of those actors. However, I contend that by examining the emotional ties within these groups, we can gain a deeper understanding of their collective reasoning and the sense of belonging that sustains their activism.

This study relies on ethnographic fieldwork and focus group data with field-recruited participants within three anti-gender organizations: a radical right LGB group, a Catholic traditionalist organization, and an anti-trans medical advocacy group. Reflexively such an approach poses challenges, both intellectually and emotionally for the researcher (Bellé, 2016). Yet, by embracing the researcher's sensitivity as a tool, we can better grasp the affective dynamics of anti-gender mobilizations (Hemmings, 2020). Deeming emotions as central to both identity formation and mobilization, this paper seeks to offer new insights into the emotional infrastructure of anti-gender movements and their capacity to engage and sustain their members.

Social Love, Solidarity, and the Civil Sphere: Strengthening Bonds to Heal Divided Societies

The contemporary global landscape presents unprecedented challenges for fostering social cohesion and solidarity. We explore the dynamics of social love within the framework of the civil sphere, focusing on emotions and emphasizing its role as a key mechanism for promoting inclusivity and collective well-being. How can social love bridge social divides? By analyzing the interplay between social love and solidarity, we show these concepts contributing to the strengthening of the civil sphere, where individuals and groups negotiate shared values, democratic principles, and mutual respect. Through case studies we highlight the potential for social love to create (emotional) bonds of solidarity that are essential for the sustainability of democratic societies in the face of polarization and social fragmentation. Our aim is to offer insights into how cultivating solidarity through social love can enhance the resilience of the contemporary civil sphere.

Love As a Vocation. Professionalisms in Childcare 0-3

The feminisation of work has led to a political change favouring the expansion of early childhood education and care (ECEC). ECEC is considered to facilitate women's participation in the labour market, thus reducing the risk of poverty and gender inequalities, and to improve children's social and cognitive development to enable society's productivity in the knowledge economy. In this context, ECEC services have diversified into different provision models (public, private for-profit and non-profit, social innovative initiatives) with varying degrees of institutionalisation. Despite the emergence of different work settings, each characterised by different formulations of professionalism and its pedagogical project, one common feature of their professionalisms is love. Professionals in the field – an overwhelming majority of women – must provide *by-default* love to their very young children, and they are chosen for their loving capacity more than their credentials. Care – as an expression of social love – is an ambiguous term in their discourses: once considered the primary scope of ECEC service, it is now neglected in favour of assuming a more educational attitude.

This paper will explore the consequences of the expansion of ECEC services on the professionalism of early childhood educators and the role that love plays in defining professionalism in the different work settings examined. I will present the preliminary results of 20 in-depth interviews conducted with 24 practitioners in early childhood education services in Barcelona.

Trans-Mediterranean Generation: Youth of North African Origin in Italy between Local Configurations and Global Connections

'Youth' - conventionally understood as a phase of transition to adulthood - is a controversial and ambiguous concept, difficult to define from a global perspective, as it varies from one context to another (Bessant, Collin, O'Keeffe, 2024; Philipps, 2018). In Western societies, and particularly in Italy, youth is a complex and elusive stage of life (Gambardella et al., 2021; Magaraggia, Benasso, 2019). This is particularly true for young people with a migrant background, for whom the liminal nature of youth is intertwined with the liminality of their 'in-between' experience of identity and citizenship (Besozzi, Colombo, Santagati, 2009; Caneva, 2011). This paper presents the first results of the research project 'Growing old, feeling like citizens?' (PRIN, University of Padua & Milan-Bicocca) - a multi-site qualitative study based on biographical interviews, focus groups and ethnographic observation - which addresses the transition to adulthood of young Muslims of North African origin in Italy. Drawing on an intersectional and 'lived citizenship' perspective (Kallio et al., 2020), the study explores the transnational, diasporic and trans-Mediterranean connections between practices of identity performance, political engagement and cultural expression (Acocella & Pepicelli, 2018; Camozzi et al., 2019; Cingolani, Ricucci, 2014). In constructing their own sense of 'multiple belongings' (Valtolina, Marazzi, 2006), the descendants of North African migrants in Italy must come to terms with structural constraints that reiterate their exclusion (Hepworth, Hamilton, 2014) and a sense of 'marginality' linked to their family history (Ricucci, 2005) but also to the particular life phase they are experiencing. Nevertheless, they manage to mobilise multiple resources and adopt different strategies to navigate this complex liminality, linking their own identity, political and cultural practices to transnational dynamics, often involving their parents' countries of origin (Queirolo Palmas, Stagi, 2018; Zanfrini, 2018).

The Access Equity Model: An Action-Oriented Framework to Address Health and Participation Disparities Among People with Disabilities

In 1990, the Americans with Disabilities Act enshrined legal protection from discrimination based on disability status into federal law. Yet, despite progress made from 35 years of civil rights protection, the 74 million people living in the United States with disabilities continue to experience significant barriers to social participation in all aspects of society as full and equal members. Notably, people with disabilities, especially those living at the intersection of other minoritized identities based on race/ethnicity, gender, sexuality, and economic status, are disproportionately impacted by the adverse effects of social determinants of health, leading to health and participation inequities.

To support the development of evidence-informed interventions and public policies to break down barriers to health and participation experienced by people with disabilities, a community-based participatory research team of disability rights advocates and disability scholars developed the Access Equity Model. Grounded in aggregated data from four qualitative studies with cross-disability samples (n=159), the Access Equity Model emphasizes modifiable barriers and supports at the individual and environmental levels as entry points for intervention, as well as measurable outcomes, grounded in the World Health Organization's International Classification of Functioning, Disability, and Health.

This presentation will include exemplars of the application of the Access Equity Model across a range of contexts and demonstrate its utility in addressing the complex health and participation inequities that confront people with disabilities in the Anthropocene.

Green Transition through Socially Engaged Arts: Addressing Climate Change By Capturing Cultural Value through 'Roaming Rooms' and 'Public Map Platforms' in Ynys Môn

Green Transition Through Socially Engaged Arts discusses feminist, arts based research, affective and site-specific engagement methods as tools to engage children and young people with public mapping processes. The methods and practices we discuss in this paper, have been developed as part of The Public Map Platform (PMP) research project. PMP is a two-year research initiative led by Cambridge University to make places in the UK better for the people who live there. The project is currently being piloted on Ynys Môn, North Wales. PMP proposes that engaging voices of diverse communities and representing data spatially on a public map platform accessible to all, enhances decision-making and resource allocation in pursuit of a socially just, green transition.

Lle Llais as a temporary, site-specific experience, comprises a pop up architectural installation, a multi-sensory activity journey and a programme of arts based activities. The aim of *Lle Llais*, is to create temporary relational and infrastructures that facilitate embodied, arts based experiences, inviting children and young people to share and map their knowledge and experience of specific cultural, social and environmental value.

In this paper, we discuss how feminist, arts based research, affective and site-specific engagement methods, offer relational and imaginary infrastructures with which to activate, listen to and map children and young people's relationships with, and knowledge of, their cultural social and natural environments. We propose that the novel formation of the physical and relational infrastructure of *Lle Llais*, combined with a designated digital open public map platform, and the social artistic engagements that they facilitate and curate, can feed into social and cultural consultation with children and young people; methods of public engagement core to green transition processes.

Case Studies Regarding Responses to Distress in Extreme Events

In the contemporary world, experiencing extreme events have become part and parcel of many individuals and communities' everyday realities. From genocide and war, state violence, economic crashes, to pandemics and severe climate change, extreme conditions and events have been made commonplace as never before, leading to severe collective and intergenerational suffering, displacement, and material vulnerabilities. Within these radical times, humanitarian and medical interventions, and their discourses of recovery and social justice, seem lacking, inappropriate in scale, and many times unfitting. This panel is focused around interdisciplinary inquiries into life, recovery in violent and extreme times. It is a follow-up of the, 'Researching Responses to Distress Caused by Extreme Events: A Virtual World Cafe for Mental Health Researchers and Practitioners' held in October, 2024. We look at how individuals and communities live in extreme times, mapping their ways of healing, recovery and rebuilding, and the forms of psychological, medical and economic distress that they experience. We also examine the various services, interventions and regimes and policies of care around extreme events, assessing their efficiency. In this panel, we draw on ethnographic, sociological and clinical approaches from various regions like South-East Europe, the Middle East, Latin American and Asia, to discuss our connected histories, current trends and research gaps.

Each of the authors will offer insights through case studies based on their research to date. One of the case studies will focus on the Virtual World Cafe noted above.

Energy Transition and Energy Demand Flexibility: From a Technological/Behavioural Approach to a Community-Based Perspective

Our contribution will focus on energy demand flexibility in the context of energy transition. Under the RePowerEU scenario, renewable energy sources are expected to comprise approximately 69% of electricity generation by 2038. This significant shift will profoundly reshape the design and operation of energy systems in particular in relation to energy demand and the role of consumers. While in the past energy demand was treated as something fixed, now it is thought of as something that can and should be flexed. This is linked to the need to manage a higher proportion of intermittent forms of renewable energy supply. However, in the literature different approaches can be identified as to how flexibility should be analysed and implemented. In particular in our presentation on the one hand we will highlight the limits of the dominant technological/behaviourist approaches to flexibility which focus on offering more information or varying the economic incentives. On the other hand, we will uncover the added value of sociological approaches to flexibility which focus on the role of social practices and social relations and highlight the role of inequalities through the concept of flexibility capital. Eventually sociological approaches underscore the distinctive value of Energy Communities in reducing and flexing demand through their capacity to reconfigure collective socio-technical contexts of action. Accordingly, in our presentation we will conclude with the analysis of some community-based projects around flexibility elaborated by three European energy cooperatives (the Italian *Enosra*, the French *Enercoop* and the Dutch *Endona*). Through in-depth interviews and analysis of grey literature we will uncover the way the selected energy cooperatives accompany the socio-technical process towards energy demand flexibility and actively engage prosumers.

MAGOUT, MOHAMMAD* (Free University Berlin, Germany)

The Roots of Arabic Sociologies of Religion in the Nahda

One of the primary motifs of the Arab *Nahda* with its thriving printing sector was the production and dissemination of “useful knowledge” —be it scientific, cultural, social, or political. Among the topics addressed in the numerous publications of the *Nahda* was religion—whether as a general category of social thought or specific religions. While one cannot speak of a scholarly field of the sociology of religion in the Arab world during this period (roughly 1850s – 1920), one can locate in the literature of the *Nahda* the earliest attempts at producing knowledge about religion in Arabic outside the domain of traditional religious disciplines (such as theology and heresiography). This article will analyze a number of articles and entries from periodicals (especially *al-Jinan*, *al-Muqtataf*, and *Thamarat al-Funun*) and *al-Ma'arif Encyclopedia* (the first modern Encyclopedia in Arabic) and a selection of books. The paper will argue that many of the writings of *Nahda* on religion were motivated by two main concerns: “otherness” in religion—both geographical “other” (in far-away countries) and the local “other” (heterodox minorities in Syria such as Alawites, Ismailis, Druze, and Yazidis)—and the relevance of religion for politics. The paper, additionally, will try to infer the resources of these preliminary investigations, locating them in traditional heresiographies, folk knowledge, and missionary sources.

RAMOS, ANNE (University of Fribourg, Switzerland)

On the Importance of the School Context for Well-Being. Comparative Analysis of the Perspectives of Children Under 6 and over 8 Years of Age

In Switzerland, school-related well-being has become particularly relevant since the pandemic, or rather since the publication of research showing not only the intensification of social inequalities but also the increased loneliness and rise in suicide attempts among children and adolescents during and after school closures (see Stocker et al. 2020).

In the paper, we draw on two projects that focused on the subjective well-being of children and asked children aged 2–6 and 8–14 years about what is important to them and what they value. The study in the area of early childhood was conducted during the pandemic, while the one with older children followed after the pandemic. Even though neither the pandemic nor school were the subject of the research, they served as relevant contexts for

the interviews. It was the children themselves who, in their narratives, made the (shortcomings of) school relevant – without being asked.

The article is based on comparative analyses of the way the two age groups talk about their kindergarten, which is part of the school system in Switzerland, and about school. What role does school play from the children's point of view? From the earliest years, how important do children consider school contexts to be for their well-being?

While, for example, system-theoretical perspectives ascribe the functions of selection and socialisation to schools and inequality-theoretical and praxeological perspectives demonstrate how schools themselves reproduce social inequality, the children's narratives show what they miss when they cannot go to school. This perspective on the aspects that are relevant and even missing, that represent a deficiency, provides *ex negativo* information about the psycho-social and emotional relevance of the school context for the well-being of the children. We are pursuing these aspects systematically and comparatively with regard to the age groups under 6 and over 8 years of age.

MAGYAR-HAAS, VERONIKA* (Université de Fribourg, Switzerland)

On the Interrelation between Vulnerability and Violence. Phenomenological Approaches to Perceptions of Violence in Heterogeneous Phases of Life

In recent decades, the phenomenon of vulnerability has received considerable attention in the fields of philosophy and ethics, but also increasingly in childhood studies and gerontology (see Mackenzie et al. 2014; Butler 2010; Andresen 2014; Heite & Magyar-Haas 2020). In philosophical works (Mackenzie et al. 2014), it is assumed, that human existence is conditioned by vulnerability due to the sociality and dependency of the body. Bodily beings are vulnerable because they depend on others and on their ‘responses’ and care. In addition to this ontological argument, it is emphasised that dependence on the care of others varies according to the different phases of life. Human vulnerability is always situated in concrete social and political conditions. This brings into focus another form of vulnerability that is specific to situations, contexts and social structures. The interconnection of these two – ontological and relational – dimensions of vulnerability can be seen in the argument that humans, as social and emotional beings, are exposed to humiliation, abuse, and so on, and as socio-political beings, to political violence (Butler 2010). Concepts of violence – as well as concepts of childhood and old age – are embedded in historical, social and cultural contexts and are subject to their orders and ordering arrangements. Based on phenomenological perspectives (Staudigl 2014), the paper addresses the following questions: Which distinctions – with regard to the heterogeneous phases of life – are considered relevant when it comes to what matters as violence? Which forms of interaction, humiliation and (institutional) discrimination against children and old people are perceived as violence? By linking the two ages, the aim is to go beyond the bodily and symbolic dimension of violence and also to explore those vulnerabilities and violations that result from what is not yet or no longer articulated, considered or recognised as violence.

MAHDAVI, MOJTABA* (University of Alberta, Canada)

Iran's Woman Life Freedom Movement and the Challenge of a Post-Islamist Democracy

“Zan, Zendegi, Azadi” (Woman, Life, Freedom) was the motto of Iran's recent democratic social movement, which sparked after the death in detention of Zhina Mahsa Amini on 16 September 2022. This nationwide progressive movement, largely led by women and other Iran's subalterns, has manifested a paradigmatic societal transformation towards a “post-Islamist” social condition in post-revolutionary Iran.

Inspired by theories of social movement and employing a methodology of discourse and data analysis (utilizing both primary and secondary sources), this paper delves into the dynamics of Iran's “civil society” and its “post-Islamist social condition” (not post-Islam as a religion and culture) wherein all forms of Islamist discourses are socio-intellectually exhausted. Given the emergence of multiple democratic social movements in post-2009 Iran, the paper demonstrates in detail how discursive, structural, and demographic paradigmatic shifts at the “societal” level have profoundly contributed to Iran's “post-Islamist renaissance” and to a “cautious” optimism for the rise of a post-Islamist “polity”.

Subsequently, the paper will critically examine major structural and agential obstacles hindering the materialization of a post-Islamist “polity”. It will be argued that the current post-Islamist “social” condition is surrounded by some “political” obstacles. Employing a “dialectics of structure and agency,” the paper examines how the interplay of three structural factors – the “state

apparatus", "uneven socio-economic conditions" and the complexities of "global power" – reinforce these obstacles. The examination of "agential" factors will focus on "leadership" skills, "organizational" capacities, and "ideological discourses" within Iran's pro-democracy forces. The conclusion will shed light on whether and under what conditions Iran's social-political agents can transform structural obstacles into opportunities to materialize the Iranians' dream of a post-Islamist democratic polity.

MAHDAVI, MOJTABA* (University of Alberta, Canada)

The Sacred and the Secular in the Post-Islamist Condition: A Critique of Multiple Faces of Muslim Exceptionalism

Contrary to conventional wisdom, Muslim-majority societies are generally in a "post-Islamist" (not post-Islam) *social* (not political) condition. What is the relationship between the sacred and the secular in such a post-Islamist condition, where both secular and Islamist authoritarianism challenge the rise and success of a post-Islamist democratic polity? This paper examines this question in three interrelated sections: The first section problematizes the rise and revival of the idea of "Muslim exceptionalism", which suggests that Muslim culture is exceptionally and inherently incompatible with secular democratic values. Revived after the crisis of contemporary post-Islamist social movements in the Middle East and North Africa (MENA), this discourse characterizes Muslim culture and religion with authoritarianism and ties this to the crisis of secular democracy in the MENA region and beyond. It will be shown that this idea is shared by some seemingly opposing views, including Orientalism, Orientalism in reverse (religious and nationalist nativism), and a particular reading of cultural relativism. This section problematizes the epistemological roots, intellectual flaws, and political implications of this discourse.

The second section conceptualizes the idea of a post-Islamist democratic polity and how it may resolve the false dichotomy between the sacred and the secular in Muslim majority contexts. It demonstrates how a progressive post-Islamist discourse demystifies the myth of Muslim Exceptionalism, challenges both the ethnocentric idea of Western universalism and cultural particularism, and offers a third path toward an alternative and multiple modernities and democracies in Muslim contexts.

The third section examines a concrete case of the post-Islamist condition in post-revolutionary Iran at the societal and state levels, as well as the prospects and challenges ahead for reconciling the sacred-secular binary and establishing a post-Islamist democratic polity in the country.

Negotiating Muslimness and Informality: Jamia Millia Islamia and the Making of Jamia Nagar

This study examines the dynamics of Jamia Millia Islamia, a Public University, and Jamia Nagar, an unauthorized (informal) Muslim majority settlement in Delhi, India. By constructing a spatio-temporal trajectory of Jamia Millia Islamia and its precincts over a 100-year period, I investigate its evolution, the departure from the University Settlement to University and the informal settlement and their inter-linkages. The study employs an evidence-based approach, utilizing archival data, historical anecdotes, secondary literature, and open-ended, semi-structured field interviews.

Building upon the extant literature on universities as anchor institutions, I demonstrate the changing roles and the causal relationship of the University and community, from philanthropy to shared values and place-based initiatives to cutting down on extension of material resources. Based on the analysis, I situate the University in five thematic roles in its interaction with the space and people—University as the land developer, University as employment generator and multiplier, University as a community (*Jamia Biradari*), University as the locus for Muslim educated middle-class concentration, and University as political site.

Through this study, I conceptualize Jamia Millia Islamia as an unconventional and multifaceted urban actor, creating an overarching Muslim sanctuary and providing tacit patronage and legitimacy to the production of Jamia Nagar amidst India's shifting political landscape. I argue that this unique positionality stems from the University's historical ideological mission, thereby resulting in a Muslim space distinct from conventional Muslim spaces in India. Moreover, this case highlights the role of anchor institutions in inadvertently supporting urban informality. These findings contribute to universities' capacity to shape urban development trajectories beyond educational and economic impact, and particularly in contexts of informality and socio-political complexity.

Implementing Indigenous Data Governance for Indigenous Data Sharing and Access in Australia

Indigenous Data Sovereignty (IDSov) is a global Indigenous developed and led philosophy asserting Indigenous rights in data. In Australia, an Anglo-colonised state, IDSov has increasingly been identified and communicated as a high priority for governments. All governments have committed to supporting 'data sharing' through a National Partnership Agreement for Closing the Gap by providing access to data and information at a regional level for Aboriginal and Torres Strait Islander communities. To ensure that the data agenda benefits Aboriginal and Torres Strait Islander communities requires commitment and systems change in those state agencies and embedding Indigenous Data Governance (IDGov) structures and processes to guide Indigenous data priorities, data sharing from the state to communities and state actors facilitating access to Indigenous data for Indigenous communities.

The Maiam nayri Wingara Indigenous Data Sovereignty Collective together with the Australian Capital Territory (ACT) Aboriginal and Torres Strait Islander community and the ACT Health Directorate have embarked on a process to embed IDSov through IDGov. This presentation will share the IDGov development and implementation processes of: (1) Socialising IDSov and IDGov concepts with community, the ACT Health Directorate, including the executive, (2) Undertaking priority setting and data mapping exercise, (3) Developing an IDGov structure including policy and procedures and (4) Mapping the system to evaluate the systems change.

The project may act as an example for other state agencies across the Australia to embed IDGov structures within their systems. The result will ensure that Aboriginal and Torres Strait Islander people can take control of their data for their self-determination and nation (re)building.

MÄHLCK, PAULA* (Stockholm University, Sweden)

Domestic Work in Postcolonial Tanzania Examines the Dynamics of Learning Domestic and Care Work within Affluent Expatriate Households, Characterized By Significant Economic Privilege and, at Times, Diplomatic Immunity

Paula Mählck employs contemporary narratives from privileged female expatriate employers and Tanzanian domestic workers, colonial documents, analysis of the built space of expatriate households, as well as literary works and analytic autoethnography to investigate the continuities and changes in contemporary employment relations as compared to those during the British colonial era from the 1920s to the 1960s. While the relationship between women employers and domestic workers serves as the entrance of the investigation, the study delves deeper into postcolonial dynamics of learning and their interconnections with gender, race, and class. It emphasizes learning to cope as a dynamic process involving negotiation and movement, offering a nuanced perspective that transcends the victim/survivor dichotomy.

Moreover, the book highlights the subtlety of unlearning oppressive practices and relations, distinguishing them from formal affirmative actions. It underscores unlearning as a means for individuals and collectives to challenge established knowledge, perceptions, and practices, aiming to demonstrate the possibility of change. Through its multifaceted approach, which includes the historicization of alternative narratives, sociological analysis, theoretical discussions on social reproduction, and critical examinations of research methods for Western scholars researching non-Western contexts, this book provides valuable insights into the complexities of domestic work taking place in expatriate households in postcolonial Tanzania. It offers a thought-provoking examination of learning, learning to cope, and unlearning within the context of privilege and power.

Intergenerational Solidarity in the Context of Migration: A Scoping Review

Providing physical, emotional, and financial support to ageing parents is a deeply ingrained social, religious, and, in some cases, legal obligation within ethno-cultural contexts. As population of ageing have changed the socio-demographic composition of various societies, and the globalization of international migration has destabilized the ethno-cultural landscape in which care is provided, debates on intergenerational solidarity and conflict have re-surfaced. Against this backdrop, engaging in inventories of knowledge becomes particularly propitious since theorization tends to expand the sociological imagination. One of the questions one can pose is for example whether the literature on filial piety is relevant to our understanding of international solidarity as it plays out outside of the North American and European context. To explore what characterizes research on intergenerational solidarity and conflict, this study deploys scoping review methodology. Relying on the Social Science Citation Index (SSCI) and delimiting the search to the following keywords: filial piety, intergenerational solidarity and intergenerational conflict, an approximate total of 500 peer reviewed articles have been identified. The review utilizes content analysis to identify the moral and material connections that the literature takes for granted, the research questions that the literature have focused on, the methodology employed, as well as the results which have derived from the empirical studies. In doing so, the review will identify the knowledge gaps that ought to be addressed in order for the debates on intergenerational solidarity and conflict to be advanced within the sociology of ageing, sociology of migration, and the sociology of family.

MAHROUG, NAOUAL* (Université Paris Cité (Cerlis) & Fellow ICM (Policy), France)

« Step By Step » : De l'Endurance Pour Comprendre Les Procédures De Demande d'Asile (France)

Pendant près de quatre ans (de 2016 à 2020), j'ai mené une ethnographie des espaces de l'asile de la région parisienne, là où les exilés parlent des procédures, les interrogent et se questionnent sur les démarches à mener. L'ethnographie repose sur mon implication auprès d'eux, sur des observations dans les permanences juridiques, des structures d'accueil et d'hébergement pour demandeurs d'asile, des files et salles d'attente de préfectures, du tribunal administratif, des cabinets d'avocats, entre autres.

Les demandeurs d'asile sont ballotés entre les diverses administrations, juridictions et associations, bloqués dans les procédures, obligés de recommencer sans fin les démarches. Les expériences de l'incertitude font écho à ce que j'appelle les « incompréhensibles de l'asile ». Les exilés ont conscience de ce qui leur échappe tout au long des procédures. Ils font face aux « incompréhensibles de l'asile ». Herd et Moynihan (2019) qui travaillent sur la notion de fardeau administratif, théorisent trois types de coûts administratifs : les coûts d'apprentissage, de conformité et psychologiques. Il est possible de penser les coûts de l'incertitude.

C'est en cheminant, au sens propre comme au sens figuré, qu'ils parviennent à injecter de l'intelligible dans les procédures. Parcourir les « chemins de l'asile » est une pratique qui contribue à donner du sens aux règles du droit et à tenter de s'extirper de situations insécurisantes. Il s'agira de démontrer que marcher participe au cheminement permettant la compréhension des procédures de l'asile. Marcher apparaît comme un acte de résistance pour comprendre et s'informer (Lejeune, 2014). C'est en marchant que se bâtit la conscience du droit (Merry, 1990; Péliasse, 2005) de façon à la fois pragmatique et intime, par le vécu de situations. C'est aussi en dehors du droit que les exilés trouvent des ressources pour cheminer dans les démarches de l'asile, le rapport à la loi se construisant par la marche.

Privileged Mobilities and in/Voluntary Travel

In recent years, I have been an active member of two distinct scholarly networks/associations. One focuses on refugee/migration: *The Critical Refugee Studies Network Canada*, and the second focuses on tourism: *Critical tourism Studies Association*. These affiliations have led to my participation in numerous workshops and conferences in which I have consistently noted remarkable overlaps in the two fields. For example, as critical projects, the fields of Critical Tourism Studies and Critical Refugee Studies share the fundamental objectives of examining border controls and how governmental power normalizes geographic mobility for some while restricting the movement of others. They also share many conceptual and political concerns about how race, gender, class, and citizenship are shaped and reflected in governmental processes and practices of political economies and nationalisms. Yet, those who work in refugee/migration studies and those who work on tourism rarely 'speak' to each other.

This paper seeks to bring together these distinct and seemingly disparate critical fields of inquiry and to highlight how they inform each other under the broader rubric of "privileged mobilities." To this end, I examine the conceptual and material links between tourists and refugees in the contemporary moment. The aim is to propose a theoretical framework for exposing the compelling similarities and crass differences between the figures of 'the tourist' and 'the refugee'. It takes as its starting point the idea that tourism is a social phenomenon (as opposed to an industry) in which the access to voluntary travel is paradoxically linked to the increased policing and surveillance of borders (Torabian & Mair, 2017).

Negotiating Boundaries of Intimacies in Family and Marriage: Ethnographic Cases from Contemporary Urban India.

This paper investigates how young urban Indians understand, experience, and negotiate intimacies particularly in family and marriage, in the increasingly digital landscape of contemporary urban India (Lupton 2014). Drawing from our ongoing research across the Indian metropolises of Pune, Mumbai, and Bengaluru, this paper explores how incorporation of digital technologies into daily routines and activities, digital embodiments, shapes intimate spheres and intimate relationships into newer forms. Thus, this paper reflects on how dispersed social ties are becoming the new norm and a mantra for new-age mobility (for more details on this shift, please refer to Hannam, Sheller, and Urry 2006; Salazar 2017).

Situated within the sociological framework of intimacies as both individually experienced and institutionally mediated through family and marriage, this study examines how the evolving and contested nature of these institutions is transforming intimacies in the increasingly digitalized urban Indian context. In doing so, the paper explores the negotiations around non-normative intimacies and how young urban Indians transgress, challenge, or reproduce traditional norms vis-à-vis marriage, family and beyond by employing the boundary work framework (Lamont and Molnar 2002; Alba 2005; Barth 1969; Wimmer 2008).

La Escuela Superior De Guerra: Un Análisis De Sus Cursos y Sus Reflejos Para Las Relaciones Civiles-Militares En Brasil

La Escuela Superior de Guerra (ESG) ha contribuido, al largo de sus 75 años, para la producción de conocimiento y para las relaciones civiles-militares en Brasil, en especial, en las áreas de Seguridad, Desarrollo y Defensa Nacional. Este trabajo buscó presentar y analizar cómo se ha materializado este aporte desde su creación en 1949, a partir del análisis documental y bibliográfico realizado, inicialmente, con énfasis en los once reglamentos que guiaron la estructura organizacional y académica de la Escuela y, posteriormente, sobre los lineamientos que regulaban sus cursos. Con este objetivo, caminamos por este marco legal, extrayendo las ideas y acciones que guiaron la construcción del conocimiento, sus relaciones con la estructura y el ambiente organizacional, buscando también comprender los impactos que el ambiente externo tuvo en la Escuela y sus reacciones, a partir de la materialización de estructuras y cursos. Finalmente, se presenta la materialización de la investigación científica y de los estudios de posgrado stricto sensu en el Instituto Therezinha de Castro.

Caring for Those Who Care: Domestic Workers and the Global Care Economy

Who will care for us? And who is doing the caring for those who care? Domestic workers migrate internationally and within their home countries across "global care chains" that are racialized, gendered, and change with time (Hochschild 2002). Migrant domestic workers often face concerns around legal status, immigration barriers, employer dependency and fears of deportation. Many of these workers leave behind families and kin networks and find themselves without the structural support they may have once had.

Yet an important shift has happened over the last twenty years in terms of these legal protections, as many governments have shifted to establish equal rights protections under the law for domestic workers, especially across Latin America. Yet there is a gap in terms of domestic workers being left out of care provisions in the countries they work in and live.

This paper touches on the importance of *worker voice* for domestic workers, in that they must have a voice in policy discussions around the politics of care and the growing care economy. It draws from a 7-point framework on worker voice to suggest that the only ways forward to care for those who care is to center domestic workers' voice at the heart of the discussion.

Finding Hope in Faith: How Religion Supports the Faithful during Times of Loss and Despair

Gabriel Marcel suggests that hope is the expectation that something desirable will happen in the future, even if there is no guarantee. However, hope does not manifest passively – waiting for good things to happen, but takes an active engagement with the world through the willingness to take risks and make choices to pursue goals. The church, during the COVID-19 pandemic, has lost its essentiality, and the religious find it hard to connect with the faithful. When they have been given the chance to resume their pastoral care, they, too, have either been compromised or suffered from loss and despair. This study elaborates on how the religious continue with their pastoral activities despite having been diagnosed with COVID-19, suffered a personal loss, or have witnessed friends losing their lives from the pandemic. From the narratives of priests and seminarians who have personally experienced the harsh impact of the pandemic, this paper aims to understand how faith factors in the propagation of hope. For Marcel, faith is an essential part of human existence as it gives a sense of meaning and purpose that is not dependent on individual circumstances. The research participants acknowledge that their faith, just as Marcel described, allows them to transcend their finite, limited selves and connect with something greater than themselves – the community, the world, and most importantly, God.

MAIDO, MARJORIE* (Iloilo Science and Technology University, Philippines)

Heritage, Power, and Politics: The Institutionalization of Cultural Mapping for Community Engagement and Identity Formation

Cultural mapping has become an essential tool for documenting and preserving heritage. Sen. Loren Legarda's and the National Commission for Culture and the Arts' joint advocacies aimed at community cohesion and identity formation were realized upon the enactment of Republic Act 11961.

Drawing on empirical data gathered from the cultural mapping project, this paper explores how different social institutions engage with the identification and recording of their cultural properties to add value to the interpretation of heritage within their communities. Anchored from Laurajane Smith's Authorized Heritage Discourse (AHD), the paper contends that cultural mapping is located within performances of power, manifested by the interests of the dominant political actors and institutions. Though the process offers opportunities for the marginalized groups to assert, if not include, their narratives, bureaucratic political structures remain a challenge.

Moreover, the paper expounds on the role of cultural mapping in identity formation, delving into how this initiative influences communities' collective memory and sense of belonging. This paper aspires to discuss the complex intersections of heritage, power, and politics in cultural mapping, highlighting its potential for community empowerment and a tool for political authority.

MAIER, TOBIAS* (Federal Institute for Vocational Education, Germany)

How to Capture the Unknown? Lessons from Systematic Forecasting of Future Labour Market Dynamics

The aim of the Qualification and Occupation Projections (QuBe) is to systematically extrapolate developments in the German labor market and education system to identify medium- and long-term matching problems at the occupational level as early as possible. By maintaining past behaviors and trends in a baseline projection while also modeling alternative scenarios, QuBe offers a systematic approach to provide decision-makers in the labour market and education sector with critical insights into actual and potential future labor market dynamics.

The model includes information on labour demand by 72 economic sectors, 144 occupational groups and 4 skill levels, labour supply by four qualification levels and 144 initial vocational qualifications as well as information on occupational and regional mobility, household consumption and Germany's position in the world market. Since its inception in 2010, with a projection up to 2025, the baseline projection has now been updated for the eighth time (until 2040) and more than 30 alternative scenarios have been calculated. These include, for example, the digitalisation of the world of work, the socio-ecological transformation (climate adaptation, implementation of a hydrogen value chain) and the impact of a change in population growth due to changing migration flows (Syria and Ukraine).

Each update includes a comprehensive assessment of the model system, providing a nuanced understanding of whether current trends are in line with traditional trajectories or diverging towards alternative scenarios. Even though the model system combines several rich data sources such as national accounts, the German microcensus and employment statistics, the evaluations show that it is not so much the exact forecast but the structural changes that add value for decision-makers. In the presentation I will show what kind of concepts have been useful and robust to inform about the uncertainty of the future, given the long history of the unique model system.

MAILLARD, DORIAN* (Université de Lorraine, France)

Re-Dimensioning Urban Decline from the Perspective of Weakening Popular "Habitalité" in the "Bassin Minier Du Nord-Pas-De-Calais"

This communication offers a primary theoretical and programmatic formalization of empirical results obtained from two field researches focused on the analysis of the "spatialités" (Lussault and Stock, 2010) of inhabitants from an exemplary area of urban decline: the "bassin minier du Nord-Pas-de-Calais" (Maillard, 2021, 2022).

They highlighted that the closing of coalmining triggered a material and symbolic reconfiguration of this territorial construct which challenges the “traditional” running of local lifestyles and local people’s multidimensionally limited capabilities of adaptation. This growing misalignment between “habitat” and “habiter” (Lévy and Lussault, 2013) weakens the capacity of the vulnerable working-class populations to turn the restructuring arrangement of their local space into resources of action (Stock, 2015), thus co-contributing to the weakening of their already socio-economically strained sustaining strategies (Fol, 2009).

The systemic nature of this issue of “in-habitabilité” (Lévy and Lussault, 2013) tends to highlight a structural dynamic of urban decline in post-industrial/mining areas which is yet overlooked by the literature on “left-behind places”. I formulate the hypothesis that this analytical “blind spot” stems from the “modèle partitionnel” (Volvey et al., 2021) of this research field, which, far from considering the “spatial question” as a genuine co-explanatory dimension of decline phenomena, continues to grasp it as the study of the translation/distribution “dans l’espace” (Lussault and Stock, 2010) of more fundamental socio-economic dynamics (e.g., Fol et al., 2014).

The empirical highlight and theoretical formalization of this new spatial issue open up a new dimensional (Volvey et al., 2021) contribution to the study of the structural dynamics of “left-behind places”. In this communication, I propose to set out: (1) the empirical foundations of this issue of “(in-) habitabilité”; (2) its contributions to the more general analysis of “left-behind places”; (3) and the perspectives opened by its new empirical testing in the coal mining areas of Lorraine and Nord-Pas-de-Calais.

Muse Science & Humanities Program As a Tool to Welcome, Investigate and Illuminate the Anthropocene in a Science Museum

The oral contribution will present the MUSE Science & Humanities cultural program as a vehicle for engaging with the Anthropocene theme in a science museum context. Started in 2020, the MUSE Science & Humanities (S&H) Program is part of the overarching MUSE Anthropocene initiative that reflects the museum’s commitment to address the pressing environmental and societal challenges of this era. By blending scientific rigor with the creativity of the arts, MUSE aims to foster a deeper understanding of climate change, biodiversity loss, and environmental sustainability through an articulated portfolio of post-disciplinary exhibitions, conferences, publications, masterclasses, collaborations, site specific art, music, dance and theatrical installations. Through these practices, the S&H Program presents the Anthropocene not merely as a scientific concept but as a lived reality that demands to the audience both intellectual engagement and emotional reflection, transcending populist gestures, and offering participative experiences that prompt visitors to critically reflect on humanity’s role in shaping the planet’s future.

The presentation will account of how the S&H Program was conceived to act as a “contact zone” where scientific knowledge and artistic perspectives could converge to spark dialogue among diverse actors, audiences and backgrounds. In line with the session’s theme of art as a medium for climate change mediation, the presentation will put forward practical examples of emblematic program initiatives. “Agorà”, a new museum space for hybrid projects, and “Collezione Antropocene” the first Italian public art collection dedicated to Anthropocene, will be presented as key outputs of the program. MUSE’s efforts align with broader questions about how museums can serve as platforms for climate action. Through collaborative and bottom-up projects, the Science & Humanities Program and the Anthropocene Initiative try to transform MUSE into a dynamic space for fostering environmental awareness, cultivating global-local connections, and inspiring actionable change in response to the Anthropocene challenges.

Older Citizens’ Perspectives on Quality of Life in Their Cities: Analysis of Resident Reports Submitted through a Co-Created Online Tool

Population ageing and urbanization are two dominant forces shaping today’s social and economic landscape, particularly in the context of developing sustainable, age-friendly cities. The challenge is to prepare for these shifts in ways that enable both current and future generations of older adults to benefit from age-friendly urban strategies (van Hoof et al., 2018). While “ageing in place”—the ability of older adults to live safely, independently, and comfortably within their communities—has become a priority in many national policy agendas (WHO, 2015), many aspects remain underexplored, especially through the active engagement of older citizens.

This presentation aims to examine reports from older adults submitted via a web application developed as part of the City and Co project, funded by ENUTC (2021/03/Y/H56/00213). The application feeds data into a Geoportal, a city map that visualizes user input alongside other city information, such as demographics, services, and land use. Together, the application and Geoportal serve as innovative tools for supporting the creation of age-friendly initiatives. The study analyzes data from two Polish cities—Kraków and Wrocław—where older citizens co-developed the application during the co-creation process.

Our analysis is based on a study involving over 50 users aged 65 and older, who tested the application between Winter 2023 and Summer 2024. The tool allowed users to submit photos with comments about age-friendly challenges, positive experiences, and neutral observations, linking them to specific WHO domains and city locations. Participants found the application intuitive and effective, noting that it gave them a sense of agency in shaping age-friendly city initiatives. Preliminary findings reveal both similarities and differences in how older adults perceive the quality of life in their cities, which are discussed in the broader context of promoting age-friendly policies.

MAJASTRE, CHRISTOPHE* (FRS-FNRS/Université Libre de Bruxelles, Belgium)

Is It Possible to Write a History of “Anti-Sociology”? Taking a Look Back at Alternative Traditions in France and Germany

“Anti-sociology” is an uncommon expression: it was claimed by German sociologist Helmut Schelsky as a self-designation in the 1970’s and also used in the French context to designate Deleuze and Guattari’s effort to turn the marxist and freudian traditions over their own head. In the first case, anti-sociology apparently refers to an alternative tradition to a supposed “mainstream sociology”. As the example of Schelsky shows, this tradition can not be entirely absolved from its link to the historical experience of Nazism, even when this historical background appears totally absent, such as in the case of Schelsky’s former pupil Niklas Luhmann. In the French context, on the contrary, the critic of sociology seems to take hold in the opposite political camp: it stems from philosophers vying to radicalize the emancipatory revindications of “1968”.

From the vantage point of a history of sociology, this raises the question of the relationship between these two intellectual movements: can they be subsumed under a single category such as “anti-sociology”? Is it possible to think of them as somehow related, rather than opposed? And finally, what do they tell us about the political standing of sociology?

These are the questions that will be treated in this presentation, which will take stock of the intellectual approaches of “histoire croisée” and historical sociology.

MAJASTRE, CHRISTOPHE* (FRS-FNRS/Université Libre de Bruxelles, Belgium)

CASTELANELLI, BENJAMIN (Université Paris 8, France)

Les Livres De Sociologie Sont-Ils Des Livres Comme Les Autres? Les Sciences Sociales Dans Le Champ Éditorial Allemand Des Années 1970

La place des sciences sociales dans "l'ordre des livres" (Chartier 1996) fait l'objet depuis quelques années l'objet d'une réflexion accrue au sein des travaux se réclamant d'une "histoire sociale des idées et des intellectuels" (Hauchecorne and Matonti 2017). Cette approche prend pour objet les conditions de production, de diffusion et de circulation des savoirs sociologiques à travers leur support matériel principal – le livre. Or, la définition même de ce qui constitue un livre de sociologie apparaît ambiguë, dans la mesure où elle ne réside pas que dans le contenu, mais dépend aussi des processus d'étiquetage et du travail d'intermédiation réalisé par les éditeurs (Bourdieu 1999).

Cette communication porte sur la manière dont cette catégorie a émergé en Allemagne de l'Ouest à travers les jeux de concurrence au sein du champ éditorial dans les années 1970. En se concentrant sur l'"après-68", elle propose d'interroger les effets des transformations sociales et culturelles de la période sur le statut des ouvrages en sciences sociales. Son hypothèse principale est que ce statut se transforme sous l'influence de deux phénomènes : d'une part, une démocratisation de l'accès au livre à travers l'élargissement de sa diffusion et l'abaissement continu de son prix et, de l'autre, la nécessité de distinguer la valeur des livres scientifiques par rapport à d'autres types de littérature profane.

La communication montre comment ces phénomènes affectent les stratégies des éditeurs généralistes ou spécialisés dans les sciences sociales, mais aussi les discours sur la place des savoirs sociologiques dans l'ordre politique. Elle combine deux types d'analyse : une analyse quantitative d'une base de données des publications en sciences sociales constituées à partir des entrées de la Deutsche Nationale Bibliographie (12 000 observations) et une analyse qualitative des discours sur les pratiques associées à la lecture des sciences sociales dans les publications professionnelles spécialisées.

MAJDA, SOUMANE* (ABS-UM6P, Morocco)

BÉDUNEAU-WANG, LAURENT (ABS-UM6P, Morocco)

Valuation, Organizing and Craft : Carpet Making in the South of Morocco

Recently, the role of craft in our contemporary societies has experienced renewed interest. While some considered it a primitive mode of organization and work, recent literature has highlighted its role in reconfiguring societies. Beyond its economic aspect, craft carries a deeper significance of guardianship, linked to historical nostalgia and re-enchantment. Socioeconomic relations and societal values are continuously renegotiated, evolving alongside technological and societal progress. This work focuses on carpet weaving within a rural community living in Siroua, a semi-arid mountain region in the South of Morocco. Through an empirical case study, we trace the whole process of carpet production and commercialization from sheep rearing to its sale in the market. We have adopted an iterative field approach, going back and forth regularly to maintain strong relationships with the targeted population and ensure the critical distance needed to interpret and analyze our data. Our research specifically directs attention towards the natural circumstances associated with climate change, acting as a catalyst for transformation, turning carpet weaving from a simple domestic activity into a revenue-generating business. As a research question, we ask how the transformations affecting the carpet craft generate new configurations that challenge dominant societal structures while constituting a new organization. Weaving, well beyond a simple «primitive» traditional activity, represents an evolutionary mechanism of societal reconfiguration. Significant changes have been implemented to address climate change by introducing innovative techniques, namely by fostering entrepreneurship. These dynamics result in a shift from a domestic practice to a structured income-generating activity, paralleling the transition from individual efforts to collaborative ventures in cooperatives and, potentially, factories. As weaving practices evolve, women's roles within the community are also being redefined. The new production methods and work organization (cooperatives) emerge as forms of social mobilization and women's empowerment, enabling them to contribute to addressing broader community challenges.

MAJED, RIMA* (American University of Beirut, Lebanon)

Beyond the "Scholar Activist" Label: Reflections on Positionality in the Lebanon's 2019 Uprising

Rare are the instances when a scholar of social movements finds herself in the middle of a revolutionary uprising at home. For more than a decade, I have been engaged in reading and studying waves of uprisings and revolutions in other countries from an academic perspective. In the afternoon of October 17, 2019 - on a casual day in Beirut - history suddenly took a major turn with the eruption of an uprising of an unprecedented scale and spread. Within hours, the streets and squares of major cities from North to South of the country were filled with hundreds of thousands demanding the downfall of the regime. I found myself amongst the masses, making similar demands. In this roundtable discussion, I want to reflect on three main questions: (1) who gets to write our (hi)story? through a reflection on the role of foreign reporters and academics; and the ethics of extractivism in knowledge production; (2) what is the role of the engaged academic beyond the "scholar/activism" framework? through a reflection on positionality, and a critique of the colonial "mission civilisatrice" approach that is prevalent in academic culture; and (3) how do we produce theory from within the unfolding events? through a reflection on "messiness" as an analytic category.

MAJUMDAR, PRATICHI* (University of Delhi, India)

Gendered Smartness: An Exploration of Women's Experiences of Digitised Indian Cities

Like several countries in the Global South, India too has seen a recent influx of governmental and private projects with the aim to transform the urban space into a "smart" one. The Government of India has identified 100 cities under its *Smart Cities Mission* and several others are selected by private developers for improving economic growth and quality of life through the use of information technology and digital tools.

While most such projects exclude the urban poor and working classes – men and women – from their visions of smartening the city, middle-class women, interestingly, are not invisibilised. Rather, images of "the modern Indian woman" – entrepreneurial, adept with digital technologies, financially independent, and yet rooted in the family – are often placed at the centre of such proposals. But a slight scratching of the surface reveals the masculine ordering of the plans and their translation in the city space. Whether in terms of security and surveillance, access to housing, health and sanitation, or in terms of public discourse and celebrations, the new high-tech cities remain entrenched in traditional, patriarchal moralities. Women, are sometimes enthusiastic participants, and sometimes resist and rebel against this. Mostly however, women across classes try to find ways to negotiate with the old and new anxieties and vulnerabilities that come with living in the city, while trying to benefit from the opportunities and access that it allows.

Drawing from ethnographic and cyber-ethnographic qualitative research conducted among women in different cities in India, the paper highlights the lopsided experiences of digitised urban spaces in terms of gender and class. Through a reading of the *Smart Cities Mission* and other public and private projects, the study examines the space allocated to women in these developmental dreams; and its coincidence with women's own dreams and experiences of the city.

MAJUMDAR, PRATICHI* (University of Delhi, India)

Masculinities, Media and the Creation of the Gendered Cities and Identities: A Study of Desi Hip-Hop and Stand-up Comedy about Gurgaon

"Gurgaonwala chhora" (the boy from Gurgaon) is infamous as a violent, aggressive, young man unable to give up his hyper-masculine ways in spite of the rapidly urbanizing and sophisticated space around him.

Gurgaon, a city in the National Capital Region of India, has one of the highest crime rates in the country, particularly violence against women. One finds concerns regarding safety (or the lack of it) in Gurgaon everywhere – in news, on social media, in pop-culture references, in serious conversations, in jokes or passing remarks.

This paper examines two forms of media content about Gurgaon – online stand-up comedy videos and Hindi/Haryanvi rap or *Desi Hip-Hop* (DHH) music videos. In both case, one finds frequent references to violence and aggression, with mentions of guns, alcohol and sexual innuendos. But the tone, descriptions and the targeted audience for the two are polar opposites.

The comedy videos, catering to the white-collared professional, working in the IT companies and Multi-national corporations located in "new" Gurgaon, mock the rural, uncivilized male of the "old" city. The DHH songs, on the other hand, are popular among the local, semi-urban Haryanvi population of the region and the machismo of the visuals and lyrics is a source of regional and masculine pride and a projection of strength.

Through the examination of these videos and the audience reactions to them, the paper tries to show how media images and discourses about cities is shaped by people's perceptions of them; but also go onto further colour and reinforce these perceptions. In this case, adding to the general image of Gurgaon and its people as hyper-masculine. Interestingly, this becomes a way for people to create and express identities, forming groups as well as "othering" people in terms of gender and sexuality, class and communities.

MAJUMDAR ADUR, SHWETA* (California State University, Los Angeles, USA)

"You Should Have Thought about What Would Happen to Us": Queer South Asians and Transnational Familial Solidarity

This paper examines the lives of Queer South Asian immigrants in the US as they "do family" across their countries of origins and destination. I focus particularly on "coming out" narratives and the impact that "coming out" as LGBTQ+ has on transnational South Asian families. Based on 30-indepth qualitative interviews, archival material, and web content analyses of queer South Asian websites and blogs, the findings demonstrate the centrality of the transnational, extended, and multigenerational family in "coming out narratives". Findings further show that "coming out" is fraught and a multilayered process that disrupts familial solidarity and the conventional, heteropatriarchal - expectations around the circulation of care and expectations of caregiving and results in nuanced reorganization of solidarities, expectations, and care. Theoretically, this paper contributes to the broader scholarship on sociology of sexualities - especially, to the work on "sexual migrants" as well as to the broader scholarship on transnational families by queering the conversation of families and circulation of care.

Gendered Spatialities on Platform: Solidarity and Tensions in Worker Organising Efforts

This study examines intersectional gender spatialities and how they influence and shape the leadership, hiring practices, networks, and worker organising efforts within the platform work model. Drawing on the theoretical constructions of spatiality, the paper explores the spatio-temporal arrangements that resist or reinforce worker unionising and solidarity in the platform economy. Using narrative interviews conducted in the Indian context with platform workers engaged in ride-sharing and delivery services, as well as prominent trade union leaders, this inquiry brings forth the lived experiences of gender intersectionalities. Our findings suggest that worker organising efforts and trade union composition are dominated by patriarchal spatialities, which undermines the rights and concerns of gender-marginalised workers within the platform economy. This, in turn, creates an environment which is unable to foster true worker solidarity and leads to further 'division of labourers'. The study further finds that many platform companies have systematically encouraged and promoted seemingly gender-progressive moves, especially hiring women in traditionally male-dominated services like driving and food delivery. These strategic decisions have been introduced by companies with the objective of (a) creating gendered tensions that shape and constrain collective bargaining efforts and (b) disrupting worker organising efforts, where the introduction of women can challenge the solidarity and power equations within traditional unions that are male-dominated. Therefore, gendering the workforce is a strategic effort by platform companies to increase tensions that break worker unionising. Men dominate the trade unions and the workforce, thereby producing patriarchal spaces where women have limited visibility and roles and while the 'introduction of women' in some of these male-dominated services by the app companies may seem inclusive and progressive, it has reified patriarchy and gender inequalities, further hampering women's representation and unionising efforts in platform work.

MAJUMDER, MRINMOY* (UCA, India)

Locating 'Caste' within Labour Theory

This conceptual paper attempts to critique the Marxist perspective on class-based labour theory, which primarily accounted for the post-colonial economic landscape. In this paper, I argue that the traditional Marxist theory fails to account for social constructs such as 'caste', which plays a significant role in shaping the labour market in India and most of Southeast Asia.

I contextualise the work arrangements within the platform economy, which is rapidly growing in India. Several studies and news reports have already established the plight of platform workers. Given the increasing challenges, it becomes necessary to critique the social positioning of caste and labour within the platform economy model. Incorporating the social realities of caste-based division of labour and exploitation in the platform economy will offer a more nuanced and context-specific understanding of labour.

SIMOES, SOLANGE (Eastern Michigan University, USA)

Women and the Future of Democracy: Anti-Gender Politics and Women's Electoral Responses in Brazil and the US.

Our paper examines the advances of the extreme right on democracy by shedding light on the attacks on gender and setbacks in women's rights focusing on the gender dynamics in recent electoral processes in two very distinct societies and countries that, nonetheless, have experienced a converging and strong resurgence of the political right. We look into those trends in Brazil, a Global South country whose recent political history includes a military dictatorship, and the United States, a Global North country that has taken so much pride in its centuries-old democratic institutions. On the one hand, we draw attention to the similarities and convergences in the centrality given to anti-gender discourses and policies by right wing candidates and political parties. On the other hand, we put light on the increasing gender gaps in voting and their impact on the state of democracy in both countries.

Moving beyond gender gaps in voting, we also examine the recent changes in gender gaps in political representation, with both countries experiencing an increase in the number of women elected to political office with progressive agendas but also, in some cases, reproducing conservative views of gender. We conclude by discussing a) the factors that might explain both the electoral appeal and electoral contestation of the anti-gender agenda in such distinct contexts and) the extent to which women and gender issues might impact the future of democracy in those societies.

MAKHETHA, TREVOR* (University of the Western Cape, South Africa)

Early Childhood Education Beyond the Anthropocene: Drawing on Indigenism Knowledge Systems and Ubuntu to Shape ECE Curricula, Policy, and Pedagogy

In South Africa, Early Childhood Education (ECE) is defined as "a comprehensive approach to education policies and programmes for children from birth to five years with the active participation of practitioners, their parents and other caregivers". South Africa's vision for ECE is to protect children's rights by providing environments and resources for the development of a child's full potential in all aspects of growth and development: cognitive, emotional, social, physical and moral. Research has shown that quality care and education during early childhood are beneficial to children's growth and development throughout their lives. Environments and programmes must thus provide varied and age-appropriate experiences for young children in the years before formal schooling. This intervention could not be more urgent, given the reality that more than one-third (36%) of the 19.5 million children in South Africa are under the age of 6. Of the children below 6 years old, approximately 4 million live in the poorest 40% of households, with the gap between rich and poor widening. Research also indicates that the children who live in the poorest conditions have the least opportunities for growth and development. There is no equitable access to quality ECE provision and resources, and there is no equitable expenditure on ECE across geographic areas. Stark inequalities exist across the country, with poor and wealthy children being exposed to considerable variation in the delivery of essential services based on the area in which they live. To address these disparities, the president of South Africa recently signed into law the mainstreaming of ECE. This creates the space for contemplating innovative approaches to provide equal access to ECE. My paper, drawing on qualitative research conducted in South Africa, demonstrates how Indigenism Knowledge Systems and Ubuntu can be used to inform education about nature, the environment, and sustainable futures.

MAKHETHA, TREVOR* (University of the Western Cape, South Africa)

Forging Inclusive Solidarities: Developing Learner-Centred Interventions to Prevent and Reduce Violence in South African Schools

Schooling in South Africa has been characterized as unequal, unjust, unsafe, and generally dysfunctional. The level of school-based violence is particularly alarming, with many scholars contending that it is an enveloping experience, arguably one of the most critical issues facing young people in South Africa. However, school-based violence is experienced uniformly, and it mainly impacts the Coloured minority and African majority in rural areas and urban peripheries. A substantial body of scholarship has been dedicated to uncovering the complexities of school-based violence at schools attended by mostly African youth. However, very little research has been done to examine how school-based violence impacts Coloured youth. I should pause to mention that South Africa's history of colonialism, slavery, and Apartheid, essentialized race, racism, and race thinking to the extent that race structures all facets of South African society. To answer my main research questions: (i) How do young Coloured male learners experience and navigate school-based violence, and (ii) how these experiences impact the educational trajectories of young Coloured men, I conducted a 13-month-long ethnographic PhD study in the Northern Cape Province, South Africa. My study reveals that gender-based and homophobic violence is rampant and has lasting implications for Coloured male learners and schools attended by Coloured youth. My findings suggest a clear sense of unhappiness and frustration with the culture of misogyny and homophobia that stigmatizes and excludes many young Coloured men. Learner narrative suggests that interventions to counter the scourge of violence should be multipronged and not limited to infrequent discussions in Life Skills classes. Adults (teachers as well as parents) need to break the silence on homophobia and cultivate a disposition of tolerance and respect. Additionally, such discussions and programmes should be discussed in partnership with young people and not be isolated and hidden from the public domain.

Updating Adaptation Strategies and Developing the Meanings of Dacha Space

The report examines a wide range of practical issues related to the process of migration of the urban population from large cities to small settlements, namely, the process of updating adaptive strategies and the development of meanings of dacha space during the implementation of the process.

This view of the study of deurbanization acquired particular significance in the years marked by the total COVID-19 pandemic, which forced city dwellers to leave cities en masse and settle in non-urban spaces. The theme continues to be heard today - in the context of new epidemiological threats, natural disasters and other factors pushing city residents out of its borders.

In the new wave of research 10 cases of relocation of Moscow city residents aged 19 to 53 years of various professions and social statuses were examined.

The family's opportunistic strategy becomes more complex and no longer involves the use of absolute practices "we moved out of town", "stayed in an apartment", "we live in two houses", but becomes more multi-level, includes the combination of different formats of interaction with space and implementation solutions found that satisfy each family member.

Citizens note an increased need for creative function: it becomes possible to introduce a creative hobby as a regular ritual, rather than a one-time random activity. There is a change in attitude towards social networks (they are considered as one of the possible channels of communication with an audience of observers about the peculiarities of living outside the city without the goal of blogging).

Push and pull factors are considered not from the perspective of a radical and final assessment that influences decision-making, but, often, in the context of a possible impending rise or fall of the "wave" of the epidemic or other reasons to continue maintaining dacha space living.

Exclusion of Indigenous Fijian Knowledge: Factors and Effects

Chilisa (2012) underlines the necessity for social science research to free itself from only Western European perspectives, urging for the recognition of other forms of living and knowing among non-Western realities. According to Chilisa, the hegemony of Euro-Western knowledge systems in contemporary research comes at the expense of other cultures, especially those of the formerly colonized. In the Pacific and Fijian contexts, Naidu (2010) presents the impact of globalization on the mindset and value systems of South Pacific Island nations, particularly in Fiji as a post-colonial state. He notes that even before the contemporary integration of developing economies in the global market as well as the consequent political crisis brought by socio-economic and technological forces, decades of colonialism already featured major structural changes in island societies. Varani-Norton (2017) narrates the persistent dominance of British colonial structures over the handling of the culture of the iTaukeis, the indigenous Fijians, although adoption or hybridization of other systems with traditional culture has been in practice among them even before first contact with Europeans. While this essay argues that colonial and contemporary politico-economic and socio-cultural factors contributed and continue to contribute to the exclusion of Fijian indigenous knowledge, negatively affecting local communities, the student-researcher intends also to explore the role of indigenous societies themselves along with the state in these exclusionary dynamics. This, in turn, would inform the understanding of the causes and past initiatives to address the issue as well as the proposal of possible alternatives and solutions in relation to negative effects and conditions.

Roots in Water: How Fijians Deepen into Their Traditions to Combat Current Crises

Roots in Water: How Fijians Deepen into their Tradition to Combat Current Crises

The Covid-19 pandemic came as a shock, aggravating existent economic and political crises (Institute for Economics & Peace, 2022), along with the consequences of climate change. Despite this, it has also demonstrated how civil societies have responded with resilience and solidarity, challenging conventional approaches to development and peace.

In the Pacific Islands, the crisis has pushed communities to resort to alternative strategies based on indigenous sociocultural contexts that "have made us rethink human security (Ratuva, 2021, p.20)." Meanwhile, even after decades of globalization, villages became "safe havens" during the pandemic, sparking a "re-storying" of economic development (Kabutaulaka, 2020, p.49).

Back in 2009 at the UNGA, climate change concerns involving Pacific Island countries already led to a resolution placing the agenda along with international peace and security (Weir & Virani, 2011). Further, Havea (2019) asserts that climate change affects people's peace due to its effects on livelihoods, health, and well-being, emphasizing how peace can be promoted in adaptation strategies.

As more and more areas in Fiji are either already suffering from or at risk of seawater intrusion, its consequences, along with the challenges brought by relocation efforts, push indigenous communities to adapt their knowledge and practices accordingly.

Fiji as site of research provides a microcosm of the interplay between social order and social growth. With its history of colonization and its multicultural society, Fiji offers not just a map of peace and development issues, but more importantly, a resource for solutions and strategies from its indigenous cultures and contemporary experiences.

Fiction Cinema As an Alternative Sociological Tool for Exploring the "Pluriverse": The Example of Kaili Blues (Bi Gan, 2015)

Our work is part of a general framework of critical reconceptualization of sociological theory in connection with decolonial perspectives (Mignolo and Walsh, 2018) and the ontological turn (Holbraad and Pedersen, 2017), taking the visual arts of the Global South as a possible alternative non-Eurocentric

methodology for exploring the worlds of subaltern minorities, beyond the modern global world. It follows the model called "ethno-cinematographic rhizomes" (Malaina, 2020), inspired by Deleuze and Guattari (1987), applied to independent film productions in Southeast Asia.

In our paper we want to expand its application to the film *Kaili Blues* (2015) by Bi Gan, for the study of the Guizhou region, southwest of China, where alongside modernizing processes coexists a local culture that combines Mahayana Buddhism and animism of ethnic minorities such as the Miao ethnic group. This low-budget film combines narrative techniques of an almost documentary realism with dreamlike and surrealist irruptions. We are shown a rural reality with intertwined times and spaces that is especially visualized in a sequence shot of more than 40 minutes. In this diegetic universe, people perceive time in a non-linear way, past, present and future coexist at the same time, thus showing the notion of circular time characteristic of traditional agricultural societies in East Asia, different from the Western conception of linear time. This film, like others by directors such as Apichatpong Weerasethakul (Malaina, 2022), shows us that fiction cinema can be a very effective aid to the decolonial social scientist who seeks to study the "pluriverse" (Escobar, 2018). With its immersive qualities, it allows us to explore other non-modern "worlds" in a sensorial and emotional way, constituting an innovative and alternative sociological approach to orthodox Eurocentric methodologies of rational and formal representations.

MALAINA, ALVARO* (University Complutense of Madrid, Spain)

Revisiting Animism in Sociological Theory Through the Cinema of the Global South

The concept of animism has been revisited in recent decades in anthropology within the framework of the so-called "ontological turn" (Descola 2013, Viveiros de Castro 2014, Holbraad and Pedersen 2017), leaving the colonial framework in which it arose as the primitive belief of the colonized. It is understood more than as a religion as an experiential and lived form of relationship with the environment (Ingold 2000) in which the modern separation between culture and nature do not operate, hence its interest in the era of ecological crisis of the Anthropocene, which is born from the anthropocentric forgetfulness of said relationship (Latour 1993, 2018).

I consider that sociological theory must also open itself to the new concept of animism, to broaden its modern Eurocentric limits, an urgent task in this context of ecological crisis. I have recently incorporated selected independent films of the Global South as a heterodox methodology for visualizing animist ontology for a sociology that I propose to call "ontological." Specifically, I have investigated as an example the film work of Thai director Apichatpong Weerasethakul, who presents us with the Thai region of Isaan, highly influenced by Laotian animism and shamanism (Malaina 2022). Within the framework of an epistemic model inspired by Deleuze and Guattari's (1987) concept of rhizome, I suggest that films such as *Tropical Malady* (2004) or *Uncle Boonmee who can recall his past lives* (2010), allow us to sensorially and emotionally explore "other world" of the "pluriverse" (Escobar 2018) with different relations between the human and the non-human. I conceive these examples of fictional cinema as "ethno-cinematographic rhizomes" that could be extended to other independent film productions from the Global South and serve as practical and methodological support to a social theory that opens up to the "ontological turn."

BARSGTED, MATIAS (Instituto de Sociología, Pontificia Universidad de Chile, Chile)

Cultural Change in Contemporary Chile

Recent studies suggest that cultural change can be explained by two broad models. The settled dispositions model posits that people's dispositions remain stable over the life course, whereas the active updating model argues that dispositions are updated in response to new events. Generally, existing studies have adopted one of these explanatory models without systematically evaluating or contrasting them, which is problematic since both processes may account for change. In this context, Kiley and Vaisey (2020) analyzed panel data from the USA, finding that most individual-level changes in attitudes reflect non-persistent change, highlighting the significance of generational replacement. Conversely, using data from several countries, Lersch (2023) and Tormos (2021) present evidence supporting the active updating model. A persistent gap in this literature is that most panel data evidence of individuals' changes comes from just a few countries, mainly Britain, Germany and the USA. High-quality panel data for studying changes in personal culture are scarce in the Global South.

This study addresses that gap by examining changes in personal culture in Chile. We analyze six waves of the Social Longitudinal Study of Chile (ELSOC)—a representative panel of residents in Chile—to assess whether patterns of personal cultural change are better explained by the active updating model or the settled dispositions model. The findings suggest that most attitude dynamics align with the settled dispositions model, leaving little room for life-course changes to drive social change. These results are consistent with existing research and provide insight into the external validity of previous findings. We also explore the role of social heterogeneity in explaining these results, particularly the importance of socioeconomic status.

Revisiting Social Innovation through the Lens of the Global North and South

This presentation explores different notions of innovation and social innovation, contrasting perspectives from Europe and Latin America. Drawing on three key concepts - social innovation, grassroots innovation and Buen Vivir (BV) -. Although these concepts do not reflect innovation in the same dimensions, they share a critical perspective on an idea of innovation and development that is different from purely technological development and that needs to discuss new social arrangements.

The research highlights the characteristics of social innovation and analyses how it is understood in different regions and cultures (Maldonado-Mariscal, 2023a). It also reflects on a study that analyses the importance of the combination of social innovation and grassroots innovation, in which countries in the Global South, particularly India and Brazil, play a major role (Maldonado-Mariscal, 2023b). Finally, the study deepens the four analytical dimensions of Buen Vivir (technology, environment, economy and society) and offers a vision of how this socio-environmental philosophy rooted in Latin America emphasises the balance between human well-being, community and nature, as well as ecological harmony over traditional growth models (Maldonado-Mariscal & Hölsgens, 2024). By comparing the different approaches to innovation in the European and Latin American contexts, this research provides a comprehensive understanding of how social innovation can serve as a tool to address global challenges. It also highlights the importance of alternative perspectives in shaping more sustainable and inclusive development pathways.

Social Innovation in Higher Education: The Role of Universities from a Historical and Contemporary Perspective

This paper proposes a definition of social innovation in education (Maldonado-Mariscal & Schröder, 2023) and examines its transformative potential in higher education. Through historical and contemporary analysis, it explores how universities have evolved from a focus on teaching and research to a 'third mission' that incorporates social responsibility and civic engagement (Brenzitz & Feldmann, 2012). Initially framed around economic contributions, this third mission has expanded to address broader societal challenges. We introduce the concept of the 'engaged university', which is particularly relevant in the Global South, where institutions act as regional change agents through knowledge and technology transfer (Appel et al., 2017). Universities are increasingly seen as spaces for activism and multi-directional knowledge exchange with communities (Loorbach & Wittmayer, 2024), highlighting the importance of co-creating knowledge with society. This collaborative approach fosters innovative educational practices that respond to contemporary global challenges. In addition, we present a case study that illustrates how universities can drive social innovation in education. Overall, this paper emphasises the crucial role of universities in fostering social change.

MALGOSA GASOL, ESTEL* (Universitat Autònoma de Barcelona, Spain)

(In)Valid Consent: Early Childhood's Narratives about Consent in Spain

In 2022, the Spanish government enacted a law that centred consent as the key principle for regulating cases of sexual violence. This legislative shift, alongside several high-profile cases of sexual violence in the sports sector, brought consent into the spotlight of public debate around sexuality education. However, the topic remains controversial in Spain, as not all forms of consent are equally valid (Serra, 2022).

The notion of childhood innocence (Robinson, 2013), which positions children as asexual beings in need of protection—a concept particularly reinforced in early childhood (Cela & Malgosa, in press)—complicates the recognition of children as capable and agentic individuals who can make decisions about their own sexuality (Alvarez & Malgosa, 2024). While consent is recommended in numerous sexuality education curricula (Bragg et al., 2021; Gilbert, 2018), adults often validate children's consent for practices such as hugging and kissing, yet do not extend this validation when it comes to practices perceived as related to adult sexuality, such as peer genital touching (Hulth, 2024).

From a new feminist materialist perspective, which conceptualises consent as part of a sexuality 'assemblage' (Deleuze & Guattari, 1988), this paper will explore the human and more-than-human elements that, through intra-action (Barad, 2007), shape the (im)possibilities of (sexual)consent for children. Focus groups conducted with children aged 3 to 8 as part of the ethnographic research project *SexAFIN* of the Autonomous University of Barcelona will serve as the basis for this analysis.

Harassment and Disability Justice: Rethinking the Place of Workers with Disabilities in the Anthropocene

Whose knowledge counts in the Anthropocene? How can we include the voices of people with disabilities? In this paper, we explore the meaning of disability justice through a reflection of the lived experiences of workers with disabilities in Ontario, Canada. Based on an analysis of 39 qualitative open-ended interviews with adults living with a variety of disabilities engaged in some sort of paid work, we interpret their experiences and identify barriers. We suggest that three variables worked to demoralize disabled participants: stigma, unattainable expectations, and barriers. Together, we argue that these variables constitute a poisoned environment for some workers with disabilities: the working conditions are hostile, negative and intolerable. We suggest how avoiding burnout and facilitating retention of employees with disabilities requires a serious commitment to fostering an inclusive environment. We are cognizant how time structures the workplace in a way that is exclusionary of many people whose mind-bodies function in disparate ways. Using the groundbreaking work of the philosopher Cornelius Castoriadis, we suggest that his notion of social imaginary significations may assist in creating a workplace that is sensitive to the needs of people with disabilities and respects the knowledge of disabled people to create authentic disability inclusion in the workplace.

Conspicuous Abstinence: Distinction through Restraint Among Muslim Americans

Sociological literature tends to measure religiosity through belief (e.g. in God, scripture, etc.), practices (e.g. prayer), attendance in religious services, or identification (i.e. declared membership in a denomination). Abstinence, as a form of religious practice and/or a signifier of religious identity, remains

under theorized. Yet, there's reason to believe it may be salient. We draw on life history interviews conducted with eighty second- and 1.5-generation American Muslims to explore the role of abstinence in religiosity. We use name-based sampling drawn from a voter-registry to recruit Muslims who are varied in their levels of practice and involvement in Islamic spaces and institutions. We deploy a Bourdieusian model of distinction, and find that abstinence does important boundary work for Muslim Americans. Among non-Muslims, abstinence from pork, drugs, and alcohol serves as a signifier of identity. Among Muslims, abstinence from music, movies, and mix-gendered interaction establishes tiers of religiosity, marking the 'more practicing' from the 'less practicing.' In either case, distinction works by creating interactional tension. Our work has three payoffs. We add to the broader understanding of religiosity, suggesting that abstinence can be an important metric for understanding both religious practice and identity. We also expand on theories of distinction by examining the interactional deployment of abstinence as a boundary marker. Lastly, we add to empirical knowledge on Muslim Americans across levels of religiosity and embeddedness in Muslim space.

Affective Sublimations or How We Feel with Intelligent Technologies

This presentation explores an aspect of the evolution of human emotional cultures in response to interactions with intelligent technologies, to offer a comprehensive taxonomy of emotions that arise in these contexts. Inspired by the phenomenon of "uncanny valley", it systematically traces unique affective responses to our technologically mediated environments and investigates how these emotions shape human social identity. This talk draws on my latest project titled *Artificial Feelings: Emotions We Have Developed With Technology* which rather than viewing emotions solely through a psychological or biological lens, frames them as outcomes of cultural practices, signaling how human emotional make-up is co-constructed alongside intelligent machines.

Central to this analysis (and the proposed talk) is the concept of affective sublimation, defined here as a specific emotional transformation that occurs when human feelings are modulated, redirected, or reinterpreted through interactions with technological devices. This phenomenon captures the way technologies, by blending functionality and perceived agency, evoke responses that surpass ordinary emotional reactions – generating a unique spectrum of attachment, empathy, or even discomfort that reshapes our sense of self and others.

In response to the session's call and drawing attention to these interpretative tensions, this presentation seeks to illuminate how our emotional responses to technology challenge and expand traditional notions of human subjectivity, ultimately revealing the deep entanglement between emotional experience and the socio-technical world we inhabit.

Ethnographies of Science: Boundary Organizations in the Agricultural Biotechnology-Policy Interface in India

This paper is based on ethnographies of science to posit science, to study the culture of science, to understand the changing narratives about the nature, methods and ethos of science, and to help science and its publics re/design new research questions, programmes, and science and technology policies. It explores qualitative research that examines how scientists encounter the science-policy boundary in the normal course of doing their research. Grounded in the questions of practical relevance, it relies on an interview-based study that took place between 2017 and 2019 in different institutional settings in India in which interviews with 68 practicing agricultural biotechnologists aimed to encourage scientists to reflect as openly as possible on their own experiences of and engagement in policymaking domains. These institutional settings include institutes of national importance, central universities, state universities, mission-mode organizations, Council of Scientific and Industrial Research and Indian Council of Agricultural Research. These agricultural biotechnologists sometimes refer to institutions that mediate between policy- or decision-makers and scientists, called boundary organizations. The influence of contract funding brings somewhat volatile and diverse patterns (often referred to as anomalies) in research activity. In other words, the pressure to bring in research funding allied with the demand for policy accountability also presents a kind of diversity within a scientist's repertoire of projects. Individual scientists often have to negotiate and delineate research relationships with various customers who are simultaneously policymakers and funders of research. Empirical evidence from interviews suggests that there were often occasions when such boundary organizations were absent from the drawing up of contracts, agreements and the negotiation of research boundaries at the science-policy interface.

MALOUTAS, THOMAS* (Harokopio University, Greece)

The Building Stock and the Evolving Social Relations and Neighbourhood Profiles in Central Athens between the Early 1970s and the Early 2020s

In the last 50 years (1970-2020) the centre of Athens was dominated by the typical Athenian apartment block built during the building boom of the 1960s and 1970s. This stock still accommodates about 70% of the population of the city centre (Municipality of Athens). This housing stock remained the same during these 50 years to a large extent, but residents changed much as well as the relations among them. The social and ethno-racial profile of central neighbourhoods changed substantially together with their position in the social status hierarchy of the neighbourhoods in the metropolitan area.

The proposed presentation focuses on the significant changes of the social profiles and relations among the residents of the centre of Athens, although the housing stock, the type of housing and allocation system remained, more or less, the same. The main point is to provide evidence about the important changes in social relations and to claim that such changes are not necessarily linked (produced by) changes in the building stock and/or the housing allocation system.

RC21-311.3MALOUTAS, THOMAS* (Harokopio University, Greece)
SOULIOTIS, NICOS (National Centre for Social Research (EKKE), Greece)*The Social Profile and Spatial Imprint of Elite Groups Among Higher Occupational Categories in Athens*

The paper will use a combination of detailed data of the 2021 census (type, level and country of studies; occupational status; available housing space and tenure etc.) and other accessible data (e.g., the detailed distribution of real estate prices across Athens) to delimit the spatiality of concentrated privilege, assuming that concentrated privilege works in a similar way with concentrated deprivation. In a recent research we have shown that the expansion of high occupational categories (professions) in Athens reinforced internal divisions (based on characteristics such as family traditions of pursuing the same profession, advanced studies in prestigious institutions, and employer or self-employed status). However, at the same time social segregation in Athens remained relatively moderate, as the high rate of home ownership and the low rate residential mobility obstructed the translation of socio-economic inequality into spatial division (among others see Maloutas 2016). The paper will examine whether there are changes of the elite spatiality during the 2010s which alter the above-mentioned patterns.

MALTZ, HERNÁN* (Czech Academy of Sciences, Czech Republic)

Peripheries of the Sociology: The Sociology of Literature in Argentina

When approaching the sociology of literature in Argentina, at least two main dimensions emerge on its outlying situation: not only the peripheral condition of Argentine sociology within Western sociology, but also the marginal (even neglected) position of the sociology of literature within the local sociology. Pablo Alabarces has already called attention to this problem regarding the sociology of culture and some of its connections to the sociology of literature. However, as he tends to dissolve the latter into the first one, I find it relevant to establish a more detailed account of the sub-discipline. Given that there are no international overviews (in English) on the development of this area of studies in Argentina, I propose a presentation that takes into account not only the main authors and published works (starting with the key works by Carlos Altamirano and Beatriz Sarlo in the 70s and 80s), but also the publication of intraductions (local translations of foreign works), the development of teaching activities and the celebration of conferences, among other factors of importance. Framed within a general perspective of an international (although disconnected) sociology of literature, the description of the history and the current state of the sub-discipline in Argentina can also function as a way to bear in mind one of the more unstable sides of sociology.

Laguna De Bay: A Vital Ecosystem Under Threat

Laguna de Bay, the second-largest lake in Southeast Asia, plays a crucial role in the livelihoods of approximately 100,000 artisanal fisherfolks in the Philippines. This vital ecosystem supports a range of activities, including fishing, power generation, transportation, water supply, flood management, recreation, and wildlife preservation.

However, rapid urbanization, industrialization, and the proliferation of illegal fishpens have significantly impacted Laguna de Bay's water quality, ecosystem, and the livelihoods of artisanal fisherfolks. The planned Laguna Lakeshore Road Network further threatens the lake's delicate balance.

This study will employ evidence-based research methodologies to investigate the current state of Laguna de Bay and explore potential solutions. In collaboration with MAPAGPALA, a Coalition of Laguna Lake Fisherfolks federations covering five major areas in the South and the National Capital Region namely - Taguig, Rizal, Lumban, Siniloan, Tanay, Binangonan, primary data will be collected through focus group discussions, key informant interviews, surveys, and analysis of existing data. Key Objectives of the study include impact assessment of human activities on Laguna de Bay's ecosystem and the livelihoods of artisanal fisherfolks; identification of sustainable practices and policies to protect and restore the lake's health; and exploration of opportunities for collaboration among stakeholders to promote the sustainable use of Laguna de Bay.

The study will provide valuable insights into the challenges facing Laguna de Bay and offer recommendations for sustainable management, conservation including climate change mitigation, adaptation and disaster risk resilience. By promoting evidence-based decision-making and fostering collaboration among stakeholders, this research aims to contribute to the preservation of this vital ecosystem and the well-being of the communities that depend on it.

VARGAS, EDWARD R. (OPAPP, Philippines)

NARCISO, HILDA (Claimants 1081, Philippines)

Lessons on the Reparation of Philippine Martial Law Victims-Survivors

Under Proclamation 1081, Martial law was declared in the Philippines by the late President Ferdinand Marcos in September 1972, until February 1986. Historians and human rights monitoring entities view that the period had 3,257 extra-judicial killings, 35,000 documented tortures, 737 "disappearances" and 70,000 incarcerations.

After 25 years, in 1994, the US and Singapore Courts, awarded the Philippine Martial law victims the amount of \$2 billion as indemnification. Nineteen years later, the 15th Congress under the late President Benigno Aquino III, enacted Republic Act 10368 otherwise known as the "The Human Rights Victims Reparation and Recognition Act of 2013". The said law established the Human Rights Violations Victims Compensation Board (or HRVCB) and authorized P10 billion (about US\$245 million) in payments to the victims. The funds came from the ill-gotten wealth of the Marcos administration. Out of the funds, 11,128 were awarded and compensated.

So far there is no available scientific literature involving assessment on the nature, processes and the impact of the reparation undertaken. Employing evidence-based methodologies, in collaboration with Claimants 1081 and with victim-survivors and their families in select areas in Metro Manila, Central Cebu, Davao and CARAGA, primary data will be collected through focus group discussions, key informant interviews, surveys and analysis of existing data. Key objectives of the study include an evaluation of the gains, level of pursuing justice against specific perpetrators, the economic, psycho-emotional, social-spiritual wellbeing, the healing/restoration of the dignity of the survivors and families. Gaps in the implementation of RA 10368 will also be identified.

This study is timely as it will provide invaluable insights and offer recommendations in adopting effective remedies and reparation in the light of the extra-judicial killings during the anti-illegal drugs campaign of the Duterte Administration, and other grave human rights transgressions of individual and collective rights in the country.

MANARAS, NIKOLAOS* (Maynooth University, Ireland)

Organizing in the Era of the Far-Right Ascent; The Spanish and Greek Left after 2015

Externally imposed austerity and its adoption by mainstream parties from across the political spectrum in Greece and Spain in the 2000s and early 2010s triggered several waves of social mobilization, focusing on a range of issues including socio-economic grievances as well as identity and national sovereignty. Capitalizing on mass mobilizations and widespread discontent with traditional mainstream parties, left-wing outsiders Podemos and SYRIZA gradually gained support. Following their rapid ascent, these parties witnessed dwindling influence as they moderated their discourse and experienced internal disputes and splits. Popular disappointment with the parties' performance and a de-legitimation of leftist projects more broadly led to mass withdrawal from active popular participation as a 'left-wing melancholia' took hold. In the wake of such processes, space has opened for various conservative projects to increase their influence and present themselves as offering the only realistic responses to long-standing socio-economic grievances and sentiments of declining national sovereignty following the era of neo-liberal globalization. Indeed, far-right parties have gained access to parliaments in both countries espousing an anti-immigration and nationalist rhetoric that is often normalized by the mainstream parties and media. Drawing from qualitative interviews with key figures in the Greek and Spanish left -including academics, activists, trade unionists and organizers- this research identifies the strategies utilized both by institutional (parties and unions) and non-institutional (social movements, local activists and organizations) forces to counter this reactionary wave; the social bases they are targeting; and, more pertinently, the principal challenges they face. Initial findings suggest four interlinked phenomena are stifling their collective efforts to re-build and confront the reactionary wave: a) lack of co-ordination between those actors, b) decline of active membership and/or participation, c) rising violence against sympathisers and d) weakness to construct a concrete narrative for the current situation.

RC34-567.2MANDICH, GIULIANA* (University of Cagliari, Italy)
CUZZOCREA, VALENTINA (Università di Cagliari, Italy)*Constructing 'Nodes' for the Future? Belonging and Return Mobility in Sardinia*

This presentation seeks to discuss varieties of belongings flourishing in the Italian island of Sardinia. Standing in the centre of the Mediterranean Sea, Sardinia has a long tradition of emigration due to economic difficulties, which contraposes itself to a strong touristic vocation. In this context, young people have seen mobility as a way to imagine their future (Cuzzocrea and Mandich 2016). In this presentation, we discuss what it happens when the desire to return after having had some experience abroad - which is itself based on articulated dynamics of belonging - starts to arise (a), and the possibilities of accumulation of capital that may accompany this process (b).

To explore this theme, this presentation delves into the rich material generated by NODI (Home - NODI (nodi-itaca.com), an experiment of community creation initiated by a Sardinian returnee, which is flourishing around the objective to create a system of transferable resources travelling across continents, but having Sardinia as an elected hub to support human and social capital. This example of community creation is explicitly based on the appreciation of potentialities found in loco, but also on a peculiar relation with the island that could be connoted, again, as belonging. Looking at the activities organised by NODI, and reflecting on the podcast material gathered through ITACA (a section of NODI) with the involvement of returnees and/or Sardinians abroad, the presentation also touches on the concept of aspirational justice and on an emotionality that is not encapsulated in itself but rather used to explicitly inspire and support future generations of Sardinian youth to engage with the territory, attempting to design new possibilities and scenarios of justice.

MANDICH, GIULIANA* (University of Cagliari, Italy)

Examining Foundations of Hope through the Lens of Optimism

This proposal seeks to analyse the epistemic and methodological foundations of hope by exploring its intricate relationship with optimism. This connection is a nuanced and critical topic within sociology, philosophy, and social theory, offering rich ground for discussion.

Both hope and optimism are situated within a temporal framework and are deeply intertwined with emotional experiences; however, they are often viewed in contrast to realism. The relationship between these two constructs can be complex. For instance, Bennett (2011) posits that optimism represents a tendency to entertain positive expectations about the future, potentially serving as a "stronger version of hope." Conversely, Terry Eagleton (2015) critiques optimism as a superficial trait that does not inherently require deep reflection. He argues that hope, in contrast, is cultivated through reasoned engagement with the future and provides a basis for meaningful social transformation.

I propose that hope and optimism, while distinct, belong to the same family of positive constructs regarding future outlooks (Mandich and Cuzzocrea forthcoming). Hope emerges in personal experiences, triggered by specific events and emotions (Anderson, 2006), and is responsive to unique contexts (Cook & Cuervo, 2019). Optimism, however, is understood as a broader disposition shaped by cultural and socio-historical contexts, acting as a vital component of the "structure of feelings" conceptualized by Williams (1992) and further explored by Berlant (2008) and Coleman (2020).

While it is essential to analytically distinguish between hope and optimism, recognizing their interrelation in individual experiences is crucial for understanding how people orient themselves towards the future. This exploration contributes to a deeper comprehension of emotional dynamics and provides insights into the potential for social change rooted in hope.

MANELLA, GABRIELE* (Alma Mater Studiorum - Università di Bologna, Italy)

The Mediterranean Sea: Between the Coastline...and the Hinterland: A Review through the Astmed Conferences

The sea, and the economic, social and cultural world around it, has changed a lot in a few decades. If we just focus on tourism, it has been pointed out how the coastline has gradually shifted from a symbolic socio-cultural "showcase" to a possible element of union for different coasts and social systems.

Even the idea of "tourist destination" has changed considerably: it has left more space to the one of "tourist region", to be considered as a larger territory able to offer peculiar and integrated products. This new meaning, therefore, includes not only the coastline but also the hinterland on the one hand and the maritime and intercoastal tourism on the other.

The Mediterranean region is notoriously characterized by an historical and cultural complexity that makes a unique image impossible. On the other hand, there is also the impression that this sea represents a common physical and symbolic heritage not only for the Mediterranean countries but also for all the people who cross and enjoy it.

How has the way of seeing the Mediterranean Sea changed in recent decades? Which focuses of attention have been decreasing and which ones have been increasing? In which countries or regions?

This proposal starts from these questions for a historiographical and sociological reflection through the last six ASTMed conferences (Ravenna 2001, Thessaloniki 2005, Granada 2008, Sassari-Alghero 2011, Arcavacata di Rende 2014, Kotor 2019 and Bertinoro 2024). As regards the research tools, the publications resulting from these conferences will be used together with some bibliographic databases and some interviews with ASTMed Board members or former members as key-informants.

RC26-426.3

MANERA, MARIKA* (University of Messina, Italy)

Power, Knowledge, and Gender: The Historical Marginalization of Women in Sociology

The history of sociological theories is conventionally told as a story of male agency, a narrative of theoretical contributions divided into a "founding generation" that includes Auguste Comte, Herbert Spencer, and Karl Marx, and a "classical generation" that includes Emile Durkheim, Max Weber, Georg Simmel, George Herbert Mead, and Robert E. Park. This history is presented as a natural account, beyond the power of human beings to change it. On the contrary, as sociology teaches us, history is a social construction (Berger, Luckmann, 1966) shaped by the power dynamics within the discipline, and like all histories, it reflects a conflict between exclusive and inclusive values and practices (Becker, 1971; Lemert, 1995; D. Smith, 1987). Over time, due to cultural and political processes, women have experienced both the institutionalization of the discipline and the gradual definition of the sociological canon (Politics of Knowledge) (Lengermann, Brantley, 1998), as well as processes that delegitimized their scientific contributions based on their gender identity. Through these processes, the authority of their thought was diminished or

denied, and their audience was relegated to that of the men close to them (Politics of Gender). Political, social, and economic power has influenced the production, dissemination, and use of knowledge, relegating female empirical contributions to oblivion. This research aims to explore the processes of knowledge erasure experienced by female figures in the field of sociology during the canonization process, considering the broader historical phenomenon in which women are often depicted in historical narratives as lacking genius and scientific talent. In reality, they were systematically deprived of opportunities and hindered in disseminating their knowledge to future generations. The primary object of this contribution is to adopt a critical approach towards conventional paradigms of social and scientific knowledge, questioning the practices and styles of thought, action, and writing typical of sociology (Stalel 1985).

Les Défis De l'Entrepreneuriat Des Femmes Et Des Jeunes Au Sénégal

Depuis son indépendance en 1960, le Sénégal a mis en place plusieurs programmes pour booster l'entrepreneuriat des jeunes et des femmes afin de promouvoir l'autonomie de ces dernières et de lutter contre le chômage des premiers. Ces programmes sont conduits par un cadre institutionnel avec diverses directions et agences, qui se sont multipliées au lendemain de l'alternance 2000. Toutefois, si ces programmes ont été jugés ambitieux, ils peinent à atteindre les objectifs visés. Les obstacles sont entre autres la faiblesse des remboursements, la « mort précoce » des entreprises, ... Fort de ce constat, cette recherche s'intéresse aux raisons de l'échec de ces entreprises et aux profils des bénéficiaires.

Les données analysées dans le cadre de cette recherche ont été recueillies à partir d'une méthodologie qualitative avec des techniques telles que les entretiens, les observations directes et indirectes et les coupures et commentaires d'articles de presse. Les cibles sont les autorités au niveau institutionnel et les bénéficiaires. Pour l'analyse, nous avons eu recours au logiciel Nvivo et à l'analyse de contenu.

Negotiating Tradition and Modernity: The Experiences of Maltese Young People in Tertiary Education

The societal changes and transformations occurring in the last two decades have left an impact on the transitional journey of young people. This paper explores the interplay between tradition and modernity in the lives of Maltese young people in tertiary education. Taking a qualitative narrative approach, narrative inquiry gives the participants the opportunity to construct their own stories. Three sets of interviews were held with sixteen participants throughout the course of their studies at the University of Malta. This paper focuses on one common pattern elicited from the data: the traditions of a small island state, Malta, against the backdrop of societal changes. It highlights the transformations in the structure of the family, religion, gender, the labour market and the digital revolution and how these changes impact the transitional journey of Maltese young people. The findings of this study illustrate that Maltese youth are still rooted in tradition and continue to rely, to different extents, on social structures which provide powerful frameworks. However, a number of Maltese young people are ready to embrace new freedoms, providing opportunities for growth and development. This study contributes to a deeper understanding of how Maltese young people in tertiary education negotiate their transitional journey, offering insight into the wider theoretical understanding of youth transitions.

MANI SANKARAN, SABARI GIRISAN* (PhD Candidate, South Asian University, India)

Creating Alternate Channels for Circulation: The Hidden Labour of Farmer-Environmentalists in South India

The academic discourse on health/ natural foods often centres around the friction in beliefs and practices between those involved in the agroecological campaign and the profit-seeking enterprises engaging in organic food production. Even the works that attempt to emphasise the significance and embeddedness of commercial endeavours within the agroecological campaign predominantly characterise social movements to be of oppositional nature, thus foreclosing the possibilities of studying the constructive practices that are essential to some of the campaigns. Coming out of a year-long ethnography in Tiruvannamalai district in the south Indian state of Tamil Nadu, this paper presents the practices of small-scale farmers who engage in the production, conservation and selling of native rice and vegetable varieties. Creating new networks, finding appropriate processing methods and 'translating' their principles to their buyers - the paper particularly explores these hidden labours that those farmers perform as they are made to find their own channels for processing and marketing their farm outputs both within and outside their district. The farmers' meetings, seed campaigns, and the food festivals that they conduct also help them expand their consumer base and gain legitimacy - thus blurring the distinction between the campaign and their commercial interests. Drawing from works that contrast farmer collectives, territorial markets and household livelihood strategies with organic food companies, global capital and expansionist logic, this study adds a new critique to 'the conventionalisation framework' that marks the literature on sustainable food production practices. The farmers engaging in sustainable food production in India actively create pathways to circulate their commodities outside those offered by the corporates and aggregators. Thus, an attempt has also been made to challenge the theoretical limiting of farmers to the production aspect of the agroecological discourse that, in actuality, encompasses a broad range of entities nospanning the production-distribution-consumption spectrum.

MANI SANKARAN, SABARI GIRISAN* (PhD Candidate, South Asian University, India)

Fragmentary Virtues and Assembled Traditions : The Dietary Prescriptions of Farmer-Environmentalists in South India

Despite having a fundamental connection with food production, a farmer with three-four acres of land living in an Indian village is not an image that comes to our mind when we read the anthropological literature on people making ethical and health-related choices in their food consumption. Coming out of a year-long ethnography in Tiruvannamalai district in the south Indian state of Tamil Nadu, this paper presents the dietary schedules, health choices and medicinal articulations of small-scale farmers who engage in the production, conservation and selling of native rice and vegetable varieties. These bodily virtues are often drawn from varied sources, such as everyday sayings, folklore and literary texts, in a fragmented way. Creating new networks, finding appropriate processing methods and 'translating' their wisdom and principles to their buyers - the paper also discusses these hidden labours that those farmers perform as they are made to find their own channels for processing and marketing their farm outputs both within and outside their district. The farmers' meetings, seed campaigns, and the food festivals that they conduct also help them expand their consumer base and gain legitimacy - thus blurring the distinction between the campaign and their commercial interests. In this way, an attempt has been made to challenge the theoretical limiting of farmers to the production aspect of the agroecological discourse that, in actuality, encompasses a broad range of entities nospanning the production-distribution-consumption spectrum. A deeper look at the farmers' perception and practical enunciation of tradition and indigeneity is also carried out to critique both the works that assume that farmers of the global South inherit a knowledge system passed on smoothly through their respective traditions and the frameworks that reject the articulations of indigeneity and alterity altogether.

Social Protection of Vulnerable Children in South Africa: The Case of the Implementation of the Foster Child Grant Programme

International conventions and charters recognize the right to social protection for children. In South Africa social protection of vulnerable children is seen as especially important due to their exposure to various social ills such as poverty, child abuse, orphanhood. Social protection policies and legislation are in place to address these issues. South Africa offers a variety of social protection interventions for children, primarily in the form of social grants, including the Foster Child Grant, Child Support Grant, Child Support Grant Top-up, and Care Dependency Grant. This paper draws on a doctoral study which focussed on the impact of the Foster Child Grant (FCG) and the experiences of foster parents in accessing the Grant in South Africa. The study employed a qualitative methodology, gathering data through in-depth interviews with 40 foster parents from four different local municipalities. The study findings indicate that under conditions of poverty, the FCG is primarily used by foster parents for nutrition, schooling, clothes, medical expenses and burial insurance. However, despite these favourable impacts, challenges were identified by foster parents in accessing the FCG. Some of the challenges include the lack of information regarding the application procedures and eligibility criteria, lack of required application documents and long waiting periods for application approval. These challenges impact on the distribution and access of the grant. The recommendations of the study include the need to revise the Foster Care Grant programme's accessibility and distribution procedures to improve its reach and impact. Some of these revisions include improving the systems, structures and procedures that are in place to deliver the FCG programme.

MANIFET, CHRISTELLE* (UNIVERSITY OF TOULOUSE, France)

Higher Education Systems between Quality Assurance, Rankings, and Alienation to the Labour Market. What out-of-Ranking Higher Education Systems Can Teach Us?

This examines changes in university access in France between 2000 and 2010 through the lens of institutional sociology, which considers political, sectoral, and organizational dimensions. It aligns with the hypothesis of a decline in 'social institutions' while exploring what replaces them, focusing specifically on the evolving university institution.

Access to higher education is a significant social and political issue that has sparked debates and reforms globally. A sociological approach allows us to move beyond simplistic classifications of educational systems as elitist versus democratic or closed versus open. For instance, the American model, often regarded as elitist, incorporates compensatory mechanisms in its admissions policies that do not merely select but also prepare and support students. Similarly, the hierarchical organization of higher education no spans from elite universities to community colleges.

The French university system is known for its 'non-selective' admission rules. However, it experiences new challenges, such as selection by drop-out rates and a distinction between academically elite institutions and accessible universities. The introduction of authentic admissions policies in France since the 2000s reflects more complex dynamics than just a shift from democratic to neoliberal education ideologies. These policies are often justified by the need to combat university failure, provide individualized student support, and enhance public service delivery.

This study questions how these changes in policy occurred and what institutional conditions enabled them. By adopting a pragmatic approach that considers various interests, legislative frameworks, and administrative provisions, we aim to uncover the key institutional forces that have shaped the emergence of new admissions policies in France.

MANN, ALANA* (University of Tasmania, Australia)

Food Ethics and Practices of Care in the Uncanny Anthropocene

The future is messy but not without hope in the "uncanny" Anthropocene of the new materialists. In opposition to grand narratives that glide over situated differences, Tsing's (2015) "patchwork" of localities don't scale neatly into any discernible whole. Like Tsing, Esing (2022) invites us to look beyond the grand notion of the Anthropocene to see "what else is there". She argues that survival of all species on earth requires "renewed care and attention to the complexities of multispecies resurgence" and a "making space for the resurgent dynamics of natural ecologies" (2023).

This paper explores the potential of care ethics to inform the planning and development of value-based territorial food networks (VTFNs), contesting the *agrilogistics* (Morton 2016) or "dark uncanniness" of an Anthropocene - an earth 'sacrificed' to agriculture. It applies feminist political ecology and new materialism approaches in analyzing where and how care ethics contribute to the relational dynamics of VTFNs.

The concept of an ethics of care has its roots in feminist philosophy, dating back to Françoise d'Eaubonne's *Le féminisme ou la mort* (1974), and moral theory. It informs postcolonial and ecocritical thought including eco-feminist perspectives that emphasize relationships, responsiveness, and interdependencies. Practices of care intersect with what Thompson (2016) calls the overarching goal set of food ethics - the right conduct, social justice and sustainability. Following Puig de la Bellacasa (2017), this research reveals how care in VTFNs is relational and situated between multispecies, objects and emerging forces in a more-than-human world making and remaking itself. It demonstrates how affective, ongoing practices of care are generated in the agri-food entanglements we are pulled into by crisis in the Anthropocene.

MANN, ALANA* (University of Tasmania, Australia)

Speculating on Agri- Imaginaries with and through Digital Food

Food and agriculture have long been at the center of popular and scientific or 'expert' imaginaries of the future. In presenting alternative visions of desirable or undesirable worlds, agri-imaginaries investigate possibilities across all aspects and dimensions of production and consumption. In imagining alternative futures, we are able to critique and reimagine our current food system.

Meaningful engagement in imagining alternative futures is the goal of speculative design. Speculative design involves developing scenarios based on prototypes as a means to explore alternative present and future states by engaging people in critical reflection and facilitating public discussion (Barendregt & Vaage 2021). This paper theorizes how speculative design methodologies can be applied in building and debating food imaginaries that focus on digital food technologies and proposes a structure for operationalizing this process.

Digital food, simply defined as food-related digital engagement, has a significant role to play in achieving sustainable food futures across the domains of production, distribution, representation, and consumption. Digital agriculture is already integrating the key elements of food production with transformative impacts and digitalization is profoundly reconfiguring consumers' relationships with food, with new platforms emerging from already existing, multi-scalar webs of community resilience and sociality. During the Covid-19 pandemic many of these webs played a vital role in provisioning locked-down communities, from providing online deliveries meals to communities in need to reconfiguring disrupted supply chains for local needs.

Digital technology is only a means to an end, however, and technologies are not neutral or universally accessible. Nor do they necessarily invite wide participation in the governance of food systems. How might agri-food researchers employ speculative design to create the spaces, contexts and perceptual bridges (Dunne and Raby 2013) that invite a broad range of imaginative, even radical, perspectives on thinking and doing digital food?

Can Economic Development Steer Women's Empowerment in Rural Bangladesh?: A Feminist Perspective

This study explores the nexus between economic development and women's empowerment in rural areas in Bangladesh. The role of Non-Governmental Organizations (NGOs) in reducing poverty and empowering rural women through income-generating activities is well acknowledged. By creating income-generating opportunities, NGOs play a significant role in getting women involved in the decision-making process as well as in becoming confident, strong leaders. NGOs have success stories but all these stories do not have a consistent trend. Though NGOs have made considerable socio-economic changes, they have not paid attention to the deep-rooted patriarchal social structure that hinders women's status and empowerment process in rural society.

In this paper, the author revisits the same villages that she studied 22 years ago, to investigate if socio-economic development has impacted women's lives in any other way in the selected villages. Qualitative methods were employed for data collection, with the help of a set of guidelines, 15 case studies were constructed, using in-depth interviews and participant observation. Qualitative analysis was used to draw broad inferences with minimal use of statistical techniques. The revisit observed some significant changes such as the physical appearance of the villages (roads and buildings etc.), diversification of livelihoods, and migration of both men and women, which has changed the dynamics of household relationships. Feminist discourse has long argued that without the empowerment of women, real development is not possible. Despite this fact, feminist scholars critically argue that culture and religion portray an expectation of the ideal role of a 'good woman' in society. More importantly, discriminatory laws and violence against women proved to be a hegemonic masculine culture in Bangladesh. Hence, the author of this paper contends that in the context of globalization and women's empowerment -economic progress does not necessarily usher in women's agency in rural Bangladesh.

Boundaries of Compassion: Affective Dimensions of Refugee Solidarity in Germany and Britain

Times of crisis are times of contested solidarity: While solidarity with those affected by wars, environmental disasters or pandemics is called for, marginalised groups are also often scapegoated and excluded from practices of aid and solidarity. Against this background, our paper investigates boundary drawing as a key dimension of solidarity: What narratives are used to justify or reject calls for solidarity? How are symbolic boundaries (Lamont) used to include or exclude actors from the community of solidarity? And what role do emotions and affects play in the (de)legitimation of solidarity?

Based on a qualitative discourse analysis of the reception of refugees in German and English newspapers since the so-called refugee crisis in 2015, our paper examines the way boundaries are drawn in narratives of cohesion and solidarity. Based on our findings, we distinguish between hierarchical, identificatory and moral/affective dimensions of boundary work.

On the one hand, our findings suggest that similar struggles are taking place in England and Germany between more right-wing and left-wing interpretations of who deserves solidarity. On the other hand, an examination of the affective foundations of solidarity reveals notable differences between Germany and England in the valuation of 'compassion' as a basis for solidarity claims. While in England the role of 'compassion' is at the centre of struggles over solidarity, in German discourse empathy and compassion are problematised as legitimate foundations of solidarity and play a subordinate role.

Our paper reflects on these differences by examining their political, historical and philosophical background. We conclude with an interpretation of the role of compassion for practices of solidarity inspired by the works of Arendt, Adorno and Honneth.

Artificial Intelligence, an Intricate Part of the 4th Industrial Revolution – Motifs and Implications for Human Development?

This current decade witnessed an upsurge in scholarly research on the phenomenon dubbed the 4th Industrial Revolution (4IR). This was largely influenced by the claims of its advocates that the 4IR is bringing changes at the global scale never seen before and therefore that the world will never be the same. Such claims are no new to academic scholarship. Francis Fukuyama before wrote about the end of history and others wrote about globalisation as marking an end to fragmented world. Whether such claims are founded or not, the point is that they are made based on observation under the subject that has always captured the imagination and interest of social scientists i.e., seeking to understand and explain epochal changes in human history. Presently, we have seen a shift in this interest to artificial intelligence (AI). The question though is: just how new is this AI phenomenon? Closely linked to this is, what drives it and what implications does it have for human development in the long term? Is it likely to mark progress or the opposite of it? This paper examines the AI phenomenon through a critical review of evidence. The drive behind its rapid growth and its implications for human development, as understood through the United Nations Development Programme's index, are also examined.

Indigenous African Theoretical Concepts of Social Cohesion and Unity in Diversity in South Africa – an Exploratory Analysis.

While the concept 'social cohesion' is often used interchangeably with 'social solidarity' as articulated through Durkheim's theory of social change. These concepts refer to positive social relationships in society which give rise to social capital as a glue that binds people together. This is especially so culturally diverse societies where social cohesion binds people across the boundaries of diverse identities into a nation. Thus, any nation riddled with divisions, and which seeks to build a common coherent national identity, would find this concept appealing. South Africa is one such society where this concept enjoys high currency within the national discourse. The post-apartheid government has been working hard to overcome the historical racial and social divides by creating a nation united in its diversity. This however remains a challenge as it has not yet been achieved and therefore begs the question: how best can the achievement of this national imperative can be enhanced? With this question in mind, this paper explores the indigenous African theoretical concepts of social cohesion. This is done to not only showcase indigenous African concepts as contribution to the world's theoretical body of knowledge on social cohesion and nation building, but also to highlight the specific role these concepts can play in strategies meant to achieve social cohesion for a nation that is united in its diversity.

MARANGONI SANTOS, HUGO* (State University of Campinas - Unicamp, Brazil)

Analysing the Intersectional Dimensions of Emotional Experiences Among Black Educators in the Framework of Educational Work.

This paper aims to analyse emotions from sociological, historical, and geographical perspectives. It seeks to outline the analytical framework adopted for addressing and advancing reflections in these fields, as well as the points of convergence and tension between them, and how they shape the work experiences of Black teachers. The sociology of emotions, dating back to the 1970s, is oriented by an interest in how emotions are shaped by prevailing social structures and modes of production. This allows for a connection with the analytical categories of emotional labor proposed by Hochschild (1983) and the dynamics of differentiation and hierarchization that underlie the sexual division of labor (Kergoat, 1983), combined with intersectional dimensions (Crenshaw, 1985). History acknowledges gaps produced by historiography and identifies a redirection of its analytical lenses toward emotions, particularly through dialogue among some other social sciences, which seems to pave a new avenue for analytical production, namely emotionality (Stearns and Stearns, 1985). In this way, history appears to issue a kind of mea culpa, aiming to recalibrate its own investigative methods. Geography, in turn, reorganizes the debate around the experiences between space and emotions and the psychological effects produced by the interaction among individuals, nature, and social relations. It emphasizes the paths taken

toward understanding the mechanisms of belonging and non-belonging that operate in the production of territoriality and are deciphered in emotional experiences, which, non-arbitrarily, align with dimensions of class, race, and gender (Rodó-Zárate and Jorba, 2022). Thus, the study suggests a potential understanding of a possible sexual and racial division of emotions that would unevenly shape the work and spatial experiences of these educators.

The Influence of Adversarial Conduct in Legal Procedures on Women's Access to Justice: Female Experiences with Enemy Criminal Law Practices in the Turkish Judicial System

The concept of enemy behaviour towards women has a long history. In the historical period, this enmity appeared in different shapes. In ancient Greece, it was expressed by philosophers and poets humiliating women, while in the Middle Ages with trials were established and women were judged according to irrational reasons. Hostile attitudes developed against women in many areas of social life cause women to be excluded from social life and to hesitate to attend social life. Law is one of the fields where women face these prejudices. The masculine structuring within classical legal practices causes women to avoid accessing the justice. Both during the complaint and during the trial, women are confronted with misogynist attitudes and practices that prevent them from being a part of the justice system. In this study, the problem of women's access to justice has been analysed based on the reflections of misogyny in law. However, the hostility that prevents women from accessing the justice system is addressed according to the theory of enemy criminal law. In Turkey, it has been observed that women and males receive disparate treatment in courtrooms, resulting in a prevailing perception of impunity in cases involving crimes against women. Nonetheless, in instances where women are defendants, the judiciary adjudicates them with utmost severity. This condition has led women to lose faith in receiving equal treatment in court, resulting in their reluctance to seek access to justice. This scenario was studied through a gender-based study of enemy criminal law, as addressing such attitudes and activities just through the concept of enmity would not yield adequate legal knowledge. Within this framework, court documents were examined, and solicitors from several cities were interrogated. The influence of a gender-biased enemy criminal law culture on women's access to justice was demonstrated through field study.

Engaging Universities and High Schools in Disaster Preparedness: Bridging Teaching, Research and Extension Activities

The Sendai Framework for Disaster Risk Reduction (SFDRR) provides many recommendations about the importance of risk knowledge in guiding policies and actions to prevent and mitigate disaster risks and potentialize disaster preparedness. Particular references are made to involving diverse social groups, such as young people, in risk knowledge generation. However, implementing SFDRR recommendations is still challenging, especially in developing participatory methods in disaster preparedness that bridge the generations of children and youth, such as those in high schools and universities. This study discusses innovative methods of risk knowledge generation: i) participatory analysis of disaster risk creation processes, ii)

decolonial participatory mapping to enhance capacities, and ii) citizen science on risk perception and communication. The participatory analysis of disaster risk creation processes was based on adapting the Pressure and Release Framework to young people. Using Sao Luiz do Paraitinga, Brazil, as a case study, students used PAR to identify and discuss the root causes, dynamic pressures, and unsafe livelihoods that explain why disasters happen in the city. The decolonial participatory mapping was based on epistemologies provided by Global South scholars, especially those discussing territoriality and place attachment. Based on this innovative method, high school students mapped the potentialities of their neighborhood. Finally, the methods related to citizen science aimed to advance its debate on social science fields, bringing the topics of risk perception and communication to engage high school and undergraduate students. Using these three innovative methods, students identified why disasters happened, the people's perception of disaster risks and ways of communicating them, and discussed strategies for increasing their capacities to extreme events. The repertoire of methods can help enhance people's preparedness, especially students' skills, and abilities in managing data, information, and misinformation in emergencies, in communicating risks in social media during crises, and in co-producing contingency planning in the schools.

The 'Pictorial Form' As a Social Datum

The aim of this contribution is to show how painting, not only in its content aspect but above all in its formal aspect, constitutes a social 'datum' of great interest for scientific research. A 'datum' taken not as a numerical value, but as a conceptualisation of socio-historical experience realised in the form of an image.

We refer above all to the formal aspect of pictorial art because it is precisely in the formal constitution of the work and the pictorial space that a semantic field is defined that is capable of producing, enhancing and reflecting the constitution of political-social relations. A good example of this is the Renaissance perspective construction and its subsequent dissolution.

Housing Affordability and Segmentation in Urban Europe in the 21st Century

The 'dramatic' decline of housing affordability has been noted in many global and ordinary cities around the world in the past decades. And it is clear that house prices and household expenditures on housing have escalated faster than household incomes. The situation aggravated in the late 2000s in the aftermath of the Global Financial Crisis (GFC), and there are voices arguing that the COVID19 pandemic has even further increased the importance of the housing affordability issue. This presentation illustrates trends and variations in housing affordability, understood here as the housing expenditure-to-income ratio, and housing segmentation (housing ownership) in Athens, Berlin, Budapest, Helsinki, London, Madrid, Paris, Vienn, Warsaw, and Zurich in 2006-2022. This study relies on the micro-data from several rounds of the EU-SILC survey; for Warsaw, we used the results of the Household Budget Survey. In addition to a descriptive analysis portraying changes in housing affordability and segmentation in the ten selected cities in the first two decades of the 21st century, we also offer the results of regression models which illustrate the demographic, economic, and social disparities in housing burden and ownership patterns. Whereas the differences across cases in the share of owner-occupied housing are sensitive to the institutional/national context, the declining rate of homeownership has been a consistent trend since the mid-2000s. Even if it is hard to weave a universal narrative on the relationship between characteristics of households and differences in housing affordability, it seems that homeowners and higher income households enjoy a relatively low housing burden.

Digital Ecosystems and Sociocybernetic Dynamics in the AI-Driven Metaverse

The expansion of artificial intelligence (AI) systems and the emergence of the metaverse are reshaping our understanding of social structures, economic processes, and human interaction. This paper explores the complex interplay between AI, data capitalism, and the metaverse through the lens of sociocybernetics. We examine how these digital ecosystems transcend traditional territorial boundaries, creating new paradigms of power, control, and social organization.

Drawing upon sociocybernetics principles, we analyze the feedback loops and self-organizing processes that characterize the AI-driven metaverse. This approach allows us to uncover the dynamic relationships between human behavior, AI systems, and virtual environments, revealing how they collectively shape social norms, economic structures, and governance models beyond conventional geographic constraints.

In addition, this paper delves into the commodification of data within these digital ecosystems, investigating how AI-powered data capitalism perpetuates existing inequalities while simultaneously generating novel forms of digital stratification. We explore the ethical implications of these developments, focusing on issues such as digital surveillance, data privacy, and the potential for algorithmic bias in shaping social interactions and economic opportunities.

By applying sociocybernetics analysis, we provide a comprehensive framework for understanding the complex, interconnected nature of AI, the metaverse, and data capitalism. It concludes with a review of the challenges and opportunities posed by these technological advances, anticipating more nuanced debates on digital governance, digital justice and the future of coexistence between humans and artificial intelligence in virtual realms.

MARCELLO SERVOS, CHAIME* (Universidad de Zaragoza, Spain)

From the 'social Question' to the 'digital Question': Challenges of a Digitalized Planet.

As our world becomes increasingly digitised, we are witnessing a profound shift from the old 'social question' that dominated the discourse of the 19th and 20th centuries to a new 'digital question' that defines the 21st century. This paper explores how the growing influence of artificial intelligence (AI) and digital technologies is reshaping social structures, economic systems and human interactions on a global scale, giving rise to new forms of inequality and injustice.

Through a socio-cybernetic approach, we examine the complex feedback loops between human behaviours, digital technologies, AI systems and social structures that perpetuate and exacerbate existing social disparities while creating new forms of exclusion. We are experiencing a great transformation where computers and data have moved beyond the machines that powered the industrial revolution.

Today, the planet is conditioned by data capitalism. Unprecedented control over personal data and digital infrastructures by corporations and states reflects historical power imbalances. This paper shows some global patterns of digital injustice and identifies possible mitigation strategies.

It proposes a roadmap for addressing the 'digital question' of our time from a socio-cybernetic basis, seeking alternative, sociologically imaginative perspectives that envision possible future developments and solutions to the challenge of 'digital justice' as a response to the 'digital question', avoiding the pitfalls of past social challenges.

The Impact of Brexit on European Works Councils: Forms and Factors of Continuity and Change

European Works Councils (EWCs) provide employees with consultation and information rights in multinational companies (MNCs) operating in the European Union (EU). The decision of the United Kingdom (UK) to leave the EU

(Brexit) meant that UK subsidiaries in EU-based MNCs no longer fall under the scope of the European works council directive. As a result, UK-based EWCs are moved to other EU-countries. Management may eliminate UK members from EU-based EWCs. The directive's threshold conditions for the existence of an EWC may not be met anymore, resulting in their extinction.

This paper explores the question of how EWCs have been affected by Brexit and what strategies the various actors have developed to pursue their interests in keeping or disrupting a specific EWC. Using a qualitative case study design of some 60 company cases, we analyse how EWCs developed since Brexit. Interviews have been led with EWC and SE-Works Council members and managers from the UK, France, Germany, Belgium, Spain, Italy and Ireland. This data is complemented by data from trade unions, expert interviews and document analysis.

We focus on two sets of questions. First, we seek to analyse the characteristics of change in EWCs in specific companies: Which changes have occurred in EWCs regulatory frameworks, i.e. the company specific EWC agreements, formal structures and participation rights and how can those developments be categorized? In which aspects did an EWC remain stable or change after Brexit? To cover different types of change, we draw on institutional theory and develop a typology with four types of developments, i.e. stability, exclusion, limitation and innovation. Secondly, the study aims at explaining the changes observed: What are the key factors and mechanisms explaining the above-mentioned developments? How did the developments unfold in processes of bargaining between the actors involved (i.e. management, EWC, national representatives, trade unions)?

Predictors of e-Professional Behavior of Doctors of Medicine and Dental Medicine in Croatia on Social Networking Sites

E-professionalism refers to a form of professionalism that involves the implementation of the principles of "traditional" professionalism in online activities. The research, understanding, and monitoring of e-professionalism are of great interest not only to the healthcare professions but also to medical sociology and the sociology of professions. To achieve broader results and applicability of the findings to more than one healthcare profession, this study included two healthcare professions: doctors of medicine (MD) and doctors of dental medicine (DMD).

The aim of this study is to measure the e-professional behavior of MDs and DMDs in Croatia and to identify predictors influencing their e-professionalism.

The study was conducted on a purposive sample of MDs and DMDs in Croatia who were users of at least one social networking site (SNS). Data collection took place in 2021 through an online survey, yielding a total of 1,013 responses, of which 753 were from users of social networks. E-professionalism was measured using validated instruments based on a defined normative framework constructed from relevant sources.

The results show that a stronger acceptance of attitudes toward the ethical use of SNS in interactions with patients is the strongest predictor of unprofessional behavior on SNS, followed by the frequency of SNS access (those who access more often exhibit unprofessional behavior more frequently). In contrast, established predictors of the benefits of SNS, such as the potential for proactive posting of professional information of public health interest, show that the most important predictors are age and attitude toward SNS, with older doctors and those with positive attitudes engage in such activities more frequently. There were some differences between MDs and DMDs that support the existence of two types of professionalism: organizational and occupational.

MARIANETTI, MARTINA* (University of Palermo and University of Messina, Italy)

Climate Change and Mobility in the Small Island Developing States of the Pacific Ocean: How the Blue Economy Approach Can Help Boost Adaptation

Climate change significantly alters migration patterns, particularly in the Small Island Developing States (SIDS) of the Pacific Ocean, where environmental degradation threatens livelihoods and displaces communities. This paper explores the complex climate change-migration nexus, highlighting how traditional frameworks often overlook the multifaceted drivers behind mobility. While the term *environmental refugee* has gained traction in academic discourse, it remains contentious and fails to capture the socio-political intricacies influencing migration. By analyzing existing literature and case studies, we argue for a more nuanced understanding of climate-induced mobility that incorporates economic, cultural, and political factors.

We propose that the Blue Economy approach offers a viable pathway for adaptation, promoting sustainable use of ocean resources to enhance community resilience. This framework not only addresses immediate environmental challenges but also empowers local populations by integrating ecological sustainability with economic development. By advocating for policy solutions that recognize the interconnectedness of migration, climate change, and socio-economic conditions, this paper aims to contribute to the ongoing discourse on justice in the Anthropocene, emphasizing the need for equitable and inclusive interventions in the face of climate-induced displacement.

MARIN GUTIÉRREZ, DANIEL* (Universidad Pablo de Olavide, Argentina)

Aproximación Cuantitativa a La 'religión Vivida': El Caso Del Cofradierismo

Una de las características específicas del enfoque de la 'religión vivida' es la polisemia de significados que adquieren las creencias, rituales y verdades dogmáticas de cada sistema religioso en la adaptación que cada persona realiza para incorporarlas a su vida cotidiana. Esto hace que las metodologías para analizar la 'religión vivida' hayan estado restringidas al uso de técnicas cualitativas, especialmente, etnográficas. Sin embargo, se han advertido casos específicos que podrían ser tratado como singulares y que, de un modo u otro, fomentan esta forma de experiencia religiosa: el cofradierismo, como frame socio-religioso, promueve que las personas se integren en un sistema religioso de base católica, con un alto grado de institucionalización, aunque con la suficiente flexibilidad como para desarrollar su propia estructura de creencias, valores y opiniones. Si bien las hermandades y cofradías son asociaciones públicas de fieles y, por tanto, instituciones de la Iglesia católica que oficialmente comparten el mismo sistema religioso, el estudio cuantitativo de las creencias, valores y opiniones de las personas integradas en las hermandades demuestra que, generalizadamente, estas personas se alejan sustancialmente de las posiciones magisteriales y dogmáticas de la propia Iglesia. En esta ponencia se sostiene, por un lado, que dentro de sistemas religiosos aparentemente estructurados existen fenómenos que promueven experiencias de religión en la vida cotidiana y, por otro lado, que el uso de metodologías cuantitativas pueden producir inferencias significativas, aunque fuesen descriptivas, para evidenciar un determinado comportamiento homogéneo dentro de la 'religión vivida'. Los datos que se presentan corresponden a una encuesta realizada entre personas que pertenecen a hermandades en Sevilla (España), observando que mayoritariamente éstas se alejan de las opiniones de la Iglesia católica. Esta tendencia de homogenización abre la puerta a considerar a estos fenómenos singulares como sistemas religiosos propiamente constituidos o como meras desviaciones de un sistema religioso anterior.

MARÍN RAMOS, ESTHER* (University of Alicante, Spain)

El Conocimiento Como Ideología De Opresión o De Emancipación a Través Del Cine

El cine constituye una inspiración necesaria para la sociología especialmente ávida de alternativas en la sociedad poscolapso (Francescutti, 2004, 2011, 2022; Marín-Ramos, 2018a). Sin embargo, los abordajes más usuales que ha recibido desde nuestro campo lo reducen a una consideración epistemológicamente subordinada: como reflejo de la realidad (Kracauer, 1947), reproductor del orden dominante y sus desigualdades (Sorlin, 1977), como instrumento propagandístico o evasión alienante de las masas (Dorfman y Mattelart, 1972; Combs, 1993). Sus tratamientos más benévolos

se limitan al uso del cine como divulgador del conocimiento y ejemplo crítico de las falencias ya señaladas por las ciencias sociales (Subirats, 2012).

Pero nos resistimos a descubrir en los escenarios narrativos de la ficción audiovisual su potencial no ya para predecir ni solo para advertir del riesgo, sino para desplegar posibilidades y conocer alternativas a las ya conocidas. Esta investigación reconoce el valor del cine como agente de cambio social en sí mismo, a través del análisis cualitativo de las producciones de algunos de los cineastas más reconocidos en la actualidad. El análisis realizado arroja conclusiones ciertamente autorreferenciales, en las que el cine busca legitimarse a sí mismo como agente de transformación social y, al hacerlo, ofrece propuestas sobre una nueva ideología de emancipación para la que el conocimiento ya no es suficiente.

MARÍN-NANCO, BETZABETH* (Universidad Santo Tomás, Chile)

Empleo Público En Precario

- Dentro de la literatura sobre precariedad laboral, el sector público ha sido considerado un espacio de buenos empleos (Vives et al, 2021; Blanco y Julián, 2019; Favieri, 2016), incluso para las mujeres. Sin embargo, las transformaciones del trabajo han permeado las fronteras que han separado al sector privado del público, sumado a la instalación de la Nueva Gestión Pública que exige al Estado en tanto empleador actuar desde la eficiencia, privatizando o subcontratando al personal y externalizando la provisión de servicios básicos.
- En la ponencia se presentan algunos resultados derivados de la tesis doctoral de la autora, respecto a la medición de la precariedad laboral en el empleo que ofrecen las municipalidades de Chile. Para ello, se articulan datos cualitativos y cuantitativos, estos últimos derivados de una base de datos nacional construida por la autora. Como técnicas se utilizan el análisis de contenido, y el análisis de correspondencias múltiples con el análisis de clúster k-medias para construir una tipología de perfiles precarios.
- Entre los resultados, se identifica que las variables más relevantes son la ley de contratación, el sector de servicios y el lugar de trabajo. Los perfiles vinculados al funcionariado tradicional están feminizados, mientras que las nuevas formas de contratación tienden a estar ocupadas por hombres. En relación con las características territoriales e institucionales, las comunas donde hay mayor ruralidad, se concentra el funcionariado, mientras que en los urbanos la proporción se invierte. Así también los municipios con presupuestos más grandes concentran al personal en perfiles precarios regulados por estatutos no públicos.
- Con todo, se concluye que la precariedad laboral en el sector público chileno es multidimensional y se expresa como un mosaico de formas y grados, superando la visión dicotómica de precario/no precario, o de un continuum ascendente.

MARÍN-NANCO, BETZABETH* (Universidad Santo Tomás, Chile)

Gender Equality Indicators for Public Employment in Chile.

Data governance in the public sector remains a pending issue when measuring Gender Equality. The sexual division of labour is a phenomenon that also affects the State, which is usually required to be the guarantor of progress towards Decent Work and Gender Equality in the private and civil society sectors. However, less is known about what happens internally, especially in local governments.

The paper will show a proposal of Gender Equality indicators for employment in Chilean local governments, with special emphasis on those that allow observing horizontal segregation and vertical occupational segregation.

For this purpose, the database elaborated by the author in the framework of her doctoral thesis will be used, with secondary information sent by different governmental agencies. In addition, interviews with key actors in Chilean municipalism will be used.

The results will be divided into five indicators: access or entry to public employment, input, process, outcome, and impact (Buquet et al, 2010). Along with this, problems that cannot be seen with numerical data will be shown, so qualitative variables will be necessary.

The presentation will conclude with the identification of a basic system of municipal employment indicators with a gender perspective. Theoretically, this research seeks to show evidence of public employment in full transformation, ceasing to be an expression of secure and stable jobs, especially for women.

MARONI, MARTA* (Maastricht University, Netherlands)

The Data Governance Act and European Constitutional Imaginaries: Assessing the Environmental Impact of European Data Sovereignty

Data have gained ground as a metaphor for prosperity and innovation, promising to solve complex individual and societal problems, including environmental crises. The EU is pursuing an ambitious strategy of reorganising the European economy and society around big data. As part of its data governance strategy, the EU has enacted the Data Governance Act (DGA). This legislation establishes a horizontal regime to unlock the re-use of certain categories of protected data held by the public sector, sets up data intermediation services, and promotes services based on data altruism for the public good. The DGA echoes issues of solidarity and distribution, treating data as the great equaliser in today's surveillance-capitalistic society.

However, by combining sociotechnical and constitutional imaginaries, this paper argues that the idea of data as a source of powerful innovation also functions as a tool for the self-empowerment of the European constitutional project. The paper underlines how the European data governance strategy comes at the expense of environmental justice. To advance this argument, the paper particularly focuses on data centres. Data require physical infrastructure as they need to be stored and securely contained. Data centres, massive assemblages necessary to store, manage, and process data, are part of critical internet infrastructure. A constant power supply and cooling systems are imperative for protecting the operations of data centres, which are dependent on specific climate and geographical conditions.

This paper claims that, while the European data strategy attempts to foster greater redistribution, efficiency, and prosperity, the strategy remains inherently rooted in the capitalistic logic of extraction and accumulation, which dramatically contributes to the exploitation of environmental resources. This is an opportunity to rethink constitutional questions at the boundaries of law, technology and the environment.

Tourism Breaking Barriers: Connections between Industrial Tourism and Waterfront Regeneration in Naples (Italy)

The process of deindustrialization and subsequent tertiarization of urban economies has resulted in significant changes to the urban landscape in recent years. These transformations have resulted in the creation of unused spaces and structures that separate urban and marine areas, thereby disrupting the mutual interdependencies between them. In coastal cities, the ports have historically played a pivotal role, serving as significant industrial hubs at the local and international levels. Despite the gradual loss of their centrality, these structures retain significant architectural vestiges that serve to attest to their past significance and contribute to the formation of urban collective memory. In several cities, these vestiges of the industrial past have undergone functional reconversions and rehabilitation into sites that are the subject of industrial tourism. This trend, which has involved several port cities in recent decades, is characterized by the valorization and rediscovery of disused industrial areas.

The principal aim of this study is to examine the phenomenon of industrial tourism in port areas in the context of Southern Europe, with a particular focus on the city of Naples (Italy). In addition to hosting numerous examples of disused industrial heritage, Naples is confronted with discontinuous processes of waterfront redevelopment that are often incongruous with the urban characteristics of its city. The case studies were analyzed through a literature review, while the case of Naples was examined in greater depth through an ethnographic research approach. Preliminary results indicate that while several southern European cities have embraced industrial tourism through brownfield redevelopment, Naples has notably lacked this engagement. The city's neglect of its port heritage has prevented the revitalization of its historical connection to the sea, leaving significant opportunities for cultural and economic enhancement untapped.

MARQUARDT, FRANCA* (Scuola Normale Superiore, Florence, Italy, Germany)

Radical Hearts Exploring Affective Threads of Internationalist Feminist Movements in Spite of Systemic Violence

The PhD project explores different threads of affective relations within internationalist feminist social movements and to what extent this relates to a new form of intersectional, prefigurative practice of movement-building. As such, it interrogates how we can move from an isolated narrative of identities towards a political struggle, taking into account the complexities of interlocking systems of oppression. Internationalist feminist movements spearhead intersectional thinking as they centre revolutionary love, a more-than-romantic feeling of relation based on a common vision for liberation.

The Palestine solidarity movement is a poignant point of departure for studying solidarity and love in social movements, as these frames are deeply engrained in the Palestinian struggle. Recent efforts to provide a feminist perspective in these protests and building trans-territorial and intersectional coalitions have contributed to establishing the movement as a cornerstone of liberatory organising. At the same time, the movement, especially in Germany, is exposed to increasing state and police violence which relates to the specific historical context as well as a general authoritarian turn in global politics. Correspondingly, the fieldwork will focus on how internationalist feminist movements in Berlin, Germany engage in love and solidarity despite violence and how this creates a new form of affective organising.

In this context, the thesis advocates for a deeper understanding of affective ties in social movements as transformative tools against systemic violence and capitalist alienation. Through long-term ethnographic fieldwork and participatory methods, the project looks at the possibilities and challenges of building affective bonds within and across movements. Here, emotions between activists and their networks build the groundwork for exploring the larger process of building an international feminist movement for liberation from imperialism and capitalism.

MARQUES, EDUARDO* (University of São Paulo, Brazil)

The Politics of Incremental Progressivism: Governments, Governances and Urban Policy Changes in São Paulo

Large metropolises of the Global South are usually portrayed as ungovernable site of clientelism and patronage, or as cradles of civic action and social participation. They are neither. Or maybe they are both, but also many other things simultaneously. The book *The Politics of Incremental Progressivism: Governments, Governances and Urban Policy Changes in São Paulo* challenges these views by suggesting a more nuanced and grounded interpretation. By comparing the trajectories of 31 redistributive urban programs in eight policy sectors studied in detail with process tracing analysis, the book shows the recent occurrence of a slow and contentious, but clear incremental process of progressive policy change. The comparison between programs and sectors shows the existence of two types of policy trajectories - of gradual incorporation in the agenda and of oscillation. The triggers to these trajectories involve a mixture of partisan politics, median voter behavior and elements of the policy process, such as its multilayer governance, and mainly the multiple connections between state institutions and civil society organizations within policy sectors. The book constructs conceptual bridges between political science and urban studies to explain progressive policy change, mobilizing processes and mechanisms associated with both urban politics and policies. The analysis contributes to the understanding of how cities are governed, what kind of policies their governments construct and deliver and, more importantly, under what conditions they produce policy changes that can reduce their striking social and urban inequalities.

MARQUES, EDUARDO* (University of São Paulo, Brazil)

The Trajectory of Urban Precarity in São Paulo, between Policies, Crisis and Inertia

Precarious urban areas are among the main social and environmental problems in cities in the Global South. As is widely known, Brazilian cities house a large stock of precarity in favelas and irregular settlements. At same time, the country experienced an important expansion of progressive policies towards these areas since the return to democracy in the late 80s. These policies were formulated and disseminated locally in the 90s and reached the federal government later in several progressive administrations. At the same time, recent years brought one intense economic crisis, the Covid pandemic

and a very conservative federal administration, before the recent return to the precious political trajectory.

This article explores the net effect of this trajectory over the urban and social conditions of precarious areas in São Paulo, the largest and most important city in the country. Exploring recently released data from the 2022 data, the article investigates comparatively the social and urban features of precarious areas today with the two previous decades the new millennium.

Preferences Regarding Social Justice in Argentina and Spain: A Comparative Analysis of Stratification Factors and Perception of Inequality.

The aim of this paper is to carry out a comparative study between Argentina and Spain on preferences for social justice, mainly regarding income redistribution. To this end, the weight of certain objective and subjective stratification factors (social class, educational level, income) on these dispositions regarding inequality will be analysed. At the same time, as mediating factors in this relationship that can explain the social mechanisms involved, the role played by some dimensions of inequality perceived by people will be analysed (Gimpelson and Treisman, 2018). We will focus on observing the effect of subjective social mobility, as a proxy indicator of relative deprivation, and of the perception of social inequality.

The Vicious and Virtuous Circle of Inequality: A Comparison of Social Mobility between Latin American and European Countries

This study examines the structural and relative dimensions of intergenerational social mobility across ten countries, encompassing five from Latin America and five from Europe, through the application of an innovative measurement approach. Using the Mutual Information Index, we provide a nuanced analysis that simultaneously captures and distinguishes between the structural and relative effects in social mobility patterns. Two main hypotheses guide our research. The first posits that nations with late industrialization processes, exemplified by the Latin American countries in our sample, exhibit reduced social fluidity compared to their early-industrialized counterparts. We anticipate that countries with intermediate industrialization timelines, such as Italy and Spain, will display characteristics more closely aligned with late-industrialized nations. Our findings largely support this hypothesis, although Italy's behavior deviates somewhat, showing greater similarity with early-industrialized countries.

The second hypothesis proposes that early-industrialized nations show a reduction in inequality gaps relative to late-industrialized countries when assessed through the M Index, particularly with regard to the marginal effect. Contrary to our expectations, this hypothesis is not supported. Instead, we observe an inverse relationship: in Latin American countries, the marginal effect amplifies inequality, while in European nations, it mitigates class barriers. The application of the Mutual Information Index reveals a mechanism that elucidates the "vicious circle" prevalent in late-industrialized nations and the "virtuous circle" characteristic of early-industrialized countries.

This research highlights the methodological advantages of incorporating both structural and relative dimensions in social mobility analyses, complementing traditional approaches that primarily focus on relative mobility. Our findings contribute to the broader discourse on comparative social mobility, offering insights into the complex interplay between industrialization timelines and social fluidity in diverse national contexts. This study not only advances our understanding of intergenerational mobility patterns but also underscores the importance of multifaceted analytical approaches to capture the nuanced dynamics of social stratification.

MARSHOOD, HALA* (University of Manchester, United Kingdom)

The 2021 Dignity Uprising in Palestine: New Developments in Class Formation, Settler-Colonialism, and Resistance in 48 Palestine

My research focuses on the 2021 Dignity Uprising in Palestine that is considered a highly significant moment in the recent history of Palestinian struggle. Through 34 interviews with participants and organisers of the uprising from 48 Palestine (Palestinians with Israeli citizenship), I am exploring the features and impact of changing class formations in this settler-colonial situation, attentive to how the uprising included wide engagement of marginalised youth, as well as the distance the uprising opened from traditional Palestinian political elites and structures. I also explore the emerging de-colonial and emancipatory views of the participants during and since the uprising.

Through this research I examine how the break from elite Palestinian mainstream structures, as well as the wide engagement of segments of the Palestinians proletariat, which I explore through the concept of 'surplus populations', was reflected in the tactics of resistance that defragmented the map of Palestine organically and from below and gave a moment of hope and a sense of momentary liberation. This will represent an archive of strategies of political mobilisation, as well as an identification of the uprising's qualities\ tactics\imaginaries\motivations and how they break from older structures of Palestinian struggle.

My fieldwork occurred during the major events that happened in Palestine on the 7th October and the ongoing genocide in Gaza, and this has informed my research in ways that I am developing. However, the research includes a reflection on the current situation from the point of view my participants, bringing to the focus ideas around solidarity, belonging and re-fragmentation, as well as the further distancing of younger generations from Palestinian political elites in 48 Palestine (with a similar reflection on the West Bank) instigated by the the events of October 07 and what followed.

MARTI, LUNTUMBUE* (Université Libre de Bruxelles, Belgium)

La Fabrique d'Un Anticolonialisme d'Etat. La Mise à Distance Du Passé Colonial Dans La Politique Étrangère Belge (1990-2002)

En 2002, le ministre belge des Affaires étrangères reconnaît la « **responsabilité morale** » de la Belgique dans l'**assassinat de Patrice Lumumba** et présente, au nom du gouvernement, des **excuses officielles** à la République Démocratique du Congo. La coalition libérale au pouvoir – engagée dans une double stratégie de **mise à distance du passé colonial** et de **modernisation de sa diplomatie** à l'égard des pays d'Afrique centrale – a décidé deux ans plus tôt de mettre en place une commission d'enquête parlementaire chargée d'étudier ce crime fameux de l'histoire postcoloniale belgo-congolaise, afin de favoriser un rapprochement avec le nouveau président du pays, Laurent-Désiré Kabila. Cet acte de reconnaissance est l'aboutissement d'un double processus de fond qui anime le champ du pouvoir belge depuis plus d'une décennie : (1) la préoccupation croissante de **contourner les accusations de néocolonialisme** afin de préserver des liens économiques et politiques privilégiés avec la RDC, le Rwanda et le Burundi, ses anciennes colonies ; (2) une « **intégration** logique et morale », paradoxale et problématique à bien des égards, **de la critique anticolonialiste par les élites** politiques et administratives belges.

Sur base d'entretiens et d'archives inédites du parti libéral belge couvrant la décennie 1990 – un parti historiquement proche des milieux d'affaires, et, à ce titre, particulièrement investi dans ce travail de préservation de ces relations postcoloniales – cette intervention voudrait retracer la sociogenèse de cette mutation du discours diplomatique belge à l'endroit des pays d'Afrique centrale et le rôle décisif joué par ce parti dans la fabrique de ce nouveau discours d'Etat. On tentera notamment de montrer comment ce **néocolonialisme progressiste**, ou cet **anticolonialisme d'Etat**, relève à la fois d'une forme spécifique « **d'ignorance blanche** » et d'une appréhension cynique et ordinaire de la **compétition géopolitique**.

MARTICORENA, CLARA* (CEIL-CONICET/UBA, Argentina)

La Clase Trabajadora Frente Al Proyecto Refundacional De Milei. Un Análisis De Las Condiciones De Posibilidad De Emergencia De La Extrema Derecha En Argentina.

El presente artículo sostiene que el ascenso de la extrema derecha en Argentina expresa un cierre del ciclo abierto con la crisis del 2001. La insurrección popular a comienzos del siglo XXI, expresó y configuró un punto de inflexión en la correlación de fuerzas sociales, abriendo una etapa donde la clase trabajadora, aunque sin capacidad de plantear una salida autónoma a la crisis económica, social y política del neoliberalismo, condicionó la restauración de la dominación y acumulación capitalista posterior. Entre los procesos sociales que explican el ascenso de la extrema derecha en Argentina, cabe destacar un largo proceso de estancamiento económico, sobre el cual se desplegaron los efectos de desmovilización y desorganización de la clase trabajadora durante la pandemia, y de una crisis política profundizada por el fracaso de las últimas dos coaliciones electorales de la burguesía, el gobierno de Cambiemos, y el gobierno del Frente de Todos.

El objetivo de este trabajo es indagar en las condiciones de posibilidad del avance de la extrema derecha considerando los cambios en el poder de clase en las últimas décadas. Para ello, recuperamos el análisis propuesto por Gramsci para el análisis de las relaciones de fuerza, centrándonos en los cambios en la disposición de fuerzas objetivas y en la disposición de fuerzas políticas. Abordaremos, por un lado, distintas fuentes que permiten caracterizar el mercado de trabajo y los cambios en la composición de la clase trabajadora, y por otro, diversos indicadores que permiten abordar el nivel económico-corporativo de las relaciones de fuerza (Evolución salarial, Conflictividad laboral, afiliación sindical, negociación colectiva, legislación laboral). A partir del análisis propuesto, buscamos inscribir el reciente ascenso de la extrema derecha en clave de la articulación de procesos de movilización-desmovilización y (re)organización-desorganización de la clase trabajadora en la Argentina reciente.

Creators of Law? Disciplinary Measures and Police Officers in Crime Novels, Cinema and TV Series

This speech focuses on the disciplinary measures applied to police officers in crime novels, cinema and TV series. Such measures are represented as narrative devices that show an anti-hero in conflict with society. From the point of view of the plot, the character takes on almost subversive connotations, positioning himself towards society as a potential creator of law. The reasons why this legal creation is not realized are examined. Officers' behavior rather indicates the critical potential of the detective genre, which departs from the perspective of amusement to offer insights into the relationship between the ethics of principles and responsibilities. The adoption of disciplinary measures offers the image of a legal system that seeks to stabilize social tensions. The officers' reinstatement into service is the culmination of a narrative plot and a reflexive mechanism that the law develops in order to redefine its boundaries by accepting a certain degree of discretion by the officer subjected to disciplinary measures.

Blurred Lines: Impact of Digital Technology in Child Sex Trafficking and Online Child Sexual Exploitation - Critical Issues for Practice and Research

Historically, child sex trafficking (CST) and online child sexual exploitation (OCSE) have been seen as distinct crimes requiring different research, different practitioners, and different responses. Both are global issues with lasting effects on children, families, communities; yet responses typically fail to comprehensively address multi-level factors contributing to their exponential growth. Experts including those with lived experience, note that the increasing role of technology has blurred the distinction between groups of victims: in the past, CST victims were not typically also victims of OCSE. New methods of luring, tracking, selling, abusing and exploiting children are almost always facilitated by technology and perpetrators are increasingly able to commit these crimes from a distance and continuously adapt and diversify their methods, especially as technology rapidly evolves. Perpetrators seek child victims both to exploit a very high demand for sex with children and because younger victims are easier to manipulate and control. In Canada, individuals at greatest risk of CST and OCSE include children, particularly young girls, and members of vulnerable or marginalized groups such as:

Indigenous and Black girls; migrants and new immigrants; 2SLGBTQ+ youth; children with cognitive disabilities; children in the child welfare system; street-involved youth; and those who are socially or economically disadvantaged. The way forward requires improved responses to CST & OCSE, and increased access for all youth regardless of race, sexual and gender identity, class/socio-economic status, and ability, as well as policy development that supports improved and equitable access to services. A cross-sectoral, international, and multidisciplinary response is critically needed if we are going to even begin to reduce these crimes, protect potential victims, and help those who have been directly impacted already. In this presentation, two new programs in CST and OCSE - an international executive leadership program and an international graduate degree program - will be discussed.

Systems Theory Perspectives on Social Digitalisation and Techniques of Affection

In recent years, major proponents of systems theory have developed an update of their theoretical-analytical apparatus to address the pressing questions of the rise of digital techniques and technologies in contemporary society. Whereas one influential offer (D. Baecker) emphasizes the escalating importance of possibilities and compulsions to *networking* in the (digital) next society, another (A. Nassehi) advocates a sociology of knowledge that focusses on the role of *pattern recognition* with the help and constraints of digital techniques. While these positions propose different diagnoses concerning the (r)evolutionary effects, i.e. the very novelty of digitalisation for the structure of modern society, they nevertheless both stress (a) the need to deepen the sociological conceptualization of *social digitalisation beyond* phenomena of merely technological transformations, thereby inviting a reluctant sociology to (b) reflect on processes of digitalisation as problems of *observation*, i.e. as problems for the conceptual and analytical distinctions and tools that can adequately address social digitalisation.

This paper will address systems theory approaches as helpful supplements, but also as challenges for the theory of Social Digitalisation (Kornelia Hahn). It will focus on new and changing *techniques of affections* brought about by social digitalisation (and accompanying technological reconfigurations) – as questions for empirical research as well as challenges for social theory and the suitable terminology sociology has as yet to develop.

Tecnologías, Cuidado y Emociones En La Alimentación

Comer, además de una necesidad básica humana de nutrición, es también una de las formas de ser parte del mundo y de relacionarnos con el entorno. Cuando las personas, en determinadas situaciones, no pueden proporcionarse a sí mismas el alimento que precisan, ser alimentadas es una forma de cuidado que otras personas pueden y deben realizar por ellas. En tales circunstancias, comer y dar de comer pueden convertirse en actos mecánicos, repetitivos, desprovistos de las emociones, significados y vivencias propios de las actividades que nos hacen desarrollar vínculos con el mundo, que nos hacen sentirnos parte de él. Realizadas de modo negligente, dar y recibir alimento pueden devenir prácticas que ponen en riesgo, tanto la atención a la salud y el bienestar, como el respeto a la dignidad de las personas. Hay relaciones de poder que se expresan en pequeños gestos: una cucharada introducida en la boca a la fuerza, el resto que cae y ensucia,...

Se producen así diversas tensiones entre cuidar y descuidar en torno a la alimentación y el comer. Estar o no atentos a cómo se produce el ensamblaje entre las modulaciones de la necesidad (apetito, hambre, des gana), las prácticas (servir el plato, ayudar a ingerir alimento), las respuestas (cómo se traga la comida, o se saborea lentamente) y los objetos y cuerpos que forman parte de todo el entramado, marca la sutil frontera entre cuidado y descuido. Nuestra investigación busca explorar, por eso, las tecnologías destinadas a facilitar el comer y dar de comer, un cuidado no solo físico, sino también emocional y moral, pues su materialidad está marcada por aspectos éticos, en tanto actividades que hacen mundo cada día.

Interrogamos, pues, las múltiples relaciones que se establecen, en la trama de los cuidados, entre alimentos, objetos y personas, así como las relacionalidades que vehiculan.

MARTÍN RÍOS, ANA* (University of Málaga, Spain)

Reconstructing Grief: The Role of Support Groups in Suicide Bereavement

This study explores the experience of bereavement due to suicide in the context of the growing privatization of death in contemporary societies, which has made the socialization of grief more challenging. The primary objective is to understand how suicide bereavement is experienced from a sociological perspective, through the accounts of individuals who have participated in mutual support groups organized by an association in Málaga, Spain.

The methodology employed was qualitative, involving semi-structured interviews with people who had lost loved ones to suicide. The interviews addressed topics such as the social and familiar support received, the stigma attached to suicide, and emotions like: shame, guilt, and failure. A significant finding is that parents, particularly those whose children have died by suicide, often experience intense feelings of guilt or failure due to their perceived role as protectors.

Preliminary results indicate that social stigma surrounding suicide complicates the grieving process, leading to the isolation of bereaved individuals, as social discomfort often results in inadequate support. Interviewees noted that society tends to avoid discussing suicide, which exacerbates their emotional distress.

Conversely, specialized mutual support groups for suicide bereavement play a crucial role in the emotional reconstruction of the bereaved. These groups offer a stigma-free environment where participants can express their feelings and rebuild their social identity. They act as substitutes for traditional mourning rituals, which once provided communal support.

In conclusion, this study highlights the importance of support groups in managing suicide bereavement by providing spaces for emotional release and the rebuilding of social networks—an aspect that postmodern society has largely lost. Further research into these phenomena is recommended to enhance the support mechanisms available to those grieving a suicide.

TG12-992.3MARTINELLI, MONICA* (Università Cattolica Milano, Italy)
LAMPUGNANI, DAVIDE (Università Cattolica del Sacro Cuore, Italy)*The Role of Breaking Events and Feelings in the Generation of Solidarity*

The presentation aims to focus the link between turning points in individual biographies and social change focusing on the role played especially by compassion and empathy. We aim at investigating how biographical specific rupture events can lead to specific forms of social solidarity enabling sustainable, supportive social bonds generating new possibilities in people involved in them. To this end, we build a theoretical framework that integrates the perspectives of M. De Certeau concept of "founding ruptures" and the G. Simmel "sociology of sense impression". The theoretical framework of De Certeau theory of "founding ruptures" allows us to identify the process and specific conditions that can lead an individual from a biographical turning point to social forms of solidarity in which compassion and empathy build responsible and free social bonds, able to change not only the own personal life but also the social context. Simmel's analysis of sensitivity in the interaction space suggests the important role of our sense impression that brings about feelings in us becoming a bridge over which we feel the human condition in a deeper way. The mutual perception that takes place from the senses is the site where emotional experiences (feelings) and meaning attribution (knowledge) to the other and the human condition generate not only an unexpected subjective resonance or biographical change but also reciprocal actions and relationships having relevant social effects. We consider a set of life stories marked by biographical 'founding ruptures', showing that this shift was facilitated, above all, by unexpected encounters with human fragility and a living compassion and empathy. The stories were collected during an exploratory and qualitative research project and relate to founders or members of organizations, associations, or communities operating 'on the borders' of the rationalized, technically developed contemporary social reality.

Bridging Faith and Health: Religious Diversity and Sexual and Reproductive Rights in Catalonia

This presentation explores the intersection of religious diversity and the management of sexual and reproductive health (SRH) within Catalonia. Specifically, it aims to bridge two fields often studied separately: the management of religious diversity and the governance of sexual and reproductive rights. The concept of SRH has been central to global development policies since the late 1940s, with international bodies such as the UN and WHO playing a pivotal role in its advancement. At a national level, in Spain SRH gained formal recognition in 2010 with the introduction of national legislation that expanded rights, promoted sexual education, and included SRH in health science curricula while emphasizing the training of professionals in this field.

Simultaneously, Catalonia has experienced significant diversification in its religious landscape. For instance, according to the latest data from the Map of Religions elaborated by the General Directorate of Religious Affairs (body of the Generalitat de Catalunya), the region now hosts 7,291 places of worship representing 15 different faith traditions. In response, institutions have developed strategies to actively manage religious diversity, offering training programs to enhance understanding in areas such as healthcare, where religion can play a key role in shaping beliefs and practices.

Drawing on policy documents analysis and interviews with experts in both fields, this presentation will highlight the key debates and challenges surrounding the integration of religious diversity into policies on sexual and reproductive rights, with a particular focus on the use of assisted reproduction techniques (ART).

Homilías Desde El Límite. Adam Kotas y La Inmigración Latina En Las Vegas, EUA

El padre Adam Kotas, de origen polaco, es todo un nuevo *influencer* por determinados momentos de su apostolado. La pandemia de COVID-19 permitió y facilitó difundir mensajes por medio de las redes sociales a través del video, ayudó a darle visibilidad a su estilo de predicar, pero no han sido esos los únicos factores que lo hicieron "viral" en las redes. Quizá menos visible, ha resultado el hecho de que, a fines de 2021, Kotas dejara la Iglesia Católica con sede en Roma y se uniera a la Iglesia Católica Nacional Polaca, institución creada en el siglo XIX como reacción a la falta de atención de la iglesia de Roma a las congregaciones de inmigrantes polacos en Estados Unidos. Adam Kotas ha asumido la bandera de defensa de los migrantes latinos, en especial los mexicanos, en su congregación ubicada en Las Vegas, Nevada, añadiendo más elementos a su figura polémica: predicar en "la ciudad del Pecado", una ciudad asociada a las apuestas y a la prostitución y de la que no salió a pesar de dejar la iglesia de Roma. El registro del lenguaje (rural, popular) y los giros de un lenguaje en doble sentido que utiliza en sus homilías, han generado popularidad y a la vez controversia en torno a su imagen. Estas circunstancias que dificultan la secuencia y la predica de los rasgos de esta figura del Padre viral Adam Kotas entabla una serie de nuevos retos y con ellos nuevos enfoques metodológicos para el análisis sobre el impacto que sus homilías tienen en el creer y el actuar de la feligresía latina que se encuentra dentro y fuera de Estados Unidos. Sobre estos nuevos retos metodológico aquí presentamos.

SOTO SANCHEZ, ALMA PATRICIA* (CONAHCYT-CIESAS PS, Mexico)

Construcción De Alternativas Para El Acceso, Uso y Apropiación De Tic Por Jóvenes Indígenas Universitarios En Oaxaca, México.

Las TIC son un elemento de la sociedad actual, presentes en la salud, la educación, las finanzas y el gobierno, con impactos en el mercado, finanzas y en los hogares (Clercq et al., 2023). De acuerdo con los Objetivos de Desarrollo Sostenible, es necesario promover la inversión en tecnologías para el empoderamiento de las comunidades para lograr el objetivo 9. Construir infraestructuras resilientes, promover la industrialización sostenible y fomentar la innovación (Naciones Unidas, 2015).

Estudios de Bartikowski et al. (2018) y Alva de la Selva (2015) sugieren que no todos los individuos se apropian de las tecnologías digitales, que en consecuencia genera la brecha digital, asociada con factores económicos, sociales, educativos y normas socioculturales. Por otro lado, existen en distintas latitudes proyectos de medios comunitarios, como radio, intranet, telefonía, que se desde la apropiación de estas tecnologías, producen y difunden contenidos, transmitiendo voces y proyectos, al tiempo que son utilizados como herramientas para la defensa de los territorios (Barrón, 2019; Huerta, 2021; Srinivasan, 2007)

Con respecto a la brecha digital en la educación, Lloyd (2020) señala la falta de infraestructura tecnológica, escasos programas de alfabetización digital y la carencia de dispositivos. La misma autora señala que, en 2018 el 55% de los estudiantes a escala nacional no contaba con internet ni computadora en casa, pero la cifra aumentaba para las zonas rurales e indígenas.

En ese sentido, el objetivo consiste en analizar cómo la brecha digital afecta el proceso de educación de jóvenes indígenas, y los procesos en que distintas comunidades enfrentan esto, a través de la generación y apropiación de tecnologías (internet y radio) para la comunicación comunitaria y la educación superior. La metodología consiste en un análisis cuantitativo y cualitativo, utilizando información del INEGI y la aplicación de entrevistas semiestructuradas a estudiantes del ISIA y la Unixhidza.

SÁNCHEZ-ANCOCHEA, DIEGO SÁNCHEZ-ANCOCHEA (University of Oxford, United Kingdom)

Autocrats Prefer Carrots over Sticks, Too: The Cases of El Salvador and Nicaragua

How does social policy differ under electoral autocracies compared to electoral democracies? While the existing political economy literature has focused on autocrats' motivations for providing public goods, it has paid less attention to within-country comparisons. The latter provides an ideal research design to isolate the role played by political regimes while an array of other factors is kept constant. More research can also be done considering the varieties of responses to social policy under authoritarian contexts in countries with an exclusionary social policy legacy.

Our research draws on two comparisons that speak to the voids mentioned above. First, we examine President Bukele's electoral authoritarian government in El Salvador against the preceding eight years of electoral democracy. Second, we compare social policy in two electoral autocracies: Bukele's El Salvador and Ortega's longer-standing regime in Nicaragua.

In El Salvador, excluding the impact of the pandemic, Bukele has given social policy less priority than previous administrations. Moreover, decision-making has been more unpredictable, opaque, and volatile under autocratic rule, in contrast to preceding governments under which checks and balances were more robust. In this regard, Bukele's administration resembles other populist regimes, regardless of whether they function under electoral democracies or autocracies—similar to Mexico's López Obrador and Brazil's Bolsonaro (Borges, 2023).

The comparison between El Salvador and Nicaragua reveals that authoritarian governments use social policies to maintain legitimacy when fiscal resources are available and abundant. However, in the absence or presence of limited resources, the lack of institutional checks makes social policy an easy target for cutbacks. This is evident in Nicaragua's social policy retrenchment following the depletion of Venezuelan aid in 2017 and the cuts of overall social spending imposed by El Salvador's growing debt following high public spending during the COVID-19 pandemic.

MARTINEZ FRANZONI, JULIANA* (University of Costa Rica, Costa Rica)

The Social Policy Agenda in the Global South: 25 Years of Limited Expansion

What has been the trajectory of ideas regarding social policy over the past 25 years? The evolution of policy ideas has been shaped by global challenges, with expanded social protection becoming central in debates. The need for state-led solutions has intensified in recent years in response to mounting inequality, automation, humanitarian crises, and the transition to greener economies. Crises such as the 2008 financial crash and COVID-19 temporarily amplified discussions around transformative ideas like universal basic income (UBI) and universal healthcare. However, these debates often receded as immediate threats were managed, reflecting the transitory nature of such radical policy debates.

Before these crises, the global social policy agenda shifted significantly. A breakthrough came with the focus on gender and intersectionality, driven by feminist economics. These ideas reshaped the global discourse, highlighting the unequal burden of unpaid care work, particularly for women. This intellectual shift spurred the development of integrated care systems in Latin America, bringing gender disparities to the forefront of policy.

The Sustainable Development Goals (SDGs), adopted in 2015, further accelerated this evolution. The SDGs solidified a broader vision of social protection, emphasizing decent work, gender equality, and reduced inequalities within a rights-based framework. International organizations like the UN, ILO, and WHO played vital roles in institutionalizing these ideas and setting global standards.

Looking back, social policy ideas responded to the failures of market-driven reforms of the 1990s. These reforms, which emphasized deregulation and privatization, deepened inequality and vulnerability, prompting the shift toward poverty reduction in the Millennium Development Goals (MDGs) of 2000. These ideas laid the foundation for today's social policy agenda, which is way more ambitious than 25 years ago. Then and now, to redress the recurrent underplay of political economy factors might be one of the main challenges ahead.

MARTÍNEZ GARCIA, JOSÉ SATURNINO* (Universidad de La Laguna, Spain)

GIOVINE, MANUEL* (National University of Córdoba, Argentina)

Educational Inequalities and Conceptions of Justice. Indicators for Their Measurement

The way we think about justice, equity and education are not independent of the way we construct and interpret the indicators that emerge from international assessment exercises. Perhaps no operation has as much impact on mass media and public opinion today as the Programme for International Student Assessment (PISA) report. However, readings of the results of the indicators can sometimes be confusing or even contradictory.

The aim of this communication is to analyse the way in which theories of distributive justice, and in particular those dealing with equity in education, are linked to the way in which the statistical data that can be obtained from international education assessment operations are processed and informed in indicators.

The conception of equity according to a philosophical model of understanding social order establishes a criterion for considering under what conditions an observed inequality can be considered fair or not.

This is a highly topical and relevant issue given that these indicators are used by educators, politicians and communicators in order to assess the current state of education in different countries and, consequently, affect the design, implementation and evaluation of national and regional education policies that seek to improve these indicators. Utilitarians and libertarians will not use the same indicators. Neither will libertarian liberals and egalitarians. Much less Marxists. An example is given for Spain using PISA data.

MARTÍNEZ JOYA, LUCÍA* (Universidad de Almería, Spain)

SÁNCHEZ ESPINOSA, JOAQUÍN JAIME (Universidad de Almería, Spain)

El Discurso De Odio Online: Percepciones Sobre El Ciberacoso Desde Una Perspectiva De Género

La presente comunicación versa sobre datos obtenidos en el marco del proyecto de investigación PID-2021-1271130D-I00 durante el año académico 2023/24 en distintos centros de la provincia de Almería. Dicho proyecto se encuentra focalizado en los discursos de odio y la radicalización violenta tanto dentro de las redes sociales y nuevas tecnologías como fuera de las mismas. A tal efecto, la investigación ha permitido conocer las reacciones de los menores de los centros de secundaria, formación profesional y bachillerato frente a los discursos de odio tanto fuera como dentro de las redes sociales. Durante dicha labor de investigación se contó con una muestra total de 571 menores.

Al interior de esta muestra, se hallan un total de 261 hombres, 263 mujeres y 19 personas no binarias. Además de poseer una gran diversidad cultural y étnica, el hecho de que gran parte de la muestra pertenezca a la parte de la población almeriense descendiente de personas migrantes, captura la realidad multicultural de la sociedad almeriense.

Por otro lado, la investigación ha permitido comprender la percepción que comparten los jóvenes sobre la ciberviolencia y cómo ésta ha sido percibida o si ha causado perjuicios psicológicos o sociales en jóvenes, indistintamente de su género.

El método seleccionado para dicha investigación ha sido cuantitativo. En cuanto a la técnica, se ha usado la encuesta. Para la explotación y su consiguiente análisis de datos, se ha utilizado el software estadístico SPSS, desde el que se ha creado una matriz de datos que ha permitido el cruce de las variables objeto de estudio.

MARTINEZ LOPEZ, MIGUEL ANGEL* (Uppsala University, Sweden)

Contemporary Struggles for Housing Justice

Most medium and large-size cities have been experiencing an acute housing crisis since, at least, the 2008 great financial crisis, although questions about housing injustice have much longer and deeper historical roots since the dawn of capitalism. The features of housing injustice no span from classical issues of unaffordability, discrimination, poor construction and maintenance, overcrowding, and segregated urban location to increasingly cries about home evictions and forcible displacement, homelessness, unsustainable indebtedness of homeowners, unprecedented global real estate speculation, tax benefits for luxury (and largely vacant) homes, landlords harassing tenants, overpriced and short-term rentals, the decline or privatisation of social housing, and racialised and gendered social reproduction in home-making, to name a few. Housing scholars in general and sociologists in particular have rightly paid attention to many of these phenomena, but research on contemporary grassroots struggles for housing justice has enjoyed less relevance in mainstream publications, conferences, funding and teaching. This presentation aims at offering an account of studies focused on recent housing movements, protests and organising, mostly from Spain and Europe. I will argue that key concepts from what I designate a 'sociological political economy of housing activism' framework help analysing the contentious processes in which activists, their opponents and third parties are involved. In particular, 'sociospatial and sociotemporal structures of opportunities and constraints' of housing struggles and their 'multi-dimensional outcomes' have fruitfully contributed to my analyses of squatting, anti-eviction and tenants' movements. I will thus present my findings on these movements by recalling the importance of appropriate theoretical interpretations.

MARTÍNEZ MORENO, ALICIA* (Universidad de Alicante, Spain)

RUIZ CALLADO, RAUL (Universidad de Alicante. Domicilio: Crta. San Vicente, s/n; 03690 San Vicente (Alicante), Spain)

El Deporte Como Motor De Cambio Social. EL Caso De Lucentum Zona Norte En Colonia Requena, Alicante (ESPAÑA).

El deporte ha demostrado ser un motor clave en la transformación social, especialmente en contextos de vulnerabilidad social. El proyecto **Lucentum Zona Norte**, desarrollado en el barrio Colonia Requena (provincia de Alicante, España) se enmarca en la premisa de que el deporte puede ser el motor de un proceso de transformación social positiva en una comunidad vulnerable.

Colonia Requena es un barrio ubicado en el norte de la ciudad de Alicante que experimenta una realidad social ciertamente compleja. La escasa inversión pública desde la propia fecha de creación del barrio supuso el grave deterioro de las viviendas y el espacio comunitario en muy poco tiempo. Existe una "nueva problemática urbana" que está estrechamente ligada al incremento de la degradación en las áreas periféricas de las ciudades (Wacquant, 2007; Castells, 2010; Sassen, 2010).

El principal objetivo del proyecto es fomentar la inclusión social a través de la práctica deportiva. Además, busca promover un estilo de vida saludable entre la infancia y adolescencia del barrio, haciendo partícipes a los adultos y personas mayores en los encuentros comunitarios que se celebran en el marco del proyecto. El aparato metodológico es de carácter cualitativo, basado en el enfoque del *Design Training*, y las técnicas de la Investigación-Acción Participativa (IAP). Mediante la ejecución de dos entrenamientos semanales, se realizará una autoevaluación bimestral que va a proporcionar datos longitudinales para su posterior análisis y seguimiento.

El diseño, la ejecución y el seguimiento de Lucentum Zona Norte desde la sociología aplicada y de la comunicación subraya la importancia de integrar el deporte en las políticas públicas de inclusión e intervención social, siendo una herramienta clave para mejorar la calidad de vida en barrios vulnerables. En definitiva, se propone que el deporte, como fenómeno social, tiene el potencial de romper ciclos de exclusión y marginación social.

The Caring Capacity of the City. Examining the Experiences of Polish Homeless Migrants with Care in Berlin

This paper discusses how the city prefigures possibilities for care. Drawing on insights from an ethnographic study of Polish homeless migrants in Berlin and their experiences with care in the city, it outlines a complex ecology of social practices and material arrangements that, in acting infrastructurally to sustain precarious urban lives, generatively shape the city's caring capacity. Polish migrants make up the majority of Berlin's non-German homeless population. Since most of them are either not entitled or practically unable to claim state benefits, they rely on care that operates in the city beyond the local welfare system, mainly through non-state emergency services, the city's material infrastructure, and people's care-full non/engagement. Taken together, these care infrastructures form a life-sustaining web that interweaves multiple and diverse sites of care and extends throughout the city. Prefiguring the everyday work of caretaking, maintenance, and repair, this web sustains Polish migrants throughout their experience of homelessness in Berlin.

Non-Formal Education of Children in the Context of Transnational Families Life

The child is the future of society and its potential. Childhood is the most vulnerable stage of life, when it is important to respond to the child's needs and also to ensure his rights. The United Nations Convention mentions the following basic principles for ensuring children's rights: (1) non-discrimination; (2) the best interests of the child; (3) the right of the child to express his opinion and to be heard; (4) the child's right to live and development. Child development includes the creation of a safe, creative environment that promotes the child's development and ensuring the freedom to act in it. In order to ensure the comprehensive process of the child's development in childhood, formal and non-formal education is important. Transnational families face the challenge of how to ensure quality of non-formal education of children when one or both parents live at a distance. The aim of the presentation is to analyze the role of non-formal education in the child's development process in Lithuanian transnational families. A combination of several researches was used to reveal this goal. *First*, the study of focused discussion groups with experts from various fields of non-formal education in Lithuania. *Second*, a qualitative study was conducted with members of Lithuanian transnational families. In order to comprehensively analyze the experiences of transnational families, both parents and child(ren) of the same family were interviewed. The visual map method was used for conducting interviews, the uniqueness of which is manifested through the opportunity to receive not only verbal, but also non-verbal information, to engage the research participant and to obtain visualizations of the research participants' descriptions. The conducted research revealed the main challenges faced by transnational families during the provision of non-formal education for children, highlighted the resources used by families, good practices, possible solutions and recommendations.

GALINDO FILHO, LUCAS TAVARES* (LA SAPIENZA University of Rome (ITALY), Italy)

Technological Advances and New Ecosocial and Affective Solidarities

In this context of a crisis of values and ideologies in the 21st century, we believe that technological advances are contributing to the creation of new generations of narcissistic and fragile individuals and, conversely, individuals who have a deeper existential and affective awareness of reality. On the one hand, we observe with concern artificial intelligence taking the form of an active and autonomous agency in the organisation of cultural institutions and collective and individual subjectivities. However, in the opposite direction, we see ecosocial reactions in favour of new processes of moral, affective and political individuation. These new physical and virtual associative networks have enabled the emergence of experiences of democratisation of everyday life at local, national and transnational levels that facilitate a new ecosocial consciousness. These reactions generate new processes of collective and

individual subjectivisation that allow for the formation of more affective and loving solidarity networks. It's as if the risk of the climate crisis has led those individuals who are more sensitive to the phenomenon of finitude to develop new survival strategies based on more intense and lasting affective and loving ties. It's as if the risk of the climate crisis has led those individuals who are more sensitive to the phenomenon of finitude to develop new survival strategies based on more intense and lasting affective and loving ties. The number of individuals involved in caring for the most vulnerable or who co-operate in the production of solidarity economy or agro-ecology is growing. This process is necessary for the advancement of a humanist movement that articulates individual and collective rights, respecting the coexistence between humans and non-humans, between culture and nature.

XEREZ, ROMANA (Instituto Superior de Ciências Sociais e Políticas- Universidade de Lisboa - CAPP, Portugal)

Sustainable Social Housing and Eco-Social Policies: Exploring the Linkages in the Portugal Case

This article explores the relationship between social housing and eco-social policies, a topic that has recently gained attention as it seeks to redefine well-being from an ecological perspective by addressing human needs and planetary limits. Portugal is one of the EU countries most vulnerable to energy poverty, largely due to poor housing quality and low energy efficiency, particularly affecting low-income families. Rising energy prices and a lack of building rehabilitation exacerbate the problem. While energy poverty is increasingly recognized, energy costs are not fully integrated into social housing policies. Current measures, such as energy cost subsidies, only target low-income households, and clear guidelines for measuring energy poverty are absent in Portuguese laws and literature. Although a National Long-Term Strategy to Combat Energy Poverty exists, there is limited data on its effectiveness.

The article investigates the link between eco-social policies and sustainable social housing in Portugal in the last decade, using a systematic review of literature and a content analysis of housing laws, combined with measures to combat energy poverty and promote the rehabilitation of residential buildings. Efforts to address energy poverty in Portugal have largely focused on rehabilitating buildings for tourism rather than for social housing. Furthermore, energy policies aimed at reducing energy poverty often rely on public awareness for their successful implementation. The Recovery and Resilience Plan (PRR), funding for the rehabilitation and construction of social housing mandates improvements in energy efficiency. However, these policies have proven more effective in new constructions than in the rehabilitation of existing buildings.

This article provides valuable insights for Southern European countries, such as Spain, Italy, and Greece, which have similar social housing systems, and highlights the urgent need for immediate action to promote sustainable social housing.

Social Love, Trust and Pro Environmental Attitudes and Behaviours

Relational good, both a fundamental aspect of a community's well-being and of an individual's quality of life, requires the commitment of the single individual and the relational role played by others (Portela et al., 2013). The relational good thus affects the behaviour and propensities of individuals towards others and it is determined by several factors, such as trust. The presented research aims to understand the interactions between the propensity to engage in loving behaviour considering trust towards others. This interaction refers to environmental behaviour to observe how trust and social love can interact in producing pro environmental attitudes and behaviours which are examined as an element of the public sphere. To achieve this cognitive aim, the results of a questionnaire previously used as part of a larger research program dedicated to Social Love were adopted. In particular, the questionnaire was administered to a wide range of respondents throughout Italy to investigate Italians' propensity for loving behavior. The first phase of the research involved the construction of a social love index, with which the respondents' disposition to have loving behaviors in their daily lives (Cataldi e Iorio, 2023). Instead, the second phase of the analysis was dedicated to the theme of trust. The topic was divided into three dimensions, and an index was constructed for each of the three dimensions. More specifically, these dimensions concern trust towards the generalised other, mistrust and distrust towards specific categories of people, for example, people with

a different ethnicity or religion. In the end, the aim is to understand the relationship between love behaviour, the three dimensions of trust, mistrust, and distrust, and how this relationship affects pro behaviour towards the environment.

The Experts' Self-Representation. They Mirror Themselves in the Perceptions of the Non-Experts Public(s)

Several crisis events rapidly succeed one another, often overlapping, determining a permacrisis, a prolonged period of instability and insecurity due to the transition from one crisis to another (Wright, 2022; Zatti, 2024). The COVID-19 pandemic, geopolitical conflicts, and climate change are all multiple and permanent crisis events that generate uncertainty among individuals. In these circumstances, experts put their expertise at disposal, to inform and prepare citizens disoriented by unforeseen phenomena they do not understand (Dayé, 2020). Furthermore, the experts make their expertise available to decision-makers, offering practical solutions to challenging problems that destabilise the community's everyday life (Bulsei, 2017). The research topic presented in this paper is the relationship between the experts and their non-expert public(s). Empirical research has been conducted on the self-representation of the expert, delving into how experts feel their non-expert public(s) perceive them, to inquiry the representation that the expert has of his/her public(s), how the expert perceives to be represented by the people addressed to, and the responsibility the expert feels to carry out on the shoulder when she/he applies his/her expertise. To reach these objectives, twelve focus groups have been conducted in private and public research institutes that deal with geopolitical, climate, and healthcare topics. Sixty experts in these knowledge domains have been interviewed through the focus group technique. The results explore the relationship between the experts and their non-experts public(s), assuming the point of view of the experts in an interactional environment. This relationship can be conflictual when non-experts public(s) interpret it as symmetrical, wherein their lay expertise can replace that of the experts; on the contrary, this relationship is trust-based when non-experts public(s) rely on experts and their solving performance of a crisis context.

MARY, MARCO* (Laboratoire des sciences sociales (LASSP) / IEP Toulouse, France)

Le Chorégraphe : Ni Intellectuel, Ni Militant. La Revendication Artistique d'Une Posture De Créateur Engagé Sur Des Sujets Sociétaux.

En danse contemporaine, les artistes mobilisent régulièrement comme inspirations artistiques des questions d'actualité notamment en lien avec les rapports sociaux de genre, de classe, de race ou les questions écologiques. Dès lors, l'enjeu de cette communication est d'analyser la spécificité de la posture des chorégraphes : ils revendiquent la légitimité de créer de nouveaux imaginaires tout en affirmant une autonomie par rapport aux milieux académiques et militants. Ainsi, nous articulons une sociologie des dispositions des créateurs (Faure, 2000) avec une sociologie des biens symboliques (Chamboredon, 1986) pour rendre possible un rapprochement entre les conditions de la production et l'interprétation des formes esthétiques (Alpers, 1983 ; Baxandall, 1985 ; Elias, 1991 ; Casanova, 1997).

En premier lieu, nous étudierons les ressources (livres, articles, podcasts) mobilisées par les artistes pour créer des spectacles pensés comme « engagés ». Nous montrerons que ces biens symboliques agissent comme des socialisations de renforcement (Darmon, 2016) : leurs mobilisations permettent de situer socialement et politiquement le chorégraphe. Dans un second temps, nous proposerons une science des œuvres chorégraphiques : en quoi les créateurs « tordent » le réel sur scène ? Quels sont les outils (corporéité, texte, costumes, objets) mobilisés par les artistes pour revendiquer des visions alternatives sur des thématiques sociales ou citoyennes ?

Cette communication s'appuie sur une enquête ethnographique par entretiens avec des chorégraphes et des programmeurs (50) et par observation-participante comme danseur-interprète dans une compagnie qui travaille sur des problématiques écoféministes. Cette position de recherche privilégiée m'a permis d'observer de près les mécanismes d'esthétisation d'enjeux sociétaux par des artistes. En somme, cette recherche vise à démontrer la tension dans l'affirmation d'une nouvelle posture du chorégraphe qui d'une part, affirme la légitimité d'un regard singulier sur le monde, mais qui d'autre part, refuse d'être considéré comme un militant ou un chercheur académique.

MARY, MARCO* (Laboratoire des sciences sociales (LASSP) / IEP Toulouse, France)

L'Art Et l'Argent. Ethnographier La Négociation Des Financements Entre Les Chorégraphes De Danse Contemporaine Et Les Institutions Culturelles.

Dans le milieu de la danse contemporaine français, la première étape de la création d'un spectacle consiste à trouver des financements. Les chorégraphes doivent solliciter des rendez-vous avec des représentants culturels (directeurs de théâtres ou responsables politiques) pour parvenir à récolter suffisamment d'argent pour salarier des collaborateurs (danseur, scénographe, créateur son, costumier). Cette activité est indispensable dans la mesure où le champ chorégraphique dépend économiquement et politiquement des pouvoirs publics (Faure, 2008). Dès lors, de quoi parle-t-on dans un rendez-vous avec un théâtre ? Dans un milieu qui invisibilise les questions financières, comment se déroulent les négociations pour obtenir de l'argent ?

A partir d'une enquête ethnographique par entretiens avec des chorégraphes et des programmateurs (50), cette communication étudie les enjeux économiques du travail artistique. De plus, étant moi-même salarié dans une compagnie de danse contemporaine comme danseur-interprète, j'ai pu assister et observer directement des rendez-vous entre des créateurs et des institutions culturelles (10). Il s'agit ici de proposer une ethnographie du rapport entre l'artiste et l'institution en analysant les liens de séduction et les effets d'homologies structurales. L'enquête révèle l'ambiguïté de ces rapports économiques : à la fois indispensables pour la survie des artistes mais toujours déniés par l'idéologie du génie créateur.

Nous nous intéresserons d'abord aux dispositions sociales acquises par les chorégraphes lors de socialisations antérieures (famille, écoles supérieures) créant un capital spécifique : le créateur doit apprendre « sur le tas » à élaborer des relations avec les programmateurs dans le contexte d'un marché artistique qui intègre de plus en plus les outils du néomanagement (Sinigaglia, 2021). Ensuite, nous analyserons la continuité entre « identité professionnelle » et « style de vie d'artiste » : l'entretien des rapports de séduction et d'amitié (Quemir, 2021) avec les institutions sont indispensables pour la survie dans la carrière du chorégraphe.

MASATAKE, HONGO* (Momoyama Gakuin University, Japan)

Is the COVID-19 Vaccine Crisis a DIS?: A Comparison of Japan's DIS and the UK's "Blood Scandal" Case

This presentation examines the significance of side effects and health damages caused by COVID-19 vaccines being framed as "drug-induced sufferings (DISs)" in Japan, and compares it to the recent "blood scandal" case in the UK. In Japan, health damage caused by pharmaceuticals, along with social problems accompanied by social suffering, such as prejudice and discrimination, has historically been categorized as a DIS. Thalidomide and AIDS have emerged as notable DIS issues, and there has been a history of victim movements where victims have won compensation through lawsuits. These movements played a crucial role in shaping the current medical system. While health damages from COVID-19 vaccines are partially compensated for under the framework established by previous DIS cases, there is a possibility that vaccine-related harm could be redefined as a DIS, leading to victim movement, as in the past. Furthermore, conspiracy theories about the replicon vaccine, which has not been approved in any country other than Japan, are spreading. Could the COVID-19 vaccine crises evolve into a DIS issue? If so, how would it differ from past DIS cases, and would it lead to sufficient compensation? This report considers these issues by analyzing the strategic differences between various compensation movements. It focuses on the UK's contaminated blood scandal, where an inquiry report was submitted in May 2024, revealing HIV and HCV infections caused by contaminated blood products. Based on this case, I assessed whether framing the COVID-19 vaccine crisis as a DIS issue would lead to compensation and the resolution of the problem.

MASI, BELÉN* (Universitat Pompeu Fabra, Spain)

"on Top of Everything, You're Argentinian". Methodological Notes on the Challenges of Studying Elites in Catalonia

Studying elites is widely recognized for presenting several challenges. Firstly, elites are a small yet highly powerful group, well-educated, with vast resources, and often elusive and difficult to access. Additionally, they may hold more symbolic and cultural capital than the researchers, placing the latter in a subordinate and sometimes uncomfortable position (Cousin et al.,

2018). These challenges vary depending on the country and the specific type of elite being studied (e.g., economic, educational, or cultural), and are further influenced by the researcher's own class background and network of contacts. In the case of Catalonia, the Catalan elite, commonly referred to as the Catalan bourgeoisie, is particularly closed and cautious, with very few studies managing to gain access to this world. Moreover, most of these studies are more focused on social and family profiles than on research related to social stratification (see Pérez Arias 2022, Culler & Farràs 2001).

This presentation will explore the challenges of conducting qualitative research on elites in the city of Barcelona. Specifically, this research not only involves interviews but also utilizes a methodology for studying the geographies of intersectionality: Relief Maps (Rodó-Zárate, 2013). This self-administered digital tool captures individuals' experiences in various spaces of everyday life based on different social identities, such as gender, race, age, and more. The particularities of this methodology, combined with the affiliation to a well-established research group (Intermaps-UPF), introduce challenges for fieldwork that yield ambivalent results, facilitating certain aspects of access while complicating others. This presentation will address the access barriers arising from the characteristics of the population and the researcher's own positionality, while also highlighting the adaptive strategies employed during fieldwork to navigate these complexities effectively.

MASSARI, MONICA* (University of Milan, Italy)

DI MEO, SILVIA* (University of Milan, Italy)

Wounded Memories, Besieged Lives: Surviving and Resisting across the Mediterranean Borders

Since the explosion of the so-called "refugee crisis" and the introduction of increasingly restrictive policies aimed at preventing migrants from crossing European borders, the topic of migration and death across the Mediterranean has gained high visibility in public debate. The endorsement of harshly questioned policies aimed at enforcing the externalization of European borders often through violence and human rights abuses and the rise in the number of migrants missing/drowned in the Mediterranean, however, have actually enhanced a collective indifference in public opinion on the dramatic conditions migration by sea still largely occur and on the destiny, identity and right to be mourned of those who disappeared in the Mediterranean.

Based on ongoing research addressing three major shipwrecks occurred in the Mediterranean (2013-2023), this paper deals with the relationship between hegemonic forms of narration enhanced by institutional agencies and mainstream media and counter-narratives of the same *disasters* promoted by survivors and victims' family members who witnessed the tragic event or their consequences both at public level and in their intimate lives and relationships. In particular, through the analysis of biographical interviews carried out with survivors and victims' family members – men and women of different nationalities and generations, often dispersed across borders and operating at transnational level –, the paper focuses on the forms of memorialization and memory practices carried out in the public arena that strongly call for a recognition of victims' rights, agency and identity. Attention will be devoted to the role played by women (mothers, sisters, daughters) in promoting forms of mobilization through art-based participatory practices where mourning for their beloved ones becomes not only a way of remembering, but also an act of disobedience that challenges that regime of invisibility, censorship and oblivion that politics and history would like to consign those bodies and their identity to.

MASSIDDA, LUCA* (University of Tuscia, Italy)

Right to Inform, Victims' Rights and Right-Wing Politics: When the Interplay between Political and Journalistic Discourse in Gbv Reporting Reinforces Distortions and Discriminations.

The paper examines the relationship between journalistic discourse and political communication, focusing on how the principal national and local newspapers covered gender-based violence during the recent national election campaign in Italy (September 2022). The objective is to examine how the electoral context shapes the journalistic representation of gender-based violence. Specifically, it seeks to determine whether the electoral context leads to an increase or decrease in attention towards the issue and whether the interaction with the electoral frame facilitates a more accurate narrative of journalistic coverage or, conversely, acts as an amplifier of the distortions and prejudices that are commonly encountered in public, media and political discourse on gender-based violence. Comparing the journalistic and the political actors' representation of GBV the paper aims to understand if and how these narratives influence each other. Data presented were collected within the framework of the PRIN research project, entitled "STEPSISTER - STereotypes and PrejudiceS In preSs representation of gEndeR-violence" (Principal Investigator: Dr. Rosalba Belmonte, Tuscia University).

Women's Rights and Gender Issues in the 2024 US Presidential Campaign: A Video-Style Analysis of the White House Candidates' Campaign Ads

The paper aims to analyse the role that gender issues and women's rights played in the 2024 US presidential election campaign. The analysis of the communication strategies adopted by Donald Trump, Joe Biden and then Kamala Harris will focus on the election commercials released by the three candidates who placed gender issues and women's rights at the centre of their political narratives. The videos were subjected to analysis in their verbal, non-verbal and production components. This was achieved through the construction of an audiovisual content analysis form, which was developed by combining the video-style analysis methodology proposed by Kaid and Johnston (2001) with the coding and content analysis methodology used by the Wesleyan Media Project (Fowler et al., 2023). Ultimately, the form was integrated with a bespoke set of variables designed to identify and classify the ideological and value-based references present in the examined multimedia texts, whether implicit or explicit. The objective is to understand the extent to which gender, family, and women's rights issues were pivotal in the construction of the different campaigning strategies and in the configuration of the axes of conflict on which the electoral competition was played/decided.

Gender and Class Influences on Monetary Behaviour and Financial Subjectivities

This communication analyses the main transformations of payment methods and their effects on spending, saving and indebtedness patterns.

The digitization of payment methods and systems entails numerous transformations related to the structure of monetary transactions, which in turn leads to new behavioural patterns and financial subjectivities. Our aim is to identify how the digitalization of payment methods affects to the categorization processes developed by different social groups. To this end, this communication analyzes the most relevant contributions and limitations in theoretical approaches to these issues: the theory of mental accounting (Thaler, 1999); the everyday life financialization (Chiapello, 2015; Martin, 2002); the social earmarking of money (Zelizer, 2011) and the concept of relational work (Bandelj, 2016, 2017, 2012).

The communication focuses specifically on three closely related aspects: first, the effects of the digitalization of payment methods on economic behaviour; second, population's attitudes towards money and its social functions; third, different spending and saving strategies according to social groups (gender, age and social class).

We have conducted a telephone survey of a sample size of 2000 individuals in Spain over 18 years, and semi structured interviews to 30 individuals according to three variables: gender, age and income levels.

Provisional results points out to the identification of the relational functions of money and the identification of different mental accounting patterns by gender and class.

Shadows of the Deep Transition. a Political Ecology of War Beyond the Anthropocene Narrative

Existing sociological perspectives on the ecological crisis, particularly those centered on the Anthropocene, often neglect the complex links between environmental degradation, global fossil capitalism, and the intensification of armed conflicts. We argue that these processes are instead central features of the shift towards a profound, long-term transformation of interconnected socio-technical systems, particularly centered around the energy sector: the Second Deep Transition. By integrating insights from political ecology, social metabolism, and Arrighi's world-systems analysis, we position contemporary conflicts within the competitive dynamics of both established and aspiring

hegemons seeking to shape new hegemonic cycles while reconfiguring global capitalist metabolic patterns. Our examination of the interplay between nature, capitalism, and war, historically intertwined with military power's need for energy access and control, reveals how extractivism and ecocidal militarism manifest in both old and new armed conflicts, rooted in systemic power disparities. Despite recurrent pacified imaginaries of the transition, we highlight how the novel competition for energy resources and raw materials can still exacerbate potential conflicts and violence, indicating both the continuity and co-existence of traditional resource wars with the so-called "Green Wars" for critical minerals and renewables. Understanding these complex interactions is essential for fostering and envisioning just, peaceful, and sustainable futures. By challenging reductionist and deterministic narratives, we advocate for a political ecology of war as a vital framework for sociology to address these urgent challenges.

Strategic Knowledge and Neo-Organicist Sociology: Lessons from the Forgotten Paths of Sociological Thought

This paper examines the trajectory of Italian sociology between the two World Wars, emphasizing the concept of Strategic Knowledge as a heuristic tool. This approach complements the internal history of the social sciences, particularly sociology, by investigating the blurred boundaries where sciences become knowledge and disciplines transform into techniques of thought, control, and social action. During the fascist regime, sociology didn't disappear but aligned with creating an integrated system comprising the state, society, and individuals. Anticipating later functionalist and systemic theories, Neo-organicist sociology, developed by the renowned scholar Corrado Gini, responded to this need. Gini updated and radicalized Spencer's ideas, defining strategic, selective, and biopolitical knowledge to address bio-social reproduction problems, framed as "social pathology" issues. This theory envisioned society as an organism where the public hand assists and controls the market, ensuring order and integration, and supporting evolutionary tendencies while intervening as needed. Combining racism and planning, it proposed a then appealing reordering of social and (re)productive forces to address the crisis of international capitalism through social engineering. By examining the production, selection, dissemination, and consumption of sociological knowledge in this authoritarian context, the paper reveals peculiarities, unexpected influences, and connections with other experiences and sociological frameworks. It also addresses underexplored aspects in the history of sociology, focusing on how - despite other claims - sociology may coexist with authoritarian experiences; how science can influence the development of political and social techniques to achieve social order, and how these techniques, in turn, shape scientific arguments.

MATAR, JIMMY* (Scuola Normale Superiore, Italy)

Between Widened Imaginaries and Retreat: Strategies from the Margins of the October 17 Uprising in Lebanon

Despite recurrent waves of social mobilizations in many parts of the world, dominant power structures remain relatively unshaken. Continued opposition to current socioeconomic and political realities, absorbed and nullified by reformist pathways, has left many disappointed and demobilized. In line with this general development, albeit with key contextual differences, Lebanon has witnessed a series of social mobilizations since 2011 culminating in the October 17 uprising in 2019. Struggling against a hegemonic sectarian system firmly controlled by ruling political and financial elites, a variety of collective actions ranging from disruptive to prefigurative were deployed. While many organizations focused on bottom-up change tried to adapt their visions and/or strategies to the rapidly developing context, siloed and sectoral approaches remained dominant. A wider more coordinated strategy that captures the imagination of the moment, directs various actions towards a common goal, and dislodges electoral politics from the dominant discourse remained elusive. Based on a series of semi-structured interviews with activists from various organizations, the adaptability of tactics to turbulent changes were dissected. Responding to the uprising, repression, pandemic, socioeconomic collapse, August 4 port explosion, parliamentary elections, and sectarian parties' resurgence, collective actors, specifically those driven by bottom-up social change, engaged with the different phases from varying lenses. Mobilization peaks were met with intensified activities, widened imaginaries were met with a flourishing of initiatives - many of which did not survive, socioeconomic crises were met with mutual aid and solidarity, and demobilization was met by retreat and return to gradual slow building. Notwithstanding their shortcomings and marginal influence on the overall trajectory of the uprising, the strategies and principles of some actors guided their attempts to maneuver harshly changing realities on the ground.

RC21-322.2

MATAR, JIMMY* (Scuola Normale Superiore, Italy)

Commoning in Turbulent Times: Between Cooptation, Survival, and Social Change in the Aftermath of the October 17 Uprising in Lebanon

The deep socioeconomic and political legitimacy crisis facing the dominant neoliberal system in many parts of the world has resulted in recurrent waves of social mobilizations opposed to the current realities. Far from being classified as a unified movement in regards to what is desired, a notable segment struggles for alternative systems rooted in solidarity, cooperation, and participatory forms of democracy. While not being an all-encompassing ideological direction, a significant overlap lies between such principles and commoning. In line with this general development, albeit with key contextual differences, Lebanon has witnessed a series of social mobilizations since 2011 culminating in the October 17 uprising in 2019. Struggling against a hegemonic sectarian system firmly controlled by ruling political and financial elites, a variety of collective actions were deployed. Beyond the disruptive actions which are not the focus of this paper, alternative ways of life and reimagined realities were temporally born in the squares, as well as more durable ones which fed into and resulted from these mobilizations. Based on a series of semi-structured interviews with activists from various commoning initiatives, the challenges of navigating a complex, hostile, and changing landscape were dissected. With varying degrees of success and failure, initiatives constantly had to grapple with survival against market forces and private property, cooptation and absorption into NGO structures, and internal community building based on commoning principles. To avoid isolation and being driven to the margins, social movements also constitute an opportunity for such initiatives to engage in wider social struggles that attempt to alter the wider socioeconomic landscape into a more favorable environment.

An Ounce of Prevention: How Health Narratives Can Bridge Social Inequalities

This study aims at investigating those changes that occurred in public health communication over the past 20 years, through the lens of cancer screening and vaccination campaigns. While public health communication is meant to serve the entire population, it often targets specific audiences based on disease prevalence and demographic factors. This creates a tension between effective messaging and the risk of perpetuating health inequalities, particularly regarding gender.

The research, part of a financed research program entitled "ECoHeTE", analysed 223 campaigns between 2000 and 2023, focusing on cancer screenings and vaccines and edited by World Health Organization and specific Italian health institutions. Data was collected from institutional websites and social media platforms. The analysis found significant gender imbalances in the content of these campaigns. A large portion (38%) focused on women's reproductive health, especially HPV vaccination and screenings for cervical and breast cancer. No campaigns were found targeting men specifically, despite the existence of male-specific screenings, such as for prostate cancer. Screening campaigns are more frequently aimed at women, while vaccination campaigns tend to address the general population, often featuring mixed-gender protagonists. Women are often the central figures in cancer screening campaigns, reflecting their traditional roles as caregivers and health advocates within families and communities. However, this portrayal can also reinforce a narrative of women as vulnerable and in need of expert guidance.

The study also examines the evolution of gender representation in these campaigns over the last two decades, analysing the language, visuals, and narratives used. It highlights how the portrayal of women in health communication has shifted, but still often emphasizes their role as individuals who need to be protected, sometimes at the cost of portraying them as fragile. This exploration provides insight into how public health narratives may contribute to or challenge social inequalities, particularly in gendered contexts.

MATERASSI, LETIZIA* (University of Florence, Italy)

MACRÌ, ESTER (University of Florence, Italy)

Before and Beyond Covid-19: A Multidisciplinary Study on Vaccine Hesitancy in a Post-Pandemic World

Since 2020, the focus on vaccines has primarily centered around Covid-19, shaping both public and scientific debates, as well as communication strategies and individual perceptions. Vaccine hesitancy, in particular, has become entangled with politically charged and media-driven narratives, often creating a polarized divide between supporters and skeptics, which has complicated a deeper understanding of the issue. In this study, we take a multidisciplinary approach, combining insights from sociologists, social psychologists and physicians, to explore the different aspects of vaccine hesitancy— fear, lack of awareness, knowledge gaps, uncertainty, and trust— and how these factors influence vaccination behaviors beyond the immediate crisis of the pandemic. While the research emerged in the wake of the Covid-19 emergency, our scope extends beyond that single vaccine to include others: Measles, Tetanus, Hepatitis B, and HPV. To begin, we carried out an extensive literature review, analyzing the contents of 124 articles indexed on Scopus and published in international journals between 2013 and 2023. Subsequently, qualitative research was carried out through the administration of a standardized questionnaire using a mixed-method approach (CAWI-CATI), involving a sample of 1.000 individuals, proportionally distributed across Italian regions and covering the entire Italian territory. The research investigates the relationship between the various dimensions of vaccine hesitancy concerning the different types of vaccines considered, in comparison with pre- and post-Covid literature. The primary goal is to determine whether, and to what extent, the debate surrounding Covid-19 vaccinations has influenced the perception of the effectiveness of other vaccines for different diseases; secondly, we aim to examine the narrative frames employed in vaccine communication and how they influence the motivations or positions of hesitant populations.

Youth Entrepreneurial Pathways: Gendered Experiences of African Graduates

Formal employment has been shrinking since the 1970s, with work becoming more piecemeal and informal. Youth participation in the labour market, especially on the African continent, is primarily characterised by precarity. Faced with structural barriers to livelihoods, youth are pursuing opportunities outside of formal employment, including entrepreneurship. Entrepreneurship entails starting a new business venture and/or expanding an existing one. With the precarity of work expected to continue, partly due to Africa's youth bulge, it is imperative that youth entrepreneurial pathways be better understood as entrepreneurship has been shown to contribute to innovation, job creation and economic growth. This paper describes the entrepreneurial motivations and journeys of African graduates, with a focus on their gendered experiences. Tracking graduates funded through scholarships and using an integrative mixed methods approach, this paper draws from the findings of a five-year longitudinal cohort study. Quantitative interviews were conducted with 577 graduates in 2020, 2022 and 2024 while 106 graduates participated in qualitative interviews in 2020, 2021, 2022 and 2024. Findings showed the gendered nature of entrepreneurial motivations and journeys of African graduates, with a higher proportion of male than female participants having started business ventures and operating businesses with formal registration. While the data indicated the interconnectedness of entrepreneurial drivers, the primary entrepreneurial motivation for both male and female participants was to make money and help people. Furthermore, entrepreneurship was described as an "alternative" to formal employment in contexts of poverty and unemployment. The profitability gap between male and female-owned businesses was concerning with the types of businesses started, particularly in agriculture and the digital economy, favouring males than females due to gender stereotyping. This paper underscores the need to expand the concept of work and for context- and gender-sensitive interventions and continuous support for African graduates in order to ready them for the future.

Coping with Mining Risks in the Ecuadorian Amazon: Daily Life in the Grip of the Anthropocene

The Ecuadorian Amazon region is at the heart of tensions between environmental preservation and economic development. Long isolated, it has been integrated into the global economy through the exploitation of its natural resources. Today, extractivist policies and the "Buen Vivir"-oriented Constitution have created a complex context where development issues, environmental preservation and indigenous rights tend to collide. Their friction influences lifestyles, land use and sociocultural relationships, in a context of contamination risks. Our study focuses on the Tena region, where legal and illegal mining expansion is rapidly transforming territories and exposing populations to various pollutants.

Using an ethnographic approach, we reveal how communities living near mining activities interpret, experience and deal differently with environmental threats, while considering the structural inequalities that influence their vulnerability. Our aim is to examine how they live and cope with the challenges of the Anthropocene, negotiating between traditions, economic necessities and new environmental realities. Reconstructing the web of ordinary experiences and knowledge enables us to better grasp the reality of risk society in the Amazon, and identify ways of living in the ruins of extractivism.

The final purpose is to enrich our understanding of the socio-exposome concept as developed by P. Brown and L. Senier to decipher the complex dynamics that shape exposure to pollutants, taking into account social practices, socio-economic contexts and power relations. It is also a way of discussing indigenous alternatives to the current crisis of global contamination.

"I Thought, Well, This Is a Sindhi Paada (Neighbourhood)!" : Hindu Sindhis and Diasporic Belonging in Hong Kong

This paper explores how Hong Kong became a meaningful and desirable node in the Hindu Sindhi diasporic network, and how older mercantile imaginaries frame contemporary forms of belonging in the 'global city'. The Hindu Sindhi diaspora in Hong Kong has emerged through a range of mobilities and connections - sojourning for trade from the 1880s onwards, displacement from Sindh during the 1947 Partition, and more contemporary migrations for business, employment, and marriage. Drawing on interviews, ethnographic data, and archival sources, this paper explores how Hong Kong emerged as a 'place of the future', and as a 'Sindhi place' in this diasporic imaginary. Research for this paper was carried out from 2019-2021 - at a time when 'expatriate' mobilities and futures in Hong Kong came into question alongside new 'national security' legislation, pro-democracy protests, and the Covid-19 pandemic. However, during this uncertain time, older mercantile imaginaries continued to shape the Sindhi diaspora's ties to the city. An interlocutor who described Hong Kong as a 'lit-up city' and place of the 'future', also felt, on arriving at Hong Kong's Wyndham Street in 1969, that they had arrived in a 'Sindhi paada' (neighbourhood). Interlocutors often narrated local histories of such neighbourhoods to map diasporic change and belonging. They also expressed how a futural vision and promise of Hong Kong circulated in the wider Sindhi diasporic imaginary, and continues to mediate mobility and community here. Through such accounts, I suggest that diaspora nodes (like Hong Kong) emerge as 'points of convergence' - in space and time, where people, things, goods, and ideas collect; and as 'points of articulation' - for articulating and experiencing belonging, as well as orienting and facilitating movement and connections to elsewhere. This frames the 'global city' as a node within wider diasporic currents, mediating forms of belonging for such communities.

Women Street Reclaimers: Existing Practices and Potential for Organising

Reclaimers engage in precarious labour that involves rescuing materials that have been thrown away and revaluing them because they see value in things others discard as valueless. In addition to the mental and physical challenges confronted by all people (men and women) who do this work, women street reclaimers often struggle to freely navigate urban streets due to safety concerns due to high levels of gender violence and working hours that start before dawn. Research on gender and how reclaimers organise is limited, and this study aims to contribute to this knowledge by exploring the organising experiences of informal women street reclaimers. Through participatory observations and semi-structured interviews with 5 women street reclaimers in Johannesburg who are members of the African Reclaimers Organisation (ARO) and 3 ARO leaders, this study explored how the women work collectively and opportunities to deepen this collaboration. The findings revealed that, ironically, a key strategy used by women to address the gender issues they confront is to enrol support from male colleagues and partners, which addresses their immediate practical gender needs, but serves to reinforce patriarchal assumptions and power. In addition, women reclaimers also draw on traditionally feminised forms of solidarity, such as stokvels and collective purchasing to mediate their work-related challenges, strategies which are not typically understood as part of worker organizing and collective action.

MATSUKAWA, ANNA* (University of Hyogo, Japan)
TATSUKI, SHIGEO (Doshisha University, Japan)

Breaking Administrative Silos and Enhancing Vulnerable Support: A Post-Earthquake Strategy for Disaster Response in Aging Communities

The 2024 Noto Peninsula earthquake exposed significant challenges in disaster response within Ishikawa Prefecture, largely due to horizontal and hierarchical siloed administrations. These siloizations hindered effective coordination, particularly in providing comprehensive support to vulnerable populations such as the elderly and disabled. The rigid division of responsibilities between the prefecture and municipalities further slowed response efforts. To address these issues, the establishment of a special unit for coordinated disaster response was recommended, focusing on bridging administrative gaps.

While progress has been made in wide-area evacuation strategies through the creation of intermediary centers, challenges remain in effectively supporting vulnerable individuals. The needs of the "hidden vulnerable" demographic—those not easily identified but at high risk—have been particularly difficult to address. However, emergent NGO networks have played a vital role in disaster recovery, deploying specialized professionals and highlighting the importance of collaboration between government agencies and civil society.

In Okunoto, the earthquake exacerbated pre-existing social and economic disparities, particularly in the reintegration of evacuated elderly and disabled individuals. The proposal to incorporate long-term care facilities into new housing developments, such as temporary and public housing complexes, has been put forward as a sustainable solution. This approach would provide more efficient care for an aging population and address the logistical challenges posed by remote areas. However, this strategy requires significant public investment and intergenerational consensus to transition towards more compact, accessible settlements, especially as the region faces the dual pressures of hyper-aging and population decline.

In summary, addressing administrative siloization, enhancing support for vulnerable populations, and fostering government-civil society collaboration are critical for improving disaster response in hyper-aging regions like Okunoto.

WG10-935.1**MATSUSHITA, KEITA*** (Kansai University, Japan)*Digital Nomads in Japan: Community Integration and Sustainable Tourism Practices*

The COVID-19 pandemic has accelerated the adoption of remote work, leading to a rise in digital nomads. While freelancing has traditionally been common among digital nomads, more corporate employees now practice this lifestyle. This trend reflects a broader shift in how people evaluate work-life balance, seeking more flexible and personalized approaches. In tourism, "slow tourism," which focuses on sustainability and minimizing environmental impact, is gaining attention as an alternative to over-tourism and rising concerns about climate change.

Digital nomads, many of those in tech and AI industries, often engage in long-term stays in various locations, contributing to both sustainable tourism and local business innovation. These individuals promote environmentally conscious travel and stimulate entrepreneurship and investment in the areas where they live temporarily. In response, many countries and regions have introduced policies such as digital nomad visas and subsidies to attract this new workforce and enhance local economies.

In addition to their economic impact, digital nomads highly value community building. They strive to integrate into local communities while forming connections with other nomads with similar work and life values. Co-living and co-working spaces have become vital hubs for fostering these communities, blending professional collaboration with social engagement.

This study uses Japan as a case study to examine how local governments and organizations attract digital nomads and how communities form around them. It explores how regions develop environments that meet the needs of digital nomads, focusing on co-working and co-living spaces. The research also looks at the perspectives of local stakeholders, including community managers, residents, and the nomads themselves.

Findings reveal that digital nomads value community and intimacy but face challenges balancing diversity, mobility, and a sense of stability. A combination of online and in-person interactions is also essential to maintaining their communities and intimacy.

RC05-82.5**MATSUTANI, MINORI*** (Otemon Gakuin University, Japan)*Does Work-Life Balance Matter?: Narratives of Motives for Migration Among Young Japanese in Germany*

Young migrants from developed countries have relatively more freedom to choose their destination countries and residential status. Students or young workers in Japan tend to choose Oceania, North America, or Western Europe due to the various residential options available in these regions. Although they may initially enter these countries as travelers, students, and working holiday makers, they may eventually become migrant workers to stay longer. These Japanese migrants, unlike business expatriates, have been considered lifestyle migrants. Previous studies of Japanese lifestyle migrants in Canada and Australia found that they prioritized work-life balance, which aligns with typical Western values. However, the reasons for leaving their home countries, such as overworking in Japan, may not be directly connected to their choice of destination. Even though dissatisfaction with life in their home country may lead them to migrate, the choice of destination is a complex decision influenced by a wider range of factors. Are Western values, as seen in the narratives of migration motives, a decisive factor in choosing the destination, or do they merely justify the decision to stay? The paper examines the attitudes of young Japanese migrants towards Western values in their narratives of migration motives, based on an ongoing survey in Dusseldorf conducted since 2019. It aims to uncover how migrants change their attitudes towards Western values after migration and how this change shapes their narratives of migration motives and choice of destination.

RC38-JS-118.5**MATTHIES, PAULA*** (Frankfurt University of Applied Sciences, Germany)*Biographical Perspectives on the Nexus of Antisemitism and Genderpolitics*

Antisemitism is not merely prejudice against Jews, it is also an ideology itself and therefore a worldview. Its efficacy is not only historically evident, but also contemporarily visible. It intersects with racism, anti-feminism and misogyny, and is linked to societal dynamics. This can be seen particularly well in social gender relations in liberal democracies. It is precisely against the background of the flexibilization of gender relations, and the simultaneous persistence

of traditional gender roles that a field of tension and struggle is emerging. This brings ambivalences and uncertainties to the fore. These, in turn, provide fertile ground for antisemitic and anti-modernist responses (visible e.g. in the TradWife Phenomenon), going hand in hand with wider developments of de-solidarization and nationalization. I argue, that in order to understand these kinds of phenomena they have to be embedded in the biographical as well as the socio-historical context. Biographical research is particularly suitable for this purpose as it claims to reconstruct the interrelationship between the individual and society. Lived experiences are the place where society inflicts its pain and thus becomes tangible as a universal framework (Adorno 1993). Against this background, I argue that antisemitism serves as a cohesive force during times of changing gender relations and that a biographical approach is critical to understanding the function of antisemitism within societal dynamics. In this contribution, I will provide an overview of my ongoing dissertation project, outlining the research design and its underlying explanatory potential in addressing the following questions: What function do antisemitic patterns of interpretation fulfil within biographical meaning making? How do they relate to regressive gender political orientations? And what insights do they offer regarding the way subjects orient themselves within and respond to dynamics of changing gender orders?

RC17-248.3**MATTHIEU, GARCIA-MESA*** (LEST CNRS UMR 7317 / Aix Marseille Univ, France)*Meta-Organisation As a Response to the Challenges of Quality and Fraud in the Field of Continuing Vocational Training in France ?*

The continuing vocational training (CVT) market in France is worth around 30 billion euros (Froment et al., 2023). It is a sizeable market shared between more than 120,000 training organisations (TOs) (Froment et al., 2023). Since 2021, part of this market has been regulated by Qualiopi certification. The aim of this certification is to meet the challenges of both training quality and fraud prevention. However, this certification has major shortcomings and does not guarantee the quality of the training courses (Cour des Comptes, 2023 p.56-57) or sufficiently regulate fraudulent practices (Froment et al., 2023, p. 4). Faced with these pitfalls, the IGESR and IGAS proposed in a joint report to create a governance body to coordinate the quality of vocational training (Froment et al., 2023, p. 6).

Could this governance body be a meta-organisation (MO)? A MO is an organisation made up of organisations. It is based on consensual and non-hierarchical practices whose main objective is to organise collective action at a relatively low cost (Berkowitz and Dumez, 2016, p. 150-151).

This study is based on several semi-structured interviews and observations conducted with Céreq, France Compétences, competence operators and private, associative, cooperative or public OFs. This exploratory study attempts to materialise the operational reality of setting up a meta-organisation and its limits in the field of continuing vocational training.

RC24-395.1**MATUS, CLAUDIA*** (Center for Educational Justice, Chile)*Biodiversity and Gender As Hypotheses*

This study examines the scientific knowledge generated at the OHM-I Patagonia Bahía Exploradores, explicitly addressing the intersection between the climate crisis and gender. Here, gender is not merely understood as a social category or as the representation of women within research teams but rather as an epistemological approach. We argue that existing data related to climatic variations, ecological disturbances in rivers, biodiversity shifts, and changes in land use should be re-evaluated through the lens of gender as a hypothesis. This analytical shift enables us to challenge ingrained assumptions and avoid reinforcing inequalities within the research itself.

Our methodology is grounded in a critique of three fundamental aspects: sampling processes, instrument design, and data management. First, concerning sampling, we question the gendered assumptions embedded in the selection of samples. What presumptions about gender and sex guide these decisions, and how do they influence our understanding of ecosystems and environmental changes? We also explore whether interdisciplinary approaches inform sample collection and the prevailing discourses that underpin these practices.

Second, the role of instruments in shaping research outcomes is critically assessed. We analyze how measurement tools are designed and used, focusing on their assumptions about objectivity and their implications for knowledge production.

Finally, we scrutinize databases and data characterization and management. This involves interrogating the underlying logic that organizes environmental

data and how it might be transformed when gender is treated as an analytical hypothesis rather than a neutral category. By addressing these dimensions, we aim to produce more inclusive, equitable scientific knowledge that is attentive to the nuanced intersections between environmental science and gender.

RC04-60.1

MATUS, CLAUDIA* (Center for Educational Justice, Chile)

The Problem with Naming in the School Curriculum

This research critically examines how Chilean school curricula construct and reinforce ideas of normality and difference, particularly around dimensions like gender, sexuality, race, and social class. It identifies four problematic aspects of how public policies on education frame social inclusion.

First, policies often adopt a narrow, essentialist understanding of diversity, reducing complex identities to singular categories that oversimplify students' experiences. Second, social inclusion efforts typically focus on superficial interventions—such as anti-bullying programs or teacher diversity training—while neglecting more profound structural inequalities embedded in educational practices and curricula. Third, most policies lack an intersectional perspective, failing to account for how overlapping identities like race, gender, and class intersect to create distinct forms of marginalization. Lastly, policies tend to center on accommodating marginalized students within existing norms, leaving dominant, heteronormative, middle-class values unchallenged, which further perpetuates systemic inequities.

This study challenges such approaches by examining how formal and informal curricula perpetuate essentialist notions of identities. Through ethnographic research in two Santiago schools (one with a high percentage of vulnerability and the other with the elite and upper class), we document how students and teachers perform common sense and power structures present in the official curriculum that normalizes specific identities while marginalizing others.

Rather than addressing segregation or academic disparities, our research explores how students are taught to categorize identities as superior or inferior, normal or different. By problematizing how these notions are embedded in school knowledge and practices, we argue for rethinking inclusion policies by understanding how a particular knowledge is produced in the official curriculum. This research contributes to debates on social inclusion and policy enactment, promoting a more critical understanding of educational justice.

Inside out: Exploring the Constraints of Researcher Positionality in a Comparative Study Involving Marginalized Urban Migrants

Numerous studies have highlighted the complexity of the insider position in knowledge production. While shared nationality, gender, or language between researchers and study participants can facilitate fieldwork access, they may also limit the development of genuine rapport. A handful of studies have explored the significance of the researcher's social class in studies involving marginalised migrant communities and the limitations it may impose on qualitative research outcomes. Using a case of a comparative study of marginalised Polish migrants accessing welfare systems in four top-immigrant destination cities: Berlin, London, Stockholm, and New York - we address this gap. Our study is based on 95 interviews with migrants and service providers conducted between 2020 and 2024. The findings suggest that a partial insider stance, resulting from shared characteristics such as ethnicity, language, or immigration status, but not social class, can create a false sense of rapport between researchers and participants, leading to inadequate knowledge production. We will focus on the limitations of our positionality as white Polish university-based scholars during fieldwork and the risks it carries. Our experiences revealed how class differences expressed in language (using academic categories, regional differences) or place of origin (capital city vs. other cities) between the researcher and participants influenced the quality of collected qualitative data. Throughout the research, we encountered participants' anxieties about discussing their earnings, reluctance to describe their living conditions, and efforts to use "proper language." We also faced challenges in positioning ourselves in relation to participants' racist narratives. Our analysis explores how the researcher's position contributes to the reproduction of meanings and narratives and

perpetuates feelings of shame and undeservingness among participants. The presentation concludes with ways of reducing such risks in qualitative research with marginalised migrants.

Employers' Discrimination Against Fathers and Mothers Taking Parental Leave: Evidence from a Choice Experiment

In this study, we examine the consequences of parental leave use for mothers' and fathers' hiring and earning opportunities. This topic is of high social importance given the persistently low uptake of parental leave by men in Europe. In countries where parental leave is granted to fathers on a "use it or lose it" basis, men typically make use of the portion of the leave specifically designated for them but rarely take advantage of the entitlements available to both parents. One of the reasons for this state of affairs might be that employers discriminate against parents who make use of parental leave and penalise fathers more than mothers. This is because men are still expected to be loyal employees for whom work always comes first. We test these hypotheses using a self-designed discrete choice experiment, which allows for the estimation of causal effect and discriminatory practices. We interview 1,000 managers who are asked to assess hypothetical job candidates with randomly assigned genders and varying durations of parental leave taken. We also asked them to answer several questions about themselves (e.g. gender role attitudes, work centrality) and the company they work in (e.g. presence of ideal worker norms). The sample is representative in terms of the employer's gender and the company's size, sector and region. This study is situated in Poland, where a two-month parental leave for fathers was introduced in May 2023, following the implementation of the EU Work-Life Balance Directive. Data collection is still ongoing, and results are not available at this stage; however, data analysis and the final article will be completed by the time of the conference.

MATZNER, NILS* (Helmholtz Centre for Environmental Research GmbH - UFZ, Germany)

OTTO, DANNY (Helmholtz Centre for Environmental Research, Germany)

Carbon Cascadia - a Carbon Dioxide Removal Game

Carbon Dioxide Removal (CDR, also known as Negative Emissions) is positioned by the IPCC as a necessary component for achieving climate goals and is part of Germany's climate strategy. However, methods for removing CO₂ are still not well known. The opportunities and risks of CDR are barely discussed, both among stakeholders and the general public.

In our talk, we will build on the research conducted on biomass-based CDR (bioCDR) in the project "BioNET - Multi-level Assessment of Biomass-based Negative Emission Technologies" to introduce a CDR removal game. Previous stakeholder processes and modelling have shown that bioCDR methods have significant CO₂ removal potential but also face numerous challenges. Furthermore, our research indicates that no single CDR option can provide the necessary contributions to meet climate targets. Instead, a portfolio of methods is required to balance the weaknesses of individual approaches, maximize synergies, and consider co-benefits for the environment and society, alongside the removal potential.

Given this complex situation, the challenge is to clearly convey knowledge about various CDR methods and provide opportunities for discussion regarding their just application and (competitive) relationships to one another. For this task, we designed a serious game called "Carbon Cascadia". It serves both as a communication tool and as a means of scientific data collection to better understand the complex interplay of different CDR options. The game has already been successfully tested in a simplified pilot version with stakeholders. Currently, we are developing it further as an online video game.

MAULSHARIF, MIRA* (Narxoz University, Kazakhstan)

Patriarchal Structures and Gender Attitudes: Barriers to Women's Opportunities, Global Trends, and the Role of Education

Globalization has significantly impacted gender relations, creating tension between global efforts to promote women's rights and traditional cultural norms. While international frameworks advocate for gender equality as a fundamental human right, some societies justify maintaining gender hierarchies through cultural and religious arguments. Over recent decades, Kazakhstan has experienced cultural changes, and gender equality has become a more prominent issue. Deeply entrenched patriarchal norms remain a major barrier to gender parity. These cultural values, transmitted through family and education, perpetuate the belief that women should be subordinate to men, and this patriarchy, supported by kinship and religious values, continues to marginalize women in decision-making processes.

This study explores how patriarchal structures and gender attitudes contribute to gender inequality and limit women's opportunities in Kazakhstan. Using qualitative methodology, 25 interviews were conducted with young Kazakh men and women, aged 20 to 35, examining their perspectives on gender roles. The findings reveal that family upbringing reinforces gender stereotypes, with men often assigned primary status. While society places more expectations on women, men are often justified or supported. Traditional norms that restrict women's freedom are more prevalent among older generations, and education is seen as less influential than social media in shaping understanding of gender equality.

Some informants noted that religion can support gender equality and family values but can also be misinterpreted by followers. Despite these challenges, there is an awareness of how gender inequality should not manifest in family, societal, educational, and career contexts. Globalization, education, career opportunity and internet access have contributed to delayed marriage, lower birth rates, increased female financial independence, and the spread of progressive views, but these advancements often clash with existing patriarchal structures. To address these conflicts, a comprehensive approach is necessary, including reforms in educational curricula and policies that promote gender sensitivity in education and society.

WG11-954.3MAXWELL, CHRISTOPHER* (Michigan State University, USA)
MAXWELL, SHEILA (Michigan State University, USA)
GARNER, JOEL (Retired, USA)*Structural Determinants of Lethal Violence By and Against the U.S. Police*

In the U.S., there is a longstanding and deepening concern about the rate of homicides by and against the police and how these vary across areas and across critical demographics (such as race). This concern has led to numerous studies testing hypotheses about the differences in police-induced homicide rates by jurisdictions. Our literature review of more than fifty studies identified various samples, methods, and measures used in these studies and a lack of consistent findings for any of the tested hypotheses. This study addresses several limitations of previous studies by linking newly collected data from a representative sample of US law enforcement agencies [LEAs] with data collected for the U.S. Census and by non-governmental organizations to bring an alternative view to the debate. Several critical items provided by the LEAs are their annual counts of people shot at and shot by police officers. Using these data as dependent measures, this study re-examines frequently tested hypotheses identified by our review. Additionally, we examine the influence of changing social conditions on variations in the rate of civilian and police use of lethal force. Our analyses use multivariate regressions to produce models that explain the variations in the frequency of violence. The results uniquely show the impact of the tested factors on lethal violence rates and how these factors vary by the target.

RC34-553.2MAXWELL, SHEILA* (Michigan State University, USA)
MAXWELL, CHRISTOPHER (Michigan State University, USA)*How the Prevalence of Drug Use and Timing of First Initiation Influence Risky and Protective Behaviors Among Youth in the United States: Assessing Three Decades of Data*

Since at least the early 1990s, the United States government and non-governmental institutions have invested significant resources into preventing the use of addictive substances, particularly by adolescents. The U.S. federal

government alone spent nearly ½ Trillion dollars between 2012 and 2024 to prevent and reduce drug use. The scientific rationale behind these efforts was a body of correlational evidence that showed that alcohol and marijuana use, particularly early-onset use, were likely "gateways" to numerous more risky behaviors and adverse outcomes. Yet, many prevention efforts tested through experimental trials have produced mixed effectiveness results. It is possible that while drug use is associated with risky behaviors and adverse outcomes, marijuana use, particularly, is not the 'gateway' drug that it is purported to be. Drug use and other risky behaviors are potentially co-occurring behaviors all resulting from stressful life events and other adolescent characteristics. Indeed, investigators have not yet examined systemic changes in drug use patterns by youth over time, and how these changes relate to variations in risky behaviors. Using completed surveys of about 250,000 14- to 18-year-old students from a nationally representative sample collected bi-annually between 1991 and 2023, this study aims to address this gap in research by first examining the degree by which prevalence and timing of first substance use vary over time (years). We then assess whether any temporal changes have, in turn, influenced the prevalence of various risk and protective factors once the sample's demographics are controlled. This latter assessment will examine whether drug use and changes in drug use patterns precede changes in adolescents' risky behaviors since the 'gateway' hypothesis presumes that drug use precedes other risky behaviors.

RC57-867.2

MAYER, ELISABETH* (University of Vienna, Austria)

*Tracing Postcolonialism - Discrimination in the French Labor Market in the Film *Vivre Me Tue**

Images can address topics that are beyond the reach of narrated language and make it possible to connect to the experiences and events of previous generations. It is well known that biographical experiences can manifest themselves in subsequent generations. I will use the example of France to show how colonial history plays a role in the life stories of French men and women of Maghrebi origin.

In a film analysis, I focus on the feature film *Vivre me tue* by Jean-Pierre Sinapi, in which Sami Bouajila portrays the character Paul Smail. Although the film was released in 2002, it addresses a still pressing and relevant issue in French society that shapes the lived life of many: the discrimination faced by individuals in the job market due to their Maghrebian background. To illustrate this, we accompany Paul Smail during his job interviews. I analyse three scenes from the film in which Paul experiences various forms of discrimination. Through the examination of these cinematic representations, it becomes evident how individual experiences are intricately woven into a complex interplay with overarching societal and historical contexts.

My research focus is originally rooted in sociological interpretative-reconstructive biographical research, in which I study visual biographies in particular, which are created with analog and digital images. This has given rise to questions regarding the integration of moving images into biographical research and the treatment of text and image montages. This article aims to explore the use of video material in addition to biographical-narrative interviews, in order to gain deeper insights into social phenomena that are often difficult to articulate linguistically, such as a country's colonial history.

RC38-625.4

MAYER, ELISABETH* (University of Vienna, Austria)

'Youth' in Images – Liminality and Emancipation in Visual Biographies on Social Media

Youth, as a time of coming of age, is characterized by processes of emancipation, particularly through the detachment from family and societal self-positioning. Social media offer a playful way to shape identities, negotiate ambiguities that arise, create new spaces 'without family' and connect with peers. At the same time, analog photo collections remain significant for these biographical processes, complementing the digital realm.

In my presentation, I aim to explore the question of how the liminality of the life phase 'youth' becomes visible through image motifs and practices as a form of visual biographical work. The focus is on the visual self-presentation of a biographer in his mid-thirties. The data material is drawn from my dissertation, which is grounded in interpretative-reconstructive social research and combines image cluster analyses with biographical case reconstructions. A defining characteristic of the selected case is that a visual biography emerges, meaning that biographical communication with images takes place across several phases and areas of life, with particular emphasis on emancipation processes. I show how questions of orientation, which are usually associated with youth, are negotiated particularly on social media and can continue to be of importance in young adulthood.

The aim of this contribution is to explore youth not as a clearly demarcated life phase but to examine how biographical questions associated with 'youth' are negotiated with images. This offers insight into the liminality and ambiguity of this life stage, which is often difficult to define. The presentation highlights how these negotiation processes become visible in visual biographical work and how social media, in particular, provide a pictorial (rehearsal) space.

MAYORA SYNNE, RONALD* (University of Agder, Norway)

Límites Étnicos En La Iglesia Noruega En El Extranjero

Este artículo investiga cómo se crean y negocian los límites étnicos dentro de la Iglesia Noruega en el Extranjero (NCA). Utilizando la teoría de la creación de límites étnicos de Andreas Wimmer, los autores analizan entrevistas y observaciones en seis iglesias de la NCA en los Estados Unidos. Este artículo muestra que el lenguaje emerge como un marcador de límites crucial. Si bien la NCA es inicialmente inclusiva con todos los que se identifican como noruegos, el lenguaje ritual crea una barrera entre los noruegos en el extranjero y los noruegos-estadounidenses. Los noruegos-estadounidenses, especialmente las generaciones segunda y tercera, enfrentan desafíos porque a menudo no hablan noruego, lo que los excluye de la plena participación en rituales como la confirmación.

Además, el artículo identifica la "blancura" como una expectativa implícita dentro de la NCA, a pesar de las opiniones antirracistas del personal. Los autores argumentan que tanto el lenguaje como la blancura funcionan como elementos estabilizadores en la construcción de la identidad noruega. El estudio demuestra cómo, incluso en un contexto aparentemente inclusivo como la NCA, los mecanismos sutiles pueden contribuir al mantenimiento de los límites étnicos y exclusión.

MAYSTOROVICH CHULIO, NATALIA* (University of Sydney, Australia)

Between Two Worlds: Vicarious Trauma in Ethnographic Fieldwork on Exhumations and Francoist Repression

This paper examines the immersive nature of ethnographic fieldwork, particularly when researching the exhumation of mass graves and interviewing survivors of Francoist repression in Spain. Ethnography requires researchers to engage deeply with participants' lived experiences, which, in the context of mass violence, exposes them to traumatic environments. The psychological impact of these experiences often goes unnoticed during the fieldwork itself but surfaces during the transcription and write-up phase, when the researcher has returned to the relative calm of everyday life. This paper highlights the importance of reflection in ethnographic research, but argues that meaningful reflection can only occur with sufficient temporal and emotional distance from the fieldwork, which poses challenges when researchers are still closely engaged with their material. This delayed processing of trauma, compounded by the isolated nature of ethnographic research – particularly for novice or doctoral researchers working abroad – leaves researchers vulnerable to vicarious trauma. The paper seeks to interrogate the emotional toll on researchers conducting participant observation in the context of exhumations. By exploring how they navigate the tension between violent pasts and peaceful present-day environments through their close contact with survivors of political violence. It calls for better institutional support and strategies to mitigate the psychological risks associated with such work.

Colonial Legacies and Intersectional Justice: A Comparative Analysis of Palestinian and Indigenous Activism

This presentation examines the intersectional dynamics of Palestinian movements and their connections to broader global struggles for racial, economic, and gender justice. It also highlights solidarity between Indigenous communities, specifically focusing on the ties between First Nations youth in Australia and Palestinians. Both groups contend with historical and ongoing colonial practices that undermine their cultural identities and access to land, which is essential for community survival. By analysing contemporary activism—such as the BDS movement and local initiatives like the Blak Caucus—this presentation underscores the critical role of youth

in advocating for justice and recognition. Drawing on foundational colonial studies texts, including works by Wolfe, Watson, and Tauri & Porou, it situates these movements within a broader framework of resistance against settler-colonialism, illustrating how local struggles contribute to and enrich global justice efforts. This comparative analysis emphasises the shared experiences of Indigenous communities and the potential for cross-cultural solidarity, underscoring the importance of an intersectional approach in understanding liberation struggles worldwide.

MAZHAK, IRYNA* (National University Kyiv-Mohyla Academy, Kyiv, Ukraine & RCSI University of Medicine and Health Sciences, Dublin, Ireland, Ukraine)

Social Capital and Psychological Well-Being of Ukrainian Female Refugees in Ireland: An Online Survey

This study investigates the relationship between social capital and mental health outcomes, including psychological well-being, perceived stress, depression, anxiety, and PTSD, among Ukrainian female refugees settled in Ireland. Given the forced displacement triggered by the 2022 Russian full-scale invasion of Ukraine, refugee populations are at heightened risk for mental health issues.

This online cross-sectional survey explored various dimensions of social capital—such as relationships with family members, relatives, friends, colleagues, neighbours and locals, participation in Ukrainian community meetings, participation in the Ukrainian religious community, communication with people living in Ukraine, having close one to share their issues with—and their associations with mental health indicators.

A sample of 656 Ukrainian female refugees (2023) aged over 18 years old was recruited through online platforms. Key social capital factors were measured alongside standardized psychological assessments, including perceived stress (The Perceived Stress Scale), depression (Patient Health Questionnaire-9), anxiety (The Beck Anxiety Inventory), PTSD (Post-traumatic Stress Disorder DSM-5), and self-reported mental health of Ukrainian female refugees in Ireland.

The study underscores the critical role of social capital in shaping mental health outcomes among female refugee populations. These findings have implications for policy and practice, highlighting the need for initiatives that strengthen social networks and foster community integration to enhance the psychological resilience of refugees.

The Dual Spread of Disease and Social Norms. Modeling Social Networks and Mechanisms of Stay-at-Home Orders during the Covid-19 Pandemic.

This study examines mechanisms of public compliance with stay-at-home orders implemented in response to the Covid-19 pandemic. Scholars have proposed various hypothesis to explain compliance patterns as the result of media coverage, public policies enforcement and civic capital. However, they fail to explain why some countries such as France had high level of compliance while having low levels of trust in policy makers and medias. We hypothesize that, through their daily interactions, individuals have contributed significantly to the emergence and reinforcement adherence to stay-at-home orders through social control. Using the french 2020 spring lockdown as an example, this article aims at answering to *what extent social networks and interactions have an impact on the dynamics of compliance with public health policies.*

Using data from Google Community Mobility Reports and social surveys conducted in France, we first perform a statistical analysis to find evidence of the existence of such mechanisms. Then, we develop a counterfactual reasoning, using data-driven agent-based simulations to explore compliance mechanisms by systematically comparing model outputs with the actual lockdown compliance curve. Our results reveal significant variation in compliance levels resulting from social interactions, showing that individual compliance to lockdown cannot be properly understood without taking into account social networks and interactions. Our model allows us to better interpret compliance with public health measures as the result of the combined effect of policies, media coverage and social interactions.

Gentrification and Extractivist Touristification in Lavapiés, Madrid. Reasons and Impacts of a Unique Convergence in Contemporary Southern Europe

This paper examines the simultaneous processes of gentrification and extractivist touristification in the neighborhood of Lavapiés, an emblematic area in the historic center of Madrid, Spain. Lavapiés represents a distinctive case in southern Europe, where both trends have coexisted and interacted for years without either process reaching its full development.

In this context, the study delves into the intricate relationship between the dynamics of gentrification and touristification, followed by an analysis of their current interaction in the case of Lavapiés. Through a mixed-methods approach that combines ethnographic research with data from official statistical sources, the analysis demonstrates that the current transformation of Lavapiés is more complex than a simple disruptive touristification, as has occurred in other historic centers in southern Europe, such as Barcelona or Lisbon. In Lavapiés, this process intertwines and competes with other urban processes, such as the renewal of the built environment, the gentrification of residents and businesses, and the territorial precarity and stigmatization of a significant part of the neighborhood.

Thus, the recent emergence of the speculative tourism industry in Lavapiés has led to the displacement of the gentrifiers who arrived in the neighborhood in the late 1990s, as their distinctive lifestyles and consumption practices are increasingly hindered. As a result, the neighborhood is becoming an exclusive (and exclusionary) enclave, characterized by the simultaneous transformation of the traditional commercial landscape into a new disneyfied tourist commercial area and the conversion of family homes, both rented and owned, into high-yield financial assets.

Finally, the analysis concludes by emphasizing the importance of considering local sociopolitical contexts when studying gentrification and touristification, warning that generalist comparisons between cities may lead to misleading conclusions about the transnational dimensions of urban change processes in southern Europe's central urban areas (and beyond).

MAZORRA, ALVARO* (UNED, Spain)

Social Inequality and Residential Segregation in Spanish Global Cities. the Cases of Madrid, Barcelona and Valencia (2001 - 2021)

Over the last three decades, the most populated Spanish cities have experienced significant spatial, social, and economic changes. The new urban economies have played an essential role in the acceleration of such transformations, entailing a range of both positive and negative impacts at the spatial, social, economic, and environmental levels. This paper presents a quantitative analysis of how the advancement of the globalization and deindustrialization processes has encouraged social polarization in the Spanish cities of Madrid, Barcelona, and Valencia, as well as a significant increase in intra-urban socioeconomic residential segregation.

In particular, the globalization of the three metropolises have strengthened their position in the world hierarchy of global cities, becoming important poles of attraction for multinational companies, investments, tourists and qualified human capital. However, the economic growth of these cities has not been endorsed in the social sphere. The period between 2001 and 2011 is clearly marked by the influence of the economic crisis of 2008. The polarization of the occupational structure, the structural decline of industrial employment and the sharp increase in unemployment then fuelled the increase in social inequality in these cities. The consolidation of the unequal dynamics during the period of expansion that began in 2015 highlights that inequality has become a structural element of the current dynamics of the main Spanish global cities.

The research concludes by arguing that the increase in levels of social inequality and residential segregation reflects the trend towards polarized urban models, which reproduce in urban space the differences observed in the social structure. In this context, the growing contrasts observed between the winning and losing areas and groups of globalization suggest that the main social challenge of global contemporary cities is to be able to move towards economic development, without relegating the disadvantaged groups and spaces from the process of modernization

MAZZAGLIA, SILVIA* (University of Milano-Bicocca, Italy)

Young, Beautiful and Temporary. the Outsourcing of Emotional Labour and Interactional Practices between Front-Line Workers and Customers in Milan's «Events Industry»

Within the global urban tourism and leisure industries, the events sector has experienced rapid growth, significantly impacting local labour markets in urban contexts undergoing deindustrialization.

In recent years, the Italian city of Milan has undergone a remarkable proliferation of events. Although this is not a new phenomenon, since EXPO 2015 there has been a noticeable shift toward the rise of a proper events economy, contributing to the creation of a multitude of temporary service jobs.

Among these positions, the labour demand of stewards and hostesses, providing front-line services during events, has increased. Although these jobs are often portrayed as 'side hustles' for students and young people, the reality is far more complex.

First of all, the outsourcing of front-line event workers has significantly expanded in recent years, resulting in the rapid growth of specialized labour intermediaries, which play a central role in recruiting, selecting and managing labour force for events. Moreover, this system has also shifted the quality of employment, prioritising flexibility and cost-effectiveness, which translates into low-wage and unstable working conditions for employees.

Secondly, these roles require significant emotional and aesthetic labour. Therefore, workers are expected to uphold a particular appearance, often reinforcing the processes of gender stereotyping and essentialisation. In addition to this, workers are tasked with managing customer interactions, all while facing intense pressure, fast-paced environments, heavy workloads and strict forms of labour control.

Drawing on ethnographic research conducted in Milan, this paper explores the precarious nature of event-based labour, with a dual focus. First, it examines how employment agencies shape the labour conditions and individual experiences of stewards and hostesses. Second, it investigates the strategies these workers employ to cope with the stress and pressures of customer interactions.

(Un-)Bordering Universities? Staggered Pathways to Higher Education for Displaced Students in Italy

Thriving on the growing literature on refugee participation in higher education (HE), this contribution sheds light on the institutional opportunity structure by examining how universities problematize and redefine social, juridical, and educational boundaries that characterize the participation of displaced students in HE. In doing so, the paper argues that universities are not just educational providers, but also key (un-)bordering actors as they actively shape these dynamics of in-exclusion through dedicated policies, practices, and narratives, defined here as 'bordering practices'. The focus is on Italy, a context whose increasing sensitivity towards displaced students has yet to be thoroughly examined by dedicated research.

Specifically, the paper inquires how Italian universities create obstacles and opportunities for displaced students by delving into the heterogeneity of dedicated institutional provisions implemented by 12 public universities in 2015-2023. More than 160 documents and 50 semi-structured interviews with academic and administrative staff were collected.

Data reveals two important aspects. Firstly, universities create staggered pathways of inclusion, where displaced students face various difficulties at different stages of their academic careers, starting from the selection phase. Secondly, bordering practices occur along three main dimensions of inequalities: geographical, symbolic, and social. First, universities act as gatekeepers in crossing political borders, determining who is granted access to education based on legal and administrative borders (*geographical dimension*). Second, each university provision establishes different selection criteria according to citizenship, educational level, or migration trajectory, thus creating multiple categories of displaced students (*symbolic dimension*). Third, universities also influence the broader academic inclusion of displaced students with the presence or absence of dedicated services and support, which are often provision-based (*social dimension*). Overall, although showing sensitivity towards forced migration, the (un-)bordering practices implemented by Italian universities also create new lines of inequalities between displaced students themselves, directly impacting their educational trajectories.

RC17-256.12

MAZZERO, CRISTINA* (University of Trento, Italy)

Are Some Displaced Students 'More Displaced' Than Others? How University Categorization of Displaced Students Affects Educational Inequalities in Italy.

Decentering the traditional state-centric perspective, recent studies call for a stronger analysis of how other state institutions and non-state actors create and (re)negotiate migrant categories through everyday practices, policies, and narratives (Könönen, 2018). Thriving on this debate, this paper focuses on the higher education (HE) sector and explores the role of HE institutions (HEIs) and university personnel in identifying and categorizing students with a forced migration background (*displaced students*). Usually considered "super-disadvantaged" (Lambrechts, 2020), this category fruitfully unveils the inequalities that categorization practices might produce in granting educational rights. Thus, the paper inquires how HEIs categorize displaced students by delving into the heterogeneity of institutional provisions implemented by 12 public HEIs in the period 2015-2023. The focus is on Italy, a context whose increasing sensitivity towards displaced students has yet to be properly unpacked by dedicated research. More than 150 documents and 50 semi-structured interviews with academic and administrative staff were collected.

Documentary data confirm that Italian HEIs categorize displaced students very differently according to criteria like citizenship, legal status, previous educational attainments, and period of migration. These categories change over time and across provisions, showing HEIs responsiveness to international crises but also to shifting political interests. Overall, these findings suggest that HEIs categorization practices create new lines of inequalities between displaced students in accessing HE. Furthermore, interview data indicate that such differences mirror divergent institutional expectations on students' academic performance and ideas of deservingness and merit. Specifically, HEIs and their personnel find themselves divided between performative and humanitarian logics, whose balance directly affect displaced students' educational rights. In terms of policy implications, findings indicate that adopting the most comprehensive category of "at-risk students" allows universities to recognize the multifaceted and changing factors of risk underpinning displacement and to implement more inclusive provisions.

MCDONNELL, KATHERINE* (University of Galway, Ireland)

INGOs As "Justice Enablers" for Corporate Human Rights Harms?

Access to remedy, accountability, and justice for human rights harms arising from business activities and development projects is a central concern in the field of Business and Human Rights (BHR). According to the UN Working Group on Business and Human Rights, civil society organizations (including International Non-Governmental Organizations (INGOs)) and human rights defenders "have a critical role to play in facilitating access to effective remedies. They are often "justice enablers" for the victims of corporate human rights abuses" (UN Working Group, 2017), tasked in part with translating and sharing relevant knowledge on remedy, and supporting those seeking remedy in their efforts. Drawing from scholarship, primary sources, and reflections from the author's time as an INGO practitioner, this paper critically examines the role of INGOs as "justice enablers" in the context of seeking remedy outside of court for corporate human rights abuses. It focuses on three central questions:

- How is the role of "justice enabler" imagined for INGOs in this context, both by themselves and by others involved?
- How might they fill that role effectively and ethically? What are the challenges in doing so?
- How do practices of power by corporate actors undermine their justice-enabling efforts?

Having access to and experience with relevant "epistemic goods" (Fricker, 2007), namely information related to rights, and to technical and strategic information about engaging in various remedial mechanisms, INGOs may be seen as distributors of those goods. Being tasked with addressing power imbalances in this role, INGOs must also grapple with their potential complicity in reproducing harmful power dynamics (Knuckey, et.al, 2020). This is particularly important, given practices of power commonly employed by corporate actors include framing INGOs negatively (Fuchs and Lederer, 2007). The paper considers how INGOs might, and should, try to navigate their role in facilitating access to remedy, accountability, and justice.

Hope As a Social Practice: Insights from Naturally Living Parenting and Children's Oral Health

Keri Day explored hope as a social practice in motherhood within the Madres de Desaparecidos movement in Argentina, illuminating how hope manifests in everyday, mundane aspects of mothers' lives. We deliberate on how hope itself can be interpreted as a social practice or a "connective tissue" which holds social practices together in complex arrangements.

We position our research at the intersection of the sociology of hope and the sociology of parenting, addressing two key points in Scribano's (2024) agenda for advancing the sociology of hope: rethinking multiple ontologies and a renewal of methodological approaches.

Our study examines how hope manifests in naturally living parenting approaches to children's oral health, studying the interplay between

utopian ideals, growing individualisation, the mundanity of daily life and the romanticisation of the natural as a means of "doing" hope.

Using Social Practice Theory as a theory-method package, we consider hope as both an emotional practice and a connecting element between practices. Our data comes from a practice-based study of naturally living parenting and children's oral health, using qualitative methods to interpret how social practices constitute naturally living parenting.

We explore how hopefulness of a "natural" utopia is reproduced through practices like food choices, health interventions, and resistance to mainstream norms in online and offline spaces. Within these connections, hope is entangled with love, care, responsibility, and guilt, reproduced through daily parenting practice.

Our findings support Day's argument that hope emerges in the messiness of the mundane and extend it by revealing how hope is both a social practice and a connective tissue between practices. This research advances the sociology of hope by demonstrating its applicability to everyday parenting practices and contributes to the sociology of parenting by illuminating the role of hope in shaping alternative parenting approaches.

"the Magic Pill" - Reflections on a Psychiatric Panacea

"I have been mad enough to study reason; I was reasonable enough to study madness" (Michel Foucault)

My desperation to take away the constant pain of living with schizoaffective disorder legitimises and empowers my faith in biomedicine and its psychiatric science, hoping that there is a "magic pill" to cure me, a panacea for mental ill-health. I am subject to the powered space, manifestations and ramifications of the reason and power of psychiatry.

Part of the human experience includes reason and faith and power and pain, and these can be translatable and understood as per relative variable social and cultural contexts. An example of a cultural experience of Madness, that I will examine, is within the hegemonic Western psy-science space, whose biomedical activity is constructed not as a procedure or as a set of principles but as a culture (Latour and Woolgar 2013).

Psychiatry - its science, its reason, its values, its perceived validating measurements, its treatment can be understood as cultural artefacts of psychiatry; 'magical' cultural artefacts, such as the treatment of the 'Magic Pill'. The Magic Pill is an esteemed cultural artefact of psychiatry. Part of the magic of psychiatry can manifest as a hope, allure, belief, and possibly a deception - not offering a panacea after all. The Magic Pill has been developed and augmented over the history of the hegemonic Western psy-science space, within which the phenomena of Madness have been determined, inaugurated, instituted, and intellectualised. Foucault further explains how Madness can be viewed as a factor of biopower (Cisney & Morar 2020)

I will use the method of the "sacred" narrative (Hendry 2009), providing a lens of lived/living experience to understand the magic of psychiatry and the faith we have in it, demonstrated by a discussion of psychiatry's cultural artefacts.

MCNULTY BURROWS, CATHRINEA* (Queen's University Belfast, United Kingdom)

Voice: Notions of Bias, Competency & Institutional Capture within Qualitative Research for Institutional Ethnographer's with Lived Experience of the Ruling Relations Being Investigated..

Dorothy Smith's (1987) sociology of institutional ethnography (IE) emerged to address the objective bifurcation of knowledge whereby ordinary people could no longer see themselves, or their lived experiences within the sociological accounts being created about them. Smith's ontological turn towards a sociology for the people came from listening to the women's voice and taking action. Smith's notes (2021) the aim was to develop a useful methodology that would both capture the actualities of their lives and extrapolate how their lived experiences tied into the wider web of relations to talk back to decision-makers. It was Smith's ontological turn that captured my attention as a traditionally trained sociologist and later drive to pursue a PhD.

Fast forward to three decades later, at the launch of Simply Institutional Ethnography (2021) Smith is reflecting upon a question about her legacy mused she had hoped more sociologists had taken up IE. As a PhD student, I felt sad because I could see its usefulness driving meaningful

progress, however, my attempt to apply the sociology within the context of institution had not been good and I would later fall out of my programme. In actuality, unfortunately had found beginning in my lived experience to locate a door into the social triggered supervisory concerns, overshadowed my voice as a competent researcher, brought my credibility into question and feelings of wrongdoing to the fore.

This paper's aim is to explore the tensions between traditional sociological training and conducting institutional ethnographic work in contemporary academic institutional settings. In doing so, I discuss the key concepts underpinning qualitative working practices being navigated by researchers at the subjective/objective interface e.g. bias, voice, competency, institutional capture and how these are connected to other wider institutional procedures used to guide and assess the work of researchers producing knowledge within the lived experience paradigm.

Erosion of Minority Rights in the 21st Century: Navigating Global Challenges, Postcolonialism, and the Role of AI

Since the beginning of the 21st century, the previously favorable stance towards minority rights, regarded as fundamental components of democratic societies, has begun to show signs of fatigue, if not outright resistance, leading to the erosion of established minority rights standards. As a result, minority rights have increasingly lost prominence on political agendas, overshadowed by other global challenges, including the disruptions caused by climate change, rising global economic inequalities, health crises, increased international mobility, international conflicts, and technological advancements, particularly in media and artificial intelligence. This shift also intersects with the ongoing global debate on postcolonialism, which calls for a re-examination of power structures and a reconsideration of whose voices and rights are prioritized.

Aiming to revitalize the field of minority rights research and reframe the minority rights paradigm amid global challenges, including postcolonialism, this presentation explores the increasing significance of AI systems across various domains of human life, particularly in relation to minorities and the accommodation of their needs and claims. Using Kimberlé Crenshaw's (1989) concept of intersectionality as the main framework, we argue that discriminatory AI is a human-made problem and can therefore only be tackled through a human-centered approach. This approach includes discussing protected attributes and their (in)stability, vulnerability, and essentialist vs. non-essentialist attributions of group identity, as well as focusing on human-made inequalities and power imbalances as the source of biased AI systems. AI models are biased and discriminatory because our societal structures are as well; solutions that only address technological challenges fall short of tackling the underlying issue of inequalities. We analyze the EU AI Act and the European Centre for Algorithmic Transparency as possible strategies for mitigating discriminatory effects through AI governance, and conclude that successfully creating fair AI will not be possible without addressing the societal roots of its discriminatory behavior.

Cultivating Partnerships with Indigenous Communities in Davao City, Southern Philippines

The study analyzes the developments in Catholic church teachings after Vatican II in promoting dialogue with indigenous communities through an examination of documents issued from the Vatican and local Philippine Church. In the light of these, it then aims to examine and analyze the current initiatives of the Josefa Segovia Foundation (JSF) as a faith based organization (FBO) in its efforts to partner with the five indigenous communities of Davao City. The concept of dialogue, various roles of civil society in promoting peace and development and an interdisciplinary ecological perspective was utilized in examining strategies, approaches and innovations in working with indigenous communities. Findings show that JSF views indigenous communities as partners in promoting peace and development in Davao City. They have supported the organization of indigenous leaders, women and youth with their efforts to empower them in accessing services of different government agencies and civil society organizations, by promoting peace and dialogue, education and respect for indigenous culture, and environmental protection.

Indigenous Community Displacement from Their Land and Homes: The Case of the Manobo Indigenous Community in Bukidnon Province, Southern Philippines

The study examines the various factors in the displacement of indigenous communities in Bukidnon Province, Southern Philippines, using concepts related to mobility and an interdisciplinary political ecology perspective. In particular it traces the historical roots of indigenous communities displacement and the social and ecological factors that affected their lives in their ancestral domain and resulting movement or mobility to other places. The roles of government and civil society vis a vis internal displacement of the indigenous community will also be analyzed in an effort to recommend policies and programs to assist these communities.

TG03-962.1

MEDNICOFF, DAVID* (University of Massachusetts-Amherst, USA)

The Politics of Regional Regimes and the Prospects for Addressing Increasing Refugee Crises in the Middle East

Scholars of Arab societies for decades have used the term "azmatology" to describe the Middle East's tendency to always seem in *azma*, crisis in Arabic (e.g., Dwyer 1991). This regional state of crisis appears even more urgent than ever today, with millions of Lebanese, Palestinian and Sudanese adding to the ongoing displacement of nearly 6 million refugees from Syria. As Israel's war in Lebanon and Gaza continues, neither international refugee law nor relevant international organizations have proven able to stem the rising tide of massive human displacement of vulnerable Arab populations. At the same time, the Middle East is remarkable both in its range of regional governance challenges and its entanglement in global resource and military geopolitics. A dearth of regional governance organizations has encumbered the alleviation of problems of mass displacement in the region, while the global significance of the Middle East has likely exacerbated these problems.

Indeed, there are both concrete issues and contested global discourses around international rights and governance that play into the lack of development of regional legal and institutional approaches to collective governance challenges. Building on prior work I have done on human rights and refugee policy in the Middle East, this paper begins by elaborating the importance of the double-edged sword of Western countries' engagement in the Middle East through the oil and weapons economy but also the language of democracy and the rule of law. The internal contradictions of resource and military politics versus liberal political norms have amplified many Middle Eastern states' own tendencies to limit their use of regional and international formal governance norms and structures. Contextualizing these contradictions then allows the paper to consider what changes, and prospects for change, might foster a more effective interplay of regional and international policy towards mass refugee displacement in the Middle East.

RC12-180.13

MEDNICOFF, DAVID* (University of Massachusetts-Amherst, USA)

The Rule of Law and Lexicons of Development and Justice in a Shifting Middle East and North Africa

Two phenomena have typically been true recently regarding the rule of law in Arab states as they seek to expand, or at least retain, their reach. First, judicial review has been minimized in order for it not to constrain executives (e.g., Brown 2001). Second, law has been deployed as a lexicon that can sustain bureaucratic growth and globalization. In such a context, states seek to instrumentalize the rule of law as a technology of public administration, and, sometimes, intimidation.

Nonetheless, legal values across Arab societies are contested complexly domestically, regionally and internationally (e.g., Dupret 2021). However autocratically states may deploy law, this contestation means liberalizing norms around law and justice emerge, and erupt, as they did in 2011 (e.g., Brown and Mednicoff chapters; Bali and Lerner 2017). Governments in the MENA reacted to 2011 in part by foregrounding legal change that they claim enhances the rule of law, a strategy assisted by multifaceted lexical meanings of "the rule of law" itself.

Building on original data from a \$1 million grant project in the Arab Gulf, this paper argues that Arab governments, particularly those with major resources like

Gulf states, have balanced religious and secular tropes around law to underscore technocratic and transnational mediational legal features so as to claim fealty to the rule of law, while avoiding pressures for greater legal accountability or political rights. This effort helps account for the extensive public diplomacy that countries like Qatar and the UAE maintain around the rule of law. Explicating the process of skirting judicial review by hyping law as a technology of growth and globalization links the paper to both panel themes. Specifically, the paper illustrates its argument based on overall legal growth in the post-2011 Arab world, and the recent case of Qatar's legal management of the 2022 World Cup.

RC53-825.3

MEDRANO LOERA, GERONIMO* (Universidad Autónoma Metropolitana, Mexico)

Play in Early Childhood: A Tool for the Construction of the Psychic System and the Sociological Subject

This paper aims to explore how play in early childhood is a fundamental tool for the construction of the psychic system, allowing children to be considered as sociological subjects with agency, rather than merely categories of study. Play is analyzed as a voluntary, symbolic action essential for children's cognitive, emotional, and social development, while also contributing to neurodevelopment by stimulating key areas of the brain involved in integrating the internal (emotions, thoughts) with the external (social norms, rules). This process facilitates neuroplasticity and the consolidation of neural networks that are essential for emotional regulation and decision-making.

Based on the theories of Piaget, Luhmann, Mead, as well as other theorists of child development and sociology, the analysis examines how play facilitates the internalization of social norms, emotional regulation, and the formation of mental schemas, while simultaneously allowing children to develop an autonomous identity and create a sense of agency. Play is a symbolic space where children experiment, learn, adopt roles, rehearse social situations, and develop cognitive and emotional skills, enabling them not only to internalize social expectations but also to actively participate in shaping their social reality.

Furthermore, it is argued that play in early childhood serves as a means of self-regulation and adjustment to social expectations, allowing children to acquire socially determined emotional and social skills expected for adulthood. Finally, this paper highlights the importance of understanding play as a manifestation of children's agency, suggesting a shift in how we conceive early childhood—not just as a phase of development, but as a stage where children actively influence and are influenced by the social structures around them, which has significant implications for child-centered educational and social policies.

MUELLER, ALEX (Charité Universitätsmedizin Berlin, Germany)

"We Must Finally Deport on a Grand Scale": State Violence in Germany in the Context of Israel/ Palestine – Public, Personal and Affective

Over the past 12 months, the German state has aggressively expanded restrictions on expressions of solidarity with Palestine. This ranges from bans on demonstrations in various federal states following 7 October 2023, to the prohibition of wearing kuffiyehs at schools and public places, to banning any language other than German or English at protests, to erecting police check points at the entry of largely immigrant (Arab) neighbourhoods. At the same time, the state has actively encouraged, and participated in, expressions of support for Israel, as well as directly politically and financially supporting the Israeli state. It claims this as its 'Staatsräson' (raison d'état), threatening those that do not conform to this orientation toward Israel with censure and, in the words of chancellor Olaf Scholz, "deportation on a grand scale". In this political economy of emotions (Ahmed, 2004), the nation is consistently oriented toward a love relationship with Israel (Dochartaigh, 2007). By contrast, migrants and racialised people are seen as threats to public safety and as contagions of antisemitism and become objects of hate – unwanted, unrepresentative, and ejectable, feeding from and into ever-more-popular right wing populist anti-immigrant narratives. Drawing on our own observations as scholars living in Berlin, and an analysis of media and state policy, we describe how through the restriction of basic civic and political rights, the German state constructs migrants and German racial minorities as dangerous 'others', the rightful subjects of state control and violence. We then examine the impact of sustained state violence over the last year on migrants' and racial minorities' mental health and feeling of (un)belonging and (un)safety: drawing on quantitative survey data and in-depth interviews from an on-going study, we show that migrants and racial minorities living in Berlin experience state power as pervasive, controlling publics, persons, and affective lives.

RC47-736.4

MEHRA, ANAND* (University of Delhi, India)

The Forgotten Dalit Land Movement: A Struggle for Sovereignty and Land Rights in Postcolonial India

This study delves into the overlooked Dalit land movement in Haryana, India, from a postcolonial lens. In 1965, 3,000 acres of government land were allocated to landless Dalits, but dispossessed in 1973 for state projects, sparking a 113-day satyagraha. The Republican Party of India and leader Chaudhary Chand Ram mobilized 27,000 protestors in Delhi, facing mass arrests and casualties. The movement's eventual success, secured by Prime Minister Indira Gandhi in 1979, restored land ownership to Dalit tenants.

This movement represents resistance against internal colonialism, exemplifying struggles for sovereignty and autonomy within India's postcolonial framework. It is a significant case of marginalized communities resisting dispossession and advocating for equitable land rights. Yet, the movement remains largely unrecognized, highlighting the necessity to decentralize perspectives on subalternity and power geographies.

By engaging with this history, the study contributes to broader discourses on social movements, intra-nation resistance, and the ongoing fight for socio-economic justice in postcolonial contexts. The movement also demonstrates a critical aspect of environmental and land colonialism, where state projects challenge the rights of marginalized communities. Such localized, decentralized struggles provide fresh perspectives on the historical and contemporary dynamics of power and dependency.

MEHTA, SHRAY* (Queen Mary University of London, United Kingdom)

Anti-Colonialism in the Vernacular: Swami Sehajanand and Anti-Caste and Anti-Colonial Peasant Intellectual Thought in India

Writing in the 1910s Swami Sehajanand, a Hindu saint and later the founder of the Indian Peasant's Front which later became the Communist Party of India, started his intellectual career as an advocate of Brahmanical supremacy. By the end of his intellectual career by late 1940s, he had broken all his ties with any caste organizations and created anti-imperial peasant struggles by arguing that for the collapse of imperialism it was necessary to confront the caste system in India. He was a strong critic of Gandhi's anti-colonial thought and centered caste as the main target of his politics and thus challenged both Gandhi and the Indian National Congress's strategy of fighting the British. He thus saw the breaking of the feudal land relations in India as central to contesting imperialism in India.

This paper will build an intellectual biography of Sehajanand's anti-colonial thought by engaging with a newly discovered archive of his work which contains hitherto untranslated and unexplored works. These new sources were chanced upon while working on a larger project of an oral history and a political ethnography of the Communist Party of India.

The paper will contribute to the sociological knowledge of anti-colonial thought by introducing the centrality of caste as a social relation to the success of colonialism. Sehajanand's thought provides a window to explore the dialectic of caste and colonialism and the challenge of confronting them simultaneously.

Post-Colonial Nations, Populism and the Enemy of the People: Situating Modi in the Past and the Present of the Indian State

This paper argues that populism in post-colonial nations is based not on the idea of 'the people' but on the idea of the 'enemy of the people'. This 'enemy of the people' is constructed historically and includes political parties that mobilized for, and failed to enforce, revolutionary political change. While political parties create, as opposed to just mobilizing, cleavages it is not understood as to what happens when the attempts to create these cleavages fail. I demonstrate that the resultant 'failed articulations' get institutionalised in the judicial, political and popular history in the form of 'the enemy of the people' and these failed articulations in the past hamper emergent anti-authoritarian politics in the present.

I make this argument through an archival and ethnographic case study of the political idea of the 'anti-national' in India. Using archives from 1920 to

2014, covering the terrain of anti and post-colonial politics, I historicize the idea of the 'anti-national' as it goes from having a fluid meaning to becoming a consolidated legal term and bring forth the various legislations that were passed, over decades, to curb 'anti-national' political parties and social movements which challenged the hegemonic state. Further, through a sixteen-month-long ethnography of emergent anti-authoritarian movements in India led by the Communist Party of India and Dalit organizations, I demonstrate how this historical concept has been expanded by the Modi government to undermine the emergence of oppositional politics.

In doing this, I bring to bear the importance of colonialism and its impact on emergence of populism in postcolonial nations and thus chart a distinct trajectory of historicizing populism in the global south. Methodologically, I argue for archival and ethnographic 'immersion' to be built into historical sociological projects to appreciate path dependency and historical contingency in which political articulations succeed and fail.

Maneuvering between Cultures: The Reception of Hospice Care in the Chinese Medical Community and Implications for Health Policy

The expansion of hospice care worldwide has been received differently by medical communities in different societies. Nonetheless, the existing effort to explain how culture affects the reception of hospice care is inadequate. Based on fieldwork conducted at Chinese medical institutions and care facilities between 2017 and 2022, this paper draws on a theoretical framework that distinguishes between declarative culture and nondeclarative culture to explain the discrepancies between healthcare professionals' beliefs about the value of hospice and their daily healthcare practice. Moreover, I want to demonstrate that the culture of hospice care and the culture of medical institutions are not separate, independent entities but rather are in "constitutive relations" that bring out specific forms of hospice care and influence the design and implementation of health policy in the Chinese context. The above analysis helps clarify the obstacles and opportunities faced by hospice care in China and contributes to existing research on the reception of hospice care worldwide.

The Body in Representation and What That Means for Promoting an Inclusive Democracy

In recent years, scholarship on the radical right has displayed an increasing interest in understanding its gendered aspects and what radical right political leaders and members of parliament ventilate. Scholars have unpacked the hegemonic white, binary, cisgender, heteronormative conceptions of femininity and masculinity that obfuscate any intersectional differences, and revealed how radical right discourses on sex, gender and sexuality propagate a toxic masculinity and a reactionary conception of femininity. Increasingly, feminist scholars investigate how members of parliament and other political or social actors engage with defending and strengthening gender and LGBTIQ+ equality and rights to counter radical right, often labelled anti-gender initiatives, focusing on strategies, coalitions, and mechanisms of resistance or opposition. Much of this work sees a political arena, which for decades has been considered a main hub to promote equality and an inclusive society, turning increasingly hostile, inaccessible, shrinking, or even disappearing. This paper will address one particular aspect of this issue, focusing on the body of political actors. Literature on political representation pays a lot of attention to what politicians say and do while little attention is paid to how messages get constructed, supported or undermined relying on the body, be it intentional or not. This paper would like to look at attacks of radical right political actors focusing on the body and how it is used to convey anti-gender messages attacking the equality acquis. First, it will discuss how bodies become politicised and accrue meaning in themselves, as strong carriers, or symbols of their views on sex, gender, and sexuality. Second, it will address the question of what to do with this from a feminist point of view when it comes to the repertoire of strategies they can rely on to counter anti-gender attacks.

Analysis of the Ecological Consequences of International Armed Conflicts: A Preliminary Review

This paper examines the ecological consequences of military activities in two emblematic cases over the last five years (2019-2024). Our approach is based on a qualitative metabolic analysis rooted in urban political ecology and social metabolism. By focusing on the transformation of most affected ecosystems through conflict, the study investigates how military operations reconfigure socio-ecological structures and systems, exacerbating environmental injustices and generating ecological degradation.

By focusing on environmental degradation as both a consequence and a weapon of war and drawing on frameworks from political ecology and social metabolism, the research explores how the material flows of warfare—including resource extraction, energy consumption through manufacture, transport, utilization, and waste generation including emissions—intersect with existing power structures and environmental vulnerabilities in select areas in Ukraine and Palestine. The study emphasizes the disproportionate impact on communities, examining how military activities amplify pre-existing inequalities in resource access and environmental quality, leading to forced displacement.

Through a critical analysis of secondary data, including spatial analysis, environmental impact reports, and policy documents, the paper maps the biophysical and social consequences of those two international conflicts which recently drive media attention, multilateral involvement and costed great environmental social degradation. This article considers how destruction of infrastructure, contamination of water sources, and degradation of agricultural lands reshape the urban fabric and social structure.

This research not only contributes to ongoing debates in urban political ecology, but also advances our understanding of environmental justice in conflict zones. It demonstrates the need for a more detailed framework that takes into account the complex interplay between military operations, social metabolisms, socio-ecological vulnerabilities and power structures.

Construction of 'useful Others'? Neoliberal Logics and the Emergence of Agency in the Austrian Labor Market

The following article presents a critical examination of the categorization and differentiation of young mobile individuals (YMI) within the context of Austrian labor migration. The analysis is centered on the agency of these individuals and, consequently, on the structural and symbolic dynamics that shape their experiences. In light of demographic shifts across Europe and the persistent labor shortages in Austria, the recruitment of YMI is increasingly regarded as a pivotal strategy for sustaining social and pension systems.

By employing Degele and Winker's multi-level analysis, this study illuminates the structural dimensions and symbolic representations that shape the lives of YMI at various levels. On this foundation, the research adopts a dual approach. This entails the integration of structured interviews with key stakeholders in the field of labor migration to examine institutional contexts, coupled with the utilization of narrative interviews to elucidate the lived experiences of YMI.

The objective is to examine the processes through which YMI are constructed as "useful others". This necessitates the identification of the structural and symbolic dimensions that shape both access to labor market resources and social benefits, as well as the agency of these individuals.

Preliminary findings indicate that YMI are situated in disparate economic and social contexts as a consequence of the interplay between gender, origin, age, and class relations. These positions are shaped by the influence of heteropatriarchal, colonial and neoliberal logics. Individuals are considered "useful" if they provide economic benefits, yet they must also conform to cultural norms, as postulated by Kourabas (2021) in the concept of "ambivalent concurrency."

This study contributes to a broader discussion on social participation and integration in contemporary migration policies, and serves to highlight the urgent need for political and institutional reforms to promote inclusivity in education, the labor market, and social services.

The "Grey Digital Divide": A Longitudinal Analysis of ICT Attitudes Among Italian Older Adults

This longitudinal study examines the evolving digital engagement of older adults in northern Italy, addressing the critical intersection of population aging and societal digitalization. The literature consistently demonstrates that older adults often exhibit lower digital literacy and technology usage, potentially leading to social exclusion. This research aims to provide a comprehensive analysis of changes in digital engagement over time, informing targeted interventions to enhance digital skills and promote active aging.

The study employs a quantitative approach, initially comparing data from 1,381 questionnaires collected in 2019 and 2022, capturing perspectives before and after the Covid-19 pandemic. The research investigates: 1) changes in the frequency of digital device usage; 2) self-reported comfort with technology use as a proxy for digital literacy; and 3) attitudes and motivations related to technology and digital education among Italian adults aged 60 and over.

Preliminary findings from the 2019-2022 comparison reveal an increase in the frequency of digital technology use among older adults post-pandemic, albeit still low in absolute terms. This increased usage was not accompanied by improved comfort or perceived ease of use, suggesting that the pandemic-driven push towards digitalization did not necessarily enhance digital literacy or motivation for improvement. Counterintuitively, attitudes towards the digital technologies appeared to have deteriorated rather than improved post-pandemic.

To provide a more comprehensive longitudinal perspective, a new data collection based on the same methodological approach is planned for spring 2025. This extension will allow a periodic comparison in three-year steps (2019-2022-2025), providing insights into the long-term evolution of digital engagement among older Italian adults. The findings of this study can provide valuable input for policy and intervention strategies aimed at addressing the "grey digital divide" in the context of ongoing digital transformation.

MELE, VINCENZO* (University of Pisa, Italy)

A Vitalist Turn in the Last Generation of Critical Theory?

The 'third' and the 'fourth' generation of the Frankfurt School – Axel Honneth and his student Rahel Jaeggi – tried to redirect critical theory out of the 'ice-desert of abstraction' (Adorno) back to a possible concept of 'good life'. Drawing from – and renewing – Honneth's analysis of the social pathologies of recognition, Rahel Jaeggi attempts to elaborate a Critique of forms of life (Jaeggi, 2018). Jaeggi is convinced that Habermas' exclusive attention to the question of ethics and normativism has produced an analytic neutralisation toward any form of individual life and all its potential emancipative properties. Within this conceptual frame the critique of form of life is not conducted from an external authoritarian perspective, but from an immanent perspective. Like Georg Simmel taught us in his major *Sociology* (2009), we should consider the forms of social life as arising from the reciprocal relations of intentional individual actions. In every form there is an 'immanent transcendence', strictly connected to the process of life: the dialectics of 'more life' – the immanent side of life – and 'more-than-life' – the transcendent one. These are two complementary aspects of life within a dialectical scheme which is open and tragic, since it never ends, and has no final synthesis. Even if Jaeggi seems to disempower Simmel's possible contribution to an immanent critique of forms due to her pragmatist approach in terms of a 'problem-solving' attitude towards life – life is viewed as a process of accumulated experiences that does not know 'springs' or 'new beginnings' – at the same time her form of criticism intends to be immanent and transformative: it is immanent because it starts from the immanent crisis of social practices and institutions; it is transformative, as it allows for a transcendence of context.

Anti-Migrant Populism and Simulated Embeddedness in Eastern Europe

Based on the analysis of an emerging excellent recent literature on an authoritarian turn in the region and my 2023 book of "The Migration Turn" anti-migrant populist rhetoric is not only an instrument of authoritarian governments, but it is part of a real historical event and represents the emergence of a new epoch. The Eastern European developments have been shaped by the interplay of global and local demographic transformations, a wave of marketization, and

structures of migratory capitalism— appearing in ideational processes as reification and a sense of biopolitical competition. Eastern Europe is not a passive victim in this historical change, but it has been legitimizing the neoliberal order for a longer period of time and it is now questioning some of its consequences without any systemic critique. This has led to the isolation of humanitarian discourses and the rise of anti-migrant populism. These discursive developments have also been facilitated by the particular varieties of migratory capitalisms and mechanisms of unequal exchange in the region that have been accompanied by a demographic and migration panic and a nationalist claim for further sovereignty and national emancipation with regard to intra-European hierarchies. After summing up some points concerning local-regional development, the paper ends with reflecting on why the enormous tensions of marketization and the reification of migration (the migration turn) have become immanent engines of change. I will also argue why we should speak about neoliberal nationalism and populism as stated by Joppke, and why these changes do not represent a Polanyian double movement and why the claim of rising embeddedness in this respect needs more careful consideration. It seems that it is better to talk about a simulation of embeddedness as a new form of populism, when we confront a deepening crisis of the neoliberal regimes.

La Migration Des Étudiants Marocains : Entre Pauvreté Sociale Et Quête D'intégration Économique Et Culturelle

Cet article aborde la migration des étudiants marocains vers l'étranger sous l'angle de la pauvreté sociale et de l'exclusion, en mettant en lumière l'impact des conditions économiques et sociales au Maroc, telles que la pauvreté et la précarité, sur le désir d'intégration sociale et économique. En s'appuyant sur le cadre théorique de Serge Paugam concernant «l'intégration inégale», il analyse les facteurs qui poussent les étudiants à quitter le pays, notamment la faiblesse des politiques publiques, le manque d'opportunités professionnelles et l'exclusion sociale. L'article examine également la possibilité d'un retour de ces étudiants après avoir achevé leurs études à l'étranger, en explorant si ce retour est motivé uniquement par des raisons économiques ou s'il inclut également des dimensions sociales et culturelles. Cette analyse est liée aux politiques migratoires marocaines et internationales, en mettant l'accent sur le rôle de l'État marocain dans l'encouragement au retour des compétences et sa contribution à la lutte contre la pauvreté et la précarité sociale, dans le but de bâtir une société plus inclusive et intégrée.

Normalization of Precarity after the Financial Crisis in Greece and Spain

The contribution explores the distinctive form of precarity that emerged in Southern European countries Greece and Spain, in the aftermath of 2007/08 financial crisis. Over the past decade, these two semi-peripheral states implemented extensive labour reforms, that significantly contributed to the widespread rise of precarious working and living conditions. It is argued that the precarity has taken on a contradictory form, becoming „normalized“ in the subjective perceptions of individuals regarding both present and future expectations. The normalization occurs as working and living conditions deviate from established normative standards but are nevertheless accepted as the limits of what is realistically achievable within these societies. The adaption to these limitations, particularly through lowering of expectations, emerges as the key mechanism by which precarious workers internalize and accept their precarious status. The analysis is based on qualitative interviews with young professionals without pre-crisis working experience. The findings, especially the divergence between normative and realistically achievable standards, are discussed in the conclusion, in the context of different conceptualizations of precarity in the North and South.

Changement Climatique Et Transformation Des Rapports Sociaux Du Genre Dans La Commune Rurale De Meski, Région De Daraa Tafilelt. Maroc

Le changement climatique (CC) transforme non seulement l'environnement physique mais aussi les rapports sociaux au sein des communautés rurales. Au Maroc, les femmes, souvent responsables de la gestion des ressources domestiques et agricoles, sont particulièrement vulnérables aux effets des changements environnementaux. Notre communication cherche à appréhender les transformations des rapports sociaux du genre dans les communautés rurales au Maroc sous l'effet du CC. Elle se base sur une étude de terrain menée dans la commune de Meski située dans la province d'Errachidia, région de Draa Tafilalet au Maroc. L'étude est basée sur l'observation directe de terrain, une douzaine de focus groupe auprès des femmes et des hommes, une vingtaine d'entretiens semi-structurés avec différentes catégories d'acteurs et parties prenantes directement ou indirectement concernés par les questions du genre et CC. Nous montrerons comment la contrainte climatique qui caractérise la région de Draa Tafilelt (climat semi-aride de type saharien) a chargé le calendrier de travail domestique et productif des femmes et intensifié leur contribution à la gestion des ressources naturelles et aux activités productives. Sous l'effet de la contrainte climatique, les normes inégalitaires de genre se renforcent en matière d'accès aux ressources naturelles et aux politiques de soutien mises en place par l'Etat pour atténuer les effets de la sécheresse. Il ressort aussi que les inégalités de genre en matière de pouvoir de prise de décision au sein de ménage et de la communauté persistent mais des nouvelles dynamiques de pouvoir, de prise de décision et d'autonomisation en faveur des femmes et des jeunes filles apparaissent. La contrainte climatique nous donne ainsi à voir les capacités d'action des femmes et des jeunes filles rurales pour déjouer les normes établies de genre et contourner la domination masculine

Les Nouvelles Perspectives De La Sociologie Des Groupes Professionnels Dans Le Contexte Académique Marocain

Les groupes professionnels qui se sont imposés comme des objets importants et toujours renouvelés en sociologie n'ont historiquement occupé qu'une place marginale dans la foisonnante production sociologique marocaine. Celle-ci a été plutôt axée sur d'autres objets tels que l'étude des tribus, de la religion, de pouvoir politique, des élites et du sacré. Les questions portant sur la famille, la femme, l'islam, la politique et la religion continuent à occuper une place centrale dans les publications des sociologues marocains que ce soit en arabe ou en Français. Mais des nouveaux objets émergent en lien avec les transformations de l'économie et la société marocaine tels que le travail, les professions et les métiers.

Dans notre communication, nous proposons de montrer comment et pourquoi la sociologie des groupes professionnels s'est éclipsée au profit de la sociologie politique et de la sociologie rurale dans la trajectoire académique marocaine avant de connaître un regain d'intérêt. Les groupes professionnels ont émergé comme des nouveaux objets en lien avec les nouvelles dynamiques de la vie économique et sociale marocaine : développement et multiplication de salariat, évolution et diversité sans précédent des activités productives formelles et informelles, émergence et développement d'une manière simultanée des professionnalités contemporaines, des métiers organisés et bien établis mais aussi des petits métiers à bas statut, précarisés et sans reconnaissance sociale. Le décryptage de ces dynamiques professionnelles n'a pas manqué de susciter l'intérêt des chercheurs marocains. Des nouveaux thèmes sur le travail, le salariat mondialisé, les métiers et les groupes professionnels ont émergé dans le prolongement des travaux sociologiques conduits principalement en Europe. Se pose alors la question des postures méthodologiques et des catégories d'analyse adoptées par les chercheurs pour appréhender les situations des groupes professionnels dans le contexte social marocain.

MELLAKH, KAMAL* (Faculté des Lettres et Sciences Humaines de Mohammedia. Université Hassan II de Casablanca, Morocco)

Les Pharmaciens D'officine Entre L'Etat Et Le Marché Au Maroc : Un Groupe Professionnel Sous Influence

Notre proposition de communication porte sur la situation paradoxale dans laquelle se trouve les pharmaciens titulaires d'officine au Maroc. Ce groupe professionnel à caractère libéral se trouve tiraillé entre les injonctions de l'Etat et les pressions du marché. La profession pharmaceutique s'est progressivement imposée depuis l'indépendance du Maroc comme une des professions libérales les plus valorisées scolairement et socialement. Cette profession a été introduite au Maroc par le protectorat Français à travers la figure du pharmacien militaire et de pharmacien hospitalier. Après l'indépendance du pays en 1956, l'Etat a maintenu le modèle Français d'organisation de la profession en lui injectant une dose de marocanisation. L'Etat a octroyé aux pharmaciens le monopôle de la vente des médicaments tout en leur imposant une politique de fixation de prix et de régulation pharmaceutique au nom de la préservation de la santé publique. Les pharmaciens se retrouvent ainsi continuellement face aux injections de l'Etat qui ne cessent d'intervenir pour contrôler le prix de médicament. Ils doivent également faire face à la puissance des industriels et des laboratoires pharmaceutiques qui agissent pour contrôler en aval le processus de production et de distribution des médicaments et à l'influence des médecins qui cherchent à contrôler l'achat de médicament à travers l'ordonnance et la prescription médicale.

Perceptions Sexo-Spécifiques Du Changement Climatique Et Ses Effets Dans L'Oasis De Figuig, Région De L'Oriental. Maroc

Au Maroc, les femmes subissent les effets néfastes du changement climatique (CC) plus que les hommes notamment dans le milieu rural. Dans les zones oasiennes, les femmes font d'autant plus face à la vulnérabilité climatique puisque 60% de la production agricole est faite par des femmes oasiennes. Du fait des conditions socio-économiques et juridiques différenciées entre les deux sexes, les femmes oasiennes sont beaucoup plus vulnérables face aux effets des CC. Notre communication cherche à comprendre les perceptions et les effets sexo-spécifiques des changements climatiques au Maroc. Elle se base sur une enquête de terrain menée par entretiens et observations directes dans l'oasis de Figuig, située dans la région de l'oriental. Nous montrerons que les hommes et les femmes dans l'Oasis ont des perceptions et des préoccupations différentes à l'égard du changement climatique et ses effets. Les perceptions formulées sont régies par les normes de genre et les rôles socialement assignés aux femmes et aux hommes. Sous l'effet des contraintes climatiques (pénurie d'eau, la sécheresse répétée, crues, inondations, températures élevées, etc.), la charge des tâches domestiques devient plus importante, ce qui a intensifié la contribution des femmes oasiennes à la gestion des ressources naturelles et aux activités productives. Les CC ont limité les ressources que les femmes utilisent de façon spécifiques dans leurs activités génératrices de revenus tirées de l'agriculture et l'élevage. Ils créent, également, des contraintes supplémentaires qui aggravent l'accès des enfants, en particulier les filles, à l'éducation et à la santé.

Affirmative Action and Epistemic Changes: The Emergence of the "Sociology of Emergencies"

One of the most effects of the implementation of the affirmative action policy in higher education is the increase in the presence of black students and students from lower classes at universities. The entry of this public means that new subjectivities become part of a universe, which until then was mainly

made up of white, middle-class people. The "traditional" public of the Brazilian university system has been accused of collaborating in the reproduction of what sociologist Guerreiro Ramos calls "sociologia enlatada", that is, a sociological practice that largely reproduces Eurocentric knowledge in an uncritical way. Students from affirmative action tend to provoke epistemic changes in their work.

Epistemology, as a theory of knowledge, investigates the standards used to evaluate knowledge or why we believe that what we believe is true. Patricia Hill Collins assert that this is not an apolitical study of truth, but that epistemology indicates how power relations determine what is believed and why. The sphere of discussion around epistemology is important because it determines the questions that deserve investigation, the interpretative references that will be used to carry out the analysis and the purpose of knowledge.

The proposal of this communication allows us to think about how the process of racialization materializes in the production of knowledge by students. Scientific practice, far from being something neutral and objective, is fraught with several subjective aspects. The question is how and why race, in its social connotation, intervenes in the process of knowledge production. In other words, how black and brown students choose their objects of study and develop their postgraduate research in sociology. Thus, the processes of decolonization of the academic environment are focused.

MELOTTI, MARXIANO* (Niccolò Cusano University, Rome, Italy)

Mafia As a Difficult Heritage: Cultural Commodification and Urban Tourism

Mafia and, more broadly, organized crime represent an unavoidable aspect of contemporary society and the life of many communities. Over time, they have become part of the cultural landscape in many areas, and through the sedimentation of cultural stereotypes often conveyed by the media, they have also become a significant element of the tourist image of these regions.

From this perspective, the mafia constitutes a "difficult heritage," an aspect of historical and cultural identity that local communities, territorial stakeholders, and national agencies struggle to manage but nonetheless exploit as it becomes fully integrated into processes of heritage-making and tourism.

A series of converging mechanisms ultimately result in the commodification, banalization, and touristic exploitation of the mafia.

The liquid and post-modern culture of our society (even though it may be in a phase of transition) accelerates the processes of banalization and commercialization of history and cultural heritage. This also contributes to the banalization and touristic exploitation of the mafia, which is transformed into a tool for commercial theming, territorial marketing, and emotional and experiential tourism.

This process is further driven by a broader trend toward the patrimonialization of every cultural and social expression, promoted by both national and supranational agencies that protect cultural heritage, as well as by stakeholders seeking to highlight new attractions for their territories.

At the local level, the social and economic fragility of many areas (whether individual neighborhoods, entire cities, or regions) drives parts of the local community to capitalize on the tourist appeal of the mafia, responding to and regenerating the "tourist gaze" of visitors. These processes can be seen as forms of reappropriation of one's past (and potentially legitimate).

The paper examines several significant and paradoxical cases of the mafia's exploitation as a heritage element and tourist attraction.

MELOTTI, MARXIANO* (Niccolò Cusano University, Rome, Italy)

Museums and the Challenge of Contemporaneity: New Narratives between Sensitivity and Rhetoric

The relationship with community and society is a constitutive aspect of the museum. This is a dynamic relationship that, albeit in a discontinuous way, reflects and accompanies sociocultural and sociopolitical change, allowing museums to maintain a central role in the life of the communities at a local, regional, national and even supranational level.

The gradual decolonization of collections and narratives reflects a new, more inclusive and post-national concept of heritage, which simultaneously mirrors new dynamics of globalization and international balances, as well as new awareness within the local community.

The increasing focus on sustainability shows the assimilation of a significant cultural and economic paradigm shift, necessary to maintain a connection with younger generations and to respond to their demands. Similarly, attention to issues related to the role of women in society and art, and more broadly to gender identities, highlights the museum's adapting to a transforming society. Participatory dynamics, increasingly valued, reflect a renewed dynamism from the community and an interesting bottom-up process of re-appropriation of museums and heritage.

However, let's not forget that museums are still part of more complex territorial dynamics related to urban policies, tourism and gentrification (including iconic buildings by star-architects, blockbuster exhibitions, Michelin-starred restaurants inside museums, etc.), which reveals their dependence on financial and political mechanisms.

Does the attention to new sociocultural demands truly reflect the assimilation of ongoing sociocultural change? Or is it a sophisticated (not necessarily conscious) form of exploitation and commodification of new sensibilities, through which museums reassert their centrality in community mechanisms and regain an increasingly fragmented and hard-to-reach audience? With these practices are museums responding to the needs of powerful stakeholders and adapting to institutional and territorial processes, where museums represent a tool for urban competition, territorial and tourist marketing, and place-branding aimed at enhancing the attractiveness of territories?

Public Sociology and the Collective Co-Production of Knowledge with Roma/Ciganos

There are still severe limitations regarding systematic, up-to-date, and in-depth knowledge about the conditions and living conditions of Roma/Ciganos people in Portugal, which is an obstacle to monitoring the impact and effectiveness of public policies and the processes of including this population. "Public sociology brings sociology into a conversation with publics, understood as people who are themselves involved in conversation." (Burawoy, 2005, p. 7) In this context and from this perspective, we have undertaken a study that seeks to overcome these shortcomings, committing itself from its conception to its implementation, monitoring, and publication to actively promote the active participation of people and groups of Roma origin, making them protagonists in the process of the social construction of knowledge about themselves. In other words, based on a multi-method strategy that is still being implemented, the aim is to implement a more inclusive strategy of collective co-production of knowledge, research "with" the Gypsies/Roma and not "about and for" them (Ryder, 2018). In this process, we aim to involve Roma organizations, informal groups, and other institutions that work closely with this community at various scales (local, regional, and national). The aim is to produce recommendations regarding public policies that efficiently and effectively combat the different levels and forms of inequality and discrimination. This research aims to unveil and analyze the cultural, ethnic, social, economic, symbolic, and geographical diversity and heterogeneity of people and collectives of Roma origin in Portugal and to adopt an intersectional perspective that intersects and interrelates various factors that are at the origin of mechanisms for the production and reproduction of social inequalities, from a multidimensional and multilevel perspective. Research "with" implies bridging the gap between academics, activists, and policy-makers.

Discussing the Challenges of a Sociology of Global Elites

Elites are under scrutiny and the field of elite research has flourished as both a critical observer as well as an active reporter of practices, consumption and cultural meanings associated to privilege. I discuss four challenges derived from editing the Oxford Handbook of the Sociology of Global Elites:

1) how to address the issue of power in globalised but also situated contexts, varieties of capitalism and stages of neoliberalism in different parts of the world?; how to bring to the forefront sociohistorical accounts that arise from the critical encounter and disruption with theories produced in the Global North.

2) how to address contemporary forms of elites' internal fragmentation, distinction and diversity?; Is this a matter of studying elites in different fields (political power, culture, economic power, public bureaucracies, sciences, among others)? Is there space for new elites (indigenous people, orange economy, etc.)?; How to adopt a relational and dynamic perspective

to hierarchies and fragmentation within contemporary elites, as well as to their relations with and boundaries drawn towards other groups and social classes?;

3) how to address space?: how to respond to recent calls for more attention to the multidimensional urban geographies and demographics of elite reproduction and transformation by giving particular relevance to cities and urban landscapes as key arenas where capital accumulation, consumption take place? what is the role of contemporary elites in shaping cities in different parts of the world; exploring the role of the elites in redefining urban civic and financial centers; understanding the ways in which the elites define urban reputations, aesthetics and senses of belonging at different urban scales, etc.).

4) what to do conceptually?: are we addressing correctly contemporary forms of social reproduction among the elites? what is the role of other notions such as privilege or wealth accumulation?

Entangled Platforms: Brazilian Migration and Food Delivery Struggles in the UK

This paper takes the case of Brazilian food delivery workers organizing in the UK to demonstrate how migrants can buttress the local labour power, even in such adverse conditions. While research acknowledges that migrants are the majority of the labour force in this industry, especially in the Global North, little is known about the detailed consequences for the labour processes and collective action. Moving from the discussion on how the food platform economy is shaping migration globally, this research sheds light on how this industry is being (re)shaped by this particular composition of its workforce.

The concept of 'platform migration', along with the Marxist theory of class composition, provided the analytical route to understanding how both 'platforms' (of delivery and of migration) are integrated. While platforms have benefited from migration, mainly by providing access to a larger pool of potential workers with little or no social protection, this dynamic has also produced the conditions for workers to respond and react. The migrant condition creates common ground cutting across all aspects of this industry, from the labor process and life experiences to collective forms of resistance and organization. It is by no accident that most organic strikes in these countries have been led by migrant workers (Cant, 2017). As a consequence, these struggles reflect the weaknesses, strengths, and transnational potentialities of these migrant communities. This double movement, I argue, is at the core of the political economy of the platform industry.

This study is based on a five-year participant ethnography with the Brazilian drivers' community in London and the IWGB Union, a migrant worker's trade union in the UK where I spent most of this time working as a full-time organizer. As part of this role, I engaged in many delivery struggles in Brazil as well.

Between Inclusion and Academic Performance: The Enactment of an Inclusion Policy in Schools with High Academic Standards

This paper explores the policy enactment of the Inclusion Law (2015) and its new School Admission System (SAE, in Spanish), a desegregation school reform in a key case of social inequality worldwide: Chile, the third most unequal country within the OECD. SAE consists of a lottery-based online system where families apply to schools under a free school choice policy. Consequently, all types of selection in the admission processes started to be forbidden in those schools receiving state funding (which concentrate approximately 90% of the national enrolments), to eliminate arbitrary discrimination and increase social diversity in schools. This paper draws on a study focused on a small subset of secondary schools categorised as 'Schools with High Academic Standards' (SHAS), which are allowed to continue some degree of academic selectivity to keep their academic excellence. Our theoretical framework dialogues with studies on school inclusion that warn against a romanticised conceptualisation of it as 'happy togetherness' (Wise & Noble, 2016). Thus, we explore how school actors in SHAS are experiencing inclusion and social diversity while trying to keep high academic results. This paper focuses on the qualitative component of a mixed methods study, based on in-depth

interviews with school actors at 15 SHAS in Chile (out of a total of 34). We explore the experiences of the students and parents, as well as the strategies and adjustments implemented and/or projected by these schools' members of staff, given the implementation of SAE, to understand how the SHAS are enacting the reforms and adapting to more socially diverse students while trying to keep high academic results. We conclude with a discussion on the feasibility of desegregation policies in environments of academic excellence, an important challenge for school systems in transit of desegregation, such as the Chilean one.

The School and the Consequences of Confinement: New Social-Emotional Needs

The school, as a fundamental space for socialization and social networking, has become even more relevant after the pandemic (Choi and Lee, 2021; De Schaepe-meester, van Braak and Aesaert, 2021). Our study focuses on the consequences of the pandemic on school coexistence in Chile, the OECD country that kept schools closed the longest since 2020, with a total of 259 school days with school closure (OECD, 2022), preventing students from interacting in the same physical space for an exceptionally long period. Available data suggests a serious deterioration after the reopening of schools, mainly reflected in situations of school violence (Bellei et al., 2022). However, there is no systematic diagnosis of the school coexistence challenges in the post-pandemic period, nor is there a characterization of institutional responses to these challenges. This paper presents the findings of a research project that seeks to contribute to filling this gap by focusing on public schools. A mixed methods design was used based on descriptive and multilevel factor analyses of available data on school coexistence, as well as interviews and focus groups with key school actors. These methods have made it possible to gather valuable information on the perceptions and experiences of those at the front line of the educational system. The analyses show that the students' socioemotional wellbeing has required special attention from teachers, who have seen an increase in emotional dysregulation in their classrooms. Educational teams have recognized the urgent need to adapt the teaching spaces and pedagogical practices to address the emotional socialization deficiencies experienced by Chilean students during the long months of confinement. These results contribute to better understanding the schools' socioemotional challenges and responses in the post pandemic context and provide orientations to address these challenges, both nationally and internationally.

MENDOZA ZAPATA, ROSSANA MARÍA* (UNIVERSIDAD NACIONAL MAYOR DE SAN MARCOS, Peru)

Children and State Violence in Peru

En los últimos seis años, el Perú ha tenido seis presidentes en el poder. Con el autogolpe del ex Presidente Pedro Castillo en medio de una fuerte oposición y polarización de la sociedad peruana, se inició el periodo de la actual presidente Dina Boluarte, apoyada en las fuerzas armadas y policiales y en una mayoría congresal de baja legitimidad. Quien llegara al cargo de vicepresidenta del Perú de la mano de Pedro Castillo con un programa progresista y de amplia popularidad, asume hoy el control del país haciendo uso desproporcional del aparato represor y abuso de las declaratorias de emergencia en las regiones del sur. Desde que inició su mandato las fuerzas del orden han asesinado 50 ciudadanos entre ellos siete adolescentes en el periodo diciembre 2022 y marzo 2023.

Se sabe además de otros cuatro niños y un adolescente muertos en el contexto de las protestas, y a la fecha resulta inestimable la cantidad de heridos y su actual estado de salud, además de otros daños colaterales. El estado peruano no ha protegido sus derechos y siendo de procedencia indígena y perteneciendo a regiones con historial de luchas y protestas, se les ha tratado con extrema violencia sin reconocerlos como niños, niñas y adolescentes, en otras palabras fueron adultizados.

Se pretende exponer de qué manera las niñas, niños y adolescentes de las provincias del sur se han visto afectados durante el estallido social para lo cual se presentarán avances de una Investigación Acción Participativa con niños trabajadores organizados de dos provincias del sur altamente afectadas, cómo ven ellas y ellos al estado peruano y qué piensan de lo ocurrido en el sur del Perú.

Mapping the Thematic Evolution of Qualitative Approaches in Food Environment Research: A Bibliometric Analysis (1995-2025).

A socio-ecological approach is essential for understanding the food environment (FE) and its impact on health equity, going beyond individual choices and considering how multiple factors interact to shape food behaviours. Acknowledging these complex influences helps explain why some populations face more significant challenges in accessing healthy foods, highlighting the role of structural barriers such as poverty and food affordability. For this reason, qualitative research can provide deeper insights into these dynamics and offer a more nuanced understanding of the FE. The study employs a bibliometric analysis software (SCIMAT) to examine the structural and dynamic characteristics of scientific research and illustrate the cognitive architecture of this topic, creating a science map and performance analysis to identify and visualize the conceptual subdomains within the research field as well as track its thematic evolution. We employed the Participants, Concept, and Context eligibility criteria to define search terms for the Web of Science core collection database. We analyzed 1,763 papers from 395 journals published between 1995 and 2025. Co-word and h-index measures were used to quantify and visualize thematic areas across four subperiods: A (1995-2010), B (2011-15), C (2016-20), and D (2021-25). Key findings include OVERWEIGHT as a motor theme from periods A to C, with the HOME FOOD ENVIRONMENT transitioning from a peripheral (highly developed and isolated) to a motor theme in this period. NEIGHBOURHOOD emerged as a motor theme in period B. In period C, URBAN FOOD ENVIRONMENT and AVAILABILITY emerged as new motor themes, and INMIGRANTS emerged as peripheral theme, forming clusters with ACCULTURATION and REFUGEES. In period D, FOOD INSECURITY became a motor theme, with PHOTOVOICE emerging as a peripheral theme. This analysis highlights the increasing complexity of the FE and the untapped potential for interdisciplinary qualitative research to both assess and improve the FE for public health.

La Discriminación De Las Mujeres Privadas De Libertad: Revisión De Las Reglas Bangkok

Se analiza la discriminación y desigualdades de las mujeres privadas de libertad en los centros penitenciarios españoles. Para ello se han recogido 135 entrevistas en profundidad en 16 centros penitenciarios, tres eran centros solo de mujeres, y el resto eran prisiones de hombres con uno o dos módulos de mujeres. Las entrevistas fueron a los y las profesionales que trabajaban en la prisión y a las internas en régimen cerrado. Entre los resultados obtenidos podemos destacar tres aspectos discriminatorios según las Reglas de Bangkok de Naciones Unidas (2010). En primer lugar, los espacios e infraestructuras en las prisiones son más reducidos y con peores condiciones para las mujeres en las prisiones de hombres con módulos de mujeres, siendo mejor en aquellas cárceles destinadas exclusivamente a las mujeres. En este sentido, los módulos y los patios son los más pequeños, son pocos patios o son un único módulo, estando hacinadas y sin la clasificación en función de su situación penitenciaria (primer grado, segundo, etc.). En segundo lugar, la oferta educativa, de actividades, de formación, de puestos remunerados era más escasas en las mujeres, a pesar de los esfuerzos de las prisiones y los planes de igualdad planteados. El menor número de mujeres frente a los hombres en los centros penitenciarios, el 8% de la población reclusa española, supone dificultades para crear actividades formativas para las internas. En tercer lugar, siendo muy desigual en función de la prisión, la oferta de atención a la adicción a sustancias psicoactivas es escasa o nula, y cuando se ofrece carece de perspectiva de género y de adecuación a las necesidades femeninas. Por último, cabe destacar que al ser los delitos de las mujeres menos graves y menos violentos hay una mayor tendencia a otorgar la excarcelación o medidas alternativas a la prisión.

PONCE LARA, CAMILA* (University of Ostrava, Czech Republic)

La Cuarta Ola Feminista En América Latina. Radicalidad e Innovación En Los Métodos De Acción En Chile y México

A lo largo de la última década, América Latina ha sido epicentro de grandes movilizaciones feministas encabezadas por mujeres jóvenes que luchan por la igualdad de género, la no discriminación, el derecho a decidir y a vivir una vida libre de violencia, demandas que las llevaron a ocupar masivamente el espacio público físico y virtual a través de clásicos métodos de acción -marchas, mítines, reuniones, cabildeo- pero, sobre todo, a proponer muy innovadoras estrategias para la protesta, que han ido desde el escrache, los tendedores, las asambleas y marchas separatistas, las ocupaciones de instituciones diversas, performance, pintas, quemas, acción directa, por un lado, y por otro lado a las ocupaciones virtuales por medio de los hashtag # para denunciar la recurrencia de la violencia a la que nos hemos visto sometidas de una u otra forma.

Dar cuenta del innovador repertorio de la protesta juvenil feminista en Chile y en México es el objetivo de la presente ponencia, con el fin de identificar las influencias, flujos comunicativos y particularidades de ambos países, así como la radicalidad desplegada que les ha permitido incidir en los cambios institucionales y formales de sus respectivos países.

MENESES REYES, MARCELA* (Universidad Nacional Autónoma de México, Mexico)

Universidades Estadounidenses Como Epicentro De La Movilización Estudiantil Contra El Genocidio Palestino. El Caso De UCLA

En abril del presente año, tras seis meses de atestiguar la brutalidad de los ataques del gobierno israelí contra la población civil de Palestina, el estudiantado de diversas universidades estadounidenses se organizó en acampadas dentro de sus campus para demandar a las autoridades de sus instituciones que revelaran los contratos y recursos económicos invertidos por Israel para el desarrollo de investigaciones, armas e infraestructura para dar continuidad a su poderío económico y político (Disclosure); así como para exigir la desinversión en los proyectos con fines de exterminio (Divest). Sin embargo, la movilización estudiantil que fue masiva y clasificada como la brújula moral de la población mundial hasta entonces impávida por los horrores del genocidio, prontamente fue reprimida a solicitud de las autoridades universitarias, en connivencia con los gobiernos de diferentes niveles que privilegiaron los intereses de los inversionistas sionistas.

Dar cuenta de tales acontecimientos al interior de la Universidad de California Los Ángeles (UCLA), la organización estudiantil, la represión vivida y el despertar de conciencias entre distintos sectores universitarios sobre la dominación colonial israelí, así como de la ejecución en el presente de un genocidio, es el objetivo de la presente ponencia.

MENOSCAL CEVALLOS, JONATHAN* (Flacso, Ecuador)

Disaster Risk and the Regularization of Informal Settlements in the Peri-Urban Areas of Quito: A Public Policy Design and Governance Approach

More than 200 million people are affected by disasters, whose magnitude is worsened by factors such as climate change and the socioeconomic conditions of vulnerable populations. This makes disaster risk a development issue. As a result of this concern, disaster risk has entered the public agenda with a systemic vision, considering risk as a social product linked to hazards and vulnerabilities in an exposed society.

Informal settlements in Latin America generally present high levels of vulnerability as they are often located in multi-hazard zones. In Quito, Ecuador, there is accelerated growth toward hazard-prone peripheries, contrasting with the urban decline of its central areas. This has generated social problems such as segregation, gentrification, marginalization, and more broadly, an increase in disaster risk, as evidenced by the recurring impact of events.

In response to this issue, the study aims to analyze how disaster risk has been constructed in the peri-urban areas of Quito, and how different public policies are currently being applied to reverse this situation. To this end, an

analytical methodological framework for public policy design is proposed, where governance models serve as the explanatory factor for policy outcomes. This is done through a mixed-methods research design.

The qualitative, quantitative, and socio-spatial data processed reveal at different scales that, while informal settlement regularization policies have succeeded in formalizing land tenure and ownership, their legalization has not mitigated risk conditions. On the contrary, it has reproduced and generated other types of physical and social vulnerabilities. Therefore, alternatives for policy implementation are proposed.

RC39-642.2

MENOSCAL CEVALLOS, JONATHAN* (Flacso, Ecuador)

Disaster Risk Management and Reduction in Quito: An Analysis of Public Policy Design and Governance

More than 200 million people are affected by disasters whose severity is exacerbated by factors such as climate change and the socio-economic conditions of vulnerable populations. This makes disaster risk a development problem. In response to this concern, disaster risk has been incorporated into the public agenda with a systemic vision, which considers risk as a social product linked to threats and vulnerabilities in an exposed society.

Despite advances in risk knowledge and the implementation of policies, the impacts of natural events are increasing, especially in Latin America, due to factors such as weak institutions, the lack of regulatory frameworks, inadequate planning, and, above all, the widespread poverty affecting most of its population. This research, therefore, seeks to answer the question: What factors determine the success of risk management and reduction policies?

The hypothesis suggests that greater articulation between state and non-state actors in the policy design process leads to more coherent, congruent, and consistent policy instruments, which in turn generates behavioral changes in individuals, groups, and institutions, helping to achieve the expected political objectives. To explore this, an analytical-methodological framework for policy design is proposed, where governance modes become the explanatory factor for their outcomes.

The case study is Quito, Ecuador, a city exposed to multiple threats with a vulnerable population, especially in informal peripheral areas. Although policies have evolved through various instruments, the increasing frequency of disasters highlights their failures. However, there are specific cases where community actions, supported by international cooperation, have successfully generated capacity and reduced risk.

MENSE-PETERMANN, URSULA* (Bielefeld University, Germany)

Cross-Border Labour Markets: The Problem of Embeddedness in Infrastructures

The notion of the embeddedness of markets in institutions (Polanyi 1957) and social networks (Granovetter 1985) is a cornerstone of economic sociology. This also applies to labour markets (Marsden 1999; Fligstein 2001; Granovetter 1995). Yet, when it comes to **cross-border** labour markets, not only institutions and networks are of vital importance for enabling the cross-border matching of labour power to jobs. What is also needed to move workers across borders and place them on jobs in destination states, are "migration infrastructures" (Xiang & Lindquist et al. 2012; Xiang & Lindquist 2014; Lindquist 2017). Through their seminal articles, Lindquist and his co-authors have drawn attention to these migration infrastructures over the past decade. However, "infrastructure" is used by these authors in a very broad sense, encompassing brokers and other intermediaries (hence: actors), networks, rules and regulations (hence: institutions), channels, and physical entities such as dormitories and accommodation camps, transportation facilities, and the like. Hence, in this understanding, among other things, infrastructures include networks and institutions. The planned presentation ties in with focusing on forms of embeddedness beyond networks and institutions that may, however, be considered equally important for the enabling of cross-border labour markets. A typology of migration infrastructures will be presented that will help to define the term more precisely and allow to shed light exactly on those infrastructures that are not actors, networks, or institutions. Furthermore, these infrastructures will be linked to other concepts, such as the logistics that make infrastructures available for cross-border labour markets (Krifors 2020), as well as the migration industries that provide both, and by doing so create new markets. Thus, the presentation seeks to contribute to an economic sociology of migration by considering the embeddedness of cross-border labour markets in migration infrastructures, logistics, and other markets as a particular feature of migration labour markets.

Religion-Related Mobilisation Frames As a Counterforce Against Far-Right Hindu Nationalism in India: The Case of Ambedkarite Online Activism

Socio-political activism and mobilisation efforts against caste-based discrimination are integral to the cultural history and heritage shared by Dalit and Bahujan communities across India. Their activities emerged as a reaction to hundreds of years of caste inequality and discrimination in social, political, economic, and religious interactions. With the wider availability of the Internet and new technologies in the 21st century, digital media has gained much importance in propagating anti-caste discourses and efforts, especially among the younger and college-educated generation of Dalit-Bahujans and Ambedkarites. Drawing on the legacies of Jyotirao Phule, B. R. Ambedkar and Kanshi Ram, activists primarily aim at creating change in Indian society, utilising digital media as a new type of protest repertoire for addressing the caste-religion relationships and the rise of far-right Hindu nationalism in India.

This paper focuses on the mobilisation discourses of contemporary Ambedkarite anti-caste activists through analysis of textual production published on the prominent Ambedkarite online blog platform *Round Table India: For an Informed Ambedkar Age* (RTI). The case study utilised a combination of structural topic modelling and content-based frame analysis on public textual contributions from 2010 to 2023, comprising approximately 3,000 documents with metadata from more than 1,000 authors all around India. The paper presents major topics, mobilisation frames, and grievances that dominate the current debate in Ambedkarite communities, how they evolve through time, and the role of religion in them – specifically Buddhism, which has been at the centre of one of the largest Dalit-Bahujan socio-political protests in history since the 1950s. With its central question of whether and how activists employ religion-related framings in mobilisation discourse, the paper addresses the current socio-political situation in India, interactions between Hindutva discourse and its anti-caste counterforces, and the overall role of religion in the mobilisation strategies of social movements.

RC06-JS-87.7

MERAYO, ELENA C.* (Western Sydney University, Australia)

When the Mother-To-Be Is the Daughter-In-Law: Transnational 'Matrescence' and Women's Family Care Between Australia and Nepal.

Nepal is a patrilineal society. Typically, women move into their in-laws' household after marriage and are expected to 'care for' their in-laws. Conversely, the mother-in-law becomes the daughter-in-law's primary carer when she gets pregnant, and traditionally, her main child-rearing companion and guide through this major life event. These care giving and receiving practices establish that the wife and the children 'belong' to the husband's family. When having a baby overseas, the in-laws will often be called into the host country to perform their postpartum caring duties, as culturally prescribed. They will bring their ancestral health-care knowledges and relevant therapeutic items with them. However, they will also be 'guests' in their daughter-in-law's home. This drastically changes intergenerational family roles and its associated care circulation practices and hierarchies. This paper analyses how these women's family care roles are re-signified and contested by the condition of the 'transnational household'. It draws on multi-sited ethnographic research on transnational experiences of antenatal and postnatal care for Nepalese women living in Sydney, Australia, and for their extended families in Nepal. In defining this life stage in anthropological terms rather than biomedical ones, I follow anthropologist Dana Raphael's (1975) use of the term 'matrescence'. I argue that *matrescence*, in the South Asian context, ought to be conceived as a *collective* biopolitical, discursive, spiritual, relational and bodily *process* that accompanies the prospects of the birth of a new family member. The collective aspect of this estate of 'becoming' in the family is emphasised, placing careful attention to how the web of relationships around the mother-to-be and future child shifts after conception, and how these relationships are negotiated in new terms in the transnational context. Data from more than 30 in-depth interviews and from extensive participant observation with mothers and their families in both countries illuminate these dynamics.

RC30-488.4

MERCIER, DELPHINE* (Maison Française D'Oxford - Kellogg College - Oxford University, United Kingdom)

From the Informal Economy to the Popular Economy: Concepts and Practices in Field Surveys.

The idea that the economies of the South are characterised by a large so-called 'informal' sector continues to dominate. The concept of the informal economy was coined in the 1970s to refer to the economies of the countries of the South, but the epistemological debate has tended to fade since the 1990s. As a result, there is a growing gap between empirical studies and their theoretical underpinnings. Today, the diversity and heterogeneity of the content covered by the notion of informal economy are such that this semantic category can no longer function as a concept. The use of the notion of popular economy stems from a series of intertwined theoretical traditions: 1- the Gramscian discussion of subaltern sectors, 2- British Marxist historiography, 3- a history from below valuing the practices and resistance of popular sectors. The tradition of subaltern and postcolonial studies has deepened these discussions from the margins, which, in the case of Latin America, has been reflected since the 1990s in the development of the notion of popular economy as a means of drawing attention to political alternatives on the continent. It was during our surveys in South America and in England, and our confrontation with Latin American colleagues, that the concept of popular economy appeared to us as more operative to describe economic activities which are neither informal nor totally illegal, but forged by experiences of creating income-generating economic activities and which are implemented by the populations without, however, being fully declared to the authorities. In this paper, we will attempt to move back and forth between categories and data, highlighting the different meanings of the activities observed in the logistics sector, particularly intermediary activities.

Logistique Et Ses Monstres - Logistics and Its Monsters

Once again, it could all have started on the high seas. The history of capitalism is made and unmade by the conquests of the seas. Just as the birth of the great industrial cycle was made possible by ships laden with sugar and cotton, heavy with the labour of the slaves who amassed them, so the giants of the seas laden with containers are beginning something of a new cycle: not so much a general upheaval of the world's economies, but much more a managerial or technical transformation. The logistics revolution began with the invention of a big box in which to store goods. The container, which can be handled with a minimum of manpower, transported from quay to ship and then from ship to lorry without unloading any of the goods it contains, thus resolving the twofold constraint of breaking loads and the immense nuisance caused by port handling and its tumultuous dockers.

MERET, JACOB-LAKRIMDI* (Freie Universität Berlin, Germany)

Homeland Politics across Borders – How Borders Shape Political Activism Among the Libyan Diaspora

The events of 2011 have marked a turning point for the political activism among the Libyan diaspora. During the ruthless reign of Muammar al-Qadhafi, former Libyan leader by means of a successful military coup d'état in 1969, political dissent was efficiently suppressed by his consolidated security service – and often across international borders. While the Libyan diaspora is built on a long history of political emigration, going back to the Italian invasion and colonisation in the early 20th century, and continuing during Libya's short-lived independent monarchy, it has reached its peak during the era of al-Qadhafi. All along, borders have had a significant impact on political activism within the diaspora just as they both enable and limit activism in the diaspora's state of origin. For instance, living in exile did little to prevent Libyans from being subjected to al-Qadhafi's Revolutionary Committees that spied on Libyans across international borders and had them abducted or assassinated, often without repercussions. Constant mistrust towards fellow Libyans thus heavily constrained the diaspora's sense of unity and political activism. In the wake of the 2011 uprisings, however, the Libyan diaspora mobilized against the regime and became an important pillar of the revolution. More than a decade later, political activists still work with and through borders in order to navigate the fragmented political landscape in Libya. Border Studies offer approaches to research borders from different angles which enrich our understanding of the multiple functions a border combines. Therefore, this paper intends to examine how borders shape possibilities for political activism among the Libyan diaspora. Bringing together the entanglements of literature discussions that have often been considered separately until now, the goal is to outline the complex set-up in which Libyan diaspora political activism is embedded.

MERICO, MAURIZIO* (University of Salerno, Italy)
SCARDIGNO, ANNA FAUSTA (University of Bari, Italy)

The Pandemic As a Challenge to Rethink the Co-Operation between Formal, No-Formal and Informal Education

The paper relies on the consideration that the debate on educational processes that developed during the Covid-19 emergency focused almost solely on the role of schools and formal educational agencies, paying little attention to the multiple educational opportunities of which children, adolescents, young people and families have been deprived during the pandemic time.

Yet the pandemic revealed the need to focus on the times, opportunities, spaces and actors of no schooling which strongly re-emerged during that phase, thus inviting to take into serious account the challenge of the co-operation between the formal, non-formal and informal dimensions of educational processes, also as occasions for contrasting the "learning losses" associated with school closures, supporting student performances and attainments, and above all for sustaining the aspirations of youth in a wider manner.

The paper is based on an analysis of the scientific and public debate on the issues of schooling and education emerged since the very beginning of the pandemic, which reveals the need to re-evaluate the contribution of the no schooling within the more general education processes of younger generation.

In this perspective, beyond the everyday urgency, the Pandemic becomes a challenge also useful to rethink the educational processes of youth in light of a meaningful co-operation between formal, no-formal and informal education; it also means the possibility of integrating the educational processes that occur into places and spaces other than the formal and traditional ones.

Moving from this analysis, the paper final aim is to consider this dramatic but extraordinary opportunity as an occasion to outline the contours of a new time for education - richer, heterogeneous, and polycentric - able to put at the core the idea of a "continuum" in education.

L'appréhension Juridique De La Justice Sociale à L'ère Anthropocène

La justice sociale, concept transversal aux sciences humaines et sociales, a été interrogée depuis l'Antiquité par des philosophes, des sociologues et des juristes. Si les appréhensions de cette notion ont évolué au fil des siècles, l'avènement de l'Anthropocène pose de nouveaux défis à sa conceptualisation et à sa mise en œuvre.

Les changements climatiques, la dégradation des écosystèmes et la raréfaction des ressources naturelles exacerbent les inégalités existantes et en créent de nouvelles. Aussi, le droit se trouve confronté à des questions inédites: la reconnaissance d'un statut juridique aux réfugiés climatiques, la responsabilité des États en matière de réduction des inégalités environnementales, et la question de la répartition équitable des ressources rares; sont autant de problématiques qui interrogent la notion de justice sociale à l'aune du droit. Ces enjeux soulèvent des questions fondamentales: la justice sociale doit-elle se recentrer sur les dimensions environnementales? Comment concilier les aspirations à la justice sociale à l'échelle locale avec les enjeux globaux? Le droit est-il outillé pour répondre aux défis de l'Anthropocène?

Dans un contexte mondialisé, on se demande également si la justice sociale devrait adopter une conception globale, ou si elle doit conserver des spécificités locales? Les différentes interprétations qui en ont été faites à travers les cultures, renseignent davantage le juriste sur la relativité du concept.

Cet exposé propose d'explorer les conceptions de la notion de justice sociale à l'ère de l'Anthropocène. Il s'agira d'analyser les apports et les limites des approches juridiques existantes, d'identifier les nouvelles formes d'inégalités et de vulnérabilité, et d'envisager des pistes pour une justice sociale plus inclusive et durable. En somme, il s'agira de réfléchir à la manière dont le droit peut contribuer à construire un avenir plus juste et équitable pour tous, dans un contexte marqué par les bouleversements environnementaux et sociaux.

MERINO PAREJA, RAFAEL (Autonomous University of Barcelona, Spain)

MIRANDA, ANA* (FLACSO, Argentina)

La Transición Laboral De Las Personas Jóvenes En América Latina: Regímenes De Transición, Perspectiva De Género y Desventajas Educativas y Laborales.

En los últimos años hemos asistido a un fuerte debate entre las posturas que reclaman una economía política de la juventud, y aquellas que demandan un análisis renovado de la estructura social de clases en los procesos de transición a la vida adulta. Se trata de un debate que ofrece un nuevo contrapunto en el campo de los estudios de juventud, luego de aquel vinculado al antagonismo entre la teorización de las generaciones sociales y los marcos conceptuales de las transiciones juveniles.

En la presente comunicación se propone aportar aquellos debates conceptuales desde una mirada desde América Latina. Con ese objetivo, abordará el desarrollo de dos núcleos teóricos: los regímenes de transición y la perspectiva de género. Desde el punto de vista empírico, se trabajará con los resultados de una investigación sobre transiciones juveniles al mercado laboral, desarrollada en base al procesamiento de fuentes estadísticas secundarias de 18 países de América Latina. Una investigación realizada en base a la aplicación del Índice de Transiciones en Desventaja (ITeD), un indicador complejo desarrollado por la FLACSO Argentina y la UAB, bajo el auspicio de la Fundación Ayuda en Acción (España).

En las conclusiones, se sostendrá que el campo de los estudios de juventud no solo representa un campo de especialización para la elaboración de teorías de alcance intermedio, sino que tiene la capacidad de desarrollar marcos conceptuales sobre las características estructurales de las sociedades contemporáneas. Pero, que para el desarrollo de esa capacidad, debe incorporar miradas globales que integren las "múltiples e interconectadas modernidades".

Glammons: On Commoning Museums and Other Cultural Memory Organisations

This paper presents findings from the GLAMMONS project (2022-2025), an EU Horizon-funded research project focusing on small, community-run GLAMs (galleries, libraries, archives, and museums). Framed by the concept of the commoning (Dardot & Laval, 2019; Linebaugh, 2008), this research aims to understand how self-organised communities address their cultural needs and explores how communities generate mutual wealth through the collective production and sharing of cultural resources, highlighting the collaborative and participatory processes that underpin them. A commoning perspective broadens the understanding of the diverse forms and processes involved in 'doing GLAMs', which seek to challenge dominant economic narratives, by proposing alternative models and frameworks for how these institutions can operate in a more socially engaged way. This approach demonstrates the capacity of community-driven GLAMs to promote cultural sustainability and collective ownership outside traditional institutional frameworks of the market or the state. The presentation will introduce the project, the methodology and the first findings on one aspect we are investigating: how different financial practices can facilitate and sustain community building in cultural memory institutions. To ensure long-term sustainability, all commons activities need resources to sustain their commoning - gifts, donations, volunteer work or financial practices that align with commoning principles such as indirect social reciprocity, autonomy, and self-organisation (Perilleux & Nyssens, 2017). A commons perspective raises many substantial questions for the GLAM sector and cultural policymaking. For example, contemporary public cultural funding often perpetuates neoliberal principles of competition, newness, efficiency, and market-orientation. Yet how would a more equitable, non-extractive funding paradigm look like that would enable heritage commons in the GLAM sector?

Children in Shared Physical Custody: Creating Stability in a World-in-Motion

Based on in-depth fieldwork, funded by an ERC Starting Grant project, with 21 children aged 10-16 living in (quasi-)egalitarian shared custody arrangements in Belgium, this paper explores how children create stability in their mobile lives. This issue is particularly important as stability is often considered an important prerequisite for the identity construction of children (Merla et al., 2021). SPC is approached here as a form of multilocal residency where children navigate within an archipelago (Duchêne-Lacroix, 2014) composed of two islands (their two parental dwellings) with specific characteristics and particular – and sometimes contradictory – local cultures (Winther, 2015). The paper starts by presenting a typology of the limits that each parent draws with their ex-partner's "island", and which constitute the background against which young people must deal in their daily lives. It then shows how children anchor themselves in their two living places and create stability in movement, notably through managing personal belongings that they take with them or, on the contrary, choose to leave in each place. The paper concludes by highlighting the key factors that shape those practices.

Relational Wellbeing: Understanding the Role of Social Connections in Youth Eudaimonia

Relational well-being as a dimension of youth eudaimonia accentuates the cachet of social connections to foster meaningful life. This paper explores how relational well-being, which is defined as the depth and quality of social connections and relationships, contributes to the overall eudaimonic experience of the contemporary youth. Using the frameworks of relational cultural theory and self-determination theory, the study sheds light on how the primary circle of family, friendships, and community cultivate relational well-being from psychological, sociological, and philosophical perspectives by highlighting the significance of interconnectedness and the fulfilment of the basic psychological needs of the youth. Literature suggests that having positive social connections is essential and the most fundamental aspect of youth development as it impacts their personal growth, autonomy, resilience and overall life satisfaction. The study also considers how social media and digital interactions influence relational well-being among youth, both enhancing and complicating traditional face-to-face relationships. This paper aims to offer insights into various interventions that can strengthen relational well-being and promote a holistic approach to youth development by understanding the role of social connections in youth eudaimonia. Focusing on the quality rather than the quantity of social connections, this research contributes to a deeper understanding of how supportive relationships can act as catalysts for youth eudaimonia. Implications for mental health interventions, educational practices, and community programs are also discussed, which underscores the potential to foster relational well-being as a holistic youth development that significantly impacts the Anthropocene.

Liminal Transitions: Rethinking Transgender Journeys over Time

The fundamental role of life transitions is undeniable both in terms of empirical evidence and theoretical understanding. Lives undergo multiple changes over time, which accumulate and compound in different ways, and which have been a key object of study in the field of life course theory. The sequence of positions (related to employment, demographic ageing, parenthood or other) of a given person over time allows us to examine the interplay between individual lives and social change. Life course analysis is concerned with the frequency and timing of changes in these positions (Kok, 2007), and each change or event is therefore a transition, the key element that unifies the temporal and biographical fabric of lives.

Transitions are often understood as normative stages or milestones that occur for most people from birth to death, following a linear, age-structured life course that must overcome deficits and risks to achieve stability. For transgender people, gender transitions have generally been perceived as heightened disruptions - significant shifts that can be resolved by moving from one binary gender to the other, thus restoring the proper order of gender

(Connell, 1987). However, recent societal changes and the unprecedented rise of gender non-conforming identities call for different analytical lenses and a differentiated perspective on what is meant by gender transitions.

Using data on gender transitions in Portugal and the United Kingdom, this paper discusses six exemplary cases that illustrate the temporal dynamics of non-linearity that are poorly captured by current life course tools. By revisiting and rethinking the notion of gender transition in tandem with that of liminality, following van Gennep and subsequent developments, we address the limitations of sequential models and demonstrate the need for tools that capture the ambiguity, temporal asynchrony, continuous and often never-ending transformations in the lives of trans and gender non-conforming people.

From Segregation to Inclusion: Analysing the Implementation of Inclusive Reforms in Belgium's French-Speaking Elementary Schools

In Belgium's French-speaking region, the education of students with special educational needs (SEN) has historically been organized through a **segregated system** centered on specialized education. This system has been marked by the **overrepresentation** of boys from disadvantaged and immigrant backgrounds. However, recent reforms under the *Pacte pour un Enseignement d'Excellence* (2015) have aimed to shift the system towards a more **inclusive** model. Two major policy measures have been central to this transition: the Decree on **Reasonable Accommodations** (2018) and the creation of **Territorial Poles** (2022). These reforms aim to facilitate the inclusion of SEN students into ordinary schools.

This paper examines how these policies are being implemented in schools, using the **public policy instruments framework** developed by Lascombes and Le Gales (2005). The focus is on the level of flexibility that school principals have in applying these policies. This research is based upon **20 interviews** conducted with primary school principals in the **Brussels-Capital region**. The sample includes schools with different socio-economic profiles: schools with low socio-economic indices (ISE) located in culturally diverse areas, high ISE schools in homogeneous neighbourhoods, and mixed ISE schools in socially diverse areas. Additionally, each category includes schools with an active pedagogical approach.

The study has two main objectives. **First**, it aims to analyze how reasonable accommodations and territorial poles are being implemented and adapted across different school contexts. It also seeks to understand the roles of various stakeholders, such as families, psycho-medical professionals, and educational staff, in supporting SEN students. **Second**, it compares the decision-making processes and stakeholder involvement across these schools to identify any differences linked to socio-economic factors and pedagogical methods. The ultimate goal is to assess whether exclusionary practices are being reduced, whether referrals to specialized education persist, and whether these new measures are helping to reduce, maintain, or exacerbate educational inequalities.

SOUTO LOPEZ, MIGUEL (UCLouvain, Belgium)

From Theory to Practice : A Literature Review on the Use of Intersectionality to Cast Light on Educational Inequalities

Despite increasing acknowledgement in social sciences, **intersectionality** - **originally theorized within Black feminist thought and movements** - remains either **neglected** or **oversimplified** in **educational research** (Jones et al., 2013; Sibbett, 2020). Its theoretical complexity is often overlooked, resulting in superficial applications that fail to fully capture the intricate intersections of social categories and power structures. This limits its potential to reveal the deeper mechanisms driving systemic inequalities in education (Sibbett, 2020). As both a theoretical and methodological framework, intersectionality offers a valuable lens for analyzing how different **social categorizations** such as gender assignment, racialization and classism intersect to influence **students' educational trajectories**.

Applying intersectionality to research methodologies presents significant **challenges** (Choo & Ferree, 2010; Davis, 2008; Nuñez, 2014). One significant challenge lies in recognizing the fluidity and interdependence of social categories (McCall, 2005). Additionally, focusing narrowly on specific marginalized groups without considering the larger systemic structures risks overlooking the

institutional and political roots of these inequalities (Anthias, 2013). Moreover, as intersectionality gains popularity across disciplines, concerns arise about the dilution of its critical roots in **Black feminist thought** (Robert et Yu, 2018). This shift threatens to reduce its transformative potential to tokenistic mentions of intersecting social categories, rather than employing it as a tool for challenging structural inequalities (Harris et Patton, 2018; Haynes et al., 2020).

In regard to these challenges, this paper presents a **systematic review of qualitative research** that applies intersectionality to the study of **educational inequalities**. It highlights the value of intersectionality as a heuristic tool, **rooted in feminist scholarship**, that has the potential to enhance our understanding of educational disparities and to drive social change (**praxis**) (Cho et al., 2013). Furthermore, the paper tackles the methodological difficulties of implementing intersectionality in qualitative research and suggests future pathways to better capture the complexities of educational inequalities.

MERVILLE BOUDJEMA, LISON* (University Lyon 1 - International Center for Infectiology Research (CIRI), France)

Race, Migration and Tuberculosis : Which Treatment Orientations for Which Patient ? Qualitative and Quantitative Response

Tuberculosis (TB) is a contagious respiratory disease with a strong social inequality component and a major public health challenge on a global scale.

Diagnosing a patient suffering from TB means that healthcare professionals must act not only for and with the patient, but also with the whole social group in which they are embedded (the history of the patient and their community, their geographical itinerary, past and present living environment, professional activities, migration paths, etc.). This need to pay attention to both the individual and the social justifies the importance of the sociological approach to health.

This post-doctoral research is based on a study of public health authorities to the Centres de Lutte Antituberculeuse (CLATs) in Lyon, France. In high-income countries such as France, the majority of TB burden is related to displaced individuals born in high-incidence countries, or to at-risk individuals such as prison inmates or other socio-economic precarious individuals. Around a hundred cases of TB are diagnosed each year in France, over 90% of them in patients foreign-born.

The success of the public health plan depends to a large extent on the dialogue between patient and healthcare provider. In order to shed light on the major, often silent, trends in public health policy for people with migrant backgrounds, this work takes a detailed look at the interactions between medical staff and patients. Based on interviews and observations, the numerous quantitative data produced by public health agents are closely observed to shed light on the following questions:

How are patients steered towards one type of treatment or another based on how they are racially perceived by medical staff?

What is the impact of this unilateral decision on patients' access to remission?

How do public health policies organize screening of target groups, care and treatment termination?

Complex Systems Studies and a Polysemous Meaning of the Term Corporate Sustainability

Sustainability, referring to various levels of societal hierarchy, has become one of social theory and practice's most popular and influential terms. It has also become one of the crucial issues in modern management. However, the multitude of meanings of sustainability may doubt its applications' validity. Economic, environmental, and social domains cover all areas of corporate activities. Additionally, sustainability is a value-laden term, a universal good. Under such circumstances, the research on sustainability demands a sound conceptual background. The paper aims to show how selected methods of complex systems studies applied in studying the relations between a system and its environment can help order the research on corporate sustainability understood as a polysemous normative term. The environmental aspects of corporate sustainability will be treated as the core issue. The following problems will be studied: 1) Companies strive for environmental sustainability and the universal meaning of environmental sustainability. 2) A more detailed interpretation of the idea: "Think globally, act locally" in environmental protection. 3) The role of complex systems research in developing theoretical foundations of sustainability studies in the general sense and at the corporate level 4) The future applications of complex systems research in studying environmental and economic aspects of sustainability at the corporate level.

MESJASZ, CZESLAW* (Krakow University of Economics, Poland)

Governance of Artificial Intelligence: An Unachievable Aim?

AI governance concerns all societal levels and refers to politics, military, social systems, economy, and business. It is impossible to present a universal definition of AI governance that embodies both broadly defined institutional aspects of governance and normative recommendations concerning technical functional solutions relating to deep learning. In all attempts to develop AI governance, rules are usually presented based on ethical assumptions and involve all stakeholders. It is visible in all documents concerning AI governance, which various national and international institutions and business institutions have prepared. The universal challenges of any kind of governance deriving from the implementation of AI are identical with the traditional patterns of exercising power at all levels of societal hierarchy deriving from the infinite regress and reflected in the famous Juvenal's saying "*Quis custodiet ipsos custodios?*". In reference to the institutional reality this observation meets a specific contradiction. While this saying reflects the infinite regress in social control, in the institutional reality, there always must be the highest level of control. A sovereign state is the best example. The paper aims to show how obstacles deriving from multi-criterion and multi-level governance always lead to unsolvable paradoxes at all levels of societal hierarchy

MESQUITA, MONICA* (NOVA University Lisbon | MARE Centre, Portugal)

Aye. a Praxis of Pracademics' Body

AYE - Action-research for Youth in Europe, as a ERASMUS+ project, has the challenge of to create dynamics of cooperation between youth collectives and universities, and being developed in four countries - France, Portugal, Italy, and Finland. In Portugal, with Ocean Literacy Observatory-NOVA University of Lisbon, and the EBANO Collective - a Youth Association, the main goal is to promote action research with young people through the art. The project is developed in the Trafaria - a coastal village on the other bank the European capital - Lisbon, which presents a complex, systemic, and diverse territory - a third margin. There is a significant heterogeneity of social groups - from small-scale artisanal fishermen to communities of African origins that suffer from marginalization processes. Nowadays, the ideal of development for the area became to take advantage of the touristic and landscape potential. The AYE in Portugal comes to counter-colonize the idea of development, searching in the own local context tools to minimize the detachment between academy, associations, communities, and Trafaria's territory. Moreover, research and projects related to Trafaria have been carried out top-down without genuinely considering the communities' rich coastal and riverside spatial knowledge, also manifested through their art. Thus, the Academy-YouthAssociation body, acting through the belonging in this locality, presents itself with an emergency character in an attempt to overcome the historical lack of citizen participation and to confer greater justice in the production and living of this territory. This collective of people active in both civil society and academy identify themselves as pracademics - an emergent human posture to collectively act on the intellectual diversity encounters based on equal-liberty, bringing a cosmology to the humanscapes. The research process behind this co-construction generates politicization and allows for greater critical problematization of everyday territorial situations and sociocultural and ecological relations.

Understanding the Paradoxes of Water Resource Management in Morocco: A Critical Analysis of Modernization Discourses in Rural Areas of the El Hajeb Province (Saïss Plain, Morocco)

Morocco is facing a widespread water crisis, exacerbated by six consecutive years of severe drought. This crisis threatens not only irrigation but also urban water supply, increasing inequalities in water access across different sectors. In response, the Moroccan government has implemented several measures under the banner of "better water governance." These include large-scale projects, such as the construction of over twenty new dams and several desalination plants, aimed at securing access to new water resources for domestic, industrial, and agricultural use. These initiatives are framed through narratives of "adaptation," "resilience," and "sustainability," emphasizing the need to maintain development efforts despite water scarcity.

This presentation will explore the discourses behind these strategies, particularly the reliance on dam construction to face water shortages. While one might expect a shift in discourse away from modernization in times of crisis, we observe the opposite—an intensification of the “modernity through water” narrative. Using the example of the M'dez dam project in northwestern Morocco, we will analyze the contradictions and competing discourses surrounding water management and governance, highlighting the paradoxes inherent in the country's approach to agricultural and environmental sustainability.

MESSINEO, FRANCESCA* (Sapienza University of Rome, Italy)

Italians in Colonial Tunisia: Social and Cultural Implications

This paper explores the history of Italian migration to Tunisia. In the late 19th and early 20th centuries, many Italians, particularly from Sicily, migrated to Tunisia in search of better economic opportunities. This migration presents a unique case: a social group that cannot be strictly categorized as either colonized or colonizer (El Houssi 2012) and yet very much instrumental in supporting the colonial system (Morone 2015).

The phenomenon is illustrated by presenting the case of the author's family. Memoirs reported in literary or academic works and historical documentation are therefore combined with first-hand personal memoirs and the visual archive (mainly photographs) stored by the family itself.

Family archives represent a hybrid material that is difficult to catalog (Woodham et al., 2017), but they prove to be extremely useful for bringing back to life memories forgotten or silenced by conventional historical narratives. Family memories (Appadurai 2013) are also a site to produce shared meanings and social regulation, through which individuals make sense of their experiences and knowledge, inscribing them into a broader frame of reference (Neumann 1996). Essentially, they allow us to question the relationship between intentionality, identity representations, actors' horizons of meaning, and broader historical-social processes.

The memory of Italians in Tunisia has long been removed from national historical accounts and imagination, leading to its transmission being relegated to informal and family circuits, which are necessarily idiosyncratic and fragmented. Today, as part of a broader rediscovery of Italy's colonial past, Italians from Tunisia and their descendants are reclaiming their history and identity in the public sphere. Amid failed attempts at Mediterranean integration, where North African neighbors are increasingly viewed as a threat, recovering these memories highlights the vital interdependence and exchange between the two shores—an essential connection, despite the legacy of colonial exploitation.

Digital Self-Representation of Minority Women: An Intersectional Analysis of Sámi Content Creators

Intersectionality is useful as both a theoretical framework and tool for practical analysis. This is particularly the case in the experiences of minority women holding multiple minoritized identities and interacting with power structures that have historically and contextually marginalised them. This paper considers self-representation of Sámi women through colonial legacies of forced assimilation and lasting colonial gender dynamics; their engagement with environmental activism through decolonial representations; and the development of inter-Sámi and inter-indigenous solidarity. Through an in-depth discourse analysis on three Sámi women's content creators on Instagram, the analysis shows how they utilize the digital realm towards self-representation and cultural survival, while challenging dominant and mainstream narratives about their culture. This paper aims to show how intersectionality can provide a critical framework to connect digital self-representation and minority identity. Ultimately, this paper aims to capture the digital processes of identity production in intersectional terms, namely in relation to minority and indigenous identity(ies), representation, discourse and power.

METE, ALIM IRMAK* (TED University, Turkey)

Internet Restrictions, Vpn Technology, and the Dynamics of Trust and Distrust in Türkiye

Since the early 2000s, governmental intervention into online content has significantly increased in Türkiye. Numerous online platforms, including news sites and social media, have faced access restrictions or bans due to content deemed controversial or misinformative by the government, especially during times of turmoil. Turkish IP addresses have experienced incapacitation through bandwidth throttling or outright bans imposed by internet service providers. These restrictions have been intermittent, unpredictable, and conditional on platform officials abiding by governmental demands. The resulting discussions concerning internet freedom, state censorship, and state surveillance have led people towards digital solutions, specifically and increasingly toward VPN technology.

This study focuses on Ekşi Sözlük, a popular collaborative dictionary platform in Türkiye where users share thoughts and experiences under different topic titles. Similar to a forum and mostly oppositional in attitude, Ekşi Sözlük had its own share of governmental restrictions. For the purposes of this research, the most frequented titles about VPNs were selected and over 1500 entries were analyzed with qualitative data coding method. Preliminary results suggest that Turkish users consider VPN as a means of resisting and bypassing governmental internet restrictions, as a tool for solidarity in times of disasters and social movements, and as a must for online freedom. However, distrust in governmental curatorship of accessible online content does not imply total trust in VPNs, seeing as trust and distrust are not antonyms in the sociological sense. Users report distrust in VPN companies' autonomy from state influence and the provision of data privacy, constantly redefining their criteria for trust and distrust in the technology. Studying the fluidity of distrust in VPNs in the turbulent sociopolitical context of contemporary Türkiye promises insight into the interplays between citizen and netizen, between perceptions on internet freedom and government censorship, and between the very definitions of trust and distrust themselves.

BEST, FABIO (German Centre for Integration and Migration Research (DeZIM), Germany)

Far-Right Normalization in Germany? Understanding Its Dis-Linearities through a New Multi-Level Approach

A current major focus of research about right-wing populism/extremism is on investigating and explaining the electorate of far-right movements and parties in Europe. The adoption and spread of far-right ideologies and policies and therefore their normalization in the national public discourses and parliaments are also highly discussed against the backdrop of their rise. However, how the process takes place at other societal levels is still little analyzed.

In this contribution, we want to empirically discuss the process of far-right normalization in Germany by proposing two very innovative perspectives and applying new methodological approaches. First, we are asking, how the Alternative für Deutschland (AfD) in Germany is perceived by the population in the course of normalization processes. Interestingly, in a survey in Germany, conducted in March 2024, the majority of the population does not accept the AfD as a normal party and classifies it as racist and extremist. Secondly, we analyze far-right normalization at the local level. We present the results from a qualitative interview study on the perception of organized local democratic civil society groups and politicians about a far-right normalization. Experts are identifying new problems, challenges, and the possible development and impact of civil society counter-strategies against normalization processes. The results show that the analysis of the far-right normalization process at the level of attitudes and local spaces offers deep insights into the complexity and understanding in phases of parallel (dis-)linearity of the multilayered process.

MEYER, ALINA ANNA* (University of Rostock & University of Marburg, Germany)

Unite behind the Science! behind Who? a Qualitative Analysis Of the Scientists for Future Movements Understanding of Science.

The Scientist for Future (S4F) Movement describes itself as a „a non-institutional, non-partisan and interdisciplinary association of scientists“ who „[...] are committed to ensuring that scientific findings are appropriately incorporated into political debates and taken into account when shaping a sustainable future“ (Scientist for Future 2024). The S4F Movement positions itself in the contested field between science and politics. They represent an unprecedented organisation of scientists in the German-speaking world and are thus entering a field of activities to tackle the climate crisis while also trying to maintain scientific integrity.

As part of my examination, I conducted a qualitative analysis of the S4F's understanding of science in order to identify the ambivalences and potentials of these negotiations. To this end, I used Donna Haraway's scientific-theoretical approach of situated knowledges (Haraway 1988) and conducted episodic interviews which I then analysed with grounded theory methodology (Corbin and Strauss 1990). I identified two different understandings of science within S4F, which I describe as less formalised and less exclusive and more formalised and more exclusive towards, for example, different types of knowledges and epistemologies. The understandings of science constitute themselves in relation to each other in terms of their internal and external logic as well as through functional and strategic distinctions to a social extriority.

My analysis suggests that the representation of understandings of science is closely linked to social diagnoses of a credibility advantage or loss towards science. This largely determines the extent to which scientists constitute their role understandings as scientists within and outside of S4F and which areas of responsibility they perceive for the S4F movement. S4F can thus be utilized to illustrate and discuss how different types of knowledges and epistemologies are perceived and negotiated in the tension zone between science and politics in the context of the climate crisis.

Refugee Women's Transition to VET in Germany: Examining the Role of Gender Norms and Human Capital Endowments

Between 2015 and 2020, over 600,000 women applied for asylum in Germany (Eurostat, 2023). Since formal qualification and labor market outcomes are strongly coupled in the host country, the completion of vocational education and training (VET) can be considered an important foundation for the socio-economic integration of the predominantly young refugee women (Cardozo, 2023). So far, however, refugee women have only participated in VET to a very small extent (Niehues, 2021), which limits them to rather unfavorable segments of the highly segregated German labor market. For women's vocational trajectories in particular, traditional gender roles that assign women to the domestic sphere as well as the varying accessibility to education and employment systems depending on the country have proven to be of great influence (e.g. Nussbaum, 2004). The article therefore examines the extent to which various contextual conditions related to gender norms as well as human capital endowments acquired in the country of origin are associated with refugee women's transition chances to VET in Germany.

For this purpose, the IAB-BAMF-SOEP Survey of Refugees is analyzed using a piecewise-constant exponential model for the time period 2016–2021. The sample comprises refugee women who are of the appropriate age to enter VET, i.e. between the ages of 18 and 30, and arrived in Germany after 2013 (N=945).

The descriptive results reveal that only 9% of the women in the sample transitioned to VET during the observation period. The multivariate analyses indicate that neither their human capital endowments acquired in the country of origin (i.e. level of education and work experience), nor their own gender role attitudes, nor having children nor the frequency of contact to persons from the same country of origin are significantly associated with their transition chances to VET; only having a partner shows a particularly strong negative association in this regard.

Trust, Risk, and Uncertainty Surrounding the Use of Artificial Intelligence in Healthcare: A Scoping Review of Public Perceptions

Artificial intelligence has immense potential to improve the health of societies. However, the pace at which AI is developing generates uncertainty in the utility of these technologies for social benefit. Accordingly, public trust in AI for use in healthcare is imbued with considerations of perceived/real risk. In recent years, scholars have conceptualized trust in AI in healthcare, noting dimensions of competence, honesty, and benevolence. The underlying assumption that has yet to be unpacked, however, is in what, or in whom, we are asking people to trust and how this relates to risk and uncertainty. For example, is the focus on algorithms, training data, the humans involved in obtaining training data, tech companies developing/regulating the technologies, or a combination? Do risk perceptions relate to public discourse and rhetoric? Does trust vary across social identity? We aim to systematically document empirical literature investigating public trust in AI within the context of healthcare. Following Arksey and O'Malley's framework for scoping reviews, we searched four databases to identify peer-reviewed and grey literature published between 2022 (launch of ChatGPT) and October 2024. Articles will be extracted in Nov 2024 and data will be charted in consideration of study design/location, definition/conceptualization of trust, focus of trust (in who/what), study population characteristics, and determinants accounted for as influencing public trust, including risk and uncertainty. To realize the potential benefits of AI in healthcare, health officials need to ensure that AI is trustworthy and then secure public trust. Building trust will require transparency regarding the real risks of AI use in healthcare, and how these risks will be managed given the uncertainty of the rapid evolution of AI. The present work will respond to identified gaps in our understanding of public perceptions of AI required before these technologies can be implemented for health system improvement.

MEYLAKHS, PETER* (National Research University Higher School of Economics, Russian Federation)

Lay Epidemiology and Its Tools: The Case of Vaccine Sceptics

Increasing vaccine uptake became a national priority in many countries. The lack of public confidence in the vaccines is often explained by the deficiency of knowledge about vaccination or inadequate understanding of information. However, there is extensive evidence that vaccine sceptics have more knowledge about vaccination than people who are ready to be vaccinated. This presentation seeks to explain this paradox by using the concept of lay epidemiology. The idea of lay epidemiology is based on the fact that individuals seek to make sense of the world around them, they make inference about the disease from personal observations and personal stories as well as from the media (both traditional and social) and, increasingly, from readily accessible in the Internet scientific research. In many respects lay epidemiology mirrors professional epidemiology: lay epidemiologists also conduct their own research; they collect and evaluate evidence and they also engage in risk evaluation. Based on 37 semi-structured interviews with vaccine sceptics residing in St. Petersburg, Russia we will systematically compare different aspects of professional and lay epidemiologies, such as ways of becoming an epidemiologist, criteria of evidence, risk evaluation and other features that pertain to epidemiological research. Unlike professional epidemiologists their lay counterparts focus not on populations, but individual cases, and their criteria of evidence, risk evaluations and other aspects related to epidemiological work are fundamentally different. In the era of ever-increasing erosion of public trust in many fundamental (including medical) social institutions the easiest and traditional ways of combatting dissent by disqualifying the dissenters as conspiratorial freaks may not be the most optimal way of dealing with the lay epidemiology phenomenon. The problem constitutes a major challenge for public health with no ready-made solutions.

Two Drug Epidemics in St. Petersburg, Russia? Substance Use, Risk Behaviors, and HIV and HCV Prevalence Among Young and Older People Who Use Drugs Attending a Harm Reduction Facility

Russia has an estimated 1.3-1.8 million people who inject drugs (PWID). In recent years concomitant decline of opioid use and rise of new psychoactive substances (NPS) use was observed. We conducted secondary analysis of survey data collected by a harm reduction organization in Saint-Petersburg, Russia (n = 978). The data were collected in 2019-2021 and analyzed using statistical and regression techniques. Older PWID group (30+) was significantly more likely to use opioids (87.5% vs. 32.4%) than young PWID; young PWID used NPS four times more frequently than older ones (79.9% vs. 21.5%). The odds ratio of being an exclusive stimulant user but not an opioid user among younger cohorts is more than forty-five times higher than among older cohorts all else being equal (AOR = 47.38; CI - 21.90-102.53; p < 0.001). The younger respondents were more than four times less likely to be HIV-positive than older participants (8.4% vs. 36.7%) and four times less likely to be HCV-positive (23.5% vs. 80.6%). Young PWID were significantly more prone to risk behaviors (syringes sharing in past month; having overdose in the last 12 months; and inconsistent condom use during past 3 months) than older PWID, which renders them vulnerable to rapid HIV and HCV transmission both by parenteral and sexual routes. It is possible that currently we are observing two epidemics – an “old” opioid epidemic among older generations of PWID and a new NPS epidemic among younger generations of PWID. New forms of harm reduction tailored to the needs of NPS users along with expansion of existing harm reduction programs for opioid users are urgently needed.

Produire Une Expertise Territorialisée Entre Chercheurs Et Acteurs Autour Du Climat

Ce travail aborde les formes d'expertise scientifique territorialisée produites en interaction avec des acteurs sociaux (élus et techniciens). Ces expertises se manifestent par des données, cartes, systèmes d'information géographique et des modèles. Nous considérons l'expertise climatique comme un « objet intermédiaire » facilitant la collaboration entre acteurs et chercheurs. Cette approche remet en question le déterminisme technique qui postule que les connaissances des chercheurs transforment systématiquement les pratiques des acteurs. Toulouse, Dijon et Tunis illustrent la diversité des formes de collaboration entre chercheurs et acteurs autour du climat urbain.

À Toulouse, la collaboration entre chercheurs et acteurs a eu un impact significatif sur l'action publique, grâce à un développement sur vingt ans et un consortium diversifié. Les collaborations se sont structurées autour de plusieurs objets intermédiaires (cartes climatiques, guides de recommandations, etc.) pour construire une expertise hybride selon un large éventail de modalités d'interactions, depuis la recherche pure jusqu'à l'internalisation de l'expertise par les services de la métropole.

À Dijon, les chercheurs manifestent un engagement dans la collaboration avec les acteurs. Les analyses sur la chaleur urbaine et les campagnes de

mesures mobiles initiées ont agi comme des objets intermédiaires facilitant les collaborations entre chercheurs et acteurs et sensibilisant les citoyens à l'adaptation. L'effet de ces objets est visible à travers leur intégration dans les documents de planification.

En revanche, à Tunis, dans un contexte institutionnel et urbanistique plus complexe, l'émergence de l'adaptation sur la scène urbaine repose principalement sur la capacité des outils intermédiaires produits, à savoir la carte de végétation, les cartes climatiques.

Ces expériences se déploient dans des temporalités variables. Elles prennent différentes configurations, allant de la simple consultation à l'initiative des praticiens, à l'application territoriale à l'initiative des chercheurs, jusqu'à des travaux de recherche-action entrepris dans une perspective de transfert ou de co-construction.

Schooling and Child Protection from Children's Perspectives.

While all children learn through experience, in a range of interconnected and influential contexts, like school, home and community, there is a staunch assumption that school is a strong protective factor for children's well-being. However, it is important to understand how children who have experienced trauma experience well-being in educational settings. Research on children's experiences of school when they are unsafe in other contexts is limited. There is evidence that children who are unsafe at home, underachieve academically as students. However, a deeper consideration is needed on how safety at school is constructed and might exacerbate or support the well-being of children who are exposed to violence, neglect and/or living in out-of-home care. This paper presents a theoretical discussion of how children construct safety at school, and other socio-political imperatives that drive social constructions of safety at school. It compares the dominant approaches of education as *means* to future well-being with an appreciation of academic achievement as an end *goal* resulting from well-being. It challenges the idea that school is always constructed as a positive learning environment and safe haven providing comfort and stimulation from violence in the home, through physical environment and relationships. It presents the experiences of traumatised children who describe school as a multifaceted and inherently risky institution. An institution where children's agency is needed to navigate safety with peers, safety with adults, and safety in physical spaces that can replicate unsafe experiences in other contexts of their lives. The implications of this analysis indicate that children's constructs of school-related safety, are essential. They need to be prioritised in educational policy to access the untapped potential for learning contexts to counter the impacts of violence on children. Furthermore, they invite a more integrated and dynamic discourse of schooling and children's well-being.
