Les Coopératives De Travail Dans Les Professions Réglementées : Défis, Opportunités Et Quête De Sens

Cette communication s'intéresse aux coopératives de travailleurs dans les filières régies par les ordres professionnels. Ces modèles alternatifs d'organisation du travail suscitent un intérêt croissant, compte tenu de leur mode singulier de gouvernance et de gestion démocratique et participative. Face aux tensions croissantes entre les logiques professionnelles et managériales qui caractérisent de plus en plus de milieux de travail, les projets coopératifs constituent des voies alternatives en émergence pour atténuer ces tensions et favoriser les pratiques professionnelles en phase avec l'éthique professionnelle et la quête de sens des travailleurs. La création de coopératives de travail dans les filières régies par les ordres professionnels se heurte toutefois à de nombreux obstacles, liés notamment à la méconnaissance du modèle coopératif par les ordres professionnels, ce qui complexifie, voire freine la mise en œuvre de coopératives de travail. Fondée sur des entrevues auprès de professionnels impliqués dans la création et la gestion de coopératives de travail de la province de Québec (Canada), cette communication examine des enjeux liés à ces nouvelles formes de collaboration au sein des professions réglementées, ainsi que leurs impacts sur les pratiques et professionnelles et le sens au travail des professionnels.

MICHEL-SCHERTGES, DIRK* (Aarhus University, Denmark)

Alienation and the Sense of Possibility

What alienation theories and studies have in common is that they can be understood (implicitly) as contemporary seismographic reflections on social problems that reveal an "incompatibility" of the individual with the social structural dimension. If for Marx it is primarily a matter of structures of alienation that arise from alienated and alienating work practices and organization, exchange value and not least the commodification of everyone and everything, then analyses of alienation can be understood as depending on the particular form of human coexistence under the given formation of society. In this framework, it seems interesting to shed light on the currently significant (global) socio-cultural and political shifts in society with the help of Lefebvre's rhythm analysis. That is, the rhythms of the immanent relations between everyday life and social structure are to be addressed. In this context, the question arises whether and how currently developing social tendencies and their immanent contradictions can be anticipated in order to recognize, understand and react to possible future alienation scenarios.

MICHEL-SCHERTGES, DIRK* (Aarhus University, Denmark)

Concrete Utopias and the Anthropocene

From the very beginning, human history was characterized by the integration of humans into their natural environment. In order to survive, it was essential to adapt to natural conditions on the one hand, and to change these to such an extent that they could be used by humans (for survival) on the other. In (particularly Western) history, this duality shifted towards the "cultivation" of nature, or with the (scientific) thinking of the Enlightenment, and subsequently in economic growth thinking towards the (destructive) adaptation or even destruction of nature to achieve short-term "profit". The results include the environmental catastrophe and the associated social problems, such as escape and "migration" and resource wars and the ever-increasing division of society into more poor and fewer rich people. These global social changes are not only reflected in the erosion of the organization of (democratic) societies, but also in social coexistence and social coldness, which is expressed not least in exclusion and ethnic division efforts. The question that arises here is to what extent concrete-utopian aspirations can be brought together with political realities of power constellations in order to stop the end of history.

MICHELIN, IRENE* (University of Trento, Italy)

Overeducation Dynamics in Germany and the United Kingdom: Risk Persistence of the Phenomenon and (Gender) Wage (Gap) Prospects

This study delves into the complex phenomenon of overeducation in the context of the German and United Kingdom labor markets, adopting a longitudinal perspective. Most contributions on the risk of experiencing overeducation (and on its consequences) employ a cross-sectional approach, often neglecting the micro-level persistence of the phenomenon. Consistently with the latter aspect, a number of empirical contributions depict overeducation as a persistent phenomenon, rather than a temporary one. Therefore, first of all, the study investigates overeducation persistence and its possible heterogeneity across groups (i.e., distinguishing primarily between female and male workers), in a comparative framework. The two countries chosen for the study represent two different ideal-typical institutional configurations, but, according to existing literature, both of them have experienced an increased wage inequality recently. Research on the scarring effects of overeducation has shown a strong lock-in effect, especially in a highly educationally stratified context, such as the German one, as well as reduced earnings and wage trajectories. Then, the study addresses the potential role of overeducation persistence in contributing to the gender wage gap, and it investigates the extent to which processes of state dependence and/or mechanisms of accumulation of (dis)advantage over time are involved. In particular, it is expected that not just overeducation risk but overeducation dynamics vary by the gender of the workers, with female workers facing increased penalties, thereby contributing to the gender wage gap. The study draws on panel data from country-specific longitudinal household studies, namely SOEP for Germany, and BHPS and UKHLS for the United Kingdom. For the analysis, dynamic random-effect probit models and the Oaxaca-Blinder Decomposition are performed. The study aims at contributing to research on stratification and on the longitudinal accumulation of inequality through a better understanding of both overeducation dynamics and gender wage gap, and their relation.

Questionnements Sur Les Mécanismes De Réinstallation Des Réfugiés Depuis Un Pays Tiers – Le Cas Du Québec

Cette communication a pour objectif de décrire et de discuter le processus de sélection des Réfugiés Pris en Charge par l'État (RPCE) du Québec. Dans un contexte mondial défavorable à l'accueil des réfugiés, les programmes de réinstallation depuis un pays tiers deviennent des leviers permettant de contourner les regards suspicieux entourant les migrations de population pour garantir un accès légal et sécurisé à certains pays d'accueil. Ces mécanismes connaissent une véritable réminiscence depuis les années 2000 alors qu'ils restaient marginaux au siècle dernier, qui a pourtant connu des conflits plus meurtriers et des déplacements de populations bien plus intenses que ceux que connaît aujourd'hui l'échiquier mondial. Cette communication est issue d'une recherche confiée par le ministère de l'Immigration, de la Francisation et de l'Intégration (MIFI) du Québec à l'Équipe de Recherche Interdisciplinaire sur les Familles Réfugiées et Demandeuses d'Asile (ERIFARDA) de l'Université de Montréal (UdeM). Il se base sur une revue de littérature réalisée à l'hiver 2021, que nous confrontons à huit entretiens semi-directifs réalisés au printemps 2021 avec des cadres du Haut-Commissariat des Nations Unies pour les Réfugiés (HCRNU), de l'Organisation Internationale pour les Migrations (OIM), d'Immigration Réfugiés et Citoyenneté Canada (IRCC) et du MIFI. L'objectif est de mettre en débat le processus de sélection réalisé dans des pays tiers, souvent au sein de camps de réfugiés, avec les recommandations émanant des acteurs supranationaux. Dans son objectif de permettre aux réfugiés un accès légal et sécurisé au Québec, nous verrons que bien des enjeux stratégiques entrent en ligne de compte.

MICONI, ANDREA* (IULM, Italy)

KOMPATSIARIS, PANOS (HSE University, Russian Federation)
CANNIZZARO, SARA (De Montfort University, United Kingdom)*Gendered Constructions of Migration in Europe an Intersectional Analysis of Inclusionary and Exclusionary Discourses on Social Media Platforms*

This presentation explores intersectional discourses of migration and gender in the social media environments of three different European countries – Belgium, Greece, and Italy. Through a discursive analysis, we identify 1) an inclusionary discourse providing constructions of gender that welcome migrants in European societies articulated around the nodal points of *empathy and care*, *visibility*, *equality* and the *acknowledgement of societal relevance*; and 2) an exclusionary discourse providing constructions of gender that prohibit the inclusion of migrants in European societies, articulated through the nodal point of *threat*, as a *burden*, as *radically different* and *irrelevant or invisible*. For the analysis, we retrieved a dataset of 1000 posts per country about migration from Facebook and Twitter (now X) and we selected posts with a gender dimension. There is a lot of research about how traditional media, such as the press or TV and radio broadcast, report on migration in Europe, but less is known about what the role of social media – characterised by a mix of mainstream media agents and citizens journalism – is in representing migration in Europe. The paper shows the intensity over the discursive struggle over migration and how gender becomes activated in the struggle across the left/right-wing political spectrum in Europe.

[the paper was written as part of the EUMEPLAT Horizon project and apart from the listed authors for this conference the rest of co-authors are: 1. Carpentier, Nico 2. Lagrange, Babette 3. Van Bauwel, Sofie 4. Hroch, Milos 5. Doudaki, Vaia 6. Ingebreetsen, Jim. 7. Archontaki, Ioanna].

RC26-428.2

MICONI, ANDREA* (IULM, Italy)

Representation and Misrepresentation of Migration in Social Media Discourse in Europe

The paper is based on a wide-scale analysis of social media debate in ten countries – Belgium, Bulgaria, Czechia, Germany, Greece, Italy, Portugal, Spain, Sweden, Türkiye – that we run in the context of the Horizon 2020 project EUMEPLAT. We studied the debate between 2021 and 2022, selecting the posts discussing a number of keywords related to *immigration*; and, within this cluster, we focused in particular on those also implying a *gender* dimension. Following a "digital methods" approach, we collected the most impactful posts in terms of traffic, based on the metrics specific to each platform – Facebook, YouTube, Twitter – for a total of 720 posts per country. The focus we adopted is due this topic traditionally being the most polarizing issue in Europe; and, even more, to migration playing the role of constitutive other in the building of the European identity (i.e., Delanty).

We will present an overview on the between-country analysis, and in-depth observations of three sub-trends. In the first case, the use of a set of keywords in national languages allowed us to detect some nuances in the representation of migration. As to the in-depth inquiry, a first significant aspect has to do with all differences, in terms of impact, between the contents posted by common users and those posted by institutions, either media agencies or politicians. The second one is the role played by the reference to Europe in the representation of migration, which will confirm the hiatus between top-down and bottom-up communication (or between top-down Europeanization and Europeanization from below, to quote della Porta). The third aspect, that we also analyzed in force of a qualitative method – the theoretical discourse analysis – is the intersectionality between gender and migration in the social media debate in Europe, which will reveal an intricate pattern.

MIEG, HARALD* (Humboldt-Universität zu Berlin, Germany)

Translating Values into Quality: How We Can Use Max Weber's Ethic of Responsibility to Rethink Professional Ethics

A risk-based reinterpretation of Weber's ethic of responsibility can resolve core problems of professional ethics (the role of values, the multilevel problem, etc.) and address current issues—such as the social responsibility of professions or the accountability of professionals. From this perspective, professions as organizations and professionals as their individual members share and distribute responsibility (and risk) in that the primary responsibility of a profession is to provide domain-specific quality standards, while that of individual professionals is to be able to justify service against those standards on a case-by-case basis.

MIELEWCZYK, MARCIN* (Doctoral School in the Social Sciences at the Jagiellonian University, Poland)

Giving Voice to the Future Generations - Bringing Future Generations to the Debate on Green Transformation in Poland through Deliberation Using the Imaginary Future Generations Method.

The climate crisis has unleashed a series of doubts about what kind of future awaits us as a society. In the debate about social adaptation and acceptance of new climate policies, due to the longevity of the transition processes, it is essential to consider the fairness of the transformation process for current, but also for future generations. Although the role of future generations in the green transformation has been noted (cf. Jones et al. 2018), there is a lack of research on the procedural use of the category of future generations. Future generations are often referred to in political speech, media discourses, and scientific studies, but the "future generation" reference may be more than a rhetorical figure. Is it possible to gain insights into the worldview of values of future generations? If so, how can we give future generations a voice so they can speak for themselves?

The Imaginary Future Generations (IFG) method (see Hara et al. 2019) proposed the creation of imaginary groups that would represent future generations (not yet born) and negotiate with representatives of the current generation regarding visions of the future and related decision-making processes. In this way, future generations could become one of the stakeholders in the deliberation process. The method thus bridges the gap between the need for intergenerational justice and listening to the many different grassroots visions of the future, which has contributed to choosing sustainable regional policies while ensuring acceptance and understanding by the currently living local societies.

In the presentation, I'll show the results of the application of the IFG method in deliberation about green transformation policies (shift from coal, housing policies, transportation policies, biodiversity protection) in Poland, comparing visions of the future and the needs and goals expressed by the current and future generations during participatory workshops conducted in 2024.

Bottom-up Social Infrastructures in Settlement-Making: Case Study from Lahore

This contribution will draw on longer-term empirical fieldwork in a low-income settlement in Pakistan's Lahore to focus on two interrelated dimensions of social infrastructure: First, the settlement process will be traced. It is not linear but characterized by progress and setbacks due to adverse policies by contesting land claimants and owners on the one hand and respective repeated steps to establish basic infrastructure on the other. Social infrastructure here comprises especially common buildings of congregation, e.g. a gurdwara, church or mosques, but also service infrastructure, such as sewage and electricity connections. Second, drawing on Simone's notion of "people as infrastructure," the analysis focuses on how a specific (un)settlement process at the margins depends on social capital. However, in extension of Simone's understanding of infrastructure made up of people through horizontal ties, the analysis clearly points to the necessity of having a mixture of both horizontal and vertical ties to employ patrons, seek protection from eviction and thus ensure mid-term settlement. Vertical alliances and operations constitute a relevant component of claim-making and political mobilization besides horizontal networks based on ethnicity, kinship, and religion. (In)justice is countered through people-to-people support in ad hoc social coalitions of the residents that reflect a moral positionality and community ethic of the low-income dwellers. At the same time, the community is not homogeneous but power-hierarchies exist and destabilize the performance of a joint moral positionality around the establishment of tangible social infrastructure. The contribution reflects on power-hierarchies and (in)justice in low-income settlement contexts of the Global South and the two-dimensional role of social infrastructures in settlement processes that continue to be fragile. The case study draws on ethnographic data collected during several fieldwork research stays between 2012 and 2017 through informal and in-depth interviews with dwellers, neighbours, and local public representatives including from urban development authorities.

MIGLIETTA, ANNA* (University of Turin, Italy)

Parenting and the Transmission of Values in Immigrant Muslim Families

For Muslim migrant families, the transmission of traditional values and a strong ethno-religious identity is a central aspect of the educational process. However, Muslim parents face challenges in reconciling various educational models—both those tied to their cultural heritage and those of the host society. This tension also involves balancing different needs: the desire of parents to preserve and pass on religious and cultural values, and the need to adapt to the societal values their children encounter in everyday interactions. This study explores the cultural negotiation process undertaken by Muslim parents and examines its impact on their educational and parenting practices. A sample of 11 Muslim migrant parents from different national backgrounds (9 women; mean age = 48; average years in Italy = 25) participated in semi-structured interviews discussing their experiences of raising children within both their cultural heritage and Italian society. Data were analyzed using Atlas.ti. The findings underscore the pivotal role of religion in guiding parents' cultural negotiation processes, while also highlighting the perceived threat that cultural differences pose to their educational expectations.

Primeros Acercamientos a La Sordoceguera En Uruguay

Las personas sordocegas resultan un contingente poblacional que ha sido históricamente invisibilizado desde lo social en nuestro país. Esto ha llevado a desconocer cuántos son, dónde están, cómo transcurren sus cotidianidades, cómo han sido sus historias de vida, cómo se proyectan hacia el futuro, cómo son percibidos/as y cómo se autoperceben, cómo han devenido sus entramados familiares, médicos, educativos y sociales.

Más allá de que personas sordocegas han existido siempre, recién hacia fines del siglo XIX comienzan a aparecer textos en torno a la temática (fundamentalmente, en Estados Unidos, Canadá y algunos países europeos), a partir de estrategias educativas orientadas a esta población. Desde el ámbito de la salud llevó unas décadas más que la tomaran como una situación de discapacidad en sí misma, y no como la sumatoria de ceguera y sordera. La sordoceguera puede ser: congénita, adquirida, sordera congénita y ceguera adquirida y viceversa. Varios síndromes pueden llevar a la misma, siendo el más común el Síndrome de Usher. También puede adquirirse por otros síndromes, así como por meningitis, prematuridad, traumatismos encefalocraneales, toxoplasmosis congénita, entre otros.

En nuestro país, y en la región (salvo algunos países), se ha constatado la casi ausencia de investigaciones sobre la temática desde lo social. Por ello, a través de esta primera investigación exploratoria, nos orientamos hacia la delimitación de dicho objeto. Nuestro equipo de investigación está conformado por integrantes de la academia (uruguaya y francesa), así como por referentes de la Asociación de Sordociegos del Uruguay y de la Asociación de Sordos del Uruguay.

Consideramos que resulta fundamental poner este tema sobre la mesa, darle visibilización, conocerlo y hacerlo conocer, de manera de que comience a circular la temática y sus diversas aristas desde lo social, al menos, por los entramados académicos y sociales.

Residualization of Public Housing – Lessons from Poland's Five Largest Cities

Housing inequality is one of the central topics in urban studies, and in the social sciences more broadly. It is also one of the most significant and visible aspects of socioeconomic inequality. Over the last three decades, the process of housing commodification has accelerated across western societies and, consequently, the public housing sector has contracted and become more closely associated with the poorest sections of societies in many cities. Over the same period, the political changes in Central and Eastern Europe have contributed to the dismantling and monetizing of state housing sectors at the forefront of broader social and economic transformations. Unfortunately, most recent studies on housing commodification and inequalities in Europe are confined to the national scale. The aim of this research is to detail the linkages between the position and functioning of public housing in the five biggest cities in Poland (Warsaw, Krakow, Wrocław, Lodz and Poznan) and the evolving socioeconomic profile of individuals and households that rely on public housing. Additionally, the aim is to present the spatial patterns of social housing concentration in the analysed cities, and how those patterns of evolved over the years. This study relies on microdata (statistical information on individuals and households) from three national Polish censuses (1988, 2002 and 2021) and from household budget surveys (2005–2022). The main finding of our study is that 'residualization' is present in the public housing stock in urban Poland, and that the process gained momentum in the first two decades of the 2000s. Nonetheless, the pace, scale and patterns of public housing residualization are sensitive to a given urban context.

MIKULAN, JANJA* (School of Advanced Social Studies (SASS), Slovenia)

From Personal Suffering and Collective Trauma to Political Violence

This study investigates how structural conditions, individual incentives, and enabling environments interact to influence radicalization and violent extremism among former prisoners involved in political violence in Lebanon. Using thematic analysis of 10 in-depth interviews, the research explores how personal trauma is understood, how it influences beliefs and behaviours, and how trauma is reframed through collective experiences, contributing to radicalization.

The findings reveal that personal trauma plays a pivotal role in shaping violent behaviours. Many interviewees attached deep meanings to their traumatic experiences, viewing them as injustices that warranted retribution. This perception, often intensified by experiences of loss, violence, and psychological distress, led them to embrace extremist ideologies as a means of empowerment.

Collective and intergenerational trauma also emerged as critical in the radicalization process. Interviewees frequently reframed their personal suffering as part of a broader collective narrative of historical oppression and marginalization. This intergenerational transmission of trauma reinforced a sense of victimhood, driving individuals to align with violent groups in defence of their community's identity and perceived threats.

The research further explores the dynamic interaction between macro, mezzo, and micro levels. At the macro level, political instability, sectarian conflict, and war provided the structural backdrop for radicalization. Mezzo-level factors, such as community norms, extremist networks, and local violence, enabled individuals to turn to extremism. At the micro level, personal motivations, including the desire for revenge, belonging, and control, were instrumental in shaping their involvement in violent acts.

In conclusion, the study demonstrates that the radicalization process is a complex interplay between trauma, collective narratives, and structural conditions. Addressing violent extremism requires a holistic approach that considers trauma-informed interventions and the broader social and political contexts shaping individual behaviours.

RC42-679.3

MIKULAN, JANJA* (School of Advanced Social Studies (SASS), Slovenia)

Radicalization in Lebanon: Unravelling the Interplay of Social Identity, Ideology and Trauma

This study explores the processes of radicalization and political violence among former prisoners who engaged in acts of political violence in Lebanon. Through a thematic analysis of 10 interviews conducted with these individuals, the research examines how social identity, ideology, and collective trauma contributed to their radicalization and subsequent involvement in violence.

The findings reveal that religious and political ideologies played a crucial role in shaping the interviewees' identities and justifying their participation in violence. Radical interpretations of religious texts and sectarianism were central, with individuals perceiving their violent actions as part of a broader defence of their sect or religious group. Political contexts, such as the Syrian conflict and local political tensions, further amplified these identities, embedding the notion of violence as a necessary response to perceived injustices.

Collective trauma also emerged as a significant theme, with many interviewees recounting their exposure to violence and loss from a young age. This trauma, experienced both personally and communally, normalized political violence and fuelled feelings of revenge. Many former prisoners cited specific traumatic events as pivotal moments in their radicalization. The long-term psychological effects of these experiences manifested as post-traumatic stress, marked by hypervigilance, emotional detachment, and avoidance behaviours.

Furthermore, social networks and peer pressure were critical in the radicalization process. Family, friends, and community leaders influenced individuals to adopt violent ideologies, often through exclusionary social environments that left little room for dissenting views.

In conclusion, this study demonstrates that the interplay between social identity, ideology, and collective trauma is central to understanding the radicalization and engagement in political violence. Addressing these factors, particularly the impact of trauma, is crucial in efforts to deradicalize and reintegrate former combatants and prevent radicalization of youth.

RC24-JS-58.1

MILANI, KHOLOUD* (HASSAN II AIN CHOCK CASABLANCA Laboratoire LADIS, Morocco)

He Gendered Division of Sustainable Work in Moroccan Households: Cultural Legacies and Contemporary Challenges

In traditional Moroccan culture, women are widely perceived as being responsible for all domestic tasks, while men's involvement in such tasks is often associated with a loss of status or masculinity. This perception is reinforced by proverbs and oral expressions that highlight the strong social stigma attached to men participating in domestic labor. This paper explores how these cultural representations not only shape the division of household labor but also influence the allocation of sustainability-related tasks within Moroccan families.

As environmental concerns and the need for sustainable lifestyles grow, women often find themselves at the forefront of efforts to reduce energy consumption, manage waste, and adopt eco-friendly practices. However, these new responsibilities add to their existing burden of unpaid domestic work, exacerbating gender inequalities within households. Meanwhile, men remain largely disengaged from sustainability-related tasks, reflecting a continuity of cultural norms that position women as the primary caretakers of the domestic sphere.

This paper draws on empirical data and an analysis of Moroccan cultural expressions to explore the gendered dynamics of sustainable work within households. It examines the persistence of these cultural norms in a context where pressures to adopt sustainable practices are increasing and where the unequal distribution of this labor can have direct consequences on women's well-being and quality of life.

By investigating the role that traditional representations play in shaping the division of sustainable labor, this study highlights the challenges Moroccan households face in responding to climate change. It also offers comparative perspectives by examining how these dynamics evolve in other sociocultural contexts and what lessons can be drawn to promote a more equitable distribution of sustainable work.

Computing the Uncertain: Environmental Data, Hazard Standardization, and the Foundations of Risk Assessment

During the 2025 hurricane season, two back-to-back hurricanes in the Atlantic Basin stressed the already ongoing concern about natural disasters and the impact of climate-risk-related environmental threats on the well-being of local populations. In recent years, environmental data streams have gained critical importance as they feed granular risk assessments and value calculations, which are increasingly relevant in decision-making processes like infrastructure spending, insurance premiums, and housing markets. The “vast machine” (Edwards 2010) appears to have transcended atmospheric politics and gone steadily into the ground. A deep entanglement of distributed sensing capabilities, decoupled from its exclusive human orientation, has assembled a new “world to be acted upon” (Gabrys 2019). Still, conceptualizations of disasters from science and technology studies have stressed the lack of straightforward confinement of their outcomes and the limits of standard operating procedures to address them (Kim Fortun et al., 2017). Uses of environmental data to minimize impact, standardize hazards, and project certainty over climate threats appear to be directed to avoid the disruption of specific sociotechnical systems. This paper is set to illuminate the infrastructural and epistemic processes that allow this by looking at the emergence and consolidation of risk assessment research since the 2010s. Using text-processing techniques on article metadata and close-up analysis of data-sharing statements, it identifies environmental data infrastructures critical in sustaining risk assessment efforts. Moreover, by showing the presence of specific entities and components of the sociotechnical systems as objects of disaster research, it describes the priorities, biases, and blind spots on what counts today as a risk, where it is perceived, and the prescribed ways to address it.

Anthropology, University of Notre Dame, USA)*Infrastructure Commoning? Contributions of FAIR-Care Integration Projects for the Future of Digital Sovereignty*

In the nospan of five fast-paced years, data practices and infrastructures have been transformed by key technopolitical interventions. In the space of data management, CARE principles were articulated to introduce key questions of Indigenous sovereignty and stewardship that have been mostly absent from this space (Carroll et al., 2020). Debates about digital governance and sovereignty started to reach an effervescent point with critiques of infrastructural concentration, data extraction, and platform dominance (Zuboff 2023; Terranova 2022; Srnicek 2019). In this paper, we engage the new moment in this debate concerning the question of domain-specific FAIR-CARE integration and suggest alternatives for solidarity building around digital sovereignty projects (Carroll et al., 2021; Jennings et al., 2023; Murillo, 2023). Based on the study of the commons as an alternative governance framework that is not state or private-based, we discuss the experience of the Socio-Environmental Knowledge Commons (SEEKCommons) project in common tools and infrastructures for allies to support Indigenous, Latino, and Black digital projects. We elaborate on the concept of “infrastructural commoning” as a contribution to the work of FAIR-CARE integration in a space that necessitates more clarity concerning the importance of participatory governance mechanisms that involve indigenous and non-indigenous allies working on common infrastructures that protect data security and sovereignty in a context of extensive data extraction.

GOTTFRIED, HEIDI (Wayne State University, USA)

The “Gray Market” in US Home Care: Complexities and Contradictions

Home health and personal care are among the fastest-growing occupations in the United States. Public funds (primarily Medicaid) often cover home care workers' wages, but many care recipients are not eligible for such support, and instead pay out of pocket. Many privately-paid home care workers are formally employed – hired through specialized employment agencies or on-line matching services, but a substantial (though unknown) number are hired informally, typically paid in cash and outside of governmental regulation. This is the “gray market,” for which data is almost nonexistent. To understand this gap, the paper presents the findings drawn from original data generated using an innovative methodology (based on Facebook's targeted advertising) to survey privately-paid home care workers compared to agency workers in four large U.S. areas: New York City; Los Angeles and surrounding counties, and a selection of metro areas in the Southwest and the Southeast. We also interviewed a subsample of survey respondents to both help interpret the survey results and collect workers' own insights on the past and future of home care. On the basis of these data, we compare three types of home care: formal employment in the Medicaid-funded segment of the home care market, formal employment in the privately-paid segment, and the understudied “gray market.” Our analysis complicates the conventional narrative about this rapidly growing occupation by highlighting the structural segmentation of the home care labor market as well as its geographical variations.

We seek to inform efforts to strengthen labor standards enforcement, which is especially vital for undocumented and vulnerable immigrant workers employed by private households, and support the broader effort to secure equitable and sustainable long-term care, for care providers and recipients alike. In this presentation, we will describe the challenges and rewards of our methodology and present preliminary findings from the project.

WG11-942.2MILLER, KAREN* (City University of New York - LaGuardia
Community College, USA)*Settler Colonization and the Blurry Lines between State-Sanctioned and Extra-Legal Violence*

In this paper, I examine how states use seeming challenges to their monopoly on the use of legitimate violence to help spur the expansion of projects that may undermine the stability of the rule of law, but support the expansion of states' interests. I focus on Melquiades Fellores, who moved in 1941 from Panay, a sugar-plantation region in the Philippines' Visayan Islands, into what is now the municipality of Norala, a majority-Muslim area in South Cotabato on the island of Mindanao. Since early in the century, colonial administrators were attempting to spur transfers of populations from areas already dominated by imperial capitalism into indigenous-controlled spaces. They wanted to build a national political economy organized around commercial agriculture and mining that expanded into what they saw as the periphery. Upon arrival, Fellores was issued a plot of land that had been deemed “public” early in the century, a designation that dismissed the sovereign claims of its indigenous inhabitants. The Philippines' National Land Settlement Agency, responsible for migration into Cotabato at the time, also provided him with a rifle, a hoe, a level, and two saws, retired American-military supplies. Manufactured in 1900, the rifle was a tool for empire-building. It had been brought to the islands to prosecute the US military's brutal counterinsurgent war against Filipino sovereignty early in the century. In 1941, it was being redeployed as an instrument of conquest. Issued for hunting, these rifles contributed to the expansion of settler holdings on land confiscated from indigenous populations. They were also part of settlers' extra-legal arsenal for the consolidation of their power through intimidation, bullying, eviction, and the subjugation of the area's most vulnerable Muslim inhabitants. While they contributed to explosive unsanctioned violence, these weapons upheld the state's investment in settler colonization and its disinterest in Muslim lives.

MILTISOV, ALEX* (Bishop's University, Canada)

Reshaping Work: The Governance of Generative AI Integration and Its Impact on Labor Dynamics

This paper aims to critically explore current governance approaches for the integration of generative AI in the workplace, encompassing levels from company policies to regional, national, and international regulations. Generative AI, recognized for its capacity to produce human-like content, is poised to significantly impact labor dynamics (Frank et al., 2019; Warnke, 2023). Workers around the world, including social scientists, are expressing concerns about whether their employers may prefer AI over them in the near future. Anxiety about the potential loss of jobs to AI is a common sentiment among workers (Cox, 2023; Vallance, 2022).

This paper argues that generative AI is significantly transforming the workplace experience, raising complex governance challenges beyond the immediate issue of job displacement. These challenges include ensuring robust privacy protections amidst widespread data collection, maintaining equitable task distribution between generative AI systems and human workers, and providing equal opportunities for skill development to prevent a divided workforce where only some have the necessary skills to succeed in an AI-driven environment. Effective governance models are essential to address these comprehensive concerns, focusing not just on ethical dilemmas but also on fostering environments that enhance worker well-being and job satisfaction. This requires proactive regulatory compliance, clear communication policies, and an organizational commitment to continuous learning and adaptation.

Through an examination of various AI governance approaches—including legislative measures, corporate ethics policies, and international agreements—this study aims to identify effective strategies that positively influence worker well-being. These strategies may involve using generative AI to augment rather than replace human labor, leveraging AI for skill enhancement, and creating new roles that capitalize on human creativity. Understanding and implementing robust AI governance can help mitigate negative impacts and fully leverage the benefits of AI technologies in the workplace.

RC33-540.5MINELLO, ALESSANDRA* (University of Padova, Italy)
RUSSO, CONCETTA (Guglielmo Marconi University, Italy)*Navigating Future Preferences: A Narrative Analysis of Fertility Decisions in Italy's Evolving Landscape*

This study investigates the narratives surrounding fertility intentions and the fertility gap, emphasizing the evolving preferences of men and women in Italy. The discrepancy between intended and realized fertility reflects a complex interplay of deliberate choices to remain child-free and barriers that prevent individuals from having children. To explore these motivations, we analyzed specific emails sent to a prominent Italian newspaper in response to a survey addressing the country's low birth rate and fertility challenges, published in March 2023. This national platform, which ranks among the top three in online reach, facilitated a rich dialogue on a pressing societal issue.

Utilizing thematic qualitative analysis, we examined 86 personal narratives from 40 men and 46 women—comprising parents, childless individuals, and those child-free by choice. Narratives are a method of recapitulating past experiences through events that individuals interpret and convey. Labov (1972) noted that narratives encapsulate sociological information, enhancing the depth and robustness of our research. This approach reflects how individuals make sense of their experiences, revealing the socio-cultural, psychological, and emotional factors influencing fertility decisions that quantitative data often overlook.

Our analysis unearthed three salient themes: economic uncertainty coupled with ineffective family policies, mistrust of public healthcare regarding fertility treatments, and the anxiety linked to intensive parenting expectations. These themes resonate across genders, indicating a shared landscape of priorities and concerns among individuals regardless of their fertility status.

The convergence of narratives suggests a need for future policy interventions that address these critical issues, particularly focusing on economic stability, accessible healthcare, and robust family support systems. By understanding these narratives, we gain valuable insights into the preferences and behaviors shaping the fertility landscape in Italy, ultimately informing decision-makers on how to foster conditions that align with the needs of future generations.

RC14-JS-177.1MINGUIJON PABLO, JAIME* (University of Zaragoza, Spain)
SERRANO MARTÍNEZ, CECILIA (University of La Rioja, Spain)
GASTÓN FACI, DIEGO FÉLIX (University of Zaragoza, Spain)*Desarrollos y Limitaciones De La Innovación Tecnológica En Los Servicios Sociales Españoles: La Opinión De Sus Responsables*

En esta comunicación se van a presentar los resultados de un estudio en el que se analizó la percepción de los responsables de los servicios sociales de las diecisiete comunidades autónomas que componen el Estado Español sobre el nivel de integración de las innovaciones tecnológicas en esa parcela de la administración pública.

Para ello, se ha utilizado un enfoque fundamentalmente de carácter cualitativo, basado en un cuestionario confeccionando siguiendo las directrices de la escala Likert. El citado cuestionario fue elaborado partiendo de una propuesta inicial del Laboratorio de Gobierno Abierto de Aragón, que fue perfeccionada y mejorada por el equipo de investigación. En concreto, se aborda la cuestión de la innovación pública a través de seis dimensiones, una de las cuales es precisamente la innovación tecnológica, que es la que se explota de manera específica en esta comunicación.

Entrando ya en las conclusiones del trabajo, a juicio de sus responsables, existe una implantación desigual de la innovación tecnológica en los servicios sociales entre las diferentes comunidades autónomas o regiones españolas, con un nivel general medio-bajo. Andalucía y Castilla La Mancha son las comunidades autónomas que presentan un mayor nivel de desarrollo, mientras que Baleares, Canarias, Cantabria y Extremadura son las que menos. Por otra parte, se ha detectado que el nivel de integración de las innovaciones tecnológicas tiene que ver con el desarrollo de las infraestructuras tecnológicas y con el apoyo técnico al conjunto de la organización. Igualmente, favorece el camino hacia el nuevo campo de la inteligencia artificial, el machine learning, etc.

Finalmente, hay que resaltar que esta investigación constituye una acción innovadora tanto en lo que hace relación al método como al objeto y presenta una alta potencialidad de ser aplicado en otros ámbitos públicos y países.

RC49-774.1MINH TIEN, LE* (Ho Chi Minh City Open University, Vietnam, Vietnam)
LE THI THANH THU, LE* (Ho Chi Minh City Open University, Vietnam)*Perceptions of Mental Illness Among University Students in Vietnam: A Quantitative Research*

The process of modernization, as well as rapid changes in society, have had a significant impact on people's mental health. As a developing country, Vietnam also faces serious mental health problems. According to the Vietnam Ministry of Health (2023), about 14 million Vietnamese are suffering from mental disorders. Many people also face stigma, discrimination and human rights violations. Mental health undoubtedly presents significant challenges to public health and development concerns, making it essential to enhance awareness of mental illness, particularly among the youth. Therefore, the current study aimed to determine levels of knowledge, perceptions, and attitudes towards mental illness among university students in Vietnam. A cross-sectional survey was carried out from June to July 2024. Data were collected using an anonymous, self-administered questionnaire distributed to 450 undergraduate students from various universities in Ho Chi Minh City, Vietnam. The previous validated Attitudes to Mental Illness Questionnaire was used. Data analysis included descriptive statistics, Cronbach's alpha, t-tests, and one-way analysis of variance (ANOVA) to examine relationships between variables. The findings of the research will serve as a basic for the development of educational initiatives aimed at increasing mental health awareness and reducing the stigma associated with mental illness among students.

The Emerging and Development of Sociology in Vietnam: An Overview

Sociology, as a discipline, is relatively nascent in Vietnam. This article seeks to provide an overview of the evolution and establishment of sociology in Vietnam, examining its trajectory both prior to and following the Vietnam War through the analysis of secondary sources. The war resulted in a bifurcation of Vietnam into the South and the North, each governed by distinct political ideologies, which significantly influenced the emergence of sociology within the nation. In the South, where a pro-Western regime prevailed, sociology flourished, bolstered by scholars educated in Western institutions. Conversely, in the

North, under a socialist regime, sociology was regarded as a subversive field, as characterized by Bourdieu, and thus faced considerable resistance. After the war, Vietnamese sociology encountered a fate akin to that of its Chinese counterpart, experiencing a period of prohibition. It was not until the significant contributions of Francois Houtart, a sociologist from Catholic University of Louvain in Belgium, that sociology began to re-establish itself in Vietnam.

The Far-Reaching Effects of Menopause on Happiness, Mental Health and Quality of Life

Due to a lack of suitable large-scale survey data, the impact of the menopause on women's lives, e.g. in terms of work, leisure and family, has been severely understudied in the quantitative social sciences in general and in sociology in particular. Using waves 10-13 of the German Family Panel Study (*pairfam*), this study begins to fill this gap. The effect of menopause on quality of life and well-being is tested using a series of outcomes and fixed-effects regression. These outcomes include up to 20 indicators of happiness, mental health and life satisfaction. Menopause has a negative effect on all outcome variables, and for the majority of outcomes the menopause effect is significant. The results suggest that the menopause has far-reaching effects on quality of life and well-being, i.e. it reduces well-being and significantly worsens mental health. I conclude with an agenda for future research and important questions that remain to be answered.

MIRA, DAVID* (Université Paris Cité, France)

De Nomade à Entrepreneur : Le Développement Et l'Encadrement d'Un Tourisme De Masse Par Les Aït Khebbach Dans La Sahara Marocain.

Merzouga se situe dans le Sahara du Sud-Est du Maroc et vit principalement du tourisme. Les habitants du village sont majoritairement des nomades amazighophones du groupe tribal des Aït Khebbach, qui se sont sédentarisés près de l'Erg Chebbi en raison de l'agriculture oasienne à partir des années 1930. Depuis les années 1980, les dunes de sable (d'une taille de 24 x 8km) attirent un nombre croissant de voyageurs. En conséquence, les habitants élaborent de plus en plus d'activités touristiques (des bains de sable, des activités de quad et de 4x4, des balades en chameau, des randonnées, des séances de yoga, etc.). L'arrivée des touristes a déclenché un processus de mise en valeur de l'environnement (le paysage désertique), du patrimoine immatériel et matériel (amazigh et nomade) et a entraîné une amélioration de la qualité de vie des habitants (développement économique, accès à l'éducation scolaire, accès aux services médicaux).

Depuis les années 2016, une explosion du tourisme que l'on pourrait qualifier « de masse », laisse des traces à Merzouga. Même s'il est impossible de chiffrer le nombre de touristes, leur influence se fait sentir dans la transformation des lieux : à côté des nombreuses structures et de la présence visible de visiteurs à Merzouga, ainsi que d'une ambiance lumineuse et bruyante, le village se retrouve engagé dans un processus d'urbanisation. La zone de l'Erg Chebbi est entourée par des bivouacs sur un côté des dunes (environ 150) et par des hôtels de l'autre (environ 100), où se situent plusieurs villages, dont Merzouga. Une émergence des structures de luxe avec des piscines, de la haute cuisine, des systèmes de climatisation et de chauffage attire une clientèle plus aisée. À travers des données ethnographiques recueillies pendant deux ans chez les habitants de Merzouga, il s'agit d'examiner les effets sociaux d'un tel développement.

Youth Women and Transitions between Education, Work, and Care in Post-Pandemic Argentina: Belonging Among Young Mothers in Argentina

This presentation examines the transitions of young women from education to either employment or reproductive work, focusing on those who became mothers during the pandemic. Based on a qualitative longitudinal study conducted in two waves during and after the pandemic in the Buenos Aires Metropolitan Area (Argentina), it assesses how the interaction of place, gender, and class shapes women's identities. The presentation concludes that understanding the sense of belonging is essential for developing affirmative and youth-centered policies. Additionally, it argues that expanding young women's horizons through guaranteed access to education, employment, and the care system is key to achieving social justice.

Gender Differences in Digital Self-Efficacy at School across 52 Countries

Despite the widespread integration of technology in classroom instruction and general exposure to it, significant gender disparities persist in digital self-efficacy—understood as individuals' confidence in their ability to navigate challenges and achieve desired outcomes using technology. Digital self-efficacy plays a crucial role in the development and application of digital competencies, making it essential for acquiring and exercising relevant skills.

The existing literature identifies two key dimensions of digital self-efficacy: one related to basic or general applications and another focused on advanced or specialized technological tools. Using data from PISA 2022 (OECD's Programme for International Student Assessment), which surveyed 307,425 students from 52 countries through an ICT module, this study aims to achieve three objectives: (1) assess the dimensionality of self-efficacy based on the two constructs outlined above, (2) examine gender disparities across both dimensions, and (3) explore cross-national variations in these patterns.

Preliminary findings reveal that the two dimensions—basic and advanced digital self-efficacy—are empirically distinguishable across countries. Globally, students report higher levels of general self-efficacy than specialized self-efficacy. However, consistent with prior research, female students exhibit higher general self-efficacy but lower specialized self-efficacy compared to their male counterparts. These patterns show meaningful variations across countries, highlighting the influence of contextual factors on digital skill development and gendered outcomes.

Participatory Mapping and Socio-Environmental Vulnerabilities: Natural Threats and Industrial and Urban Stressors in Mejillones.

This article addresses the identification and characterization of multiple risks in Mejillones, Chile, through a participatory mapping approach and the use of local knowledge. Unlike traditional approaches that separate natural hazards from stressors in the built environment, this work highlights how both categories interact, increasing the vulnerability of the local population. The primary goal is to understand how communities perceive and prioritize both natural hazards, such as tsunamis and earthquakes, and industrial risks, such as the storage and transportation of hazardous materials and environmental pollution.

The increase in storm surges because of climate change has had a direct impact on the management of the industrial zone, further exacerbating contamination in the bay and illustrating the interconnected nature of these risks. This study highlights how such phenomena, combined with other hazards, contribute to a complex vulnerability network where industrial stressors and environmental changes converge, increasing exposure to multiple risks.

Four participatory mapping workshops were conducted with key stakeholders, including neighborhood councils, fishermen, the Bay Protection Circle, and residents of informal settlements, who identified risk scenarios and mitigation strategies. The results reveal significant gaps in risk perception: while companies prioritize the management of industrial accidents, the community emphasizes environmental pollution and the lack of information on evacuation procedures. These discrepancies broaden the concept of risk, suggesting that the absence of consensus among stakeholders increases exposure to danger.

This participatory methodological approach offers a new perspective on risk management by integrating technical knowledge with local expertise, and it highlights the heterogeneous risks present in the territory. The study reinforces the importance of addressing both natural hazards and industrial stressors to reduce the vulnerability of the community, particularly in the face of evolving risks such as increased storm surges.

Creative Resilience: Socioecological Art Practices in the Climate Change Crisis

As concern over the consequences of climate change escalates, art has emerged as a powerful medium for raising awareness and inspiring action. While the latest scientific studies (IPCC 2022) emphasize the urgency of the situation, a growing number of grassroots movements, such as Fridays for Future, Extinction Rebellion, and Just Stop Oil, are mobilizing millions to confront the climate crisis. In parallel, artistic practices are playing a crucial role in promoting socioecological awareness and catalyzing societal change.

This paper will explore how ecological art aligns with the broader socio-ecological practices driven by movements and organizations working across sectors like production, consumption, and energy. Beyond merely illustrating the environmental crisis, ecological art demands a radical rethinking of artistic practice by embedding social and environmental objectives at its core. Through transdisciplinary collaborations between artists, activists, and scientists, art is contributing to a collective effort to oppose or reverse the damaging effects of climate change.

The presentation will highlight key case studies, including art projects that intersect with grassroots movements, emphasizing how these works engage with the broader public, institutions, and policymakers and provide visceral experiences of environmental degradation, emphasizing art's unique ability to foster emotional engagement and inspire action.

This analysis, connected to the Project Socioecos, will contribute to transdisciplinary perspectives, encouraging collaboration between artists, NGOs, scientists, and activists to address the climate emergency through artistic creation and collective mobilization. Finally, this discussion highlights the importance of the role of art in socioecological practices to address the climate crisis.

Reimagining Resilience. the Collective Imaginary, Artificial Intelligence, and Climate Change in the Future of Biodiversity.

Cornelius Castoriadis' concept of the collective imaginary emphasizes its central role in shaping societal institutions, norms, and cultural frameworks. The imaginary is a dynamic force that influences how societies interpret reality and innovate, forming symbolic structures that underpin law, politics, art, and science.

This paper explores how Castoriadis' theory intersects with climate change, using art as a critical lens by analysing the dystopian botanical atlas *Hortus Artifis* (Miranda de Almeida, 2024), inspired by *Hortus Eystettensis* (1613) that reimagines plant life under global warming. Using AI-generated images, this art project envisions resilient weeds adapting to climate stress, paralleling AI's capacity for continuous adaptation.

Through 16 images of weeds, the work inquires on how art, co-creating with an artificial intelligence, can shape future imaginaries, presenting both symbolic and literal transformations of plant species. This creative re-imagining emphasizes the resilience of overlooked species like dandelions and nettles, symbolizing society's need to rethink resilience and adaptability in response to environmental crises.

The project expands Castoriadis' idea that the imaginary evolves in response to environmental pressures. *Hortus Artifis* uses speculative imagery to encourage reflection on society's relationship with nature, technology, and the future. It exemplifies how the collective imaginary can be mobilized to address pressing challenges like climate change, highlighting the role of art in shaping societal transformation. Ultimately, Castoriadis' theory highlights the importance of the imaginary in the construction and re-construction of societal norms, and this artistic project becomes a vivid exploration of how the collective imaginary might be mobilized to address one of the most pressing issues of our time: climate change.

MIRELA, IVANOVA* (University of Basel, Switzerland)

Algorithmic Labor As a Game: Agency, Passion, and Unpaid Work in SEO

This paper examines the work of Search Engine Optimization (SEO) specialists who optimize websites for private businesses to achieve higher rankings on Google's Search Engine Results Pages (SERPs). Google's search engine is conceptualized as a proprietary marketplace (Staab, 2024; Christophers, 2022), where website owners compete for user attention. SEO specialists are the paid labor power responsible for improving website visibility. They have to navigate the inherent uncertainties of this market, shaped by the dynamic interactions between Google's algorithms, user behavior, and competitors (other website owners). Through qualitative interviews with SEO professionals in Germany and Switzerland, the study explores how these specialists perceive and experience their algorithmic labor.

The findings reveal that SEOs experience a strong sense of agency and efficacy in navigating the uncertain algorithmic environment, framing their work as a game. This agency stems from their ability to influence marketplace outcomes by studying, interpreting, and strategizing around algorithmic rules. This, in turn, fosters a deep personal investment—or "illusio" (Bourdieu & Wacquant, 1992)—in the "game" of their work. The online marketing specialists frequently describe their work not merely as a job, but as a passion, love, or even a hobby. This romanticization of work (Gregg, 2011) conceals the unpaid labor involved, such as continuous self-education and skill development, which SEO specialists pursue in their free time. The paper argues that this phenomenon is grounded in the construction of SEO work as a metrified game. This gamified structure (Ranganathan & Benson, 2020) enhances their sense of agency, deepening specialists' commitment to their work, while simultaneously concealing the labor embedded in activities perceived as "free time." The paper thus illustrates how algorithmic, game-like experiences align individuals' motivations with managerial interests.

MIRHOSSEINI, SABA* (Bielefeld University, Germany)

Feminist Fusion: A Year of Global Sisterhood and Struggle

2022 witnessed a year of significant feminist activism, driven by a range of social, political, and economic issues. These movements, though diverse in their contexts, collectively underscored the ongoing global struggle for women's rights. This study examines the global intersectionality of these activisms, focusing on the women's protests in Iran (known as Women, Life, Freedom) and the international solidarity they received, particularly from U.S. feminists. In Iran, protests initially opposing hijab laws evolved into a broader resistance against authoritarianism. Concurrently, in the U.S., the reversal of *Roe v. Wade* spurred a movement against conservative policies and the erosion of reproductive rights. This research argues that despite differing sociopolitical environments, women in both countries not only challenged patriarchal structures but also critiqued the dominance of white feminism, fostering a more inclusive and intersectional approach while unfolding new possibilities for women's autonomy at the same time. Drawing on the theoretical frameworks of Hardt and Negri's *Empire*, *Twenty Years On* (2019) and Julian Go's *Postcolonial Thought and Social Theory* (2016), this study explores how "Woman, Life, Freedom" functioned as part of "intersectional multitudes," confronting gendered oppression and broader forces of capitalism and authoritarianism. Highlighting the commonalities between Iranian women and U.S. feminists and activists, this paper emphasizes how these movements globalized their voices to effect systemic change. Using online reports, scientific articles on the globalization of feminist movements and archives, this research will contribute to understanding the global feminist movements and highlight the emergence of new forms of solidarity and resistance that are reshaping the global feminist landscape and contributing to the broader project of decolonizing knowledge. It further shows that women's protests in 2022 were not isolated and localized but gained international support and recognition, ultimately creating new forms of alliances against oppression and injustice.

Unveiling Paradoxes: Global Population Control and the Rebirth of Women Under Authoritarianism

The rapid population growth in developing countries during the 1960s raised global concerns about potential economic and social instability. In response to these global pressures, the Islamic Republic of Iran removed legal barriers and initiated its exceptionally successful Family Planning Program in 1988, winning the 1999 United Nations Population Awards. This research

explores the transformative effects of the Islamic Republic of Iran's Family Planning Program on women's rights and societal norms. Although this population policy was at times implemented forcibly and violated women's rights and autonomy, it had significant "inadvertent" emancipatory effects on women. The program led to a notable decline in birth rates, increased life expectancy and evolved gender norms. It fostered an environment where love and partnership began to redefine heterosexual relationships for the first time under the Islamic regime of Iran. Drawing on Bourdieu's Field theory and his concepts of cleft habitus and symbolic revolution, this research analyzes how Iranian women navigated and resisted authoritarian constraints to enhance their agency. Using primary archival sources and exploring demographic trends in Iran, I highlight the paradox of empowerment amid oppressive conditions. This research contributes to the broader discourse on violence in authoritarian regimes and the resilience of feminist movements in contexts marked by both progress and backlash. Ultimately, it underscores the impact of the global field of population control in destabilizing authoritarian gender regimes and enhancing gender equality.

Why Does Gender Matter so Much? Neoconservatism and Antifeminism in the Brazilian Case

The advance of anti-gender neoconservatism in Brazil, even while operating within a democratic context at this moment, undermines the citizenship of women in the country, as it persistently focuses on disqualifying feminisms and various struggles for the rights of the immense diversity of women in Brazil, all while defending a type of retraditionalizing Christian morality that genuinely threatens women's human rights. Despite the transnational nature of the advances of neoconservative agendas, we are experiencing political attacks in different institutional spheres (judicial, parliamentary, among others) that threaten and constrain the daily lives of women, jeopardizing the achievements of the last decades of democratization, especially the fight for gender, sexuality, and racial equality. The most evident manifestation of this is the attempt to prevent the expansion of women's human rights, as we observe an interest in restoring — with a focus on political centrality — the racist patriarchal family, traditional gender roles, and sexuality. This is an antidemocratic tendency of the neoconservative political project that is increasingly advancing within our parliamentary houses and other state powers. However, there seems to be a feminist reaction that involves placing one's own body in the political struggle, and the immediate consequence of this kind of "daring" is the response of political violence against women. How will we navigate this impasse, which is not (and never has been) merely identity-based, but overtly a matter of democratic reaffirmation? We will examine some examples from the Brazilian case that seek these possible paths forward.

Discourse of Clickable News – Style of Hybrid Genres in Contemporary Journalism

Contemporary lifestyle allows us to access media content on the go – we use "smart" phones and watches to gain knowledge of the world instantly. The change in perception of importance of being informed right away and the never ending flow of information through our minds made some inevitable but quite obvious changes in the way media put those information on our cognitive plates. Style of news genres changed from concise objective language to narrative baiting for the media to gain clicks and views. Those language changes made a full change within the discourse too: the media are now the pushers of information instead of being independent torch-bearers. Phrasing of headlines leaving the crucial information from it (e.g. *You will never believe what happened next*) derives the discourse of misunderstandings; not all media readers will click on that kind of headline, but all of them will have an opinion about it. Therefore, the media do not help the culture of dialogue, nor they help a person to understand the world around them better but rather help confusing them more. The media are making the public information unintelligible in the times of "smart" technology, by which they make human understanding adjusted to the trends of technology instead of helping to shape the technology to be more prone to the living. This paper offers an introduction to the research of the new media language provoked by the need for clickability instead of informing the public, which makes profound changes in the media discourse and the reality of how media work.

Neet-Youth of Tajikistan and the Effect of Education and Family

The level of NEET (not in education, employment or training) – youth people who are not engaged to education or employment in Tajikistan is one of the highest – 39-41%. Using missed method approach this research will investigate main reasons that increase the level of NEET in Tajikistan.

Article aims to investigate factors affecting youth during their transition from education to work. The focus of the paper is NEET-youth NEET (not in education, employment or training) of Tajikistan, and main factors that lead young people to this category. Particularly, this paper aims to investigate the impact of family background and individual characteristics on NEET in Tajikistan of age 18-29. Data from large-scale retrospective survey of 2000 youth, which was conducted in 2017, is used. And, results will be compared with results from 2022.

Methods of regression analyses and Kaplan-Meier estimator are used to analyse data. Initial analyses showed that education has positive impact on labor market outcome and the effect is stronger for women. Family background has no significant impact on labor market outcome, but can increase level of education which decreases the NEET level. Educated parents have higher chances to have employed children.

QARAKHANI, MASOUMEH* (Reserach Fellow at Ruhr-Universität Bochum, Allameh Tabataba'i University, Iran)

Scientific Societies As Drivers of Science Reform

This research examines the critical role of scientific societies in influencing scientific reforms and advocating for accountability within Iran's predominantly state-controlled science policy. The main research question addressed is how scientific societies in Iran influence science policy and contribute to scientific reforms. The study involves an in-depth analysis of official documents related to science policy and the functioning of scientific societies in Iran and semi-structured interviews with a sample of Iranian scientific society presidents to obtain qualitative data on their perspectives, challenges, and strategies in dealing with state-driven science policies. Utilizing Bourdieu's field theory, the research investigates the complex relationship between science and politics and uses Burawoy's typology of sociology to uncover scientific professionalism. Their engagement in policymaking and their ability to moderate, challenge, or oppose state-driven policies largely depend on their development of professional, critical, policy, and public dimensions of their professionalism. The study finds that scientific societies encompassing a broader range of professionalism dimensions can be more influential. With multifaceted professionalism in science, these societies are more experienced in navigating constrained environments, influencing policy decisions, driving scientific reform, and upholding scientific integrity. The relative independence of scientific societies, particularly compared to universities, provides an outlook on their potential to shape science dynamics.

Corporate Social Initiatives for the Sustainable Development in the Global South: Glocal Perspective of Social Changes

Issues of social injustice and social inequality attract the attention of a large number of people and various actors (governments, international organizations, businesses, NGOs, and activists) around the world, who are capable of influencing their resolution. The primary framework for the strategic fight against social injustice is often the Sustainable Development Goals (SDGs), which help focus on specific environmental and social challenges and develop corporate social initiatives (CSIs) to address them. Business organizations in the Global South countries are increasingly seen as key players in addressing local issues. This research was conducted using literature review methods, secondary data analysis of SDG achievements in the Global South, organizational ethnography (based on InDrive, which implements social initiatives in LATAM, Africa and Asia regions), and competitor analysis. The results of the study indicate weak legal frameworks in many Global South countries, allowing businesses to implement CSIs with fewer restrictions. CSI strategies in these countries are shaped by local cultural, political, and social contexts, which can both facilitate and limit the implementation and scaling of CSIs. Business organizations strive to implement CSIs by engaging strong institutional partners, which helps to strengthen these initiatives, promote

best practices and creates potential for their institutionalization. CSIs impact various levels of the ecosystem and are often focused on achieving SDGs related to environmental protection, education, equal labor, and social and gender inequality. Given that the same people may be negatively affected by different environmental and social issues, companies are focusing on using an intersectional framework for CSIs to achieve more significant social impact and reach the largest number of vulnerable populations.

MISHEVA, VESSELA* (Uppsala University, Sweden)

Alienation from Self As a Virtue

This discussion addresses alienation as a psychological problem or “illness” that involves the separation of a subject (a self) from an object—either other objects or other selves, including one's own self. Self-alienation is thus regarded as a problem as equally serious as alienation from the other, from one's work, or from the means of production.

An existing interpretation of alienation as a psychological phenomenon suggests that alienation is a separation of self from both other selves and non-selves, and from itself. However, this assumption is problematic from a microsociological or symbolic interactionist point of view. I propose that particular problems of modern society do not necessarily have their locus in social structures, but are instead associated with deficiencies in social selves, one of which is the lack of a capability for alienation-from-self. In this respect, self-alienation is not an individual problem, but rather a social problem, insofar as a self that is incapable of alienating from itself and looking at itself from without is not capable of cooperation and of playing cooperative games and social roles.

From this perspective, I qualify self-alienation and a return-to-self-as-other (me) in order to build a new and more sophisticated self (I-me)—which acknowledges that the other's opinion is taken into account—as a social virtue that heightens social integration and builds interpersonal trust. I maintain that self-alienation, in any of its forms, does not necessarily contribute to loneliness, as is sometimes assumed. I instead argue that non-alienated or non-alienable selves, which apparently depict the ideal of authenticity, may be viewed from another perspective as self-enclosed, self-centered, self-sufficient, and unreflective. They thereby possess neither an opportunity to gain a modern type of complexity, nor the possibility to know themselves as a whole.

RC36-593.3

MISHEVA, VESSELA* (Uppsala University, Sweden)

The Alienation of Sociology from Its History

In 2001, a number of sociologists combined forces to publish a book entitled *What's Wrong with Sociology?* (Stephen Cole, Ed.). This paper aims to contribute to the continuation of this discussion by offering a new answer to the question that they raised. I here argue that the main problem facing sociology is that not only has it been alienated from its own history, it has also been provided with a scientific biography that failed to grasp its true nature and did not present a comprehensible explanation of what the classical sociologists were doing and why.

This discussion puts forward the premise that the reason for the alienation of sociology from its history is that it was not constructed upon a solid and unitary foundation, but instead came to be marked by a persistent conflict between two opposing conceptions of sociology that reflected two different methodological positions and two different understandings of how sociology should begin—with theory, or with empirical data collection. The primary focus of the present investigation is on one of the most important controversies in sociology, namely, that represented by Talcott Parsons and Herbert Blumer which involved macro and microsociology as the markers of the two main opposing views of sociology. More particularly, I will explore “predecessor selection” as a strategy for writing both macro and microsociological histories that was employed by Parsons, as Camic (1992) established, as well as Blumer, who presented the history of the symbolic interactionist tradition.

Job Satisfaction, Commitment, and Retention of Border Security Forces: Insights from the India-Pakistan Border at Amritsar

This study examines the linkages between bureaucratic structures, moral decision-making, and emotional experiences of Border Security Force (BSF) personnel stationed at the Amritsar border between India and Pakistan. Drawing on sociological perspectives of bureaucracy and emotion work,

this research investigates how BSF personnel navigate the demands of rigid institutional protocols, personal moral judgments, and the emotional challenges inherent in their roles. Through in-depth interviews with BSF personnel, coupled with ethnographic observations, the study aims to answer several key questions: How do organizational factors, such as the BSF's culture and structure, influence personnel's job satisfaction and commitment? What role do moral emotions and ethical decision-making play in the retention and attrition of BSF personnel? How do personnel cope with the emotional labor demanded by their roles, and what is the impact on their well-being and job retention? Preliminary findings suggest that the BSF's strong organizational culture significantly shapes personnel's attitudes and commitment. However, the emotional demands of the job, the liminal status of the organization between military and police, and the moral dilemmas faced in the course of duty can lead to stress, burnout, and attrition. Building trust with local residents emerges as crucial for effective border management and personnel's job satisfaction. Yet, formal protocols and the need to “see like a state” strains these relationships. The study examines the gendered dimensions of border security work and their implications for personnel's experiences and retention. By providing insights into the factors influencing the job satisfaction, commitment, and retention of BSF personnel at the Amritsar border, this research aims to inform policies and practices to support the well-being and effectiveness of security forces tasked with managing complex border dynamics. The findings contribute to understanding the human dimensions of border security and the challenges faced by those on the frontlines of geopolitical tensions.

Re-Examining Linguistic Performance at a Community Participation School in Rural Rajasthan: An Ethnographic Exploration

Most people, including teachers, consider language simply a means of communication. There is a need for a holistic perspective on language in order to appreciate the role of language in schooling and overall educational transmission. Language is needed to be examined in a multi-dimensional space and give due importance to its structural, literary, sociological, cultural, psychological, and aesthetic aspects. Sociologists and Sociolinguists emphasise that not only does linguistic competence need to be understood but socio-cultural and economic aspects of linguistic performance too must be taken in the consideration while discussing about the language and its origin, practice, and implications (Bernstein 1973, Bourdieu 1977, Gumperz 1962, 1971 Gumperz & Hymes 1986, Habermas 2001, 2002).

Against this backdrop, the present paper, based on an ethnographic fieldwork at a community - participation school in the Alwar district, Rajasthan, India attempts to examine and explain the nuances and modus-operandi of socio-cultural dimensions of linguistic competence & performance in the pedagogic communication and overall classroom processes at a community-participation school. These socio-cultural dimensions are categorised as Procedural & Empirical Language, and Lexical & Referential Understanding. These dimensions are categorised to capture different aspects of linguistic performance. The present paper, based on the fieldwork experience of the researcher and participants' rich narratives, specifically asks that how does the Procedural and Empirical Language function at the school and in overall educational transmission? and, how the Lexical and Referential Understanding is determined by variations in the efficiency of the communication between teachers and students from different socio-economic backgrounds?

Hence, the present paper is an attempt to present the detailed theoretical - conceptual interrogation and ethnographic reflection of linguistic performance during the process of schooling and overall educational transmission at a community-participation school situated in a village of Alwar district, Rajasthan, India.

From ‘Green Revolution’ to ‘Data Revolution’: How India's Emerging Ag-Tech Ecosystem Builds on the Capitalist-Colonial Promise of Technological Emancipation

Data-driven agricultural technologies (Ag-Tech) are becoming a global phenomenon. While much of the academic literature focuses on Ag-Tech in the Global North, there is much to be learned about the current push to expand the development and use of these technologies in the Global South. This paper explores India's emerging Ag-Tech ecosystem, which, according to Agfunder, is among the top five countries when it comes to investment in this

sector. Historically, India has also been the testing ground of many science-based agricultural innovations via the so-called 'Green Revolution', which has had a profound impact across the world. But what makes Ag-Tech funding in India more unique is the role of the Indian state, which is currently building a database to store data about farmers and their farming practices with the help of private companies.

We argue that this current wave of data-driven Ag-Tech, which prioritises science, technology, and corporate power over local knowledge and agricultural practices, has capitalist-colonial roots, which were followed by the British in the 19th century and later implemented by the Indian state post-independence with the help of American benefactors during the so-called 'Green Revolution'. Through the lens of anti-colonial Science and Technology Studies (STS), we consider how the funders, developers, users, regulators, and activists understand and enact the foundations of India's Ag-Tech ecosystem. In doing so, we pay specific attention to the post-colonial context which shapes realities and possibilities in Indian farming.

Our aim will be to shed light on the Ag-Tech space in India, critically looking at the historical roots of the emerging data-driven Ag-Tech sector as well as exploring possibilities of alternative ways of seeing technology with the rural communities instead of the top-down imposition of technology by Ag-Tech firms.

Drugs Trafficking and Transnational Crime: An Appraisal in India

Transnational crimes are illegal activities that transcend international borders and significantly impact several countries. Of all the transnational crimes, drug trafficking is considered to be the most powerful resource of transnational organized crime. Drug trafficking is the cultivation, manufacture, distribution, and sale of substances that are subject to drug prohibition laws as defined by Interpol. They are often linked with organized crime, violence, and corruption and have a significant impact on the global economy with widespread addiction straining public health systems. Drug trafficking is often controlled by cartels, which frequently engage in various illegal activities beyond the drug trade, such as arms smuggling and human trafficking. Poverty and unemployment are usually seen as a factor in driving individuals towards drug trade and abuse. In India, drug trafficking is a significant issue, determined by various factors including geographical location, socio-economic conditions, and global drug demand. As India shares borders with other countries, it is convenient for illicit drug dealers to use it as a transit point, with established trafficking routes through land, sea, and air. India has enacted stringent laws, such as the Narcotic Drugs and Psychotropic Substances Act, 1985, aimed at curbing drug trafficking and abuse. The following study examines the present trend of drug trafficking in India and assesses the effectiveness of the laws aimed at curbing drug trafficking in the country.

Victimization of Children in the Cyber Space: A Case Study in India

In the 21st century, Information and Communication technology plays a huge role in the lives of every human being irrespective of age group. During the pandemic, ICTs proved to be a boon, enabling us to carry on work without the anticipated disruption. However, the constant use of ICTs in our lives has also brought about certain risk factors. The frequent use of internet especially in children has introduced them to new threats in the cyber space. Being difficult to detect, cyber crimes often look for easy targets, children being one of them. Cyberbullying, Online harassment, Child sexual exploitation are some of the incidents that a child may face online. Cyber crimes have a detrimental impact on the psychology of children often affecting their personality and threatening their lives. The following study evaluates the trend of cyber crimes against children and tries to assess the effectiveness of legislative measures in combating victimization of children in cyberspace in India.

MISIASZEK, GREG* (Beijing Normal University, Faculty of Education, Institute of Educational Theories, China)

Wicked Problems Sustained By Attacking Sociology: (Re) Entrenching Sociology in Higher Education to Avert Our Environmental Collapse

Deprioritizing and delegitimizing sociologies through global neoliberalization of higher education (HE) diminishes societies' ability to tame wicked problems by removing a discipline that untangles the inherent messiness between anti-environmental acts and social injustice. Attacks include perverting sociology into neoliberal, (neo)colonial tools that, at best, ignore and, at worst, justify hegemony, socio-historical oppressions (e.g., racism, patriarchy, heteronormativity), injustices, inequalities, planetary unsustainability, and anthropocentrism. A vital role of HE in the public spheres is teaching students for praxis to solve wicked environmental problems in which transformative sociologies are essential. The conundrums of how teaching sociologies diversify reflexivity for effective problem-solving is also the reason why the discipline is being attacked – as pedagogical enemies of hegemonies grounded upon neoliberalism – will be unpacked. Ecopedagogical and transdisciplinary approaches of teaching sociologies to end wicked problems will also be highlighted.

Sociologies are crucial to better understand the local-to-global contexts of inseparable socio-environmental connections and interrogating the politics of (in/non)formal education that instils such false separations and world-Earth distancing (i.e., separating humans from the rest of Nature). Without sociological analysis, the connections that we have with one another, and the rest of Nature are largely unseen, unlearned, and, in turn, unaddressed.

After briefly describing wicked environmental problems, this paper will delve into the essential aspects of teaching sociologies in HE, including in transdisciplinary and ecopedagogical approaches, to counter wicked environmental problems and why such teaching is being attacked. Then, the ways in which opposing processes of globalization is deprioritizing and perverting sociologies will be discussed, including aspects of neoliberalism, neocoloniality, and anthropocentrism that hinders taming the problems. The last section focuses on how utopic imaginaries emergent from sociologies are vital to solve the messiness/clumsiness of wicked problems, including the disruption of oppressive, unsustainable, and fatalistic framings of "development," "modernization," and "modernities."

MISKOLCI, RICHARD* (Federal University of São Paulo (UNIFESP), Brazil)

Disinformation: Digital Sociology's Challenges in the Studies of the Technomediatic Public Sphere

Among Digital Sociology's theoretical and conceptual challenges are those connected to the field of studies on the new public sphere created by the use of information and communication technologies (ICTs). This paper discusses the possible dialogues between digital sociology and political communication aiming to address what already configures a technomediatic public sphere. Most of the analytical frames available deal only with the digital and technological aspects of this new public sphere or with its informational and communicational characteristics. The presentation proposes to discuss the necessity of articulating these frames, their main theories, and concepts. Therefore, it presents and analyzes few of the most central theories and concepts in each of them and how they can be associated. Among these concepts, it discusses mass autocommunication and that of horizontal exchanges through digital platforms as well the concepts of public sphere, and public opinion as well those of information, and propaganda. The objective is to contribute to the development of a more solid analytical frame able to be used on studies on the new informational battles that most of literature addresses as disinformation. This new analytical frame would be more properly sociological for comprehending disinformation not as a thing in itself, but as a strategy in the political disputes in which ICTs play a more central role and challenge the old mass-media ecosystem and its gatekeepers.

CASTROMIL, ANTÓN (Universidad Complutense de Madrid, Spain)

Health Disinformation: A Comparative Study during the Covid-19 Pandemic in Brazil and Spain

Based on a comparative research about health disinformation during the Covid-19 Pandemic in Brazil and Spain this paper discusses one of the new challenges to public health in the digital age. The research compares how editorials of the most read newspapers in Brazil and Spain engaged in debates about governmental measures against the Covid-19 pandemic. The editorials, published between March 2020 and March 2023, revealed much more political conflict and widespread disinformation in Brazil than in Spain. Associating frame analysis to historical and sociological sources the paper compares the editorial's perspectives in each country as a mean to identify sources and themes of conflict, their protagonists, and positions. According to the editorials, while in Spain there was relative consensus on the measures against the pandemic and political disputes were mainly about legal aspects, in Brazil conflicts about health measures were stronger and involved the far right's strategic use of disinformation against social distancing, mask use, and vaccination. Based on contemporary discussions on the new technomediatic public sphere, the paper tries to understand how and why health disinformation was not relevant in the European country while it has shaped the way Brazilian society faced the sanitary threat. Among the conclusions, the presentation highlights that health disinformation was widespread in Brazil because of a contextual alliance between the far right government and health market's actors in a network of disinformation coproduction. The results of this research might contribute to comprehend new challenges to public health that associate radical political actors and market interests in the strategic use of information and communication technologies (ICTs).

RC35-585.2

MISRA, RAJESH* (University of Lucknow, India)

Not Class but Classes Matter

A taxonomy of classes; the corporate capitalist, the middle and the working classes may explain the contemporary world more efficaciously. The four substantive concerns of the prevailing times – human vis-à-vis nature, the conflict-ridden world order, the rise of authoritarian nationalism, and the rise and growth of ethnic identities can be better explicated in terms of rising class inequalities, class injustice, class advances and class antagonisms. Additionally, the class framework has a 'sociologic' and every class has its own distinct character, this provides class analysis an extra heuristic ability. It has conventionally been maintained that the corporate capitalist class is primarily marked by self-interest, profit motive and accumulation; the working class is generally distinguished by collective interest, communitarian bond and political agency; and the middle classes are mainly characterized by ambiguous and conflicting interests, technical competence and professionalism. However, the nature, dynamics and character of classes have been changing while the productive forces are constantly revolutionized by the capitalist class as proclaimed. This paper contends that taxonomic fundamentals of the theory of class may be retained, nevertheless, recent changes in class dynamics are to be considered. Notwithstanding the diversification and divergences, the corporate capitalist class has emerged as the most connected, conscious and potent class. It has captured every institution ranging from the state to media and from creed to culture, the commanding class at the world scale and primarily accountable for the Anthropocene. The middle classes have been trying to have control from the middle with educationally acquired scientific, technical and managerial competencies. In the process they tend to become the comprador or legate of the corporates. Occasionally it reflects in their political actions. Recent changes have made the working class a divided and disjointed class, yet the most powerful carrier of ethnonationalism and authoritarianism.

Strife-Torn World: Towards a Sociological Explanation

There is hardly any doubt that human history has been marked by sanguinary at various phases, however, at this juncture humankind has been living in a critical conflict-ridden time. Time and again it appears like a series of crises would lead us to a world war. Armed clashes between nations, violent fights within nations, raging hostilities among communities, slaughters of innocent children and women in the name of right to defend, and savage brutalities of opposing groupings in all parts of the world have

become normal. Currently more than 100 violent conflicts have been going on in different parts of the world. These conflicts need to be understood and analyzed social-scientifically. Traditional sociological explanations and theories have certain limitations. There would be a merit to go beyond basically materialistic, economic, political or functional explanations. A dated idea of ethnocentrism can be recapitulated to elucidate the socio-psychological process in various power struggles, either between nations or within a nation or a region. These are times of supremacist zeitgeist. Supremacist ideologies are contested by each other determined by race, religion, ethnicity, language, region, nationality, nation, tribe, and gender. A systematic exposition of the conceptual framework for ethnocentrism is called for.

MISUMI, KAZUTO* (Kyushu University, Japan)

How Social Capital Fosters Local Community

The importance of social capital lies in its ability to promote cooperation with strangers, and then resolve social dilemmas. In this view, this study empirically examines functioning of social capital in the social structure of local communities. Local community is defined as a social system that consists of interactions for managing public goods and common pool goods necessary for local life, namely regional common goods. It is inevitable for local communities to control free riding on regional common goods, that is why social capital embedded in the local social structure has significance. Data are taken from surveys conducted by the author in Kumamoto and Takeo in Japan, between 2021 and 2022.

General trust is measured by the standard questions. Generalized reciprocity is measured by social cognition regarding penetration of the norm, and additionally experience and memory of receiving help from distantly related people. Analysis target is neighborhood free riding—free riding on regional common goods managed by neighborhood associations. The numbers of participating groups and involved activities other than those related to neighborhood associations are network indicators that show the likelihood of bridging ties through people's diverse social relations. We examine how social capital enhances neighborhood free riders to have general cooperative attitude, that is measured by willingness to participate in town development efforts and will to help operation of evacuation shelters during a disaster.

Results of logistic regression analysis show that being a neighborhood free rider weakens the general cooperative attitude. However, when social capital variables are added, the previous negative effects disappear. The types of social capital that show a consistent promoting effect are the number of involved activities other than those neighborhood association related and social cognition of generalized reciprocity. General trust unexpectedly shows any positive effect.

MITCHELL, ANDREW* (Kumamoto University, Japan)

A Luhmannian Analysis of Disaster Preparedness for Foreign Residents in Kumamoto City, Japan

People moving to Japan face the same natural disaster risks as all other residents. The vast majority of these new residents however lack the disaster training know-how that is taken for granted by those raised in Japan, who take part in disaster drills from childhood. This is to say little of the challenges faced with language, lack of community, etc.

Despite these challenges, many foreign residents also do not take the necessary precautions towards disaster preparedness, often remaining in the mindset they had in their home countries with an attitude of "it won't happen to me". This can lead to a double problem: that of Japanese municipalities designing disaster plans which do not take into account the lived realities of a growing heterogeneous foreign-born population and these newcomers maintaining outdated views on risk based on the ones they faced in their homeland.

This presentation will examine this issue from a Luhmannian perspective, focusing on the first-order ontological views on risk that incoming residents can carry to Japan with them and the second-order observations of Japanese municipalities, observations which aim to keep all residents safe but can struggle to understand the growing foreign-born population it attempts to observe. It will also discuss the problem of double-contingency and how it can be difficult to build disaster resilient communities when residents do not share cultural norms through which they place expectations on each other.

The presentation will focus on a case study of Kumamoto city, where a major earthquake occurred in 2016. This will allow a discussion of the issues faced by the foreign community at the time of the disaster, shifts in disaster management based on lessons learned, and intractable issues which still remain, along with a discussion on whether, systemically-speaking, they can be overcome.

MITRA, ARPITA* (The West Bengal National University of Juridical Sciences, India)

Restorative Policing: A Step Towards New Age Policing

Criminal Justice System has paid more attention to the cause of the offender- his rehabilitation and monitoring to prevent recidivism. The victim and his plea for justice is limited to the level of the response from the judiciary. Post victimization, during trial and post-trial the victim is left to fend for himself without much emotional and financial support. The philosophy of restorative justice in general and restorative policing in particular upholds the cause of the victim. Restoration of the victim is an extension of victim assistance by reaching out to the victim and enabling restoration of the victim to the mainstream. Restorative Policing upholds the principle of restorative justice and the new age enabling police force extends support to the primary and secondary victims in diverse institutional domain. It helps the transcendence of the police force into progressive, innovative, community driven police service. The police act as crime fighters and social engineers employing empathetic strategies towards victim assistance and promise to secure a safe and progressive future.

MITRA, ARPITA* (The West Bengal National University of Juridical Sciences, India)

Theoretical Advancements for Protecting Voiceless Victims of Environmental Harm

Environmental harm has long awaited recognition in criminology and victimology. While the debate in addressing environmental crimes/green crimes as organised crime or white-collar crime has misguided researchers from recognizing and addressing it from an innovative theoretical background as a distinct form of crime and not necessarily one among the existing classification wherein it shares a few traits. Green criminology has addressed environmental crimes/green crimes from a distinct approach and perspective. Moreso, the developments in green victimology also goes beyond the rigidities of the classical perspectives and acknowledges and recognises environment as a victim without a human face. This progress has given a voice to the unheard and the voiceless much to the satisfaction of environmentalists and researchers. Since we have always conceived the victim with a human face much depriving the silent victims most importantly the environment which comprises a vast diversity encompassing air, water to flora, fauna wildlife, smaller animals and natural vegetation to name a few. In the present discussion an attempt will be made to unravel the prospects of green victimology from its theoretical approach, progresses and practical implications.

Aproximaciones a La Caracterización De Espacios De Comercialización Agroecológicos De Mendoza, Argentina

En un mundo en donde los índices de hambre muestran una tendencia ascendente (UNICEF; 2022), junto con los de malnutrición (Aguirre, 2007); y siendo que estas estadísticas se dan en simultáneo con el incremento en la producción de alimentos a nivel mundial (FAO, S.f); se podría pensar que las formas de acceso a los alimentos de buena calidad nutricional responden a diferentes nichos de mercado.

En tal sentido, interesa indagar sobre agroecología, siendo que "contribuye a la nutrición humana a través de diferentes formas, incluyendo el aumento de la diversidad y calidad de las dietas" (Powell et al., 2015). Puntualmente, en este caso, se propone ahondar sobre los espacios de comercialización de productos agroecológicos que, en contrapunto con los espacios de comercialización convencional, se visualizan como espacios de intercambios que abonan otras formas de producir y consumir (Sarandón, 2020).

Mendoza cuenta con una trama de organizaciones dedicadas a la producción y comercialización de alimentos agroecológicos (Persia, 2015). Estas propuestas presentan diversidad en cuanto a su grado de desarrollo; modo de organización, trayectorias, productos, entre otros; lo que las vuelve interesantes como casos de estudio, para comprender su rol en la distribución y acceso a los alimentos de origen local y fresco. Para ello se implementarán diferentes técnicas como encuestas y entrevistas a miembros de los espacios de comercialización del área metropolitana de la provincia

y se analizarán aspectos sobre tres dimensiones: 1-socio-organizativa, 2-productiva y 3-económica (Ejerque, 2023). Las mismas se realizan desde un enfoque interdisciplinario en el que convergen las ciencias agrarias, sociales y de la nutrición.

Marxist Social Theory and Ideology in the Japanese Historical Context

The paper explores the development of Marxist social theory and ideology within the unique historical context of Japan. Beginning in the late 19th century, Marxism entered the Japanese intellectual landscape, initially as a theoretical framework that permeated various academic disciplines and political movements. I will examine how Marxist thought evolved through significant historical events, including the Meiji Restoration, the rise of militarism, and the post-war reconstruction, which collectively shaped its trajectory in Japan. I will also discuss the contributions of key figures whose interpretations of Marx's theory provided a distinct Japanese perspective, and the role of the Japanese Communist Party in popularising Marxist ideology among the populace. The paper will also highlight the tension between traditional Japanese values and Marxist principles, as well as adaptations of Japanese Marxists to address local socio-economic conditions. By situating Marxist theory within the broader context, the paper aims to illuminate the complexities and nuances of its ideological evolution, offering insights into how historical context shapes theoretical frameworks and their applications in society.

MITWALLY SAMI, MAYAR* (Doha Institute for Graduate Studies, Qatar)

Between the Palestinian National Imagination and the Formation of Reality: The Sheikh Jarrah Uprising

This research stems from the movement of Palestinian society within the fragmentation in which Palestinians live. The research focuses on the transformations and shifts in Palestinian society from a state of "factions" to a "collectivity," and vice versa, seeking to understand this movement within the framework of the national imagination. The study specifically examines the social movement that emerged in Sheikh Jarrah Uprising in 2021, claiming it as a pivotal historical moment concerning the Palestinian national imagination, with comparisons to the movement and imagination after October 7. The main question is: **How did the Palestinian national social imagination transform during the 2021 Uprising of Dignity?**

This research adopts a qualitative methodology by conducting in-depth interviews with activists during the Sheikh Jarrah Uprising across all segments of Palestinian society, including the diaspora, with 3-4 interviews for each region. In addition to discourse analysis is used to examine and analyse the mainstream posts during the uprising on social media concerning liberation.

The research stems from a critique of Durkheim's distinction between mechanical solidarity in underdeveloped societies and organic solidarity in developed societies, aiming to critique this distinction within the Palestinian context, highlighting the impact of colonial and neoliberal policies in shifting cooperation from collective to individual. The research moves from Durkheim to engage with Benedict Anderson's concept of imagined communities, illustrating how the community is formed as a deep comradeship that may lead the individual to sacrifice for its cause. This research understands imagination as a vital system that links humans to their environment through symbolism and social emotions, shaping perceptions of the present and future through symbols derived from memory and collective imagination, reflected in political and cultural expressions. This research aims to understand the creation of a comprehensive imagination that challenges this fragmentation and brings historical Palestine to life.

Growing Diversity and Intercultural Friendship Activities in Central Tokyo

The ongoing ageing of the population has become a major social issue. In fact, the ageing population has led to changes in communities of central Tokyo. However, at the same time, because of the constant influx of foreign residents, ethnic diversity has grown, and ethnic businesses have developed in some inner areas of Tokyo. Although the movement of international

population declined markedly and even stopped due to COVID 19 pandemic, since 2022 the trends in international migration have recovered. In central Tokyo, such as the Shinjuku and Toshima wards, which embrace more than 10 percent of foreign residents, there has been an important level of movement, both in and out of foreign residents. Many foreign residents move out of the area after a relatively short stay, but on the other hand, some foreign residents have come in and settled in the district in order to run their businesses. Thus, various ethnic businesses have been developed. This is especially the case of the Ikebukuro district of Toshima Ward, which is the focus for this fieldwork. In these areas, we can witness some collaborative activities between local residents and people who come from abroad. In this paper, I would like to consider expressions of empathy in local communities by focusing on examples of collaboration and cooperation between diverse cultural groups.

Black Women Secretaries at University: Work Experiences and Career Aspirations

Amidst the expansion and success of South African public universities, departmental secretaries, commonly referred to as administrative assistants, have become essential to the university. Secretaries have continuously offered vital support services across various university departments, yet their contributions have often been overlooked. This study explores the work experiences and career aspirations of Black women secretaries employed at a South African university. Existing literature on secretaries in South African institutions of higher learning reveals a significant knowledge gap, particularly regarding the experiences of Black secretaries, a group whose voices have often been at the margins of research. Utilising a life history research approach allowed this study to gain a deeper understanding of the participants, their work experiences and career aspirations. This paper highlights empirical evidence from a qualitative investigation that delved into the professional realities faced by Black women secretaries, shedding light on the unique challenges they navigate and the opportunities they leverage within their roles. Some of the key findings of this study suggest that while Black women secretaries possess a strong work ethic and a deep commitment to their jobs, they often encounter institutional barriers to professional advancement. The secretaries expressed feelings of being trapped in these administrative positions that offer limited opportunities for growth and career progression. Consequently, the women in the study voiced a desire for a platform where they could raise their concerns and engage in discussions and a need for increased support and recognition from university management to help them realise their professional aspirations and enhance their skills and abilities. Access to coaching and mentoring programmes has also been viewed as a critical and consistent method to assist in career advancement. Recommendations for the university management include introducing career advancement and promotion prospects for non-academic staff members to promote greater equity and inclusion.

MOALLEM, MINOO* (University of California, Berkeley, USA)

The Genocide in Gaza and the Dual Moral Framework of Feminist Solidarity

This paper interrogates the convergence of feminism, nationalism, and imperialism within the context of the genocide of Palestinians, a historical context that cannot be overlooked. More specifically, I wish to examine the convergence of Zionism and feminism within the context of mainstream feminism in the US and Iranian diaspora through a close reading of the media campaigns and websites of two major mainstream feminist organizations in the US: Feminist Majority and National Organization of women and several websites and TV stations of Iranian diasporic communities in the US and Europe. I argue that while the spectacle of the "liberated" woman versus "oppressed Muslim women" is as old as colonialism, since the genocide, it has taken new forms by staging a global dual moral framework. This form of feminism might be invested in neoliberal values, including individual freedoms, yet function as a form of imperialism. While a transnational feminist approach has criticized every other form of nationalism, the question of Palestine, its history of colonization, and the entanglement of feminism and Zionism remains to be explored further from a transnational perspective since the genocide in Gaza.

ÖNDER ÖZEN, NESLIHAN (PhD student in Human Geography at University of Granada, Spain)

A Systematic Literature Review on Social Impact Assessment Methodologies: The Case of EU-Funded Projects Targeting Climate Migration

Social Impact Assessments (SIAs) play a crucial role in making evidence-based policies by intellectualizing the impacts, lessons learnt and further adjustments of the projects carried out. Based on the findings of a systematic literature review, the proposed research aims to outline a structured framework to conduct better social impact assessments of the EU-funded projects targeting climate-migrants by seeking ways to incorporate the often-overlooked experiences of these marginalized groups in wider social contexts.

Based on analysis of secondary sources, the current literature highlights several methodologies exist in SIA: qualitative, quantitative, mixed methods and alternative participatory approaches. Upon a comprehensive review of the aforementioned SIA methodologies, qualitative and participatory methodologies' contribution to adequately represent the migrant population's experiences in the assessment of climate finance and investment projects will be further used to bridge the contextual gap. While quantitative methodologies are effective in capturing broader economic impacts and maintain their importance due to the consistent and comparable results they produce, they tend to overlook social dimensions often and do not fully address the specific needs of vulnerable populations. Among these methodologies, special attention will be given to the cost-benefit analysis (CBA) and the difficulties it encounters in integrating migrants' experiences into the assessment outcomes and processes will be noted. Finally, the necessity of integrating both qualitative and quantitative approaches will be highlighted.

A comprehensive evaluation framework that combines these methodologies can provide a more nuanced and complete assessment of revealing social impacts, ensuring that the broader benefits of climate finance projects are fully recognised and leveraged as it captures both tangible and intangible benefits. To this end, the research aims to enhance the relevance and accuracy of SIAs, ensuring that they contribute meaningfully to the development of inclusive and resilient communities in the face of climate change.

Images of Childhood and Family in the Context of Institutional Accommodation for (unaccompanied) Refugee Minors in Switzerland and the Dynamics of Their Marginalization

In the context of global movements of refugees and migrants, the structures of asylum policy as well as the (social) pedagogical institutions for institutions are shaped by specific conceptions of childhood and family. In the field of institutional accommodation, (un)accompanied refugee minors are not only categorised as 'legitimate' or 'illegitimate' refugees according to the administrative logic of asylum policy. They also move in different ways along other lines of difference, such as social origin, gender, age and generational order, against the background of normative (Eurocentric) images of childhood and family, in the field of tension between external and self-positioning: How is childhood, and above all what kind of childhood, produced in institutional contexts of placement?

This presentation examines (institutional) representations of childhood and family in the placement contexts of (un)accompanied refugee minors in Switzerland. It asks what practices of inclusion and exclusion these representations entail for the children and young people concerned. To this end, we draw on ethnographic material from two research projects: 'Unaccompanied refugee minors in institutional care' and 'Between home and return centre: an ethnography of the everyday lives of refugee children and their families'. Through a contrastive analysis, we reconstruct how unaccompanied minors are treated as special in comparison to accompanied refugee minors and reflect on the related dynamics of marginalisation in terms of socio-political provision and social status. The focus is on social practices and interactions in refugee accommodation centres, which are analysed in the context of normative notions of childhood, parenthood and intergenerational relationships.

Balancing Blueprinted Methods and Methodological Flexibility in Cross-Cultural, Multi-Lingual and Multi-Country Contexts: A Processual Methodology

In the history of research methodology, a persistent tension has existed between blueprinting methods and methodological flexibility, often resulting in the dominance of one over the other. This tension is amplified in four distinct circumstances: In research projects in which funding is based on research proposals, in larger-scale research projects involving extensive qualitative data, in comparative, cross-cultural, multi-lingual and multi-country research; and fourthly, in collaborative research projects where multiple researchers co-operate.

This article shows our reflections on addressing and pragmatically reconciling this tension within the context of a research that encompasses all four circumstances—the CO-CREATE project.

In this Youth Participatory Action Research (YPAR), 199 adolescents in 5 countries were tasked with formulating policy proposals to prevent adolescent obesity. To assess the PAR process, we created and collected over 1500 pages of field notes, subjecting them to collaborative and comparative qualitative analysis.

To organise and structure the data collection, management and analysis, we adopted a methodological approach conceptualised as a dynamic process, aligning with a pragmatist and perspectivist orientation. Anticipating potential challenges at the project's inception, we prepared for foreshadowed problems, while also confronting unforeseen obstacles along the way. Reflecting on this methodological journey, we offer a nuanced exploration of the implications of methodology as a dynamic process within the context of collaborative multi-country qualitative projects employing pragmatist and perspectivist perspectives. To balance blueprinted methods and methodological flexibility we propose a processual methodology with two strategies: Blueprinted Methodological Reflexivity and Collaborative Moments of Iterative Validation.

Sociological Film: Blending Filmic and Sociological Imaginations

This paper explores the integration of sociological and filmic imaginations through sociological film. It examines the role of sociological film within visual sociology, distinguishing it from traditional approaches that often overlook the artistic elements of filmmaking. By blending sociological theory with creative storytelling, sociological film captures social realities and, through its engagement with affect, visually constructs the sociological. The paper also discusses socially conscious cinema and highlights the historical context of social problem films and their limitations in promoting sociological imagination. Additionally, it explores sociological film in relation to other concepts, such as research film and social science film. It also reviews the interview as a method in four different films to demonstrate the role of affect in documentaries. Finally, by analyzing *Chronicle of a Summer* (1961), this paper advocates for collaboration between sociologists and filmmakers to enhance the impact and reach of sociological documentaries.

RC57-876.3

MOGHIMI, HABIB* (University of Sydney, Australia)

Sociological Film: Modes of Engagement with Publics

This paper examines the concept of sociological film through the lens of public sociology, arguing that such films engage the public by allowing individuals to narrate their own stories and fostering a participatory filmmaking process. While existing literature on community-engaged research emphasizes the role of researchers in solidarity and true partnership with the publics, a significant gap remains in understanding how the filmmaking process, as a method, can actively foster public engagement, particularly concerning where the researcher's camera should stand and what to capture in representing the experiences of this collaboration. The paper begins by defining sociological film and highlights four distinct modes of engagement with the publics through the filmmaking process. These modes are explored through: (1) researchers, as outsiders, joining the public to create documentaries that

highlight their experiences and challenges, exemplified by *You Can't Move History* by Dr Pollyanna Ruiz; (2) researchers producing sociological films about their own communities, as seen in *The Sociologist's Wife* by Catherine McDonald, Ros Edwards, and Val Gillies; (3) researchers supporting the public by providing resources and training to enable them to create their own films, illustrated by the Pacific Community Filmmaking Consortium; and (4) offering access to archives or interactive platforms that allow the public to represent their narratives on their own terms, demonstrated by *Gaza/Sderot: Life in Spite of Everything*. By analyzing these diverse examples, this paper highlights the multifaceted impact of sociological film as a powerful medium to promote sociological imagination.

Artificial Intelligence (AI) and Qualitative Research in the Global South: A Critical Perspective

The integration of Artificial Intelligence (AI) into social science research has the potential to revolutionize the field, particularly in the Global South. While AI offers powerful tools for data analysis, its application in contexts characterized by limited resources, diverse languages, and unique cultural nuances presents distinct challenges and opportunities.

In the Global South, AI can be leveraged to address pressing social issues such as poverty, inequality, and climate change. For example, AI-powered tools can analyse large-scale datasets to identify vulnerable communities affected by climate change, as demonstrated in a recent study in Bangladesh. Additionally, AI can facilitate cross-cultural communication and understanding by translating and analyzing text data from multiple languages.

The adoption of AI in the Global South, however, is constrained by factors such as limited access to technology, infrastructure, and expertise. Moreover, the development and deployment of AI algorithms must be sensitive to the specific contexts and values of different cultures. To ensure that AI benefits rather than harms the Global South, it is imperative to address these challenges and promote equitable access to AI technologies.

This study, conducted through participant observation and in-depth interviews with researchers and policymakers in South Africa, explores the potential of AI to transform qualitative research in the Global South. It highlights both the opportunities and limitations of AI adoption, emphasizing the need for ethical considerations and collaborative approaches to ensure that AI is used to empower marginalized communities and promote social justice.

Negotiating Religious Identity in "Secular Spaces": A Comparative Study of Christian and Muslim Students in Danish High Schools

This study explores the differing perceptions of religious students within Danish high schools, focusing on how classmates perceive and interpret religious practices of Christian and Muslim students. Preliminary fieldwork in two schools reveals that students who actively practice their Christian faith face challenges in being understood by their ethnically Danish peers. Despite sharing the same ethnic and cultural background, these Christian students are often viewed as socially awkward, introverted, or mentally unwell due to their abstinence from drinking, romantic relationships, and other behaviors seen as typical in non-religious Danish youth culture. Conversely, Muslim students, whose religious identity is more visible and culturally distinct, are more readily accepted, with their peers explaining their behavior as part of "how they are" due to their Muslim identity. This distinction highlights an underlying dynamic where difference is more readily accepted when framed through an ethnic or cultural lens, while intra-ethnic religious adherence leads to confusion and pathologizing. Moreover, this dynamic fosters the creation of distinct collectivities of cohesion, wherein cultural or ethnic differences serve as a basis for group solidarity, while intra-ethnic religious variance contributes to social fragmentation and marginalization. The study contributes to the understanding of how religion, ethnicity, and social norms intersect in secular educational settings, and the ways in which students construct social distance through cultural and religious difference.

Le Numérique En Milieu Juridique : Quels Impacts Et Quelles Stratégies Adoptées Par Les Cabinets d'Avocats Depuis l'Émergence Du Mouvement Legaltech En France ?

En milieu juridique, la promulgation de la loi pour une République numérique a marqué le début d'un chapitre inédit dans le fonctionnement des cabinets d'avocats : l'arrivée des LegalTechs et le développement des outils d'intelligence artificielle ont créé un électrochoc dans leur univers.

Depuis, nombreuses sont les études (Deffains, Garapon, Haeri) qui prédisent une transformation en profondeur du métier d'avocat: de la recherche basique d'informations en passant par la génération automatique des prestations juridiques, c'est toute une profession qui vit dans un climat de tension sans précédent.

Bien que réticents au début, les avocats, longtemps éloignés de cette préoccupation, font depuis face à :

- de nouveaux enjeux, sources d'une remise en question de toute une profession, (remise en question du traditionnel «business model» et la pratique du taux horaire).
- de nouveaux acteurs émergents qui exercent une pression sur tous les acteurs du marché.

Notre communication se basera sur les résultats d'une thèse de doctorat en SIC, qui se focalise sur deux volets. Le premier vise à étudier les mutations engendrées par l'usage des nouveaux outils numériques en milieu juridique; le second a pour objectif d'analyser les stratégies d'adaptation déployées par les acteurs impliqués.

Pour ce faire, nous avons adopté une approche croisée à la fois sur le plan méthodologique et disciplinaire.

Sur le plan méthodologique, et au regard de notre statut de documentaliste, nous avons inscrit ce travail dans une réflexion opérationnelle et professionnelle.

S'inspirant de la recherche-action (MEYER, 2006) et de l'observation participante, nous avons fait appel à deux corpus : un plutôt qualitatif lié à nos entretiens et un deuxième, quantitatif, produits par des acteurs institutionnels.

Sur le plan disciplinaire, nous nous inscrivons à la suite des travaux de Claire Oger et de Caroline Ollivier-Yaniv qui ont initié un rapprochement entre la sociologie compréhensive et l'analyse du discours.

How Gang Violence in France Makes the City

Understanding the links between space and street violence, and in particular inter-neighborhood rivalries, has mainly been based on the study of socialization to these conflicts or to public policies. Research has focused on the weight of segregation and localism, the place of youth gangs and their attachment to the defense of a collective honor, the role of human and technological surveillance in deterring mobility, and the impoverishment and social immobility of residents in the most vulnerable neighborhoods. Based on nearly 20 years of research into gang phenomena in France, we propose to show the extent to which these rivalries between neighborhoods also contribute to redefining the "urban imaginary", the "mental map" and therefore the way the city functions for the young people most exposed to this violence. This has many invisible consequences, but with very tangible effects on social opportunities, spatiality, the functioning of institutions, educational choices and career paths.

MOHAMMED, MARWAN* (CNRS, France)

Quand La Violences Fait La Ville

La compréhension des liens entre l'espace et les violences de rue, notamment les rivalités entre quartiers, s'est principalement appuyée sur l'étude de la socialisation à ces conflits. La recherche a insisté sur le poids de la ségrégation et du localisme, à la place des bandes de jeune et leur attachement à la défense d'un honneur collectif, au rôle de la surveillance humaine et technologique qui dissuade les mobilités, mais aussi la paupérisation et l'immobilité sociale des habitants des quartiers les plus vulnérables. En prenant appui sur près de 20 ans de recherche sur les phénomènes de bande,

on propose de montrer à quel point ces rivalités entre quartiers contribuent également à redéfinir «l'imaginaire urbain», la « carte mentale » et donc le fonctionnement de la ville pour les jeunes les plus exposés à ces violences. Ce qui a de multiples conséquences invisibles mais dont les effets sont très concrets sur les chances sociales, la spatialité, le fonctionnement des institutions, les choix et les parcours scolaires.

MOHANTY, HIMALIKA* (Tata Institute of Social Sciences, India)

Women's Experiences of Domestic Violence and Their Access to Law: Looking at the Domestic Violence Law (PWDVA) in India

Within the Indian subcontinent, law is a major process through which domestic violence is defined. Although the courts are inevitably involved in adjudicating such cases, the civil law route allows women themselves to define the circumstances under which domestic violence may be deemed sufficiently oppressive to call for legal action. Yet within the rigid boundaries of legal definitions, experiences of women are tailored to fit certain interpretations. A version of the truth is created within law, and anything that does not corroborate with that is seen as deviant or unimportant.

Based on my MPhil thesis on women's experiences of domestic violence in this paper I look critically at the design of the Protection of Women from the Domestic Violence Act, 2005 (PWDVA) and unpack the jurisprudence behind it. I conducted most of my fieldwork during the pandemic, which is also when the cases of domestic violence increased globally, so much so that the UN termed it a "shadow pandemic". The PWDVA is considered a significant feminist contribution to the field of family laws, affirming the survivor's agency, and envisioning violence through multiple registers. Along with critically analyzing this law and its implementation, and looking at a few survivors' own lived experiences of this violence, my paper will also look at a few judgments nospanning the almost twenty years since the law has been around. Some of the questions my paper will try to address include: How does the PWDVA change the way domestic violence has been understood historically in the Indian legal scenario? How has the trajectory of use of this law changed and what does it mean in the context of social and cultural ideas of family? What is the role of women's experience in the articulation of such ideas of justice?

Blended Family: Stepparent-Stepchild Gender Variation and Its Influence on the Phenomenon of Children Living and Working on the Streets in South Africa

Children assign going to the street to mean various things such as being free from their parent's maltreatment (e.g. typical mistreatment by stepparents), parent's discipline, parent's strict rules, etc. Blended families are emerging and growing at a fast rate in the contemporary society, because of the growing number of divorces, separation and unmarried parenthood. Therefore, there is conflicting evidence concerning whether children of various genders adapt to the arrival of a stepparent. It has also been found that children have more positive relationships with their biological parents, as compared to stepparents, and they normally have a biological parent of the same gender as the stepparent comes to their lives. Social practices of gender essentially thus affect relationships in stepfamily. The aim of this paper is to understand the Stepparent-stepchild gender variation and its influence on the phenomenon of children living and working on the streets in South Africa.

This paper draws from the qualitative data gathered from a Ph.D. study, making use of attachment theory. The findings consist of information collected from 15 street children receiving services at the two drop-in centres in the North-West Province of South Africa, and their parents making a total sample of 30 individuals. In-depth interviews were conducted in Setswana language and later transcribe in English. Data was manually coded, resulting themes and sub-themes were analysed thematically. Ethical approval was obtained from North-West University.

The results of the study revealed that children living and working on the streets come from various family structures. A proportion of such children were from complex stepfamilies, they provided various reasons for going to the street, such as the mistreatment of the stepparent of the opposite gender. This paper suggests that there should be policy interventions and programmes that strengthens various family structures that are transitioning.

MOISEEVA, ALEVTINA* (Center for Sociological Research of Russian state University for the Humanities, Russian Federation)

Quality of Life As an Indicator of the Social Contract

Local government plays a key role in improving the quality of life of the population, which is the most important indicator of the effectiveness of the implementation of the social contract between the state and citizens. Quality of life is not only the goal of socio-economic development, but also a direct indicator of how effectively the obligations of both parties are fulfilled. The state develops and implements various tools to improve the quality of life, including management mechanisms, assessment standards and feedback from citizens. Local government, ensuring the participation of residents in solving the problems of socio-economic development of the city, not only increases the level of responsibility and transparency of decision-making at the local level, but also helps to reduce social tension.

Organization of local self-government activities, formation of effective work of local authorities is a key direction of evolution of the modern state, being the basis for democratic changes in society and its improvement in the interests of citizens. In order to achieve maximum efficiency, approaches and evaluation criteria are developed that allow identifying problems in the process of implementing management policy. The current system of indicators and methods for evaluating the effectiveness of local self-government activities do not take into account the specifics of territorial development; there are structural shortcomings associated with the criteria used for evaluation. The performance evaluation system is turning into a simple reporting tool for government agencies and citizens, rather than an effective way to improve functioning. As a result, the opportunity to fully use feedback to really improve the quality of life and strengthen public trust, which is a key element of the social contract, is missed.

Loss of Solidarity and Civic Virtue? Shift from the Three Worlds of Welfare to Technocratic Social Investment Hybrid Welfare States

The paper examines how Esping-Andersen's (1994) "three worlds of welfare states" have evolved into social investment hybrids (Hemerijck 2006). Over the past three decades, European welfare states have become hybrids with social investment elements, driven by a technocratic and functionalist social investment framework. The rise of the social investment approach has meant a shift towards a more individualistic approach, with the loss of solidarity, especially in social-democratic welfare states.

Following Sandel's (2010) framework of three types of justice, we argue that with the adaptation of the social investment framework there has been an ideological shift in European welfare states from communitarian and civic values towards a growing emphasis on utilitarian and liberal values. This shift has weakened solidarity, the foundation of the legitimization of welfare states, especially the Nordic welfare state. We also argue, following Sandel, that the ideological shift from communitarian values towards utilitarian and liberal values in European welfare states has also devalued work as a source of social cohesion and recognition, which is a concerning and paradoxical development given the welfare state's reliance on high employment and its central role in the social investment framework.

Also, we argue that the adaptation of welfare states to the ecological boundaries demands a redefinition of values of the good life and civic virtue, lacking both in the utilitarian and liberal goals of the welfare state. European

welfare states, with their social investment approach, due to their technocratic approach and individualization, must revisit the normative discussion of the good life and the normative foundations of welfare states. There is a pressing need to rethink and potentially reinvent the welfare state into a new civic model that better balances individual freedom with collective responsibility and ecological boundaries.

Amílcar Cabral's Two STAGE Social Transformation in South African Context

This paper utilizes Amílcar Cabral's two-stage transformation theory to analyze South Africa's post-apartheid evolution. Cabral's framework, which distinguishes between political independence, as the first stage and national liberation as the second, serves as a critical tool for assessing the country's progress. While South Africa achieved political independence in 1994 with the end of apartheid and the establishment of democratic governance, the second stage national liberation remains largely incomplete. The second stage involves the aggravation of contradictions that were muted during the liberation struggle. The paper explores how the persistence of inequality, neoliberal economic policies, and structural racial, and sexual disparities reflect the unfulfilled second phase of transformation. By applying Cabral's model, this study emphasizes the need for deeper economic and social reforms to realize the full potential of South Africa's liberation.

MOKHTAR, SHEHRAM* (Northwestern University in Qatar, Qatar)

Class, Cross-Dressed Women, and Comedic Gender-Play in Pakistani Social Films

Pakistani cinema experienced its heyday in the 1960s and 1970s, when it thrived in a commercial mode and adapted a genre termed "social" as a dominant mode of making commercially viable films in the language Urdu. While the term "social" suggests that these films dealt with serious social issues, it referred to a cross-generic form that incorporated elements of romance, melodrama, song-and-dance, comedy, and sometimes action, woven into narratives about family and changing society. If cinema is considered a technology of gender and sexuality, then Pakistani cinema is known for valorizing normative notions of both, concomitant with family, home, and nation. However, within Pakistani cinema, the normative order was also ruptured by unruly desires, which manifested through visuals, aesthetics, embodiments, performances, and styles that countered and transgressed the norms, before ultimately restoring them. This article examines the appearance of cross-dressing women in social films. In several social films, women's characters from working and lower classes often cross-dressed and masqueraded as men to fulfill narrative demands. Trade magazines catering to Pakistani film fans frequently featured photographs of actresses in cross-dressed attire, showcasing a fascination with such characters. These unruly portrayals disrupted the normative gender assumptions of bourgeois moral order, leading to a comedic play of identities and a confusion of hetero- and homo-erotic relations within the films. This article analyzes the 1974 film *Aabroo* ("Honor") alongside a range of other films from the 1960s up to the 1980s that featured such characters. While the narratives often aimed to restore the acceptable gender order, this article argues that the instances of cross-dressed women offered subversive pleasures. However, these pleasures were less disruptive because they had limited screen time, were associated with lower- and working-class characters, and were played for laughs.

Do People Really Prefer Unequal Societies?

Existing research emphasizes unequal opportunity as central to concerns about economic inequality, suggesting that fair competition mitigates concerns about unequal outcomes. However, this work overlooks the potential for individuals to take for granted different levels of economic inequality, implying that outcome inequality may operate on a distinct cognitive level in shaping normative concerns about fairness. To test this, we

conduct an online experiment (N=3,335) that simultaneously manipulates opportunity and outcome distributions in a multi-round game setting, thus creating and assigning individuals to environments with different levels of outcome and opportunity inequality. We assess fairness concerns through in-game attitudes, responses to GSS-based inequality questions, and behavior in Dictator and Ultimatum games. Consistent with prior work, the results show that both winners and losers oppose unequal opportunities regardless of the different levels of outcome inequality, though the intensity of their opposition varies. However, their ideal levels of inequality consistently mirror their experienced outcome inequality, irrespective of opportunity distribution. This suggests that individuals naturalize experienced inequality of outcomes. Notably, we find no corresponding effects on behavioral measures. Overall, these findings highlight that while individuals generally uphold the principle of equal opportunity, they also internalize and accept their experienced level of economic inequality, demonstrating the powerful influence of habituation on fairness concerns.

MOLINA DERTEANO, PABLO* (Instituto de Investigaciones Gino Germani, Argentina)

Social Inequities and Digital Development. Two of a Kind?

The aim of this paper is to analyze the impact of digital inequalities in relation to income and gender inequalities. Existing literature, including initiatives from international organizations such as UIT, has shown a certain interrelation between socio-economic development and the development of connectivity infrastructure and the use of ICTs. Within the EU framework, the Digital Economy Social Index (DESI) has also provided evidence in this regard. However, one of the less explored aspects is to what extent inequalities in infrastructure and digital skills imply a complementary analytical dimension integrated or not with other measures of inequalities. In other words, does the interaction between inequality indices in infrastructure and/or digital skills and gender or income inequality indices represent a significant statistical leap? Or does their separate treatment and then addition in an equation not present significant differences? To address this, two approaches will be proposed: by gaps and by indices, using the experiences previously carried out in INCASI (International Network for Compared Analysis of Social Inequities), and will be applied to countries in Europe, North America, and Latin America. The results will allow approximations to describe the impact of digital developments and their role in increasing productivity, job training, and reducing inequities.

Sensitivity of Compliance Regarding the Institutionality of Water Management in Situations of Water Scarcity

Climate change is reducing precipitation in various regions, impacting agriculture and economies. Adapting to these changes requires new water management strategies, necessitating effective regulations and user adherence. Effective regulations must be based on a comprehensive model of human behavior that accounts for outcome-based social preferences—such as resource and need distribution—and intention-based preferences, which consider whether scarcity arises from exogenous causes or norm violations. Previous studies indicate that humans exhibit social preferences, aversion to inequality, and prioritize intention-based decisions over purely outcome-based ones. This study proposes an experimental approach to explore how individuals respond to water use regulations during scarcity, and whether awareness of others' needs influences compliance.

Our hypotheses suggests that non-compliance rises during scarcity due to both exogenous causes and norm violations. Conversely, awareness of others' needs is expected to reduce non-compliance, potentially due to inequality aversion and an understanding that others' non-compliance is driven by necessity despite unequal outcomes. Alternatively, heightened awareness may reinforce scarcity perceptions, fostering a feedback loop that escalates non-compliance initially triggered by external factors.

A lab-in-the-field experiment tested these hypotheses. Participants engaged in an economic game sharing limited water across multiple rounds in pairs. Each round presented a scenario where total demands exceeded available supply, with a rule requiring equal division. Participants made independent decisions to either follow the rule or exceed their quota,

which could disadvantage their partner. Random selection determined the implemented decision, with proportional monetary penalties for unmet demands. One group knew only their own water demand each round, while another group also knew their partner's needs. Results indicate that both groups escalated non-compliance in response to scarcity. Furthermore, non-compliance increased among individuals experiencing previous losses due to their partner's non-compliance. Surprisingly, participants aware of their partner's needs did not improve compliance compared to those unaware.

The Predictive Validity of Factorial Survey Experiments – a Systematic Review

Factorial survey experiments (FSEs) have become a widely used method in social science research for capturing behavioral intentions through hypothetical scenarios. Despite their extensive use, the predictive validity of FSEs—whether and to what extent reported behavioral intentions align with actual behavior—remains a topic of debate. Rare systematic validation studies show ambiguous findings across the exemplary fields of application and provide mixed evidence.

The given talk presents a systematic review of existing research, examining the conditions under which FSEs successfully predict real-world behavior. The review aims to identify key factors that influence the alignment between behavioral intentions and actions. Particular attention is given to the realism and complexity of vignettes, social desirability bias, level equivalence, context-factors and surveyed population. In addition, the review will take into consideration theoretical frameworks often employed in FSEs, such as social action theories and theories on decision making, to understand how these models may also help to explain observed gaps between intentions and behavior.

By synthesizing the findings, the review seeks to clarify the social settings and methodological conditions under which FSEs provide valid behavioral predictions in order to contribute to the ongoing methodological debate on factorial surveys. Some guiding considerations will be outlined for researchers, aiming to enhance the predictive validity of their survey instruments. In sum, the presentation contributes to the development of FSEs as a robust tool for studying complex social behaviours.

Reimagining Men in Eldercare: Shifting Roles of Male Staff in Home Care

Background and purpose

Demographic changes and migration patterns have led to increased participation of men in formal eldercare. As the number of male caregivers continues to rise, care users face a new situation: experiencing eldercare services provided by male staff. This trend challenges traditional stereotypes that associate care work with femininity. While a growing body of research indicates that men are increasingly stepping into caregiving roles, including in formal care provision, attention has largely focused on the perspective of care workers, omitting care users' experiences.

This study adds to contemporary research into male caregiving by focusing on how home care users in Sweden relate to male care staff, aiming to explore how care users perceive their experiences with male caregivers.

Methods

Data was collected through 34 qualitative interviews with home care users, aged 68 to 96, from diverse socioeconomic backgrounds. Both public and private care providers were included. Thematic analysis was used to explore how care users reflect on their interactions with male care staff.

Findings

Many respondents expressed indifference toward the gender of their caregivers, instead prioritising the quality of care. However, male caregivers, often from migrant backgrounds, were sometimes praised for providing good support, while other – primarily female – interviewees highlighted unease in intimate care situations such as showering. In such cases, concern was also expressed from the care user to the male staff members, whose potential discomfort worried some respondents.

Conclusions and implications

Contradicting the perception that caregiving is “women's work”, this study challenges traditional gender norms, showing an acceptance among older

adults for male caregivers. Discomfort, when experienced, tends to relate to intimate care. The expanding role of men in eldercare calls for a recognition of their contributions, potentially increase diversity and inclusivity in the caregiving professions.

MÖLLERGREN, GLENN* (School of Social Work, Lund University, Sweden)

The Unrecognized Partners in Home Care Provision: How Older Adults Engage in Unintended Co-Production

Background and purpose

Conventional understandings of dependency in eldercare often view older adults as passive and powerless. This study challenges such narratives by exploring how care users are actively involved in co-producing the services they use, even in formal home care contexts in a Nordic welfare state. Applying a conceptual lens of agency in care relationships, it unveils how formal care provision involves significant - if often unacknowledged - contributions from the care users themselves.

This study's aim is to explore how care recipients act to ensure a sufficient level of quality in the care provision.

Methods

Data were collected through 34 qualitative interviews with 36 Swedish home care users aged 68 to 96, and 15 observations of home care delivery. Respondents represented diverse socioeconomic backgrounds and were users of both public and private care. The ensuing thematic analysis was theory-driven, focusing on care users' activity.

Results

Users are found to engage in the care provision, compensating for systemic deficiencies. These contributions include planning and coordinating services, emotionally supporting strained and under-paid staff, as well as performing more - often decisive - practical and preparatory work. Despite themselves needing support in everyday life, participants are profoundly involved and are crucial, though unacknowledged, partners in the service production.

Conclusions and implications

Care users' efforts can be interpreted as a form of unintended co-production, highlighting a paradox in which individuals assessed as less capable of independent self-care play an essential role in the care provision.

Recognising this coerced involvement enables the acknowledgement of a hitherto underexplored dynamics in elder care and encourages addressing systemic shortcomings in formal welfare services. Viewing older care users as de-facto co-producers of domiciliary care in an advanced Nordic welfare state can contribute to understanding older adults' agency and competencies across welfare regimes and care traditions.

The Social Impact of Covid 19 in Hungary

The covid-19 epidemic has posed a major challenge to society as a whole. At the same time, the changes brought about by the pandemic may have affected the lives of people living in different types of settlements in different ways. The aim of this presentation is to show how different levels of the settlement hierarchy in Hungary have been affected. Dealing with the coronavirus pandemic that unfolded in 2020 and minimising losses required the introduction of new rules and restrictions that changed people's everyday lives. The requirement to remain physically distant has resulted in fewer social encounters, and many economic and cultural activities have been relegated to the online space (physically within the home, the household). While learning and many intellectual tasks have become home-based activities, some of the work that requires presence (physical work, some services) is done temporarily.

All these processes may have reassessed the advantages and disadvantages of urban and rural spaces.

Using the results of a qualitative research, we show how the inhabitants of different types of settlements experienced the new rules of the pandemic, how it changed the patterns of action of local communities and families, and how it affected the valorisation of rurality and localism.

Protective Factors for the Impact of Daily Adverse Childhood Experiences on Mental Health Disorders in the Early Life Course

This study aims to clarify what kind of social relationships and social support would reduce mental health problems if multiple adversities in childhood have a long-term negative impact on mental health in adulthood. Progress in understanding how multiple childhood adversities affect later health inequalities has been made in recent years. Previous research has focused on acute or exceptionally high levels of risk factors (e.g., parental abuse or death of a parent). However, it has been suggested that low-level everyday risk factors at work, home, and in the community (e.g., poverty, being a victim of bullying at school) have not been adequately considered and that the range of experiences included in childhood adversity is narrow. Therefore, this study examined the impact of adverse childhood experiences, such as social aspects (victimization by bullying at school and bad atmosphere at home at age 15) and economic aspects (material deprivation at age 15 and subjective poverty at age 15), on mental health problems in adulthood. The study also identified which social relationships and social supports can be protective factors in reducing long-term mental health problems in adulthood.

The Land of Liberty: A Decolonial Perspective on International Migrations to Haiti (1804 - 1888)

This study examines international migrations to Haiti during the 19th century, utilizing historical and secondary sources and adopting a decolonial approach. This aspect has been little explored in the international literature, particularly in the Brazilian literature on the migratory phenomenon related to the Caribbean country. The objective is to highlight that, after gaining independence in 1804, Haiti rigorously fought against colonialism and slavery. The country became a refuge for Afro-Americans and Afro-Caribbean individuals fleeing slavery in other nations of the Americas. Furthermore, before becoming a country of emigration today, throughout the 19th century, Haiti warmly welcomed immigrants from various origins, including Europeans and people from other parts of the world, of multiple nationalities. These arrivals of non-nationals to Haiti preceded Haitian emigrations to other countries, and understanding this context is crucial from a decolonial perspective.

Transnational Families, Social and Symbolic Aspects in the Remittance Practices of Haitian Diaspora in Brazil

In the emic sense, in Haitian Creole, *dyaspora* refers to a person of Haitian nationality or origin living in a foreign country, a status that carries prestige for the Haitian migrant. *Voye kòb* - the act of sending money - is a common and recurring economic action among the *dyaspora*. In the Haitian transnational context, money does not exist to eliminate exchanges. On the contrary, this transactional intermediary transcends economic exchanges to embody symbolic exchanges between the *dyaspora* and those who remain in Haiti.

Based on data collected from 180 Haitian migrants in the metropolitan region of Belo Horizonte through questionnaire-interviews, participant observation, and immersion in the Haitian community, and in dialogue with theories of Economic Sociology, I argue that *voye kòb* - or sending money - is a recurring act of reciprocity that does not adhere to rational economic calculations. Instead, this practice forms part of social reproduction strategies within family groups, aimed at reconverting forms of social and economic integration both in Haiti and in Brazil.

By exploring the reasons why Haitians in Brazil send money to Haiti, two truths about this common practice among Haitian migrants are revealed. The first truth relates to its utilitarian aspect: fulfilling essential family needs such as food, education, and housing. The second truth pertains to its symbolic dimension, highlighting broader social meanings such as status, recognition, and honor. Those who do not *voye kòb* without providing justifiable reasons are negatively sanctioned by being labeled *dyaspora bouda chire* (those who have failed abroad), *engra* (ungrateful), or *manfouben* (indifferent attitude). In doing so, they disqualify themselves in the Haitian transnational social space and risk being "de-diasporized," particularly by agents from their community of origin.

Haitian migrants send money not only to support their families but also to maintain the prestigious status of *dyaspora*.

Beyond Sexual Attraction: A Study of Asexual Identity Discourse on Reddit

Asexuality is a complex and evolving concept that challenges conventional understandings of sexual attraction and identity. It functions as an umbrella term encompassing a broad spectrum of sexual identities and experiences, fundamentally questioning the assumption that sexual attraction is a universal and essential aspect of human identity. This reconceptualization challenges normative sexual frameworks, opening discussions about the diverse ways humans experience attraction, desire, and relationships.

Despite its relevance, the discussion of asexuality in gender studies remains marginal and under-explored, positioned alongside other 'invisible' sexualities such as bisexuality and pansexuality. Against this backdrop, this study investigates asexuality through the analysis of discourses within the digital spaces of Reddit, a social networking platform characterized by user-generated content, specifically within topic-driven "subreddits".

This research employs an integrated mixed-methods approach, combining quantitative and qualitative techniques to study the role of online communities in the construction and recognition of asexual identities. Textual data are extracted through web scraping from subreddits focused on asexuality. Latent Dirichlet Allocation (LDA), a topic modeling technique, is utilized to analyze the textual content, identifying latent themes in discussions and uncovering patterns of identity and self-narration in the digital space. Additionally, digital ethnography provides in-depth insights into how online environments contribute to the construction and recognition of asexual identities.

This research not only offers a new lens for knowing sexual identities in digital spaces but also enriches the conversation on asexuality by thoroughly investigating how individuals within the asexual community construct and describe their identities online.

On the Margins of Elderly Care: The Case of an Emerging Social Care Profession

In Switzerland, a shift in favour of aging in place and away from institutionalisation has become the subject of a consensual political discourse, framed in the mid-1990s by federal policy. Since the late 2000s, this policy direction has led to the emergence of a new professional group: social care referents. These professionals are central to a new instrument of these policies – a 'housing with social care' for elderly people, that is housing facilities situated in-between institutional care settings and private homes, aimed at delaying or preventing admissions into long-term care structures thanks to the assistance provided by care referents. Although social care referents are expected to play a key role in implementing new elder care policies, they are positioned at the margins of established professions within home care services. Their work, role and place within the division of labour remain vaguely defined and ambiguous, leading to a lack of social and financial recognition.

This paper seeks to examine how social care workers in this emerging profession in the field of elderly care construct their professional identity. Through an exploration of their lived experiences, we identify how social referents define, organise, negotiate, and give meaning to their work, as well as three distinct ways in which they conceive and embody their role. We show how, in managing the daily implementation of the policy objectives, these professionals find themselves at the centre of the tensions created by these policies.

We draw on in-depth interviews conducted with 30 referents and a questionnaire distributed to all identified professionals in French-speaking Switzerland.

How Did States' COVID-19 Mitigation Policies Affect Drug Overdoses and Suicides in the United States?

During the COVID-19 pandemic, U.S. states enacted physical distancing policies (e.g., stay-at-home orders, business closures) to reduce the spread of COVID-19. There was speculation that these policies could adversely affect mental health and increase drug overdose risk. To mitigate the adverse effects of the pandemic and its restrictive policies, many states also enacted economic supports, such as direct cash payments and eviction moratoria. States varied in both the implementation and duration of their physical distancing and economic support policies. Using mortality data from the U.S. National Vital Statistics System and state policy indices from the Oxford COVID-19 Government Response Tracker, we identified associations between states' COVID-19 policies and fatal drug overdose and suicide rates among U.S. working-age adults (ages 25-64). In terms of drug overdoses, state physical distancing policies significantly increased, while economic support policies significantly reduced overdose rates. A one-unit increase in physical distancing policy strength predicted a 15% average monthly increase in county-level overdose rates for males (IRR=1.15, 95% CI=1.09, 1.20) and a 14% increase for females (IRR=1.14, CI=1.09, 1.20). A one-unit increase in economic support policy strength predicted a 3% average monthly decline for males (IRR=0.93, CI=0.95, 1.00) and a 4% decline for females (IRR=0.96, CI=0.93, 0.99). Ultimately, the economic supports that states enacted were insufficient to fully mitigate the adverse relationship between activity limitations and drug overdoses. In terms of suicides, a ten-unit increase in physical distancing policy strength was associated with a decrease of 0.065 (95% CI=-0.101, -0.036) in the state-level male suicide rate. This decrease was concentrated in reductions in firearm suicides. There was no association for females. The economic support index was negatively associated with the suicide rate for males only in 2022 (-0.031 95% CI -0.064, -0.010). These findings contribute to understanding unintended consequences of pandemic mitigation policies in the United States.

Studying Religiosity in Switzerland from a Longitudinal Survey: New Results from a New Methodological Approach

The study of changes in religious practice and affiliation over the long term has generally been approached using cross-sectional data from several surveys conducted at different points in time (Voas 2009; Voas and Chaves 2016). The use of longitudinal data, which follows the same individuals over time, allows distinguishing the age directly from the cohort effect. The Swiss Household Panel (SHP), launched in 1999, which annually surveys individuals randomly selected from the Swiss resident population, offers several interesting insights into the evolution of religious practices and beliefs in a Christian cultural context.

In our first paper (Monnot and Wernli 2023), we studied three indicators of religiosity over a 20-year period (1999 to 2018): religious affiliation, frequency of religious service attendance, and personal prayer, taking into account the socio-demographic characteristics of individuals. For the three religious indicators, a cohort effect is a key factor in explaining the decline of religiosity, younger individuals being less affiliated, practicing less often, and praying less than the older cohort. We also observe an effect of age or life cycle, especially on religious practice, and a period effect on the religious disaffiliation of individuals.

In a second series of analyses, based on four waves of SHP (2012, 2015, 2018, 2021), we measure personal attitudes towards different religious belongings (Christianity, Atheism, Judaism, Islam, Hinduism, Buddhism). Our preliminary results also show a cohort effect on the feelings towards religions and atheism in general, but with different trends over time. Beside the cohort effect, we also note that religiosity plays a significant and positive role in attitudes towards the different religions. In addition, political position, life satisfaction, education, and political trust also have an effect on tolerance.

Diversity and Exclusion: Migration Status, Local Cultural Capital and Unwelcoming Encounters in an Inclusive East London Borough

The nature of superdiversity in London is constantly transforming in response to world events, internal and international mobility, demographic changes and an ever-changing and multi-scalar policy and discursive landscape. Exclusionary national immigration policies often stand in stark contrast to the more inclusive approaches of local governments. Drawing on ethnographic research, this paper builds on theories of social complexity (Vertovec 2021) to discuss unwelcoming service encounters that expose the disconnect between a local authority's inclusive representations of diversity and the harsh realities faced by newcomers with insecure legal status and limited local cultural capital, who face multiple barriers in accessing resources. We illustrate how these realities, exacerbated by unfamiliarity with the unspoken rules within support services, can result in exclusionary interactions marked by judgment, even by fellow residents of migrant heritage and within services aiming to promote diversity and inclusion. The paper argues that despite public narratives of inclusivity, ground-level encounters risk marginalizing vulnerable newcomers, undermining these inclusive representations. It illuminates the complex interplay between diverse configurations and the perpetuation of unequal social structures, offering insights into the relevance of less visible dimensions of difference in increasingly diverse urban environments.

How Tourism Changes the Face of Cities: Bologna and Palermo between Transformation and Touristification.

In recent years, the debate around over tourism has intensified, touching on a variety of issues, such as ownership, governance, local identity, resource extraction and consumption, social fragmentation, the depopulation of city centers, the privatization of urban spaces, capital accumulation dynamics, pollution, and more.

While tourism can bring economic benefits to cities, it is crucial to find a balance between tourism development and the preservation of local communities' identity and quality of life. Local authorities must implement urban and tourism policies that promote the diversity and authenticity of cities while safeguarding their communities and urban environments.

What is needed is a collective vision of a city that guarantees both residents and visitors the right to citizenship (Lefebvre, 1968).

The rise of the "tourist city," which inevitably promotes an iconic, branded model, must be met with greater awareness of the risks posed by Digital Urban Gentrification and the inequality effects of over tourism. This includes the growing disparity in quality of life between urban spaces and public spaces, especially when the latter is no longer considered a common good. The urgency of considering all parts and bodies of the city becomes clear, including the need for the integration of spaces, policies, and generations, as well as the shift from mono functional to multifunctional use of places.

The aim of the paper is to examine the need to balance transformation with the risks of "touristification" by analyzing the dynamics of two Italian cities that have recently experienced significant tourism influx: Bologna and Palermo.

Making and Remaking Whitespaces: Comparing Mexico City and Boston

Gentrification is the process of creating Whiteness and Whitespaces; how that is achieved varies by locality. While gentrification literature has explored how new development, consumerism, and cultural products transform communities, less emphasis has been given to the role of Whiteness and White supremacy in the overall process. Part of the transformation caused by the process of gentrification includes a change in the demographics of the community. In most places, this is essentially a transition from a displaceable group to emplace a White middle- and upper-class group or ethos. This research compares Boston and Mexico City for the visible signals of the

emplacement of Whiteness. While both localities are distinctly different, this research argues that similar processes are taking place in both localities. In both locations, various qualitative methodologies (auto-ethnography, critical visual and digital analysis) were used to explore the emplacement and making of Whiteness. This presentation will focus on visual elements of emplacing Whiteness.

MONTALVA BARBA, MIGUEL* (University of Massachusetts Boston, USA)

Settler Colonialism, the White Child, Gentrification, and Gensociocide

The reproduction of Whiteness, White supremacy, and settler colonialism focus on taking over land, space, and bodies, and this research argues that the image of the White child is used to rationalize these processes. By focusing on interviews with self-identified progressive White gentrifiers and archival research in a borough of Boston, Massachusetts, this research demonstrates how White folks resettled into a heteronormative Whiteness with the physical arrival or the construction of the image of the White child. The physical and imaginary of the White child becomes a tool for resource hoarding and taking over lands and justifies all forms of violence by referencing the vulnerability and potentiality of a White person in the making. In the end, White parents use the figuration of the White child to rationalize changing and taking over communities at the expense of everyone else. This research argues that the figuration of the White child becomes a tool for the generational killing of the social, what the author calls gensociocide.

MONTANARI, BERNADETTE* (Centre for Biocultural Diversity (CBCD), University of Kent & Interdisciplinary Institute for Social Sciences (2I2S), Fez, Morocco)

Women's Work in Africa's Development

The African continent is undergoing significant changes due to neoliberal development policies, which are further facilitated by promoting public-private partnerships (PPPs) in the context of globalisation. In this landscape, high-added-value natural resources have gained a significant place in the international markets. The concept behind PPP is based on the idea that global companies and governmental actors drive weaker economies towards globalization, creating stable and profitable economies for local and international entities, thereby indirectly contributing to the Millennium Development Goals (MDGs). Women, who are typically the custodians of natural resources and management, are central to the initiatives, as they produce and process these resources. The initiatives have not produced tangible results at the local level, and rural employment remains an issue.

Morocco is not excluded from these processes and has seen exponential growth of PPP in several sectors including agriculture, industry, goods and services, amongst others. Perhaps the most salient example is the global marketing success of argan oil. Although it has generated millions of dollars for multinational companies, it has not significantly benefitted local economies, and multinational companies have yet to demonstrate tangible corporate social responsibility (CSR) at a local level.

Consequently, the social and solidarity economy (SSE) trend has emerged as a solution to buffer for socio-economic stagnation at a local level. Although it focuses on economic, social, and solidarity aspects, promoting the values and principles of solidarity based on voluntary participation and personal initiative, it closely resembles the spirit of cooperatives.

While the interplay between these aspects is complex and the objective is not to review all the complex interactions, the presentation will focus on specific factors related to rural women. I would argue that rural women can significantly contribute to securing sustainable socio-economic development as they respond to specific societal needs.

KHAZAEI, FATEN (Northumbria University, United Kingdom)

Rethinking Family Reunification Policies in Europe – between Discourses of Integration and Mobility Restrictions (cases of France and Switzerland)

In this paper, we will demystify some assumptions that are often taken for granted, even in critical migration studies, such as the idea that family reunification policies for workers and seasonal workers in Europe are a

progressive achievement that respects migrants' human rights. Challenging this common narrative around the inclusion of migrant workers' families and family reunification laws, we will examine the visa restrictions and borderisation that followed these policies, which limited the mobility of regularised migrants and their families who benefited from family reunification. In addition, we will show how these restrictive policies create competition among migrant workers to respond to economic needs and are consistent with selective migration policies.

Our presentation will share findings from research into migration context in Switzerland and France conducted between 2015 and 2020. The data includes participant observation among migrant communities in France and the analysis of secondary literature in Switzerland since the start of the Schengen Agreements (1995). We test the hypothesis that family reunification and the introduction of visas were designed not only to prevent additional unselected migrants from entering Europe, but also to restrict the freedom of movement of former and future migrant workers - a freedom that was relatively guaranteed before Schengen. The regulation of immigration rights through border closures thus aims to prevent back-and-forth migration, reduce the potential for resettlement in countries of origin, and tie migrants' existence to the fulfilment of labour and immigration policy objectives.

TG04-972.2

MONTEFRIO, MARVIN JOSEPH* (Yale-NUS College, Singapore)

Filipino Migrant Fisher's Negotiations with Risks at Home and in the Deep Seas

Every year thousands of Filipinos, many of whom hailing from poor coastal communities in the Philippine archipelago, choose to migrate and work aboard foreign commercial fishing vessels. Despite the widespread discourse of labor abuses in fishing vessels, workplace hazards in the deep seas, and fraudulent contract arrangements, many Filipinos continue to seek this migration prospect. The usual trope is that coastal poverty forces them to migrate in spite of the risks and uncertainties of migration. I endeavour to provide more nuance and complicate this explanation by unravelling how migrants understand, compare, and balance risks and uncertainties manifest in their lived realities at home and their work lives aboard foreign fishing vessels in the deep seas. Building on the literature on the sociology of risk and the political ecology of coastal lives, while drawing from my ethnographic research in coastal communities in the province of Capiz, I examine how migrant fishers negotiate the risks and uncertainties associated with labouring in commercial fishing vessels vis-a-vis the combined effects of climate precarity, market instability, and fish stock decline in coastal communities. The risks and uncertainties emanating from these coastal pressures have created and reinforced neoliberal risk-taking subjectivities in which coastal dwellers learn to "gamble" their lives in the hope of assuaging coastal precarity and poverty. Part of this emergent gambling behaviour is their willingness to migrate—even with the fear of maltreatment, injury, and death—because of the perceived promises of high gains. With the intention to improve their life situation, migrants and their families then utilise economic gains to either temper risks and uncertainties at home by investing in everyday fishing assets or engage in riskier livelihoods that entail high capital requirements and greater susceptibility to failures and debt traps.

MONTEJO LÓPEZ, NEREA* (Scuola Normale Superiore, Italy)

Challenging the Capitalist Timescape: Mobilising Negative Rhetoric and Emancipatory Strategy

This article examines how emancipatory movements use narratives of defeat and negative/dystopian rhetorics to challenge the capitalist timescape, identifying these narratives as opportunities for antagonistic forces to emerge as antagonistic forces striving to control and overcome capitalist social relations. Using a theoretical framework based on the sociology of time and social movements studies, it explores how social movements disrupt the capitalist hegemonic continuum or timescape by employing strategies that subvert temporalities aligned with capitalist dynamics. The study focuses on two case studies, the Socialist Movement in Spain and a climate movement (to be determined). The article contextualises these movements within moments of political impasse and disarticulation. In the Spanish case, the Socialist Movement emerges from the post-anti-austerity cycle, navigating a landscape marked by political stagnation, while the climate movement represents a broader response to ecological crisis under late capitalism. The methodology combines Framing and Documental Analysis of social media, journals (2018-2025), interviews with activists and Participant Observation, aiming to interpret the mobilising frameworks, diagnose the catalysts for mobilisation, and understand the strategic articulation and practices of both movements. The findings highlight how a rhetoric of urgency, rooted in a dystopian vision of the future (whether due to the intensification of the capitalist crisis or impending ecological collapse) serves as a catalyst for mobilisation. It also shows how the

case study strategically employs prefiguration to create a counter-temporality with the potential to be sustained over time, as it is strategically aligned with its emancipatory strategy. Based on these findings, this article highlights the need for further research into how negative axes, prefiguration, and strategy help sustain counter-temporalities in social movements, aiming to develop a framework for understanding and enhancing emancipatory coordination across different contexts and crises.

"Controversy over Male-Only Conscription in South Korea: Democratization, Gender Equality, & Hierarchy Among Men"

By approaching conscription as a key mechanism to establish and maintain a relationship between the state and its citizens, who are differentiated by various social structures of inequalities, this article focuses on recurring controversies over male-only conscription in South Korea since the 1990s. Specifically, it investigates why and how the issue was framed in the language of gender inequality against men and women's conscription offered presumably as a remedy. Is the system of male-only conscription solely or primarily a matter of gender equality/inequality? What does the recurring agitation over women's conscription reveal about other forms of inequalities, such as social class, disability, ethnicity/race, and sexuality? Why and how did conscription become so controversial once it became accepted as men's duty to the divided nation and a rite of passage into adulthood? The paper examines these questions against the back drop of Korean's democratization.

MOORE, EIBHLIS* (University of Melbourne, Australia)

An Exploration of What Paid Work Means to Women over the Life Course from the Perspective of Older Women Who Work in Low-Paid Customer Service Jobs.

The research on women's employment has long shown that they are significantly disadvantaged in the labour market compared to men throughout their working lives. Women are more likely to work part-time; they are concentrated in low-paid and low-status industries; they shoulder the bulk of unpaid caring responsibilities which constrains their choices around work; and their retirement savings are significantly lower.

Despite this extensive research on women's employment, less attention has been paid to how women reflect on their working lives later in their life course. How do older women make retrospective sense of what paid work has meant to them at different points in their lives? How do they feel about the work they have done and how their working lives have unfolded?

To provide some answers to these questions, I present personal reflections on paid work from narrative interviews with women aged 45-60 who work in retail and hospitality industries in Victoria, Australia. By looking at these industries, I also explore the women's experiences of ageing in low-paid, low-status occupational contexts where youthful subjectivities are prioritised in their affective, aesthetic, and emotional labour demands. Understanding what paid work means to women throughout their working lives is a necessary step for expanding what is known about women's employment and addressing the disadvantages women experience in the labour market.

RC06-94.1

MOORE, ELENA* (University of Cape Town, South Africa)

Producing Care in Older Persons Households in South Africa

Social grants are the main income in many households in South Africa. The paper focuses on the redistribution of social grants in Older Person Grant (OPG) receiving households. It unpacks the (care) work involved in managing 'care' costs in OPG households in ways that expand our understanding of care work but also sheds light on how livelihoods are sustained in low-income households. This paper draws on findings from a mixed methods study about the economic precarity of OPG households in South Africa. Whilst budgetary analysis reveals the changing landscape of financing elder care at the macro level, semi-structured interviews with 100 caregivers and 100 older persons (care receivers) outline the ways in which caregivers and receivers at the micro level develop multiple strategies to enable family members to meet the basic needs of the household. The article adopts a social reproduction approach to uncover the work involved in 'financing' care and enabling care work to happen in low-income households. In contributing to scholarship from the Global South, the paper highlights the interdependence of producing resources (food, shelter, energy etc) and reproductive labour at the household level that is shaped by gendered, racialised, classed and locational divisions.

MOOSAVI, LEON* (University of Liverpool, United Kingdom)

What Does It Mean to Decolonise Research and Is It Even Possible?

There are a growing number of scholars who claim to be conducting decolonial research. But what is decolonial research and what are its complexities and limitations? This paper begins with a delineation of the most common features of decolonial research. This involves explaining its critique of traditional research, its treatment of research participants, and its views on the purpose of research. It also involves noting some of the misconceptions about decolonial research and identifying the synergies that decolonial research has with other critical research methodologies. The paper then proceeds to deploy 'decolonial reflexivity' as a tool to examine the potential complexities and limitations of decolonial research. Perhaps most significantly, this critique results in a consideration of how some research which claims to be decolonial, may not only fail to dismantle coloniality, but may even reinforce coloniality and Northerncentrism. This is accompanied by a consideration of how we can redeem decolonial research so that we do not have to abandon it entirely. It is argued that this sort of critical interrogation of decolonial research is necessary if we want decolonial research to have a greater chance of achieving its goal of dismantling coloniality. Otherwise, decolonial research may remain a false promise which does not decolonise even whilst claiming it does. Thus, it is argued that, while decolonial research is a worthwhile aspiration, it should be undertaken with cautious self-reflection so as to ensure it generates interventions that are worth celebrating rather than ones that may do more harm than good.

MORA CASTRO, ALBERT* (University of Valencia, Spain)

Intercultural Policies in Spain and Their Role in Combating Racism and Discrimination

The intercultural policy paradigm has been spreading its influence in recent years as a response to the failures associated with both multicultural and assimilationist integration models. Especially in the local context, this paradigm has inspired different social and political initiatives and has been officially adopted by 145 cities that are currently part of the Intercultural Cities Programme led by the Council of Europe. 25 of these cities are located in Spain, the second country, after Italy, with the most municipalities participating in the programme. In this country, interculturalism generally has a good reputation among most of the political and social spectrum and, over the past few years, different policies at the regional and local level, led by different political parties and social organizations, have been implemented in order to promote intercultural dialogue and create better conditions for living together in cultural diversity contexts. Nevertheless, the intercultural paradigm has also been represented as something "naïve" that do not address the real roots of ethnic and racial discrimination and is mostly focused on sharing cultural expressions and finding common ground among people with different ethnic backgrounds but also with different levels of power and social and political recognition. Through different studies carried out by the Human Rights Institute of the University of Valencia, we address this debate and the current situation of intercultural policies in Spain.

MORALES, EMMA REGINA* (ITESO, Universidad Jesuita de Guadalajara, Mexico)

Secessionary Heavens in an Urban Hell: Borders, Boundaries and the Retreat of Old and New Money from the Risks of City Life

This paper discusses the presence of extreme gated communities in Guadalajara, Mexico such as "El Cielo" (Heaven) or "Puerta de Hierro" (Iron Door). In this Mexican city, we still find some 'old money' but also new rich linked to diverse sources: everything from industry, tech, food production, to organised crime. Here, elites almost never cross key physical borders. This has its origins in the foundation of the city, in which the poor lived on the east side of the river and the rich on the west. The new borders are even more tangible now with gates, streets that are not pedestrian-friendly, and more privatised open spaces. The borders are tangible and visible. There are other borders defined by infrastructure that cross the city. For example, the presence of "La Bestia" (The Beast), the train that migrants use trying to reach the US, crosses right across the city; many migrants remain here and never reach the US. This has resulted in unease among both elites and the middle classes and a drive for neighbour associations to propose gating historically open neighbourhoods as a strategy to avoid homeless migrants using their parks or streets. This paper considers these new design strategies and the increasing presence and class functions of physical boundaries in the new urban Mexican context.

MORALES- OLIVARES, ROMMY* (Department of Sociology, University of Barcelona, Spain)

Concept of Economic Progress: Reconstructing Collective Self-Understanding in Chile and Spain from a Comparative Sociology Perspective.

Chile and Spain both experienced massive social movements beginning in 2011, where widespread protests questioned the promises of economic progress in the context of growing inequality, social discontent, and a deepening crisis of institutional trust.

This study analyzes the controversies surrounding the notion of **economic progress** in **Chile** and **Spain** since 2011, examining how organized actors in the public sphere have transformed their understanding of economic progress in both countries. Using a **comparative sociology** approach, it explores changes in **collective self-understanding** (Wagner, 2014) in contexts marked by uncertainty about the future, fluctuating trust in economic structures, and the experience of contingency (Bourdieu, 1979; Habermas, 1999; Koselleck, 2004; Luhmann, 2007; Wagner, 2016; Beckert, 2016).

The concept of "**promissory legitimacy**" (Beckert, 2016) is key to understanding how political promises regarding the future have justified economic decisions, enabling the mobilization of social actors. However, when such promises fail to materialize, a **crisis of legitimacy** emerges (Habermas, 1973; Beckert, 2019), deeply undermining public confidence in economic progress. In both countries, since 2011, collective actors have developed a critical and oppositional consciousness toward institutions representing economic progress, leading to renewed demands for future changes.

This analysis is grounded in a **systematic review** of the literature on economic progress, offering essential conceptual tools for investigating current controversies. **Comparative sociology** allows us to assess how specific historical trajectories and institutional frameworks in Chile and Spain have shaped the emergence of these crises and demands for transformation.

This paper contributes to the field of **comparative economic sociology** by examining how, during periods of crisis, social actors in Chile and Spain have reconstructed their collective expectations of progress, exposing the widening gap between economic promises and their practical realization.

Human Dignity: Conceptual, Normative and Political Tensions in the Contemporary Context.

This research examines the conceptual, normative and political tensions of the concept of human dignity, from its historical development in social theory and its potential to express contemporary political aspirations. The analysis is motivated by the October 2019 Social Outburst in Chile, which provoked two failed constituent processes and a social, political and economic reordering. During this event, 'dignity' emerged as a central slogan and demand of social movements, challenging the political-institutional system and becoming a key normative principle of the protests. Dignity, loaded with symbolism and multiple interpretations, organised other social demands, to the point of renaming the epicentre of the demonstrations as Dignity Square, giving the slogan 'until dignity becomes customary' a determining role in the social crisis.

Following Koselleck, the paper historically characterises the concept of dignity, highlighting its various dimensions and complexities, identifying fundamental aspects and strategies for its materialisation. The analysis draws on the work of key thinkers in Western political and social thought, such as Cicero, Augustine of Hippo, John Locke, Jean-Jacques Rousseau, Mary Wollstonecraft, Immanuel Kant, Karl Marx, Hannah Arendt, Jürgen Habermas, John Rawls and Martha Nussbaum, who placed human dignity at the centre of their normative postulates.

The study also explores the tensions that the concept entails in its Western formulation, marked by the exclusion of otherness, including women, the poor and invisibilised groups. However, it is the search for its legal and institutional concretisation that has energised the contemporary debate. It is concluded that the necessary transformations should not be limited to the symbolic or merely redistributive, but should address the dynamics of social, semantic and material exclusion, and open up space for its redefinition in the face of new normative challenges.

MORANO, ALISON* (Institut des Mondes Africains, Mayotte)

Mineurs Confiés, Mineurs Non Accompagnés : Regard Ethnographique Sur Des Trajectoires Migratoires Juvéniles à Mayotte

Au cours de la dernière décennie, les enfants et adolescents migrants ont cessé d'être des figures secondaires, subordonnées à celles de parents, pour assumer un rôle de premier plan au sein des mobilités insulaires. À Mayotte, trois formes principales de migration juvénile cohabitent : le confiage à un tiers, les migrations d'accompagnement/de regroupement familial, et l'exil pour les demandeurs d'asile. Si les références produites dans le champ des migrations internationales et transnationales sont foisonnantes, d'un point de vue local, un relatif vide documentaire s'observe. Cette communication propose d'examiner la figure des mineurs non accompagnés (MNA) et/ou confiés à des tiers à Mayotte en s'intéressant à leur *agency*, leur capacité d'agir sur le monde, même lorsque celle-ci n'est pas acceptée ou reconnue par les adultes. Nous questionnerons l'articulation entre vulnérabilité et agentivité, qui apparaissent comme les deux facettes d'une même pièce : cette complémentarité dessine les contours d'un groupe vulnérabilisé par sa situation familiale et d'insécurité sociale et affective, mais qui, en réponse à ces événements, se saisit de son expérience pour se positionner en tant qu'acteur du parcours migratoire.

En nous appuyant sur des recherches menées à Mayotte depuis 2015 auprès d'enfants et d'adolescents comoriens et africains du continent, nous verrons qu'au sein de cette catégorie des mineurs migrants, deux sous-profil émergent : les volontaires et les non-volontaires, avec une variable d'âge déterminante car les premiers sont plus âgés que les seconds. À l'adolescence, certains choisissent (ou sont contraints) de quitter leur pays, parfois avec l'aide de leur famille, et se positionnent comme « enfants acteurs », au sens défini par Julie Delalande : « Un enfant est acteur quand un adulte (citoyen et/ou chercheur) reconnaît sa capacité d'agir, l'autorise à exercer sa puissance d'agir sur son environnement » (2014 : 2).

MORATO MACIEL, TADEU* (Institute of International Relations and Defense at the Federal University of Rio de Janeiro (IRID-UFRJ), Brazil)

El Nexa Entre Seguridad y Desarrollo a Partir De Las Fuerzas Armadas Brasileñas: Genealogía De Una Violencia Pacificadora

En el siglo XXI se evidenció el debate de que Brasil tendría una perspectiva diferenciada sobre la relación entre seguridad y desarrollo, en gran parte debido a la actuación de las Fuerzas Armadas Brasileñas en Haití. El objetivo de este texto es argumentar que el binomio seguridad-desarrollo construido en Brasil posee importantes emergencias precedentes, en escenarios de supuesta inestabilidad. Basándose en el análisis genealógico como referente metodológico, la hipótesis aborda la conexión entre las emergencias del nexo entre seguridad y desarrollo en Brasil y la implementación de una violencia pacificadora encabezada por las Fuerzas Armadas, que se convierte en central para la formación del ethos de esta institución. Se analizan la profesionalización militar y la construcción de una política militar intervencionista en la década de 1930, la Doctrina de Seguridad Nacional durante la Dictadura Civil-Militar, la transición hacia la democracia y el reajuste de las agendas globales de seguridad, así como la reafirmación interventora en las misiones de pacificación en la transición al siglo XXI. En cuanto a los resultados obtenidos, se sostiene que las prácticas realizadas por los militares no serían una mera repetición de prácticas, sino que poseen un principio común: el discurso de renovación de una especie de 'misión civilizatoria' que garantizaría cierto progreso (o desarrollo), sin perjudicar un determinado orden (o seguridad).

LINN, JAMES (Optimal Solutions in Healthcare and International Development, USA)*The Global Covid-19 Pandemic, Social Isolation and Mental Illness*

Mental health clinicians continue to be focused on the high prevalence of depression, substance abuse and other negative effects on persons impacted by the COVID-19 pandemic. Serious and continuing isolation, loneliness, anxiety, physical illness and grief were commonly experienced, but already marginalized groups and young people have had higher rates of impact. More

recently, we have learned that the COVID-19 causes mental disorders months after the resolution of the original sickness. This paper will discuss the impact of COVID-19 in two very different developing countries: The first is Chile which has relatively high levels of income and social and health services and the other is Mozambique which is a relatively poor country with very limited social and health services. Recommendations are made for resolving the obstacles of isolation and loneliness associated with the COVID-19 pandemic so that afflicted individuals can experience higher levels of social inclusion

Messy, Heterogeneous, and Distinct: Lived Religion in Latin America Today

The presentation explores the interaction of religion and modernity. The thesis proposed here is simple: There is an interaction between modernity and religion in Latin America, but the result has not been religion diminishment, but its transformation. The difficulty in assessing religiosity as it exists in Latin America is due in part to the continuing use of categories that were not designed for religious cultures outside the North Atlantic world. Those categories point us toward a different kind of dynamics, which in fact obscure Latin American religious dynamics. If we look at religion from Latin America and from the people who practice it, we will find a different definition and different conceptual tools for understanding the religious experience of Latin American people, and perhaps it helps us to look at religion in a different way.

MORENO-ALAMEDA, DAVID* (Complutense University of Madrid, Spain)

Quantifying Class Identity: Measurement and Predictions

Measurement of class identity, as a perception of inequality, is often conducted using closed-ended categorical questions or a 1-10 scale (as seen in surveys like the International Social Survey Programme (ISSP) and the World Values Survey (WVS)). However, studies from the Sociological Research Center of Spain (CIS) utilize spontaneously open-ended questions to assess social class identity.

This research has two main objectives. First, we will compare differences in perceptions of social class identity and subjective positioning within the social structure across different countries, using various measurement approaches. Second, we will highlight the significance of different dimensions and their categorical variables in predicting class identity, including perceptions of life trajectory (past, present, and imagined futures), ideological beliefs, status variables (educational level and occupation), and socioeconomic and sociodemographic factors.

For this purpose, we will analyze databases from the ISSP, WVS, and CIS using logistic regression models. In the specific case of the CIS databases, we can apply a multinomial model due to the open-ended nature of the variable subjective social class.

RC15-222.3MORETTI, SABRINA* (University of Urbino, Italy)
SACCHETTI, FRANCESCO (Università degli studi di Urbino, Italy)*Ensure Social and Healthcare Integration in Crisis Situations. The Case of the 2016 Earthquake in the Marche Region*

In the field of healthcare, the tendency to seek organizational models based on the integration of all social and healthcare services emerges, as demonstrated by the WHO guidelines. In the Italian healthcare system, this has led to the creation of local integration systems that involve the definition of protocols and formal relationships between centers that provide social and healthcare services.

Catastrophic events, such as earthquakes or floods, cause rapid and unexpected changes that undermine the planned structure of the inter-organizational structure. Existing network configurations must quickly adapt to the new situation.

Our work presents the results of a study involving ASUR (Azienda Sanitaria Unica Regionale) Marche in the province of Ascoli Piceno, which was hit by the 2016 earthquake, and the University of Urbino Carlo Bo, aimed at studying the evolution of the structure of the inter-organisational network linking the centres involved in providing social welfare services in the field of mental health, as a consequence of the seismic event.

The analysis was carried out using Social Network Analysis based on data from both databases and semi-structured interviews. In addition, in-depth interviews were conducted to investigate the meaning and context of social relationships within the network.

The results show that in emergency situations the network adapts and becomes denser. The evolution of the network depends both on how these external pressures are received by individual actors, and on contingent situations, such as geographical location and available resources.

MORO, GIUSEPPE* (University of Bari Aldo Moro, Italy)
CASSIBBA, ROSALINDA* (University of Bari Aldo Moro, Italy)

Evaluation, Equity and Social Justice

Evaluation can be a space for critical thinking that assumes criteria for judging public policies that are alternative to those present in neoliberal politics. In the history of evaluation, there are methodological orientations and theoretical reflections that look at the ability of evaluation to promote social justice by assuming judgment criteria that consider the interests of less privileged groups as priorities and look at the ability of the evaluated programs to promote equal access to civil liberties, human rights and opportunities.

Justice-oriented evaluation is not neutral but must take into account above all the needs and interests of those who have less power and must highlight how certain political choices lead to increasing social inequalities. This vision is particularly important in the evaluation of social and educational interventions aimed at children and adolescents where it is necessary to think of evaluation models that can listen to their voice while taking into account their specificity and fragility.

This does not only imply, formally, that all stakeholders are represented, but that the evaluation exercises a rebalancing towards those who are more likely to be overlooked in the political decision-making process and that participants are ensured at least a tendency towards equality of power.

In order for an evaluation oriented towards social justice to be carried out, it is important to reflect more on the ethics of the evaluator which should be inspired by values such as moderation, humility, social dialogue to verify whether the various actors involved in the evaluation process are inspired by values that conceive of justice differently from one's own and whether the evaluation process itself cannot lead to the development of new criteria of judgment emerging from the comparison between the different perspectives.

The Disappearance of Social Services and NGOs in Italy and Albania Treaties on Migration

The paper aims to present current research on the response of social workers and NGOs operating in Italy and Albania to the new migrants and asylum seekers reception policy signed by these two countries, a representative example of the border externalization policies implemented by EU and its member states. The study begins with an examination of the currently contentious Memorandum of Understanding that Italy and Albania signed in November 2023 and later enacted into law (No. 14 of February 21, 2024). In summary, the agreement states that the asylum applications of migrants intercepted in the Mediterranean will be processed on Albanian territory, but under Italian and European jurisdiction, and that individuals awaiting expulsion and repatriation will be detained, with an extraterritorial application of administrative detention. The project provides for the transfer of the migrants in different types of reception centres in an area in northern Albania to allow Italy to detain migrants deemed 'non-vulnerable' there. This procedure therefore does not provide for the application of all the social policies foreseen in the framework of reception in Europe. An analysis of the EU's increasingly lauded action plan, which aims to "strengthen and accelerate asylum and registration procedures," shows that the text speaks only of strictly medical assistance for migrants and never of broader social assistance, nor of its main actors, social workers, while there is an unclear call-out of NGOs. Our research continues with an investigation on whether and how Italian and Albanian social workers and NGOs are reacting to this new experience. The research involves analysis of the Italian and Albanian social workers professional orders and NGOs websites and analysis of official stances, as well as interviews with qualified witnesses and individual social workers to understand whether or not the views of individual actors differ from official stances.

MORRIS, ALAN* (University of Technology Sydney, Australia)
Housing and Inequality in Australia

In Australia housing is playing a central role in accentuating and perpetuating inequality. This presentation, drawing on primary and secondary data, discusses the various ways in which housing tenure in Australia contributes to wealth and income inequality. It argues that a neoliberal housing policy framework and accompanying financialisation of housing have had a range of inter-related consequences: a dramatic increase in house prices, the neglect of social housing and a deepening wealth and income divide based on housing tenure. With respect to wealth, the key divide is between outright homeowners versus low-income private renters and low-income households in mortgage stress. The wealth of outright homeowners has grown substantially in recent decades and many have been able to acquire a holiday home and / or investment properties thereby intensifying the wealth divide. Approximately a third of Australian households are now locked out of home ownership for an extended period or even lifelong. Housing tenure status also has an impact on the disposable income of households. For example, low-income outright homeowners are invariably in a far better position with respect to disposable income than their counterparts who have large mortgages or are private renters.

MORRIS, ALAN* (University of Technology Sydney, Australia)
The Impacts of Eviction on Private Renters in Two Australian States

Around one in four Australian households are reliant on the lightly regulated private rental sector for their accommodation. The light regulation means that landlords are able to increase the rent to whatever the market can tolerate and can evict tenants for little or no reason. Although precise data is not available, organisations assisting tenants have reported that evictions in the current tight rental market are a common phenomenon. Despite its prevalence, there has been scant research on evictions in Australia in the private rental sector. To better understand the impacts of eviction I draw on 53 interviews with tenants in two states, New South Wales and Queensland. The article examines the impacts of both the threat of eviction and actual eviction on private renters. Judith Butler's and Isabell Lorey's precarity framework is used to examine the consequences. Several interrelated impacts are discussed – the effects on the mental health of tenants, the financial implications, the reluctance to complain or ask for maintenance, the loss of support networks and sense of home and decline in accommodation quality.

(Re)Socialisation Au Travail De Professionnel. Les Formées à l'Étranger Lors De Stages De Requalification Au Québec En Enseignement, En Physiothérapie Et En Droit

Au Québec, les professionnels formés à l'étranger (PFÉ) sont nombreux à s'inscrire à des programmes universitaires de requalification afin de poursuivre leur carrière, surtout dans les domaines de l'enseignement, de la physiothérapie et du droit. Afin de pouvoir travailler dans la province canadienne, ils doivent faire des cours et des stages. Scolarisés et ayant cumulé de l'expérience dans un autre contexte national, ils éprouvent particulièrement leurs compétences en stage, lesquelles ne sont pas toujours ajustées aux enjeux et aux attentes partagées de leur nouvelle écologie professionnelle. Adossant notre travail à une théorie sociale de l'apprentissage qui éclaire la manière dont de nouveaux venus sont socialisés aux conventions d'une communauté de pratique (Wenger, 2005), nous avons conduit une recherche ayant documenté 1) en quoi les contextes de stage constituent des défis d'acculturation pour des PFÉ dans ces trois domaines et 2) quelles sont les opportunités de (re)socialisation au travail qui se présentent à eux en interagissant avec leurs partenaires de travail (Conseil de recherche en sciences humaines du Canada, 2021-2024). Des 31 participants à l'étude, 11 étaient des PFÉ originaires d'Afrique, d'Amérique du Sud et d'Europe, 11 des superviseurs de stage et 9 des enseignants au sein d'un programme

universitaire de requalification. Ils ont été invités à participer à des entretiens individuels et collectifs pour renseigner les particularités des stages, les défis rencontrés par les PFÉ (apprentissage, incidents) et les stratégies d'accompagnement. Les résultats obtenus mettent en relief les différences de cultures professionnelles entre le Québec et leur pays d'origine. Également, ils éclairent des opportunités de (re)socialisation à la profession, découvertes en stage par les PFÉ au contact de leurs partenaires de travail, en particulier en lien avec les stratégies d'accompagnement de leur superviseur.

Savoir De Référence Et Rapport De Placés Pour Des Professionnel.les Formés à L'Étranger: Trois Professions à L'Étude En Contexte Québécois

En raison des politiques d'immigration au Québec et de l'importante pénurie de main-d'œuvre dans différents secteurs de l'économie, les professionnel.les formés à l'étranger (PFÉ) sont de plus en plus nombreux à s'inscrire à des programmes universitaires de requalification afin de poursuivre leur carrière dans cette province canadienne. Leur formation initiale et leurs expériences ne sont pas toujours ajustées aux attentes des milieux au sein desquels ils doivent faire des stages obligatoires menant à l'autorisation de travailler au Québec, en raison de référents professionnels distincts. Nous adossant à une sociologie des groupes professionnels (Demazière et Gadéa, 2009), nous avons conduit une enquête dans les disciplines où ils sont les plus nombreux à être inscrits dans les programmes universitaires québécois (Conseil de recherche en sciences humaines du Canada, 2021-2024) : le droit, l'enseignement et la physiothérapie. 31 entretiens individuels (2 h) ont été tenus en 2022 et 2023, auprès de 10 personnes du domaine du droit, 11 de l'enseignement et 10 de la physiothérapie. Nous avons aussi réalisé 6 entretiens collectifs (3 h). Plus spécifiquement, 11 PFÉ ont été interviewés (originaires d'Afrique, d'Amérique du Sud et d'Europe), de même que 11 superviseur.es de stage et 9 enseignant.es de cours de formation pratique. Les entretiens visaient à documenter les enjeux des stages dans chaque discipline qui se posent en défis d'acculturation pour les PFÉ. Les résultats exposent la manière dont leurs interactions en milieux professionnels, notamment avec leurs superviseur.ses de stage, sont régulatrices de leur activité professionnelle par rapport à deux enjeux cruciaux : les savoirs de référence pour l'action professionnelle et le rapport de places. Ils nous conduisent à discuter des rapports de pouvoir qui s'exercent entre les cultures professionnelles concernées.

A Feminist Digital Practice on Trust and Care: The Case of Ageing Migrant Caregivers in Italy

This study contributes to feminist research by emphasizing the importance of care as an ethical framework in social research, particularly when working with vulnerable populations such as older migrant women caregivers. Traditional academic research often overlooks the well-being of participants, leading to potential biases and extractive practices. This study seeks to address these concerns by fostering meaningful, reciprocal relationships between researchers and participants, thus advancing a feminist ethic of care. Based on 60 in-depth interviews with caregivers from diverse cultural backgrounds, the research highlights the role of digital technology as a tool for ethical engagement. Platforms like Facebook and WhatsApp proved invaluable in facilitating ongoing communication, care exchanges, and trust-building throughout the research process. These technologies not only bridged generational and cultural gaps but also challenged the assumption that older individuals are less adept with digital tools. Instead, the study demonstrates how these platforms can enhance the ethical conduct of research by creating non-intrusive yet effective ways of maintaining relationships. The relevance of this research lies in its feminist approach to care as an ethical practice in research, arguing that relationships with participants should adapt to their specific needs and contexts. By integrating care into research methodologies, the study advocates for more responsible, respectful, and participant-centered approaches that not only generate knowledge but also nurture genuine connections.

MOSCHETTA, LUCREZIA ALICE* (University of Padua, Italy)

Who Takes Care of Old Migrant Caregivers? the Challenges of Ageing in Italy

This research explores the complex relationship between migration, aging, and care in Italy, a country facing the concurrent challenges of a rapidly aging population, a weak welfare system, and a growing migrant population. The study investigates these issues through an intersectional lens, focusing on the experiences of aging migrant women working as caregivers and their future plans. By doing so, it addresses a critical gap in the Italian discourse on the migration-care-aging nexus. The research draws on 60 in-depth interviews with caregivers aged 60 and older, residing in Padua, Venice, Bologna, Modena, and Naples. Participants come from diverse backgrounds, including Ukraine, Moldova, the Philippines, and sub-Saharan Africa, offering varying perspectives on aging, caregiving, and retirement. The findings indicate that cultural and national contexts shape differing conceptions of aging, care and retirement, moving beyond Eurocentric paradigms traditionally considered in this discourse. Many migrant caregivers face difficulties in retiring, as it often results in financial insecurity. Consequently, continued work remains a necessity for many, even in later life. The study also highlights the paradoxical situation in which these women, while providing care to elderly Italians, are distanced from their own families and support systems. In this context, diaspora networks emerge as crucial sources of emotional and practical support. This research highlights the need for more attention to the specific needs and challenges faced by aging migrant caregivers in Italy.

Reconnecting to (one's own-)Nature through Consultations with Horses: An Ethnographic Study of Neo-Shamanism

Recent ecological concerns have triggered renewed interest for spirituality related to nature, namely neo-Pagan and neo-Shamanic practices. Most of these practices prone a reconnection with primary elements (water, earth, air, fire) as well as with fauna and flora and see the development and healing of the self as the first step toward this reconnection. While shamanism has traditionally intertwined human beings, animals and supernatural beings, some forms of neo-Shamanism reactivate and appropriate these relationships to animals as new allies for individuals' self-development. In this communication, I present the fieldwork my team and I have carried on with a shamanic therapist who draws on Michael Harner's transcultural shamanism to offer consultations with horses as a form of spiritual accompaniment. I show how, following Jungian notions of archetypes, the connection between animal and human being builds on the perception of a common experience of subjugation and quest for freedom that makes the project of rehabilitating the self go through the rehabilitation of animals. Drawing on new trends for interspecies studies as well as Animal Studies that give importance to animal experience and agency, I discuss the roles, status and conditions upon which mutual healing can occur and explore how this compares to traditional shamanism's relationship to animals.

Online Violence As Political Action: A Reflection on Hate Speech

The widespread diffusion of social media and, more generally, of the web has often been seen as an important advancement in terms of individual freedoms by their ability to promote digital democracy. On the one hand, digital platforms create in users the illusory belief that they can express any comment or point of view, contributing to the construction of discourses, and debates, and enhancing forms of political participation. On the other hand, however - in the name of alleged freedom of opinion - social networks increasingly become arenas where people, shielded by anonymity, attack and even persecute with impunity. The behaviour of these keyboard warriors or online *haters* can be traced back to the encouragement of hatred, discrimination, or hostility towards individuals or members of minorities motivated by prejudice against them, as occurs in cases of violence perpetrated against immigrants, disabled people, or LGBTQ+ people. Far from being an isolated and spontaneous practice, hate speech increasingly ends up becoming a real political action that, although virtual, ends up producing important real effects on people's lives. A practice that is functional to political debate is a resource that parties, especially those openly populist, increasingly draw on to gain consensus and build an enemy to fight. The essay intends to propose a reflection on these practices - highlighting their political significance- and analyse them in the light of specific cases in the Italian reality.

The Representation of "Gender Ideology": The Beginning of a New Political Ideology?

Beside the advancement of LGBTQ+ rights in all countries with mature democracies, we have witnessed an exponential growth of conservative movements that present themselves as custodians of traditional, if not "natural," sexuality.

Thus, gender becomes an interesting political field in which an increasingly bitter clash occurs between radical right-wing movements, often of populist origin, and LGBTQ+ individuals. Through the creation of a discursive repertoire and political actions opposing the rights of women and LGBTQ+ communities—accused of promoting "gender ideology" or "gender theory"—we are also seeing the emergence of new coalitions and intersections in Italy. These efforts aim to develop strategies focused on constructing an enemy, embodied in the constellation of movements, activists, researchers, and all those who advocate for legal gender equality. These various and complex mobilizations are internationally known as anti-gender campaigns.

Based on a series of studies conducted in Italy by the author in recent years, this paper offers a theoretical reflection on the ability of radical right political forces to frame the political demands of sexual minorities under the ambiguous label of "gender ideology." In the Italian case, this alleged ideology is described as a direct consequence of the individualism of Western societies, increasingly affected by secularism and relativism, as well as by misconceptions about feminism. Through campaigns that include street demonstrations, petitions, signature collections, lobbying activities, alliances with political parties, and opposition to gender education in schools, these movements not only demonstrate their ability to influence the political agenda but go even further. The imposition of traditional values of family, nature, and biology as insurmountable moral standards prevents genuine democratic debate. Thus, by constructing the notion of "gender ideology," the goal seems to be the creation of a "grand narrative," aimed at promoting a profoundly conservative vision, if not even imposing a new political ideology.

MOSTAFA, SALMA* (Northwestern University, USA)

Modern Pharaonism and the Deconstruction of Egyptian National Identity

Egyptians presently find themselves at a critical geographic, economic, and sociopolitical juncture that is played out discursively in responses to border politics, migration, dispossession, and economic crisis. Studies of Egyptian nationalism across decades and in recent years have emphasized the impact of national identity formation through militarism, popular revolution, and anti-colonialism on the production of modern citizenship narratives. At the same time, recent decades have seen different configurations of Egyptian nationalism through the multi-dimensional discourse of Pharaonism, an ideology that draws from European Egyptology, Egyptian militarism, and the various conflicts that arise from frictions between culture, religion, and regional politics. These arguments can be recalled and modified to describe more recent narratives of citizenship and belonging that center ancient and historic claims to land, especially in the context of nationalist responses to refugees and migrants arriving in Egypt from neighboring countries (Sudan, Palestine, Somalia, Syria, and Eritrea as main examples). Such narratives come at a point of great material and political uncertainty in Egypt, and wherein claims to land are repeatedly and often violently contested by the Egyptian state. A question arises: how is the Egyptian media and state's framing of the so-called refugee crisis co-constitutive of modern Egyptian nationalist citizenship, and how is it linked with Pharaonism as a nationalist ideology that pulls from a complicated collective memory of the land and its imagined histories? I explore this by analyzing data from news articles, online posts, and interviews with individuals who work with migrants and refugees in Egypt, applying frame analysis as the primary framework for understanding how fraught histories and their associated memories can lead to discursive battlefields where modern citizens of an "ancient land" play out their existential uncertainties, which may lead to scapegoating vulnerable populations to manage these conflicts.

Exclusion and Inequality in Late Working Life in Europe

The impact of demographic ageing on the labour market is becoming more pronounced' (EC 2020b: 15), while digitalisation and the green transition are causing shifts in production and industry structures (Eurofound 2023; NCM 2020). Older workers are increasingly expected to remain in the labour force, not only to support public budgets in the pension system, but also to meet the demand for skilled labour in the market. However, none of these trends in themselves will bring specific benefits to older workers. Instead, increases in working life expectancy are not uniform, and heterogeneous shifts in work and employment will create winners and losers. They can exacerbate existing problems of labour market inequality and risks of exclusion, and threaten the productivity and resilience of European societies and economies.

Based on nine different projects, focusing on inequality and exclusion risks in extended late working life and identifying preventive policies in a comparative perspective, the results of the EIWO research programme show how job loss, health interruptions, care responsibilities and unwanted labour market exits, combined with low chances of re-entry, are key drivers of inequality and social exclusion in general and economic exclusion in particular. EIWO also shows how sectoral policies and company practices can contribute to inefficiency and inequality - or have the opposite effect. The promotion of lifelong learning and age integration is discussed as a policy option to address the problems of inequality and exclusion risks in late working life.

From Models to Logics: A Critical Lens for Understanding Conflicting Perspectives on Madness and Mental Distress in Community Mental Health Services

A diverse range of explanatory models for mental distress (including biomedical and social perspectives) are utilised within community mental health services. This has led to enduring tensions and conflicts amongst practitioners and service users over ways of understanding distress. Drawing on an empirical study (Moth, 2022), this paper aims to theorise the social and political forces, collectivities and interests anchoring these contested knowledge claims, and examine how socio-political processes associated with contemporary neoliberal policy agendas are reshaping the ways that explanatory models are articulated and acted upon within this setting.

The paper addresses these aims in two stages. The first is to extend the framework of emergentist Marxism (EM), a form of critical realist morphogenetic approach, by drawing on recent conceptual work on

subsumption, sedimentation and temporality. The second is to apply this temporalised EM framework to the empirical findings of the study in order to identify the situational logics and associated directional tendencies (Archer, 1995) shaping knowledge and practice within community mental health services. Two such tendencies, 'biomedical residualism' and 'ethico-political professionalism', will be identified and their role in enabling and/or constraining various conceptualisations of, and responses to, mental distress by practitioners and service users will be illustrated.

Drawing on this framework, the paper will conclude that there is a need to move beyond a reductionist focus on the 'models' with which particular professionals and service users identify in community mental health services. Instead, it will advocate a 'logics' approach which offers a more contextually situated understanding of what professionals and service users think, articulate and do within this service setting, recognising how interactions between concepts, contexts, interests and actions shape everyday experiences, practices, conflicts and processes of change within this setting.

MOTIMELE MOTIMELE, MOSIBUDI HELLEN* (University of the Free State, South Africa)

"What to Teach the Native?": A Provocation for the South African Black Public Humanities

Taking to task the onto-epistemological aspects of coloniality as they find expression in University curriculums, this paper considers the different strategies available to black creatives and intellectuals to disrupt dehumanizing pedagogical practices premised on an anti-black, Euro-American worldview. Disrupting dominant economic narratives on South African students call to decolonize the university, this paper takes seriously the curriculum as a site of subject formation and epistemic warfare in which black students are demanding a theory and praxis which affirms their legibility and emancipatory aspirations. In what ways can the contemporary, 'post-democratic' curriculum be seen as an extension of that agreed upon at the South African Commission of Native Affairs in 1903? Put differently, to what extent have

black intellectuals been successful in creating the space for an emancipatory political imagination within their classrooms and course outlines? At the intersection of Soudien's 'What to teach the native?', Woodson's 'Mis-education of the Negro', Harney and Moten's 'Undercommons' and students' claims of intellectual alienation in the classroom is a serious claim of the impossibility of restructuring western educational institutions in ways that betray their racist, capitalist foundations. If indeed the 2015 student movement created a potential moment of epistemic rupture, how do weaponise pedagogic tools to harness the moment into new educational practices grounded in a commitment towards creating the space for new epistemic paradigms that affirm black life, love, thought and existence?

We Are Fed up! Bridging Rural-Urban Divides for Agrarian and Food Change in Germany

Since 2011, the street protest "Wir haben es satt!" (We are fed up!) has demanded food and agrarian change in Germany. Organized by a coalition of peasant and organic farmers, environmentalist and human rights movements, and development organizations, it bridges important divides in agri-food politics, not least the rural-urban one. Drawing on participant observation, interviews with leaders, documents and visual materials, this article reconstructs the relationship between state and society at the core of these protests, analyzing achievements; areas of conflict; the incorporation of food justice, gender and racial justice agendas; and the challenge of broadening its agrarian basis while keeping a distance from right-wing populism. Beyond the food and agrarian system, the coalition's alliances with new organizations could expand its impact to issues like climate change, racism, sexism, and right-wing populism. Although structural inequalities and other challenges will not be solved through agrarian policies alone, these alliances can aid in the demand for a stronger democracy and a fairer society. Finally, as seen here, in order for agrarian-urban coalitions to have a progressive political impact, they must not only mobilize the working classes but also address other axis of inequality and engage, among others, with racial justice, decolonial justice, and gender justice.

MOTTA VIVIAN, MARIANA* (Freie Universität Berlin, Germany)

Crisis and Future in Contemporary Sociological Discourse: Theoretical Approaches, Limitations and Potentialities

The present work addresses narratives of crisis diagnosis in contemporary social sciences with a focus on their discourse on the future. It starts from the understanding that, through the production of interpretations of the present, sociological narrative is continuously involved in articulating claims about the past and future of societies, thus being able to outline the most diverse aspirations and anticipations within social groups. This allows one to think of sociology itself as a future-oriented practice, which in contexts of crisis seems to gain an increased relevance. Though "crisis" appears as a disputed concept in the field of social sciences, there seems to be no doubt that we are currently living in troublesome times. At least since the events of 2007-2008 in the financial markets, the idea of a present in crisis has spread across diagnoses of different spheres of social life, appearing in such readings both in specific (e.g., "economic crisis", "environmental crisis", "democracy crisis", etc.) and in all-encompassing terms (e.g., "multiple crises", "entangled crises", "global crises", etc.). But what futures can emerge out of a crisis diagnosis? This is the question on which this work concentrates, and it does so through the discussion of the interrelation between both concepts within different traditions of thought in contemporary social theory. In order to substantiate the debate, the Brazilian case is presented as an example, as diverse sociological readings of a democracy crisis have produced different images of the future and ways of relating to it as well.

Performance, Compensation, or Disconnection? Exploring the Roles of Physical Activities in Academic Stress Management

This presentation examines the relationship between work-related stress management and physical activities in academia. The research draws on a well-being survey conducted across six Quebec universities, incorporating quantitative data collected in 2021-2022 from 231 professors and 113 lecturers, along with qualitative interviews with 13 university Chairs.

Physical exercise emerged as the most frequently reported coping strategy among professors and lecturers to enhance their well-being. However, the frequency of participation in these activities does not appear to be strongly associated with the most favorable well-being outcomes. While engaging in physical activities is important for managing stress in the short term, it does not seem to provide lasting relief from the negative impacts of unmet needs for justice in the workplace.

The qualitative insights from university Chairs reveal three distinct ways of justifying the role of physical activities in managing excessive workloads. The first frames physical activity as an extension of the performance mindset, perpetuating the same emphasis on achievement that characterizes the workplace. The second views it as a form of compensation, offering a counterbalance to the intellectual and indoor nature of academic work by prioritizing manual and outdoor activities. The third emphasizes the importance of cultivating relationships with close ones, aiming to foster emotional connection.

This study therefore calls for a more nuanced understanding of the role of physical activities in sustainably enhancing well-being. While physical activities can indeed create meaningful opportunities to disconnect from work and find moments of resonance, they may also serve as mere extensions of the performance-driven mentality, failing to address the underlying acceleration of life. These results thus emphasize the need to analyze long-term patterns of engagement and to differentiate how individuals experience these activities.

Slowing Down in Fast-Paced Services: Challenges in Academia and the Restaurant Industry

This presentation examines the tensions faced by workers in academia and the restaurant industry as they navigate the pressures of the productivity mindset prevalent in the Anthropocene and Capitalocene eras. The Slow movement promotes reducing the pace of life, with Slow Food advocating sustainable and equitable practices as an alternative to fast food, and Slow Science prioritizing depth and mindfulness over relentless productivity.

Based on field research in academia and the restaurant industry, this presentation identifies three key challenges to adopting a slower ethos in fast-paced environments.

The first challenge is ambivalence. Despite being stressed by excessive workloads and work-life balance conflicts, those I label as “overworked individuals” deeply enjoy their work. Restaurant workers take pride in pleasing customers, thrive on adrenaline, and embrace a festive lifestyle. Similarly, academics value their freedom, inspiring students, and contributing to knowledge. Internal support and respect from colleagues often buffer the negative effects of high-pressure performance.

The second challenge stems from ethical dispositions. Workers feel compelled to demonstrate resilience, driven by a moral order that values overcoming adversity. This creates a “double moral penalty”, where struggling to meet demands leads to being perceived as weak. Specific professional ethos in both sectors further constrain alternative approaches to work: academia emphasizes both performance and collegiality, generating ethical tensions, while Slow ideals in the restaurant industry remain confined to niche contexts.

The third challenge relates to strategy implementation. The Slow movement emphasizes individual actions rather than structural changes. However, personal strategies often fail to offer sustainable solutions, instead reflecting the intrusion of work into all aspects of life. Structural reforms, meanwhile, remain difficult to identify and negotiate.

This presentation sheds light on these challenges and the broader difficulties workers face in advocating for slower rhythms in environments dominated by speed and performance.

Active City Transformation in Cairo through Local Shopping: Solidarity with Displaced Communities in Gaza and the Arab World

A local shopping movement has been rising in Egypt by ordinary people, adopted by the passionate adolescents as well, as a form of solidarity with the rising number of displaced communities in Gaza and the Arab world. Abstaining from buying any products from the oppressing countries and their allies, as the world watches silently. The paper demonstrates bottom-up transformations in the features of public life in Cairo through the act of this conscious local shopping to stand with the 1.9 million people displaced in Gaza, since October 2023 -more than 85% of Gaza population according to the UN, and the one million people displaced in Lebanon since September 2024, in less than one month -according to the National authorities- surpassing the 2006 war. This local shopping movement -together with other factors like the devaluation of the Egyptian pound, and other displacements in the Arab world- has been actively changing the commercial landscape of Cairo the capital city, not only with the replacement of global mega stores with local brands but also the rise of multiple -possibly temporary- localities within the country; like Syrian, Yemeni, and Sudanese zones. The study is carried out through the case study of one of Cairo's leading local marketplaces: 'Bazarna Pop-Up Society' that is shifting people's behavior towards buying local brands, with more than 170,000 followers on social media, and shortlisted as one of the finalists in Egypt's Entrepreneur Awards, 2024. Demonstrating how it is transforming public life in Cairo, by introducing temporary activities, and attracting different crowds back to marketplaces; injecting life to different areas of Cairo. The study demonstrates a form of inclusive regeneration of Arab cities that can not only aid in adapting to upcoming calamities, but also enable cities to unite together and recover from this calamity stronger than before.

The Future of Pharmaceutical Prices: Successes and Failures of Drug Pricing Reforms

Just like 30 years ago with new HIV treatments, the steep costs of numerous medicines are grabbing the spotlight in the media. These sky-high prices are influenced by various factors, with the main culprits being the lack of competition and the increasing financialisation of pharmaceutical companies. This increase leads to growing challenges in accessibility and the sustainability of health systems, even in wealthy countries. The presence of national and international regulations can contribute to reducing price, and hence enable a larger population to benefit from medications and/or result in significant public savings. Yet, those come with trade-offs: efforts to lower pharmaceutical prices may result in reduced investments and output in research and development, or cause delays and shortages in drug availability. Additionally, choosing not to reimburse promising medicines or quantifying the value and quality of life for price determination might be politically costly. There are also trade-off regarding the basis for negotiating the prices - whether the costs of production (which are rarely very transparent) or the

value of the pharmaceuticals (which is often uncertain and speculative for innovative medications and might lead to unsustainable prices (imagine if antibiotics had been priced according to their value).

The willingness and ability of certain governments to implement regulations on pharmaceutical pricing, and the choices of regulations they make, raise fundamental questions about the future of pharmaceutical prices. What prompts or will prompt governments to undertake reforms at a specific moment and not earlier? What factors will determine the success of these reforms? What insights can we deduce from this about pharmaceutical power and the (future) state's capacity to pursue the common good?

In this paper, we present the preliminary results of a funded project asking those questions, with a preliminary analysis of the Italian and US cases - both using a qualitative methodology.

Narrative Disputes and Political-Legal Strategies on the Memorialization of the Carandiru Massacre

This paper aims to present a description of the narrative disputes and the political-legal strategies that have been constructed around the memorial spaces marked by the Carandiru Massacre, based on the understanding of collective memory as a social construction process (Ricoeur, 1999) and political struggles (Jelin, 2021). The Massacre, which occurred on October 2, 1992, at São Paulo's House of Detention, is a traumatic event that involved the deaths of at least 111 incarcerated individuals and the bodily injury of numerous survivors. As a result of this episode, accountability processes were initiated at both the national and international levels, including the publication of Report 34/00 by the Inter-American Commission on Human Rights, which determined reparative measures. Despite these determinations, the state's process of memorialization of the event is marked by disagreements and absences. In 2002, three of the detention facility's pavilions were imploded, and today it is home to the so-called “Youth Park”. The remaining pavilions were renovated and have become a library and a technical school. There is no indication that the park serves as a space for difficult memories. At the São Paulo Penitentiary Museum, located outside this park, the narrative provided by the state is that the episode of violence was a reaction to a “prisoners’ riot.” The inauguration of a Memory Space about Carandiru in 2018 marked the possibility of confronting the “riot” narrative through the exhibition of objects and letters produced by individuals imprisoned at Carandiru, but there are still controversies over the ways this collection is portrayed. Victims have organized around the “First Front of Prison Survivors” and the group “Carandiru Memories” to resist the erasure of the living memories of the massacre and demand new ways to remember and tell this story.

Contested Amazonification: Comparing Amazon Workers' Struggles in Italy and Poland

This paper examines the conditions, forms and consequences of workers' struggles at Amazon and its ecosystem of subcontractors in Poland and Italy, combining the inspirations of the power resources approach with the literature on the infrastructural power of big tech companies. The countries selected represent two traditionally considered semi-peripheral regions of Europe that differ in terms of trade union power resources and regulatory power of the state vis-à-vis platform companies, such as Amazon. Against this backdrop, two research questions are formulated: What kinds of power resources are mobilised by workers in Poland and Italy to counteract the infrastructural power of Amazon? How can we explain the similarities and differences in the forms of mobilisation (and non-mobilisation) of Amazon workers in both countries? Empirically, the paper takes advantage from secondary data, background interviews with industrial relations actors and semi-structured

interviews with workers, employers' and management in Amazon and its subcontractors (around 50 interviews in total). The analysis so far confirms two hypotheses formulated at the outset of the research. First, forms of workers' collective mobilisation are mediated but not determined by traditional trade union power resources, national institutions and employment and business practices of Amazon. Workers' innovative resistance practices continue to shape the local varieties of global 'Amazonification' even in Poland, where their overall power resources are weaker. Second, the Amazon effect is also visible in the international diffusion of some repertoires of discontent through union networks and critical media discourse, parallel to the diffusion of coercive company management practices. The latter outcome is explored with reference to the activities of the radical trade unions both in Poland and in Italy.

Housing Wealth Differentiation Among Urban Residents in China from the Perspective of Spatial Structure

Since the beginning of the 21st century, with the deepening of housing marketization and financialization, housing has surpassed income as the primary component of wealth for urban households in China, becoming a major driver of wealth growth. Using 2019 China Household Finance Survey (CHFS) data, this study examines housing wealth inequality from both "static" and "dynamic" lenses. Unlike previous research that mainly focused on institutional and market factors, this study centers on spatial structural factors, revealing the intricate relationship between geographic space and housing wealth accumulation. The findings indicate significant disparities in both housing wealth and appreciation rates across different levels of the urban hierarchy. Large cities play a critical role in housing wealth growth, functioning as "escalator regions" that offer higher investment returns and enable rapid accumulation of housing wealth. Furthermore, this study identifies two pathways driving housing wealth and appreciation. First, the degree of urban marketization significantly influences housing price growth, indirectly boosting both housing wealth and appreciation rates. Second, the development index of the housing provident fund affects the use of housing loans, thereby shaping housing wealth inequality. These results highlight space as a critical resource in housing wealth differentiation and provide deeper insights into the spatial foundations of housing wealth inequality, underscoring the significance of opportunity structures shaped by spatial context.

Beyond Economics: Evaluating Social and Environmental Impacts of New Apicultural Technology in Rwanda

Apiculture development in Africa has primarily been led by NGOs promoting supplemental income alongside crop and livestock farming. Often, little attention is given to production technology (e.g., beehive types), market dynamics (trends, consumer behavior, industry demands), and environmental factors. Innovations in agriculture provide various forms of value beyond economics, including social, cultural, political, environmental, and moral benefits. This study uses diffusion of innovation theory to examine a new social enterprise-led apicultural training model focused on conserving native bees, promoting biodiversity, and creating sustainable job opportunities for women and youth in Rwanda. The agricultural innovation is evaluated using technology attributes such as relative advantage, compatibility, complexity, trialability, and observability. Findings from this study aim to inform policymakers about the social, cultural, and environmental implications of the innovation.

FEIERSTEIN, DANIEL (Universidad Nacional De Tres De
Febrero, Argentina)

How Representations Shape the Aftermath: Reviewing the Syrian Case through Four Lenses

The way violent events are defined and conceptualized has tremendous implications for the ways in which people deal with their effects on both the individual and the societal level. Based on Daniel Feierstein's explorations concerning the implications of the four main ways in which the violent past in Argentina is described – as a war, state terrorism, crimes against humanity or genocide – this paper applies these narratives as analytical concepts to another case: The Syrian dictatorship.

Even though this case of state violence is ongoing, it is no less significant how the violent events which unfolded particularly since 2011 are conceptualized. On the contrary, it might be even more important to provide an analytical view of the advantages and disadvantages of reproducing any of these contested concepts in academia.

Similar to what Feierstein proposes in his recent work *Memories and Representations of Terror: Working Through Genocide*, this paper therefore analyzes the implications of these four different perspectives – war, state terrorism, crimes against humanity or genocide – on different areas of the Syrian case. Through each lens, we will explore:

1. How the victims are defined
2. How the perpetrators are defined
3. The meaning assigned to the state's actions and the causality implied
4. The types of analogies and comparisons each label gives rise to
5. How the social consequences of terror are evaluated
6. The (social and legal) actions proposed or assumed to be necessary for healing and/or to prevent a repetition of the terror
7. Intergenerational transmission (including mourning) and how each form of representation helps us to own the events or not

Therewith, this paper provides an initial exploration of how these representations might eventually shape an aftermath in the Syrian case.

WG11-946.1

MUCKERMANN, VERENA* (Ruhr-University Bochum, Germany)

In (Biographical) Limbo – Experiencing Ongoing Syrian State Violence in Exile

While there is already extensive literature on approaches to *transitional justice* for dealing with violent pasts, even in this established academic field, contributions from diasporas are generally underrepresented. Moreover, all these approaches require – by definition – an end to violence. Yet, for the increasing group of internationally displaced persons of protracted conflicts or ongoing dictatorships, this end is often unforeseeable, which requires new strategies to articulate and recognize their suffering.

Based on ethnographic research, narrative interviews and group discussions with Syrian refugees in Germany, this doctoral project asks how exiled Syrians deal with the impacts of ongoing collective experiences of state violence in Syria. It focuses on people who fled the direct threat of violence since 2011, but who remain displaced from their homes for (at least) as long as the violence continues. They find themselves in a complex position between the individual challenges of finding their way in a new country, dealing with past violence they suffered themselves, and the ongoing concern for those remaining exposed to state violence in Syria. This, as an ongoing phenomenon, is hard to integrate into biographical narrations or collective memories.

The data shows that when narrating their experiences, many exiled Syrians refer to living in a "limbo-state" between past individual and current collective experiences of violence. They position themselves dynamically in a temporal (past – present – future) and geographical dimension (Syria – flight – Germany), as well as between individual and collective interpretations of their experiences (myself – family/friends – population).

This paper sheds light on (1) the academically neglected phase of being caught up in limbo due to ongoing acts of collective violence, (2) its social consequences as well as (3) survivors' ways of dealing with and representing their experiences of being caught up in limbo.

"You Can Run This Whole Gamut": The Arduous Pathway to Abortion in Germany

Although access to abortion is a crucial reproductive right, in Germany, abortion is criminalised and subject to intensive regulation. It is only 'free of punishment' in the first trimester if the abortion-seeker follows a formalised process, which includes mandatory counselling and a mandatory waiting period. Our study critically examines the pathway to abortion necessitated by the current German regulations. We conducted 17 semi-structured interviews to capture views of abortion-related service providers on barriers and enablers to abortion in the federal states of Berlin and Brandenburg, applying a thematic analysis approach. Our findings point to multiple individual barriers along the pathway, but also that the complexity of the abortion pathway is itself a structural barrier. We identified 9 steps which most abortion-seekers must undergo to end an unwanted pregnancy, involving numerous different administrative and health service providers and the repeated need to communicate their pregnancy status and intention to have an abortion to these providers, exposing them to stigma, and limiting privacy. Even providers themselves were sometimes uncertain about how parts of the process worked and what they were or were not allowed to do. Our study illustrates that the pathway to abortion in Germany is in fact a state-induced barrier to a fundamental reproductive health service, and in this respect can be viewed as a form of structural violence. This underscores the need to analyse access to reproductive healthcare through sociological frameworks that expose structural injustice. It also reminds us that reproductive rights remain contested in wealthy western nations, despite their ostensibly progressive values. Our findings support existing recommendations to decriminalise abortion, which would align Germany's regulation of abortion with its international human rights commitments and with international best practice.

RC09-JS-247.5

MUELLER, GEORG* (University of Fribourg, Switzerland)

Social Clocks As Instruments for Measuring the Progress Towards the United Nations' Sustainable Development Goals

This paper presents a new methodology for monitoring the progress towards various types of policy goals. It works with an ideal schedule of goal attainments, which is represented by the shortest way from a starting point to the respective policy goal. This way it becomes possible to determine how many years a social actor is ahead or behind this ideal schedule. The related social clocks facilitate the comparison of different policy goals and social actors since time leads and lags are universal concepts. Comparisons between policy goals can be used for analysing asynchronies between different components of social development, e.g. between general democratisation and female empowerment. Similarly, comparisons between actors may be used for their categorisation: "leaders" that are ahead of the schedule, "laggards" that are behind, and "on-timers" just following the planned schedule.

A typical example of normatively binding policy goals are the Social Development Goals (SDGs) of the United Nations, which were initiated in 2012 at the international Rio+20 conference: in 17 policy-domains they define for all countries binding development goals, which are to be realised in the 15 years between the end of 2015 and 2030. We will show the usefulness of social clocks for describing the progress with regard to three of these goals: the reduction of poverty, the improvement of safely managed sanitation, and the eradication of food insecurity. Empirical analyses show, that already in 2020, Paraguay, Ecuador, and Peru were laggards with regard to poverty reduction. In principle, they could compensate this delay till the end of the planning period (2030). However, for Peru and Ecuador this seems to be unlikely due to the limited development-speed of these counties. Consequently, the paper ends with a general discussion on how social clocks can be used for early warning about the missing of targets.

RC20-JS-218.1

MUELLER, GEORG* (University of Fribourg, Switzerland)

Social Processes and Their Boundaries: Causal Versus Teleological Explanations

In general, there are two approaches for explaining a social process. The first is *teleological*: "things" happen because an actor intentionally pursues them as a goal. The second is *causal*: "things" happen because they are caused by factors of the past. Teleological explanations are typically used by historians, who try to understand processes of the past. *Ex-ante* forecasts are rarely possible with this approach. To the contrary, the causal approach is over-determined by the past and typically neglects the intentions and the "free will" of the concerned drivers.

This article attempts to unite the two mentioned approaches: Causal reasoning is used in order to explain the *impossible* results of a process. This way, the *boundaries* of possible processes are delimited by *causal* factors. However, how the resulting *space of possibilities* is used by a particular social process depends on the intentions of the concerned actors/drivers and consequently calls for *teleological* explanations.

Explaining the boundaries of a social process requires special statistical regression techniques. One of them is *quantile regression*: by an asymmetrical error-function it allows to explore the relation between independent structural variables and the best/worst results of a process. The other is *iteratively reweighted least squares*: here, the best/worst results of a process are identified by the stepwise elimination of observed processes with lower/higher performance.

As an illustration of the previous methodology, the author investigates the boundaries of authoritarian regimes, which aim at restraining political liberties. Some of their boundaries are the protests of the *national civil society*, others the sanctions of the *international community*. With the appropriate *freedom-house* indicators it is possible to assess their relative importance and to make forecasts about unlikely political changes. The use of the related possibility space by the political regime requires teleological explanations that will be presented for exemplary cases.

MUELLER-BRANDECK, MARLENE* (Berlin-Brandenburg Academy of Sciences and Humanities, Germany)

The Construction of Social Inequality in Identity Politics Semantics

This paper examines how social inequality is constructed within contemporary identity politics and how this shift can be understood in sociological terms. My study, "The Sacralization of Identity", analyzed contemporary auto(socio)biographies that address discrimination across various dimensions, including racism, sexism, and classism. Here, I focus on comparing the labor movement of the early 20th century with today's identity politics. In the early 20th century, the labor movement emphasized the capital/labor distinction, viewing capitalism as the primary source of social inequality. This distinction represented two opposing groups within the social class structure, suggesting that a revolution to dismantle capitalism would ultimately abolish social inequality. In contrast, today's identity politics fundamentally change how social inequality is understood. Rather than focusing solely on economic factors, identity politics encompass a broader range of discriminatory dimensions. They frame social inequality through the concepts of privilege and discrimination, highlighting that inequality arises from various forms of discrimination, including racism, sexism, and ableism. Individuals are seen as embodying both privileged and marginalized aspects of their identities, experiencing discrimination and privilege simultaneously. This complexity transforms the understanding of social structures, as the distinction no longer corresponds to two opposing groups but instead identifies the mechanisms of inequality production: discrimination. As a result, the privileged are no longer viewed as a clearly identifiable group. This shift refocuses the struggle against social inequality from combating a specific dominant group to encouraging individuals to take responsibility for learning and practicing non-discriminatory behavior. This analysis shows how influential the construction of social inequality is for social movements of social inequality and how important it is for sociology to observe which constructions are effective in the discourses on social inequality. Only in this way can it observe discourse mechanisms without itself becoming part of the discourses it observes.

"Doing Family or Undoing Family?" – Grandparental Care Relations Among Pakistani Transnational Families in the UK

Transnational families, characterized by geographically dispersed members who maintain strong familial bonds, are increasingly common in today's globalized world. Literature on transnational families often portrays older individuals as passive care recipients, "left behind" by adult children or family members who migrate to other countries. This narrative reinforces stereotypes of older persons as dependent and isolated. However, this research challenges that notion, arguing that older people can actively participate in transnational families by contributing to an intergenerational exchange of care.

Investigating the complex interplay of migration, care, and transnational families, this research seeks to understand how care is reimagined and reconstructed within Pakistani families residing in the UK with a specific focus on grandparents and their role in navigating caring responsibilities across their life-course, within and beyond national borders. Utilizing qualitative methods, including in-depth interviews and arts-based methods, the study - involving multiple interviews with 24 participants - addresses specific research questions related to: grandparents' negotiation of intergenerational and multidirectional care arrangements; the impact of UK migration regimes and welfare and family policies on grandparental migration and care responsibilities; and the gendered dynamics that shape these caring relationships. By also interviewing grandparents who have returned to Pakistan after visiting their families in the UK, the research provides a unique perspective on caring experiences of returned or mobile migrants. This approach helps uncover the complexities of caring in temporal and spatial contexts, contributing to a more nuanced understanding of proximate versus distant care experiences within transnational Pakistani families across the life-course.

Conflict Dynamics and Transformations: Local Community Strategy and Resilience Towards Mining Ecological Impact

The study focuses on conflict dynamic and its transformations in the mines affected areas in the field of economic, socio-cultural and ecological. Mining often causes environmental damage, such as deforestation, air and water pollution, contributing to the escalation of conflict between mining company and local community. This study identifies the adaptation and resilience strategy of local community, such as livelihood diversification, strengthening local institutions, staging protest that are essential in responding to the adverse impact of mining operation. Besides, the interaction among stakeholders such as companies, governments, civil society and public organizations often create complex network and interests that lead to prolonged tension. Although several studies show the success of multi-stakeholder cooperation, conflict still occurs in several areas, primarily when the rights of the public are not acknowledged completely. With this approach, the research aims to provide a framework for comprehensive analyses in order to understand and manage conflict sustainably. This expectation can contribute to developing a more inclusive mining policy and increase the welfare of the local community affected by mining operation.

Navigating Dignity in Social Systems: A Comparative Ethnography of Rural Denmark, France, and the United States

This paper examines how social systems in Denmark, France, and the United States shape the daily experiences of dignity and indignity for unemployed individuals in rural areas. Through a comparative ethnographic study, we explore how systemic support or neglect, at both interpersonal and policy levels, influences personal perceptions of worth, recognition, and societal inclusion. By focusing on two key dimensions—*everyday relational*

encounters with welfare institutions (such as direct interactions with social workers or volunteers) and *invisible meetings* with policy structures (such as unemployment benefits and healthcare accessibility)—this study investigates how these systems impact the everyday lives of unemployed individuals.

The paper draws from a year-long field study following the daily experiences of 5-7 unemployed individuals in each country, exploring the relational dynamics of support and neglect. In Denmark, participants describe feeling scrutinised and over-controlled by a system that mistrusts them, while in France, they express feelings of being overlooked. In the United States, the welfare system's absence, both materially and in terms of expectations, results in a sense of disconnection and societal neglect. Additionally, the study considers differences in who provides care—whether social workers, volunteers, or informal networks—and how these roles vary across the three countries.

Our research examines the intersection of social systems to shed light on broader social justice issues in the Anthropocene. It highlights how systems of support and neglect impact individual experiences of (in)dignity and society's ability to provide fair and equitable care. The chapter also explores how different welfare and healthcare models shape our understanding of justice and social support, contributing to critical sociological debates about worth, recognition, and how we live together in a time of significant societal change.

MUNIF, YASSER* (Emerson College, USA)

The Syrian Revolution: Emergent Knowledges and Declonial Praxes

The Syrian Revolution started in 2011 as a popular and democratic uprising against a totalitarian regime. The Syrian people wanted free elections, a multiparty system, and the end of the state of emergency. The revolution lasted several years before the regime was able to besiege and derail it. The initial demands for justice and democracy were slowly replaced by sectarian politics, while the revolt of dignity gradually metastasized into a civil conflict and a proxy war. This paper explores the politics and ethics of research in the context of the Syrian revolution. It examines the challenges of knowledge production in sites where violence saturates every aspect of life. An essential question revolves around the politics of the research and the mechanisms that guide it? A related dilemma for researchers of the Syrian conflict and the Arab revolts more generally is whether their priority should be to study and better understand a social phenomenon or, instead intervene in the social process. How does one determine the ethics of the research? Is neutrality possible or even desirable when the population is constantly exposed to the regime's genocidal violence? Finally, what language should one use when exploring the Syrian revolt? Should one avoid the transposition of "Western" theories of revolution and social movements to a site such as the Syrian one? Is it possible to produce research that speaks to the Syrian people and is also understandable to a "Western" audience? Or is there an epistemic abyss that separates these two sites?

Biograms, Drawings and Ethnographies As Biographical Devices: Uses, Potentialities and Limitations for the Analysis of Inequalities, Labour and Migration Trajectories in Latin America.

Qualitative biographical approaches focus on the study of processes that occur over time. Within this perspective, there is research that emphasises the analysis of different social facts, developing a socio-structural perspective; while others focus their interest on cultural interpretation and narrative identities (Rosenthal, 2004; Kamierska, 2007).

Biographical interviews are the fundamental support used by these studies to produce information. However, there are also other strategies that are valuable devices. These include biograms, biographical drawings and biographical ethnographies.

Biograms are life stories narrated by the research subjects themselves, and which are made at the specific request of the researchers (Abel, 1947).

Biographical drawings involve the social actor initially making a drawing that visually reconstructs his or her life and then making an oral narrative about the drawing (Riessman, 2008; Escin and Squire, 2013).

Biographical ethnographies relate the story to its narrator, to the group of belonging and to the socio-cultural context, and consider the person who narrates his or her story as a mirror of his or her time and environment (Poirier, Clapier-Valladon and Raybaut, 1983).

In this paper we ask ourselves about the particularities of each of these devices, their potentialities and limitations.

To this end, we present different fieldwork experiences in which we used these strategies: with Bolivian peasant women who migrated to Argentina to work in agriculture, with Colombian teachers who migrated to Argentina to pursue postgraduate studies, and with Senegalese young men who migrated to Argentina to work.

The use of the aforementioned biographical devices has allowed us to put into dialogue the construction of information that they enable in biographical research, with objects of study that differ in terms of their country of origin and social class, but which share an interest in gender issues, migratory processes and the world of work.

Artistic Gossip in the Arts: Ethnographies of Artistic Practice

How interiorized learning patterns in art school shape the way artists work? The general objective of this project is to identify the changes caused by the digital turn in the artistic practice of established professionals. Our integrated model defines artistic practice as a socio-cognitive process of a distributed, multimodal and embodied nature. Digital resources are objects of epistemic judgment, not just externalizations of knowledge. Intersubjective situations that are first precommunicative are later co-created, such as distributed attention in dance and synchronized swimming (Muntanyola-Saura, 2015). Both in scientific knowledge and in artistic knowledge, we semantically infer what is not there, in the perceptually immediate environment. Language is our tool to bridge this cognitive gap. Moreover, there is technical gossip in laboratories (Knorr-Cetina, 1999) and artistic gossip in studios (Muntanyola-Saura, 2016, Basov & Muntanyola-Saura, 2024). Our hypothesis is that digitalization shapes the communicative modalities and epistemic objects of the artistic process, thus modifying artistic gossip. Methodologically, we compare the discourse and practices of photographers, architects, film editors, designers, choreographers and musical composers, recognized in their field and linked to artistic schools, from two different generations, one educated analogically, the other digitally. Ethnographic filming and observation focus on the reconstruction of the artistic workflow, while Social Network Analysis, interviews and focus groups capture how new meanings emerge. Initial results show how we can pragmatically and relationally explain what really happens in the black box of the artistic process in conceptualization, execution, and evaluation. The detailed analysis of the use of technology and materials allows us to understand moments of coordination and creative projection. The digital turn constitutes a process of institutionalization of specific patterns of artistic gossip. Artistic gossip is made of shared vocabularies, counterfactuals, and metaphors in conversation.

Unequal Access to Homeownership and Cumulative Disadvantage in Japan

Housing is an essential pillar of economic security throughout one's life course in Asset-based welfare states in Europe. Therefore, married women's labor force participation and shared home ownership have drastically increased. In contrast, the comparative study between the UK and Japan in 2004 revealed that Japanese women's housing equity has been less prevalent, and married women would finally obtain homeownership upon the death of a partner. Using the Japanese Life course Panel Survey by Institute of Social Science, the University of Tokyo, we examine the factors associated with housing equity. We found that 15 percent of married women own property. Our analysis shows that income and educational level influences their housing equity. The probability that women would negotiate with their husbands for shared homeownership is increased by having higher income or higher education, which improves women's bargaining power. In addition to this, gender attitude has a significant effect. Despite all this, the majority of women in Japan do not have homeownership. The cause of inequality is associated with civil law, the gender wage gap, and the housing finance system. The Japanese male breadwinner model still serves to justify unequal access to women's homeownership. Furthermore, the potential conflicts may be masked by family ideology. The late transition to homeownership is risky for their financial security in later life.

ART Policies and Regulations in Japan: Discourse Analysis of Religious, Cultural and Ethical Values in the Regulatory Landscape

This presentation examines the historical evolution of policies and regulations regarding ART (Assisted Reproductive Technology) in Japan over the past 40 years. Following the successful implementation of in vitro fertilization (IVF) in 1984, discussions on legal frameworks began, but a formal law was not enacted until December 2020. Despite extensive debate, this law notably excludes regulations on surrogacy and the guarantee of a child's "right to know their origins," highlighting the urgent need for amendments. Surrogacy has been prohibited in principle by the guidelines of the Japan Society of Obstetrics and Gynecology (JSOG), yet some politicians within the ruling Liberal Democratic Party are currently drafting proposals for its legalization.

The study explores the values that have shaped this regulatory landscape through an analysis of historical and societal debates. It focuses on the ethical considerations of physicians involved in drafting the guidelines, discussions within the academic community, policy decision-making processes, and media portrayals of related issues. While Japan is often perceived as lacking strong religious values, societal "common sense" is significantly influenced by Buddhism and Shinto, which shape these debates. Thus, this research analyzes how religious, cultural, and historical values are reflected in the policymaking and regulatory formulation concerning assisted reproductive technologies in Japan. Materials for analysis include ethical guidelines from JSOG, laws, ministerial ordinances, meeting minutes, interviews with representatives from obstetrics and gynecology societies, records from the Science Council of Japan, Diet proceedings, and newspaper articles. Methods employed are interviews and discourse analysis.

The findings reveal that religious patriarchal values, modeling heterosexual couples with children, intersect with Western-derived bioethical values, shaping ART-related regulations and policies. Session participants will be encouraged to compare Japan's unique characteristics with cases from other regions influenced by different religious values.

Stemmed — How Women's Scientific Careers Have Been Thwarted, and What Can Be Done about It

This presentation concerns the results of a qualitative study of 40 women in science, in the context of a broader quantitative survey of intimidation and harassment of scientists, including women scientists. The study includes examination of culture, voice, class and the domestic sphere as they affect women scientists, and (from the survey as well as the interviews) analysis of the patterns, forms and effects of harassment of women scientists. It addresses such questions as: What are the existing barriers that must be overcome? What do women scientists need at home, and at work? Is it all about having superior individual qualities? What can the science institutes (such as universities) do for women scientists? We observed how male scientists: reinforce power; benefit from a gender wage gap; disproportionately reap rewards and get promoted; and avoid the double jeopardy of race and gender. We also investigated a little-explored dimension – the class barrier. We assess whether science institutes can help increase women scientists' representation, including by: funding awards and granting opportunities; catering for parental needs; being more flexible; promoting women at all levels; promoting female leadership; mentoring; confronting racism; agitating the state to get back adequate funding; and perhaps most innovatively by establishing 'fairness guarantee units', the nature and function of which we outline.

Luxury Condos and the Role of Amenity Spaces in Processes of Disconnection

Over the past 20 years, Toronto has seen a consolidation of wealthy neighbourhoods in the inner city facilitated by the condensation of selective pockets of the city (Lehrer & Wieditz, 2009). Throughout these processes, the common areas and amenity spaces have continuously shifted to satisfy the needs and wants of investors and wealth elites looking to purchase a high-rise home. From hotel-style concierge services, to decked-out gyms, yoga rooms, and pool-side cabanas, amenities have taken on a 'resort-like' quality with an emphasis on lifestyle over community.

This paper will look to examine the impact that amenity and common spaces of condominiums in Toronto have on the disconnection of residents from the wider city. By conducting interviews with residents, concierge employees, and property managers of 30 buildings in the Toronto area, we hope to gain a deeper understanding of the ways in which residents interact with their high-rise neighbours, neighbourhood and the wider city. We will also look at the role of amenity and common spaces in physically bounding the social interactions of residents through internally-hosted functions and events. It is assumed that this research will contribute to a better understanding of the atomization and individuation that occurs in urban centres through the form of the high-rise building. By gaining a clearer understanding of residents' views on political action within and around their space, and their ability to (dis)engage from their surroundings, we hope to provide a better understanding of the role amenity and common spaces play in the interactions taking place in today's cities.

Exploring the Impact of Demographic Factors on Digital Access and Competence: A Cross-Sectional Study

This study investigates the relationship between demographic and socioeconomic factors (gender, age, education, income, employment status, field of work, device type, and religion) and two critical dimensions of digital inclusion: **Digital Access** and **Digital Competence**. Using survey data, we explore how these variables influence individuals' ability to access digital resources and develop competence in using digital tools. The study hypothesizes that younger, more educated, and higher-income individuals will exhibit greater digital access and competence. The findings of this cross-sectional study will contribute to the understanding of digital inequalities and offer insights for developing targeted interventions to promote digital literacy and inclusion across different population groups. This research will be presented in the context of digital capital frameworks and aims to inform future digital equity policies.

Grounding Orality and Indigenous Epistemologies: Interpreting Bosco Mulwa's Song "Kithio Kya Mukamba" through Decolonial Lens

Indigenous African epistemologies, cultures, and languages embody religious sensibilities through intricate, provocative, and pluralistic expressions captured by orality as a genre. Orality is rooted at the intersection of land, ancestors, and communal life. These epistemologies offer a rich tapestry of knowledge transmitted through oral traditions contested as new ways of knowing and knowledge production. Oral genres such as storytelling, proverbs, chants, and songs serve as vehicles for expressing complex religious and philosophical ideas. These reflect a dynamic interplay between the sacred, the lived experiences, and the cultural contexts of African societies. This paper will analyze Bosco Mulwa's song "Kithio Kya Mukamba kyandie naku" ("Where did Kamba culture disappear to?") [1] to explore how Indigenous African orality encapsulates the multifaceted nature of religious sensibilities, highlighting its capacity to convey diverse and evolving spiritual insights while preserving communities' culture and language. Descriptive analysis based on decolonial theories will ground the interplay between oral traditions and indigenous knowledge systems. The paper underscores the significance of orality in preserving and conveying African religious thoughts

embedded in the song's performance. I argue that African orality as a grounded methodology provides a rich and nuanced approach to knowledge production and preservation transgenerationally. With the centrality of oral traditions and integration into academic research, scholars globally can gain deeper insights into divergent cultural, social, and religious practices, thus preserving their identity, integrity, and relevance in knowledge production.

Blurring Lines: Youth Development, Colonization and Climate Change

This presentation will explore how climate change has affected Youth Agriculture Cooperatives (YAC) in Palestine; and the measures young people are taking towards adaptation and transformation. To do so, it is important to understand young people's lived experience and understanding of their context. Challenges and opportunities facing YAC can be understood only through the analysis of the intersectionality between policies of colonisation, land grabs, the restrictions in access to natural resources and the social structures that exclude young people in the State of Palestine. This paper seeks to situate how young people respond to climate change within their context, and how it affects their pursuit of a better life. The chapter will look at the lived experience of young people as they interact with their environment within a setting of marginalisation, as youth and as farmers.

Building the Narrative of Being

In this paper I will explore the role of academia, especially sociology, building and writing the narrative of people living a genocidal war. This will focus on few initiatives conducted during the war, but mostly will look into what it means to collect a narrative of genocide under settler colonialism. Writing people narrative has always been essential for building the memory and healing of communities living wars and genocide. It has been seen as part of the healing process. As the Palestinian society is facing a placiocide and a sociocide, the narrative provided will try to reshape the connection to a place, culture, and the people living it.

Can CSOs Evaluative Practices Take the Form of Mutual Learning?

In 2023, the OECD defined evaluation in international development cooperation as a process of determining the value or significance of an intervention by analysing the following 6 criteria: relevance, coherence, effectiveness, efficiency, impact and sustainability.

The literature highlights two main dimensions of evaluation: (1) accountability and (2) learning. The first one responds to the need to account for what has been done and how resources have been used; the second promotes reflexivity, aimed at understanding the successes and failures of an intervention.

The theme of learning is also found in the concept of mutual learning (ML), which has emerged in the field of development cooperation since the 2000s. Recent research has theoretically defined ML and developed a construct to detect its presence in social reality.

This contribution explores the relationship between evaluation and ML, seeking to answer the following question: whether and how the evaluation practices of CSOs active in the field of development cooperation can take the form of ML, i.e. an exchange of resources that leads to mutual learning processes between the various stakeholders.

Through semi-structured interviews with professionals involved in project evaluation in some Italian CSOs, the most common evaluation practices will be identified, and an attempt will be made to detect the possible presence of ML in them. Finally, based on the data collected, an effort will be made to construct a summary ML index.

Exploring the relationship between evaluation practices and ML can enable the international development cooperation to design increasingly democratic and sustainable initiatives to contribute to social justice in countries of the Global South.

Labour Market Participation of Muslim Women in Germany and the Hijab

Labour market participation of Muslim women in Germany is comparatively low. Studies suggest that this applies in particular to Muslim women wearing a hijab. Against this background, we investigate the circumstances that make the hijab a critical factor in Muslim women's labour market participation, and how Muslim women accommodate to the expectations in their working environments.

At least three explanations exist for this phenomenon. The first is an intrinsic one, referring to Muslim women's attitudes. In Western societies, women wearing the hijab are expected to support traditional gender roles and have little interest to be part of the labour force. The second refers to structural pre-conditions of the labour market itself: getting access to the workforce heavily depends on women's human capital and their family situation. The third is a systemic one, emphasising the role of discrimination that prevent Muslim women to become part of the labour force.

Having this in mind, we focus on four research questions:

- Does the labour market participation differ between Muslim women with and without hijab, even when taking differences in their human capital resources and in their family situations into account?

- Does the labour force participation rate in their country of origin play a role for Muslim immigrant women's partaking in the German labour market? Do Muslim immigrant women transfer these cultural norms to their daughters born in Germany?

- Do perceptions of discriminatory practices relate to the labour force participation of Muslim women in Germany?

- Do expectations of labour market discrimination influence the decision to wear a hijab?

For analysing these questions, we rely on data of the survey "Muslim life in Germany 2022", containing 1,442 interviews with Muslim women from 23 predominantly Muslim countries.

Politique Éducative Inclusive Au Maroc Analyse De L'Expérience Scolaire Des Élèves En Situation De Handicap Au Cycle Secondaire Cas De L'Aref Fès-Meknès

Afin d'atteindre les objectifs de développement durable à l'horizon 2030, notamment le quatrième objectif, le Maroc devait reconsidérer sa politique de scolarisation de manière à éliminer toute exclusion envers les élèves en situation de handicap en leur permettant l'accès aux classes normales. Dans ce cadre, Le Programme National de l'Éducation Inclusive est une opérationnalisation de la convention cadre entre le CSEFRS et l'UNICEF.

Or, entre le principe, sur lequel il y aurait un consensus moral, et la réalité, l'écart peut être important. Il faut observer les conditions réglementaires, pédagogiques et socio-culturelles de l'inclusion dans son contexte réel pour évaluer ses effets sur les bénéficiaires. Ainsi, en considérant différents contextes, nous analysons les modes d'inclusion et les configurations d'adhésion ou de résistance de la société scolaire au projet. Car les valeurs, les attitudes et les traits culturels propres à une société pèsent fortement sur son système scolaire. Étant donné que l'inclusion ne se résume pas à des considérations institutionnelles, dans quelle mesure le climat scolaire serait-il favorable à l'inclusion des enfants en situation de handicap ?

Nous avons utilisé une méthode mixte qui combine l'analyse *quantitative* multi-niveaux, dont le premier est *élève* et le second est *l'école*, afin

d'identifier les principaux facteurs agissant significativement sur l'inclusion, et une analyse *qualitative* par entretiens semi-directifs de focus groupes qui permet d'approfondir la compréhension de la réalité subjective.

Les résultats montrent que les élèves en situation de handicap évaluent négativement leurs bien-être et leur expérience scolaire dans les classes normales. Ils tendent à signaler des comportements d'intimidation, une absence de protection, un manque d'appui à l'apprentissage et une inadéquation des scénarios et du matériel didactique et surtout l'insuffisance et l'incapacité des *salles de ressources* pour la qualification et le *soutien à réduire les inégalités avec les autres élèves*.

Building a New Future – Young Ukrainian Refugees in the Liminal Space and Transitional Educational Phase in Finland

In this presentation, we will explore the experiences and aspirations of young adults who fled the war from Ukraine to Finland in terms of engagement, belonging, and language learning. These young people are living in a liminal space concerning their present and future. The first years spent in Finland, social relations and language training play an important role in how to start building a new life in a new country.

Our participatory team-ethnographic data was gathered during 2023–2024 academic year in two educational institutions (in Finnish rural area and in the middle-sized city) which provide transitional phase education for immigrant students who have completed their comprehensive education but need to improve their Finnish skills to move on to the secondary level. Our longitudinal data consist of observations in classrooms (7 months) and narrative interviews of the Ukrainian students aged 16–18 (35) and their teachers (9).

We analyse our data applying nexus analytical framework (Scollon & Scollon 2004). We aim to understand the engagement and language learning processes of Ukrainian youth in the nexus of three elements: First, *The historical bodies* of the participants: their bodily memories and experiences that are brought to the communicative situations in school; secondly, *the interactional orders*: what are the expected roles for the students and the teachers in these communicative situations, and thirdly, *the discourses in place*: what kind of discourses are constructed and negotiated within student groups and in the institution, and how do these reflect broader discourses prevailing in society. These discourses relate, for example, to whether students are positioned as responsible for their own choices or whether they are seen as young people who still need strong support.

Based on our results, we will discuss how to build a more justice and socially sustainable education for students with a refugee background.

PIOTROWSKI, GRZEGORZ (University of Gdańsk, Poland)

Feminist and LGBTQ+ Counter-Mobilization Against Anti-Gender Movements in Poland: From Reactive Protests to Strategic Engagement

In recent years, Poland has witnessed a surge in anti-gender mobilization, driven by far-right political actors, ultra-conservative organizations, and the Catholic Church, which frame gender equality and LGBTQ+ rights as existential threats to Polish identity. These movements have employed a mix of legal, political, and media strategies to marginalize feminist and LGBTQ+ activism. In response, Polish feminist and LGBTQ+ movements have developed increasingly sophisticated counter-mobilization strategies, evolving from reactive protests to proactive and strategic engagements. This paper examines the transition in these movements' approaches, particularly since the 2020 near-total abortion ban, which marked a critical juncture in feminist activism.

Initially dominated by mass street protests, the movement has diversified its tactics to include legal challenges, public education campaigns, and active participation in the political arena. Feminist and LGBTQ+ activists have built coalitions with political allies, launched public health and reproductive rights campaigns, and engaged in targeted actions aimed at dismantling structural barriers to gender equality. Notably, the collaboration among feminist organizations has enabled the formation of "integrated activism," combining direct action with sustained efforts to influence public policy.

However, with almost two years having passed since the transition from a far-right government to a more democratic one in Poland (parliamentary elections in October 2023), the paper also critically reflects on the effectiveness of these new strategies. Have they succeeded in achieving meaningful

progress, or do the entrenched socio-political structures continue to present significant obstacles? By analyzing the outcomes of feminist and LGBTQ+ initiatives post-governmental change, this paper explores whether these movements have truly managed to influence policy or if the normalization of far-right ideologies still holds a strong grip on public discourse.

The research was conducted within the framework of the FIERCE project (Feminist Movement Revitalizing Democracy in Europe), funded by the Horizon Europe program.

RC47-730.4

MUSZEL, MAGDALENA* (Gdansk University, Poland)

Overcoming Barriers: Feminist and LGBTQ+ Strategic Engagements in Poland's Conservative Political Landscape

This paper critically examines whether feminist and LGBTQ+ movements in Poland have managed to overcome the deeply entrenched conservative barriers in the country's political and social landscape. The analysis centers on the transition from spontaneous street-level activism to more sustained and strategic political and social engagement, reflecting on the effectiveness of these new tactics in countering anti-gender rhetoric and policies.

Poland's conservative political sphere, bolstered by the Catholic Church and far-right organizations, has presented significant obstacles to feminist and LGBTQ+ movements. These movements, initially reactive and protest-driven, have had to evolve to challenge not just immediate threats but also the broader normalization of anti-gender ideologies within public discourse. In recent years, activists have adopted a more strategic approach, focusing on coalition-building, legal challenges, and targeted political actions. However, these efforts have met mixed success, as the structural barriers to gender equality and LGBTQ+ rights remain pervasive.

Drawing on in-depth interviews with key activists, this research explores how movements have sought to translate their street-based momentum into political influence. The paper analyzes both the opportunities and limitations of these strategies. While the political shift from a far-right government to a more democratic one in October 2023 in Poland offered hope, this study questions whether feminist and LGBTQ+ initiatives have truly made headway in policy reform, or if their impact has been curtailed by the persistent influence of conservative and nationalist ideologies.

Ultimately, this paper highlights the complexity of achieving substantive change in a socio-political environment where anti-gender discourses have been entrenched. It provides a critical reflection on the successes and setbacks of feminist and LGBTQ+ strategies in Poland, exploring the long-term sustainability of these movements in the face of ongoing resistance.

MUSZYNSKI, KAROL* (University of Warsaw, Poland)

Unionization in the Polish Video Game Industry: Between Entrepreneurial Subjectivity and Platformization

This paper presents preliminary findings from an ongoing research project on unionization in the Polish video game industry, drawing on 20+ interviews with trade union members, workers, and managers. Although unionization in the global video game industry has recently garnered increased academic attention (Kelmor & Woodcock, 2023), the Polish video game industry—a major global player—remains understudied in this context.

The industry is characterized by extensive platformization, with platforms like Steam constraining companies' control over pricing structures, distribution methods, and client access (Thorhauge, 2024; Werning, 2019). Additionally, the sector faces financialization pressures (Legault & Weststar, 2021), relies heavily on long subcontracting chains (Dyer-Witthford & de Peuter, 2009), and frequently utilizes non-standard forms of employment, such as self-employment, a practice especially prevalent in Poland (Ozimek, 2019).

Game studio management often cites limited agency due to intense competitive pressures when negotiating with workers, leading to a highly individualized, project-based labor structure that depends on workers' "entrepreneurial subjectivity." This paper argues that the current wave of unionization in Polish video game companies focuses on reshaping workers' identities from a purely entrepreneurial subjectivity to a "hybrid" one (Murgia & Pulignano, 2021). This shift is occurring in the context of two significant pressures: the professionalization of the sector, driven by the ongoing video game industry crisis following the collapse of the pandemic bubble, and the increasing feminization of the workforce. Rather than challenging the entrepreneurial mindset outright, unions are leveraging it as a tool for "building momentum for collectivity" (Weststar & Legault, 2019), by highlighting workers' dependence on large studios. At the same time, unions are developing strategies to counter the impacts of platformization and financialization on the industry by advocating for alternative revenue models, particularly through the assertion of IP rights.

Trust-Building Mechanisms and Strategies for Social Cohesion and Sustainable Peace Amongst a South African Sample

Building trust is crucial for fostering social cohesion and achieving sustainable peace, particularly in environments marked by inequality, crime, and fragmented social networks. Trust-building mechanisms and strategies provide a good basis for strengthening social cohesion. This study explores the mechanisms and strategies through which a South African sample develops and sustains trust. Social Exchange Theory, which emphasises that trust is built through reciprocal actions and mutual benefits, provides the theoretical foundation for this research. A qualitative study was conducted. Twenty-five urban (15) and rural (10) participants were interviewed. The findings revealed that at the individual level, trust is established through open communication, consistent actions, and mutual reciprocity. At the family level, emotional support, conflict resolution, and the fulfillment of roles and responsibilities within the family structure were found to strengthen trust. In community contexts, trust was enhanced through collective participation in meetings, social activities, and a reliance on institutional trust in services such as policing and healthcare. A notable difference emerged between urban and rural areas: while rural communities tended to rely on long-standing, relationship-based mechanisms for trust-building, urban communities faced greater challenges, including high crime rates and a lack of confidence in institutions, which hindered the development of trust. The study underscores the importance of context-specific approaches to trust-building, highlighting the unique challenges that urban and rural areas face. Recommendations include improving communication channels, reinforcing family and community support networks, and addressing safety concerns to foster trust and promote enduring social cohesion and peace in both urban and rural settings.

Communicating Climate Change: A Content Analysis of Selected Coursebooks for Junior Secondary School in Kenya

The UN Sustainable Development Goal number 13 (Climate Action) asserts that education and innovation are at the core of our planet's fight for survival. Against this backdrop, this paper sought to evaluate educational materials and co-curricular activities in Kenya that touch on the environment and climate change. We argue that the content and language of such materials are a window through which a nation's effort to galvanize its school-going population to action can be assessed. We began by noting that environmental education is no longer a stand-alone learning area at the junior secondary school level. A recent review of the curriculum has seen content in this subject being largely subsumed under the learning area of Agriculture. However, coursebooks in other learning areas such as English and Kiswahili are expected to cover the themes of environment and climate change through creative content such as passages, poems and dialogues. Coursebooks in religious education present environmental and climate change through scripture-based lenses. Our analysis revealed that cumulatively, various coursebooks achieve varied pedagogical and discourse goals. These include presenting factual knowledge, creating awareness about causes and effects, creating awareness about mitigation and adaptation as well as instilling agency in the target audience. The materials frame climate change and climate action as a public health issue, as urgent and as threat to our collective future. Religious, economic and political frames of the issue are also evident in the materials. However, the analysis also notes weaknesses in authoritative scientific knowledge in some of the coursebooks.

Defining the Social Issues and Well-Being of Mongolian Herders

Mongolia has a millennia-old tradition of nomadic pastoralism and nomadic culture. According to the 2020 census, 36.2% of Mongolia's population lives in rural areas, of which 8.9% are herders. As a social group, Mongolian nomads include 298,789 herders from 181,050 households.

This article aims to conduct a systematic review of the social issues faced by herders from a sociological perspective, focusing on areas such as income and livelihood, family, gender, education, health, social protection, and child protection. These issues arise from the unique characteristics of nomadism and nomadic pastoralism, with the dispersed living conditions across vast territories and the mobility of herders contributing to common difficulties in their lives. Although poverty rates among herders have decreased over the last decade, their livelihoods remain highly vulnerable due to Mongolia's extreme and unpredictable climate, harsh winters, and natural disasters like "dzud" (severe winter weather) and drought. In 2010, over 50% of herders lived below the poverty line, compared to 30.5% in 2020, while the national average was 26.5%.

Around 30% of young and middle-aged herder couples live separately to ensure their children can attend school, and the number of such families has increased by 40% over the last decade. Child neglect remains a concern among herder families, with children who live in dormitories, with relatives, or independently for education often facing neglect. Among young herders, 56% are covered by health insurance, but only about 20% participate in social insurance.

Conducting a systematic review of the social issues of herders allows for a comprehensive examination rather than viewing these issues in isolation. This approach can lead to the proposal of cross-sectoral social policy strategies to address these challenges.

Double Leap: The Number of Women in the Parliament Has Doubled Due to Changes in Mongolian Legislation.

The number of female members in the Mongolian parliament has always been low. In the 2016 and 2020 parliaments, only 17% of the total members were women, but due to legal amendments in 2024, this percentage increased to 25%.

This article will cover Mongolia's experience in increasing the number of female members in parliament, highlighting the significant efforts and dedication that led to this achievement.

The Cosmopolitan Brands of Elite Universities: Reproducing Local Inequalities on the Global Stage

This paper draws upon Pierre Bourdieu's analysis of the competition for economic, social and cultural capitals within educational fields to analyse the work of elite university brands. Despite their immediate recognisability, exclusive brands such as Nike or Chanel, Harvard or Oxford, possess a nebulous quality that is difficult to define or value. Brands often act as a medium through which relational values are generated and in which consumers invest in a brand experience. The relational nature between brands and brand consumers can readily be understood within a Bourdiesian frame as the competition for cultural, economic and social capitals. Whilst elite university brands perform similar functions of generating value, they also exhibit other characteristics that are more unusual. This includes elite universities being uniquely positioned to 'self-certify' their brand's value without the need to generate greater brand consumption. For example, unlike many universities they do not have to compete for students, and if anything their exclusivity, including along lines of class and race, adds value to the brand. Elite universities also reproduce institutional positions in which they are the final arbiters of knowledge production. Their brands function effectively within global educational economies, such as measures of world rankings, by legitimising the provenance of their local, institutional elite status. The paper will explore how this brand exclusivity functions as a local phenomenon with the ability to generate value and power nationally and transnationally. We conclude elite university brands are 'Cosmopolitan Brands' immersed in local and highly exclusive practices which reinforce wider inequalities of class and race globally. The paper draws upon qualitative research conducted at four elite universities in the US and UK.

MYKHAYLYOVA, KATERYNA* (Kharkiv University of Humanities "People's Ukrainian Academy", Ukraine)

Some Methodological "Traps" in the Use of Survey Methods in Conditions of Critical Social Upheavals

Critical social upheavals radically change the structure and functional connections of society, its structural elements and subjects. They change the significance of resources, the possibilities of their use, and form new life strategies of social subjects, especially short-term ones. The example of a crisis state of society is the military actions in Ukraine, which stimulated many social processes at all levels of social dynamics - from micro- to global. Military actions in Ukraine demonstrated how uncertainty can become the leading trend of social life.

In such a situation, classical methodological patterns of sociological surveys can give errors in obtaining information. For example, the parameters of the sample suffer: in the Ukrainian context, it is more difficult to identify people with the general population, as well as to outline it when studying the general context.

The landscape of surveys also changes most of the "pain points" along the lines of inclusion and diversity, the equality of which is fought for in a stable society. In conditions of critical social upheavals, these lines often focus on exceptions, not on equality. Inevitably, there is differentiation in their perception through the prism of social resources of society at one time or another, their limitations, potential, etc. Linguistic aspects are no exception. For example, in the context of Ukraine's transition from dominating bilingualism to monolingualism, problems may arise in the formulation of questions and answer options, as well as their understanding by respondents.

Thus, in conditions of critical social upheavals, we can talk about the influence of chaotic transformation of social subjects and changes in their characteristics, which may not always be recognized by researchers for constructing a high-quality research design.

MYRTOU, NICKOS* (National and Kapodistrian University of Athens, Greece)

Maids, Wives, Kóres and Psychokóres Representations of Female House Workers in Greek Movies

Greece in between east and west with a modern history full of wars has undergone several transformations in the 19th century. But the core patriarchic structures were in full effect until the 80s. The dowry in Greece was not just a custom, but also a law. In 1978 there was a first attempt to change the laws, but the change took place in 1983 alongside a number of changes in the stature of women.

In a poverty stricken and war-torn country the dowry was a heavy burden for families with daughters. Many young women (sometimes from ages 10 and up) were moving to cities to seek a brighter future. Those girls were either foster daughters (psychokóres) or employed as maids. Both situations were largely undocumented adding to the invisible labor of women in the household. However popular films of the 50s to 70s provide us with an interesting sample of representations of this labor. Especially the representations of maids and psychokóres in Greek comedic films are iconic and diverse. The focus of this paper is on popular comedies who are still being broadcasted and considered classic and family friendly, so as to showcase the various depictions of paid and unpaid housework from women.

More contemporary films and tv shows will be analysed in order to portray how stereotypes on maids still persist, even though modern depictions are of non Greek maids.

MZILENI MIHLALI, PEDRO* (University of Zululand, South Africa, South Africa)

The Burden of Labour in Emerging Student Habitations and Decolonial Options of Life

Neo-liberalism and structural adjustments have commercialized the public university and made it prioritize revenue efficiencies. From this, it has outsourced two of its key services to the private market: student accommodation and social services. The inhabiting and sharing of urban housing by off-campus commuting students integrates them to the ongoing urban austerity crisis. Social services in urban areas are near collapse under neo-liberal city governments who mis/treat residents as consumers. In this environment, students undergo the burden of labour to survive whilst studying: petitioning, protesting, organizing, and challenging urban neo-liberalism alongside higher education structural adjustments they equally encounter daily. This is an overlooked community exploited under the myth of modernity. I provide three theoretical interventions: new forms of labour that emerge under coloniality; new forms of organizing under austerity; and hyper neo-liberalization of the public university

Social Media Platforms and the Shaping of Moroccan Youth Identity: Fostering Gender Equality and Optimizing Media Literacy

Social media platforms offer a free space for youth mobilization, advocacy and participation in political change and accountability. They offer a venue for youth-led movements to voice out their exigencies and urge public support and response. Furthermore, social networking websites enable users to maintain and promote existing cultural values as well as access myriad cultures and develop global ideals' awareness, appreciation and appropriation (Bansal et al., 2024). Moving around these media resources to advocate for change could trigger an unbalanced perception of identity and self-conception for youth grassroots (Echesony, 2024). Due to paucity of research in this area, this reality calls for the necessity of investigating how media platforms influence youth Moroccan grassroots' perception and formation of identity with respect to gender equality. The paper also has further intentions of evaluating the participants' media literacy and awareness in addressing issues pertinent to gender equality in Morocco. Theoretical perspectives and analysis will be carried out drawing on research on globalization, youth identity formation and media. A quantitative approach will be adopted, hence, the population size will be determined by simple random sampling to obtain the intended demographics. Using online surveys, responses will be provided via Google Forms by young Moroccan adults from diverse educational backgrounds after considering ethical issues. To reassure the generalizability of the results, the intended participants will be included from various Moroccan cities. The data will be processed and analysed using both descriptive and inferential statistical analysis for drawing logical conclusions.

Méthodes Virtuelles Et Étude De l'Identité Religieuse Numérique Défis Et Limites

Cette contribution a l'ambition de jeter la lumière les défis posés par l'application des méthodes virtuelles dans l'étude de l'identité religieuse numérique, à partir d'une recherche menée sur 40 profils religieux sur Facebook qui appartient à des jeunes marocains.

Nous essayons de répondre aux questions suivantes :

- Est-ce que l'ethnographie virtuelle comme méthode adaptée au contexte numérique est susceptible pour l'étude des expressions de l'identité religieuse numérique ?
- Quelles sont les défis et les limites de l'application de la Nethnographie sur les études de l'identité religieuse numérique chez les jeunes ?

Nous focalisons notre contribution sur la démarche suivie dans l'étude des 40 profils religieux des utilisateurs de Facebook, en notant les difficultés liées à l'étude Nethnographique de l'identité religieuse numérique à partir des profils de ces utilisateurs.

Ces difficultés liées à la définition de l'identité religieuse numérique elle-même, qui nécessite de poser des indicateurs religieux qui nous permettent d'étudier les expressions religieuses des jeunes marocains en ligne.

Ensuite, le problème de la définition des frontières du terrain, les difficultés du choix de l'échantillon, l'élaboration de grille d'observation, l'archivage des ressources documentaires, et bien entendu l'analyse des données.

Un autre défi se lève, celui de l'accès aux ressources numériques des usagers, ce problème s'aggrave avec l'instabilité du contexte numérique, à cause de l'évolution rapide et le changement des règles d'utilisation et d'accès aux données mis en ligne.

Au niveau éthique, l'observation virtuelle des profils Facebook suppose le respect de la vie privée des utilisateurs. De ce point se dérive un autre défi cette fois, éthique et juridique qu'on peut le résumer dans la question suivante : est-ce que l'usage des données personnelles des utilisateurs du web de la part des chercheurs est légitime et respecte les lois de la protection des données personnelles ?

Creation, within the Framework of the so.Da.Net. Social Research Infrastructure, of a Corpus of Digital Multimedia Texts (e-corpus) on the Topic of Refugee Phenomenon

The e-corpus will collect texts, narrative, biographical, informative, administrative and other documents (diaries, newspapers, autobiographies, public documents, photographs) that refer to the refugee - migrant phenomenon, both in the period of the Asia Minor catastrophe and in the more recent events. The Infrastructure allows the documentation and management of such texts. Also, with the help of the Dictionary of Social Terms of the Infrastructure, provides the possibility of linking the texts both with each other and with other data (e.g. events, persons, places, or analyses). The design of the e-corpus enables its ongoing growth with the contribution of new researchers, both with new texts and with new associations between texts or new analyses on existing material. The purpose of this paper is to highlight the contribution of the e-corpus and the So.Da.Net Infrastructure to the study of the development of collective memory with reference to the Asia Minor disaster of 1922. Another purpose is to emphasize the impact of the disaster through representations on consciousness, predisposition and the manifestation of attitudes and behavior towards related key events that emerge through the anthropogeography of places of memory. The combination of texts creates nodes of recompositions and enrichment of conceptual approaches. This happens through an additive approach or even revisionary perspective of the content of the term definitions developed by the Dictionary of Social Sciences in parallel time. Furthermore, the systematic use of e-corpus texts documented in the context of conducting social research creates a dynamic perspective for research communities wishing to promote their work on an interdisciplinary level.

NAHKUR, OLIVER* (University of Tartu, Estonia)

A New Non-Weird Cross-Country Comparative Child Subjective Vulnerability Indicator - International Child Subjective Vulnerability-Resilience Index

Background: Prevention of and early intervention in child vulnerability entails the need to assess the likelihood of future suffering. Recently, composite child indicators based on objective/statistical data have been constructed. However, children should not be seen as an 'object of concern'. Children's own views and perspectives on their life should be taken seriously when trying to measure their vulnerability.

Aims: To introduce the first version of the International Child Subjective Vulnerability-Resilience Index (ICSVRI) that aims to be an international cross-country comparable child subjective vulnerability measure; to test internal consistency and external validity of ICSVRI; to provide international comparisons of children's subjective vulnerabilities; and to examine inequalities in child subjective vulnerability by age and gender.

Data: The current first version of ICSVRI is operationalised using data from the third wave of International Child Well-being Survey (ISCWeB) collected from 10 and 12-year-old children in 20 countries around the world. ISCWeB is not a WEIRD (Western, Educated, Industrialised, Rich, and Democratic societies) survey; for example, in its third wave countries as diverse as Algeria, Nepal, and Wales were included.

Results: Internal consistency of ICSVRI was very good, e.g. Cronbach's alpha ranging from 0.813 in Albania to 0.915 in Wales. Also, ICSVRI was strongly and negatively associated with overall subjective well-being measured with the 5-item version of the Children's Worlds Subjective Well-Being Scale (CW-SWB55). Based on ICSVRI, children's overall subjective vulnerability is highest in Brazil and Hong Kong and lowest in Albania. In almost every country, 12-year-old children had higher level of subjective vulnerability than 10-year-old children. In some countries like Estonia, Wales and Croatia, this age difference was especially apparent among girls.

Conclusion: ICSVRI helps to detect the groups of children whose subjective vulnerability level is relatively high, thus, needing the attention of policymakers.

NAHKUR, OLIVER* (University of Tartu, Estonia)

Conceptual Framework for Understanding Child Vulnerability As the Risk of Harm to a Child's Well-Being

This conceptual paper focuses on 'children at risk'. For those children who are more exposed to risks than their peers, the term 'child vulnerability' is being used. It is important to reduce risk in the lives of children. However, children should not be seen as an object of concern, but as active agents capable of preventing and managing risks in their lives themselves. Recently, also resilience - successful adaptation or better than expected outcomes in the face of certain risk - is gaining importance in research, practice, and policy emphasizing children's strengths next to their weaknesses.

Aim of the paper is to introduce a new conceptual framework for understanding child vulnerability as the risk of harm to a child's well-being in relation to his/her resilience.

This framework stems from Bronfenbrenner's ecological model of child development, Ungar, Ghazinour and Richter's social-ecological model of resilience and previous multidisciplinary knowledge on the most common vulnerability/risk and resilience/protective factors. It can be considered a step forward from existing risk-centric conceptualisations and previous conceptualisations linking child vulnerability and resilience, as in the proposed framework they are considered a continuum.

NAHM, KEE BOM* (The University of Seoul, Republic of Korea)

Urban Empathy: A Spatial Perspective

This paper discusses the possibilities of spatial empathy in cities, by addressing recent changes in urban transformation and governance. Cities function as centers of specialized services and decision-making. Urban spaces promote sharing, matching labor with jobs, and facilitating learning to stimulate innovation. Cities lead investment in innovation and technology, blurring boundaries between work and life. Innovation concentrates in large cities, exacerbating disparities with smaller cities and rural areas. However, this differs from traditional urbanization processes and introduces challenges like social polarization and privatization. Drawing from Elinor Ostrom's work, effective governance of shared resources relies on trust, cultural norms, and institutional mechanisms. It involves managing various resources sustainably and acknowledges the complexity of human-ecosystem interactions. Empathetic cities prioritize citizen participation, cooperation, and inclusion, emphasizing redistribution, recognition, and representation. They promote diverse, inclusive, and sustainable urban spaces through systemic thinking, human-centric approaches, and integrated governance. Empathy in cities involves understanding and sharing others' experiences, fostering social cohesion and cultural empathy. Spatial empathy, influenced by place atmospheres, enhances individuals' connection to urban spaces. Cultural empathy strengthens community bonds and enhances local identity. All in all, efforts should focus on identity, diversity, continuity, sociability, proximity, flexibility, and integration. Overcoming compressed modernization and emphasizing citizen-centered governance are crucial for creating inclusive and vibrant urban environments, and for fostering empathy and community resilience.

NAIDOO, KAMMILA* (University of Johannesburg, South Africa)

Reviewing Intersections in Analysis of Intimate Partner Violence in South Africa

This paper focuses on recent research examining women's experiences of intimate partner violence in two historically racially demarcated but rapidly transforming sites in South Africa, specifically, Alexandra Township and Sandton. While there has been much focus on violence in Alexandra Township (a predominantly black area), with interventions from NGOs, the state, and civil society, there have been few efforts to examine violence in Sandton (a site that exhibits a high concentration of largely white and wealthier residents). Sandton is a sought-after area incorporating powerful corporations and affluent families. Within both these contexts, violence against women remains high, despite the implementation of celebrated legislation aimed at affirming women's rights and addressing violence. The paper draws attention to gendered discourses and women's revelations about how they navigate threats and insecurities and negotiate everyday violence. The persistence of IPV in both these sites implies that historical, intersectional, and holistic approaches are needed to understand why such violence is produced despite progressive legislation and strong anti-GBV and social justice initiatives in the country.

Young People, Violence and Strategic Interventions in Sub-Saharan African Countries

The book adopts a clinical sociological paradigm to capture core themes focusing on the ways in which young people living in Sub-Saharan African countries engage vulnerabilities and contend with and counteract violence (sexual and gender-based – but also structural, political, socio-economic, intimate, and familial). The chapters of the book bring in data and case studies from a range of SSA countries, notably: Botswana, Eswatini, Ghana, Kenya, Malawi, Mozambique, Namibia, Nigeria, Senegal, South Africa, Tanzania, Uganda, and Zambia. While the findings and insights are diverse, a core set of themes predominate: they reveal that violence, embedded in everyday and mundane lived realities, is a complex issue and should be probed using intersectional tools of analysis. While moments of political and xenophobic violence are reflected upon, critical attention is firmly on young women and their grappling with SGBV. In recent years, with brisk growth in Internet access and social media and online engagements, cyberviolence has emerged as a new threat for young women and men. The COVID lens has magnified micro-struggles and long-standing structural problems showing how inequities and social and political disadvantages have created an infrastructure through which violence has been exacerbated.

The book focuses on masculinities constructed by colonial and apartheid histories, social and economic crises, racism, and state disregard, but with the message that marginality should not be reified nor the gendered practices of young men oversimplified. Generally, in all the chapters, contextual specificities and insightful case studies offer thoughts and arguments about how violence manifests, what interventionist strategies are compelling, and how young people's proactive involvement in interventions could begin to address the problem of violence.

Migration, Multiculturalism, and Inclusive Education in Morocco: An Analysis of the Social Dimensions of Public Policy

Migration, as a complex, anthropo-ethics and global phenomenon (Morin, 1999), impacts many countries worldwide, including Morocco, which has become both a destination and a transit hub for a growing number of migrants and refugees, particularly from sub-Saharan Africa and the Middle East. The inclusion of migrant represents an urgent challenge, both educationally and socially.

Recent national statistics (MENPS, 2023) indicate that more than 6,000 migrant children currently benefit from educational services. According to the national survey on forced migration, these children predominantly originate from Syria, Côte d'Ivoire, Senegal, Guinea, the DRC, Cameroon, the CAR, Mali, and Yemen (HCP, 2021). These figures highlight a situation that is frequently stigmatized or even overlooked, particularly in relation to the realization of the right to education for this segment of the population.

Moreover, this situation raises critical questions regarding the access, the retention, the academic success, and the integration of identity and multicultural realities within the school environment.

Although the issue of school inclusion for migrant students is relatively recent as a focus of public policy intervention and academic research in Morocco (Alami M'Chichi et al., 2005; El Fellah & Errami, 2021; Haidar, 2022; Haince et al., 2020; Qassemy, 2014), the existing framework for integrating migrant-background children into the Moroccan education system (Circular No. 13-487, October 9, 2013) requires further evaluation, particularly in terms of its managerial, pedagogical, linguistic, and cultural dimensions. How can Moroccan schools rise to the challenge of inclusive education in an increasingly multicultural context? What obstacles and opportunities exist, and what strategies can promote the successful inclusion of migrant students in schools? What role do public policies and local initiatives play in this endeavor?

This paper aims to explore these issues within the Moroccan context and propose practical solutions for educational inclusion that account for both cultural and migratory diversity.

Emerging Anthropocene Landscapes: The Energy Frontier and Assemblages in the Arid Lands of Northern Kenya

This presentation examines how 'patchy Anthropocene' landscapes are being created by renewable energy development in Kenya, focusing on the convergence of social, ecological and material environments.

Since the Industrial Revolution, the use of fossil fuels has increased greenhouse gases and is driving the Anthropocene, a period in which human activity is impacting all life. On the other hand, green hydrogen development, particularly in Kenya, is seen as key to decarbonization and energy dominance, with arid areas becoming essential for renewable energy and low-cost hydrogen production. This area is shaped by geological factors such as sunlight and tectonic activity, are becoming energy resource frontiers.

Pastoralism has long dominated Kenya's arid lands, which have been marginalized by the state. Since 2010, renewable energy projects such as wind, solar, and hydropower have been established, leading to new aggregations of people, materials, and information. These changes are altering movement patterns, settlements, and social structures, demonstrating that the Anthropocene manifests itself differently in different regions.

This presentation explores how Kenya's green hydrogen developments are transforming marginalized areas into resource frontier, highlighting the convergence of global, national, and local dynamics in the creation of new landscapes.

NAJIB, KAWTAR* (University of Liverpool, United Kingdom)

Gaza: A Test for Justice and Love

Islamophobia is everywhere, impacting Muslims or those perceived as such all around the world and justifying the use of more violence against them. Since October 7, 2023, Islamophobic acts have increased sharply in various countries (mainly in Europe and in the United States), revealing similar racist mechanisms against Muslims and Palestinians. Markers of 'Muslimness' (such as a hijab or a beard) as well as markers of 'Palestinian-ness' (such as a keffiyeh or a flag) become the target of racist anti-Muslim and anti-Palestinian attacks. Thus, the Palestinian identity is 'Muslimized,' and vice versa, the racialized Muslim identity is 'Palestinized.' Such a conflation has led to the dehumanization of Muslims and Palestinians, but also of Arabs and any racialized minority group. All these victims are resisting the same criminal imperial machine and are part of the same global struggle against oppression, even if each one faces their own local problems. A convergence of struggles is therefore necessary, calling for rising up against all forms of injustice, whatever they may be. For example, overlooking the injustice that the Palestinians are currently suffering and failing to clearly show solidarity with the Palestinian people and their right to exist and defend their territory is no longer acceptable. But such genocidal contexts also allow us to better know who is who and who believes in indivisible justice. The fight for greater social justice must be observed and measured every day and for each victim throughout the world, because without it, there is no love possible. Gaza has offered us all the opportunity to return to the very essence of love (which corresponds to a natural desire for fair treatment) by refocusing the struggle for a true indivisible justice that must liberate itself from everything that chains it to imperialism, subjugation, racism, and capitalism.

Exploring Gender and Asset Ownership in Morocco and Lebanon: Advancing Research Solutions and Practices

Despite advancements in education, significant gender disparities in land and property ownership persist globally, particularly in the MENA region, where only 5% of land is owned by women. Cultural norms and legal restrictions exacerbate this inequality, with women facing numerous barriers to inheriting or acquiring land. While land is a valuable resource, it is unrealistic to expect that there is enough for all women and men. Therefore, it is essential to consider other assets beyond land. This study aims to bridge this research void by exploring gendered asset ownership in Morocco and Lebanon, focusing on land, livestock, gold, and agricultural equipment. While land and homes have traditionally been seen as the most valuable assets, non-land assets like livestock and gold are also crucial for women's economic security. The study examines the complexity of joint ownership, noting that shared assets do not always equate to equal control. Using data from surveys of 465 farmers in Lebanon and 464 in Morocco, the research investigates the barriers and opportunities women face in securing ownership and control

of assets. It also seeks to validate the role of women in agriculture, where their contributions are often undervalued. The findings will offer actionable policy recommendations, emphasizing the need to enhance women's ownership rights, shift gender norms, and ensure long-term sustainability of asset control. The study provides valuable insights for informing policies and programs aimed at promoting gender equity in land and asset ownership across the region.

NAKA, REIKO* (Hitotsubashi University, Japan)

Navigating Consent and Mononormativity: The Inclusion of "Infidelity" Practitioners in Japan's Polyamorous Community

This research explores how Japan's polyamorous community is open to those who engage in "infidelity" or "cheating," creating space for diverse alternative forms of intimacy. Previous studies on polyamory have tended to assume that there is a clear boundary between polyamory and "infidelity." While media coverage and polyamorous activists in the anglophone sphere do have a tendency to reinforce this boundary, an examination of a polyamorous community in a non-Western society reveals a different reality. This study suggests that culturally embedded mononormative values in Japan help create a polyamorous community that is lenient toward those who unwillingly practice "infidelity."

I conducted 32 in-depth interviews with Japanese people who participate in a polyamorous community operating through online and offline meetups and events. According to my analysis, it was noteworthy that many interviewees expressed their experiences of hesitancy and difficulties disclosing their polyamorous desires and obtaining consent from their partners. In many cases, the individuals navigate their desires for multiple relationships within a mononormative society, while benefiting from the emotional and mental support provided by the polyamorous community.

The research reveals that while polyamory is often seen as an ethical alternative to "infidelity," the boundary between the two can blur in practice, particularly when consent is difficult to obtain. A Polyamorous community in Japan offers a space where individuals struggling to secure full consent from their partners can openly discuss their challenges and seek advice without judgment. These communities help people resist mononormative pressures and provide a support network for those negotiating consent.

In conclusion, this research describes a previously under-recognized aspect of polyamorous communities. By incorporating individuals struggling with consent, polyamorous communities help people challenge mononormativity. They also foster a more nuanced understanding of (un)consensual relationships, ultimately creating space for diverse alternative relationship models.

Discomforting Necropolitics - Dance of the Dark City and Its Aesthetic Navigation Towards the Future of Afropolis Beyond Walls

Many of Achille Mbembe's works delves into the contrast of solar and nocturnal faces of modern democracy. This double face lies starkly in the urban landscape of post-Apartheid Johannesburg. Yet, how do we understand the descending spiral of violence and exclusion reified by fortification of modernity 'inside' and policing of criminalized blackness 'outside'? When such biopolitics continues to lock up our body in the past, how do we imagine the world beyond race? Can humanity fermented at the tense conjuncture of various political forces in South Africa in the course of anti-Apartheid struggles be a meaningful reference?

This paper delves into the performative power of the 'nocturnal face' by establishing a unique dialogue between Afro-American tradition exemplified by Michael Jackson's 'Moonwalker' and its collaborative invitation of the 'nightsongs' - a performative tradition among the South African migrant workers - in the movie. These bodily articulations are going to be referred to as the 'discomforting aesthetics'. It becomes a site of rupture of the enlightenment tradition of humanism by juxtaposing the colonial nightmare and fear that Apartheid politics desperately sought to unseen by the plasters of walls and segregation. In other words, this aesthetics is disruptive of the necropolitical disposal of humanity.

As a tense interface of various political and cultural forces that resisted Apartheid, the performative textuality of the movie offers an entry point to an alternative to the rational understanding of humanism and by its extension,

Apartheid urban spatiality. In sum, this paper presents a glimpse of more humane and just future African metropolis, 'Afropolis', beyond walls of Othering, exclusion, and violence.

NAKAMURA, KYOKO* (Toyo University, Japan)

Climate Change and Kenyan Pastoral Women's Dependence on Forest Resources

The East African drought from 2020 to 2022 was a greater crisis for Kenyan pastoralists than the spread of COVID-19. Cattle became starved to death one after another, and goats and sheep also perished. The few surviving goats were sold at the market to purchase food for the people. However, thin sheep fetched only low prices, and grain prices had skyrocketed due to the Ukraine crisis. Even if they wanted to leave for migrant work, travel was impossible due to the pandemic. It was truly a dead-end situation.

What saved the people was making and selling charcoal. It required no capital—just an axe and hard labor. Even before the drought, some women had been making charcoal to supplement their food expenses, but as the drought worsened, even those who had never engaged in this work joined in. However, some parts of the forests they utilized were officially under the national government control, and making use of them is illegal. Community forests surrounding the national forests, which many people relied on, were also subject to restrictions imposed by NGOs and other organizations. Yet, during the most severe periods of the drought, forest use was tacitly permitted because everyone was desperate to survive.

The use of the forests has enabled people and their cattle to survive droughts in the research area. However, the frequency of large-scale droughts has clearly increased, and in response to climate change, governments and the international community have begun to focus more on forest conservation. This study seeks to clarify that, in this region, utilizing forest resources is a vital means of survival during droughts and that, for the poorest, especially single mothers, making and selling charcoal forms the foundation of their livelihood. It is crucial to introduce methods for protecting forests without sacrificing vulnerable populations.

Stigma of Mental Illness in Japan

This paper examines how people who self-identify as having mental illnesses or neurodivergent conditions that are labeled as mental illnesses in the Japanese health care system, manage stigma and potential stigma in Japanese society. Specifically, the paper explores how individuals in Japan weigh stigma and the potential for stigma against the potential benefits of obtaining medical diagnoses that bring opportunities to receive state health and employment benefits. It discusses how individuals consider whether or not to obtain a diagnosis of mental illness, to "come out" to workplace colleagues, and to apply for state benefits based on a mental illness diagnosis. It considers how these decisions may be related to factors such as gender, age, and educational and income level. The findings are based on research conducted between 2017 and 2023 in Osaka and Tokyo involving interviews of individuals with neurodivergent conditions labeled as mental illness in Japan, and participant observation in self-help groups organized by and for individuals with these conditions. The paper argues that new labels for mental illness in Japan provide opportunities for individuals to better understand their condition even as these labels create new categories and stereotypes, and new forms of stigma. The paper argues that economic necessity – the need to find employment – often overrides concerns about stigmatization, as individuals choose to accept a stigmatizing label if they are able to find work under government disability programmes. At the same time, individuals report that negative feelings related to stigmatizing categories of mental illness are often alleviated by finding others who share a similar diagnosis. The paper also discusses the policy suggestion that to reduce stigmatization and fears of stigmatization, the Japanese health ministry may avoid using "mental illness" as a broad category of disability and instead only recognize specific medical conditions.

Preventing Climate Integrity or Integrating Just Transition?: Counter-Discourses to Tokyo's Mandatory Solar Power Installation Ordinance

This study explores counter-discourses surrounding the expansion of renewable energy, focusing on the mandatory solar power installation ordinance in Tokyo as a case study. Although numerous Japanese municipalities aim for net-zero carbon emissions by 2050, renewable energy adoption, a key strategy to achieve this goal, has not garnered unanimous societal support. Various opposition voices have emerged, presenting challenges to its expansion. Tokyo declared a goal of net-zero carbon emissions by 2050 in May 2019 and launched its "Carbon Half" plan, aiming to reduce greenhouse gas emissions by 50% by 2030. As part of these initiatives, Tokyo introduced in 2022 a regulation mandating solar panel installations for newly constructed buildings under 2,000㎡, specifically targeting developers supplying a total annual floor area of over 20,000㎡. This research analyzes opposition to the ordinance using data from sources such as Twitter, Tokyo Metropolitan Assembly records, newspaper articles, public comments, and Tokyo Metropolitan Environmental Council meeting minutes. The main counter-discourses include: 1) concerns about China as the primary producer of solar panels, with criticism further linked to human rights issues in Xinjiang, 2) concerns over rising housing prices that may exclude all but the wealthy from living in Tokyo, 3) opposition based on the environmental impacts of solar panel disposal, and 4) resistance from a disaster-prevention perspective, such as fears of fire hazards. This study shows that while climate change becomes the dominant discourse, counter-discourses mobilize human rights, fairness and other environmental issues to challenge these policies, raising the question of whether they are obstacles to climate integrity or whether they integrate 'just transition' into policy.

NAKAZAWA, WATARU* (Rikkyo University, Japan)

First Generation College Students in the Age of Universalization of University in Japan

Although those who could attend university were heavily skewed toward those from high class backgrounds, university students became more diversified as enrollment rates increased. Universities used to be elite educational institutions attended by only a few people and did not adequately respond to such diversification. Many students in the United States drop out of college because they cannot adjust to life on campus. The increase in the college enrollment rate has been driven by first-generation college students whose parents did not receive a college education. These students are more likely to maladjust to traditional college culture, and many universities in the United States, the United Kingdom, Australia, and other countries actively support them.

Japan's university enrollment rate has exceeded 60% of high school graduates, and it is not unusual for first generation college students to enrol. Progress in equalizing opportunities for students to attend university seems evident. However, first generation college students may be less likely to attend prestigious universities, tend to choose specialties directly related to their occupations, or have a higher dropout rate (although the dropout rate at Japanese universities is low). To verify this, we use data from the Social Stratification and Social Mobility (SSM) survey conducted in 2015. The sample was randomly selected from the entire Japanese population, covering a broad birth cohort aged 20-79 years old at the time. The results show that after the generation in which the university enrollment rate is approximately 50%, the difference between first generation college students and those who can attend prestigious universities becomes significantly clearer. In addition, we observed a slightly higher dropout rate and a tendency to choose occupation-oriented specialties among first generation college students in the younger cohort with more expanded higher education.

Explaining Street Harassment Victims' (Un)Willingness to Report to the Police in India

The focus of this paper is street sexual harassment victimization and factors that determine victims' willingness to report. We specifically examine their choice to report to the police from the legal and enforcement perspectives that include awareness of laws that punish street sexual harassment offenders, perceived effectiveness of street harassment laws and their enforcement, and, finally, global perceptions of the effectiveness of the police. Findings from a survey of 383 victims from New Delhi, India suggest that overall, victims who are aware of the newly enacted sexual harassment legislation were more willing to report. Interestingly, however, there is a negative relationship between the perceived effectiveness of enforcement of sexual harassment laws and their willingness to report their victimization to the police. Further, neither the perceived effectiveness of the sexual harassment laws nor the global perceptions of police effectiveness were significantly related to the victim's willingness to report to the police. Policy implications for police departments to create user-friendly apps, awareness programs, and opportunities to report sexual assault victimization are discussed.

Navigating Social Protection Challenges for Namibia's Informal Workforce

Namibia's social protection system, while comprehensive in some aspects, has yet to make significant strides to capture the informal workforce, a substantial segment of the labour market. Although the system provides social security benefits like occupational injuries and maternity coverage for contributing workers, informal workers face significant barriers in accessing and sustaining these benefits due to irregular contributions stemming from their inconsistent, low, and sporadic incomes. The COVID-19 pandemic further exposed the vulnerabilities of informal workers, many of whom lost their jobs, livelihoods, and faced deteriorating health conditions. The current system inadequately protects these vulnerable groups and the aftermath of Covid-19, intensified discussions on enhancing social protection through proposals like a universal basic income grant and both contributory and non-contributory unemployment benefits for Namibians. Drawing on a mixed-methods approach that includes secondary sources and interviews, this paper discusses the lived experiences of urban informal workers and the unemployed as they navigate the current social protection landscape and, its socio-economic impacts. It focuses on (a) informal workers' and the unemployed persons' experiences with current social protection programs, (b) barriers to accessing and benefiting from these programs, (c) the impact on employment or economic activities, (d) perceptions of whether current measures effectively support informal workers (e) suggestions for potential improvements to enhance access and benefits (f) perceptions of the effectiveness of current measures in alleviating poverty. This paper contributes to the discourse on social protection reform in Namibia, advocating for inclusive solutions to address the needs of the informal workforce and the unemployed.

RC30-479.1

NAMUPALA, NDESHI* (University of Namibia, Namibia)
Social Protection, Inequality, and Youth Unemployment in Namibia – Infringement of the Social Contract?

Are the persistent challenges of precarious employment, job insecurity, and income inequality an infringement of the social contract? Given the current state of affairs in Namibia, where the needs of workers, particularly those in vulnerable positions including the unemployed, are often overlooked, it is compelling to argue that this constitutes a violation of the social contract. Young people face significant barriers to accessing productive assets such as capital, land, and skills, leaving them dependent on the informal economy, where social protection and social security are severely lacking. Their survival initiatives and subsistence efforts are met with discontent from government institutions and other authorities. In recent years there have been several protests related to the exploitation of workers, some of which led to the arrest of protesting youths, while unions remain silent. Drawing from secondary sources and the author's ongoing research on the world of work and social protection in Namibia, this presentation interrogates these issues. It highlights the struggle of unemployed youth, questioning whether the current

social protection framework fulfils the vision of an “inclusive Namibian house” as articulated by the late President Geingob. The aim is to foster dialogue about whether the current situations represent an infringement of the social contract in Namibia and explore ways to tackle these challenges for a more equitable future. It emphasizes the urgent need for social protection reforms that cater to the needs of the youth and unemployed, while reinforcing the integrity of the social contract in Namibia. The paper concludes by reflecting on the “leave no one behind” principle and, how well Namibia’s current social protection efforts align with this principle.

NANZILE MLILO, SILINDILE* (University of Witwatersrand, South Africa)

“We Are Called Motswana Wa Pampiri” - Tactical Citizenship, Political Invisibility and Limits to Rights for People with a Migrant Background

This paper will demonstrate how the historical development of the Botswana Citizenship Act have contributed to the exclusion and othering of certain individuals due to the categorisation of citizens. I locate these debates using the experiences of people with a migrant background to demonstrate how these forms of othering manifest at the political and social level. I also show that such individuals adopt an in and out approach and view citizenship as a tool for accessing rights instead of an identity marker. Using the concept of Motswana wa pampiri (citizen on paper), I shed light on the tensions between citizenship framing and people with a migrant background’s experiences of exclusion that lead them to employ strategies to claim rights while protecting their citizenship and playing at the margins. This process I call tactical citizenship which challenges conventional notions of citizenship, emphasising the daily reshaping of citizenship through rights claiming strategies at the local level. The paper makes a significant contribution to postcolonial and citizenship studies by shifting the focus from conventional perspectives on citizenship to a more nuanced understanding of citizenship. It also builds on studies that have explored unconventional forms of citizenship such as citizenship from the below and acts of citizenship. The paper will further highlight the tactical and strategic actions of what are considered as “marginalised” groups and highlight how people with a migrant background react to this marginality by offering a fresh lens to discuss migrants’ struggles without reinforcing stereotypes. By focusing on such groups, the paper provides significant understanding of life at the margins and shows that such spaces normally viewed as merely oppressive or exclusionary, are potential sites where agency and creativity can be expressed as acts of citizenship.

Navigating Solidarity: Social Love and Queer Activism in Contemporary Morocco

This paper explores the evolving landscape of solidarity within contemporary Moroccan queer movements, emphasizing the role of social love as a transformative force in fostering cohesion and resilience. Drawing from the concept of love as an interstitial practice, this study highlights how Moroccan queer activists navigate social and political constraints to create alternative forms of collective action that challenge established norms.

By mapping these interstitial practices, the paper reveals how emotions such as hope and empathy drive acts of solidarity within queer communities, where love functions not merely as an affective bond but as a political strategy for resisting marginalization. Through a postcolonial lens, the study examines how these movements reclaim agency by redefining social love beyond Western and Eurocentric colonial heteronormative and patriarchal structures, thus challenging the “closed totality” of the prevailing moral order. The analysis draws on qualitative data from activist narratives and digital ethnography to uncover how expressions of social love forge new pathways for social change in a transglobal context.

This paper contributes to the discussion on social love and solidarity by showing how Moroccan queer movements embody an ethics of care that transcends conventional boundaries, promoting a dynamic process of mutual support and collective empowerment. By situating these practices within broader socio-emotional dynamics, the study offers insights into the methodological challenges and opportunities of researching solidarity in contexts where love serves as both an emotional and a strategic force for transformation.

NAOUA, ADIBA* (Hassan II University of Casablanca, Morocco)

Rethinking Gender and Extremism: The Roles of Women and Masculinities in Counterterrorism and Peacebuilding

This paper examines the role of women in both fostering and combating violent extremism, focusing on the intersection of gender constructions and counterterrorism strategies. Using empirical research with women who have joined ISIS or been imprisoned for terrorism-related activities, the first point of the study challenges the notion of women solely as victims in conflict scenarios. Instead, it highlights their complex roles as agents of change, both in supporting extremist factions and in peacebuilding efforts. The paper explores how gender—understood as socially constructed roles of masculinities and femininities—plays a critical role in violent extremism, influencing both the recruitment tactics of terrorist organizations and the approaches of counterterrorism actors.

The second point rethinks masculinities within extremist and counterterrorism contexts, emphasizing how hypermasculine narratives on both sides perpetuate cycles of violence. The second point advocates for a values-based approach to counterterrorism, proposing that adaptable, grounded values focused on protection, peace, and community cohesion can mitigate extremist violence. These insights demonstrate that a gender-sensitive approach, informed by an understanding of toxic masculinities, is crucial to creating effective, non-militarized counterterrorism strategies. The paper argues for shifting from hypermasculine security responses to a more inclusive, human security-centered approach.

Towards Decolonization of Our Written Words and Practice

Even though we have been talking about decolonization for several years, how does it actually play out in practice while we are ensconced within Northern academia and knowledge structures? In this presentation we outline some of the difficulties of inserting conversations which do not quite fit the canons of what constitutes sociological “theory.” We discuss the production and curation of knowledge streams, but, more importantly, how to get these to a new generation in a way that it does not remain an add-on of knowledge from other parts of the world. Knowledge production includes worlds of publishers, reviewers, prestige of outlets, and the intense pressure to conform to the expectations academia demands within current assessment regimes. However, apart from the task of publication, there is intense political pressure on teaching in countries like the US, that has to reflect “student needs” and comfort levels. The presentation outlines some efforts towards linking the production of knowledge and teaching undergraduates, as well as many remaining challenges and dilemmas.

Walking a Fine Line: Subversive Diasporic Resistance amidst Growing Authoritarianisms.

The rapid expansion of social media in the deepest recesses of our lives have enabled all those who wish to bend others to their vision of a world into the deepest recesses of our lives. Women frequently become the targets and pawns, in the discourse about upholding tradition, or the need to protect them, or the declared wish to free them. Women, from their varied intersectional structural locations, have resisted these efforts, just as some have sought to maintain their power by working with those who aim to control those who might challenge their positions. For marginalized groups in diasporas, including women, the challenges become more complicated. While the immigration literature continues to think about sending and receiving states, treating the receiving countries as discrete units separate from the places of origin, diasporic lives often are shaped by what is happening across several states, and the rapid development of national and global security regimes, which normalize escalated levels of violence. For all those who wish to claim their rights to live lives free from constant threats of restrictions on their freedoms and/or violence, this means contending with authoritarian and vigilante actors and governments of several nations.

In this paper we outline a project where we explored how women in diasporas contend, facilitate or resist religio-nationalisms. The participants spoke about walking a fine line between transnational families, nationalist governments, and groups with money and power to harass or silence people. Our focus is to briefly summarize what the participants said—those are available as podcasts—but to focus *particularly* on the methodological challenges of using a public-facing medium while trying to be attuned to the risks people face.

Capture and Consumer Citizenship: Towards Uneven Terrains of Dispossession and Inhabitation

Contemporary global urbanization propels the dispossession of those using public lands to enable investment-friendly, profit-generating global cityscapes. These impacts of urban development, however, are complicated by patronage relations and other symbiotic economic and political ties between state actors and urban residents in the Global South. Struggles for inhabitation in these contexts frequently lie at the liminalities between advance and retreat, autonomy and dependence, property logics and commoning practices.

Based on long-term ethnographic engagement with and participation in struggles for tenure security in Chennai, India, I illuminate some of these practices. The first is capture, *pidippu* in Tamil, an emic category that emerges from urban residents to refer to a stealthy and ongoing appropriation of urban land and life through routine practices of autoconstruction in increasingly commodifying urban landscapes (cf. Simone 2022). Capture itself is neither a singular event nor a consistently expansionist endeavour. It is an adaptive, dynamic practice emblematic of the ebbs and flows of urban informality as it includes the creation of local housing economies, commoning strategies to socialize reproduction and care, as well as strategic ceding of gains already made as a bargain for increased legitimacy and security. Capture is practiced alongside claims to consumer citizenship and participation in related rent-seeking economies of services essential for social reproduction in the city. Together, these strategies reveal uneven terrains in which dispossession and negotiations for citizenship can unfold, illuminating expected and unexpected opportunities for continued inhabitation in the city. Sometimes, these practices tap into the state-capital nexus, rupturing existing understandings of capture in actually existing neoliberalisms (Peck et al 2018).

Peck, J., Brenner, N. and Theodore, N., 2018. Actually existing neoliberalism. *The Sage handbook of neoliberalism*, 1, pp.3-15.

NARDI, LUISA* (University of Salento, Italy)

Athena between Empathy and Sympathy: A Mythological Analysis of Contemporary Social Relations

In contemporary sociological discourse, empathy emerges as a crucial concept for understanding interpersonal dynamics. The term, derived from the Greek “en-pathos” (feeling inside), evokes a deep emotional identification. Sympathy, on the other hand, from “syn-pathos” (feeling with), expresses a less intense emotional participation. The myth of Athena, goddess of wisdom, illustrates how a deity can embody both qualities: empathy toward Odysseus, by identifying with his sufferings, and detached sympathy, where she acts rationally for his benefit without fully sharing his pain.

This distinction mirrors contemporary social relations, where empathy and sympathy coexist, but with different moral implications. Max Weber, through his *Verstehen* theory, and Émile Durkheim, with the concept of collective emotions, discussed the role of empathetic understanding in social cohesion (Weber, 2016; Durkheim, 2017). Cataldi and Iorio also explored the concept of agapic action, an other-oriented approach that offers a complementary perspective to empathy and sympathy in today's society (Cataldi & Iorio, 2018). Zygmunt Bauman, in describing “liquid modernity” highlights how the fluidity of modern relationships weakens the authenticity of empathy, which often becomes superficial in “liquid relationships” (Bauman, 2000). Edgar Morin, meanwhile, emphasizes the complexity of empathy as part of a process involving mind, emotions, and culture (Morin, 1993).

However, empathy can also represent a source of vulnerability. Arlie Hochschild and Eva Illouz point out the risks of “emotional labor” and the commodification of empathy in capitalism, leading to emotional exhaustion (Hochschild, 1989; Illouz, 2007). Using the figure of Athena, this critical analysis explores both the positive and negative aspects of empathy in social and power relations, suggesting that understanding its ambivalence is essential for building ethical and balanced relationships.

Circulation of Care and Kinship in Transnational Refugee Networks

Our paper argues for a shift in research that analyses the circulation of care within relatively stable transnational families towards an understanding of the circulation of care as part of transnational kinship processes (Baldassar & Merla 2014). We draw on our previous and on-going ethnographic research with refugees from various backgrounds in Norway and Finland to discuss local and transnational care practices as an integral means to maintaining, doing and imagining kinship in the lives of our research participants. We consider the care and kinship practices to also be about aspirations and the anticipation of the future. We bring together Carsten's (2020) work on kinship to develop a three-dimensional understanding of kinship as (non)being, (un)doing and (un)becoming. We further propose a broad notion of care as local and transnational practices as well as emotions relating to caring, such as attending to, noticing and being attuned to the needs and wellbeing of members of kin (Mason 1996). In the paper, we will discuss the various ways in which our research participants mobilise kinship and care as an inherent part of their migratory mobilities and future aspirations. Our findings point to the need to understand kinship flexibly, as a dynamic force that is not only about being but also about making and unmaking, as well as becoming in the future.

Performing Beauties, Endorsing Capitals: Repertoires of Beauty Evaluation and How They Mark Symbolic Boundaries and Shape Social Inequalities in Accra, Ghana

This study explores how judges and TV producers in “Ghana's Most Beautiful” (GMB) pageant legitimize beauty cultures and endorse specific forms of capitals through their evaluative comments and how these shape symbolic boundaries and reinforce social inequalities in media-saturated societies such as Accra. The GMB pageant is a reality show that selects ladies each from the 16 regions of Ghana to showcase their talents on TV to redefine beauty and promote national unity. As one of the cultural products in Ghana, it promotes the idea that beauty is first of all a performance and a ‘must’ to be embodied by women. Drawing from Bourdieu's concept of capital, Lamont's theories of symbolic boundaries, and Kuipers' beauty and inequality theoretical framework, this research examines how TV producers and judges' evaluations recreate repertoires of beauty that favour contestants who effectively perform certain cultural and aesthetic roles in the GMB. Using ethnographic methods, involving interviews (with TV producers and judges); and six months observations (13 weeks live studio observation), this study found that the repertoires of physical beauty were not directly expressed in judges' comments but embedded in the criteria for evaluation and selection. Also, through my observation, I discovered how different forms of capitals collectively transform into crowning a female as beauty queen – Ghana's Most Beautiful – in three ‘stages’ (two different forms of front stage, middle stage and backstage), expanding Erving Goffman's idea of performance on stages. This study revealed how beauty evaluations perpetuate inclusion and exclusion, privileging contestants who align with the identified forms of capitals. Lastly, this study has significantly identified that beauty is not merely judged on aesthetic grounds but also is a performance played and embodied by women in line with social expectations, contributing to the reproduction of symbolic boundaries and social inequalities in the Ghanaian context.

Historical Dialogue for Social Harmony: Transforming Collective Memory and Conflict through Inclusive Narratives

This paper examines the role of historical dialogue as a transformative tool to address societal conflicts and injustices rooted in collective memory and identity. Historical narratives—whether shaped by state power or marginalized communities—tend to reinforce unequal power dynamics and exclusionary national identities, deepening divisions within society. Through a critical exploration of concepts such as collective memory, national identity, and impunity, the study demonstrates how unresolved historical grievances perpetuate trauma and cycles of violence. This is particularly evident in the Deep South of Thailand—encompassing Pattani, Yala, Narathiwat, and parts of Songkhla—where systemic discrimination, marginalized identities, and long-standing injustices have exacerbated conflict. The paper highlights the importance of fostering inclusive dialogue among key stakeholders—such as Muslim and Buddhist religious leaders, history educators, and security authorities—to build trust, mutual understanding, and sustainable peace. Drawing on Constructivist and Postmodern frameworks, the study advocates for reimagining history education and public discourse to promote critical thinking, diverse narratives, and pluralistic memory. Findings reveal that the Thai curriculum currently lacks multi-ethnic representation and fails to instill respect for cultural diversity, instead prioritizing nationalism and centralized unity. The study urges the government to expand beyond nationalist narratives and offers policy recommendations to enhance relationships between the security sector and local communities. These recommendations focus on recognizing and respecting distinct cultural and historical identities, transforming conflict into reconciliation, and laying the foundation for long-term peace.

NASCIMENTO MINARELLI, GUILHERME* (University of São Paulo, Brazil)

Housing and Tax Policies in a Latin American City: Institutional Dynamics, Fiscal Decentralization, and Urban Inequality in São Paulo

This paper examines the intricate relationship between housing and tax policies in São Paulo, Brazil, from 1995 to 2022, through an institutionalist lens. It explores how fiscal decentralization policies, electoral competition, and alternating power between right and left-wing parties have shaped local revenue collection, leading to increased progressivity and redistributive potential in taxation. The study highlights the significant increase in property tax burden in general, and specifically on non-residential properties, high-standard dwellings, and areas occupied by upper and upper-middle classes.

Our analysis reveals that these reforms and actions by different administrations have also empowered the local government, enhancing its capacity to invest in housing policies targeted at lower-income groups, who constitute the majority of the local housing deficit. However, despite these changes and possibilities, housing affordability in the city has decreased, with sharp increases in property prices and rents, alongside a significant rise in high-income housing.

The research finds that while São Paulo has become more compact, dense, and vertical, with less occupation on environmentally sensitive areas, desirable features in urban and environmental perspectives, it has systematically relied on federal housing policies for middle and lower classes through market implementation. Simultaneously, the city has increased its role in regulation and funding through zoning incentives and new instruments of financial assistance for new dwellers. This dependence and changes in the State's role at the local level have resulted in missed opportunities for significant changes in reducing housing inequalities from an expenditure perspective.

By examining these dynamics, this study contributes to the broader discussion on rethinking public policies in the context of climate crisis and urban inequality, where cities play an important role in addressing these challenges. It offers insights into the challenges and opportunities of multi-level governance in addressing housing precariousness and sustainable urban development in Global South cities.

A Cosmopolitan Critic: Silviano Santiago and Postcolonial Literature

This project aims to explore the concept of cosmopolitanism in the critical work of Silviano Santiago (1936-), an essayist, novelist, critic, and poet who is recognized as a cosmopolitan intellectual within Brazilian social thought. Our goal is to contribute to this discussion by proposing an intersection between Santiago's notion of cosmopolitanism and the debates advanced by authors from the Global South, especially those linked to postcolonial studies.

Intellectuals from the Global South have increasingly questioned the legitimacy of the term "cosmopolitanism" as it was previously understood within a Eurocentric framework. This term is now being re-examined through the lens of postcolonial studies, with scholars striving to reshape it away from its traditional Eurocentric interpretations. Silviano Santiago is one of the key figures revisiting and reinterpreting this concept, offering a new perspective on it. In his influential essay *L'entre-lieu du discours latino-américain* (1971), Santiago develops the idea that Latin American artists produce their work through a process of transgression against the Eurocentric model. He suggests that these artists operate from an in-between space—situated between the cultural center and the periphery—existing in a form of clandestine refuge. This perspective aligns with Kwame Anthony Appiah's ideas, and Santiago engages with Appiah's re-interpretation of cosmopolitanism from a postcolonial perspective in his work "Ethics and Cultural Diversity," previously titled "Cosmopolitanism and Cultural Diversity."

Through the analysis of Santiago's production, this project seeks to reinterpret cosmopolitanism based on his body of work, engaging with other authors from the Global South involved in postcolonial studies. We argue that Santiago's writings reflect an internationalist view of Latin American cultural, political, and social production, emphasizing the relationship between peripheral and hegemonic cultural centers. Additionally, we explore the concept of "cosmopolitanism" in contrast to "globalization," identifying both the potential and limitations inherent in each approach.

Thinking through Film: Popular Social Realism

Probably the dominant form of learning from popular feature-length films for Sociologists is through critique of ideology, or interpreting resistance to it (following the Birmingham School of Cultural Studies). Other traditions of thought go beyond ideology critique to consider knowledge that is produced by such films: indexical, multi-sensory, and conceptual. In this paper I will draw on work in anthropology (Lucien Taylor) and the philosophy of film (for example, that of Stanley Cavell) to consider how selected social realist films *think* in a multi-sensory way – including popular realist films. I will consider a popular social realist film in detail, analysing how it thinks with central sociological concepts such as power, inequalities, and social reproduction.

Climate Imaginaries As Sites for Weather-Making

As climate change poses a new existential and epistemological crisis, many have now turned to the future to look into ways in which we can imagine and foster an alternative to business as usual. Alongside this steady rise of attention towards the future, futuring and imaginaries, there has also been growing attention on matter and materiality within the broader social sciences. In light of these two trends, we extend the 3A3 framework of participation (Hofer & Kaufmann, 2022) as a *phenomenon* by attending to the material implications of dominant climate imaginaries in the context of planning. We do so by employing a feminist theoretical lens of "weathering" that emphasises an inseparability of structural inequalities from the bodily experiences of more-than-human, such as weather. It is through this inseparability that we firstly re-frame climate imaginaries as sites for weathering - revealing that dominant imaginaries actively reinforce structural inequalities of understanding and knowing climate change within the planning process - and secondly, demonstrate the implications of its re-framing in our understanding of participation as a phenomenon. In doing so, this novel conceptualisation attends to the power imbalance embedded in the planning process by highlighting the materiality of climate imaginaries that 'weather' participation in planning.

Social Welfare Literacy: Processes of Interpretation and Negotiation to Optimise the Life Plans of Rehabilitants in Vocational Training Centres - a Qualitative Longitudinal Analysis

As with the BCI approach, cultural determinants and their consequences for explaining health conditions are gaining more and more acceptance in science and practice. The concept of health literacy can be integrated into these observations, which describes the competence of the individual to generate, understand and apply health information. Based on this concept and the work of Stahl et. al. (2021), we have developed the concept of social welfare literacy. This was designed, among other things, on the basis of empirical data collected in a qualitative longitudinal study with rehabilitants in vocational rehabilitation in so-called occupational training centers.

Within the system of vocational rehabilitation in Germany, the rehabilitants' courses of rehabilitation are usually very lengthy and complex, especially when rehabilitants enter a new occupational field due to disability or mental or psychosomatic chronic illness. They pass through various institutions of the welfare state and meet gatekeepers who advise, label, train and allocate resources. In the overall process, the increasingly complex realities of life and problem situations of those undergoing rehabilitation are translated into the respective institutional expectations and requirements. The concept of social welfare literacy is used to analyse the skills of those undergoing rehabilitation in order to help them find their way around the system of vocational rehabilitation and optimize their life plan.

Social welfare literacy refers to the economic, social and cultural resources of rehabilitators as well as to their abilities to find their way around the rehabilitation system and to articulate and assert their needs and demands. The focus is on biographically acquired knowledge and experiences with social bureaucracies as well as on performative competencies vis-à-vis the procedural workers. Depending on the resources and socio-moral orientations of the rehabilitants, they succeed in optimizing their life plan in different ways with the help of welfare state support.

The Role of Arts Education in Strengthening Democracy: Testing Hypotheses through Social Science

French cultural policies have long relied on the belief that expanding access to artistic works and cultural objects would contribute to strengthening democracy and citizenship (SAEZ, 1999, FABIANI, 2006). While this hypothesis has been frequently debated (LAHIRE, 2006), it has rarely been subjected to thorough examination through social science research. Today, however, we have a wealth of studies on the effects of arts and cultural education (LOYD 2017).

In this presentation, I aim to revisit the conceptual underpinnings of the link—central in the history of French cultural policies—between increasing access to culture and reinforcing democracy, and to explore how social sciences can test each of these connections. What can we observe in arts and cultural education programs that might either confirm or challenge these assumptions? Is it through the development of judgment that aesthetic experience and political participation are intertwined (Arendt, 1954)? Do arts and cultural education programs genuinely contribute to the strengthening of critical thinking? How can this be measured?

Can aesthetic experiences serve as tools for socializing individuals into certain values or behaviors? Are the conditions under which art is experienced correlated with the development of particular forms of expression or political systems?

In this presentation, I will begin by offering a brief historical overview of the various frameworks used in public policy that connect citizenship with the development of cultural policies. Then, drawing on a review of the available research on arts and cultural education, I will examine both the possibilities and the limits of social sciences in testing these hypotheses through empirical investigation.

The Evolving Concept of Gender Equality in the Society of Jesus: A 21st Century Examination

This paper, *The Evolving Concept of Gender Equality in the Society of Jesus*, explores the changing perspectives on gender equality within Jesuit institutions. Drawing from a global survey involving over 1,400 respondents, the study investigates how men and women working in Jesuit ministries perceive gender equality, with a focus on the practical implementation of policies and attitudes in religious settings. Two key conceptual frameworks emerge from the data: the "sameness" approach, which promotes equal treatment and opportunities for both genders, and the "complementarity" approach, which emphasizes gender differences while advocating for mutual respect and collaboration. The results reveal a growing acceptance of women's leadership roles, though significant challenges remain, particularly concerning access to high-level decision-making positions. The study provides a comprehensive overview of how gender equality is evolving within Jesuit institutions, highlighting ongoing efforts, barriers, and the broader implications for religious and social justice. It calls for continued dialogue and actionable reforms to ensure a more inclusive future within the Society of Jesus.

The Promise of One Safe Future for the Oplan Likas Resettled Families of Metro Manila, Philippines

The study examines the impacts of the Philippine government's resettlement approach and resettlement programme on the wellbeing of the displaced poor families due to the implementation of the Philippine government climate change adaptation programme affecting an estimated 11,400 families residing on top and along major rivers and connecting waterways within Metro Manila. Overall, the resettlement programme comprised social preparation, inter-governmental involvement, financial assistance, and the distant and in-city resettlement, has failed to deliver the promise of One Safe Future to the former informal settlers living on Metro Manila waterways and instead rendered them worse off in all areas of economic, social, and psychological wellbeing. The social preparation process was tokenistic, financial assistance became a reverse incentive for the families, and in the general scheme of *Oplan Likas* resettlement programme, compared with in-city resettled families, families in off-site relocation sites are in worse situations and suffer even more due to site location, poorly constructed housing units, lack of basic and social services that altogether create irreversible damage to the welfare of the residents, both the adults and children. It is therefore noteworthy for the government to find ways on how to mainstream and scale the community-led approach, an alternative housing modality to accommodate the housing needs of the country's informal settler families with a promise of a bright future.

Veils of Faith: Exploring Familial Dynamics Among Muslim Wives in Polygamous and Monogamous Marriages in Laoag City

The study explored the experiences of Muslim wives in polygamous and monogamous marriages in Laoag City. It also investigated familial dynamics within both

marital structures. Objectives included: (1) examining how power dynamics affect wives' social experiences at home and in the community, and development in terms of education and economic empowerment; (2) understanding how social factors related to polygamy influence wives' social experiences and personal development; and (3) analyzing varying meanings and perspectives on polygamy among wives within diverse contexts.

Using a qualitative case study design, eight Muslim wives (four polygamous, four monogamous) were studied through purposive and snowball sampling, with data collected via Key Informant Interviews and field observations. Analyses, guided by Bowen's Family Systems Theory and Kim's Cross-Cultural Adaptation Theory, revealed six themes: *marital structures, driving factors, power dynamics, challenges, views on polygamy, and cultural adaptation*. Findings highlight diverse perspectives and the influence of family dynamics and cultural adaptation.

From Masses to Classes? Class Analysis of Post-Socialist Economic Protest

Three decades of neoliberal restructuring in European post-socialist countries led to inquiries related to various societal responses to economic transformations. The transformation from a specific "class-less" society of state socialism to a post-industrial capitalist society with declining relevance of class has been studied from various perspectives (social stratification, value change, political polarisation). However, we do know very little about the nature of the socio-economic protest against the post-socialist restructuring which emerged after the regime change and continues today. While the fall of socialist regimes was often driven by shapeless social forces such as broad national movements and cultural elites, the structural features of the economic protest that emerged after the return of capitalism remain understudied (Dinev 2020). By structural features, we mean the basic character of the socio-economic protest with regard to two major paradigms of societal reactions to the rise of the capitalist economy: coordinated class-based mobilizations (K. Marx) or fragmented chaotic/unspecific countermovement (K. Polanyi) (Silver 2003). Did any economic protest challenging the logic of neoliberal policies after 1989 show patterns of class mobilizations, and if so, when and how? This paper aims to analyze the field of economic contention using the relational perspective in the study of collective action (Emirbayer 1997; Diani 2015). It conceptualizes economic contention as a specific field of collective action where various collective actors make their claims, employ protest repertoire and coordinate their activities (Melucci 1996, Crossley 2002). We define class-based economic protest as both linked to political parties and ideology and coordinated by collective actors representing specific class interests (ESeC model). We build on the formal social network analysis of protest event data in two post-socialist countries with a history of rapid re-installment of capitalism - Czechia and Slovakia - between 1989 and 2022.

NAVRATIL, JIRI* (Masaryk University, Czech Republic)
MENŠÍKOVÁ, TEREZA (Masaryk University, Czech Republic)

Geographies of Economic Contention: A Cross-Country Perspective

Several decades of neoliberal restructuring led to inquiries related to the societal responses to these economic transformations. Many aspects of socio-economic mobilizations became an object of inquiry: repertoires of action, effects of political and economic context, actors' organizational attributes, or collective action frames. While acknowledging the importance of these inquiries, we aim to contribute to the research on a less studied yet important dimension of economic protest: the link between its collective coordination and geography. Previous studies have already addressed spatial aspects of economic protest, such as the diffusion of economic protest (Hedström 1994; Biggs 2005), its scaling up and down (Tarrow 2005; Della Porta, Mattoni 2014) or shift and concentration (Silver 2003; Beissinger 2022). Building primarily on the relational perspective in the study of collective action (Crossley 2011; Diani 2015), we aim to analyze the cooperation at economic protest in relation to the position of collective actors and events in physical space. We conceptualize economic contention as a collective action field where diverse collective actors follow their goals, make various claims, employ various repertoires and cooperate or compete. While such relational meso-level order of collective action represents a social space structured by relations and interactions among collective actors, it also has an irreducible geographical dimension: large urban areas and political centers attract "new social movement" tactics with broad protest coalitions, long ago industrialized regions on the semi-periphery are the storage of a traditional labor repertoire "managed" by the unions, and economic peripheries remain silent with occasional informally organized and atomized protest. To verify these expectations, we aim to link relational and spatial aspects of economic contention in two Eastern European countries - Czechia and Slovakia - and apply a network-analytic approach to protest event data (1989-2022) in Czechia (N= 2042) and Slovakia (N=2077).

'CHAOS of Conflict and CHARM of Coexistence': A Study of Local Community's Perceptions of Elephants in Odisha

Studies highlight several factors that have over the years altered the bonds between the humans and elephants. The most highlighted interactions that have shaped the present bonds has been mostly negative in nature. This particularly threatens the future of elephants in areas that report high human elephant conflict (HEC). Despite several attempts to mitigate the issue and curb intolerance against elephant depredation such as making provisions for ex-gratia to aid the afflicted families, conducting awareness campaigns, training workshops, introducing defensive technologies, demarcating elephant corridors, etc, the frequency and magnitude of HEC is continuing to grow. Having this in background, this study attempted to understand local community's perceptions of elephants, their responses towards HEC and future of human-elephants coexistence in northern Odisha that is affected by resident elephants as well as inter-state elephant migration. For the purpose semi-structured interviews conducted with 349 respondents across eight affected villages. Further exploring cultural and socio-economic components of changing human-elephant bonds as well as tolerance towards elephants, this study has made suggestions for potential participatory and community based mitigation strategies to improve the bonds.

Building Intersectional Solidarity in Feminist Coalitions in South Asia: Interrogating Frames, Praxis and Outcomes

How do internal and contextual factors influence feminist movements' attempt to build intersectional solidarity and to what effect? We examine the choices made by four different feminist coalitions in framing their agenda and praxis around decision making and resource sharing and how these choices lead to different outcomes with respect to intersectional solidarity. These outcomes range from solidarity being short-term and issue-based to long-term around multiple aspects containing transformative potential. We draw on insights from four case studies in South Asia - the Comprehensive Sexuality Education movement in Bangladesh, Bharatiya Muslim Mahila Andolan (BMMA) in India, Nepal Mahila Ekata Samaj (NMES) in Nepal, and Aurat March (AM) in Pakistan. These case studies were part of a five-year-comparative study of 16 feminist or women's rights coalitions or networks in South Asia on how movements succeed in countering backlash.

Using Ciccica and Roggeband's (2021) typology on the kinds of intersectional feminist solidarity vis-à-vis transformative praxis and framing of issues, we analyse how intersectional difference is framed for wider alliance building and praxis around representation and resource sharing that the four movements invest in to identify why solidarity outcomes vary. Our analysis contributes new empirical knowledge to emerging approaches to researching political intersectionality and feminist solidarity and deepens our understandings of how building feminist solidarity is a contentious, iterative, and ongoing process.

We argue that building transformative intersectional solidarity requires challenging hierarchy within feminist agendas and contains a range of intermediate outcomes in the journey to transforming power relations. Moving away from the conventional normative readings of solidarity practices (transformative or co-opted forms), we provide empirical evidence from South Asian feminist movements on different ways of envisioning solidarity and their long-term implications in the face of mounting anti-feminist backlash.

Do Women Matter?: Democratic Backsliding and Women's Movements in South Asia

In recent times, South Asia has witnessed dramatic political shifts, including de-democratisation and shrinking civic space, that have affected the space for advocating women's rights. Bangladesh, India, Nepal and Pakistan have experienced the rise of the religious right and conservative populist agendas and the economic shocks that has led precarity. These economic and political shifts have polarized public discourse on gender equality, co-opted women's empowerment for conservative agendas, permitted trivialization of women's rights activists, and instigated gender-based violence. In this paper we investigate what does democratic backslide mean for women's movement contending pushback against bodily autonomy, labour rights, and citizenship claims.

The four South Asian countries we focus on differ with respect to political contestations, kinds of regimes, and independence of public institutions to counter democratic backslide. Women's movement actors in South Asia have had to navigate the political space strategically, engaging with and making allies within the state, framing their agendas in ways that appeal to development and larger nation building agenda, being careful about not being co-opted by political parties. The recent elections in India and Pakistan, and political change in Bangladesh indicate spaces for women's struggles being able to promote gender equality agendas will shift further. This paper is a part of a five-year comparative research across the four countries where we track 16 cases of women's struggles and how they adapt and use different strategies to create space for their agenda in discourse, law, policy in the context of democratic backsliding. Drawing on scholarship on women and feminist movement, gender and politics, and social movement theory we show how women's movement actors navigate challenges of de-democratisation.

FASANG, ANETTE (Humboldt University of Berlin, Germany)

NIATI, NOELLA BINDA (Cambridge University, United Kingdom)

Contesting Post-Colonial Government: Social Movements in Senegal from the 1990s to the Present.

Senegal is often portrayed as a model for a stable liberal democracy with relative economic success in the region. Social movements have used political opportunities as an outlet for expression and have been used by politicians as a tactic for mobilization. However, political opportunities have not been the only rationale for movement formation. Studies conducted on social movements in Senegal have predominantly focused on large-scale mobilization worthy of media attention. Furthermore, most conceptual definitions for social movements tend to focus on the perspective of affluent liberal democracies, failing to account for the specificities of lower-income nations with different characteristics, preoccupations, aims, and strategies. For several reasons, Senegal is a particularly well-suited case to study social movements in low-income countries. First, Senegal is one of the least politically repressive countries in the region. Second, it has a relatively active and effective landscape of social movements. Third, it is dominated by moderate Islam with very little room for radical religious movements compared to other countries in the region. These unique characteristics not only make Senegal an intriguing case study but also highlight several critical gaps in the existing literature on social movements. Specifically, these gaps include: (1) how social movements form, change, and evolve over time, (2) to what extent existing social movement analytical approaches fit the context of lower-income nations, and (3) how social movements can be conceptualized to reflect the context of lower-income nations, which are marked by fragile economies, weak state provisions, and often difficult democratic transitions. This paper aims to examine the evolution of social movements in Senegal since the 1990s. In doing so, it will contribute to theoretical perspectives on social movements by informing the classification and conceptualization of these movements in lower-income countries, particularly within sub-Saharan Africa, with Senegal as a case study.

Climate Change and Livelihood Nexus in the Congo Basin: Understanding Gender-Differentiated Impacts on Women's Health and Local Response

The Congo Basin is an important ecological zone for a population of over 75 million inhabitants from Cameroon, Central Africa Republic, Democratic Republic of Congo, the republic of Congo, Equatorial Guinea, and Gabon. This population depends on rain-fed agriculture, collection of forest resources, fresh water, and other economic activities led by women. The region is threatened by climate change which has affected livelihood and wellbeing especially for the poor, majority of whom are women. This paper examines the impact of climate change on the health of women and their local adaptation strategies. It is based on grey literature and desktop review supplemented by and qualitative analysis of data from field interviews conducted among selected women groups in Cameroon and the republic of Congo. Findings reveal changes in temperatures and rainfall trends characterized by flood, drought, desertification, landslides, and with the temperatures projected to rise by 3-5°C and precipitation between 20-30% by 2100. The result is increasing water scarcity and water-borne diseases, soil erosion, reduction in crop yields, and increasing food insecurity. All of the above have increased the cost of living and healthcare in a region where most of the inhabitants have low income and health infrastructures are inadequate. This situation has impacted women most and compounded gender inequality because of women's high demand for health care and challenges to care affordability which are gender differentiated. Women resort to traditional health services, migration, and alternative sources of livelihood have so far, produced mixed results with important implications for mainstreaming women's health in national and regional climate policies.

Disability Inclusion in the South African Health System: Results of a Health System Assessment

People with intellectual and developmental disabilities face more barriers accessing healthcare and, on average, experience worse health outcomes. These barriers are attributed to inadequate health systems. The Missing Billion Inclusive Health System Framework is a new tool to support policy makers assess levels of disability inclusion within health systems. We used this framework in South Africa (SA).

Information sources used to complete the assessment included SA laws and policies, publicly available data and datasets, published literature and interviews with people with IDD, their carers/family members and service providers.

The framework was comprehensive and feasible to complete. It highlighted key strengths in terms of disability inclusion in the South African health system as well as gaps and leverage points for action.

This framework enabled us to identify progress and opportunities to strengthen disability inclusion in our health system. There are opportunities for strengthening data and evidence, inclusive policies, healthcare worker training on disability and health service accessibility.

These insights enable us to set a benchmark for disability inclusion in South Africa, and how government, civil society and academia worked together to identify ways in which the health system could be more inclusive of people with disabilities. Actions must be centered on, and informed by, people with disabilities

NEDERVEEN PIETERSE, JAN* (Global Studies 2115 Social Sciences Building, USA)

Globalization—Everything, Everywhere, All the Time

Abstract. Is globalization still a proper descriptor? Does globalization also include satellites and space shuttles in outer space? Recent work widens the definition of globalization: 'Globalization is the trend of greater worldwide connectivity of people over time and the awareness of this happening' (Nederveen Pieterse 2021: 29). This shift of emphasis to connectivity as the driving force and the key point, implies that globalization is just one of the many forms this takes. Important is not the form, which changes according to circumstances, but connectivity and what it aspires and achieves. In an era of comeback of geopolitics this may be an important course adjustment.

MARININA CHEFANOVA, ELIZAVETA* (National research university "Higher School of Economics", Russian Federation)

Exploring the Strategies of Scientific Long-Term Mobility

This study explores the strategies of long-term mobility among researchers in social sciences and humanities. Long-term scientific mobility is viewed as a crucial component of collaboration, enabling the exchange of knowledge, professional growth, and skill enhancement (Saxenian, 2006). It contributes to both individual career development and national innovation by promoting "brain circulation" (Markova, Shmatko, Katchanov, 2016). Researchers who engage in long-term mobility act as connectors between global and national scientific communities, facilitating knowledge transfer and international partnerships (Johnson, Regets, 1998). However, mobility is often associated with challenges such as career uncertainty, loss of social connections, and difficulties in adapting to new academic environments, especially in fields where local social context is vital for research, like the social sciences and humanities (Courtois, Sautier, 2022; Pajić, 2015).

This study used a mixed-methods approach to assess the career implications of long-term mobility. Researchers were categorized based on their mobility strategies. "Distant workers" maintained remote or hybrid contracts, experiencing minimal career disruption. However, not all researchers successfully implemented this strategy, with some returning to their previous roles. "Tied movers," on the other hand, struggled with skill gaps and often viewed mobility as a detriment to their career, with many seeking retraining or return to their home country (Kotsemir, Dyachenko, Nefedova, 2022). The study also revealed differences based on career stage: early career researchers benefited from mobility, gaining opportunities and advancing their positions, while leading scientists faced more challenges, including limited job opportunities and organizational regression (Petersen, Shaw, 2002; Flowerdew, Li, 2009). The findings suggest that while long-term mobility offers numerous professional advantages, it also presents risks, particularly for established researchers. The study highlights the need for tailored strategies to support researchers at different career stages in leveraging mobility to enhance their professional trajectories.

NEHRING, DANIEL* (Swansea University, United Kingdom)

The Sociology of Psychologies: Re-Theorising Moral Life in an Age of Uncertainty

Around the world, everyday life is increasingly characterised by anxiety and uncertainty about the future, against the backdrop of the 'poly-crisis' of economic adversity, global heating, and geo-political fragmentation and conflict. In turn, psychotherapeutic knowledge, in diverse, bio-medical, spiritual, and religious forms, has arguably become a pervasive moral idiom through which individuals respond to anxiety and frame care and mental healing and well-being for self and others.

Nonetheless, this 'therapeutic turn' has arguably remained under-theorised. There is an extensive body of attendant scholarship, in sociology and across the social sciences. However, this scholarship has tended to focus on a few societies in the Global Northwest, neglecting everyday experiences and practices of mental well-being in the Global South, alongside transnational connections in popular therapeutic discourses, products, and services. While research on therapeutic cultures has arguably burgeoned in recent years, in response to internationally widely shared concerns about a 'mental health crisis', its theoretical and empirical perspectives have remained partial.

In response, drawing on extensive fieldwork in East Asia, the Americas, and Europe since 2004, I develop a 'sociology of psychologies' that re-thinks the therapeutic turn and its cultural and socio-political consequences. Through this sociology of psychologies, I aim to re-theorise everyday therapeutic cultures in an age of poly-crisis and make a case for a field of sociological enquiry whose concepts, themes, and methodologies may inform broader debates about social cohesion and conflict, change, and inequalities. My argument builds on extensive research conducted in Latin America, the USA, the Caribbean, Europe, and East Asia since 2004. On this basis, I draw attention to the broadly transnational scale of the therapeutic turn, the ontologically heterogeneous, bio-medical, religious, and spiritual discourses and practices that constitute it, and the implication of these discourses and practices in the colonisation, de-colonisation, and re-colonisation of social life

Student Housing: Comparative Perspectives on Reported Experiences

More than fifteen years since the launch of a research programme on the living and housing conditions of students in France and across the European Union (Némoz, Bousquet, 2007)¹, a new survey has been introduced, conducted among and with the involvement of current students. While exactly sixty years ago, individuals enrolled in higher education were referred to as "the inheritors" within France (Bourdieu and Passeron, 1964)², what analysis can sociology offer today? This is a vast and ambitious question, as evidenced by the numerous studies carried out during and after the COVID-19 pandemic. In this paper, we pursue the more modest aim of exploring the residential practices of students by comparing around thirty autoethnographies conducted daily for almost four months in 2024. This empirical material, containing a wealth of feedback on residential experiences, was approached from a range of comparative perspectives (local, national, international and longitudinal), the methodological and analytical foundations of which we will describe. We will outline the role of collective reflexivity in these approaches, particularly when exploring issues of social justice and spatial justice. Lastly, we will present the findings on inequalities that can be obtained by using a bottom-up approach to the systems for accessing and occupying student housing.

Understanding Soil Movement and Climate Risks to the Home: Perspectives from France and Switzerland

For several years now, the enormity of global warming has been evidenced by record temperatures worldwide. In all scenarios for greenhouse gas emissions produced by human activities, the sixth Assessment Report of the Intergovernmental Panel on Climate Change (IPCC) estimated last year that the global surface temperature will increase by 1.5°C by the early 2030s (1). As a governance strategy, therefore, "cooling down the Earth" (2) continues to raise many questions and uncertainties. While these have been explored at international level for several decades in relation to the connections between housing and the environment (3), understanding these risks at individual household level is now becoming a pressing matter.

This paper presents a joint look at ways of dealing with the climate risks associated with the shrink-swell of clay soils to homes in France and Switzerland. Based on an intercultural survey (Némoz (ed.), 2024), the REFECTED study offers a comparative approach to both residential and institutional challenges. We will present the forms of vulnerability experienced and the extent to which changes, continuities and conflicts can contribute to a reassessment of the concept of "home".

Health Professions and Health Practitioners' Regulation after the Neo-Liberal Era: A Theoretical Framework for Analysis

The paper will set out a preliminary outline of a theoretical framework to analyse health practitioners' regulation and its evolution in a comparative perspective. Developing from Giarelli and Saks (2023), it will combine a theoretical framework and concepts drawn from the neo-institutionalist theory, as used in comparative health policy, and from the sociology of professions, especially the Neo-Weberian theories. Neo-institutionalist theory explores institutional conditions and policy developments by analysing the interaction between institutions and actors in comparative health policy. The methodological and conceptual tools used to reconstruct policy-making in a multi-level perspective may be adopted to analyse the policy of health practitioners. In this context, professions are interest groups or stakeholders competing for power and social position in the political and social arenas. This approach is consistent with the Neo-Weberian theories of professions. These use concepts such as social closure, exclusion, usurpation and jurisdiction to analyse how professions defend or improve their position in the social stratification, in terms of income, status and power. Contributions of these two approaches are integrated by that of industrial relations, in order to study the characteristics and strategies of social mobility adopted by the health support workers.

This framework may be tested in the study of health workforce policy, and particularly of health practitioners' regulation, after three decades of neo-liberal and globalisation policies. Marketisation, managerialisation and labour market liberalisation have significantly affected health policy and, directly or indirectly, health professions and their regulation. In particular, they altered the distribution of power among the actors in the policy arena, changed the relationship between State and professions, and challenged the traditional mechanisms of labour regulation in the health sector, which were focused on the ideal-type of professionalism and on the medical dominance. The paper is aimed at discussing the proposed framework and its empirical use.

The Politics and Policy of Welfare Service Professions in the Era of Workforce Shortage

In recent decades, healthcare, social, and educational professions in Western countries—particularly in Europe—have faced increasing levels of distress and crisis, driven by socio-economic, demographic, and public policy changes. This crisis is most notably reflected in severe personnel shortages and recruitment difficulties, which are significantly undermining the capacity of welfare systems to meet growing service demands. Despite the centrality of workforce issues in these labor-intensive services, the governance of personnel policies in welfare services and the corresponding policy arenas has rarely been the subject of dedicated investigation in the social and political sciences. This oversight has hindered a comprehensive understanding of these policies. As observed by Kuhlmann et al. (2023) in relation to healthcare, workforce policy has seldom been treated as a distinct area of investigation. Furthermore, the typologies commonly employed to analyze health, social, and educational systems tend to neglect the specific policy networks and arenas of welfare service professions.

This paper aims to make an initial contribution by proposing a conceptual framework for analyzing the governance of welfare service professions and the networks shaping this policy domain from a comparative perspective. In this context, the focus is on the healthcare, social, and educational sectors in Europe. To achieve this, the paper mainly draws on methodological and conceptual tools from two strands of literature: the first is neo-institutionalist theory, as applied in comparative social policy, to reconstruct policymaking processes and sectoral policy arenas from a multi-level perspective; the second is neo-Weberian theories in the sociology of professions, which employ concepts such as jurisdiction, social closure strategies, exclusion, and inclusion to analyze professional groups and their strategies in confronting the other political and social actors.

NETTELBLADT, GALA* (Bauhaus University Weimar, Germany)

Exploring the Role of Time in Water Governance: Contradictory Temporalities in the Planning for Urban Water Scarcity

Urban planning embrace discourses of foresight in the global transition towards a sustainable future. The proposed paper counters this narrative by foregrounding the ponderous nature of bureaucratic planning systems in the

governance of urban water scarcity, illuminating situations where the pace of climate change overtakes planning's sustainability visions. It aims to break new conceptual grounds by weaving together political sociological approaches to water management (Mollinga et al., 2008) with urban studies literature on temporalities (Besedovsky et al., 2019). Empirically, it examines the planned Lusatian Lake District in Germany, which is set to become Europe's largest artificial lake district through the flooding of abandoned coalfields. The region's future is imagined as one of lush lakes, where tourism is hoped to fill the economic gap created by the planned coal exit, with adjacent towns developing marinas and harbour districts. But lakes stay dry, and marinas abandoned, as the original plans from the early 2000s failed to project the overlapping consequences of mining and global warming-induced water scarcity now starkly characteristic of the region.

Water scarcity is thus introducing a whole conundrum of temporal dynamics into the planning of the Lusatian Lake District, stirring up questions about how, when and where the future should be built. Analysing documents and interviews with key actors, the paper asks: Which temporal dynamics characterise this process? What are the power relations embedded in the making of these temporalities? My line of argument unfolds across three mutually contradictory temporal dynamics that shape how water scarcity impacts planning: First, 'sticky bureaucracies' holding on to outdated plans, characterised by extremely slow regulation and approval processes. Second, growth-driven forecasts, which entail projections of the future that skew decision-making towards economic rationales (e.g. in planning for tourism) at environmental costs. Third, the attempts by environmental activists to 're-orchestrate' these powerful temporal dynamics.

AI-Development in Austrian's Prisons

With advances in technological development and the promises of efficiency, accuracy and traceability – especially through artificial intelligence (AI) – the public sector has started to make institutional adjustments. As a highly heterogeneous sector, with long-standing processes and practices vary depending on the area of operation, the development and implementation of new technologies should take this complexity into account. In this complex field, the various institutions and stakeholders all have the aim to include their logics, ways of thinking, and organizational practices into the processes of the technology. Taking the empirical example of the development of technology-based workflows for Austrian prisons, we examine how the different logics of stakeholder groups are included or excluded during the development process, how these are justified, and how these inclusionary and exclusionary practices influence the functionality of the system.

These findings are based on the experiences of two interdisciplinary projects in the specific prison context. Empirical results based on a situational map show how the various stakeholder groups (did not) participate in the development process of an application for prisoner room screenings and how they defined socially relevant problems for technical solutions. Their perspectives and images are presented in relation to the follow-up project, in which an AI-supported digital assistant for prison officers is being researched and developed.

Taking these perspectives into account, we want to address how a logic of impact-oriented resource management, which dominates the development of the technological tools, is negotiated throughout the process, and how other logics, such as user-friendliness, flexibility of work-flows, as well as the possibility of a non-use, compete throughout the development process. Finally, we will discuss the impact of these competing logics on the use of the finalized systems in the specific prison context and what this may mean for technology development in other areas.

Changes in the Austrian Penal System: Impact Controlling Along Formal and Informal Structures

In the light of developments of New Public Management and increasing social digitalization, legal and organizational innovations are evolving in the public sector. As a result, impact controlling was introduced in the Austrian penal system in 2018, along with a new software tool for data collection and consolidation called "Cockpit". The structural changes that process along the implementation and realization of this tool question the traditional model of a bureaucracy in Weber's sense. My dissertation project therefore focuses on the question of how formal and informal structures and actions change along

the introduction and development of the impact controlling tool “Cockpit”. Initial empirical findings from qualitative interviews are discussed from the perspective of the concept of social person-oriented service organizations. They provide insights into organizational patterns of interpretation and processes that go hand in hand with the new digitalized and automated forms of data collection and processing. Subsequently, the further empirical steps of the applied interpretative artefact analysis are discussed and the associated hypotheses and possible findings for organizational change are presented. Whether and to what extent digitalization phenomena contribute to the (de) stabilization of bureaucratic organizations, such as those in the penal system, is one of the possible focal points of the lecture.

NEVALAINEN, AINO* (University of Helsinki, Finland)

Structures of Feeling of Anti-Antiracism in Contention over (Anti) Racism in the Finnish Hybrid Media Ecology

In Finnish mainstream and social media, recent years have witnessed moments of expansive mediated contention over (anti)racism where definitions of racism as well as the content and practices of antiracism have been intensely contested, and where discourses challenging antiracism have gained abundant visibility. This contention, however, manifests not only as struggles over what racism and antiracism *are (not)* and what *should (not)* be *done* about them, but also as struggles over emotions—what *is (not)* and *should (not)* be *felt* about them.

This presentation examines the structures of feeling (Harding & Pribram 2002, 417–419) of anti-antiracism: emotional discourses that contribute to (re) producing racialized power relations by compelling and penalizing different emotions to delimit, delegitimize, and conditionalize antiracism(s). I ask, how are emotional discourses engendered, amplified, and silenced in and through mediated contention? What kind of—and whose—emotions are (de) legitimized, and on what terms? How are emotions raced and gendered?

The research material consists of mainstream news media articles (N=55) from three Finnish news media sources and of Twitter (X) posts (N=4027), which are analyzed utilizing emotion discourse analysis. I examine three moments of intensive contention regarding (anti)racism that represent some of the most visible Finnish discussions on race and racism in recent years: discussions on the use of blackface in the traditional *Star singers* play (2017–2021), discussions on colonial and racist representations in the Finnish *Star of Africa* board game (2021), and discussions on the *Marja Sannikka* talk show's episode on 'woke' (2021).

This presentation parses political mobilization of emotions in mediated contention over (anti)racism, pointing to how anti-antiracist and anti-'woke' discourses are undergirded by structures of feeling that reinforce the delegitimization of antiracism(s) challenging racialized social orders.

Asserting Tribal Data Sovereignty: Transforming Indigenous Futures and Challenging Colonial Systems in Aotearoa, New Zealand

Indigenous peoples have long endured the harmful impacts of extractive data practices imposed by colonial powers. In settler-colonial regions such as Australasia and North America, governments have gathered extensive data on Indigenous populations, to monitor, control, and intervene in their lives. Given the historical and cultural significance of Indigenous data and the growing risks posed by data colonialism and surveillance capitalism, Indigenous communities are asserting their right to control the collection, ownership, and application of their data. This paper discusses the seven-year journey of Ngāti Tiipa, a hapū (sub-tribe) from Aotearoa, New Zealand to reclaim sovereignty over their most precious data—that is, data relating to their ancestral genealogies and territories. Funded through various research grants, Ngāti Tiipa undertook a massive data collection exercise, digitising a wide range of hapū-relevant information from government-controlled archives, libraries, and online sources. They then worked with data scientists to create their own virtual data repository including a bespoke genealogical database. Community-wide wānanga (customary deliberations) were held with elders and families to develop protocols to ensure that the data collection, protection, and approaches to data privacy aligned with their tribal values and knowledge systems. The Ngāti Tiipa journey toward

data sovereignty is one worth sharing because it illustrates how community-led approaches support making informed choices regarding the protection, access, and use of their precious data to benefit families. This agency and self-determination bring about positive change, support future generations and reveal how Indigenous Data Sovereignty promotes data justice and Indigenous rights in a post-colonial era.

NEWMAN, ELIZABETH* (George Mason University, USA)

Deconstructing False Narratives of African Americans in a Modern Technological World

Through the lens of Mbembe's concept of “new exclusion” and Collin's “new racism,” I have theorized the continuation and impact of false narratives and their persistence globally. Racial and ethnic false narratives flow freely between people, media, organizations and institutions. False narratives about African Americans originate from the early years of colonization, dating back to the fifteenth century. The historical underpinnings of these false narratives have shaped and transformed and thus persist today (post-slavery). African Americans and Africans continue to endure psychological and physical abuse by White oppressors both in the United States and globally.

This theoretical research builds on the work of Achille Mbembe's *Critique of Black Reason* (2017) on his forms of “new exclusion” and the role that these false and (negative) narratives have on African Americans and Africans. Exclusion for African Americans is created and perpetuated from years of cultural development reinforced by layers of influence flowing in and out of our institutions. This research investigates how these narratives are a means of scapegoating African Americans that can be hypothesized to 1. A lack of accurate information about African Americans while at the same time, isolating oneself from any sustained and/or frequent interactions with African Americans. And 2., as Collins points out, the abandonment of acknowledging and educating historical racism in the United States by grouping African Americans in a universal paradigm which distorts the uniqueness of the African American struggle in the United States; through structural and systemic forms of new racism (Collins 2004:12). This theoretical research not only brings light to an important topic, but it also allows room to create real utopias (Wright 2012) that in turn shift these narratives from negative and false to real and accurate.

NEWTON, CAROLINE* (Delft University of Technology, Netherlands)

Transformative Feminist Pedagogy in Spatial Planning Education: Stimulating Radical Urban Imaginaries

This paper investigates the transformative impact of feminist pedagogy on spatial planning education, drawing on the critical insights of bell hooks and Chandra Mohanty. By reconceptualising education as an act of liberation and challenging traditional academic power structures, feminist pedagogies empower students to envision and create radically different futures and inclusive urban imaginaries.

Building on hooks' (1994) vision of education as a liberating practice, this presentation starts by introducing feminist pedagogical approaches. First, Chandra Mohanty's critique of conventional pedagogy underscores the politicisation of identity in classrooms to amplify marginalised voices. To mitigate potential backlash against identity politics, Mohanty's concept of co-implication is employed, highlighting shared (historical) experiences to foster solidarity and reduce conflict (Mohanty, 2003). Secondly, as advocated by hooks (1994), engaged pedagogies foster reciprocal relationships between teachers and students, cultivating a classroom environment that supports shared vulnerability and collective growth. Both approaches disrupt traditional power dynamics and promote critical engagement with knowledge, enabling students to better understand social justice and equity in urban planning.

In the second part of the presentation, using my own studio practice, I show how feminist pedagogical approaches transform design studios into dynamic spaces where urban planning is revisited through the lens of social justice. Students critically engage with material and social realities. Rigorous research and free exploration encourage creative and innovative approaches to the challenges presented to students. By encouraging transgression - crossing established boundaries to embrace choice, truth-telling and critical consciousness (hooks, 1994) - the studio becomes a democratic space that challenges conventional urbanism paradigms. This approach invites students to connect personal experiences with broader political contexts (Mohanty, 2003) and cultivates critical attitudes essential for social transformation (hooks, 1994).

This article concludes that feminist pedagogical approaches are ideally suited to foster the development of urban representations that embrace social justice and equality.

Social Ageism in Child-Centric Attitudes and Futures of Care

Amidst an increasing attention to unpacking the diversifying and dynamic forms of care, I draw attention to contrasts between different forms of care work, namely childcare and eldercare, across the culturally diverse societies of Singapore and Taiwan (in East Asia) and Canada (in North America). I argue that despite their significant cultural differences in the historical institutions of welfare policy and family care, there are common shifts toward a child-centric attitude of care organization in which intensive parenting (through education as care labour) and social ageism in care planning and policy outcomes coexist. The majority of care work studies tends to analyse childcare and eldercare in the family/household context as an individual category and separate from each other. But situating the wider trends of dialectical child-centric and ageist tendencies in care relations within modernity as a general ethical dilemma is an important conceptual move for care work scholars to challenge the dominant instrumental constructs of human valuation. I draw on a few semi-structured interviews with middle-aged working professionals in Singapore, Taiwan, and Canada who are adult children and parents of young children; members of the "sandwich generation" with multiple (and often conflicting) care obligations. Intriguingly, a common observation is what social observers of Chinese families have termed "descending familism", which refers to an inversion of traditional values of elderly respect and veneration. Singapore's and Taiwan's Confucian culture stands apart from Canada's liberal or individualist ideals, for instance, in the former's reluctance to accept the idea of elderly institutionalisation - sending one's parents to a nursing home is socially stigmatised and regarded as an unfilial act. Nonetheless, I identify a connecting thread of competitive academic culture and intensive parenting in childcare that exerts ageist effects at the interpersonal and household level. Moving forward, trends of social ageism deserve greater analytical scrutiny.

ESTHER C L, GOH* (National University of Singapore, Singapore)

Researcher's Positionality and Emotional Labour – Ethical Navigation of Power Dynamics in Research with Minority Children from Malay Muslim Blended Families

Giving voice to children is a concrete endorsement and expression of acknowledging them as competent social actors, who participate actively in the construction of their own childhoods, thus have the right to express their opinions on matters that affect them. Inherent in this paradigm are ethical and methodological challenges of what constitute responsible data collection, analysis and interpretation where the rights and well-being of children have precedence.

Drawing from our qualitative case study involving seven children between 11 and 15-year-old from Malay blended families, this presentation focuses on the ethics of power relations between the adult-researcher and child-participant. A critical perspective on researcher positionality is adopted for the careful handling of the navigation of power asymmetry. Positionality influences all research phases from formulation of research question, designing of data collection methods to addressing the challenges in implementation. A less discussed aspect of the adult researcher positionality in the field interactions with child-participants is the emotional work required to handle sensitive issues with child participants. The presentation unpacks key positional aspects and the mitigation of power imbalance. One essential practice is the active use of reframing during interviews and allowing child participants to assert subtle forms of power.

In this study, power relations are further complicated by ethnic and cultural differences. The lead author, a member of the majority Chinese ethnic group interviews with Malay children, a minority in the society. Ethical approval from an Institutional Ethics Review Board does not necessarily guarantee adequate sensitivity to these nuances. Without explicit attention to ethnicity, culture and age dynamics, there is a risk of rendering children invisible.

The presentation highlights the importance of addressing these ethical complexities before, during and after data-collection.

NGOLOKO NGOMB, NOOR VANESSA* (Groupe de Recherche pour la Performance des Organisations, Cameroun)

Gouvernance Responsable Des Méta-Organisations Et Satisfaction Des Parties Prenantes : Cas De L'auf.

Assimilée à un ensemble dont les membres sont des organisations plutôt que des individus, (Leys et Joffre, 2014), la méta-organisation est très souvent caractérisée par un mode souple d'appartenance, une absence de règles formelles et de système hiérarchique de pilotage (Malcourant *et al.*, 2015). Selon Leys et Joffre (2014), La création d'une méta-organisation modifie les frontières traditionnelles de l'organisation et engendre par la même occasion, une augmentation de l'incertitude pour les acteurs. La gestion de cette incertitude nécessite des pratiques de gouvernance spécifiques.

Dans le secteur de l'éducation tertiaire, les méta-organisations telles que l'Agence Universitaire de la Francophonie, jouent un rôle crucial dans le développement et l'amélioration d'un enseignement inclusif et de qualité. La gouvernance d'une telle structure demeure complexe, non seulement du fait de la pluralité des missions des organisations qui la constituent (les universités), mais également du fait de la diversité des attentes de ses parties prenantes.

Cet article a pour objectif d'explorer la contribution d'une gouvernance responsable de l'AUF à la satisfaction de ses parties prenantes. A partir d'une étude de cas réalisée au sein de l'agence du Cameroun, l'étude examine les mécanismes de gouvernance mis en place par l'AUF pour répondre aux attentes variées de ses parties prenantes, tout en procédant à leur hiérarchisation.

NGUYEN, ANNE* (Universidad Complutense, Spain)

La Construcción De Una Subjetividad Política a La Luz De Los Movimientos Sociales, El Caso Del Estallido Social Chileno.

Esta comunicación aborda los cambios en las subjetividades inducidos por la participación, sea activa o como observador, de un movimiento social. Me detengo en el caso del estallido social en Chile que implicó un sin precedente, una ruptura frente a los análisis de las subjetividades individuales de las décadas anteriores, consideradas mayormente despolitizadas. Este trabajo se fundamenta en una revisión bibliográfica, tomando como eje la siguiente pregunta: ¿Cómo se transforman los procesos de subjetivación política a la luz de los movimientos sociales? Propongo demostrar cómo se ha definido el concepto de "subjetivación política" en la literatura científica, especialmente aquella producida desde Chile, y sus implicaciones en el análisis del caso. Además, me apoyo en teorías desde la filosofía, la antropología y la sociología para analizar los conceptos de "subjetivación política" y de "movimiento social". Los resultados desembocan en la aparición de un sujeto colectivo, producto de este proceso de subjetivación política. Esto significó un reencuentro entre individuos a escala de la sociedad y un primer paso para pensar un proyecto de sociedad común, favoreciendo una mayor cohesión social. Las consecuencias del estallido en la vida institucional del país fueron múltiples. Así, según Garretón (Avendaño y Osorio Rauld 2021), el resultado de las elecciones de constituyentes en 2021 refleja una continuidad con las preocupaciones de las manifestaciones. Finalmente, termino concluyendo que los manifestantes buscan tener acceso a mayores instancias de participación política, entendido como una *maximización* del régimen democrático imperante.

Avendaño, O. y Osorio Rauld, A. (2021). La institucionalización del estallido en la Convención Constitucional. Entrevista a Manuel Antonio Garretón. *Revista de Ciencias Sociales Ambos Mundos*. (2), 117–121.

What Gives Women a Say in Decision-Making in Households? Agency and Bargaining Power in Pakistani Households.

This paper analyses the factors that influence Pakistani women's decision-making agency within the household and determines their participation in intrahousehold decisions. Gender and Development theorists have prescribed integration of women into the formal labour market through education and employment as the solution to the development woes of the Global South. However, this study challenges women's economic 'empowerment' under the premise of capitalism and neoliberalism. Extending from Naila Kabeer's resources, agency, and achievements framework, decision-making agency is considered as a proxy for a woman's relative position and status within the family and household. Women in the sociocultural context of Pakistan

achieve bargaining power within households by a combination of individual- and household-level determinants. Individual-level determinants include women's age, education, employment, occupation, relationship to the household head, type of relationship with husband, involvement in spousal choice, and ownership of property while household/family-level determinants include duration of cohabitation of couple, number of children, particularly sons, and household wealth. Relative bargaining power of women, indicated by their relative age (with regards to their husbands'), relative earnings, and relative education, impacts the complex dynamics of intrahousehold decision making. Furthermore, decision making dynamics between couples follow the patterns of any other form of negotiations and the outcome is determined by the bargaining power of the parties involved.

This study uses social survey data from Pakistan (Pakistan Demographic and Health Survey 2017-18) to explore the factors influencing bargaining power of Pakistani women in intrahousehold decision-making. It is critical to engage with negotiations of agency and autonomy as experienced by contemporary Pakistani women. This research is an important contribution to the enquiry into social inequalities in the South Asia, because it studies women in Pakistan as they navigate structural inequalities within homes, despite getting education and entering the labour force in more numbers than ever before.

Race and Equity in American Higher Education Post Affirmative Action: Lessons from the Gates Millenium Scholars Program

The US Supreme Court decision to outlaw *Race Conscious Admissions* in Higher Education struck a death blow to Affirmative Action policies that had dramatically increased the numbers of Black students attending and graduating prestigious predominantly white postsecondary institutions. The precipitous "Post Affirmative Action" decline in Black student enrollments gives urgency to identify possible alternatives to protect hard fought diversity and equity gains on the nation's campuses to be reflective of the country's racial and ethnic diversity. Some argue *Social Class Based Admissions* can be an effective tool to ensure equal access and success for Black students. The Gates Millenium Scholars Program (GMS) offers fertile soil to test this premise.

The \$1.6 billion Bill and Melinda Gates Foundation Initiative has funded 20,000 high ability, low-income Black, Latino, Asian and Native American students. GMS effectively removed finances as a barrier to four-year college attendance for over 20,000 first- generation scholars. "Full ride" scholarships allowed students to pursue bachelor's degree in any field, followed by opportunities to pursue graduate degrees in Math, Science, Engineering, Education, Library Science, or Public Health.

Our data are from the Fall 2001 GMS freshman class (510 self- classified as African American, 135 as Native American/Alaska Native, 312 as Asian Pacific Islander American, 219 as Hinospanic American and 114 as White). The survey included questions on college choice, aspirations, values, family support, academic preparation, undergraduate activities, and other background information. Multi-variate analyses will allow us to specify how race, academic preparation and other background factors correlate with college choice, transition, and success.

This paper helps us better understand how **race and class matter** for college choice, illuminating important differences between and within racial groupings. Further, the paper engages racial and ethnic diversity as a strength to be interrogated as supportive of young adults' positive postsecondary and identity development outcomes.

NICOLAZZI, MARTA MARIA* (Università degli Studi di Milano, Italy)

Body, Self and Space: How Women's Fear Articulates in Milanese Public Spaces

Research shows that women experience discomfort or feel unsafe in a variety of situations to the point that this becomes a "gender specific tax" that limits their right to the city (Andreola & Muzzonigro, 2021). Moreover, studies have reported that women feel the most vulnerable or in danger when in public spaces, especially if unknown and at night; while most gender-based crimes actually happen during the day, in familiar populated places or behind closed doors. After decades of feminist analysis of the relationship between marginalised bodies and public spaces, this discrepancy between the social structuring of women's fears and the actual circumstances in which

gender-based violence occurs needs to be investigated as social sources that limit women's freedom of movement have not been identified yet and the heteronormative "masculinization of public spaces" still goes unchallenged (Kern, 2020). Influenced by a range of existing studies across different disciplines, the research develops a conceptual lens that is based on the hitherto un-theorised nexus of relations between body-space-fear, where the three dialectically linked, to investigate the existence, persistence, resistance and social structuring of women's fears and their implications for women's daily lives in Milan, Italy. Aiming at the production of new counter-hegemonic forms of knowledge that resist the dominant gender-space paradigm and weaken the prevailing space-gender determinism, a feminist methodology is adopted and data are being collected through ethnographic observations, semi-structured one-to-one in-depth interviews and focus groups structured around collective walks, participatory photovoice, community and emotional mapping rethinking the concept of security.

The term "women" refers to everyone who identify as such or was assigned female at birth.

NICOLAZZI, MARTA MARIA* (Università degli Studi di Milano, Italy)

Italian Feminist Daughters: What the 'Generation Y' Has to Say about Growing up in a Feminist Household

Seeking to reconcile childhood and feminism as well as moving away from adult-centric perspectives on generational change, this paper explores the childhood experiences of women of Generation Y that grew up in feminist households in Milan, Italy. Specifically, it aims at understanding the role that mothers have in shaping the political identity of their daughters and the effects of feminist assumptions on motherhood and family structures. The research engaged with existing literature, connecting the mother-daughter relation to debates around agency, care, politics of childhood, concept of 'generationing' and generational feminism. Adopting an abductive value-based reflective and relational approach, the data was collected through one-to-one, semi-structured biographical interviews with Milanese women born between 1981 and 1999 who had a feminist mother. Findings from the interviews show an overall positive impact of feminism on gender stereotypes within family structures that reflected themselves on household dynamics as well as on generational order. Placing communication at the core of their parenting agenda, feminist mothers broadened their children's possibility to perform agency and transformed the existing standardized top-down power relation with their daughters into a more horizontal dynamic based on trust and mutual learning. Challenging the idea that messages tend to get lost in translation across generations, this paper also unveils a strong continuity between feminist waves as daughters' political identity is deeply shaped by their mothers' feminist dialogue.

Mutual, Reflexive and Dialectical: On the Constitutive Role of the Research Assistant in Ethical Knowledge Production

To study a globalized world, researchers often relocate to unfamiliar contexts, whereby research assistants can be crucial in navigating language barriers, providing local knowledge and facilitating connections. Increasingly acknowledged as central to knowledge production, scholars have yet to explore research assistants' role in ethical knowledge production. Within institutions, ethics board approval has increasingly become a bureaucratic checkbox while, in practice, it is rather an ongoing collaborative exercise actively involving researchers, participants and research assistants. As of today, ethics review boards minimally discuss the ethical implications of hiring a research assistant; only considering their role in relation to data protection, translation or risk assessments. Drawing from our own experiences as researcher and research assistant co-conducting qualitative interviews with immigration detention support actors in Italy, this paper reflects on how the researcher-assistant relationship can inform not only the research process, but also knowledge production within the ethical field. Deepening the debate on the role of the research assistant in knowledge production and considering the latter as a dialectical process, we point to the generative nature of this relationship for ethical learning in knowledge production by means of negotiating ethical principles, developing ethics skills and training, and engaging in mutual dialogue to overcome ethical challenges.

NIEBLER, VALENTIN* (Humboldt University Berlin, Germany)

Within and Against: Class-Making of Migrant Tech Workers in Berlin

Long considered an affirmative elite, tech workers have recently been increasingly involved in labor conflicts and social struggles across the world. My project explores the problems, class identities and collective action strategies of migrant tech workers in Berlin, Germany.

On the basis of 50 qualitative interviews and a 14-month ethnography of a local worker collective, my study looks at how tech workers have developed political self-understandings in recent years and how they negotiate their class position in labor conflicts. Based on the research, I argue that a shift towards social conflict can be observed in both the self-understandings and actions of white-collar tech workers. In Berlin, this shift towards class-consciousness is intertwined with struggles on migration (from Global South and Global North) and citizenship. At times, this combination has opened avenues for coalitions with other groups, such as delivery gig workers or housing right initiatives. The difficulties of trade unions in Germany to address tech workers have led to grassroots self-organizing, but also to new experimental methods and revitalization discussions on the side of trade unions.

Although my findings indicate a rise of collective action in recent years, they do not indicate whether tech workers constitute a progressive group as such. Rather, my findings suggests that the tech industry as such has become increasingly contentious and politicized in the last decade, a fact that is also (but not only) reflected in collective action phenomena among tech workers.

NIGENDA, GUSTAVO* (National Autonomous University of Mexico, Mexico)

ARISTIZABAL, PATRICIA (National Autonomous University of Mexico, Mexico)

The Precariousness of Health Workers. a Global Phenomenon That Threatens Labour Rights and Health Care for Populations.

Introduction. Precarisation of labour has spread in both industrialised and low- and middle-income economies. In the health sector, this phenomenon affects huge numbers of workers, causing them to lose, in a short period of time, rights acquired over decades. In Mexico, precarious employment affects 60% of health care workers and the negative consequences of this process are very diverse. Initially it affects the health of the workers themselves, but secondarily it also affects the capacity of the system to provide quality services and cover the entire Mexican population, mainly the most impoverished groups, which represent 36% of the total population in the country. **Methods.** The main source of information used is the National Employment and Occupation Survey of the National Institute of Statistics, which was complemented by in-depth interviews with key individual and institutional actors. **Results.** The precariousness of health workers is a phenomenon that has increased over the last 25 years, but which was exponentially exacerbated by the COVID-19 pandemic, as the health system hired around 40,000 workers under precarious conditions to deal with the health crisis generated by the pandemic. In the post-pandemic phase, health workers face enormous difficulties in providing high quality services also associated to lack of drugs and other supplies. **Conclusion.** Precariousness of work in health shows that the work of doctors, nurses and other labour groups is understood as an instrument for the production of health services in both the private and public sectors. In the private sector it helps to regulate the competitiveness of institutions in the face of market competition, and in the public sector it cushions the effect of the reduction in the public health budget, which has not grown in Mexico in the last 15 years.

Unruliness in a Changing World: Subjectivities and Political Possibilities for Change

Understanding how uncertainty is shaping the future is a core concern of climate scientists, planners and development specialists across a wide variety of disciplines. But what if our efforts to pin down uncertainty are leading us astray? What if planning and prediction create new kinds of uncertainties that make it more difficult, not less, to govern the future let alone the present? In this talk, I draw from feminist and anti-colonial thinking to suggest an emancipatory approach to questions of uncertainty, unruliness and governing the future. I build from the excellent precedents in Sociology and related fields on risk and uncertainty to take on the challenge of chaos: uncertainty that

escapes the confines of risk analysis which I call 'unruliness'. Using empirical examples from energy transition debates in Nepal, I focus this talk on how subjectivities and inequalities become foundational to the way that unruliness can derail the most well-intentioned efforts to prepare for a changing future. These new inequalities are often rooted in gender, race and class, but exposure and vulnerability to biophysical hazards adds another intersectional dimension. I outline a relational framing of change that emphasises an anti-colonial, political, cross-scalar, and socionatural analysis in order to ask, how do political struggles over how to govern the future transform possibilities for solidarity in the present?

Inte-11.1

NIGHTINGALE, ANDREA* (University of Oslo, Norway)

Unruliness in the Anthropocene: Subjectivities and Political Possibilities for Change

Fundamentally, the Anthropocene is a universal story, one where too often, the focus is on biophysical impacts that will leave traces in geological sediments. But the Anthropocene is also a sociological concern. Casting humans as the dominant driver of global change is not a neutral description. The legacies of colonialism, capitalism and patriarchy shape which processes or relations are prioritized when the Anthropocene is cast as a definitional moment. In this talk, I draw from feminist and anti-colonial thinking to suggest an emancipatory approach to these challenging times. As climate changes, so do key political subjectivities meaning that some people are assumed to understand change, while others are expected to adapt, creating new forms of inequality and exclusion at a global scale. These new inequalities are often rooted in gender, race and class, but exposure and vulnerability to biophysical hazards adds another intersectional dimension. I outline a relational framing of change that emphasises the affects and effects of climate change through a political, cross-scalar, and socionatural analysis in order to ask, how does uncertainty about the future shape subjectivities and political possibilities for solidarity in the present?

Navigating Precarity: Organizational Diversity in Iran's Industrial Labor Mobilizations

Since 2010, industrial workers in Iran have confronted mounting challenges from deindustrialization and financialization, reshaping labor processes and fueling widespread mobilizations. Despite facing similar structural pressures, workers across various sectors have adopted diverse organizational forms, ranging from grassroots self-organization to collaboration with state-controlled labor councils. This paper examines this diversity through a comparative analysis of four key cases of labor mobilization in Iran: the Haft-Tappeh Sugar Cane Company, Iran National Steel Industrial Group (INSIG), Heavy Equipment Production Company (HEPCO), and Chadormalu Mining and Industrial Company (CMIC). Each of these companies has undergone severe cost-cutting measures that increased worker precarity, including factory closures, wage suppression, and the introduction of new labor management regimes.

Drawing on in-depth interviews and content analysis of nearly a decade's worth of news reports, social media posts, and official statements, this study explores how workers have employed varying organizational repertoire in response to these pressures. It reveals that the socio-political context—particularly the workers' prior organizing experiences and regional political traditions—plays a critical role in shaping their choice between horizontal, grassroots organizations and formal state-led structures. Furthermore, the findings underscore the importance of broader societal alliances, ethnic identities, and local community ties in sustaining grassroots resistance against state repression.

This research contributes to the broader debate on labor activism by illustrating how external socio-political dynamics influence the organizational forms and strategies of worker mobilization. By highlighting the role of historical legacies, political culture, and social alliances, this study offers new insights into labor organizing within precarious industries, advancing scholarly understanding of how traditional and emerging forms of labor activism interact in contexts of economic and political upheaval.

NIKOU, IDA* (SUNY Stony Brook, USA)

Sanctions, China, and the Financialization Trap: Labor Exploitation and Resistance in Iran

This paper explores the impact of global economic sanctions and the rise of China as a geopolitical powerhouse on the deindustrialization and financialization of Iran's manufacturing sector and how these factors contribute to intensified labor exploitation. The geopolitical pressures of the sanctions, alongside Iran's growing reliance on an extractive economy, have shifted the country's industrial base toward speculative financial practices. This shift has undermined productive sectors, deepened worker precarity, and reshaped labor regimes. As financial actors increasingly dominate production processes, workers are subject to greater exploitation through wage suppression, informal contracts, and job insecurity.

This study employs a qualitative comparative analysis of four key industrial firms in Iran—Haft-Tappeh Sugar Cane Co., Iran National Steel Industrial Group (INSIG), Heavy Equipment Production Company (HEPCO), and Chadormalu Mining and Industrial Company (CMIC). These cases are significant because they exemplify the adverse effects of financialization and Chinese competition, leading to deindustrialization and the expansion of an economy centered on resource extraction. Furthermore, these cases represent some of the most robust labor resistance campaigns in response to such transformations, making them essential for understanding the interplay between exploitation and resistance.

Drawing on digital fieldwork and archival research, this paper provides a grounded analysis of how external pressures reshape national labor regimes and the strategies of worker resistance that emerge in response. It examines the role of financialization as a key mechanism of capital accumulation, driving wage suppression and job insecurity while prioritizing short-term profits over long-term productive investment.

By situating Iran's experience within broader geopolitical shifts in the Global South, this paper contributes to a deeper understanding of how global transformations in the production matrix of capitalism affect labor processes, regimes of exploitation, and class formation. Ultimately, it reflects on the potential for labor organizations to confront and challenge these evolving labor regimes.

NILS, ZIMMER* (University of Potsdam, Germany)

Between Stigma and Resilience: Emotional Geographies and Narratives of Belonging Using the Example of Mehringplatz in Berlin-Kreuzberg

Berlin is characterised by a high proportion of people with a history of migration, which makes the city a culturally diverse place. As in many large German cities, this diversity is reflected in a highly segregated urban structure. At the same time, the spatial separation emphasises the close link between migration and socio-economic factors. An exemplary case is the Mehringplatz neighborhood in Berlin-Kreuzberg. This district is marked by a high number of households in precarious situations and families with a migration background. One particular aspect of the marginalisation of the neighbourhood is its stigmatisation (see also Wacquant 2008). Children and young people are particularly affected, as they often have only limited opportunities to counteract this negative image. As a result, they develop their own strategies for dealing with it. While they sometimes adopt and even exaggerate the stigma of the neighborhood, in other moments, they reframe the area as a place of community, solidarity, and resilience. Despite the material marginalisation and negative public representations, they create positive, collectively shared narratives that enhance the place and turn it into a symbol of belonging and pride. In this way, they counter hegemonic discourses with positive narratives and use the neighbourhood as a reference point for their own logics of recognition and exclusion. The article examines the affective dimension of the spatial self-positioning of young residents and shows how places are charged by emotional and social experiences and how these contribute to identity formation. The findings of the study presented are based on ethnographic research that I conducted from 2016 to 2020 (cf. Zimmer 2021).

WG10-JS-84.3

NILSSON, JENNY* (York University, Canada)

Issues with White Anti-Racism on Social Media: The Case of the American Reparations Movement

The redress of historical racism has since the 19th century concerned a debate about reparations for chattel enslavement in the Americas. While there is currently a vivid discussion in activist, media, and academic spheres about potential federal reparations, little research has looked at the discourse on the self-declared "reparative" programs that have already been initiated in the US. According to representatives of the reparations movement, these initiatives are highly controversial and not considered actual reparations. However, my analysis of the discourse on these programs enabled unprecedented qualitative analysis of the public's support or rejection of the reparations movement itself.

In this study, I am utilizing the Value-Belief-Norm (VBN) theory (Stern et al., 1999) to explore whether X-users are in support of, or against the reparations movement in the US. I analyzed the discourse surrounding self-declared reparative programs executed by six local governments in the US between 2019 and 2022, mainly claiming to pay out reparations for chattel enslavement. I utilized data from 1,400 X-posts, posted between June 2019 and March 2024 which I gathered manually and analyzed in NVivo. I found that individuals who self-present as Black tend to be critical of these initiatives while showing support for actual reparations, aligning with support of the movement according to VBN. On the other hand, both those who reject the initiatives, or support them, tend to self-present as White and did not meet the VBN criteria of being supporters of the reparations movement. The latter finding illustrates the very real implications of uncritically supporting self-declared anti-racist programs, reflecting both issues of White anti-racism practices and misinformation in social media discourses.

This research contributes with a novel analysis of how online anti-racist social movement discourses can both reproduce challenges common to in-person activism and produce new challenges through the proliferation of misinformation.

NILSSON, JENNY* (York University, Canada)

The Formation of White Swedes: A Relational Analysis

The Nordic identity is undoubtedly categorized as White in the 21st century, as evident by for example the 'othering' of non-White Nordics and the aesthetic use of the Vikings as markers of Whiteness within global right-wing movements. While there is a wealth of studies on the Whiteness formation of other groups such as the Irish, and Italians, little research has explored the historical formation of Nordic's White racial identity. Through a relational approach (Molina, HoSang, & Gutiérrez, 2019) I will explore how the racial formation (Omi & Winant, 2014) of White Swedes in North America and Sweden synchronously developed. Emerging research highlights the importance of the Swedish institutionalization of scientific racism to the formation of Whiteness in North America, making Sweden a useful case study.

In both contexts, I will explore the formation process of White Swedes by conducting a narrative analysis of materials describing Swedish racial identities to the public, produced between the years 1840 and 1915. This allows for an exploration of the trajectory of the racial formation of the group from when they first started to mass-emigrate to when their racial identity was established. In the North American context, I will analyze how Swedes were depicted in regard to race in ten major North American newspapers. Additionally, I will analyze official immigration and church records containing ascribed racial categories. In the Swedish context, I will analyze ten major newspapers and newspaper clippings and publications accessed from the State Institute for Racial Biology Archive in Sweden.

This project is important from a social justice perspective as racial identity formation processes directly relate to the (re-)production of racism. Further, through merging racial formation theory with a relational approach, I am able to provide a nuanced analysis of how White racial formation processes historically operated across borders.

NIMROD, GALIT* (Ben Gurion University of the Negev, Israel)

Technostress As an Obstacle to Dignified Aging in the Digital Age

Numerous studies have demonstrated an overall positive association between Information and Communication Technology (ICT) use and Subjective Well-being (SWB) in later life. Without detracting from the value

of previous research, it should be noted that most studies on ICT use and SWB in older adulthood focused on positive impacts, typically neglecting adverse effects. By concentrating on technostress ("a modern disease of adaptation caused by an inability to cope with new computer technologies in a healthy manner" [Brod, 1984, p. 16]), which was highly documented in research on younger users, this presentation aims at illuminating a potential risk factor associated with technology use in old age. Based on the findings from three studies conducted in six countries, four topics will be reviewed: 1) the technology-induced stimuli that induce technostress in older age, 2) the background characteristics associated with higher levels of technostress in later life, 3) the association between technostress and older adults' SWB in varying circumstances, and 4) the global nature of technostress as an adaptation challenge in old age. Following this review, it will be argued that technostress is critical in explaining third-level digital divides (i.e., disparities in benefits gained from ICT use) and should be considered a threat to well-being in older adulthood. Moreover, as the population most affected by technostress in all circumstances and all countries is that of the frailer older adults (i.e., older, less healthy, less educated, with lower income), it will be claimed that technostress is a factor increasing social disparities within the older population. Accordingly, technostress endangers frailer older people's enjoyment of the human right to dignified aging, autonomy, and overall thriving by making them feel inadequate to live in dignity in an increasingly digital world.

The Hippie Way to Age: Keys to Well-Being According to Older Flower Children

No other group of individuals associated with the 1960s counterculture more than the hippies — The long-hair colorfully dressed youth, who rebelled against mainstream societal values and generally sought more meaningful and authentic lives. In 1970, many, if not most, of the 40 million Americans aged 15 to 25 participated or at least sympathized with some aspect of the hippie movement. These "flower children" are now over 60, making a significant part of the older population in the United States. So far, however, no study has presented an in-depth investigation of the hippies' present reality. Based on 40 in-depth interviews with lifelong, returning, and past residents of The Farm, the largest and most known hippie community and one of the few still existing today, this study offers the first outlook into older hippies' daily lives and experiences of aging. This presentation summarizes what may be described as the "hippie keys to well-being in later life": 1) *Creative identity work*, 2) *Multilayered generativity*, 3) *Meaningful play*, 4) *Customized spirituality*, and 5) *Strong psychological sense of community*. These five keys share two overarching qualities: *ideology* and *adaptability*. None of the keys nor their qualities are entirely new to the field of aging studies. However, their integration and intense application among study participants were remarkable. Accordingly, it is suggested that, like everything else they did, the hippies have their unique way of aging and that a lot can be learned from them about having a satisfying and meaningful later life.

NINA-PAZARZI, ELENI* (University of Piraeus, Greece)

The Organization of Support Centers in the Greek Armed Forces

This paper presents the organization of support centers in the Greek armed forces. The presentation is based on the description of one of the actions of the European project "Artemis – Equal" in Greece. This action refers to a network of seven support centers for gender equality in Greece in the local level. Specifically, we will point out the main characteristics and aim as well as the specific goals, the actions which took place during the whole period of the functioning, the problems that were dealt with as well as the way that these problems were resolved, for the success of this Action.

In the Anthropocene era, which is characterized by various developments and new thinking, I propose this network as a replicable model of organization of support centers for women in the armed forces making at the same time some critical remarks.

Ending up the presentation we will present the results of a research survey, concerning the problems that were recorded by the personnel of Support Centers as well as by enlisted women themselves.

Finally, a critical review of the Action will be presented and some proposals will be made for the future in order to be applied as a tool to empower women in male dominated professions.

Gobernanzas Criminales y Soberanías Compartidas: Conceptos Para Descolonizar El Análisis Del Conflicto En Latinoamérica

En América Latina, la convergencia de gobernanzas criminales provoca la aparición de soberanías compartidas, lo que redefine los conflictos contemporáneos en la región desde una perspectiva decolonial. Cuando los grupos criminales controlan territorios y cumplen funciones tradicionalmente estatales, establecen regímenes de control social con cierta legitimidad, a pesar de su ilegalidad. Este fenómeno es lo que se conoce como gobernanzas criminales. A su vez, estos grupos no siempre compiten con los Estados; a veces, colaboran y asumen funciones delegadas por el Estado, como la administración de la seguridad, lo que da lugar a la soberanía compartida.

Los modelos tradicionales de resolución de conflictos, basados en protocolos occidentales y eurocentristas, suelen fracasar al abordar esta compleja realidad. Estos modelos se enfocan en acuerdos de paz entre actores ilegales y el Estado, lo que deja fuera a grupos emergentes que no participaron en las negociaciones y resisten los acuerdos, generando incumplimientos y sabotajes.

Por ello, es necesario reconsiderar estos modelos de negociación y adaptarlos a las nuevas dinámicas de la ilegalidad, donde algunos grupos criminales prefieren gestionar acuerdos implícitos con las comunidades, ofreciendo servicios a cambio de silencio y permisividad. La propuesta de gobernanzas criminales y soberanías compartidas desafía las teorías clásicas del Estado y la Democracia, que presuponen un Estado soberano con el control de la violencia legítima. Sin embargo, en muchas partes de América Latina, esta suposición no se sostiene, y al ignorar los saberes comunitarios, se facilita la consolidación de poderes criminales en funciones estatales.

Finalmente, la perspectiva decolonial es clave para comprender las dinámicas territoriales y regionales de América Latina, ofreciendo una alternativa a las teorías liberales tradicionales sobre el Estado, la soberanía y el monopolio de la violencia.

NION, SOLEDAD* (Facultad de Ciencias Sociales Udelar, Uruguay)

Contributions of Women from the Agroecology Network in Uruguay to Knowledge about Problems and Strategies Related to Climate Change.

The work exposes the problems and strategies linked to the causes and effects of climate change, from the perspective, knowledge and experiences of the Collective Women in the Agroecology Network of Uruguay (RAU).

From this perspective, it focuses on understanding socio-productive and cultural visions, which claim a link with the land and particular nature (Niñón, 2022). Likewise, it makes visible the contemporary disputes that unfold around agri-food systems and how there are ways of existence that account for the processes of subjectivation themselves (Rieiro-Karageuzián, 2020).

Finally, it shows the concrete contributions of women to the situations of uncertainty and socio-environmental challenges that these phenomena entail, anchored in pre-existing gender roles as caretakers of life, but also in the power of the community networks they build.

The project, developed between September 2023 and November 2024, was based primarily on qualitative participatory research strategies, seeking to apply eco-health and transdisciplinary principles. It was funded through the 2023 seed funding call of the Inter-American Institute for Global Change Research (IAI), and will be developed between September 2023 and November 2024.

NION, SOLEDAD* (Facultad de Ciencias Sociales Udelar, Uruguay)

Hegemonies and Inequalities in Discourses about Risks on Production Models

There are a multitude of versions of what risk is, how it should be addressed, and who has the political, technical, and social capacity to deal with it. This heterogeneity of situations reflects, above all, the social conflicts and tensions that are the reflection of different frameworks of intelligibility regarding risks and policies for managing uncertainty.

Analyzing the risks generated in relation to the ways of producing in a region or a country from the perspective of the social construction of risk, requires taking into account the productive models, understanding them as decisions about which benefits are to be achieved and which are the acceptable costs for this. It considers the productive models as forms of production of subjectivities, where there is reproduction of power and mechanisms of domination and/or resistance. The risks that are defined in relation to these models and their definitions, suppose languages of assessment around nature and social equity.

The work is based on a cross-analysis of unique cases, which are presented as relevant considering the current geopolitical inequalities and distinctive features of the Latin American socio-productive matrix. They are instrumental cases, examples of how productive modernization is characterized today, with an orientation toward the development of countries, within their insertion in the regional and global economy.

Soy and cellulose, as productive activities, have had exponential growth in the last 20 years in Uruguay and the region, under state authorizations, foreign investments, changes in productive paradigms, which revolutionized not only technologically, but also socially and materially the environment where they were located, and the country in general. The research is based on the author's doctoral research, carried out from a comprehensive approach where she combines theoretical tools from functional anthropology, sociology of risk and cognitive psychology.

Young Indonesian's Green Entrepreneurship: Reflexivity, Practice, and Agency

This study explores the phenomenon of green entrepreneurship among Indonesian young people. As Indonesia faces significant environmental challenges and increasing impacts of climate change, the role of young entrepreneurs in promoting sustainable practices is crucial. Yet, they often have to deal with the precarious journey of entrepreneurship. Through their reflexive deliberations, Indonesian young people exercise their agency to promote sustainability in the current socioeconomic context. Using Margaret Archer's modes of reflexivity as a framework, this research aims to understand how young Indonesians navigate between aspiration, practice, and impact creation through green entrepreneurship.

Using a narrative case study approach, qualitative data were collected from founders of green businesses in several cities in Java and Bali, Indonesia. In-depth interviews were conducted to gather rich, qualitative insights into their journeys. The analysis reveals three key themes: 1) personal motivation, 2) the practice of green entrepreneurship, and 3) the sociocultural impact of their practice.

The research findings indicate that reflexivity is crucial in how young entrepreneurs deliberately develop sustainable business practices. Young people in this study reflected on their personal values, life experiences, and perceived environmental issues facing their communities, leading to creative and innovative solutions. The practice of green entrepreneurship also reflects young people's ability to leverage structural support and navigate sociocultural barriers. To some extent, through their practices (i.e. waste management and processing, smart and organic farming, and eco-tourism), small transformations are taking place.

This research contributes to the understanding of young Indonesia's green entrepreneurship, highlighting the interplay between individual agency and structural influences. By emphasizing young people's capacity for agency, this study also underscores the potential of reflexive practices to empower Indonesian youth in building sustainable futures, while at the same time actively shaping their life trajectories.

Understanding Aging in Place Among Ethnic Minorities in Hong Kong: A Qualitative Study Using the Social-Ecological Model

In developed regions, most older adults prefer to age in their own homes, or aging in place (AIP), rather than in institutions. However, research on aging choices among ethnic minority (EM) elderly yields inconsistent results, which implies that the underlying mechanisms of the EM elderly's aging choices remain limited. This study aims to answer what drives the EM elderly's aging choices by exploring their lived experiences in Hong Kong. We extended the social-ecological model with cultural elements at each analytical level to explore the multifaceted reasons. Using semi-structured interviews and participant observation involving 23 elderly from ethnic Pakistani, Indian, and Nepalese backgrounds, this study found that the EM elderly in Hong Kong prefer to age in place, particularly in their own homes, while are not willing and prepared to consider nursing homes. Particularly, the elderly's traditional cultural values in terms of family relationships and place attachment towards home, and their limited access to nursing facilities contribute to their preference of aging in place. This study contributes to exploring the aging mode of ethnic minorities in developed regions, especially in an Asian society, where the research on EM aging is limited. It offers policy implications for identifying inequalities in care planning, promoting aging in place among diverse populations, and developing culturally compatible services.

Intersectionality and Human Trafficked Survivors in India

Human trafficking is a modern day slavery and a gender based violence since it affect women and children with major social and psychological impacts not only on survivors, but their families and communities. A range of socio-economic factors like natural calamity, conflict, war, poverty, discrimination against women and children, marginalisation, child marriage and exclusion exacerbate women and children's vulnerability to the pull factors of human trafficking in India. Trafficking is mostly caused by the culture of a neo-liberal economic order as the causal or sufficient variable. This study employed individual interviews, Focus Group Discussions (FGDs) and purposive sampling method in North East India and South India. Trafficked survivors were controlled by traffickers, agents and other actors around them. There exists no accurate data on human trafficking in India and researchers often depends on the government data. The trafficked survivors's traumatic experiences are often silenced, unspoken and disregarded. Hence, this paper attempts to explore the intersectional perspectives of trafficked survivors. Intersectionality of trafficking acknowledges that women's experiences of sexual and labour exploitation, oppression and discrimination are shaped by multiple intersecting factors such as gender, caste, race, age and the like. The intersectional framework recognises that women's identities are not uniform and that various systems of power and privilege intersect to create unique experiences of marginalisation and exclusion. This study found that the trafficked survivors are often conscious of what is happening to them but they are not conscious of the feminist ideas which revolves around certain issues like justice, liberation, gender politics, sexuality, individual accomplishment, ambition, and women's autonomy and the like.

NIUMAI, AJAILIU* (Centre for the Study of Social Exclusion & Inclusive Policy, University of Hyderabad, India)

Political Representation of Naga Tribal Women in Manipur and Nagaland

This paper will address how gender equality is viewed by the Naga society in Nagaland and Manipur, Northeast India? Why Naga women are not represented equally in politics and remain largely invisible? What are the cultural constraints for the Naga women to achieve gender equality till now? Undoubtedly, the Naga women organisations and their leaders have been working at the grass-root level for equal rights and gender justice. However, they could not completely break the glass ceiling and get into a

position where they can exercise power and authority. This paper will also scrutinise the constraints, challenges and structural barriers of Naga women to politically participate in the decision-making. The feminist ideologies have not appealed to most of the Naga women owing to their cultural, historical, religious and social sphere of life. Women's issues have been espoused with the larger political issue of the Nagas., which the leaders have been negotiating with the Indian state for the past several decades. The Naga tribal feminist discourse is still in its nascent stage due to a confluence of many factors that are intertwined, and no single blame can be laid on one group or actor (s). Considering these arguments, it is understood that Naga women encounter various kinds of challenges in asserting their rights, and privileges from a feminist perspective.

Homo Artifex: How Art Made Us Truly Humans

What defines us as humans? If someone asked you these questions, how would you answer? The ability to use tools, bipedal walking, and a keen ability to communicate. One or all of these answers would probably come to mind. However, if we think about it, several groups of animals can perform these skills, to a greater or lesser extent. Monkeys use tools, chimpanzees walk bipedally during many of their daily activities, and several animals have been studied for their complex communication skills. Therefore, in isolation, none of these characteristics could truly define us. However, there is one characteristic that is unique to us: symbolic capacity. Among the manifestations of this capacity, one of the most intriguing is art. The adaptive advantages of creativity, communication, and language are evident. However, in the specific case of Art, it seems to arise in part as a need of the artist, who, in this way, expresses his relationship and that of his group with the environment to which he is intimately connected. It does not seem, therefore, to have been born especially with a practical utility or as a characteristic that offers a greater possibility of survival or differential reproduction. Some of the great enigmas are: is Art an indispensable element for our species? How could natural selection have acted on it? Our unique characteristics have led us and continue to guide us along the path of being the only animals today to observe our surroundings and our species, trying to interpret and modify what we see and what we do not see. Based on Steve Minthen's concept of 'Multiple Intelligences', we discuss the main elements that made Art a fundamental component of human societies, at least since the Neolithic Revolution.

NJIRU, ROSEANNE* (University of Nairobi, Kenya)

Endogeneity and Matrifocality in African Gender Studies: Implications for Gender Equity in Kenya

My work explores the concept of endogeneity in African gender studies and its implications for advancing gender equity in Kenya. I argue that African gender studies must prioritize endogenous ontological narratives to produce more contextually relevant understandings of gender, rather than simply validating Western frameworks. I begin by providing a brief historical overview of the development of African sociology in antiquity exemplified by Ibn Khaldūn's (1378) work predating Auguste Comte. My discussion centers on matrifocality as a key analytical tool for transcending patriarchal discourses rooted in biological determinism. Drawing on the works of African scholars like Ifi Amadiume and Oyèrónkẹ Oyèwùmí, I highlight the importance of centering local histories and practices to challenge global gender narratives. Both scholars illustrate how African kinship systems, such as those in Nigeria, exhibit matrifocality, where women are central figures in households and wield significant power in social, economic, and political spheres. This concept contests the presumed universality of patriarchy and provides an alternative lens through which African societies can be understood, showing that power dynamics in these societies are more fluid and complex than previously assumed. I demonstrate the applicability of matrifocality to Kenya, with examples from Kikuyu and Embu communities, where historical practices such as woman-to-woman marriages reflect a fluid gender system. This system allowed women to exercise power and authority within the household and the broader community, challenging the narrative that women's subordination is an inherent aspect of African society. I advocate for a re-centering of African epistemologies in gender studies to advance gender equity and argue that understanding and embracing matrifocality can provide powerful insights into gender relations in Kenya, offering new strategies for feminist advocacy and policy interventions aimed at dismantling patriarchal systems.

NKULA, LAURA* (University of Cape Town, South Africa)

Connecting Sites of Significance – Testing Innovative Approaches to Urban Memory Work in Cape Town, South Africa

Cultural geographer Karen Till (2012) describes Cape Town as a *wounded city*. A city's "woundedness" is tied to its particular histories, processes, and traumas. In Cape Town these are intricately tied to experiences of settler-colonialism, slavery, and apartheid, which create a palimpsest that can be difficult to unravel in its nuance. For example, forced removals and segregation in Cape Town are commonly thought of as apartheid phenomena, yet these processes have a much longer history. Understanding Cape Town's past – however violent, divisive, and traumatic – not merely as a burden but as an indispensable feature of its urban future captures the core ethos of the Connecting Sites of Significance project. We understand the past – enshrined in memory and heritage, relayed through stories, artefacts, cultural practices, and sites – as the cross-cutting foundation for an integrated, inclusive, and healthy city future. At present, culture and heritage are mostly seen through a narrow, legalistic lens of "heritage management" that is ill equipped to meaningfully protect or recognize intangible heritage elements, e.g. oral traditions, food heritage, traditional craftsmanship, rituals etc. Thus, culture and heritage in Cape Town are not seldom portrayed as a block to development, instead of being seen as an essential enabler for forging social interconnectedness. Connecting Sites of Significance is trying to create a space where the city's multiple narratives, voices and ideas can come together through place-based storytelling. In this presentation, we want to share our progress in building an accessible and inclusive platform that allows the city's diverse publics to tell their own stories and connect in ways that create a sense of dignity, belonging and shared humanity.

Palestinian Childhoods: Academic Responsibility in the Face of Genocide

What is the role of the academy in general, and childhood and decolonial scholars in particular, in the face of genocide and the often-violent ways in which racially marginalised children are dispossessed and rendered disposable? In this presentation we focus on questions of academic solidarity and responsibility in response to what experts are calling a "textbook case of genocide" in Gaza, where over 16,000 Palestinian children have been killed with many more injured, starved, and displaced over the past twelve months. We highlight how and why children and childhood are key targets of social, political, and physical violence in settler colonial and ethno-national states arguing that even in the midst of such destruction it is important to attend to the complexities of Palestinian children's lives – their struggles, joys, resistances, and dreams. We conclude by making a case for the importance of international solidarity in the face of genocide, including from academics, and share one such effort: *Letters for Palestinian Childhoods*. Launched in November 2023, this is an online and internationally travelling exhibition of letters, poems, and artwork dedicated to the children of Palestine which aims to stand in solidarity with the children of Palestine by attending to their names, stories, experiences, dreams, and struggles, and the conditions which are so violently shaping their lives.

Redefinitions of Meritocracy in Educational Policies for Secondary School Change in Argentina.

Education systems are at the heart of the validity of meritocracy in contemporary societies. The organizational logic of educational structures and the dynamics of expansion enable the distribution and appropriation of educational capital within the framework of broader processes of inequality. This has legitimized and contributed to the consolidation of broad social sectors in different historical moments.

In Argentina, the historical configuration of the education system and the different waves of massification contributed to the expansion of education access and to the production of new social inequalities linked to the distribution and hoarding of cultural goods. Within the framework of this double function, the state educational structure allowed the consolidation of a broad middle class constituted from processes of intergenerational upward

social mobility through, among other factors, access to free state education, particularly university education. In this process, the secondary level was a crucial link in the chain, since, with its propaedeutic origin, it selected the elite -inheritors and fellows- to continue their university studies.

In 2006, secondary education became compulsory. From that moment on, the challenges faced by public education policies that seek to modify selective practices can be seen more clearly. To achieve the universalization of secondary school, these policies alter the selective mechanisms of school organization that used to model an educational subject legitimized by the criterion of academic merit, thus supporting its social positioning.

We will explore how the changes promoted by these policies are articulated with the students' representations of how they navigate the new formats. We will delve into the redefinitions of merit in these secondary schools, how it affects and redefines the ways of being a student, and the modes of personal legitimization. This analysis is based on the research project results which analyses four provincial policies of secondary school change.

Energy Transition and Gender Issues in Southwestern Ethiopia: Focusing on Electrification and Firewood Usage

As climate change issues become more serious in sub-Saharan Africa, development assistance have been promoted, and projects to install electricity infrastructure based on renewable energy sources are rapidly developing. In Ethiopia, the site of this study, the installation of electrical infrastructure has also progressed, and electricity from renewable energy sources such as hydroelectric and geothermal power generation has reached almost 100%. This has led to on-grid electrification not only in urban areas, but also in agro-pastoral societies. However, the benefits of this development are not necessarily being enjoyed by all local residents. In particular, only about 40% of agro-pastoral communities have access to electricity, and there has been little conversion from wood and charcoal, the most common energy source used at the household level, to electricity and gas. The large amount of smoke generated by wood and charcoal combustion causes "domestic air pollution", which causes respiratory diseases in women and children. The purpose of this study is to analyze the access to electricity and the conventional use of wood and charcoal in an agro-pastoral community in southwest Ethiopia, and to identify the factors that hinder the conversion to clean energy from the actual living conditions of the local people. Through this analysis, I aim to advance the discussion on energy transition and energy mix in sub-Saharan Africa. The study found that woodchips remain an essential energy source for 'poor' producers and users, and that barriers to energy conversion are not simply economic, but a complex combination of factors including trust in government, cooking habits, and food culture. Although households are promoting the use of improved stoves and cooking methods to conserve firewood, it was also found that the negative impacts of firewood use on women's health, etc. remain unresolved due to gender issues within households.

PILOZZI, ANTONELLA (National Health Institute, Italy)

An Intersectional and Transdisciplinary Analysis of the Biobank for the Analysis of the Epigenomic Profiles of Women Victims of Violence

The Project "Violence against women: long-term effects on health for precision prevention", coordinated by the Istituto Superiore di Sanità (Italian National Institute of Health) and financed by the Italian Ministry of Health, mainly studies the possible variations, over time, in the epigenomic profile of women victims of violence. In the project the transdisciplinary approach allows, in the deeper way, the study of the violence effects in the women's bodies and in their health condition. The study of epigenetic alterations associated with stress-related pathologies in women victims of violence allows the revelation of the scars that remain in the deepest part of the organism: the scars in the genome. In addition of the developing of clinical and epidemiological tools for taking care of patients and the developing precision medicine treatment paths, we can find in the project the creation of a dedicated biobank for the analysis of the epigenomic profiles of women victims of violence. In this way, this type of collected biocapital is no longer an element that could be used in the market but this biocapital becomes an element and tool of the Public Health sector – and of research, specifically social – to adequately face a delicate and complex social phenomenon such as violence against women. The relationship of the biomedical research, the clinical studies, the epidemiology and the sociology is the challenge of

this study which, through various projects, aims to focus its attention on the subjects who become the fulcrum of a psychophysical recovery path through the use of the various tools by various disciplines. In particular, the results of the intersectional reading of the biobank project and the evidence of the transdisciplinary approach applied to research will be presented: the hypothesis is that their combination is as strategic in reading a complex social phenomenon as the use of tools such as the biobank.

Transversal Transitions in Sustainable Education: First Evidence from the Susedi Project - Route to Transformation of Educational Institutions through a Holistic Approach to Sustainability

This proposal aims to present the first results of the project Route to Transformation of Educational Institutions through a Whole Institution Approach to Sustainability [Sustainability in Educational Institutions], funded by the European Education and Culture Executive Agency (EACEA) and aimed at entirely rethinking every educational institution (formal, nonformal and informal) with the goal of imprinting it integrally to be "sustainable."

One of the main challenges for such a research-action pathway is the ongoing digital transformation, which occurs sometimes accompanying, sometimes standing in the way of the social change induced by the affirmation of sustainable education. In fact, according to the Whole Institution Approach adopted in the project, educational institutions of all levels and types play a threefold role in the process of realizing a sustainable future: a) social: developing the awareness and culture of sustainability in the community and collaborating with it to achieve the goals of sustainable development; b) pedagogical: developing sustainability competencies in students, educators, and all stakeholders through the integration of these competencies into the curricula and experimentation with innovative training and learning techniques; c) organizational: by making their operations and structures sustainable, IEs become "role-playing institutions," contributing to sustainability in general by providing a coherent learning environment and becoming living models of sustainability practices for students.

Early research findings show, therefore, how the newest technologies applied to education offer immense potential for sustainability, but careful planning, ethical considerations, and ongoing teacher development are essential for its successful integration. In particular, it will emphasize how the transformative force in education, impacting learning experiences, administrative tasks, and personalized feedback of the newest technologies improves collaborative teacher-student learning, intelligent tutoring systems, automated assessment, personalized learning and, so learning outcomes, efficiency, and global access to quality education.

NOGE, GOSIAME* (North-West University, South Africa)

Gendered Governance in Higher Education: Challenges and Opportunities for Career Advancement Among Administrative Staff

Governance structures in higher education pose unique challenges for professional administrative staff, particularly in career advancement. This article explores these issues through an industrial sociology lens and employs feminist theory to scrutinise the gendered dynamics influencing university career paths. Administrative roles, predominantly held by women, are often undervalued relative to academic roles. This undervaluation, stemming from societal patterns of gendered labour, impedes upward mobility and limits leadership opportunities for administrative staff. Feminist theory highlights how the "feminisation" of administrative work contributes to its marginalisation, reinforcing organisational hierarchies where administrative expertise is seen as secondary to the academic mission.

Industrial sociology offers a framework to understand these dynamics as reflective of broader labour market trends, where structural barriers like rigid job classifications and narrow promotion criteria hinder professional growth for administrative roles. The article notes that academic staff typically benefit from more precise, structured career advancement pathways. In contrast, administrative staff encounter a fragmented landscape with fewer opportunities for mentorship, development, or representation in decision-making. These disparities are critical in higher education governance, undermining institutional inclusivity and equity.

To address these challenges, the article recommends reforms to governance structures that acknowledge the essential contributions of administrative staff. Proposed measures include revising job classifications, expanding

access to professional development programs, and enhancing the inclusion of administrative staff in leadership and strategic planning. By creating more equitable career pathways, higher education institutions can boost retention and job satisfaction among administrative staff while furthering gender equity and inclusive governance, aligning with feminist principles of dismantling systemic inequalities. All stakeholders in higher education should share this optimism for improved job satisfaction.

Entangled Temporalities in Social Movement's Strategies: Reflections from Queer and Trans Radical Activism

Temporality is a fundamental dimension both to social movements' practices and visions and to the social change processes in which they are embedded. Their practices are inscribed in multiple and at times contradictory temporal dynamics. Everyday practices for the sustainability of a movement are inscribed in temporalities in some conjunctions at odds with the times of confronting and composing with state politics and the times of inventing new political practices and horizons are inscribed in other temporal perspectives. Conceiving activists practices as a form of concrete utopianism (Wider 2018; Dinerstein 2021), a dialectics of practice and imagination, in which past and present imaginaries and strategies come into play, shapes how each social movement navigates these temporalities differently. This paper focuses on the case of queer and trans radical activism in Colombia and Argentina in order to ask how three different temporalities have been entangled in social movements' practices and strategies: namely, the times of institutional politics (passing laws, demanding public policies, taking part in elections); the times of creating futures in negation to and beyond present constraints of political action (Holloway 2023); and the constant and transversal time of regularly maintaining, sustaining, enduring collective work while creating change (Beraiser 2017). Based on the analysis of 40 conducted semi-structured interviews with activists, participant observation in protests and documentary analysis, this analysis encompasses highlights on the changes of the balance of these multiple temporalities in the movement's visions and practices when temporal opportunities change, as with the Covid-19 pandemic or with the rise of the far right. The ways these temporalities collide, converge or diverge in the constellation of social activists' practices and strategies are the focus of this paper, shedding light on social movements as processes entangled in multiple temporalities and futurities.

NOGUEIRA MARTINS, ALEXANDRE* (Freie Universität Berlin, Germany)

Reframing Justice from Queer and Transfeminist Activisms: Futures Beyond Enclosures in Colombia and Argentina

Hegemonic debates over justice are based on liberal, North-centric and Western-centric perspectives on what justice (and injustice) means, inscribed in individualistic perspectives and centred on punitive measures to counter injustices. From the global South counter-visions have emerged: grounded collective visions of justice beyond individualism, retribution and punishment and against the promises of liberal justice. Queer and trans social movements from the South have been imagining and experimenting other grammars and forms of justice in their struggles against atmospheres of violence - as in the Colombian armed conflict and in Argentinian prisons and on the streets. This paper asks how these Southern queer and transfeminist activism envision justice for these communities and at the same time how reparative, transformative and abolitionist forms of justice are being conceived and enacted in their everyday practices. From a dialogue with transfeminist ancestral knowledge in Argentina - as in the works of Lohana Berkins, Diana Sacayán, Marlene Wayar - and the queer and transfeminist production in Colombia - for instance, from León Zuleta, Manuel Velandía, Daniela Maldonado -, the paper sheds light on queer, trans and travesti concepts of justice from Latin America. In order to apprehend the empirical grounding and development of reparative and abolitionist justices, the paper discusses transfeminist abolitionists practices from Yo No Fui, No Tan Distintos and Severas Flores, as collective elaborations of imagining and practising forms of justice in contemporary Colombia and Argentina. The Southern queer and transfeminist practices assembled and put here in dialogue allow the process of reframing justice to be rooted in the ancestral knowledge of those communities and in the daily practices against enclosed forms of justice towards the continuous invention of reparative and abolitionist worlds beyond oppression, coloniality and cis-heteronormativity.

Turing the Estranged into the Respected: Social Transformation of the Atomic-Bomb Survivors in Japan

In October 11, 2024, *Nihon Hidankyo*, a Japanese civil organization for the atomic and hydrogen bomb sufferers, was awarded the Nobel Peace Prize. In May, 2016, Mr. Tsuboi, then representative of *Nihon Hidankyo*, embraced President Obama, who visited the Peace Memorial Park in Hiroshima to take part in a ceremony commemorating the victims of the atomic-bomb the US had dropped to the Hiroshima city center in August, 1945. As shown in these instances, the atomic-bomb survivors today are not only a symbolic figure for the world peace, but also an important presence in the world politics. Back in 1945, however, things were different. Atomic-bomb survivors were never respected, not even treated by others as those to be with. For many of them job-hunt was shut down, and marriage contract was cancelled. With their deformed bodies full of scars and keloids, a consequential distortion by the atomic-bomb heat and radiation, they were viewed as a polluted ominous creature that had to be estranged and alienated socially. In a way, the post-war period has totally transformed the atomic-bomb survivors from the ominous to the sacred, and from the one representing despair to the one with hope. When did this transformation begin, and what routes have the survivors taken to transform themselves into a socially respected figure? This presentation, focusing on several years after the drop of the atomic bomb, aims to expound the initial stages of the transformation process, using historical incidents triggering an alteration of the social conceptions of survivors. Current research result shows the survivors first went from deformed individuals to a category of survivors through their medical treatment processes, and then from a category of survivors to a public figure in the political and legislative processes.

NORA, JEHLES* (TU Dortmund, Germany)

Segregation in the German ECEC-System at the Local Level

The unequal distribution of socioeconomically disadvantaged children and children with migration backgrounds across childcare facilities is gaining attention in scientific discourse. Developmental psychology and educational studies have shown significant effects of peer group composition on child outcomes (e.g., Miller et al., 2017), highlighting the importance of understanding segregation in childcare centers. However, there is still limited knowledge on the extent and causes of this segregation, especially beyond individual factors like parental choices or childcare providers.

This project focuses on the local level, where public providers are responsible for early childhood education. Previous studies show varying patterns of segregation across municipalities (Groos et al., 2018). The project employs a mixed-methods approach: quantitative analysis describes the extent of segregation at the municipal level, while qualitative interviews with public providers in six cities explore causes and potential actions, such as resource allocation based on demand or centralized placement.

Results show significant variation in childcare segregation across municipalities and providers. In most areas, public childcare centers have the highest proportion of children with migration backgrounds. Interviews reveal that some local actors are unaware of the segregation problem or its extent. Legal constraints and reliance on private providers hinder discussions about actively mixing children. Current strategies focus on demand-driven resource allocation for centers with many disadvantaged children, though data quality and methods vary widely, leading to inconsistent decision-making.

D'CRUZ, PREMILLA (Indian Institute of Management Ahmedabad, India)

Disorganized Coaction: A New Way of Theorizing Workers' Resistance in the Indian Information and Technology Industry

The prevailing anti-union corporate cultures in the Indian IT sector are supported by the footloose nature of capital and the use of sophisticated human resource management strategies. Besides this, employees also harbour the view that a collectivist agenda is at odds with business interests.

Hence, prior to COVID-19, employees quit their current jobs rather than engage in third-party intervention to redress their grievances. This was a passive way of showing their dissent. However, post-COVID-19, a more strident image of employees has emerged. Based on in-depth interviews with thirty participants, we argue that, as the economy recovered, management wanted workers to work from office (WFO), but employees resisted. While employers argued that WFO enabled building a strong organization culture, meeting the data security demands of clients, and ensuring better supervision, employees contended that working remotely gave them flexibility, helped them maintain work-life balance, and reduced their commuting costs. Employers had to postpone several deadlines for employees to return to the office due to this resistance and high attrition rates. Initially, the ability to resist was attributed to the tight labour market situation where employees had opportunities aplenty and enforcing WFO was difficult, but recent evidence suggests that this resistance continues despite the slowdown in the IT sector. This is quite an achievement for the non-unionized 5.4 million Indian IT workforce, who are acting individually yet cohesively. These employees did not, to any significant extent, coordinate the acts of confrontation, and their actions did not fit the definition of collective behaviour. Although they knew each other, they rarely met and had few close friendships. The shared problem of having to work from the office led to individual acts of nonconformity. This uncoordinated reaction by a group of individuals who share a widespread problem is an example of disorganized coaction.

NORONHA, KIMBERLY* (University of Pennsylvania, USA)

The Canary in the Coal Mine: Understanding Climate Change through the Indigenous Language of Sea Attacks in Kochi's Urban Fisher Communities

In the context of climate change, the urban-ocean interface demands greater attention in urban and marine spatial planning. Although fisher communities remain integral to these spaces, they are overlooked in climate change discourse, which tends to focus on catastrophic events rather than the slow, everyday impacts they experience. Additionally, technical and scientific expertise is prioritised over local indigenous knowledge of the oceans.

This paper examines urban fisher communities of Kochi, India, exploring how they articulate climate change through their lived experiences. Rather than adopting the language of scientific discourse, these communities describe gradual changes in the environment, such as hotter summers, variable rainfall, and increased "sea attacks"—giant waves that disrupt fishing, damage homes, and force greater reliance on debt. These observations offer valuable insights into how marginalised communities understand and informally cope with climate change.

The research asks: How do these fisher communities describe their experiences of climate change, and how can this inform broader urban policy discussions? Using ethnographic fieldwork and oral history interviews conducted from 2022 to 2024, this study focuses on women's narratives from fisher communities in Kochi. Their stories, passed down through generations, serve as both personal histories and early warnings of climate change. These narratives not only provide a unique perspective on climate change but also offer a hopeful potential to inform and shape future terrestrial and marine spatial planning.

By recognizing the unique language and knowledge of these communities, this paper argues that local governments can significantly enhance early warning systems and implement more inclusive planning strategies. This approach not only underscores the need to integrate marginalised voices into climate policy and marine spatial planning but also enlightens us about the potential benefits of doing so, ensuring a socially just response to the ongoing impacts of environmental change.

SANTANA, MARCO (Federal University of Rio de Janeiro, Brazil)

Connected in the Struggle: Workers, Social Media, and Recent Mobilisations in Brazil

Mobilisations of truck drivers and delivery workers in Brazil in 2018 and 2020/2021, key moments of recent labour mobilisations, relied heavily on the use of social media. We evaluate the usefulness of social media in terms of three aspects: a) to what extent has social media been useful to create a collective identity of workers, b) has the use of social media facilitated democracy within workers organisations, and c) how secure has the use of social media been in terms of persecution by the state and other antagonistic actors? Both groups of workers have seen enormous difficulties in defining their status (as employees, or entrepreneurs for example) due to notorious

disagreements among main organizations, therefore the identity of those workers remains fragile and contested. In spite of the use of social networks having facilitated the participation and engagement of workers in the mobilisations, democracy within workers organisations has not yet profited fully from this use. In parallel, despite of having allowed increased visibility for workers movements and its leaders, recent revelations of repression against and surveillance of leaders of both groups of workers created doubts about how secure the use of social media is for those workers. A crucial question to be tackled is to what extent these problematics are connected to the use of social media or if they would prevail in any case.

ENGELHARDT, ANNE (Kassel University, Germany)

De-Fetishising Logistics - for a More Encompassing Understanding of Class Struggles in the Global Supply Chains

In the last couple of years, different disciplines have highlighted the role of labour in logistics for class struggle. The debates ranged from "choke points" as "potential magic bullet" for class resistance to "hyper surveillance" of logistical places where the "spatial fixes" of smooth capital flow are protected by state and private security agencies, leading to severe battles with local communities. Looking at class struggle in global production networks through the lens of logistics has brought potentials, but also limits and new vulnerabilities to the fore. Those are theoretical as well as very empirically traceable. On the theoretical side, we see a possibility of an over-fetishisation of logistics in its role in capitalism as concepts like the "logisticisation of capitalism" indicate. On an empirical note, we see the potential of an over-simplification of class struggles along logistics infrastructures, eclipsing the other necessary nodes in global production- and reproduction networks and the need for a more encompassing picture for global struggles in productive as well as reproductive spaces and places. To tackle these shortcomings, we go back to the role of use value and the small and big circulation of capital accumulation, look at the current role of merchant and commerce capital, and the role of shippers in global production networks and logistics as an extension of Toyotisms. The aim of our paper is to de-fetishize logistics and arrive at a more nuanced understanding of the possibilities of struggles along global supply chains.

NOWICKA, MAGDALENA* (German Centre for Integration and Migration Research DeZIM e.V., Germany)

Convivial Visual Research with Mobile Workers and Migrants in the Polish-German Borderzone: Opportunitites and Challenges

By insisting on participatory character of knowledge creation, convivial research wants to enact reflexive and a more ethical and democratic social science in settings which are characterised by power asymmetry. Our research is located in Brandenburg, the region bordering Poland, where many daily and weekly commuters find employment in logistics (Amazon, Zalando) and industry (Tesla Gigafactory). They are attractive, for cheap and flexible workforce whose precarious condition is increasingly a concern to trade unions and counseling services. To understand these workers' lifeworlds and how they are shaped by migration industries, we use a mixture of creative, multimodal participatory methods. Rather than just documenting their practices, we invite the participants to envision with us their convivial futures using modes of creative expression proposed by themselves. In this contribution, we reflect upon the question whose futures are envisioned through collaborative research. We consider our role as researchers at different stages of professional careers (doctoral, postdoctoral, professorial), interest in our research from local, regional and national politicians, expectations of NGOs and community organizations that our research can make a difference, and the participants' – both mobile workers and local inhabitants' – capacities and readiness to engage in politicizing their own current and future situation. We thus address how convivial research could be the moment of opportunity for transformative politics. Our focus thereby is on the questions of the limits of participation, asymmetries of collaboration in research, and ethical responsibility in research-based future-proofing contemporary politics.

Transnational Migrants Thinking of a Better Future: Who, How, and What?

Thousands of Polish citizens commute between 2 and 4 hours daily to work in Germany and back home. In Germany, they perform simple and dull three-shift manual jobs in manufacturing or logistics. Their motivations are largely economic, rooted in the wage difference between Poland and Germany and corresponding to middle class dreams of more stability, savings and investments for future. The price they pay, however, throws them back into working class conditions, such as health issues, dissolving social life, no time for leisure, etc. In this contribution, we are interested if and how these commuters' engage in struggles for a socially just Europe, and whether they concentrate their efforts on one or the other side of the Polish/German border. We view imagining a bright future as a privilege of middle-class migrants, translating into engagements in protests, trade unions, and other more formal ways of working towards more justice in this part of Europe. Many migrants are also skilful in how they resist discrimination in everyday, by naming it and developing alliances across ethnic groups. This strategy, too, can possibly contribute to a better middle class future.

A Doomed Failure?: Climate Adaptation-Oriented Urban Planning That Will Probably Never Reach Climate Integrity

Adaptation to climate has been just as important as reduction CO₂ to achieve carbon neutral society. But is adaptation measure destined to fail? This presentation will discuss the difficulties of urban planning policy that can be used to adapt to climate change based on a case study conducted in central Stockholm, Sweden. In Slussen area, redevelopment project (hereafter, New Slussen) has been underway with the target of completion in 2025. At first, it started due to the aging of the structures, but later, adaptation to climate change was added as another reason. In this area, adaptation to rising seawater and water level has become an unavoidable issue gradually, because Slussen is located to the intersection of the Baltic Sea (Saltsjön) and the lake Mälaren. New Slussen nearly completed, but climate change prediction is continuing to worsen. As scientific findings updated, New Slussen becomes vulnerable to climate change. In contrast, the findings provide strong evidence of criticism for citizens who have criticized this project from the viewpoint of climate change. This case study suggests the following. The time difference between scale of decision making related to climate adaptation and time scale of updating the scientific knowledge makes urban planning never reaching climate integrity.

NOZKA, MARCJANNA* (Jagiellonian University, Poland)

Citizen Activities and Emancipation of the Homeless People. the Case of Poland

Contemporary citizenship encompasses the rights to equal treatment and participation of all citizens in social, economic and political life. Robert Dahl identified this inclusive citizenship as one of those institutions whose existence is essential in democratic states. By contrast, in Poland, a member state of the European Union, citizens in crisis of homelessness experience inequality and exclusion from various spheres of life. In the processes of social stigmatization and often apparent actions of the government, the narrative of degraded, that is, not fully valued and passive citizenship of the homeless is reproduced. At the same time, there is no shortage of examples of civic activities of the homeless. These activities recognize these people's pursuit of emancipation, i.e. empowerment, affirmation and/or 'disarming' of social stigma and reclaiming their civic rights. They are an emanation of the positive freedom that underpins the idea of democracy - the idea of citizenship.

The aim of the paper is to present various forms of civic activity of the homeless people and to reflect on the emancipation they trigger.

In order to achieve the goal formulated above, in the first part of the paper, the socio-institutional situation of the homeless people in Poland will be presented. This is a significant context for their civic activities, to which the second part of the paper will be devoted. These activities are examples of the mechanisms of self-regulation of democracy, which are considered as a measure of real political influence. They include, among others, taming stigma and making it visible; pro-social activities; demonstrations; 'fighting'

for the right to the city and electoral rights; various forms of associations. In these activities, the essence and resources of civil society are reproduced and strengthened, and it further becomes possible to change the socio-political contexts in which homeless people function.

The Challenges and Prospects of Conducting Population Census in Nigeria

Data on the population size, components, distribution, and trends in the process of population change are essential for development planning in the short and long term. Population census is a crucial source of comprehensive and reliable population data, particularly in less developed countries with no or inefficient vital registration systems, population registers, and administrative records. Unlike African countries such as Kenya and post-apartheid South Africa where census has been conducted regularly, population census in Nigeria has been irregular and controversial since the colonial era. Nigeria is Africa's most populous country with an estimated population of 222 million and the largest economy in the continent. To harness the dividends of the country's large youth population and vast natural resources for sustainable development, planning and projecting with reliable data that census provides is imperative. This ongoing research explores the barriers and prospects of efficient census in Nigeria using document analysis and a phenomenological approach. Selected key actors in census planning and administration and national planning are interviewed. The interview fields questions on the meaning associated with census, processes, engagement of technical partners, funding, challenges, and prospects, among others. The final sample size will be determined by data saturation. The preliminary results indicate the existence of challenges that revolve around the politics of control of the process and outcomes, and the increasing number of inaccessible areas due to the activities of bandits and terrorists. Despite these challenges, the government and development partners who support census in Nigeria have demonstrated commitments to conducting a census since after the last census in 2006 through funding, recruitment, and training of essential technical staff, and acquisition of advanced tools for enumeration. The implications of the identified barriers and prospects are discussed.

Inter-Generational Differentials in Perceptions of Gender-Based Violence in Nigeria

Despite global efforts, gender-based violence (GBV) remains a problem that affects millions of people, particularly women. The prevalence of GBV in Nigeria has not improved over time; women who experienced physical violence since age 15 increased from 28% in 2008 to 31% in 2018. Perception of GBV is among the factors associated with GBV. Although it has been studied, differentials in perceptions of GBV among the different generations of Nigerians are unknown. People's perceptions of GBV are influenced by societal shifts and other factors that differ among people of different ages. This research examined inter-generational differentials in the perception of GBV in Nigeria. Data were obtained from the 2021 Nigeria Multiple Indicator Cluster Survey. A sample of 53,706 men and women was analyzed using descriptive statistics, and logistic regression models. The older generations of men and women in Nigeria have significantly better perceptions of GBV than the younger generation, but there is a significant variation at the sub-national level. The observed pattern is worrisome and calls for urgent actions to advance more positive perceptions of GBV in Nigeria if the country will make progress in reducing the prevalence of GBV and achieving the sustainable development goal of a violence-free society.

The Effects of Unemployment on the Social Isolation of Young Adults with Precarious Employment Trajectories

In all southern European countries, the personal network of connections is a source of information and support for labour market integration, especially among young people. Existing empirical studies on this issue show that the contacts that have been made in the employment sphere offer the most useful support in finding employment. These contacts, however, are the ones that are most easily lost when a person is unemployed. In fact, the literature has shown that a long period of unemployment, which could be equated with exclusion from employment, causes a negative spiral of social isolation, so that unemployment leads to a loss of connections, and this loss of connections makes it difficult to return to employment, thus reinforcing the unemployed person's exclusion from employment. In this paper we study the employment trajectories of a sample of 100 young adults between 25 and 39 living in the city of Barcelona with a strong presence of unemployment in their trajectories. The analysis deals with sequential qualitative and quantitative data to analyse the influence of different characteristics of unemployment (duration of unemployment spells, frequency of unemployment, time of the trajectory in which unemployment was suffered) on the characteristics of the personal network of contacts. The qualitative data is particularly important, as it makes possible to identify the reasons and mechanisms that lead to this loss of contacts in the personal network of connections.

Legitimation Politics in Negotiating Sociological Input into Medical School Curricula

Social scientific research on medical education, particularly from a sociological perspective, has grown considerably in the last two decades, given the insights it is seen to offer on professional socialization generally. Despite posing important questions about the legitimacy and representation relating to decisions regarding the public's health, medical education has attracted less research attention among political scientists and theorists. The idea of deliberative democracy allows us to contemplate the possibility that one's interests can be represented even indirectly, such as through representation. Despite reforms, formal medical education remains a fundamental structure for reinforcing medicine's claim to autonomy, exclusivity and discretion on account of the value to society of its specialized and uncodifiable knowledge. Little research on medical education has focused on situated negotiation over the interests, priorities, power and legitimacy of different voices in shaping the content of medical education. This paper considers mixed-method data on overlapping and conflicting student, teacher and institutional views on and responses to the introduction and journey of a mandatory ethnographic project in an undergraduate medical program in Canada. Responses reflect students' desire to learn "real medicine"; institutional value placed on student perceptions; and teacher perspectives on the role of medicine in society. The seminar outlines the patterns and power differences in attempts by various actors to secure the capital to legitimate their voices. Appeals to the need of society were no match for the legitimacy afforded student and faculty perceptions of the primacy of "bio-medicine" in the medical curriculum. This research contributes to how the idea of deliberation can aid understanding social institutions in complex societies. It is questionable whether current individualistic reforms to medical education, such as teaching professionalism and promoting medical humanities, are sufficient to represent the health care interests of the populations that pay for medical education systems.

Re-Imagining Participation with an Orthodox Jewish Community through the COVID-19 Pandemic: The Role of Culture at the Policy-Practice Interface

Traditional public health approaches to catastrophes, such as pandemics, have tended to reflect majoritarian or utilitarian views, manifesting in homogenized policies. Such an approach has disadvantaged already marginalized communities. This paper aims to explore how public health responses emerge as processes in response to public health appeals. Informed by the theory of deliberative democracy, we engaged an interdisciplinary approach to discern lessons from multidimensional aspects of infectious disease manifestation within an Orthodox Jewish community during the COVID-19 pandemic. We undertook blood sampling, researcher-led surveys, key informant and community member interviews, and extensive participant-observation. A sensitivity-specificity analysis of dried blood samples determined thresholds for the trimeric-spike assay, as well as the nucleocapsid assay. Hypothesized survey responses were analyzed in GraphPad Prism version 8.4.0 and R version 4.2.1. Semi-structured interview transcripts, and ethnographic fieldnotes of research meetings, were analyzed thematically. The intersection of serological, sociological and epidemiological data showed the centrality of culture-specific modes of meaning-making in response to the pandemic and government policies. Patterned infection rates by gender reflected gender roles and experiences, with gender being one example of differentiation. Findings showed important gender differences in the community, COVID-19 being experienced differently by gender, with sources of COVID-19 information also varying by gender. The research showed an intensification of community-reliant disease management through the community's own medical resources. Findings also showed dissatisfaction with public health responses and messaging. Excessive and demonstrative policy enforcement weakened public trust. Cultural and religious identity was the main factor distinguishing "insider"/"outsider" status and corresponding distinction between who was trusted and not trusted. Policy approaches need to reflect gender differences. A "one-size-fits-all" strategy of public health communication is ineffective, requiring consultation, negotiation and a degree of self-determination in health policy to understand distinctive cultures within societies and states for sustainable and equitable health policy.

Persistent Promises, Looming Failures: Rethinking Post-2013 Istanbul through Outward Mobilities

This talk seeks to understand changing conceptions and perceptions of contemporary Istanbul, at a particular juncture whereby mobilities in and out of Istanbul have accelerated and assumed new characteristics. We delve into how political subjectivities and imaginaries form as tied to leaving the city given the dynamics of the global urban condition whereby the boundaries between city-center and periphery are exceedingly blurred. For this, we focus on how mobilities away from central Istanbul after 2013 mold the everyday and urban imaginaries given tensions around the "promises" and "failures" of Istanbul.

Istanbul has for long been marked with mobilities – typically inward as a locus of desire and promise. Its transition from being a lively Mediterranean port-city to turning inward with national developmentalism to its expansive eruption propelled by neoliberal globalization throughout the 20th century saw ebbs and flows in how its everyday fared vis-à-vis promise/failure. Outward mobility in the aftermath of the 2013 Gezi Uprising, was tied to specific economic, political and cultural dynamics fostering Istanbulites' fears and anxieties thereby altering meanings attributed to the "center." As such, we study everyday experiences of those who have left the city center for its peripheries, with a view as to analyze shifting imaginaries of the city at a moment when dualities such as the city and suburb, the center and periphery become obsolete.

This talk is based on eight months of qualitative research, including participant observation and in-depth interviews, in two recently populated "peripheral" districts of western and eastern Istanbul. By delving into the Istanbul(ite) narratives of mobilities we highlight Istanbul in-the-making ultimately contributing to the temporal and spatial understanding of urban Mediterranean continually reorganized through promise/failure in the context of economic and political flux.

NUHRAT, YAĞMUR* (Istanbul Bilgi University, Turkey)

Quantifying Academic Integrity: Rethinking the Education-Development Link through Platformization in Higher Education

Education, for long indexing development, has been fundamentally impacted by "platformization," whereby quantification through learning analytics mark novel subjectivities, new pedagogies, reformed aspirations and altered forms of capital attached to rethought meanings of value. Focusing on the case of higher education in Turkey, I delve in this talk, into the ethical and moral negotiations engendered by the quantification of academic integrity through softwares like Turnitin.

In line with quantitative approaches to development, "progress" through education can be conveniently calculated through the intense datafication of education-related endeavours. Numbers, in part generated through educational platforms, can serve as development indicators without a critical consideration of how such quantification reorganizes sociabilities and subjectivities. More than 70 of Turkey's 204 universities were founded after 2000. This proliferation may appear on the surface as contributing to "development." However, critically engaging with educational sociabilities and and subjectivities, including the impacts of platformization, offers more nuanced insights.

The similarity/plagiarism detection software Turnitin's "similarity score" constitutes a singularly reliable measure of academic integrity. I argue that quantification, part and parcel of the larger trend of platformization and tied to neoliberalization in higher education both posits academic integrity as a technicality to manage and at the same time engenders novel ethical negotiations. I highlight how what is conventionally regarded as a virtue – academic integrity – appears to become void of this definition but simultaneously acquires new (and negotiated) content through practices around the use of Turnitin. I thus show that a comprehensive consideration of education and its link to development must include the ethically and morally saturated subjectivities and sociabilities of the changing educational field.

The arguments in this talk are based on ethnographic research I conducted in 2019 and 2020 investigating the social dynamics of plagiarism within the context of the neoliberalization of higher education in Turkey.

TG04-967.2NUMERATO, DINO* (Charles University, Czech Republic)
ROSENFELDOVÁ, JANA (Charles University, Czech Republic)
PŠTROSS, KAROLÍNA (Charles University, Czech Republic)*The Double Uncertainty: Navigating Healthcare Risks By Scientists and Journalists during the COVID-19 Pandemic*

The mediatization of expert knowledge represents one of the cornerstones of navigating uncertainties related to various societal crises and risks. The societal importance of mediated expert knowledge proved particularly important during the recent COVID-19 pandemic. Within the context of uncertainty, experts represented one of the key actors addressed by journalists who struggled to come to terms with what could or will come as next. Against this backdrop, this study aimed to explore the media production processes amidst the healthcare crisis. The study draws on semi-structured interviews carried out in Czechia with both mainstream and scientific journalists and with biomedical experts and experts from the social sciences and humanities. The analysis suggests that the navigation of healthcare uncertainties was significantly affected by the media production logic. Moreover, the relations between scientists and journalists were typical of prematurity and underpinned by both sides' bilateral lack of experience, inevitably developed in the highly emotionalized context and the high sense of urgency. In these constellations of a newly evolving communication ecosystem, scientific claims were often mediated by many journalists who, until recently, had not worked with scientific statements. At the same time, the scientific claims were provided by many scientists who, until recently, had not interacted with the mass media. Different communication strategies that contributed to amplifying or mitigating healthcare uncertainties were therefore determined by another layer of uncertainties concerning the roles and positions of the key actors within the communication landscape. The notion of double uncertainty is introduced here to point out the complexity of interactions between journalists and scientists.

(Re)Construction Sociale De La Citoyenneté à Partir De La Ville : Une Étude Sociojuridique Quant Au Potentiel Émancipateur De La Régénération Urbaine

La régénération urbaine est une approche politique holistique, intégrant des aspects physiques, sociaux, économiques et environnementaux, tout en s'inscrivant dans des partenariats public-privé, et mobilisant des contributions multidisciplinaires. Cette présentation aborde les résultats d'une recherche-action explorant un processus participatif de co-création dans l'espace public urbain, à partir de solutions fondées sur la nature. Grâce à une observation participante et à l'analyse de contenu d'entretiens, dans le contexte du projet européen URBIAT, l'étude se concentre sur l'arène de co-création, impliquant bénéficiaires et parties prenantes, et sur ses coulisses, où interviennent les promoteurs. Quatre hypothèses sont avancées: (re)construction de la citoyenneté dans la ville; conscience du droit entre latences et émergences; pouvoir d'agir des bénéficiaires, parties prenantes et promoteurs; action et recherche émancipatrices.

Les conclusions offrent des lignes directrices pour un modèle de régénération urbaine émancipateur. Dans ce cadre, la mobilisation du droit repose sur la communication et l'interaction entre les différentes instances impliquées. La régénération urbaine inclusive constitue un processus de transformation pour toutes ces instances, visant des alternatives de vie, politiques et économiques, et des pratiques innovantes d'action et de recherche. La citoyenneté peut être activée comme une force socioculturelle collective, dont le pouvoir d'agir et le développement concernent bénéficiaires, parties prenantes et promoteurs. L'intégration de la perspective sociojuridique permet de mobiliser, capter, développer et concrétiser le droit comme la construction sociale d'une vie digne pour tous, un droit vivant qui se traduit par une citoyenneté substantielle et pleine.

Cette démonstration corrobore une nouvelle conception du droit, comme connaissance culturelle constitutive d'identité sociale, relations et luttes. Elle intègre la rupture épistémologique quant à la perception du droit défendue en sociologie du droit, de sorte qu'il est également capté en termes d'attentes, aspirations et revendications, et non pas seulement quant à l'ordre qu'il doit produire.

NUNEZ CARRASCO, LORENA* (University of the Witwatersrand, South Africa)

C-section and the medicalisation of birthing among Somali women, an assault of faith and motherhood

The pervasive use of C-sections among Somali women giving birth in South African public Hospitals has been observed over the last years. This practice is problematic at various levels: it responds to assumptions on behalf of medical practitioners about the identity, religion, and bodies of women, including practices of female circumcision, all factors at the base of the decision to perform C-sections.

There is a lack of informed consent on the part of the women about this medical procedure. For women, this procedure jeopardises an expectation to have large families. Religious leaders have attempted to reach out to doctors and hospitals in a dialogue that represents women's culture, bodies and religion, but without women. The paper explores and poses questions about what is being protected or harmed in the name of religion, in the name of gender and family.

The paper is based on 10 in-depth interviews with Somali women in Mayfair, a neighbourhood in Johannesburg, and religious leaders.

NUR, ABDURRAHMAN* (Yildiz Technical University, Turkey)

For a Non-Reductionist Sociology of Metaphysical Knowledge: On the Social Conditions of Possibility for Knowing Justice in the Secularocene

This paper makes the case for the "moral" need of establishing a new relation between sociology and metaphysics in a way to redefine both the discipline of sociology and the social cosmos we inhabit. Arguing that justice is no longer knowable in the Secularocene, i.e. the current state of the earth as Meziane (2024) calls it, where nothing substantial is done to prevent neither a "genocide on air" in Gaza nor a planetary ecocide (or self-genocide of human species), the paper seeks to investigate the social conditions of possibility for this obscurity and incapacity of justice. Deeming indispensable

a metaphysically and sociologically grounded imaginary of justice for the human future, the paper joins the invitation to refound sociology not just for overcoming the current crisis of sociology to avoid "the coming end of sociology", as Vandenbergh and Fuchs (2019) put it, but also for overcoming the moral crisis of secular colonial modernity to avoid the coming end of human sociality on earth all together.

NUR, ABDURRAHMAN* (Yıldız Technical University, Turkey)

What Makes a Constitution Just?: Sketch for a Sociological Theory of Constitutional Justice

Although the concept of constitutional justice is mostly used in the literature to mean the judicial system undertaking the function of constitutional review, it also refers to the problem of justice in terms of the constitutional formation of a legal system. In this latter sense, constitutional justice is an intricate problem. How can one say if a constitution is just? In legal philosophy, it seems difficult to answer this question without referring to some kind of transcendence, from which criteria for justice are derived, whether it be the state, natural law or divine law. This paper asks if a sociological theory of constitutional justice is possible. Setting out to construct the social space of constitution making as a "field of constituent power", where the living constitution is coded into a written constitution, it argues that longed due formation of constitutional imaginaries in this space can serve as a "historical transcendence" according to which the question of constitutional justice is decided. Finally, the paper provides a case study by offering a comparative analysis of 1921 and 1924 constitutions of the Ottoman-Turkish state in terms of constitutional justice.

NUR MUSE, AHMED* (University of Glasgow, Somalia)

Traditioanl Maternal and Childbirth Practices Among Pastoral Nomadic Communities in Somaliland

Introduction

This research examines maternal health practices among pastoral nomadic communities in Somalia, highlighting the significance of traditional healing systems alongside biomedical approaches. Traditional birth attendants (TBAs), spiritual healing, and plant medicine are crucial in shaping health outcomes. The study critiques the dominant biomedical narrative that often overlooks the complexities of medical pluralism and emphasises the need for a holistic understanding of women's health.

Methods

Utilising qualitative research methods, this study interviewed 20 women of reproductive age and traditional birth attendants through purposive and snowball sampling. It targeted women who had experienced pregnancy within the last five years. Employing interpretive phenomenology and ethnography, the research aimed to capture the essence of traditional maternal health practices within the nomadic community context.

Results

Findings indicate that women display remarkable resilience during childbirth, often enduring labour in isolation due to cultural expectations. Privacy and trust in TBAs significantly influence childbirth choices, as many women fear that formal healthcare will compromise their cultural and spiritual practices. Childbearing is viewed as both a religious duty and a social expectation, which pressures women to bear large families, especially male children. Economic and household responsibilities further dictate maternal health decisions, often leading women to prefer home births over health facility interventions.

Conclusion

The study reveals a complex interplay of cultural norms, spiritual beliefs, and healthcare practices affecting maternal health in pastoral nomadic communities. Despite the availability of modern healthcare, reliance on traditional practices persists, driven by fear of medical interventions and strong cultural ties. This underscores the necessity for inclusive health policies that recognise and integrate traditional practices in improving maternal health outcomes.

Double Hermeneutics in Transdisciplinary Labour Research: A Dialogue-Oriented Methodology for Overcoming Epistemological Challenges

Sociological labour studies are distinguished by their transdisciplinary approach, emphasising close collaboration with practitioners throughout the research process. Yet, the production of transdisciplinary knowledge is a highly intricate and consequently challenging process. While sociological studies are embedded in the dialectical interplay of interpretation and understanding, which has been referenced as a double hermeneutic (Giddens, 1984), transdisciplinary sociological studies are confronted with a twofold double hermeneutic. From the perspective of the practitioners themselves, they occupy the dual role of both subjects and objects of research. They engage in the research and analysis of an issue that directly affects them. Moreover, this also applies to the researchers who are participating in the study. The objectives of their research activities are to produce findings based on scientific rigour and to provide solutions to practical problems. In this way, researchers also exert a more or less direct influence on social or operational practice in a transdisciplinary setting. To address the complex epistemological challenges inherent to these double hermeneutics, this paper will present the argument that a reflexive dialogue orientation should be a core methodological feature of transdisciplinary studies. This, in turn, has the potential to enable transdisciplinary knowledge exchange formats to produce socially and epistemologically robust knowledge, by aligning it more closely with the standards of basic research. The paper will initially present the transdisciplinary research strategy and its epistemological challenges, to then illustrate the dialogical methodology with reference to the field of sociological labour studies. In conclusion, the paper will examine the potential implications of this approach for future transdisciplinary research beyond the field of labour studies.

Climate Action in an Eswatini Community: (Re)Storying Intergenerational Pedagogical Encounters

In this paper, I think-with narrative and visual stories that emerged from climate justice research with lands, children, families, elders, teachers, and a community-based agronomist in Nkambeni, Eswatini. The stories brought forward emerged from children's land-based and classroom encounters with the effects of climate change in their community, from intergenerational dialogues on revitalizing Indigenous foods, and, also emerged as children, families and community members worked with the land to build an Indigenous food garden. I bring together (post)qualitative inquiry, Black method-making and Indigenous methodologies to orient me towards a particular kind of disruptive storytelling. This storytelling is anchored in ethical commitments that refuse the anti-Black, anthropocentric and Eurocentric developmentalism that can shroud even well-intentioned research that is enacted by Global North scholars in the Global Majority world. Importantly, a situated understanding of radical relationality is carried through the article as a concept that interconnects the stories shared of this research. Engaging with (post)qualitative inquiry in this paper also means that I work with a methodology of spatially and temporally diffractive storytelling. Alongside anti-colonial and Black method-making this (post)qualitative approach insists on the rigor of storytelling as method whilst thinking through carefully about what and how stories can be shared, inviting opacity as a generative way to research-with Indigenous and traditional communities, knowledges and lands. In addition to contributing knowledge on intergenerational, land-based and community-centered climate change education, the paper also aims to offer anti-colonial possibilities that are otherwise to anthropocentric and Eurocentric stories of African childhoods.

Thinking with Black Ecologies in Early Childhood Education

This paper draws from ongoing work on liberatory possibilities that emerge from pedagogical and curricular engagements with Black ecologies in early childhood education. The focus is on possibilities for responding in affirmative ways to racist colonial erasures and deficit constructions of Black place relations. We offer possibilities for Black ecologies to be a site for a situated (re)storying of Black nature relations that is also responsive to socio-ecological injustices. The purpose of this work is to encourage early childhood educators and researchers to think alongside the potentials and

challenges of this work. As orientation devices, the paper offers questions and propositions accompanied by illustrative research stories. This storytelling is intended to highlight that Black ecologies hold multiple possibilities for early childhood pedagogies that are anticolonial, affirm Black childhoods, and are place based in ways that center repair, relationality/kinship, and reciprocity. Engaging storytelling to illustrate how Black ecologies might be put to work in early childhood education signals that stories are one of multiple modes of relational inquiry with Black ecologies. This illustrative storytelling also includes insights from research with a group of Black Canadian parents on their ecological practices with and educational desires for their young children. Our modes of storytelling underline that engaging with Black ecologies in early childhood education involves bringing together the real and the imagined—as inventive practices that are also anticolonial and antiracist.

The Role of Heritage in Disaster Resilience in Rural Communities in Portugal and Crete

Disasters often raise concerns about the loss of cultural and natural heritage – floods endanger landscapes, earthquakes destroy ancient temples, and fires engulf libraries. Typically, heritage has been viewed as something to be protected, with disaster management focusing on safeguarding sites.

This presentation takes a broader view, arguing that heritage – including shared practices, stories, and traditions – is a key factor in community resilience throughout the disaster management cycle. Drawing on findings from the Horizon Europe project RESILIAGE, the talk illustrates how (loss of) heritage can both exacerbate disaster impacts and enhance response efforts.

In the former case, the interior regions of Portugal have seen decades-long patterns of depopulation and impoverishment, leading also to a major erosion of practices and knowledge around soil management. As such, this grand-scale loss of heritage precedes and intensifies the local disaster of wildfires. With a local population's gradual reduction of knowledge pertaining to how to prepare and respond to such seasonal phenomena, the absence of heritage plays a key role in the exacerbation of the region's wildfires, themselves magnified by global climate change.

In Crete, by contrast, a process of demographic and economic decline has seen the increasing mistrust among citizens in the state's ability to respond to a disaster. Against the backdrop of the region's ongoing "polycrisis", however, the Greek Orthodox Church maintains a strong local presence, drawing citizens together in shared rituals that strengthen community bonds, as well as mobilising persons into charitable action. Such persistence of local heritage proved pivotal in the 2021 earthquakes in the region, which saw a haphazard governmental response but a vigorous mobilisation effort from the side of the Church.

Such examples underscore the significance of accounting for local heritage as a driver of community resilience, and in impacting the intensity and frequency of a disaster.

A Peak into Zimbabwe's Refugee Regime: Dynamics of Protection in a Shrinking Economy.

Zimbabwe has consistently experienced an influx of refugees despite its shrinking economy. This places a heavy burden on the state to provide social protection to refugees. We use data from twelve in-depth interviews with key informants to explore how the prolonged socioeconomic crisis has impacted the state's ability to provide social protection to refugees in Zimbabwe. The relationship between the state and other stakeholders in hosting refugees in Zimbabwe is also explored. The findings suggest that socioeconomic challenges in a shrinking economy affect the protection outcomes of refugees regardless of the presence of a robust refugee regime in the country.

Young People's Perceptions of Energy Technologies: Risks, Safety, and Impacts

Garnering a clearer understanding of young people's perceptions of energy technologies is paramount if we are to continue to make progress on climate change. In this paper, we examine how young people in Canada, a country whose economy is closely tied to the price of oil due to its vast oil reserves, perceive renewable and non-renewable energy technologies. Through online focus groups with youth aged 18-25 in both rural and urban settings, we explore young people's perceptions of the risks various energy technologies pose, what they consider to be safe and clean energy technologies, and the impacts these technologies are having locally and globally. Our findings suggest that in terms of perceived risks, fossil fuel-related energies were viewed as some of the riskiest technologies but young people's understandings were complex as they were also aware of some benefits of fossil fuel technologies. In addition, they were aware of the benefits and opportunities as well as the risks and safety issues associated with other technologies as well (e.g., nuclear, solar). Young people were optimistic that a move away from fossil fuels would create jobs and improve the environment and overall economy. However, real progress on climate change was only seen as coming through global cooperation.

OBAID, HASAN* (co-founder, European Manager and Head of the Research and Studies Department at Visto International for Rights and Development, Palestine)

War Narratives for Palestinians in the Gaza Strip after 7th of October 2023

In the Palestinian context following October 7, 2023, one of the most striking observations has been the instrumental role of narratives in shaping political actions and frameworks, particularly when intertwined with direct action. These narratives were deeply enmeshed with the Israeli military apparatus, effectively clearing the path for its incursion into Gaza and providing the ideological for the atrocities and genocide that ensued. This situation necessitated an awareness among Palestinians regarding the power of narrative in achieving three essential goals: first, defending their identity and existence; second, garnering international solidarity; and third, translating narrative into concrete action capable of halting the ongoing war.

The power of a narrative, moreover, is inherently linked to its narrator. Audiences have become accustomed to official narratives propagated by Palestinian parties, institutions, and media channels. However, regardless of how seemingly credible, authentic, or persuasive these narratives may appear to some audiences, they are inevitably subject to challenge by counter-narratives fortified by military power. This often results in varying degrees of "disproportionality" or outright contestation. Therefore, there emerges a profound need for narratives forged directly by Palestinian victims in Gaza themselves.

This paper endeavors to examine these "war narratives" through the stories of Palestinian victims, employing in-depth interviews with various individuals who lived through the war—ranging from children and women to professionals—and analyzing their testimonies.

I will use Michele Koven's (2002) approach to analyzing speaker roles to examine narratives told by self-identified Palestinians. I built on Koven's framework for analyzing speaker role inhabitation in narratives of personal experience. This method gives tools for interlocutory speaker role as additional ways of coding how a narrator relates to an audience.

OBERG, KLARA* (Halmstad University, Sweden)

Crisis and the Precarious Labour Market: After COVID19

This paper discusses new forms and normalization of precarious work in relation to the role of crisis and its different phases as well as interlinkages to other parallel, induces or coming crises. The use of crisis, as well as state- and private global enterprise management of crisis by increasingly fragmenting the global value chains sometimes leaving localities in the global South with dead ends and overused resources, restructuring of the labour forces, inducing unemployment, increasing precarity in the labour market

parallel to state interventions that increasingly put pressure on migrants to establish themselves on the labour market – to obtain a residence permit or work permit can besides being a remarkable contemporary cynicism also be understood as a continuous renegotiation of the relation between the global South and North. Empirical examples on the normalization of precarity on the labour market are from the Swedish context linked to a global level and show how the interconnectivity between different interest areas and actors has increased. This also needs to be understood in relation to precarious employment that takes form in a more complex way – in relation to different forms of crisis, war, economic debt, waiting for asylum etc. The findings on the developments of a increasingly precarious labour market in relation to a post-COVID 19 situation with a global work crisis as well as economic crisis, energy crisis, emerging wars and conflicts suggests that new routes into the precarious labour market has been created thus also new vulnerabilities and new norms of atypical work, precarious labour flexibility and where labourers to a higher extent also invest in a highly uncertain and precarious future. This paper suggests that these processes also are linked to a more cynical and complex use of crisis, the prolongation of certain crises and the mobility of crisis.

OBI, MISS ANGELA NJIDEKA* (University of Westminster, United Kingdom)

Unveiling Shadows: Gendered Violence, Abuse, and Exploitation in the Context of Border Control and Migration Policies.

This paper examines the nexus of gendered violence, migration policies, and border control, revealing the amplified risks faced by migrants, especially women and girls. It critically assesses how these policies and practices, directly or indirectly, perpetuate harm against marginalised groups. By employing an intersectional analysis, the study highlights how the confluence of gender, race, ethnicity, class, (dis)ability, sexuality, and citizenship status increases vulnerability to violence in migration and border control settings. Incorporating real-life case studies and the author's experiences, the paper elucidates the hostile climates created by stringent immigration policies, societal xenophobia, and legal obstacles, which intensify migrants' trauma and abuse. It advocates for a multi-faceted approach that includes international legal cooperation, gender-responsive training for border and migration officials, and improved survivor support services. The research also explores resistance strategies against gendered violence and the hurdles in addressing such violence, proposing a comprehensive strategy encompassing policy reform, community involvement, and international partnerships to safeguard and empower migrant women and girls. Entitled "Unveiling Shadows," this work calls for a shift towards humane, inclusive, and gender-sensitive migration policies that respect human rights and dignity, promoting a societal progression towards inclusivity and empathy. This abstract proposes a crucial dialogue for the conference on Gendered Violence, Abuse and Exploitation in the Shadow of Bordering Regimes and Border Control, offering insights into mitigating violence through systemic change.

Trends in Partnering between Foreign-Born and Native-Born Individuals: A Global Perspective

Globalization and international migration have profoundly impacted various aspects of our lives, extending even to the most intimate spheres, such as romantic relationships. With the increasing movement of people across borders, questions arise about the nature and frequency of partnerships between individuals from different cultural and national backgrounds. In this context, we address two key questions: 1) Have mixed unions—those between native-born and foreign-born individuals—become more common than in previous decades? 2) How do these trends manifest once we account for the size and composition of the foreign-born population within each country? To answer these questions, we analyze trends in both the absolute and relative prevalence of mixed-nativity unions across 82 countries, providing a comprehensive global perspective. We rely on census and large-scale survey data harmonized by the International Public Use Microdata Series (IPUMS), which allows us to examine patterns across decades ranging from 1960 to 2016, depending on the availability of data for each country. Importantly, to observe changes over time, we restrict our analysis to countries with at least two census samples, ensuring that trends can be meaningfully compared across different time periods. Our primary focus is on native-immigrant unions, or mixed-nativity unions, defined as partnerships in which one

partner is native-born and the other is foreign-born. Our findings show that there is no uniform upward trend worldwide. Instead, in absolute terms, the number of native-immigrant unions has increased significantly only in Europe and North America. The analysis of odds ratios, which adjusts for the size of the immigrant population, further suggests that this increase is primarily driven by the growing number of immigrants, rather than by substantial shifts in the preferences or behaviors of natives and immigrants when it comes to forming partnerships.

Pedagogies of Craving: Using Food As Means of Collaborative Conscientization

As a crucial threat to sustain and expand life, food's capacities go beyond functionality. From cultivating crops and gathering ingredients to preparing and sharing meals, food is embedded in a fluid network where sociocultural, political, and emotional layers intersect. This interconnectedness makes food a strategic entry point for unveiling and challenging complex power structures. In this context, we argue that food holds pedagogical potential to inspire (self)reflection on the sources, structures, and consequences of oppression. We frame this within the concept of *pedagogies of craving*, a process where communal recollection, preparation, and sharing of food bridge knowledge and practice. We interpret craving as a multilayered, visceral, and political experience—a hunger for individual and collective justice, care, and well-being that informs a collaborative process rooted in empathy, community, and joy. To explore this theoretical and methodological proposition, we reflect on three iterations of a course about research-creation, an international course hosted in Amsterdam between 2021 and 2024. The course sought to blur the boundaries between academia, art, and activism through creativity and curiosity. In this context, we facilitated three cooking sessions where food served as a medium for cultivating critical knowledge with a diverse classroom. The result was a series of dynamic encounters that brought the pedagogies of craving into practice, fostering a sense of community and camaraderie within the teaching space. These sessions also revealed both the possibilities and the challenges of implementing creative, non-normative approaches to co-creating knowledge.

Unsettling Solidarity through Co-Creative Practices with Forced Migrants

In this presentation, we explore the role of emotions in fostering and reshaping co-creative collaborations with forced migrants. Drawing on decolonial and feminist perspectives that recognize emotions as fundamental to (re)configuring power, we engage in a dialogue between our two PhD projects, focused on forced migrants in South Africa and the USA, respectively. Aware of our position as outsiders to the communities we aim to engage with, we examine the challenging emotions that emerged and fluctuated as we sought to cultivate critical and caring co-creative research projects grounded in practices of solidarity. We begin by situating emotions as contextual sensations, entangled in social grammars of race, class, and gender. This perspective is crucial as we locate emotions in contexts such as South Africa and the USA, where deep-rooted inequalities continue to marginalize communities outside the university. In the face of pervasive structures of oppression and violence, where forced migrants are disproportionately disadvantaged, we acknowledge the complexities of difficult relationships, recognizing that negative emotions like disappointment and suspicion are as important as positive ones such as trust and empathy to enable solidarity. By embracing friction and unresolved conflicts, scholars can avoid one-dimensional portrayals of collaboration and produce more nuanced, ethical research. This requires a relational approach that prioritizes humility and remains open to navigating discomfort and difference.

Multicultural Literacy Fostered By Zainichi Korean Museums: Case Studies of Kobe, Kyoto, and Osaka in Japan

In Japan, where the Ainu and Uchinanchu indigenous peoples have lived for centuries and people of Korean and Chinese origin have lived for more than 100 years, immigrants and ethnic minorities have been invisible to those who have the illusion of a mono-ethnic nation, and have been the objects of display in museums and expositions. In recent years, however, there have been attempts to democratically transform Japanese civil society, the host society, by having minorities themselves document their history and create community archives, forming a base for providing multicultural and human rights education.

This study aims to elucidate how multicultural education and human rights education provided by immigrant museums can bring about multicultural literacy to citizens of the host society, including immigrant parties, through the operation of participatory teaching methods of multicultural education and human rights education based at immigrant museums by Korean parties living in Japan. The purpose of this study is to elucidate how multicultural education and human rights education conducted at immigrant museums can bring about multicultural literacy (Banks, 1991) among citizens of the host society, including immigrants. The analysis will focus on the practices of three museums in the Kansai region, which were established mainly by Korean residents in Japan. These are the Kobe Museum of Korean Lives and Words, which open in 2024; the Korean Town Historical Museum in Osaka, which was established in 2023; and the Utoro Peace Memorial Museum, which opened in Kyoto in 2022. Examples of multicultural and human rights education practices conducted there will be introduced. Through life story interviews with people engaged in multicultural education and human rights education at the museums and interviews with the general public who participated in the education, we will clarify the reality of the learning that is taking place there.

FERNÁNDEZ ARAGÓN, IRAIDE (University of the Basque Country, Spain)

MORENO MÁRQUEZ, GORKA (University of the Basque Country, Spain)

Risk, Repression and Resilience: The Case of Nicaraguan Transnational Families.

The migration of Nicaraguan women to the Basque Country mimics patterns of transnational families observed in other settings. Through a combination of distant and proximate care practices, various forms of support circulate across borders, allowing families to maintain a sense of collective well-being and unity despite the distance. However, the Nicaraguan case stands out due to the country's complex political situation. Since 2018, the Nicaraguan government has enforced a broad campaign of surveillance and repression against its citizens, both within the country and abroad, prompting transnational families to reconsider and adapt their mobility and caregiving strategies.

The data for this study come from 24 in-depth interviews with Nicaraguan migrant women who maintain close ties with their home country and their relatives, whether in Nicaragua or in other countries. These interviews involved women and families in various stages and conditions, including refugees and political exiles, providing a basis for comparing their different care and family structures. Given the difficult situation in Nicaragua, special measures were adopted to ensure the safety of all interviewees.

The results illustrate the resilience of Nicaraguan transnational families as they adapt to an ever-changing political landscape. In the case of proximate care practices, such as temporary visits, these families must navigate the limits imposed by both the restrictive immigration policies of the country of destination and a repressive Nicaraguan government. As for the distant care strategies, families must strike a balance between assisting their loved ones in need and minimizing the risks they may face. In this context, Nicaraguan transnational families have started to communicate using false identities or secret codes, as well as sending their monetary remittances through untraceable financial services. This study contributes to understanding how political repression reshapes transnational caregiving, illustrating how Nicaraguan families adapt to the pressures of both distance and political control.

Response Bias in Web/Paper General Population Surveys: More Than a Decade of Experiments to Switch from Face-to-Face to Web/Paper in Switzerland

Several societal developments currently challenge general population surveys, such as budget constraints and the respondents' more active lifestyle, which leads to a lower contact success rate and higher costs in interviewer-based survey designs. At the same time, digitalization increasingly penetrates society. General population surveys are therefore pushed to switch to self-completion, mainly web/paper. Such a mode change raises questions as to whether and how this change affects representation bias. In Switzerland, FORS fields several international general population surveys and has conducted experiments using different designs for switching mode from face-to-face (f2f) to web/paper during the last decade.

In this presentation, we will summarise results of a series of studies focusing on representation bias using experiments fielded in context of the European Social Survey (ESS) 2012, the European Values Study (EVS) 2017 and the International Social Survey Programme (ISSP). We will first present a framework to analyse the risk of representation bias that considers several types of use of the survey data as well as several sources of benchmark data. We then present empirical results from different experiments applying this framework. Based on the EVS 2017, we present results from a complex parallel experiment fielding a f2f survey and four different web/paper designs.

Using data from a national probabilistic multi-wave web/paper survey, MOSAïCH 2020, that includes the ISSP module in the first wave, we analyse effects of different incentives on representation bias and report on effects of attrition on representation bias of a COVID-19 survey panel following up MOSAïCH 2020.

We find that all designs are feasible and provide generally comparable results, but that representation biases do occur across all modes and differ according to the type of use of survey data. Therefore, measures to reduce risks of representation bias should be tailored to the substantial analysis.

OCTOBRE, SYLVIE* (DEPS, France)

CICCHELLI, VINCENZO (Ceped, université Paris Cité, IRD, France)

K-Dramas: An Alternative Sentimental Education from the East

Romance is a globalized cultural form, disseminated through novels (Chick lit), TV series, and cinema from Europe to Central and Latin America (Mexican and Brazilian telenovelas), the United States (romantic comedies, sitcoms, soap operas), Turkey (TV series), India (Bollywood), Hong Kong (cinema). South Korea has joined the romance producers through K-dramas, which make love stories the topical themes of their storylines.

What is the significance of the K in K-drama? K-dramas take on the universal traits of the genre (strong emotional charge, wide female audience, focus on the trials that lovers go through, asymmetry of power and social positions, emphasis on a happy ending) while presenting specific features that are recognized as distinctively Korean: love does not hurt (Illouz, 2012), it emancipates.

We assert that South Korean scriptwriters (80% women) develop a discourse of love, made up of hybrid codes and imaginaries, articulating:

A) A *blurring of gender stereotypes*, with powerful women - the expectations and demands of the female figure are the driving force behind the construction of the bond, without any 'war of the sexes' - and 'soft' men - who embody non-hegemonic masculinity stripped of the signs of domination (Jung, 2012);

B) An emphasis on *working on oneself and on the bond*: this is developed within the framework of a South Korean bonding ethic, based on the Korean notion of *jeong*, a form of systematic concern for others, and on Confucian philosophy, emphasizing self-improvement (Chung, 2016);

C) A *reinterpretation of international love norms*: with the success of K-dramas and the investment from platforms (Netflix, Amazon, etc.), the love norms disseminated by K-dramas are constructed at the intersection of international norms (consent and equality) and South Korean cultural background.

We therefore propose to analyze romance in K-dramas as an alternative sentimental education (Cicchelli and Octobre, 2024).

OCTOBRE, SYLVIE* (DEPS, France)
JONCHERY, ANNE (Ministère de la Culture, France)

Re-Envisioning the Reading Practices of Young People in France: Beyond the Opposition between Legitimistic Habitus and Popular Culture

The question of reading habits of young people, more often than not, mixes cultural questions with moral and political considerations, through a series of implicit homotheticisms between culture, humanist culture and literature, common heritage and social and cultural ties, all strongly linked to the school institution (Coulangeon, 2021). In this context, the pessimistic diagnoses on the evolution of reading, often correlated with the success of digital screens, take on a general scope, and is even sometimes considered as an indication of de-civilization (Desmurget, 2019). Nevertheless, some transformations should be more discussed, such as:

1. the modification of the hierarchy of educational skills: humanities have been replaced by technical/scientific knowledge in the selection process in the school system and new educational capital have emerged that do not rely on reading in the same way (Prieur & Sagave, 2013),
2. the digital convergence and the effects of transmedia (Jenkins, 2013): star books (read and loved) are carried by adaptations in the cultural industries and not that much by the education system, which is regarded more critically and reading habits are distancing themselves of school values (observable in the dislikes declared by young people).
3. the transformation of books and papers: the types of books (literature is far from being the yardstick), just as the types of reading (Mauger et al, 2010) have multiplied (blogs, Wattpad, *webtoon*), detached from the literary form valued in the school setting as well as from linear and concentrated reading, these new forms often being strongly linked to banal writing practices (Mongenot and Cordier, 2023).

Analyzing young people's reading habits (using a quantitative survey providing information on reading habits, interests, likes and dislikes), the presentation will question the changes in the digital era in reading behaviors, including their social and cultural meanings.

ODASSO, LAURA* (Cergy Paris Université, France)

Educational Inequality and the Cités Éducatives Initiative: Bridging Gaps or Reinforcing Exclusions?

Originally piloted in 2019 and now widely implemented across France, the *Cités Éducatives* initiative targets priority urban neighborhoods (French: *quartiers prioritaires de la ville*), which face social and economic challenges. Its aim is to reduce educational inequalities and improve the living and future conditions of a population already addressed by the so-called inclusion policy. While it is part of the priority education policies that have existed since the 1980s, the *Cités Éducatives* initiative is distinguished by a stronger emphasis on partnership within the context of growing territorialization of educational policies.

According to official documents, the initiative seeks to transition from traditional territorial "educational programming" to a model of "educational cooperation," involving a broad range of stakeholders (state services, local authorities, associations, national education) and the public (residents, parents, children, and youth) in building a shared vision for education.

However, despite its democratic rhetoric, the initiative faces challenges due to increasing pressure for collaboration and to misleading representations of the target population. Stakeholders often perceive this population as a homogeneous, marginalized group with low cultural legitimacy. In reality, the public is heterogeneous, consisting of individuals with unstable social characteristics and varying needs (e.g., second-generation migrants, working-class populations, and newcomers).

Based on ongoing collective research conducted in six *Cités Éducatives* in Île-de-France, employing a mixed-methods approach, this paper explores how the new partnership-driven logic and project-based management framework disconnect from the social realities of the target population. It examines how stakeholders and local actors, both within and outside the school system, have (failed to) foster collaboration and illustrates how these dynamics influence, and are influenced by, the distorted and superficial representations of the public and its educational challenges that are embraced, instrumentalized, or overlooked. This results in new forms of domination and further exclusion of the initiative's target groups.

ODASSO, LAURA* (Cergy Paris Université, France)

Trapped in Bureaucratic Formalities: Discredit, Grievances, and Rights Claims of Migrantized Citizens and Their Partners in Europe

Scholarship has highlighted the spillover effects of restrictive migration policies and their implementation, which primarily target non-citizens but also impact national citizens. In practice, such migration policies can effectively "migrantize" citizens. This is particularly evident in cases involving marriage migration, especially within mixed-status unions. Couples consisting of one third-country national and one citizen of a European country serve as a key family configuration for examining how migration policies affect both migrants and non-migrants.

Building on this observation and drawing from scholarship on the politics of belonging, intimate citizenship, and family migration, this paper aims to demonstrate how the administrative limbo associated with marriage migration policies jeopardizes the citizenship of national partners and hinders the integration of foreign partners in mixed-status unions, while paradoxically raising their legal awareness and rights consciousness.

Based on extensive qualitative fieldwork conducted with such couples, as well as legal intermediaries, both in situ and online, in France, Italy, and Belgium since the 2010s, the paper offers a dual analysis of administrative limbo:

1. An intersectional analysis that addresses the discrediting of citizens based on their origin, gender, and social class in relation to the background of their foreign partner, and examines the bureaucratic consequences in terms of bureaucratic and biographical temporality.
2. An analysis of infrapolitics and intimate citizenship that explores the asymmetrical agency of partners trapped in administrative limbo, focusing on individual and collective grievances as well as family rights claims.

These perspectives on administrative limbo represent facets of the same phenomenon of precarious entry into the nation. Strikingly, they do not contradict one another but coexist within the lived experiences of mixed-status couples in Europe.

ODGERS ORTIZ, OLGA* (El Colegio de la Frontera Norte, Mexico)

JIMÉNEZ ROYO, JAVIER (El Colegio de la Frontera Norte / Conahcyt, Mexico)

L'islam à La Frontière Nord Du Mexique : Défis Méthodologiques Dans L'étude Des Micro-Minorités

Le Mexique est un pays majoritairement catholique, bien qu'il y ait également une présence croissante d'églises évangéliques et de personnes sans religion. En ce qui concerne l'islam, en 2020, selon le recensement, environ 8000 personnes s'identifiaient comme musulmanes, ce qui ne représente que 0,006 % de la population totale. Parmi elles, 400 résidaient dans l'État frontalier de Basse-Californie. En ce sens, l'analyse de l'islam au Mexique est pertinente parce que son étude permet de l'observer dans un contexte où il constitue une *micro-minorité* (López-Olivares 2023).

Le cas de la Basse-Californie revêt une importance particulière pour l'étude des relations entre la religion, la migration, l'ethnicité et la frontière. L'arrivée de migrants extra-continentaux, cherchant à obtenir l'asile aux États-Unis, a transformé le paysage islamique préexistant dans la région, notamment dans la ville de Tijuana, qui constitue un point de passage privilégié. Ainsi, cette communication a pour objectif d'examiner la présence de l'islam à Tijuana, en tant que micro-minorité, en analysant les interactions entre trois variables : la dimension transfrontalière, les réseaux religieux et la migration en transit vers les États-Unis, ainsi que des facteurs tels que l'ethnicité, la langue et le statut migratoire.

ODHAV, KIRAN* (University of Free State, South Africa)

Digitization and the Future for and of Youth

Digitalization's diverse spread into society creates opportunities and backlashes, respectfully, of furthering the information revolution, the spread and use of knowledge to name a few. Yet as a mass phenomenon, it desensitizes people, demeans knowledge, creates spaces for fake knowledge. In the hiatus between these totally opposite tendencies, youth have to navigate their day to day lives, careers, lifestyles and be able to manoeuvre their space in a post-

COVID era of globally conservative withdrawals into nationalism, jingoism and regression. A set of combined epithets, such as 'youth are the future' and 'the future is now', that produce lifestyles, reactions and paraphernalia that are both at the cusp of such a future with all its forebodings, negations and opportunities, but also at the juncture to potentially maximize the socializing impact of digitalization, of knowledge development if handled carefully, and of creating a new generation of youth that can harness what digitalization brings with it.

The protest upsurges as in Middle East, UK, South Africa were based on social media networking, in a digital environment. Yet now data also rules student's lives due to costs. Data is the new gold, yet there are digitalized drones used for war and massacre.

This paper outlines both tendencies, as an ambiguous terrain, of a submersion of youth into a digital future of artificial intelligence, robotics, of their perceived hegemony over it as it widens the digital generation gap, AND a set of opportunities to breakdown the traditional barriers of the global digital divide, of unleashing potential hybrid environments of work and play, of 'natural' and 'artificial', of relating and distancing. There are multiple youth responses to the new digital age, and this paper seeks to explore their development, impact and consequences on and for youth.

RC13-200.2

ODHAV, KIRAN* (University of Free State, South Africa)

The Horizon and Limits of the South African Leisure Industry

This paper focuses on an under-researched area of leisure in South Africa, to outline its parameters, uses, limitations and its stratifications. Leisure in South Africa has been historically been determined by race, class, gender, disability and geography. While there have been some changes in such categories over the past 30 years, the leisure industry remains within such parameters even while transgressing such boundaries.

While the leisure industry has shifted its parameters, it may be a market related reaction to draw in the new black middle and upper classes, and what remains to be done is for the notion of leisure to really penetrate the African townships in South Africa. There are various forms of leisure activities in South African townships, including soccer, emerging rugby among a host of sports codes. But these are sports related forms of leisure, rather than a wider definition that relates to a variety of forms (games, non-competitive sport, indigenous sport etc.).

This paper seeks to outline the variety of forms of leisure that South Africans engage in, how this sector continues to be stratified, and what the possibilities of change there are for a more diverse range to spread across the various historical categories described above. It also seeks to outline how various traditional forms of leisure are penetrated by capital, by stratifications, by an order of things and how such forms continue to create the conditions of a lack of access to all the variety of forms of leisure due to various socio-economic, econo-political and policy criteria that can be more innovative for a changed leisure sector. Notions of leisure are usually taken as epiphenomena, but they also have impacts, are linked to power and pleasure.

ODROWAZ-COATES, ANNA* (Maria Grzegorzewska University, Poland)

ZSÖGÖN, CECILIA (Maria Grzegorzewska University, Poland)

A Feminist Exploration of Online Etiquette, Ethics, and Infidelity in Long-Term Heterosexual Relationships

Feminist scholarship has long critiqued the patriarchal structures that shape intimate relationships, including how digital technologies and social media have introduced new complexities. Research suggests a correlation between increased social media use and marital dissatisfaction, potentially reinforcing unequal power dynamics within long-term heterosexual relationships. Factors such as marital investment, relationship length, and age intersect with gendered expectations, influencing how partners engage with social media. These intersections warrant a feminist examination of the ways that social media accessibility, constant connectivity, and perceived privacy can create opportunities for online flirtation, emotional labour, or infidelity—often in ways that reflect and reproduce patriarchal norms.

The lack of established netiquette or ethical guidelines surrounding social media use within committed relationships also demands feminist interrogation. Women's disproportionate emotional labour and expectations around fidelity often go unexamined, raising questions about how these unspoken norms contribute to the relational strain. Current studies on online infidelity in heterosexual relationships remain sparse and fail to account for the broader social and cultural contexts in which gendered behaviours online occur.

In this presentation, we review existing literature with a feminist lens and present preliminary quantitative findings from an online survey, exploring how gender roles and power imbalances manifest in digital spaces. Linder (2024) reveals that the average American spends 50 minutes daily on Facebook, with 25% of married adults admitting to extramarital affairs on the platform. Notably, 40% of these online affairs evolve into real-life ones, and social media is cited in 57% of divorce cases. These figures underscore the need for feminist analysis of how social media may perpetuate unethical behaviours within heterosexual relationships, especially given its role in maintaining patriarchal structures that facilitate secrecy, control, and unequal relational expectations.

OENNEBRO, CAROLINE* (Gothenburg University, Sweden)

Social Mobility through Education : "I'll Succeed Although I Go Against the Odds a Bit By Having Uneducated Parents."

This paper explores conditions for upward social mobility through education, by presenting a selection of expected results emerging from sequential life stories told by 13 academical successful youths whose parents have completed no higher than an upper secondary degree. As a part of a monographic PhD thesis with expected dissertation during 2026, those 13 youths have been interviewed once a year, three times each (except for one boy who implicitly decided to discontinue his participation after the first interview). All first interviews were held while the participants were in upper secondary school. The two youngest participants will be interviewed a fourth time during 2024 so that all interviewees will have experience of higher education or other activities after graduating from upper secondary school. The aim of the study is to gain knowledge of why individuals who are statistically less likely – based on their parents' educational background – to attain higher education, have academic success and aim for higher education. The selection of these youths as participants was made by handing out questionnaires to students attaining upper education programs having particularly high average admission scores. The research question is: What enables academic success and aims for higher education amongst youths whose parents have no higher than an upper secondary degree? An overview of the tentative results provides a complex picture of sources of motivation between the interviewees as well as within the story/stories told by one and the same interviewee. Commonly occurring sources of motivation are: an economically stable future; caring for the mother in the future; having a dream/ a strong interest; to make one's parent(s) proud; one's own endowments; the influence or encourage from a teacher; norms provided by siblings or friends; expectations and; to escape an undesired life situation.

Occupational Earning Potential: A New Measure of Social Hierarchy Applied to Europe

Social stratification research often assumes a hierarchy of occupations, yet translating occupations into a linear, easily interpretable scale remains challenging. Existing occupational scales, such as the International Socio-Economic Index (ISEI), aggregate multiple indicators like education and income but lack intuitive interpretation and often rely on limited survey data. Our paper introduces a new measurement - Occupational Earning Potential (OEP) - which ranks occupations solely based on their median earnings, expressed as percentiles of the national earnings distribution.

We construct the OEP scale using comprehensive administrative and survey data from five countries: Sweden, Germany, Switzerland, the UK, and the US, covering several decades. By pooling annual data from tax records, labor force surveys, and population censuses, we provide a harmonized, cross-country measure of occupational hierarchies that captures earnings-based distinctions in great detail. This makes OEP a valuable tool for understanding both national and international occupational structures.

Our analysis shows that OEP correlates strongly across time ($r=0.90$) and countries ($r=0.80$), supporting its use as a common scale for cross-national comparisons. The OEP also explains a significant portion of variance in earnings across occupations and countries, outperforming ISEI on key measures of earnings inequality. Additionally, we demonstrate that OEP is strongly associated with educational attainment and intergenerational social mobility, making it a powerful indicator of occupational inequality.

This study offers a new, easily interpretable scale based on real-world earnings data that provides fine-grained insights into occupational hierarchies. By utilizing new administrative and survey data, OEP opens up fresh avenues for research into the task-based, skill-based, and inequality dimensions of detailed occupations, directly contributing to the broader understanding of labor market stratification.

RC20-298.3

OFFERHAUS, JUDITH* (Federal Institute for Vocational Education and Training, Germany)

Participation in Vocational Education and Training: The Institutionalized Roles of States, Firms and Unions - New Insights from New PIAAC Data

In this study we look at how social institutions shape interest in, perceived barriers to and actual participation in vocational training. We discuss how the degree of integration of governance, businesses and organized labor into the education, vocation and skill formation systems shapes individual decision-making and social stratification comparatively. Using data from PIAAC and various macro- and meso-indicators we investigate how different patterns in the configuration of these institutions promote or reduce inequality in vocational training outcomes, and the social stratification that results. Our exploration of theory and data points towards an crucial role of unions; however, they do not operate in isolation and are part of larger institutionalized skill formation structures in each society. Using the forthcoming second round of PIAAC - to be released in the next few months - we will be able to analyze two decades of individual interest in, perceived barriers to and actual participation in vocational training in over 30 countries including some middle and a few lower income countries. Given the multi-level nature of the data with fewer cases at the highest level and cross-classifications of countries and time, we use both regression and set logic (qualitative comparative analysis) approaches to analyzing outcomes. We hope to not only understand training better, but broaden the state of the art of analyzing cross-classified data with fewer cases in comparative sociology.

OGOE, SALLY* (University of Manitoba, Canada)

Navigating Precarity: Employment Challenges and Integration of Refugees in Canada's Labor Market

This study examines the employment challenges and experiences of former refugees in Canada, providing insights into global trends of informality, precarity, and unemployment among displaced populations. Based on a data from the labour market experiences of former refugees in the Prairie provinces, this research analyzes responses from 560 refugees across various categories, including Government Assisted Refugees, Privately Sponsored Refugees, and refugee claimants. Key findings reveal that finding work is the most pressing issue, while struggling with language barriers. The study highlights the precarious nature of refugee employment respondents working multiple jobs primarily due to the need for additional income. This trend underscores the informal aspects of refugee labour integration and the challenges in achieving stable, family-sustaining employment. The research identifies lack of Canadian experience, skill recognition, and credential recognition as the top barriers to employment, reflecting global challenges in labour market integration for displaced populations.

This study contributes to our understanding of global work tendencies, particularly in the context of forced migration and resettlement. It emphasizes the need for targeted policies and support systems to address the unique challenges faced by refugees in the labour market, ultimately promoting more inclusive and sustainable employment practices worldwide. Hence, the key question driving this research is: How can policy interventions be designed to overcome the employment barriers faced by refugees, ensuring their successful integration into the labour market?

OH, HEIJIN* (Korea University, South Korea)
SHIM, JAE-MAHN (Korea University, South Korea)

The Ways of Career-Making Among South Koreans

Work experiences have been precarious and faces of precariousness have been even diversified. These phenomena emerge from not only traditional indicators of precariousness such as employment status, wage, and social insurance, but also feasible working practices such as changing jobs and/or careers, holding multiple jobs, and taking a career break. How do individuals maintain their careers amid this unstable and risky period? This study

proposes an action theoretical understanding to tackle this question. From this perspective, career or work performance is perceived as performing or practicing 'calling in work', and conceptualized as a process of making one's ego and her world through her vocation. This point of view specifies the former question and leads to another interest, the ways of career-making: through what path and by what character of work individuals have made their career. First, this study investigates patterns of career trajectory by considering the following: material rewards (wage), field of work (occupation and industry), and work-life integration or balance (working hours). Second, it compares the patterns of career trajectory by cohorts and gender. Third, it examines related attitudes and practices including investment, union membership and efficacy, and time usage. Using the panel data from KLIPS (Korean Labor and Income Panel Study), this study conducts Group-based Trajectory Modeling to reveal the patterns of career trajectory among South Koreans.

Do Lms Transform Alienation?: Human Consequences of Non-Human Language Developments

Regarding the transformation of interpersonal relations in digital age, the focus has been on the advent of pseudo relationships between human and non-human agents replacing some forms of social relationships that humans get into with their human counterparts. For instance, Elliott (2022) points out the danger that immersion in relationships with personified algorithms may lead to a narcissistically vulnerable and exhausted self (p. 260).

However, the impact of AI technology on self-identification is not limited to the "visible" dangers of pseudo-human representations. The primary purpose of this report is to critically examine the pitfalls of "invisible" technologies that threaten self-identification. This underlying threat is set against the backdrop of the rise of machine learning, which brought about the third digital revolution. Large language models (LLMs) based on machine learning achieve an understanding of the language system itself based on the probability of word occurrence. Therefore, in the process of their understanding, the semantic horizon of symbol grounding is excluded.

The fact LLMs can fully acquire and understand language without any references to the existential objectives, have the potential to overturn the conventional assumptions of linguistics and linguistic philosophy about the interrelation between language and the world (Suzuki 2024: 140-7). In response to this, I will first briefly explain the mechanism of LLMs and then summarizes how LLMs open up possibilities for reconsidering the premises surrounding language acquisition, usage, and "signification." Subsequently, I will discuss how ethical encounters between self and other, and the self-identification achieved therein, relate to the above crucial questionings in linguistics and whether there is a possibility of reinterpreting self-alienation. In doing so, I would like to open up a theoretical horizon that can introduce fundamental questions about meaning and language, derived through the mediation of LLM's technological development, into the realm of alienation theory.

When a Wind Turbine Flaps Its Wings in China. the Socio-Ecological Impact of Balsa Extractivism in the Amazonia Ecuatoriana for the Indigenous Communities of the Region.

Balsa (ochroma pyramidale), is a type of timber that is mostly produced in the Amazonia. In fact, Ecuador is the world's largest balsa exporter and it has been so for decades. Apparently the demand for balsa has skyrocketed over the past few years, and balsa trade is indirectly -responsible for some of the Amazonia's illegal deforestation, also having serious direct social impacts for the Amazonia's local communities. The - unlikely - reason is green energy: balsa is the core material used in the construction of wind turbin-blades, and since wind-farms have multiplied impressively all over the globe in the quest for green energy solutions, so has the demand for balsa. Therefore, as global market with powerful actors such as China and the European Union have competed for access to the Amazonia's 'wooden gold': balsa. But what does that mean for the local indigenous Amazonian communities?

Drawing from a 10 month ethnographic fieldwork in the Amazonia Ecuatoriana this paper is analysing the socio-ecological challenges global balsa commerce has provoked in the Amazonia Ecuatoriana, contributing to the literature on green energy, its contradictions, and its lived experience; adding to the genealogy of extractivism, in the Amazonia exploring how this case study adds/ challenges/ contradicts/ furthers what we already know. It is part of an MSCA Individual research project I am conducting at the Department of Social and Cultural Anthropology, VU Amsterdam.

OJEDA PEREIRA, IVAN* (Pontificia Universidad Católica de Chile, Chile)

Just Socio-Ecological Transition As a Techno-Political Experiment: The New Orientation of the Chilean Climate Change and Socio-Environmental Transition

In the global context of climate change and the shift towards sustainable economies, the Chilean government—aligned with the “new left” political movements—has embedded the notion of “justice” into its approach to the ecological transition. This presentation draws on a theoretical framework rooted in Science and Technology Studies (STS) to conceptualize the Just Socio-Ecological Transition (JSET) as a techno-political experiment, where laws, policies, and programs form an assemblage shaping the response to climate change within a centralized state apparatus.

Through a systematic analysis of over 20 official documents, complemented by interviews with 25 key actors from the public sector, academia, and civil society, this research traces the socio-ecological dimensions of this techno-politics. I examine its normative foundations, temporal trajectories, and the challenges it faces, such as the tension between standardization efforts and the local contingencies encountered during its implementation. In this way, the JSET is explored not only as a policy framework but also as a dynamic and contested pathway of socio-ecological change.

This paper contributes to: i) understanding the formation and evolution of a national public policy for climate change transition, ii) analyzing how theoretical-normative concepts of justice are operationalized within the South American context, and iii) fostering dialogue between environmental sociology, institutionalism, and Science and Technology Studies, with implications for both governance and climate justice in the Global South.

OJHA, ANJALI* (Banaras Hindu University, India)

Beyond the Brick and Mortar: Addressing the Housing Needs of Migrant Construction Workers in Maharashtra, India

This study delves into the living conditions and housing arrangements of migrant construction workers in three classes of cities in Maharashtra, India: Pune, Nagpur, and Jalgaon. These workers, often hailing from rural areas, encounter notable obstacles in securing cost-effective and suitable housing. Despite their pivotal role in advancing urban expansion, many find themselves residing in informal settlements devoid of basic facilities. The research delves into the varied housing scenarios of migrant construction workers, scrutinizing the kinds of dwellings they inhabit, factors shaping their housing choices, and the standard and safety of their accommodations. Data were collected using a combination of questionnaire-based surveys, interviews, and observations. It demonstrates that exorbitant housing expenses, limited availability, discriminatory practices and worker's own ignorance hinder their quest for appropriate housing. Furthermore, the uncertain nature of their jobs and transient lifestyle further impedes their search for stable housing. Substandard housing conditions can profoundly impact the health, efficiency, and job contentment of migrant construction workers. Tackling these issues is imperative for realizing the Sustainable Development Goals (SDGs). Adequate housing is fundamental for fostering inclusive cities (SDG 11), promoting good health (SDG 3), reducing inequalities (SDG 10), and ensuring decent work (SDG 8). By guaranteeing affordable housing for migrant workers, we can establish sustainable and inclusive urban landscapes. Overcoming these challenges demands a comprehensive strategy. Government endeavors should prioritize affordable housing initiatives, enhance infrastructure in informal settlements, and fortify tenant rights safeguards. Collaborations between public and private sectors can harness their combined resources to devise innovative housing solutions. Easy accessibility to community-driven programs can enable migrant workers to engage in housing planning and administration. Educational campaigns can enhance awareness about housing entitlements and existing support systems. By deploying these measures, we can foster sustainable and inclusive cities that leave no one behind and cater to all individuals.

Beyond the Evms: Gendered Patterns of Youth Voting Behaviour in Rural Haryana, India

Voting in the elections is the most visible form of political participation in democratic countries. It not only sustains democratic governance but also ensures that diverse voices are represented. In rural societies, it allows

marginalized groups to assert their agency in shaping local governance. Understanding the dynamics of voting behavior, especially among youth and women, as they represent both the beneficiaries and drivers of change in rural society, is vital for fostering an inclusive democratic culture. However, before reaching out to the EVMs/ballot their voting decision is affected by many demographic factors. The present study seeks to explore how gender influences the voting decisions of rural youth, focusing on the specific demographic, cultural, and structural factors driving these differences. This study has been conducted in two villages of Haryana, a state in north India, where The Haryana Panchayati Raj (Amendment) Act, 2015 introduced educational qualifications for candidates and has further affected the electoral landscape, influencing male and female youth political participation. In the context of the Gram Panchayat elections in Haryana, where traditional norms and patriarchal structures are prevalent, this study uses a post-poll sample survey method, offering a sociological perspective on the role of youth engagement in the democratic processes of their communities. The findings reveal that while modern factors such as education and developmental aspirations influence the youth's voting behavior, deeply rooted social structures, and established community affiliations remain crucial for their voting. Male youth are more likely to engage in political participation driven by personal contact with candidates and campaign outreach, while family opinions and lineage affiliations often guide female youth. These gendered patterns of political socialization highlight the persistence of patriarchal norms and political autonomy and the need for policies that promote greater independence and empowerment for female youth in the political sphere.

OKIGBO, KAREN* (University of Massachusetts-Boston, USA)

Black on Black: How the Marital Selection Process Among Nigerian Americans Complicates the U.S. Ethnoracial Hierarchy

Selecting a life partner is arguably one of the most important decisions in a person's life. In the U.S. where race is salient, African immigrants present a unique opportunity to study how people make such an important decision. Black immigrants now represent nearly one-out-of-ten Black individuals in the U.S. Much of that growth over the past few decades has been fueled by migrants from Africa. Therefore, it is important that studies of marital selection account for the heterogeneity of the Black population in the U.S.

Drawing on ethnographic fieldwork conducted from 2016 through 2021 and interviews with 60 participants, this paper focuses on the ethnoracial hierarchies and preferences of second-generation Nigerian Americans when selecting a marital partner. I highlight three primary findings. First, there are notable generational differences between Nigerian immigrants and their U.S.-born children. In my study, second-generation participants acknowledge that their immigrant parents have an ethnoracial hierarchy that prioritizes choosing an endogamous partner of the same African ethnicity. Although some participants also shared those preferences for an endogamous partner, several were open to a partner of a different ethnicity and/or race. Second, there is a distinct process of learning what it means to be Black in the U.S. My findings show that some Nigerian immigrants and members of the second-generation have tried to distinguish themselves from African Americans and push back on a homogenized description of the Black population. Third, the impact of #BlackLivesMatter movement has outlasted the protests of 2020. The #BlackLivesMatter protests during summer 2020 crystalized the importance of choosing a Black partner for some participants. For those already in interracial marriages, it made the Nigerian partner more aware of how often or how infrequently they talked about race with their White partners, and their comfort levels when doing so.

RC06-90.2

OKIGBO, KAREN* (University of Massachusetts-Boston, USA)

Dating While Black: Marital Selection Among Nigerian Americans in the U.S. Marriage Market

There are few decisions in life that are as important as selecting a marital partner. Compatibility, chemistry, and connection are all critical criteria when deciding if a potential suitor is a complementary match. In this digital age, for some, the process of finding a marital partner has transitioned online, further complicating things. Given the historical significance of race in the U.S., a marital partner's ethnoracial background is also a key factor worth considering. Since the 1967 landmark Supreme Court case, *Loving v. Virginia*, which ruled that anti-miscegenation laws were unconstitutional, intermarriage rates between individuals of different races have increased significantly. Therefore, it is important that studies of marital selection account not only for this matchmaking process shifting online, but also for the heterogeneity of the Black population in the U.S.

Drawing on ethnographic fieldwork conducted from 2016 through 2021 and interviews with 60 participants, this paper focuses on the marital selection process among Nigerian American in the U.S. Nigerian Americans present a unique opportunity to study how people make such an important decision for four primary reasons. First, Nigeria is the number one source country of African immigrants to the U.S. Second, Nigerian Americans are Black immigrants. This is important because contemporary studies of intermarriage tend to focus on racial differences between partners, often ignoring ethnic differences within racial or national origin groups, especially among people of African descent. Third, Nigeria is both a Muslim and Christian country; therefore, religion remains an important factor in the marital decision making of Nigerian Americans. Fourth, Nigerian Americans are one of the most educated immigrant groups in the U.S. Thus, focusing on a hyper-selective group such as Nigerian Americans allows us to investigate the ways in which groups with high levels of education navigate the digital marital selection process.

ÖKTEM, UBEYD* (Bilgi University Economics Department, Turkey)

Economic Insecurity, Precarious Employment, and the Rise of Populist Attitudes in Turkey: A Novel Methodological Approach to Assessing Precarity and Its Implications Using a Time-Series Analysis of Social Media Data

In Turkey, where precarious employment conditions and rising economic insecurity are pressing issues, how do these factors contribute to the increasing prevalence of right-wing populist attitudes? Do substantial changes in these attitudes emerge in the aftermath of major social, political, and economic events—external shocks? While the impacts of labor market conditions—such as unemployment, poverty, and inequality—on the rise of populist attitudes has been widely explored in the literature, increasing attention has been drawn to other dimensions, including economic insecurity and precarious employment. Although not fully explored, these concepts are increasingly being studied for their impact on supporting far-right political parties and policies, with findings suggesting a significant influence on the rise of right-wing populist attitudes. Turkey, in particular, stands out as an uncommon situation due to extremely high inflation, a currency crisis, and consequently rising living costs, which presents a compelling case for examining the broader economic and social implications of these challenges.

This research aims to make a two-fold contribution; the first is methodological, and the second is theoretical. While existing literature on these phenomena relies heavily on surveys, this research will introduce a new method that assesses economic insecurity and precarious employment conditions primarily through their manifestation in social media. Computational methods like Natural Language Processing will be employed to derive representative indexes. Additionally, social media's dynamic nature enables the examination of external shocks' before-and-after effects. The second contribution is theoretical. Most literature examining these relations uses voting patterns as a measure of right-wing populist attitudes. Our research, however, will adopt a more sociologically grounded approach, observing attitudes that can be classified as right-wing in the case of Turkey (as there is no comprehensive study on this topic in the Turkish context). The primary goal is to contribute to the literature from these unique perspectives.

Journalism That Promotes Human Rights and Wellbeing of the Vulnerable People

The Universal Declaration of Human Rights, specifically Article 27, recognises the right of everyone to freely participate in the cultural life of the community, to enjoy the arts and to share in scientific advancement and its benefits. Therefore, vulnerable people, within this Human Rights framework, also have the right to access scientific evidence that affects their daily lives. In the current dialogic society, there is a growing recognition of the relevance of providing Scientific Evidence of Social Impact and, therefore, either science or journalism should be oriented towards co-creation and social impact, and thus improving the lives of citizens.

The present research is a case study of an online newspaper that has a vital role in the current dialogic society and whose mission is to give voice to human rights, wherever they may be, and to report on issues of global concern with a universalist perspective. This newspaper spotlights stories and

topics of general interest, relevant to humanity as a whole, that resonate with the principles of equality, progress and inclusion, which can contribute to the wellbeing of the most vulnerable people.

Therefore, the aim of this research is to examine the impact of this newspaper on improving the lives of vulnerable populations through evidence-based news publications. To meet this objective, a mixed methodological approach has been followed. On the one hand, qualitative interviews were conducted with vulnerable people in order to know the impact of this newspaper on their daily life. On the other hand, Social Media Analytics was carried out with the aim of analyzing user interactions with the newspaper.

A key preliminary finding is that interviewed vulnerable people reported some improvements in their daily life due to the benefits obtained from the evidence-based news from this newspaper.

OLAFSDOTTIR, SIGRUN* (University of Iceland, Iceland)

Does Recovery Matter? Public Attitudes Toward Addiction and Mental Health Problems in Iceland

Sociologists have a long-standing interest in stigma, including how and when the public stigmatizes individuals and groups. Mental illness and drug abuse have been stigmatized across societies for a long time, but recent research shows that the public has become more likely to draw lines between different conditions. This means that some conditions that were previously heavily stigmatized have become close to normalized. Yet, conditions that are perceived as more serious continue to result in high levels of public stigma. Different approaches to mental health treatment (e.g. medication, different forms of therapy, the ideology of empowerment) highlight the hope of recovery. While more and more people that have recovered from serious mental illness and/or addiction lead productive lives in societies, less is known about the relationship between stigma and recovery. Consequently, an interesting question on the role of recovery in stigma reduction arises, specifically whether the public is less likely to stigmatize people who have recovered from either serious mental illness or addiction. Using data from the 2024 Icelandic stigma study, I ask „Does recovery decrease stigma associated with schizophrenia, alcohol abuse and/or heroin addiction?“ The analysis compares the three conditions focusing on whether stigma reduction is similar or different for mental illness versus addiction. In addition, I test whether the impact of recovery is modified by causal attributions and belief in the effectiveness of treatment. The results have implications for stigma reduction efforts as they provide insights into the processes of stigma across conditions and take into account the potential stigma reducing impact of recovery.

PACCHI, CAROLINA (Politecnico di Milano - Department of Architecture and Urban Studies, Italy)

Universities As Urban Actors: Assessing Campuses Impacts

Universities have increasingly gained attention as public actors in urban contexts, with scholars highlighting their ability to drive positive societal impacts. Universities are now recognized as influential actors that shape both the socio-physical spaces and economic trajectories of cities (Balducci et al., 2010; Magdaniel, 2016). Despite this, there is a lack of structured tools to specifically evaluate the impacts of university campuses on surrounding area.

This research aims to fill this gap by developing a comprehensive framework for evaluating the impacts of university campuses on their urban environments, focusing on the local, city, and regional levels.

The framework is developed based on the goals of both the university and local stakeholders, and it aims to identify the macro-impacts that the new campus will have. It defines both qualitative and quantitative criteria to evaluate its physical, social, economic, environmental, and knowledge diffusion outcomes. This tool can be used in the early stages of campus development to anticipate and mitigate potential negative impacts, while also functioning as a long-term monitoring instrument.

As Antonietti et al. (2022) noted, universities are increasingly expected to play an active role in their areas of influence, evolving into public entrepreneurial agents. Given this expectation, universities must be conscious of their impact. This framework will be tested on the planned expansion of the Politecnico di Milano's Bovisio-La Gocia campus. Given that Politecnico is the main driver of transformation in this significant area of Milan, and a catalyst for urban change, understanding and mitigating its potential negative impacts is crucial (Ballio, 2006; Cognetti, 2007; Pacchi et al., 2024).

By promoting a holistic approach that integrates academic and urban objectives, this research positions universities as proactive public actors. Ultimately, this research contributes to reimagining universities as progressive urban institutions.

The Court Is Closer Than You Think: On the Everyday Experiences of Strasbourg

This paper examines the experiences of selected applicants and lawyers from Poland, Hungary, Ukraine, Romania, and Russia as they navigate the European Court of Human Rights (ECtHR) system. Through a comparative lens, it explores the motivations driving individuals to seek justice, the complexities of domestic legal processes, and the outcomes of their Strasbourg cases. The study investigates the intricate relationships between applicants, their legal representatives, and the ECtHR, highlighting the challenges faced in pursuit of justice. The title, drawn from an interview quote, underscores the significant impact of ECtHR decisions on the daily lives of those involved. To contextualize these experiences, the empirical data is analyzed using the theoretical framework of relational legal consciousness (Chua and Engel, 2019) and the 'vertical' and 'horizontal' perspectives on rights consciousness (Engel, 1998, 2012; McCann, 2012). This approach firmly situates the narratives within broader socio-legal scholarship. Drawing from a chapter in the book 'Who are the humans behind Human Rights? Historical and comparative perspectives from Eastern Europe and Russia' (HuRIE Research Project), this presentation will primarily focus on the experiences of Ukrainian applicants to the ECtHR, while maintaining a comparative perspective with the other countries studied.

Bridging Continents: W. E. B. Du Bois and the Transnational Dialogues on Race in Brazil

W. E. B. Du Bois (1868-1963) is widely recognized as one of the most influential sociologists of the 20th century, a pioneer in urban sociology and the study of race and inequality. Although Du Bois's scholarship often focused on the racial dynamics in the United States, his intellectual engagement extended globally, particularly to the African diaspora in Latin America, including Brazil. Du Bois's interest in Brazil stemmed from the country's complex racial history and its status as the nation with the largest Black population outside Africa. Over the years, Du Bois actively corresponded with Brazilian political and intellectual elites, including writing to the president of Brazil and establishing a dialogue with Arthur Ramos (1903-1949), a renowned expert in Afro-Brazilian culture. His connection with Brazil also involved extensive communication with the American embassy, signaling his strategic approach to understanding the region's racial dynamics. This intellectual exchange was deepened through the work of Irene Diggs (1906-1998), Du Bois's assistant, who became the first African American woman to earn a PhD in anthropology, awarded by the University of Havana in 1945. Diggs conducted fieldwork in Brazil, further contributing to the comparative study of race. Together, Du Bois and Diggs fostered transnational dialogues with Brazilian scholars and activists, broadening the understanding of racial democracy and inequality. This paper examines these connections and their implications for the history of collaboration between Global North and South scholars, especially Black intellectuals, highlighting their shared commitment to combating racial injustices.

"I Am Ashamed to Bring My Friends Here." Exploring Emotional Responses to the Waste-Impacted Landscape of Lagoa De Albufeira, Portugal

This paper explores the emotional impact of landscape degradation in Lagoa de Albufeira, Portugal, due to waste accumulation from the perspective of the local community's relationship with the environment. An ethnographic approach revealed widespread topophobia—a dislike for a place that once brought feelings of well-being. Environmental degradation alters the perception and experience of the landscape, distancing residents from a positive connection with the territory. The inherently interdisciplinary study focuses on the digital community of Lagoa de Albufeira, using Facebook groups as a field of observation and interaction, where residents regularly post about waste accumulated outside containers and on the streets, often including photos, videos, and the exact location of these waste piles. Through this ethnography, it was possible to document the emotional experience of residents concerning living with waste in their surroundings. The analysis of the posts reveals a clear dynamic of aversion, with many participants expressing discomfort and shame regarding the degraded landscape. "I am ashamed to bring my friends here because of the amount of waste" reflects the recurring sentiment among community members. The visual material shared—photos and videos—provides a rich foundation for understanding how waste impacts the perception of place and the emotional relationship of residents with their environment. The daily presence of waste leads to emotional alienation, transforming the home into a space of repulsion. This paper aims to document and analyze the emotional experience of the Lagoa de Albufeira community concerning the landscape of waste, contributing to an interdisciplinary debate on environmental degradation and the emotional implications of living in waste-impacted environments. Furthermore, analyzing the shared emotional experience within this digital community offers valuable insights into the relationships between bodies and environment in the context of anthropocentric landscapes, providing a starting point for broader discussions on landscapes of waste.

Debunking Hoaxes with Scientific Evidence of Social Impact on Gender Research

Coming from ESA- RN33:

The Universal Declaration of Human Rights, in Article 27, states that everyone has the right to benefit from scientific knowledge. In this regard, sociological research on gender faces a great challenge. There are numerous hoaxes on gender issues that are undermining research in these areas and, consequently, the democratic foundations of our societies, as they hinder decision-making based on scientific evidence with social impact. These hoaxes, which foster anti-woke sentiments, also extend to contributions submitted to scientific journals for publication, when they are based on ideology rather than scientific evidence. This phenomenon threatens the rigor and scientific prestige of sociological research on gender.

Scientific works presented at the European Sociological Association RN33: Women's and Gender Studies have contributed to raising awareness of this issue and providing scientific evidence for effective preventing and overcoming gender-based violence. The Social Impact Science Platform (SIS): Sappho, includes some of these contributions, with a co-creation approach. This is a science-based participatory tool to help citizens distinguish between science-based claims and gender hoaxes. This platform is also a tool for the scientific community to share their scientific evidence with the public. These virtual dialogues have made it possible to highlight those scientific publications that help debunk hoaxes and that provide scientific evidence of social improvements in the prevention of gender-based violence, feminism, sexual consent and masculinities, among other topics. Scientific journals seek publications based on scientific evidence, not hoaxes founded on ideology.

Our work as gender researchers can contribute to uniting efforts to eradicate hoaxes and anti-woke sentiments in gender research and publications by making visible our scientific evidence contributing to social improvements. These scientific and collaborative efforts strengthen the foundations of feminist scholarship and the democratic values of our societies.

Breaking Barriers: Women's Motivations and Retention Strategies in Male-Dominated Occupations in Chile

Despite the increased participation of women in the labor market over recent decades, in Latin America significant gender-based occupational segregation persists. Based on strong patriarchal norms, this segregation continues to perpetuate women's unequal positions in terms of income, power distribution, and access to opportunities in society. Research on the integration of women into male-dominated jobs has predominantly focused on Global North countries and formal sectors. This paper aims to analyze the motivations for entry and the strategies for retention employed by women working in highly masculinized sectors in the Valparaíso region of Chile. Using a qualitative methodology based on semi-structured interviews, we present a case study of four women working in the artisanal fishing and port sectors. The findings reveal that the motivations for labor insertion are primarily anchored in: i) economic needs and the pursuit of job stability; ii) family continuity; iii) gender equality advocacy. Additionally, to remain and advance in their positions, these women deploy strategies that, through a strategic use of gender, challenge both adaptation to and resistance against a masculinized work culture. These findings contribute to a deeper understanding of the dynamics of women's entry into non-traditional, gender-based occupations within the structural heterogeneity of Latin American labor markets. This presentation is part of the research project "Descentering Gender inequalities", Chile (ATE 210051).

Más Allá De Las Normas De Género: Organización y Significado Del Trabajo En La Sociedad Rapa Nui Actual

Esta ponencia se sitúa en el estudio de las trayectorias laborales atípicas en términos de género en diversos contextos socioespaciales de Chile. Dentro de los territorios insulares, la cultura Rapa Nui constituye un caso de estudio de particular interés para tensionar las categorías binarias tradicionales que suelen utilizarse en el análisis de las prácticas y culturas laborales desde la perspectiva de género. Hombre-mujer, productivo-reproductivo, y trabajo remunerado-no remunerado se revelan categorías insuficientes para captar los significados contemporáneos que la cultura Rapa Nui otorga al trabajo. En este contexto, el trabajo trasciende la mera subsistencia material, integrándose con el interés personal y la autorrealización y articulándose dentro de estructuras familiares flexibles que combinan prácticas tradicionales con ocupaciones institucionalizadas. Las formas de organización laboral que emergen en estos entornos familiares no solo coexisten, sino que también resisten las dinámicas de acumulación capitalista global, permitiendo a las mujeres y otros miembros de la comunidad desplegar estrategias que generan rupturas cotidianas en las desigualdades de género. Estas prácticas, tanto individuales como colectivas, subvierten la división sexual del trabajo y promueven valores de reciprocidad y sostenibilidad, contribuyendo a la emergencia de formas de trabajo que desbordan las categorías binarias convencionales. A través de un enfoque etnográfico y en el marco del proyecto "Descendiendo las desigualdades de género" (ANID/ATE 210051), este análisis ofrece nuevas perspectivas sobre la reducción de las desigualdades de género en la cultura Rapa Nui, al desafiar los supuestos binarios y las lógicas de acumulación capitalista global.

Innovaciones De Las Movilizaciones Feministas En Política Educativa. El Caso De México.

En la última década, las movilizaciones feministas en las universidades públicas mexicanas han cobrado gran relevancia. Su importancia no solamente se da por su valor ideológico, sino que éstas han trascendido el debate público. También, el activismo de estas jóvenes mujeres estudiantes, se ha colocado de manera fundamental en lo político, al incidir en el

marco legislativo y adquirir un amplio reconocimiento social, al grado que han modificado políticas institucionales que atienden la violencia y la discriminación por razones de género.

Estas formas de activismo emergente se caracterizan por su diversidad y adaptabilidad. La protesta universitaria ha tenido múltiples expresiones. Incluyen pintas, denuncias públicas, performances, toma de edificios, mítines y marchas multitudinarias y acciones legales. Destaca la exigencia por el uso generalizado de un lenguaje no sexista, y el repudio a nociones como el micromachismo, el mansplaining y el gaslighting, hasta llegar al feminicidio.

Al mismo tiempo, estas protestas y movilizaciones muestran, de manera ejemplar, como las reformas educativas no se plantean exclusivamente desde arriba hacia abajo, desde el poder gubernamental, sino que éstas también son producto de un entramado mucho más complejo en el que median disputas tanto internas, a nivel de cada institución educativa, como externas, en un marco donde se visibilizan las violencias estructurales contra las mujeres y otros problemas relativos a la diversidad sexual y la no discriminación. Esto ha dado lugar a cambios importantes en la Ley General de Educación Superior y los criterios respecto a la implementación de nuevos espacios institucionales como son las Unidades de Género en las Universidades.

En síntesis, pretendemos discutir la vinculación entre movimiento social y las nuevas configuraciones de políticas educativas, como uno de los principales aportes de las resonancias del movimiento feminista en México.

Aligning Perceptions with Subjective and Objective Dimensions of the Political System: Implications of Structural Fit for Happiness

This project examined how the alignment between individuals' perceptions of democracy and broader social structures affects their support for democratic institutions and policies, particularly in relation to happiness. By incorporating insights from cognitive cultural sociology, it provides an understanding of how the alignment between public and personal culture influences individual happiness across different societies. Specifically, public culture encompasses the shared values, narratives, and norms that operate on a societal level, guiding collective behavior and expectations. In contrast, personal culture refers to the beliefs, values, and worldviews that manifest at the individual level. Both micro and macro-level cultural determinants interact in the explanation of individuals' happiness. Using data from the joint EVS/WVS 2017-2022, we propose that individuals' perceptions of democracy play a crucial role in shaping their happiness. This effect is particularly strong when these perceptions are consistent with both the actual democratic conditions and the collective representation of democracy within the society, thereby creating an alignment between personal interpretations and broader social structures. Our analysis demonstrates that when individuals' personal perceptions of democracy align with their society's collective understanding and the objective realities of the political system, they experience significantly higher levels of happiness. By integrating insights from cultural sociology and happiness research, we show that public and personal culture interact in complex ways to shape individual happiness, emphasizing the need to consider both cross-cultural and within-culture differences in the study of happiness. This research advances the understanding of how cultural differences manifest in happiness by moving beyond traditional approaches and highlighting the dynamic interplay between individual perceptions and broader societal structures, offering a more nuanced explanation of how culture influences happiness.

Structural Drivers of Right-Wing Populism: A Demand and Supply Analysis of the European Parliament Elections, 2004-2019

In contemporary democratic systems, the rise of right-wing populism has become a prominent political phenomenon. Traditional analyses, focusing primarily on voter preferences, have inadequately addressed the structural and supply-sides of populism. This study reorients the discourse by applying social identity and economic voting theories—commonly used to explain voter behavior—to understand the supply of populist electoral options. Analyzing both demand and supply determinants of right-wing populism in the European Parliament Elections from 2004 to 2019, our research utilizes a unique longitudinal panel dataset at the meso level. This dataset not only

integrates subnational election results but also categorizes the populism level of each political party and incorporates socio-economic regional indicators. Our findings reveal a disparity between voter preferences and the availability of populist parties, highlighting how economic conditions shape both the demand and supply of populism, while immigration rates have a different impact. Specifically, higher immigration levels predominantly influence the supply of populist options, in contrast to a scarcity of social contact with immigrants, which amplifies voter support. This study contributes to a deeper understanding of how right-wing populism is rooted in and responsive to structured social contradictions, and economic dislocations, offering insights into the complex interplay of forces that forge populist resonances and strategies.

Explicit Tolerance and Implicit Exclusion: A Study on National Identity in Sweden

While people in many Western countries report increasingly tolerant and inclusive attitudes, minorities continue to face considerable, and in some cases growing, discrimination and exclusion. In this paper, I propose that the gap may stem from a discrepancy between explicit attitudes and more automatic, implicit attitudes. Most people may want to be inclusive and tolerant, but implicitly harbor more exclusionary views of belonging and national identity. To survey potential differences between explicit and implicit attitudes, I fielded a survey consisting of 217 Swedish participants who completed both explicit and implicit measures of perceived "Swedishness". Participants were asked to evaluate four distinct minority groups: individuals with Norwegian, Finnish, Syrian, or Bosnian backgrounds. The results reveal significant differences between explicit and implicit perceptions, as well as between the different groups. All groups were explicitly perceived as Swedish, but only individuals with a Norwegian background were implicitly perceived as Swedish. The paper concludes by discussing the implications for research on Swedishness, national boundaries, and nationalism.

De-Centering Knowledge Production in Migration Research through Participatory Filmmaking. What Is Data, What Becomes Output?

In our contribution, we aim to engage with questions that came up during a participatory video project with young migrantised people. Together with an experienced filmmaker, a workshop series was designed and realized to teach a small group of participants basic filmmaking skills and enable them to shoot their own short documentary film. In preparation for the workshops, we as the research team agreed not to treat the final films as data to avoid a re-essentialization of our participants' self-representation and to allow for their artistic expression. However, resulting films are disseminated in scientific and public settings and used to engage stakeholders to translate our participants' experiences and topics of concern.

In this paper, we engage with the broader themes of dissemination, as well as the lifespans and impact of creative content and its potential for engaging participants and stakeholders. This brings about deeper considerations of how we define stakeholders in the context of participatory research and how one arrives at a collaborative understanding of this issue. As such, we move the discussion to themes of inclusive methodologies and participatory engagement, as applied to issues of dissemination, research translation, and transfer.

Some of the questions we wish to address are: What do we conceive as data in participatory artistic research projects? How do we frame, disseminate and work with the material created within collaborative research settings?

This paper is based on the ongoing project "Life Strategies of Young Migrants in Ageing Societies" with research conducted in Poland, Switzerland, Austria and Germany.

The Rise of Anatolian Medicine: Negotiations over the Traditional and the Modern in Turkish Medicine

The proposed paper explores the relationship between Turkey's recent Traditional and Complementary Medicine (GETAT) policies, practices, and regulations, and their intersection with modern biomedicine. By examining the intersections between these fields, the study provides an analytical perspective on how the boundaries between religious and spiritual healing concepts and medical practices are both reinforced and blurred. It examines how this encounter reshapes the boundaries between traditional healing methods and modern biomedical practices, bringing into focus the complex ways these domains coalesce in contemporary Turkey.

Central to this analysis is the concept of healing as a "boundary object" (Leigh Star and Griesemer, 1989) which is employed here to explore the role of healing in facilitating the formation of new sociotechnical networks. By ethnographically examining how healing functions as a tool for negotiation between heterogeneous elements—nspanning the scientific, spiritual, religious, and political realms—the paper analyzes how health practitioners, policymakers, and religious authorities approach these various fields.

The paper also looks at how the growing prominence of GETAT policies institutionalizes alternative health practices while coexisting with the dominant biomedical framework. Through case studies of specific practices and policies, we examine the socio-technical assemblages that emerge and analyze how they contribute to changing perceptions of health, illness, and well-being in Turkey.

The Socio-Materiality of HRT: Hormones As a Boundary Object in Negotiations of Aging

Hormone Replacement Therapy (HRT) in menopause serves as a critical point of negotiation in defining the boundaries between the normal and the pathological. As a boundary object, HRT becomes a tool through which medical, social, and individual perceptions of aging and health are mediated. It places menopause at the intersection of biomedical management and natural processes. This paper will explore how HRT has become a site of negotiation by focusing on "hormonal narratives".

Women, in particular, are often called upon to take responsibility for managing their health and HRT is often framed as a choice that requires self-monitoring and decision-making about dosage, duration, and necessity. Drawing on Foucault's concept of "technologies of the self", we will examine how women are encouraged to take on a proactive role in managing their bodies during menopause as they face social pressures to maintain productivity, health, and youthfulness. This process situates HRT not only as a medical decision but also as an ethical and social one, where women's subjectivities are entangled with narratives about aging, health, and normality.

Microfinance System As Mutual Help Networks: A Comparison between Japan and the Pacific Islands Region

This paper presents microfinance as a traditional system of mutual help networks in Japan and the Pacific Islands region, known as "rotating savings and credit associations (ROSCAS)," which also exist in other areas. The presentation discusses the findings from an interview survey and fieldwork conducted in Japan, the Republic of Palau, the Federated States of Micronesia, and the Republic of the Marshall Islands. In Japan, ROSCAS are known as *tanomoshi* or *mujin*. In the Pacific Islands, they go by various names such as *muzing*, *mwusing*, and *mushing*, and these can be compared with the well-documented Japanese systems. These systems were introduced to regions without existing microfinance through contact with the Japanese, either before or during the Pacific War. In some instances, Japanese terminology was directly borrowed and used. This can be understood not just as a matter of language but also as a "transfer of mutual help practices," including their mechanisms. Mutual help practices as spontaneous social order are categorized into three types: reciprocity, such as labor exchange for planting rice or re-roofing houses; redistribution, where community members maintain a common resource pool in exchange for access to goods; and unidirectional help, such as support during funerals and weddings, without the expectation

of repayment. The redistribution typically involves labor, goods, and money, with ROSCAS specifically focusing on the distribution of money. The aim of this paper is to demonstrate that ROSCAS are not only economically significant but also socially valuable for fostering friendships and bonds within communities. The economy is embedded in social relations and institutions. The paper concludes by asserting that microfinance, as a form of communal help, plays a crucial role in supporting communities, contrasting with public help and self-help. Modern societies might benefit from reconsidering ROSCAS as a means of rebuilding and developing communities.

Impacts of Decision-Making Processes, Peace, and Conflict on Children's and Women's Lives in Disaster Processes

Children and women have gradually come forward in the discussions. This can be observed in UN regulations, acts, and conferences. This can also be observed in disaster-specific organization activities (Yokohama, Hyogo, and Sendai Frameworks are examples).

I will discuss the importance of peace and conflict issues concerning disasters through different experiences. These examples will be explored as the source and/or the results of disasters through interwoven examples from World Wars and contemporary examples. COVID-19 and ongoing attacks in Gaza and Yemen, the imposed burden of refugee crises, and recent experiences of Türkiye in Kahramanmaraş earthquakes will be some of them.

The study will explore how disasters affect women's and children's health and well-being in Africa, Asia, and globally. The focus will be on power relations and reflections on children's and women's lives during disaster processes. The argument will be based on decision-making processes. Namely: Arnstein's decision-making levels, gaps between international regulations and local applications, and bias in applications at different levels (International, national, and local). I will discuss the importance of participatory, inclusive, transparent, and responsive processes. I will recommend ways to promote and implement disaster prevention, mitigation, response, and recovery, guided by equity and human rights principles.

RC51-789.1

ONER, ILKNUR* (Firat University, Turkey)

Importance of Decision-Making Processes in Disaster Processes in Case of Institutional Changes and Artificial Intelligence

AI Technologies and "algorithmic decision-making" changes in institutionalized relations are changing decision-making processes and their reflections. Machine learning to process big data on human behavior and real human behavior get face to face in disaster issues and decision-making issues sometimes get blurred and difficult. It has been introduced in various fields such as loan screening by financial institutions, personnel recruitment, and student evaluation in educational settings. However, this paper will discuss disasters and forest fire examples especially in Türkiye and globally.

However, I will explore how algorithmic decision-making affects society". Do decision-making and its associated concepts change or not concerning disaster issues? If so, how will they change? Particular attention should be paid to "who (or what) makes the decision" and how they can be used. Can they be combined in forest fire cases? The paper will explore decision-making individuals or decision-making subjects, and the question of distinguishing human and non-human. The possible impacts will be discussed.

From a sociocybernetics perspective, the paper will focus on the conceptual changes (evolution of meaning) by focusing on both theoretical and empirical.

Black 2SLGBTQ+ Youth Navigating the Dis/Comfort of Home Place

Addressing the challenges faced by Black 2SLGBTQ+ youth calls for an understanding of how multiple social identity markers as well as various socio-cultural factors affect their lived experiences. Intersectionality facilitates a nuanced understandings of how race, class, religion, and gendered colonial histories intersect with queerness to produce different outcomes. This presentation underscores the need for queer positive community support that centres race and culture. It begins by highlighting the need for affirming and supportive parents in the lives of Black 2SLGBTQIA+ youth. I trouble the idea of "coming out" as one that is rooted in homo-hegemonic framings of queerness, and instead advance a decolonial and intersectional

understanding through the conceptual framework "dash out". I argue that, for Black queer youth, the lived experiences of straddling the intersections of Blackness and queerness results in more of a 'dash out' (meaning to throw out in the Jamaican language), rather than a "coming out". This "dash out" experience is one that complicates simplistic Euro-Western constructions of the visibly out and proud queer. I share some cases and situations of African queer affirming parenting, and speak to positive outcomes that counter the perception of the suffocatingly homophobic African home place. Drawing on the narratives of queer Black youth, I conclude by underscoring the need to create culturally responsive safe spaces in homes and communities for Black 2SLGBTQIA+ youth.

Equity-Diversity-Inclusion Practice in Academia: A Tool of Resistance

In 1979, Audre Lorde delivered her speech "The Master's Tool will never dismantle the Master's house" at New York University's Institute for the Humanities conference. In her address, she decried the under-representation of diverse bodies and voices, particularly those of Black, working-class queer women, within the conference program. Lorde's incisive critique at that time, set the stage for subsequent scholarly discussions emphasizing the importance of diversity and difference in challenging systems of oppression rooted in racism, sexism, capitalism, and heteropatriarchy. Now, 45 years later, Lorde's critique challenges us to critically reflect on whether the mere presence of historically oppressed groups in racist patriarchal academic spaces is enough to emancipate enchained humanity. This paper invites readers to critically engage in discussions around the following questions: To what extent do EDI employment instruments serve as the 'master's tool' on the academic plantation? Can this tool be used to dismantle the 'master's house'? How can EDI serve as a weapon of the Other? What type of ideological and political commitments are needed by the targets of EDI policy interventions to contest the forces of oppression represented in the academy? What is the desired role of faculty trade unions or employee associations in promoting EDI as a tool of resistance? By asking these questions, the paper advocates for a sustained connection between the hired and social movements that made EDI possible.

ONYIGE, CHIOMA DAISY* (Bonn Center for Dependency and Slavery Studies, University of Bonn, Germany)

Human Trafficking As the Reflection of Historical Exploitation: A Case Study of West Africa

In the 21st century, human trafficking, often referred to as modern-day slavery, mirrors the exploitation of the 17th-century Transatlantic African slave trade, with similar methods of deception, coercion, and force used to exploit vulnerable individuals. Historically, African slaves were forcibly transported to the Americas, serving as chattel for labour, sex, and reproduction, exchanged for goods like guns, trucks, and money. Similarly, human trafficking today has evolved into a global enterprise, driven by institutions, criminal organizations, and opportunistic agents who prey on those impacted by socio-economic and environmental factors. This paper argues that human trafficking, like historic slavery, involves absolute power and control over its victims, undermining their freedom. Victims, like African slaves, are forced to comply with their traffickers' dictates, working for someone else's gain. Beyond the commonly known trafficking for prostitution and nightclub work, individuals are also trafficked for domestic labour, forced marriages, and even false adoptions. Despite their victimhood, modern-day slaves are not passive in their struggle for freedom. They navigate complex institutional and cultural barriers in attempts to break free from oppression. Many victims are coerced into binding agreements with traffickers through spiritual rituals, and swearing of oaths to voodoo priests. This psychological control, reinforced by cultural beliefs, often makes physical violence unnecessary. However, victims are increasingly defying these spiritual and social constraints, speaking up to authorities and exposing their captors. Through a qualitative content analysis of narratives from human trafficking survivors from selected countries in West Africa, this paper demonstrates that the concept of freedom is multifaceted. Victims' experiences highlight various levels of freedom that are often overlooked, suggesting that the notion of freedom for the enslaved should be understood from a pluralistic perspective.

Women at the Frontlines: Redefining Roles in Conflict and Peace Building in Nigeria

This study explores the dynamic roles of women in conflict and conflict resolution in Nigeria, particularly in regions grappling with insecurity, violence, and unrest. Women in these areas, either as individuals or through collective efforts, have actively contributed to the development and stability of their communities, despite their marginalized socio-economic position in a patriarchal society. The paper argues that women disproportionately bear the brunt of conflict, often being forced or coerced into participation in armed conflict or resorting to informal means of survival. Despite the profound impact of conflict on women, they are frequently excluded from key decision-making processes that directly influence their lives and communities. This exclusion underscores the need for greater inclusion of women in peacebuilding efforts. The study highlights that while women suffer immensely during conflicts, they also possess significant potential to contribute to the peacebuilding process, through both formal and informal channels. The paper calls for a re-evaluation of women's roles in conflict resolution, stressing that sustainable peace can only be achieved if women are actively involved in decision-making at all levels. To achieve this, there must be internal accountability from all actors involved in the peace process, ensuring that women are not only seen as victims but also as agents of change. This analysis underscores the need for a shift from the traditional narrative of women as passive actors in conflict to one that recognizes their critical role in resolving conflicts and building peace in Nigeria.

Being a Young Female Migrant in Ageing Society. Life Strategies of Ukrainian Women in Wrocław (Poland)

After the fall of communism and especially after joining the European Union, Poland became a significant place of opportunity for people from the post-Soviet bloc. Due to the cultural and linguistic proximity, Ukrainians chose Poland for various reasons: work, higher education or because of their Polish ancestral and familial ties. In a country where approximately 25% of the population is elderly, Poland has been admitting young migrant workers. The number of Ukrainian citizens in Poland increased significantly after Russia's full-scale invasion of Ukraine, when many were forced to migrate. By January 2024, they represented 2.5% of the population in Poland and 22.5% in Wrocław, transforming Polish society from an ethnically homogeneous to a multicultural one. Migration and ageing present important considerations for national and local authorities as well as for migrantised people themselves. Spatial mobility can be a deliberate life strategy or forced by war or other structural conditions.

Our paper aims to explore the life strategies of young Ukrainian women living in Poland by addressing the following questions: What strategies do they adopt in relation to mobility, education, work, and family formation? What are the factors that determine their mobility and shape their life trajectories? How do they reflect on the impact of migration on their life strategies, identity-formation, norms, and values? How do they, as young, female, migrantised individuals, perceive the problem of the ageing society in Poland? The paper is based on biographical narrative interviews and episodic interviews conducted with young (18-36) female Ukrainians as part of the LYMAS research project funded by the Volkswagen Foundation. It will highlight the formative events, coping mechanisms, and future scenarios of young Ukrainian individuals in Wrocław (Poland) and their perceptions of the implications of ageing on their life trajectories.

Meso-Level Organisational Factors Influencing Healthcare Workers' Resilience: Evidence from a Scoping Review

Individual resilience mitigates the adverse effects of workplace stress and poor psychosocial outcomes for healthcare workers, first and foremost nurses and physicians (Aiken et al., 2024).

Multiple scholarly disciplines and approaches, including health services research, organization studies, nursing studies, or occupational health, tried to understand the most relevant factors that impact on professionals' resilience and well-being (e.g. Diehl et al., 2021; Kelly et al., 2021; Kohnen et al., 2021). However, previous reviews mostly focused on individual characteristics or overall organisational factors, devoting less attention to meso-level organizational factors (e.g. Rees et al., 2019; Teoh et al., 2020). Furthermore, they often collect evidence from diverse settings (acute care, nursing homes, general practice) overlooking the specificities of work in hospital contexts, and concentrate exclusively on nurses or physicians (e.g. Hall et al., 2016). Also, we lack reviews that include and compare studies carried out before Covid-19 and during the pandemic.

This scoping review aims to systematise factors at the meso-organizational level (e.g. leadership, teamwork, etc.) that affect the well-being, mental health and resilience of healthcare workers, focusing on empirical research conducted in the last ten years in the hospital sector of developed countries.

Following the PRISMA-ScR guidelines, out of 7,462 papers published in the last 10 years yielded by our initial search, the final sample for data extraction included 66 papers. We identified four macro themes: supervisors, team relationships, work conditions, and workplace aggression, and we showed how findings differ across doctors and nurses and before and during the pandemic. We argue that healthcare organisations should focus on valuing/empowering middle managers, fostering team cohesion, implementing supportive policies, and addressing workplace aggression to enhance professionals' resilience, mental health, and well-being. Finally, we identify areas for further research and intervention.

The Contribution of Design Thinking Tools in Promoting a Visual Approach to Social Research

In the context of contemporary social research, the design thinking approach provides visual and participatory tools for understanding social and cultural dynamics at micro and macro sociological levels. This approach, which actively engages participants in idea generation and problem-solving activities, produces as output visual materials, such as conceptual maps, sketches, prototypes, and graphic representations that provide deep insights into practices and narratives of the participants to their involvement in participatory activities.

Our contribution intends to explore how the results of participatory sessions can be considered as testimonies reflecting the cultural and social changes the participants as a group intend to enable. On the one hand, through the analysis of materials produced during these sessions, such as graphic diagrams, storyboards, wireframes, etc. we can gain insights into participants' perceptions, experiences, and group dynamics. Additionally, design thinking presents itself as an active method for producing visual evidence, integrating drawing and graphic design into the research process, making visible the thoughts and problem-solving strategies of participants. A classification of the different visual tools based on their role in design and in social research, and the evidence produced is operated.

Finally, this contribution discusses the potential of the outputs of design thinking sessions in the communication of social research results, envisioning a future in which visualizations generated during participatory processes can complement traditional channels and materials. Drawings, system maps, and graphic prototypes can not only make research findings more accessible, but also provide an alternative narrative that captures the complexity of the social issues being studied.

In conclusion, the contribution intends to emphasize how some skills traditionally associated with designers and creatives, should be more and more considered also by social researchers, strengthening their ability to read social complex phenomena and widening the set of visual instruments used to gather and analyze data.

ORCHARD, MACARENA* (Universidad Diego Portales, Chile)

The Sociological Nature of "Respect": Understanding the Interplay between Hierarchies of Value and Expectations of Treatment

What does sociology have to say about respect? In this paper I interrogate the phenomenon of respect from a sociological perspective. Respect has been a central topic in moral philosophy, but it has not received enough systematic attention in sociological theory. Although there is both theoretical and empirical research on the concept, the sociological literature on respect is still scarce, and there is not enough dialogue between approaches. In this article I offer a systematic reading on the literature on respect and claim that it is fruitful for sociological analysis to construct a deeper understanding of this phenomenon. Given the increasing importance of morality in sociological research, I propose that respect is a moral phenomenon whose sociological nature deserves further exploration. I suggest that respect functions as the norm, the language and the practice through which we communicate value to others, which is culturally situated and historically variable according to shifting definitions of social value. I claim that there are three main types of respect which can be analytically distinguished -categorical, positional and performance- and I argue that looking at the tensions between these three types of respect is a fruitful way to read cultural changes regarding the expectations of treatment that are formed in social interactions.

Terrorism, Gendered Violence and Resistance

Talal Asad (2007: 40) in his book, *On Suicide Bombing*, poses a fundamental question: "Why did he do this terrible thing?" (Italics original). This SSHRC-funded research inverts Asad's question: *Why did she refuse to do this terrible thing?* This presentation focuses on the agentic and gender(ed) dimensions of female suicide terrorism. Much contemporary scholarship draws on data garnered from families and associates of suicide terrorists. This presentation uses primary qualitative data garnered through interviews with former sex slaves and suicide bombing candidates of Boko Haram to understand the organizational dynamics behind female suicide terrorism and the contours of resistance to terrorists. How do female terrorist captives, who managed to escape serving as human bombs, make sense of their experiences? What are the policy implications of the lived experiences of such women and girls? The presentation highlights the stages in the suicide-bomber deployment process, women's resistance against terrorism and implications for the sociology of crime.

ORJUELA, MARIAN* (Heidelberg University | Germany, United Kingdom)

Amazonian Women's Power: Leadership and Protection Strategies in Contexts of Conflict and Violence

"In Caquetá, cows are more important than women, cows have better medical care, a better place to live, they have land, and Amazonian women have nothing in that sense. We [women leaders and defenders] expose ourselves to threats and as it is not possible to stop the strength of women, they have to be killed." (Interview with environmental woman defender, 2022).

Caquetá is one of the departments (administrative region) that makes up the Colombian Amazon region, which historically has been a setting of armed violence, poverty, and governmental abandonment. In this context, women living in Caquetá are carrying out collective actions for the defense of their human rights and environmental protection, receiving threats, becoming stigmatised, some even killed. Their activities have meant a high risk to their

lives. The pursuit of gender justice and the full exercise of their rights in this specific context has led to the development of different forms of leadership and protection strategies, which these women have called "poderío amazónico de las mujeres" Amazonian women's power. In addition, these women's collectives have developed their own ways of learning about human rights, women's leadership and peacebuilding. The question then arises as to how do women leaders in Caquetá protect themselves when defending their human and environmental rights, and what kind of leadership and protection strategies do they develop in contexts of conflict and violence? In this research I analyse the kinds of leadership and the protection strategies developed by the Departmental Women's Platform in Caquetá, a loose umbrella organisation that links women leaders and human rights and environmental defenders, some of which have been threatened and stigmatised in the region. This work aims to fill a gap in research on gender and high-risk women's leadership in remote and conflict-burdened places such as the Colombian rural Amazon.

ORJUELA, MARIAN* (Heidelberg University | Germany, United Kingdom)

De Mujer a Mujer: Sentipensamiento y Autopoiesis

En este trabajo se condensan dimensiones metodológicas de investigación en contextos de alto riesgo con sentipensamiento y un sistema autopoietico como parte del mismo "proceso de investigar". Se trata de una reflexión basada en evidencia centrada en mi posicionalidad como investigadora, mujer de la Amazonía que investiga sobre movimientos sociales liderados por mujeres de la misma región, y que son quienes se enfrentan a un alto riesgo al defender sus derechos humanos, la tierra y el medio ambiente. Realizar investigación en contextos de múltiples conflictos y violencias masivas plantea cuestiones sobre el cómo construir metodologías de género desde abajo en contextos tan complejos, en donde convergen muchos intereses socio-economicos; asimismo, el cómo vincular el sentipensar, el lenguaje, las estéticas y poéticas emergentes en la conexión investigador/investigadora con el territorio y sus colectivos. Este escenario promueve la búsqueda de técnicas innovadoras en donde la investigación puede ser conducida a través de la misma experiencia emocional y sensorial. En este sentido, también se trata del proceso autoetnográfico que he desarrollado a lo largo de años en trabajo de campo, que estimula al aprendizaje de nuevas formas de empatía y construcción de redes de solidaridad de mujer a mujer.

Primary and Community Mental Health Care Intervention for Suicide Prevention in the Filipino Community of Raval Nord in Barcelona

Background: The outbreak of the COVID-19 pandemic stressed the entire health system and, in particular, primary health care (PHC). Based on a community and social participation approach some PHC initiatives have been implemented in Catalonia that have been essential to guarantee accessible and continuous health care to the population. This presentation examines one of these experiences, which took place in a multicultural neighborhood of Barcelona, known as "el Raval". Focusing on the Filipino community, during the first months of the confinement, nursing professionals of the PHC unit led a suicide prevention initiative in response to the worrying increase in the number of cases registered in this community in a short period of time. Method: Among the community interventions to prevent suicide, the training of suicide prevention gatekeepers was chosen, which has been considered an optimal intervention by the WHO and various studies. Individuals from the Filipino community were selected and they were trained in basic skills to recognize possible warning signs of suicide risk and to accompany these individuals in distress to PHC services. Results: The press embraced the project and played an important role in the multidimensional approach to the complexity of suicide, reporting without sensationalism the epidemiological reality and the preventive community activities that were carried out. Other community organizations in Raval contacted the neighborhood nurses to collaborate in the project, and as a result, a new working group was created consisting of these organizations, the neighborhood nurses, and ten Filipino community associations in the neighborhood. Conclusions: This new collaborative space, made up of PHC professionals, key people from the Filipino community and community organizations reinforced the intervention and added new elements to improve the emotional well-being of the Filipino community beyond suicide prevention.

Desarrollo Consciente De Competencias Creativas. Un Análisis Comparativo En Universidades De Guanajuato, México

Este estudio muestra un comparativo donde se analiza la percepción de competencias creativas en jóvenes de tres instituciones de educación superior en el estado de Guanajuato, dos de ellas públicas y una privada. Se implementó un taller de competencias creativas en cada institución, evaluando la importancia que los estudiantes otorgan al origen, expresión, recepción y generación de sentido en sus actividades creativas.

Los resultados muestran diferencias significativas entre las instituciones en cuanto a la valorización de la creatividad. Los estudiantes de la institución privada enfatizaron la importancia de la expresión individual, mientras que los estudiantes de las instituciones públicas destacaron la relevancia del origen cultural y social en su proceso creativo. Además, se observaron variaciones en la forma en que los estudiantes generan sentido y reciben retroalimentación en sus proyectos creativos.

Este estudio contribuye a la comprensión de cómo las instituciones educativas influyen en la formación de competencias creativas en jóvenes, así como de las disciplinas en que se forman, y resalta la necesidad de considerar el contexto sociocultural en la enseñanza de la creatividad.

Se espera que a partir de este estudio se puedan fortalecer estrategias con las que las respectivas e instituciones fortalezcan las competencias creativas de los estudiantes.

A Chance to Start Anew?: Reskilling, Reintegration, and Issues of Return in the Philippines

Compared to research on migrant deployment and experiences abroad, fewer studies investigate how governments incorporate those who return home after a period of living and working overseas. Existing literature has highlighted the lack of support for returnees, as states tend to either ignore the challenges that former migrants face or stigmatize forced returnees as criminals. For years, international organizations such as the ILO have called on source countries to support former migrants in reestablishing economic, social, and psychosocial ties within their home countries. However, initiatives within the Global South are often found to be inadequate or simply absent in all three aspects.

Still, such research should not lead scholars to assume that sending states are simply disinterested in returnees' welfare. In the Philippine case, failing to protect former migrants can be detrimental to the political futures of incumbent officials, given the massive remittances that migrants contribute to national coffers. In this presentation, I examine how Filipino state agencies sought to address the sudden return of migrant cruise workers during the COVID-19 crisis. Contrary to the image of an incapable state, I show how local government officials were quick to pivot state funds and resources from deployment to reintegration. I discuss how a key part of the Philippines' reintegration efforts was framing migrants' forced return as a positive opportunity—one that former migrant workers should maximize in their favor. I discuss how state agencies used the promise of skills training to reinforce this approach, emphasizing how new entrepreneurial or pandemic-oriented skills will allow former migrants to thrive within their communities. But, this presentation will also show how such positive portrayal of cruise workers' immobility eventually collapsed, as government officials failed to maintain its narrative of successful return.

Planning for Territorial Reparation: The Role of Neighbourhood Upgrading in Dignifying IDPs Lives

Colombia hosts one of the largest internally displaced persons (IDP) worldwide. The Constitutional Court has reiterated the systematic re-victimization of IDP through insufficient state action. State action faces two limitations, despite one of the main tenets of the 2016 Peace Accord demanding victims' reparation and land restitution. On one hand, most policies and investments have targeted rural municipalities, overlooking the concentration of IDP in the main cities' periphery. On the other hand, processes of reparation and restitution have focused mostly on material, legal and technical issues that overlook social and symbolic dimensions that are central to bring dignity into the core of housing debates and policy. The limited understanding of these dimensions in/when building territorial peace and the mechanisms for reparation in cities results in the reproduction of the multiple violences that policy aims to counteract. Building on the spatial turn to peacebuilding and debates on reparative planning, this article proposes the notion of 'planning for territorial reparation' and elaborates on how neighbourhood upgrading can become a tool for reparation in Colombian cities. Based on the cases of Cali and Medellín, our aims are 1) to discuss current multi-scalar responses to IDPs on housing policy and territorial planning based on policy analysis; 2) to explain the spatial pattern of the location of the forced-displaced populations and the intersectional conditions of IDPs vulnerability based on spatial analysis; and 3) to propose co-created set of premises to recalibrate neighbourhood upgrading in the context of protracted conflict centring IDP.

Victims-State Relationship amidst Criminal Wars: Why Victims Adopt Different Strategies to Demand Justice

Responses to victimization in violent conflicts are spearheaded by victims' families demanding truth and justice. This mobilization usually entails interaction with the state. However, the nature of the interactions with the state can vary sharply, even within the same political context. Strategies followed by victims' families range from amicable dialogue to aggressive confrontation. Authors in the literature on social movements have generally argued that these differences are explained by different perceptions of the political opportunity structure, access to mobilization resources, framing, and shared identity, or leadership and structures of contentious groups, even within the same social movement. However, most previous scholarly work focuses on strategies followed by groups comparing different settings (i.e., the feminist movement or the anti-climate change movement in various world regions) or after changes in the political opportunity structure (i.e., the LGBTQ+ movement pre- and post-AIDS crisis). We contribute to this literature by examining the dynamics of victims' relatives' mobilization strategies amidst violent conflicts. What explains the different strategies followed by victims' families in their search for justice in violent conflicts? Why do some families engage in confrontational strategies towards the state while others adopt more collaborative dialogue? We build on the social movements literature to add a condition particular to protracted violent conflicts, essential to understanding victims' contentious strategies: time since victimization. We argue that as patterns of civilian victimization extend over time, the demands and needs of victims' families change as well, the sense of urgency decreases, and they are more likely to engage in dialogue with authorities. On the contrary, victims' relatives with recent histories of victimization will be more likely to engage in confrontational strategies. We tested our argument in two cities in Mexico afflicted by criminal wars, where we conducted focus groups with groups of families of disappeared persons.

Resilience through Societal Envisioning: Exploring the Impact of HIV/AIDS Activism Among Sexual Minority Communities and Beyond

Japan is often referred to as a “disaster-prone country” due to its frequent exposure to natural hazards. It also has geopolitical and historical conditions that have led to disasters caused by science and technology, such as the atomic bombings of Hiroshima and Nagasaki, and human-made disasters, such as the Fukushima nuclear power plant accident.

Furthermore, high population density in urban areas further complicates these risks. For instance, Edo (now Tokyo) had a population of approximately one million by 1721, the largest city in the world at the time. During this period, epidemics such as smallpox and measles were widespread, which prompted the development of sanitation systems. A defining feature of Japan's history is how people have continuously faced “social suffering” (Kleinman et al. 1997) and have therefore built collective resilience. They have fostered solidarity and shared wisdom in their struggle to survive recurring disasters.

If resilience is defined as the process of rising above such difficulties and adverse circumstances, one of the characteristics of sociology in Japan has been to seek to elucidate the mechanisms of social problems associated with modernization and to explore various aspects of resilience. In this presentation, I argue that such resilience is an operational concept that indicates the process of change that (re)shapes society.

What is important is to refine it as a social theory that includes the “societal envisioning” (Oshima 2023) of people's future and its consequences and possibilities. As an example, I will examine how AIDS activism, which had a major impact on communities, centered around sexual minorities from the 1980s. The inheritance and discontinuation of this activism, have connected people and changed society through deeply expressive biographies that are a mixture of anguish and hope. The aim of this study is to contribute to theoretical refinement by examining the process of resilience.

From Participatory to Radical Democracy in Social Services: A Comparative Analysis of Citizen-Led Actions in the EU

This contribution uses original data from 6 European countries (Austria, Denmark, France, Poland, Portugal and Romania) to look at how citizen-led movements contesting the functioning of social services and social policies seek to introduce dimensions of radical democracy into this space. Based on sixty interviews with social movement leaders, we use qualitative evidence to show how citizens directly or indirectly affected by social policies and social services organise collectively to contribute to changes in those policies and practices. We examine cases that took place between 2019 and 2024 in the fields of disability, mental health, child protection and youth at risk of social exclusion, offering a cross-country comparison of the issues raised by citizens in the collective actions, the demands emerging from the social movements involved and their contributions to the democratisation of social services, understood as aiming to control, limit and distribute power in that space (Warren 1999).

By organising, campaigning and advocating for change, the leaders and participants of these citizen-led actions contribute to democratising society. We draw on Pierre Rosanvallon's concept of “counter-democracy” (2016), analysing how the collective actions identified and studied in our project contribute to a societal surveillance of power through scrutiny (*la vigilance*) and whistleblowing (*la dénonciation*). In the background of the petitions, protests, campaigns and other concrete, collective actions identified through this research, we observe a demand that continues to echo from the previous century's movements: *Nothing about us without us*.

Identity Development of Multiethnic People in Germany

There are two perspectives when considering the unique positioning of multiethnic people in society, meaning children of parents from two different ethnicities. On the one hand, they are seen as exceptionally versatile in adapting to different contexts. This rests on the assumption that their families are prototypes of modernity and integration and that the influence of two or more cultures they receive from childhood onwards would equip them with an openness and adaptability to other cultures. On the other hand, multiethnic people are viewed as tragic, torn and in-between due to their unique positioning, never fitting in completely and finding no group where they fully belong.

But how do multiethnic people themselves perceive their unique positionality? With the method of biographic-narrative interviews, this question will be explored. The context of the analysis is Germany, a country where a colourblind, postracial attitude resulting from its national socialist past often obscures discussions about ethnicity. This has led to a significant research gap on multiethnicity in Germany. The chosen interview method allows for an intersectional analysis of the multidimensional development of identity, recognizing that identity is not stable or one-faceted but rather quite the opposite. Comparing life stories from a diverse array of backgrounds allows insights into racialization processes as well as other factors such as the conditions of upbringing or unique personality that shape multiethnic people's sense of belonging. This paper will argue that multiethnic identity development cannot be simplified into one of the above perspectives as either exceptionally versatile or tragically torn. Instead, the interviews reveal a more complex reality by pointing to the flexibility, context-dependency, and uniqueness of multiethnic identities.

Digital Borders: Navigating Mobility and Inequality for Migrants from Authoritarian Regimes

In the Anthropocene, human activity has fundamentally transformed global systems, with the digital revolution being a major force behind these changes. This revolution has reshaped human mobility, influencing how people cross borders, form connections, and engage with migration infrastructures. Recent studies have introduced the concept of Digital Migration Infrastructures, highlighting how digitalization has redefined migration processes (Preiss, 2022). However, limited attention has been given to how these digital infrastructures impact migrants from authoritarian regimes.

This paper explores the role of digital platforms and infrastructures in the lives of transnational migrants from politically repressive states, focusing on how they either perpetuate or challenge existing inequalities. Migrants from authoritarian regimes navigate restricted digital environments, limiting their access to essential resources, job opportunities, and political participation, which exacerbates their marginalization in host societies. Furthermore, these migrants frequently operate within closed digital networks where information and opportunities are confined to their own communities, hindering broader social integration.

The central argument of this paper is that digital technologies act as both enablers and barriers. While they provide new opportunities for transnational mobility and communication, they simultaneously reinforce inequalities through surveillance, censorship, and exclusion from global platforms. Migrants from authoritarian regimes must often contend with restricted digital environments that further limit access to crucial information.

The methodology combines qualitative approaches, including preliminary fieldwork data from semi-structured interviews with Chinese migrant communities in Italy and participant observations of how migrants use digital platforms. An extensive literature review will support the preliminary findings, offering insights from migration studies and political sociology. This paper provides a comprehensive analysis of how digital tools reshape labor markets, social networks, and political agency for migrants from authoritarian states.

OTA, MARIA EDUARDA* (State University of Rio de Janeiro, Brazil)

PAULA OLIVEIRA, MARINA (International Relations at PUC-Minas, Brazil)

"For Justice and Memory": The Struggle of Relatives of Victims of the Brumadinho Dam Collapse, Brazil

This paper analyzes the repertoires of collective action and the construction of a sense of justice by the Association of Relatives of Victims and People Affected by the Collapse of the Córrego do Feijão Mine Dam in Brumadinho (Avabrum), Brazil. Through an intersectional analysis encompassing participant observation, interviews, analysis of videos and texts published on Avabrum's public page on Instagram, we analyze the political organization of these relatives in discussion with theories of social movements and socio-environmental conflicts, highlighting their organization in network, the construction of collective identity of victims, the internationalization of the struggle and the role of emotions in the process of social mobilization. In the context of a civilizational polycrisis, these family members, mostly women, are political subjects who interconnect different repertoires and demands: they fight for justice for their relatives and for better oversight in the mining sector. "While progress is being made in the mining sector, lives are still at risk because impunity makes crime recurrent," says the Avabrum board of directors at a mining sector exhibition. In this way, they show that demanding justice for their families also means preventing other crimes committed by large mining companies from happening. By accusing Vale of putting profit above life, they are fighting not only for their relatives, but for a society where big corporations are not above the law. As part of a long history of victims' families in Latin America who fight for justice, these family members bring emotions to the public space while denouncing socio-environmental crimes committed by big corporations.

AI-Assisted Court System: System Design and People's Attitude

This paper presents our interdisciplinary collaboration among legal scholars, socio-legal scholar, A.I. scientists, Bayesian statistician to develop an A.I.-assisted court system. In this system, the fact-finding is based upon Bayesian network system, the legal decision is based upon D.N.N. and N.L.P., and the legal reasoning is based upon logic programming. We also conducted several surveys about the attitude of Japanese people toward A.I. judge system. The Bayesian decision theory and hence the Bayesian network are the only well-defined and logically coherent decision model. The problem is that it is difficult for legal professionals to understand and utilize it. It also needs a huge amount of data to deal with various facts and evidence. The Deep Neural Network is the most promising model for the natural language processing, as is shown in the development of ChatGPT-4o. The problem is it needs a huge amount of data since it is based upon the large language model. The legal reasoning means the inference with several legal norms to reach the conclusion, i.e., the judgment. The logic programming is suitable for the legal reasoning since it is logically perfect (see the logic programming language "prolog," which is based upon the first order predicate logic). The problem is only human experts can, so far, translate legal rules and precedents into logical rules. People are very reluctant to use court in Japan (and also any countries). We conducted several surveys to find out whether and to what extent people expect and/or worry the utilization of A.I. court system.

Resilience of Lives Affected By Disasters and Climate Changes: Application of the Inochi Declaration 2025

Based on the on-going collaboration and key findings of the Joint University of Osaka- University of Melbourne workshop on women's and children's health following disasters that have been held in Osaka and in Melbourne from March and June 2023, and March 2024 and so on, this paper will present

the case studies presented and discussed at the workshop on the 2011 East Japan Earthquake, Tsunami, and Nuclear accident, the 2024 Noto-Peninsula Earthquake in Japan, and multiple bushfires in Victoria, Australia, applying the *Inochi (life in Japanese)* concept for further discussion.

The Osaka-Kansai Expo, to be held in 2025 under the theme "Designing Future Society for Our Lives," is a global event that will provide a forum for people worldwide to discuss the post-SDGs of beyond 2030. The University of Osaka has taken this view of the Osaka-Kansai Expo and launched the "Inochi Forum" together with major economic organizations in the Kansai region. The *Inochi* Forum will issue the "Inochi Declaration," a set of action guidelines to ensure that all *Inochi* flourishes, with an eye on the world in 2050.

The Framework for the *Inochi* Declaration consists of 5 components: *Hagukumu* (Nuture/ Cultivate), *Tsunagu* (Connect), *Shiru* (Contemplate), *Kanjiru* (Feel/ Perceive), *Mamoru* (Protect).

We further extend our discussion around the *Inochi* Declaration, applying it to the case studies of people's lives affected by disasters, climate changes as well as resilience at various levels: individual, community, regions and global.

OTAYA, SATOSHI* (Ritsumeikan University, Japan)

Reevaluating the Connection between High Schools and the Labor Market in Japan: Limits and Reorganization

The system for recruiting high school graduates in Japan has long provided a stable labor supply, particularly since the post-war period of economic growth. This recruitment system is based on the concepts of "employment through schools" and "institutional linkage" between schools and companies, with schools playing an active role in matching students with employers. However, in practice, schools often focus on simply securing job placements and sending students off, without offering significant post-placement support.

In the 1980s, 40% of 18-year-olds entered the workforce directly after graduating from high school, but today, that figure has dropped below 20%. High schools with a high proportion of students entering employment are now positioned at the bottom of Japan's hierarchical high school system. Many of these students face complex socio-economic, cognitive, and developmental challenges, requiring substantial post-employment support. However, schools and public institutions often lack the authority and resources needed to provide such support. This situation highlights the need to reconsider whether the employment of graduates from low-achieving high schools can still be adequately explained by the conventional model of selection and allocation.

This paper investigates collaborative efforts with local communities to support student employment at two public high schools in Osaka that are facing these challenges. The study has two main objectives. First, it aims to identify the challenges encountered by high school graduates during their first year of employment. Second, it examines the involvement of various actors in the regional labor market—schools, students, labor-demanding companies and organizations, intermediaries, and the local community—in the employment process. Based on these findings, the paper proposes a new recruitment model for high school graduates. This model emphasizes the active participation of multiple actors and aims to secure sustainable employment through the discovery and exchange of the unique assets each stakeholder offers.

WG08-906.5

OTHMAN, OROUBA OTHMAN* (Birzeit University, Palestine)

"the Dynamics of Hope in the Everyday Society of Pain in the Gaza Strip: Multiple Futurities and Temporalities"

This paper tracks how Palestinians in the Gaza Strip can produce a sense of the future and time from within the structure of colonial genocide, which aims to prevent them from flowing and thinking toward the future, making them prisoners of the present moment, running from place to place in search of lost bread, water, and security. More specifically, the research explores the ways in which the daily social pain experienced by Gazans—such as the loss of loved ones, intimate places, roles, social relationships, and routine rituals—becomes a productive site for the multiple future imaginaries they hope for. The research aims to: 1. Construct a relational political and socioeconomic analysis map of the diversities, collective intersections, or conflicts among these futures. 2. Track how their hoped-for futurities, which penetrate their difficult presents, produce diverse social practices, feelings, and emotions that work to redirect and reshape their painful daily lives governed by death, waiting, and uncertainty. These futurities create ways to negotiate the present, whether through resisting genocide, coping, enduring pain and resilience, or believing in fate "hope in God is great," among other possible meanings. 3. Explore how a local, horizontal process of producing,

distributing, and disseminating hope can emerge among individuals within the "society of pain" in Gaza, where the afflicted themselves become capable of offering and exchanging hope amidst ongoing genocide and pervasive uncertainty, by utilizing their own local resources and religious, cultural, and national beliefs, independently from hierarchical frameworks of the political economy of hope. Drawing on the voices and narratives of the sufferers, this paper explores a new epistemic space within the field of Sociology of hope, focusing on tracking the forms of hope's emergence and their operations when uncertainty of the next moment becomes an objective fundamental condition governing the Gazan lives in the time of genocide.

Making Walmart in China: Labor Regimes, Consumption, and the Movement of Goods Along the Internal Supply Chain

Big retailers became drivers of the global economy by redirecting manufacturing to the southern hemisphere. In response to the new middle classes generated by export business, retailers moved their storefronts southward, organizing new forms of work and expanding consumption. Taking this trajectory, the U.S.-originated Walmart opened stores in the heartland of its biggest trading partner, China, generating low-wage, precarious service jobs. To capture the new forms of work and consumption created, this study extends the commodity circuit of value into the retail store. It follows commodities as they travel through the hands of retail workers, themselves commodified, and into the hands of consumers, most often women performing invisible, unremunerated labor for their household. The labor is arrayed on an "internal supply chain." It is regulated by logistics technologies, managerial supervision and customer behavior. Each link on the internal chain of activities generates distinctive forms of labor and techniques of regulation, and presents opportunities to temper the relentless demands of work. I examine three types of labor and their corresponding regimes of regulation: 1) stocking, a masculinized, semi-panoptic despotic regime; 2) cashiering a gender-neutral regime driven by techno-despotism; 3) vendor-dispatched sales, a feminized entrepreneurial hegemonic regime. Unlike its U.S. stores, each store in China hosts hundreds of dispatched workers, to promote sales and manage merchandise. They figure centrally in adapting the retailers' monolithic model to diverse local markets. The paper contributes a critical perspective to analyses of retail labor as it moves to the global south, expands both consumption and women's invisible labor, unpacking the labor regimes at the heart of global retail. It also widens our frame of service labor, situating types of work (aesthetic, emotional, triadic, bodily, routinized) within the movement of goods in the circuit of capital.

Transnational Care: A Catalyst for Vulnerability or a Strategy for Mitigating It?

Migrants forced to leave their countries due to protracted humanitarian crises face a number of challenges related to the process of departure, transit and arrival in destination countries. These "survival migrants" (Betts, 2010) face new critical situations in the country of arrival, such as legal insecurity, socio-economic precariousness, discrimination and racism, etc. Due to insufficient social protection/public welfare services, the elderly staying in crisis countries face not only the deprivation of their basic rights, but also violence and daily insecurity. In these conditions, the elderly depend on their "survival migrant" adult children for support and care. This situation raises the question of transnational care in contexts of protracted humanitarian crises.

In sum, for "survival migrants", who have to assume and cope with different situations of vulnerability related to the process of arrival/settlement in the new country, there is the added responsibility of transnational care for parents in countries of origin, countries facing crisis situations. While this responsibility can be a source of stress and emotional distress and therefore an additional source of vulnerability, it can also be a source of motivation to face new challenges and avoid vulnerabilities. It is on this theme that this paper will focus. This paper is based on preliminary narrative interviews with Syrian men and women in Switzerland who take on transnational care tasks for their parents in Syria. These interviews have been conducted within the framework of an ongoing project (Carbajal, Baghdadi, Cavagnoud, 2023) investigating two cases of protracted humanitarian crisis migration: Syrian migrants in Switzerland and Venezuelan migrants in Chile and Peru. The project focuses on the analysis of perceptions and strategies of transnational care for elderly parents who remain in the (crisis-affected) countries of origin.

OTRISHCHENKO, NATALIA* (Center for Urban History of East Central Europe, Ukraine)

Longitudinal, Collaborative, Trauma-Informed: International Project on War Documentation

Living in the war is saturated with situations of radical physical and emotional vulnerability that shape academic practices professionals do not usually question. Previous routines collapsed or became reevaluated. It can take years between the idea for a study and the moment when its results are available to various audiences. Since the full-scale Russian invasion, such stability and predictability is a privilege that researchers in Ukraine are deprived of. In spring 2022, scholars faced a need to react rapidly—personally and professionally—which went against their usual practices within academia. My observations are grounded in the experience of the international documentation initiative "24/02/22, 5 am: Testimonies from the War"—an interviewing project that the Center for Urban History (privately founded academic NGO in Lviv, Ukraine) started in early spring 2022 together with research institutions from Poland, Luxembourg, Germany, and the UK. In 2024, the project entered the second phase: interviewing the same cohort of people whose stories we recorded in 2022. Although the initiative arose under extraordinary circumstances, it is inspired by many traditions: oral history, trauma-informed and feminist scholarship, indigenous methodologies, and critical archival studies. I argue that even though we must act rapidly, the work within protracted uncertainty should include reflection on future scenarios and create tools to enable shared authority. My talk will outline the research design we developed to mitigate power imbalances and conflicted expectations and to nurture sensitivities toward diverse traumatic experiences. It highlights the connection between different temporalities—rapid methodological choices under threat conditions and the long-term consequences of such decisions.

RC07-112.4

OTRISHCHENKO, NATALIA* (Center for Urban History of East Central Europe, Ukraine)

Theorizing on Futures within the War: Expertise from and on Ukraine in Global Dialogue

War shatters the existing structure of everydayness; it is a time of radical vulnerability and protracted uncertainty when the horizons of the future are shrinking drastically. However, it also provokes an avalanche of academic reflections from different positions. Some traditions explain the war by appealing to historical, political, or economic arguments; some focus on collecting and analyzing data as quickly as possible; others aim to build models and forecasts. Differences in theoretical frameworks and methodological approaches can result in heated discussions and indicate tensions in global knowledge production. As I argue, these tensions also happen due to variations in assumptions about the future. The paper builds on interviews with scholars of and from Ukraine who engaged in international discussion after the full-scale Russian invasion in 2022. What kind of knowledge infrastructures support or undermine their expertise? What images of the future do they imply in their theorizing? What is the role of justice in framing the arguments in global knowledge production on and from the regions that have long been marginalized? My presentation contributes to the discussion on the "insider/outsider" dilemma as a range of positions that change and evolve. It also shows how the future as a resource is unevenly distributed, especially during unfolding violence, which has long-lasting effects on the development of regional expertise. Finally, the paper tackles what can be done better concerning international academic collaboration in war-related projects.

OU-SALAH, LOUBNA* (University of Antwerp, Belgium)

A Comparative Analysis of Social Media Discourses of CSOs on Gender Empowerment across Different Countries

This chapter explores how Civil Society Organizations (CSOs) engage in social media discussions on critical issues related to gender empowerment and inclusion in Belgium, Austria, Poland, Italy, and Spain. Over the last decades, the social media landscape has evolved in such ways, that each platform has a specific participant group, in terms of gender, educational background and age group. Furthermore, all these channels have distinct ways of expressing and communicating, creating their own subgroups, and in some cases interacting with traditional media. CSOs have to carefully select the type of social media channels and topics they wish to participate in, and to discuss whether or not they aim to engage through social media in societal debates. In this chapter, we will conduct a thematic media analysis on five pressing topics—femicide, paid domestic work, abortion, islamophobia,

and citizenship & rights—which have become central to polarized debates and societal divisions across Europe. We investigate how CSOs in these five countries navigate these debates across different social media platforms, examining the impact of country-specific factors, such as cultural norms, political climates, and legal frameworks, on their participation. We will look at how the tone, format, and type of discourse on these platforms shape the CSOs' approach to advocacy and activism. To study this, we analyze social media discourse, including posts, hashtags, comments, and debates, to track how these topics are presented, challenged, and discussed by CSOs. This approach will provide insights into whether and how these topics approach these five topics from an intersectional perspective, and how these debates reflect or reshape public opinion and are picked up by traditional media. Finally, by comparing the approaches, we aim to further gain a deeper understanding of the role of social media in shaping (alternative) conversations around gender empowerment and inclusion across different national contexts.

OU-SALAH, LOUBNA* (University of Antwerp, Belgium)

"Make Sure I Can Come!" Gendered Dynamics in Moroccan Transnational Migrant Networks in Tenerife: Environmental Concerns, Engagement and Remittances"

The concept of transnational knowledge networks have entered the field of study of environmental mobility. Yet, how these networks play a role to deal and adapt to environmental change remains understudied. Power dynamics and familial ties impact the functioning of transnational networks and intricately shape responses to environmental challenges, with gender serving as a salient factor. This research aims to theorize and empirically study how this gendered dimension matters for how men and women engage with environmental concerns within transnational spaces of Moroccan migrants living in Tenerife. This study employs visual mapping techniques to uncover gendered patterns and modalities of communication within transnational networks. The study reveals significant gender disparities in how environmental challenges are discussed and addressed within Moroccan transnational networks. While women prioritize family welfare and employ cultural practices to tackle environmental issues, men focus more on economic implications. Women's perspectives and voices are marginalized, reflecting societal gender norms and biases that prioritize men's voices and expertise in economic matters. This ignorance hinders their participation and access to support within transnational networks, perpetuating gender disparities in engagement and decision-making.

Gender Equality Indicators: What Men and Women Think about Domestic Violence. Example of the Maghreb Countries

Demographic and health surveys carried out in Arab countries, in particular MICS (Multiple Indicator Cluster Surveys), include several questions likely to capture gender relations, and in particular, a question on opinions and attitudes concerning domestic violence: "In your opinion, is it justifiable for a husband to hit or beat his wife in the following circumstances? :

1. Going out without telling her: perception of male control over the wife's movements and freedom.
2. Neglects children: cultural attitude that women are primarily responsible for childcare.
3. Argues with him: tolerance of violence in the context of marital disputes and the husband's dominant role.
4. Refuses to have sex with him: norms on control of women's bodies and sexual rights in marriage.
5. Burns or spoils food: tolerance of violence for perceived mistakes in domestic chores.

The answers obtained enable us to assess under what circumstances women and men consider a husband justified in using physical violence against his wife. In this way, it provides an insight into social norms and cultural attitudes towards domestic violence.

The results of the MICS-Tunisia-2019 survey show that one man in five approves of physical domestic violence for at least one of the five reasons cited above (15% in urban areas and 30% in rural areas). Among women, this percentage is also significant (15% nationally and reaches 37% for the uneducated. This paper proposes to extend this analysis using MICS surveys carried out in Tunisia between 2010 and 2020, in order to understand the

evolution since the Tunisian Spring, and to characterize the people most in favor of such violence.

RC02-30.3

OUBENAL, MOHAMED* (IRCAM, Morocco)

Sporting Practices of the Moroccan Bourgeoisie

Sporting activities in the bourgeois milieu are not just about keeping the body in good physical and mental health. Above all, it has an important social and symbolic function. The sporting performances sought by these elites are proof for themselves and their peers of their legitimacy to continue exercising their dominance in society and inside their companies. At first glance, running doesn't require many resources, so the upper classes take it up as a way of distinguishing themselves by having a personal kinesiologist, equipping themselves with a Garmin smartwatch and joining exclusive clubs to take part in international marathons and be among the few Moroccans to have completed the six world marathon majors. The shift to sports such as triathlon, including its extreme Iron Man form, has taken hold among young upper-class executives who are often former students of *classes préparatoires* who are used to discipline, endurance and competition. However, other sports such as golf, water sports and alpinism continue to hold their own. It was by frequenting the clubs set up by the French and Spaniards during the colonial period, as well as in the various holiday destinations after independence, that the Moroccan bourgeoisie embraced these sporting activities. One of the holiday destinations that has been developing for sports such as water-skiing before being hit, since 2019, by the drought that has affected Morocco is the upper-class site around the Bine Loudane dam.

OUÉDRAOGO, NOÉMIE* (Pacte - UMR 5194, France)

Does the Meaning of a Word Matter ?

The heated debates around intersectionality, from Emmanuel Macron's declaration in 2021 to Natalie Heinrich's book (2023), highlighted how a part of the French public debate came to talk about this concept, social sciences and universities. While the concept has been criticized, the debates were never just about intersectionality. It seemed to be the opportunity to state or claim who has the legitimacy to define what is republican, universalist, or relevant to the French context within social sciences. The conference organised by the College of Philosophy and the Observatoire du décolonialisme was a high point in these debates. Knighted by the then Minister for Education and inviting those attending to reflect on how to rebuild after "la déconstruction". The program mentioned notions such as "déconstructionnisme", "racialisme", and "néoféminisme" amongst others. Despite the "-ism", those are not concepts recognised, nor used, through scientific consensus. But what the previous debates as well as the Minister attendance seemed to mean is that politicians can arbitrate this consensus. As the Minister used his position to approve of part of the scientific community, disallowing the rest in consequence.

But if these are not concepts recognized by scientific consensus, what to make of this word jumble?

This communication aims to make sense of this questionable association of words with Stuart Hall's concept of discursive formation (1997). Indeed, I argue that the fact that these words were associated says something about the position of academia and social sciences within France current political climate. Namely rising reactionary politics and moral panics. The authority to define concepts seem to have been seized by some public figures, out of reach of parts of academia. I introduce the notion of the utterability order to explain how ideas such as intersectionality, multiculturalism and wokism came to be affiliated.

The Role of Civil Society in Women's Empowerment in Mountainous Areas: A Case Study of the El Amane Association in Marrakech-Safi.

Over the past few decades, civil society has played a central role in empowering women worldwide. Whether through grassroots movements or international organizations, these groups have been instrumental in promoting gender equality, fighting for women's rights, and challenging oppressive societal norms. Civil society has helped create a more inclusive and equitable world for women through education, advocacy, and community empowerment initiatives. This movement for empowerment has transformed women's lives and contributed to the development of fairer and more democratic societies.

Through a case study of the active NGO El Amane in Marrakech, we will try to explore how civil society, particularly NGOs, has empowered women in Morocco. This study adopts an impact assessment approach, which will allow for a comparison of the situation of a group of young women in the rural village of Aghbar in the High Atlas region of Al Haouz before and after they benefited from the organization's services following the earthquake in September 2023, using semi-structured interviews.

Social Media and Political Communication in Morocco: A Comparative Analysis of NRI and Jdp Digital Strategies

While the effects of social media on identity, mental health, and the economy have been extensively examined, its influence on political communication—especially in Morocco—has not been as thoroughly explored. As traditional media's dominance in political discourse diminishes, social media platforms have emerged as vital tools for political figures to connect with citizens. This study investigates the social media tactics of two major political parties: the ruling National Rally of Independents (NRI) and the opposition Justice and Development Party (JDP). By analyzing the content on their social media channels, the research identifies significant themes, types of content, and digital strategies employed to advance political goals and engage Moroccan youth. Metrics of public engagement—like likes, shares, and comments—are assessed to understand the level of interaction and the impact of these strategies on shaping political discourse. Grounded in theories of political communication and digital activism, this study provides fresh insights into the changing role of social media in encouraging political involvement among Moroccan youth, addressing a crucial gap in the understanding of the relationship between politics and digital media in the region.

The Significance of Small Farms Today: The Case of Fukushima after Nuclear Disaster

For some time now, there have been discussions of agricultural biodiversity and small farms in developing countries that are not controlled by multinational corporations. This effort is a form of opposition to capitalism and an appeal for the independence of farmers, as discussed by people such as V. Shiva. Agricultural biodiversity is being discussed not only in Europe but also in Japan. In Fukushima, the conservation of agricultural biodiversity damaged by the nuclear disaster and the shortage of farmers are major issues. However, the proposed solutions do not break away from neoliberalist methodologies and do not focus on small country farms.

This study considered measures to maintain the regional circulation and use of resources that agricultural biodiversity encompasses as well as the enjoyment of agriculture. The focus of the case study was to clarify whether small farms complemented neoliberalist agriculture in the agricultural regeneration of the nuclear disaster area.

In the village of Kawauchi in Fukushima, agriculture was difficult due to radioactive contamination. However, the initiative of an elderly farmer, his own consumption of grapes, restarted farming. In 2014, the harvest was used for home consumption and gifts; in 2016, it was elevated to a crop for sale.

The case study found that in Fukushima farming was restarted, at first for home consumption, by an elderly farmer. This is significant in today's world where agriculture is threatened by various forms of disruption. Even temporary disturbances may have a major impact on agricultural biodiversity, as well as on farmers' livelihoods and enjoyment. Recovery from nuclear disaster has been driven by disaster capitalism, but small farms are the foundation of macro-level regeneration of agricultural biodiversity and have demonstrated a new significance.

Collective Representation in New Production Sites: How the Ethiopian Apparel Export Industry Was Unionized

In this paper we analyse the factors that led to the recent unionisation drive in Ethiopia's apparel export industry. In the past ten years Ethiopia has emerged as a growing production location for international firms linked into the global apparel value chain. Ethiopia has successfully attracted foreign firms supplying apparel buyers in the US and the EU into a series of new, mostly government-owned, industrial parks. These supplier firms came to Ethiopia seeking lower labour costs and easier access to US markets. Global buyers, the lead firms of the apparel sector, typically push supplier firms to accept a combination of low margins and demanding delivery schedules, in turn incentivising supplier firms to suppress wage growth and limit workers' collective representation. Resistance to unionisation in supplier firms is common in the sector and was initially supported by the Ethiopian government, which limited union access to industrial parks. The Ethiopian apparel export sector has nonetheless recently witnessed a remarkably successful unionisation drive and most firms in the country's industrial parks now have factory-level unions linked to higher-level union federations.

Drawing on theoretical approaches to labour regimes and sources of workers' power (Wright, 2000; Silver, 2003; Burawoy, 1985; Schmalz, Ludwig & Webster, 2018), mobilisation theory (Kelly, 1998), and recent extensions of value chain theory (Marslev, Staritz & Raj-Reicherts, 2022) we develop a new analytical framework to explain how the resistance of key stakeholders to unionisation was overcome. Empirically, we draw on two matched firm and worker surveys of over 1,000 workers in apparel firms conducted in 2018 and 2023, key informant interviews with company managers, government officials, UN officials, and trade union leaders, as well as semi-structured interviews with trade unionists at factory level.

Climate Crisis and Green Transition in Nigeria: Trade Unions in Policy and Practical Response.

Nigeria is an emerging market and lower-middle-income economy. It has the largest population, a young demographic profile, and is one of the richest in Africa. Its economy is highly concentrated in the oil and gas industry. That sector, while crucial to Nigeria's development to date, is responsible for contributing to far-reaching ecological and environmental degradation in Nigeria, and global climate change crises. Gas flaring and increased CO2 emissions, destruction of agricultural and marine ecosystems from oil spillage, and exposure of people to poisonous gas and resultant chronic illnesses, are significant among the negative impacts of the oil and gas industry to Nigerians and neighbouring populations.

These well-documented concerns and their crisis-deepening implications have met with mixed policy response and variable efforts for change. The Nigerian government endorses international climate change response initiatives and strives to develop and implement national initiatives. The Nigerian Labour Congress (NLC), one of the largest unions in Africa (ITUC, 2021), pursues its Climate Change Policy issued in 2015. However, even as NLC leaders acknowledge that Africa is the most vulnerable continent to climate change and global heating, with severe effects on populations portended, and demand a "just transition" to a more sustainable economy, their policy strategies and actions toward a just transition appear to date to be fragmented.

Utilising the duo of ILO guidelines on just transition and the holistic framework for evaluating policy mixes for just transition (Kalljonen et al., 2024), this paper evaluates the policies and practices of labour actors in Nigeria in responding to climate change and pursuing a just transition for workers and the poor. By so doing, it uncovers the policy interventions points of the Nigerian trade union movement, and the reactive, active and emancipatory practical responses aimed at distributive and procedural justices in their efforts at seeking a just transition.

Solidarity Networking Against the Usurpation of the SEED: SEED Exchange Networks in Türkiye

Today, seeds have ceased to symbolize collective sharing and have instead become an unrenewable commodity, one that farmers are compelled to purchase each year from seed companies. Genetically modified or hybrid seeds produced by agribusiness monopolies pose a serious threat to food security, leading to the possible extinction of local seeds. This signifies not only the loss of biodiversity but also the erosion of knowledge, heritage, and culture. In the face of multinational agribusiness monopolies, is it possible to preserve seed diversity across countries?

Due to the influence of agrochemical and biotechnology corporations such as Monsanto, Dupont, and transnational organizations like UPOV, many developing countries have undergone significant changes in their agricultural laws. In Türkiye, the sale and even exchange of seeds are regulated under the Seed Law No. 5553, which was enacted in 2006. This law mandates that all seeds sold must be certified and registered, and unregistered seed trade is prohibited. While small farmers are allowed to save and exchange seeds for their own use, any exchange that hints at 'trade' invokes penalties. This has raised concerns among farmers and activists, as it threatens local seed diversity and traditional agricultural practices.

What are the reactions to these prohibitions and the loss of seed diversity? Over the past forty years, the industrialization of agriculture has given rise to new forms of seed exchange networks. This paper analyzes the emergence of transnational seed exchange networks in Türkiye.

In response to the current seed monopolies, certain groups in Türkiye are striving to preserve biodiversity. Drawing on interviews with individuals and organizations involved in these efforts, through case-oriented study, this paper seeks to explore whether seed exchange can provide a viable solution to these challenges and will provide insights into how rural citizens navigate and influence their socio-political landscape.

Expectations Vs Lived Experience: Health Care Barriers and Social Determinants of Health in Canada and Turkey

Health care experiences of refugees are shaped by a complex interplay of access barriers and social determinants of health. Existing research suggests refugees face health care access challenges due to language proficiency, health literacy, cultural differences and bureaucratic procedures. Social determinants such as education, precarious employment, health literacy, inadequate housing and lack of social support networks also shape refugees' health experiences in host countries. Targeted interventions and policies aim to address these challenges. The study will examine the transformation in healthcare policies affecting refugee experiences in Canada and Turkey since 2015, and will analyze the experience of quality of care and overall health outcomes for refugees. It seeks answers to the following questions: How have the policy changes impacted the refugee experience of healthcare services, and why? In what ways and to what extent social determinants of health influence the impact of these policies? How does country of origin, gender, age, healthcare need matter while experiencing healthcare services, and why? The research will employ a qualitative method by collecting and analyzing reports by states, international organizations and NGOs, scholarly literature and social media posts of refugee health focused groups and interview three refugee community leaders mobilized around health in both countries. The research will use thematic analysis to identify key topics and patterns which will be coded into policy changes, barriers to access and social determinants of health. The study will use symbolic interactionism to examine the lived refugee experiences accounting for social determinants of health in a context of health policy transformation. The research will conclude with suggestions for accurately addressing health needs of refugee populations.

OZEKI, TAKAKO* (Atomi University, Japan)

Teenagers Working in Bars Late at Night and Japanese Law

In Japan, restaurants and bars where people sit next to customers and serve them are regulated by special laws. These include hostess clubs, cabarets, and host clubs. The business hours of these establishments are determined to be until midnight. In recent years, however, the number of businesses offering intimate services has increased, and the number of "girls bars" that employ

teenagers even late at night has been growing throughout Japan. The surge in the number of girl bars can be attributed to the 1999 amendment of the Equal Employment Opportunity Law, which allowed women to work late at night. In addition, the age of majority in Japan will be lowered to 18 in 2022, and parental consent will no longer be required for part-time work. Incidentally, the age at which drinking alcohol is allowed in Japan is 20. In addition, "concept cafes," including maid cafes, are registered as general cafes, and many of them employ high school students. Both "girl bars" and "concept cafes" are new forces that have emerged under the radar of the law, serving as gateways for young women to enter the night business. In this presentation, we would like to clarify that these social problems exist due to the abuse of the law.

From Local Grievances to Regional Resistance: Analyzing the Diffusion of Geothermal Power Plant Protests in the Turkish Aegean

This study examines mobilizations against renewable energy projects, which are widely seen as critical for mitigating climate change. Specifically, it focuses on the protest movements against geothermal power plants (GPP) in Turkey's Aegean Region, which began in two villages around 2013 and quickly spread to numerous others within a few years. The research has two key objectives: first, to understand the factors driving the emergence and regional diffusion of these protests, and second, to analyze the impact of this diffusion on the movements themselves as well as on renewable energy and climate policies. Using document analysis and fieldwork, the study investigates seven protest movements from various locations, as well as two outlier cases where no protests occurred despite the presence of GPP projects. This comparative approach provides a broader understanding of why some areas mobilized against renewable energy projects while others did not. Grounded in processual social movement theories, the research explores both structural and movement-related factors. It considers political and economic structures—such as state policies, capital accumulation dynamics, and the regional political economy—as well as the social, political, economic, and cultural characteristics of local communities where protests emerged. Additionally, it examines the role of protest actors, including local leaders and external supporters, in spreading resistance. The study assesses how the diffusion of protests shaped individual movements across different locations, particularly whether it resulted in a "scale shift," expanding the protests from local to regional or national levels. It also examines whether and how the spread of protests influenced renewable energy and climate policies and practices. By integrating these insights, the study offers a deeper understanding of how climate policies can trigger local resistance, how this resistance spreads and evolves, and the dynamics of protest diffusion and its impact on climate-related policies and practices.

OZERTURK SOFU, VILDAN* (Istanbul Medeniyet University, Turkey)

The Transformation of Privilege in Elite Schools in Türkiye

The theme of ascribed or achieved privilege has been a focus of research in the field of elite schools, often situated within a meritocratic discourse obscuring the presence of class privilege. However, the predominance of studies conducted in global north countries has prompted the question of how privilege is experienced in contexts where an aristocratic tradition may not be as prevalent. Within the Turkish context, elite schools were founded during the late Ottoman era to educate future bureaucratic elites, who were expected to revert the downturn of the empire. Following the Turkish Republic, these schools have retained their prestige to the present day. This study, based on the findings of an ongoing doctoral research project, seeks to elucidate the ways in which privilege is experienced in Turkish elite schools. It employs a qualitative methodology, comprising 35 in-depth interviews with graduates of different cohorts from the most prestigious three elite schools, two state schools and one private school. Grounded theory research design was adopted in data analysis and the findings were supported with descriptive quantitative data. The findings indicated that graduates of Turkish elite schools legitimize privilege via the notion of 'earned privilege' and the acquisition of 'elite qualities'. However, there are notable differences in the accounts of graduates with regard to the source of privilege. In line with Bernstein's conceptual framework, the older graduates (pre-2000) primarily highlighted 'technical-instrumental gains', such as access to a high-quality education and proficiency in foreign languages, whereas the younger generation emphasized the value of 'practical-expressive gains', including the school's brand image and alumni network. Again, while graduates of state schools emphasized the fraternity discourse among students, graduates of the private school emphasized the material opportunities provided by the school. The reasons for these differences are analyzed in the study in comparison to the related literature.

ÖZKAYA, DERYA* (University of Graz, Austria)

Ageing in Protest:(Im)Possibilities of Intergenerational Solidarity Among Struggles for Justice in Southeast Europe

This paper explores the (im)possibilities of intergenerational solidarity within social and ecological justice movements in Southeast Europe, with a focus on the intersections of ageing, gender, and political activism. While demographic shifts such as depopulation and youth migration in the region have sparked scholarly interest, less attention has been paid to how older generations navigate ongoing economic, social, political, and ecological crises, and how these struggles are interconnected with youth.

Positioning political activism as a life-course practice and a form of intergenerational engagement, this study challenges the dominant narrative that frames activism as the domain of youth. It highlights the critical role of older women activists in shaping movements for social, political, and ecological justice. Through ethnographic and archival research on social movements in Turkey and Austria, the paper examines how older women's life experiences and intersecting identities—shaped by age, gender, class, ethnicity, and religion—inform their activism and their ability to build solidarity across generations.

Key questions include: How do older activists (dis)engage with younger generations in collective action? What are the tensions and opportunities in forming intergenerational alliances? How are expressions of solidarity shaped by political, cultural, and social factors in Southeast Europe? The study also examines how the material and emotional connections between generations influence movement strategies and how collective narratives can either strengthen or hinder solidarity.

By expanding the geographical and socio-historical scope of scholarship on ageing and activism, this paper sheds light on the opportunities and challenges of fostering intergenerational solidarity within movements for justice, offering a critical perspective on the realignments between generational and political divisions in an ageing society.

OZLU DINIZ, SIMAY* (Baskent University, Turkey)

Community Supported Agriculture and Food Democracy: Güdül-Ankara

This study aims to understand how Community Supported Agriculture (CSA) in Cittaslow Güdül aligns with the New Solidarity Economy (NSE) and fosters a movement towards food democracy. NSE represents a re-socialization and re-spatialization of food, driven by ethical consumption and new technologies. The study focuses on the Tahtacıörencik Natural Life Collective (TADYA-Güdül), a hybrid CSA model that connects producers and consumers directly without intermediaries, utilizing new technological marketing and communication tools. In industrialized societies, access to good, clean, and fair food has become an increasingly pressing issue associated with quality of life. The Green Revolution, that sought to address global hunger through large-scale agricultural production, introduced significant health and environmental concerns that particularly affect vulnerable communities. Moreover, contemporary mass consumption, deeply embedded in social culture and controlled by the global market economy, leaves little room for individual agency. In response, movements promoting sustainable consumption—slow, green, minimalist, freeganist, *prosumer*—have emerged. These movements advocate for equality, justice, and democracy especially regarding nutrition. From a relational perspective, food acts as an agent that shapes social, economic, and political relationships, aligning with Latour's Actor Network Theory (ANT). This qualitative study employs *netnography* to conduct online interviews with TADYA producers (15) and in-depth interviews with consumers (10), discussions with leaders of active organizations in the region (6). The collected data is analyzed using discourse analysis to understand producers' motivations, consumers' lifestyles, and leaders' contributions. Findings reveal that CSA represents a form of social innovation, creating urban-rural proximity through reciprocity, transparency, and direct dialogue as articulated by Polanyi. TADYA, that is supported by NGOs in Ankara, acts as a mediator, offering access to quality food, fair trade for producers, and environmental protection. Understanding the CSA's role in promoting food justice in the Anthropocene era is vital for building sustainable consumption models through solidarity economics.

Transformative Trends Reshaping Intergenerational Relationships in Türkiye in the Era of Demographic Ageing

As in the world, the elderly population is increasing rapidly in Turkey. The 21st century will be the century of aging of the world. The population aged 65 and over in Turkey increased by 22.6 percent in 5 years and reached 8 million 451 thousand 669 people. The proportion of the elderly population in the total population has exceeded 10.2 percent. With the migration from rural to urban areas, the extended family structure turned into a nuclear family and the number of births per woman decreased to 1.5 in Türkiye. With both migration and family shrinkage, kinship relationships and social support systems have weakened. While elderly people can be cared for in extended families depending on traditional values; social and economic resources become insufficient to care for the elderly in the nuclear family and to maintain intergenerational solidarity. In Turkey, as in the world, the majority of both formal and informal care work is performed by women. Women also have an effective role in directing intergenerational solidarity relations in the family. According to the project of evaluating intergenerational solidarity, which was carried out for the first time in Turkey with 4 thousand 100 people; the strongest dimensions of solidarity for both the elderly and adult children in Turkey are; emotional solidarity and relational solidarity. Medium levels of solidarity dimensions for both the elderly and adult children in Turkey; normative solidarity and consensual solidarity. The lowest form of solidarity provided by the elderly to their children in Turkey is functional solidarity. While the realization rate of functional solidarity, which includes the financial support and care provided by the elderly to their children in Turkey, is 34.2 percent; The realization rate of functional solidarity, which includes the financial support and care provided by children to their elderly parents, is 75.6 percent. In this study, intergenerational solidarity will be evaluated through demographic aging.

P. LIMA CARUSO, JULIANA* (University of São Paulo, Brazil)

The Use of Computer Programs and Other Analytical Tools for the Examination of Families.

Over the past four decades, family and kinship studies have taken important turns, such as the inclusion of feminist studies and, more indirectly, the ontological turn. These dialogues have introduced novel insights into the domains of family and kinship. Concurrently, the advent of new computational tools has opened avenues for enhanced analysis and correlation, encompassing both traditional data such as genealogical memory and emerging categories and criteria within the realm of family and kinship studies. In light of the enduring paradigms in family studies and the advent of new technological tools, this presentation seeks to explore the interplay between the novel and the traditional in family and kinship studies, with a view to fostering dialogue with other disciplines, such as health. In this way, I propose to present some questions from my current research project. The project examines the interrelationship between cancer predisposition, genetics and diverse perceptions of heredity and genealogical memory, with a particular focus on the development of new theoretical frameworks and computational tools.

P. MISRA, RAJENDRA* (Jamia Millia Islamia, New Delhi, India)

Rethinking Sovereign Power: Resistance and Resilience in State of Exception of Kashmir

This paper examines the dynamics of sovereign power in Kashmir, India's northern Muslim-majority region bordering Pakistan, through Agamben's theoretical lens of state of exception. According to Agamben, individuals are reduced to *homo sacer*, or bare life, stripped of political and legal rights and subjected to unchecked sovereign violence in a state of exception. During the peak of the insurgency in the 1990s, the Indian state designated Kashmir a 'troubled zone' and enforced the Armed Forces (Special Powers) Act, granting military personnel immunity from prosecution and suspending legal protections for residents. Through brutal legal and political measures, the Indian state sought to establish complete control over the region.

This paper contends that while sovereign power seeks to reduce the local population to bare life, its domination is not absolute, even in spaces of exception like Kashmir. Through an ethnographic exploration of the lived experiences of the people, this study demonstrates how the power of life, to use Deleuze's term, undermines the sovereign's attempt at total control, revealing the limits of sovereign power. While Agamben provides valuable insights into the nature of sovereign power, his framework, the paper argues, leaves little room for the possibility of resistance within a state of exception. In contrast, this study illustrates how life in such spaces gives rise to diverse forms of resistance and resilience that challenge the sovereign's power.

Thus, the study raises critical questions about Arendt's concept of total domination in totalitarian states, and Agamben's notion of *homo sacer* in modern politics. The paper stresses the need to examine sovereignty and biopolitics in conflict zones through the people's lived experiences, showing how they challenge and negotiate sovereign power, and struggle for a politics that upholds freedom, identity, and justice. This study contributes to broader debates on sovereign violence, biopolitics, and the state of exception.

RC07-106.3

P. NIKOLIC, JASMINA* (University of Belgrade & Agile Humans Ltd., Serbia)

MARKOVIC, BILJANA (Agile Humans, Serbia)

Agileocracy: Agile Government for the Future of the Anthropocene

As traditional governance models falter amid the Anthropocene's unprecedented challenges, there is an urgent need for innovative approaches. This presentation introduces **agileocracy**—an agile government framework that applies agile methodologies to revolutionize political and social systems. Drawing on my experiences as a former Serbian Member of Parliament, founder of Agile Humans, and university professor, I advocate for agileocracy as a dynamic and responsive governance model.

Agileocracy reimagines decision-making through decentralized, adaptive, and iterative processes. By dismantling rigid hierarchies, it empowers cross-functional teams and incorporates continuous feedback loops for swift and effective responses to emerging challenges. Actively engaging citizens and

stakeholders, agileocracy fosters collaborative solutions to complex societal issues. In an era defined by rapid change and complexity, it offers the resilience and flexibility essential for navigating the intricacies of the Anthropocene.

Moving beyond theory, this presentation provides concrete evidence of how agile principles transcend business development to become powerful tools for political innovation and social transformation. Through case studies from my work with Agile Humans and my political career, I demonstrate how organizations and movements have harnessed agile methods to drive meaningful change. We explore how agileocracy aligns with social justice initiatives and redefines governance for an unpredictable future.

Combining firsthand political experience with agile expertise, this presentation makes a persuasive case for adopting *agileocracy* as a necessary path forward. It calls upon policymakers, scholars, and activists to rethink conventional governance models and embrace a system as dynamic and adaptable as the challenges we face. Join me in exploring how *agileocracy* can transform governance and build a more resilient, just world for the future of the Anthropocene.

PAANANEN, SOILI* (National Defence University, Finland)

Interoperability As a Networked and Intertwined Phenomenon

From the point of view of NATO's collective defence, it is essential for the allied actors' activities to be compatible (interoperability). From the perspective of agency, theoretical and practical discussion about the concept is largely limited to the military-to-military framework and to the development of interoperability to achieve effective military activity. In this approach, a crisis or conflict is understood to be taking place in a vacuum without other actors, their tasks and the logics of their activities.

This study provides a holistic view of interoperability, making it visible by analyzing national reports on the Afghanistan operation. When the operation was brought to an end in summer 2021 in fairly chaotic circumstances, its participating countries felt a need to analyze its success. Studies and evaluation reports on the operation and its impact were produced to the most senior central government officials in Finland.

The extended view of interoperability goes beyond the traditional military-centric view and highlights the critical role of non-military actors as well as the interdependencies between different systems and the tensions linked to them. Interoperability is therefore visible as a networked and intertwined phenomenon combining processes of multiple directions and levels. The holistic view also highlights the need to understand multicentred cooperation, multidimensional assessment and accountability of activities in more depth.

MORAL MARTÍN, DAVID (Universidad de Zaragoza, Spain)

"Resistencia Creativa En La Economía Gig: El Cooperativismo De Plataformas En Coopcycle"

En el contexto de la creciente gig economy, el estudio de modelos alternativos de organización laboral como las cooperativas de plataformas de reparto de comida a domicilio se ha vuelto crucial para entender las dinámicas contemporáneas de trabajo y resistencia. Este trabajo investiga específicamente cómo las cooperativas, organizadas bajo la federación CoopCycle, se comportan y resisten en un entorno dominado por modelos económicos precarizantes. Se plantea un enfoque multidimensional para explorar la "resistencia creativa", un concepto que encapsula las estrategias utilizadas por estas cooperativas para contrarrestar la precariedad y fomentar la sostenibilidad y la equidad laboral.

La metodología del estudio es una encuesta autoadministrada, diseñada para ser completada con apoyo técnico, que abarca un rango de 40 a 50 preguntas. Estas preguntas están estructuradas en torno a cinco dimensiones: la fundación de la cooperativa, la fase de creación, la integración de principios y valores cooperativos, la gestión de la cooperativa y las acciones vinculadas con la resistencia creativa. La muestra incluye las organizaciones miembros de CoopCycle, ofreciendo una visión comprensiva del panorama cooperativo dentro de la gig economy a nivel comparado.

Este estudio es significativo por su enfoque en cómo las cooperativas no solo sobreviven, sino que también desafían activamente las estructuras tradicionales de mercado a través de innovaciones y prácticas basadas en valores cooperativos. Se discutirán las implicaciones de los hallazgos para la política y la práctica, sugiriendo que la resistencia creativa puede ofrecer vías sostenibles y equitativas para la organización laboral en el marco de la economía digital. Este análisis proporcionará una base teórica y empírica para entender mejor la intersección de la cultura cooperativa y la economía de

plataformas, destacando la importancia de modelos económicos alternativos en la configuración del futuro del trabajo.

Catalyzing Social Innovation for a Just Transition: Empirical Evidence from Alternative Approaches to Stimulating Place-Based Solutions to Social Challenges in the Context of Decarbonization

Social innovation is arguably essential for the development of place-based strategies and approaches for fostering a just transition. It remains unclear, however, how social innovation can be effectively stimulated and maintained. This study contributes to addressing this question by exploring the effectiveness of top-down and bottom-up approaches to catalyzing innovative solutions to place-based societal challenges related to decarbonization. It draws on empirical data from seven carbon-intensive regions in Europe undergoing processes of decarbonization. All study regions benefit from territorial funds provided through the European Just Transition Mechanism (JTM) that aim to stimulate innovative response to local challenges through what we call a top-down approach. They also form part of the EU-funded BOLSTER project, which stimulated and enabled a series of community initiatives aimed at responding to local needs through action research and bottom-up mobilization and support. In this study we explore the type and scope of innovative actions catalyzed through the top-down and bottom-up mechanisms for catalyzing social innovation mentioned above and reflect on the need and possibilities for maintaining them. In conclusion, with discuss the challenges and opportunities for bridging top-down and bottom-up approaches to catalyzing and maintaining social innovations as a way of highlighting some of the policy implications of the research.

Coupling and Decoupling of Preferences for Social and Environmental Justice in the Context of Decarbonisation and a Persistent Digital Divide: Evidence from Former Mining Regions in Rural Leon, Spain

Preferences for social and environmental justice are often seen as going together among populations suffering from the negative impacts of extractive industries in the global south. Double exposure to the negative social impacts of decarbonization and a persistent digital divide, however, tend to give rise to a decoupling of such preferences in the global north. This, however, is not always the case as evidenced by in-depth qualitative research from the former mining regions in rural Leon, Spain. A consideration of different individual and contextual factors as potential drivers of the observed cases of coupling and decoupling of such preferences among different individuals and groups involved in the study, suggest the need for a closer consideration of the question of work and its social footprint, which is often unaccounted for in current notions of a just transition.

PACINI-KETCHABAW, VERONICA* (Western University, Canada)

The Anthropocene, Extractivist Capitalism and Andean Childhoods

The presentation focuses on children's active engagement in resisting extractivist logics in the Anthropocene. I ask: How might we address resistance in the context of Andean childhoods and extractive capitalism? How might we meaningfully respond, both conceptually and methodologically, to the growing impact of corporate mining in the global south? How might we respond when the proliferation of extractivist activities and the violent forces of global capital increasingly challenge the voices of local communities? I engage with these questions through two distinct yet related compositions. In the first, I attend to how thinking resistance through/with existing onto-epistemologies and non-Western orientations, specifically decolonial intersections and Latin American articulations of south feminisms, might extend methodological approaches. The second composition zooms in on children's daily resistance practices, focusing on worlding nonextractive worlds that reconfigure the EuroWestern humanist project underpinning extractive capitalism.

Gate-Openers: Role of Trust and Gender Among Latino Immigrants during COVID-19

The COVID-19 pandemic exacerbated social inequities for marginalized populations, including immigrants in the United States. Specifically, unauthorized immigrants' experiences of exclusions were deepened by their material and legal precarity, which limited their access to governmental support programs. In this context, grassroots organizations and NGOs worked together to address the absence of government support for these vulnerable populations. We analyze the New Sanctuary Movement of Philadelphia (NSMP), a power-building organization, that along with community leaders, which we call gate-openers, rapidly assisted the Latino community. NSMP's speedy adaptation to continue serving the community resulted from their grassroots orientation and close-knitted relations with the Latino immigrant population. However, the role of gate-opener undertaken by key Latina women not only assisted NSMP in reaching its goals but also enhanced its outreach capacity. In this paper, we shed light on the interplay between immigrant women's agency and leadership in grassroots organizations during the pandemic, focusing on the role played by tender and trust in building those networks.

Exploring Family Resilience and Community Strength amidst Disasters and Crisis Situations

The increase in the number, frequency and impacts of disasters and crisis situations around the world with the impact of climate change is emphasized among global challenges. The increasing social and economic impacts of disasters at the global level is an obstacle to preserving development gains and achieving sustainable development goals. In recent years, the concept of resilience has come to the fore in academic and policy-based disaster management efforts and has expanded contextually from the individual to the family and community levels.

Family resilience is considered as maintaining or re-establishing the family's balance between demands/stresses and resources/coping strategies in the face of a challenging situation. From a systems perspective, family fragility and resilience are considered within the framework of multi-level recurrent interactions in coping with stressful experiences and social contexts. The resilience of families varies depending on several factors such as existing stressors, the level of pre-existing stress, family bonds, family's social support, coping skills, family functioning, family belief systems, organizational structures, communication patterns and the resources provided by family members and other community resources.

In response to the increasing trend of global disasters and crises, strategies should be developed to address barriers to community resilience and incorporate emergency management into preparedness, response, and recovery phases. Resilience strategies should be taken proactive steps, buffering disruptions, reducing the risk of dysfunctioning, and supporting positive adaptation and offering resources in overcoming challenges. More inclusive community-based interventions should be used to respond to disasters, such as community engagement, public education, supportive mentors, volunteering, social funding, social trust, community connections, safe neighborhoods, informed organizations and professionals, quality schools, and access to quality child care and quality healthcare. Governments and community actors such as non-governmental organisations, professionals and volunteers should undertake coordinated efforts to strengthen families and communities against crisis situations and increase resilience.

Dual Exploitation: Platform Delivery Labor and Housing As Infrastructures of Social Reproduction for Migrant Workers in Berlin and Barcelona

The everyday life of migrant workers is shaped not only by their labor status but also by their migratory journeys, challenges, and search for stability. Platforms have increasingly acted as "arrival infrastructures" (Van Doorn and Vijay, 2021), offering lower-access barriers into gig work for migrants. However, their lived realities extend far beyond labor. Housing, as a vital

infrastructure of social reproduction, plays a critical role in maintaining labor power but is often precarious, commodified, or inaccessible.

This study, drawing on Van Doorn and Shapiro's (2023) "platform-adjacent" framework, explores the broader implications of platform labor within precarious housing markets. Based on fieldwork conducted from September 2023 to March 2024, including 45 in-depth interviews with migrant delivery riders (25 in Berlin and 20 in Barcelona), this research highlights how housing insecurity and precarious gig work intersect to exacerbate workers' vulnerabilities, creating what can be termed "dual exploitation."

Using Social Reproduction Theory (SRT) as an analytical lens, this paper explores how housing commodification—treating it as a speculative asset—fails to meet the social reproductive needs of workers. The pressures of both labor precarity and housing instability reinforce structural inequalities, making migrant workers particularly vulnerable. By linking labor and housing as interdependent infrastructures, this study sheds light on the compounded nature of exploitation faced by migrant delivery workers in the platform economy of Berlin and Barcelona.

The Contribution of Sociology to Understanding the Role and Evolutionary Trends of New Craftsmanship

Despite the decline in the number of craft enterprises in many countries over recent decades, there is a renewed interest in craftsmanship from policymakers and the international academic community. Studies on the neo-craft work phenomenon show that craft enterprises are regaining appeal in the contemporary context and benefiting from increasing policy support. This interest stems from the role these actors play in preserving and promoting traditional techniques and knowledge, positioning themselves as part of cultural and historical heritage, and as key contributors to the economy, society, and culture of local communities. They enhance the livability and attractiveness of places, while also expressing values such as authenticity in their products, often customized or niche-oriented, standing in contrast to standardized, industrial production. This growing attention has legitimized small-scale craft producers and new neo-craft enterprises, leading to an expansion of policies supporting craftsmanship. These policies range from the cultural and creative industries to local economic development, and include urban regeneration projects and social innovation. In particular, craftsmanship is valued for its contribution to promoting traditions and intangible heritage, as well as to tourism, where it plays a key role in strengthening cultural identity and attracting qualified visitors. This article aims to deepen the understanding of craftsmanship by analyzing key clusters of studies on the topic and systematizing recent contributions. Emerging theoretical perspectives and analytical categories will be identified to provide a clearer view of the dominant lines of thought in the field. The goal is to define the boundaries of the discipline and offer a foundation for future studies and interventions, based on theoretical models derived from the review of scientific literature. To achieve this, a critical cataloging of studies on craftsmanship has been conducted, examining how contemporary dynamics are shaping the sector and its future outlook.

Supporting Families of Preterm Infants: The Impact of Ehealth on Parental Well-Being and Care Transition

The post-Covid-19 period has accelerated an already ongoing process that aims to redefine healthcare through methodological and technological advances. The e-ParWelB project responds to this need as it aims to develop an interdisciplinary socio-psychological model by integrating eHealth tools, social research, and psychological support addressed to preterm parents. Preterm birth impacts not only the clinical condition of the infant but also the well-being and functioning of families. The primary objective of our project is to monitor and support parents' mental health during the critical period of their stay in the neonatal intensive care unit (NICU) and transition to home. To achieve this, we provide families with digital health tools, including a dedicated web app, designed to assess their psychological well-being and foster a supportive network among parents, helping them stay connected and resilient during this challenging time. This web app serves as a highly effective methodological tool for two key reasons. First, it simplifies participant

enrollment in a longitudinal study. Once parents register on the app, data collection proceeds through a smooth and non-invasive process. Second, the app provides crucial support to parents by offering a direct and confidential messaging channel with a mental health professional. Additionally, the platform fosters a support network among parents, allowing them to connect and share experiences with other parents through a specific forum in the web app. This system of data gathering yields satisfactory results and is able to support our participants in their difficult transition home from the NICU. The web app allows to keep in check parents' emotional state and promptly individuate signals of distress and to intervene with a personalized support plan. Digital tools allow parents to access resources from home or anywhere else, making support easily accessible and reducing the feeling of isolation.

PALERMO, MELANIE SARA* (University of Macerata, Italy)

Family and Work As Relational Systems: An Exploration of Tensions and Interconnections

The capitalist economy, denoted by the distinction of the labour sphere from the family sphere (Barbera & Pais, 2020), characterizes the Anthropocene. However, despite the differences due to the nature of the two mentioned spheres, a strong interconnection and interdependence between them is evident.

This theoretical contribution aims to reflect on the encounter of these two systems in contemporary society, focusing in particular on family businesses and informal care relationships; assuming that it is necessary to rethink these situations from a sociological perspective, underlining their relational component.

The text explores the intersection of and the clash between market logics and family dynamics in these frameworks. It highlights the tension between rational economic considerations (remuneration, salaried work) (Pulcini and Bourgault, 2018), and the affective bonds within families which generates symbolic and educational codes denoted by the strength of emotions (Bianchi, 2021): affectivity, intergenerational solidarity, gift, trust, reciprocity (Donati, 2018, Ganugi & Prandini, 2022). The non-utilitarian logic nourish the bond between family members who feel part of the system through the mechanism of giving-receiving-reciprocating and tend to return what they have received on the basis of gratitude.

However, these emotional aspects, while crucial for family relationships, can also pose challenges for economic efficiency (Saraceno & Naldini, 2021) and generate problems of reconciliation, thus influencing the labour market (Mazzucchelli et al., 2020; Naldini & Saraceno, 2022).

In conclusion, this contribution highlights how the interdependence and interconnection between family and work is a fundamental element of contemporary society and can be problematic due to the substantial differences between the two systems, furthermore it provides food for thought for analysing phenomena and situations that characterize the Anthropocene society through a sociological reading.

Intergenerational Engagement of Filipino Rice Farmers: A Dead-End Path to Food Security?

The continued engagement of Filipino rice farming households is vital for the country's food security. This paper explores the intergenerational engagement of rural Filipino families in rice farming. A household survey of 1,165 rice farmers was conducted, covering 10 provinces and representing eight of the 13 regions in the Philippines. Results of the study showed that

farmers are getting older, the youth are growing disinterested, and the males dominate in rice farming. There was a dramatic decline in engagement from the first and second generation to the third generation of rice farmers. However, more than 50% of the farmers wanted their children to engage in farming on a part-time basis only. It is their aspiration for their children to finish college education, but they also desire to pass on their farm to their children as inheritance to continue the family farming tradition. The study also showed a greater likelihood for a farmer's child to engage in rice farming when the farmer is older, has more years of farming experience, and has a bigger household size. However, farmers with secondary and college education are less likely to have a child engaged in rice farming compared with those who had primary education. These findings suggest formulation of policy interventions to entice rural farming households to sustain, if not increase, engagement in rice farming in succeeding generations.

From Practical Wholes to Parts and Processes in Organizational Design: Three Roads Away from Practical Formal Organization

Early literature on organizational design focused on the practical design of key organizational elements – e.g. strategy, structure, processes, people and rewards – to affect how the organization functions as a whole. However, Herbert Simon's work introduced a shift in thinking, casting doubt on the assumptions of rationality that underpinned this practical, formal approach.

In this paper, we examine three contemporary approaches to organizational design that reflects this intellectual shift. Influenced by behavioral economics, engineering and process theory, these approaches focus on behavioral design, systems design and design thinking, respectively. We show how they all continue the idea of human fallibility from Simon and how this leads to a rejection of the value and possibility of designing the organization as a practical whole.

Upwardly Mobile Men in Chile: First-Generation University Graduates, Meritocratic Striving and Its Costs

This paper focuses on the experiences and subjectivities of professional men and men in executive positions who are the first generation in their families to graduate from university and have had notable upward social mobility in Chile. In doing so, it addresses various dimensions of the mobility process, including how participants understand social mobility, the main factors that help or hinder their progress, the influence of the sociopolitical context on their career paths, and the role they attribute to elites in the mobility process.

This paper is part of a broader research project that includes more than 300 in-depth semi-structured interviews, covering social groups with diverse social characteristics. The interviews covered different topics, such as the meaning attributed to the mobility process, work trajectories, perceptions of the elite and projections for the future. In particular, this paper analyses the accounts of 39 men in professional and executive positions at various stages of their careers.

Preliminary findings suggest that interviewees understand the concept of social mobility in practical terms while also recognising intergenerational differences in their access to goods and services. Additionally, they point out symbolic and ethical considerations (Morton, 2021), along with some costs to their lives. Regarding social mobility enablers, aspects such as merit and individual effort are seen as crucial. However, participants also mention more collective and structural factors, including the roles of their family, networks and luck (Sauder, 2020). This paper aims to delve deeper into these issues and examine how they challenge the meritocratic ideal (Sandel, 2021). The analysis also reveals that the trajectories of upwardly mobile individuals are significantly influenced by the sociopolitical context at the outset of their careers. Finally, this paper discusses the different approaches participants take towards elites.

Counter Trafficking Interventions in South Africa: Critical Reflections on Global and Local Praxis.

In this paper, I present some findings of a 5-year research programme in South Africa into the development and implementation of counter – trafficking policies and interventions. The focus of the research was on understanding how global interests, coalitions, institutions, and advocacy shaped and were shaped by local conditions. Together, the research studies aimed to understand how trafficking became a preoccupation in South Africa, how policy responses were developed, the ways in which the response to trafficking was constructed and what form the interventions took. The research findings show how global influences on policy and programming that South Africa reproduced colonial narratives by evoking gendered and racialized notions of trauma, victimization and rescue. Whilst the anti-trafficking campaigns have been critiqued globally for their regulation of women's sexuality and morality, the existing literature has failed to account for the colonial logic inherent to how and why they have been taken up globally. By focussing on poverty in the global South, alongside gendered notions of home, the response to trafficking in South Africa has justified and reproduced geographically defined inequalities and justified responses that focused on restricting movement based on gender and race. In this presentation, I focus particularly on how the campaigns drew on a gendered and racialized notion of trauma and victimization that resulted in interventions that addressed trafficking as an individual risk, rooted in women's naiveté and need for protection, over the structural reforms to migration policy that could make women's movement safer.

PALMER, ANNA* (University of California, Berkeley, USA)

Anticipating Late Petro-State Politics amidst Climate Catastrophe

Many Global North countries have historically developed by exploiting fossil fuel resources, which has contributed to the climate catastrophe we face today. But what happens when countries in the Global South discover oil late, during a global shift away from fossil fuels due to the climate crisis? Development scholars often propose a stagist model for economic growth, while emerging research on climate change temporalities highlights the need for all governments to anticipate the far-reaching consequences of their fossil-fueled development plans, both for the present and future. By thinking from Guyana, where massive oil reserves were discovered in 2015, and where citizens contend with abject poverty imposed through (neo)colonialism, this paper investigates how state and civil society actors navigate entrenched visions of development amidst the pressing demands of responding to climate catastrophe. Through qualitative content analysis of judicial decisions, legal arguments, development plans, and speeches related to Guyana's oil industry, I introduce the concept of "late petro-state" politics. I show how the Guyanese government leverages compressed timelines and the anticipated impermanence of oil profits to justify accelerated development, often at the expense of decarbonization. In contrast, civil society actors resist this acceleration by invoking inter-scalar climate obligations and intergenerational commitments. As the climate catastrophe intensifies, this study illuminates how shifting temporalities influence state decision-making and resistance, contributing to broader discussions on the feasibility of fossil-fueled progress and imagining just futures in the Anthropocene.

TG12-992.2

PALMIERI, MARCO* (Sapienza University of Rome, Italy)

Social Love, Self-Transcendence, Openness to Change

Social love is a practical, overabounding action that people realise when they care for others (Iorio and Cataldi 2023). The other can be a human agent (fragile people, immigrants, the poor, and the homeless), or the other can be a non-human agent (such as the animal and plant kingdom and the entire planet Earth). Social love takes shape in people's daily lives, such as volunteering time, giving food and dresses to people in condition of need, donating money to charity organisations, and joining peaceful protests to protect the environment and the life in the heart. What distinguishes social love from similar concepts is that it is a universalistic behaviour that breaks the in-group mechanisms because the recipient is the other (human and non-human) who stands out of the group. Universalism is a pillar dimension of social love (Iorio et al. 2022). This paper empirically explores the relationship between universalism and the conative dimension of social love, starting from the answers given by 1,170 interviewees to the questionnaire on social love administered in Italy in 2023. A social love index is created to position the respondents from the minimum to the maximum propensity level for social love. Statistical multivariate analysis shows that the index of social love

correlates with the general concepts of self-transcendence, which emphasises the concern for the welfare and need of others, especially the unknown others, which recalls the value of universalism made of understanding, appreciation, tolerance, and protection for the all people and nature. At the same time, social love positively correlates with openness to change (self-direction independent thought/action and desire for novelty and creativity), and it negatively correlates with self-achievement values (pursuing one's interests, personal success and dominance over others).

 LUGARI, FRANCESCO (University of Bologna, Italy)

Intersectionality in Migrant Narratives: Preferences for Social and Media Representation

Mass media allows us to broaden our knowledge of social reality and the world. However, they also facilitate the internalization of society's norms, values, expectations, and beliefs, performing a socialization function alongside institutions, such as the family, school, or peer group (Cappi *et al.* 2021).

Mass media very often depict migrants and refugees as speechless victims, invisible, and apolitical (Nyers 2003). These depictions hide or cancel the survival strategies and agencies of migrants and refugees, turning them into objects of pity or fear. Migrants are represented either as criminals or potential terrorists with immoral agencies, labelled as fraudsters or welfare abusers, and depicted as trafficking victims or forced migrants (Mainwaring 2016). Media exclusion often mirrors and simultaneously deepens social exclusion, or in other words, invisibility caused by media reverberates in the broader public discourse and the audience agenda (Musarò and Parmiggiani, 2022).

This poster will demonstrate the media and social representation of migrants in Italy, focusing on their preferences regarding representation in media and public discourse. Drawing on qualitative and visual research methods (Pink 2001; Rose 2001) such as photovoice and photo elicitation interviews with migrants from diverse backgrounds, this poster will show how these individuals perceive their social identities and narratives surrounding them (Aiello and Parry, 2020) and their preferences on media and social representation as migrants. Intersectional methodology (Crenshaw, 1991; Collins and Sirma, 2008) and feminist standpoint theory (Harding, 1996) will be adopted to analyze migrants' visual and oral narratives on (self) representation (Hall 1996).

This poster aims to contribute through visual methods to discussions on vulnerability, agency, and social justice by remarking on migrants' visual and oral narratives and informing policymakers and media practitioners about the importance of responsible and non-biased representation and the potential for more inclusive narratives that respect the diversity and complexity of migrant experiences.

PAMPLONA, DANIELLE ANNE* (PUCPR Pontifícia
 Universidade Católica do Paraná, Brazil)

ESG Criteria on Sustainability Report: Moving Forward?

The ESG criteria emerged in 2005 as a spin-off from the Global Compact, a UN initiative that brings together companies from all over the world. The initial idea was to provide investors with information so that they could, with greater certainty and precision, make decisions about the allocation of investments, obtaining the highest possible return, while reducing the incidence of business impacts due to known social, environmental and governance risks. The reports originally served investors, seeking to understand what the environmental, social and governance issues that potentially impact businesses were and how they were tackled. Understanding the origins of these requirements is essential to understanding how today they are not sufficient to fulfil their intended purpose. In fact, these reports should be read bearing in mind that they are requirements aimed at the information needs of investors. The contribution of companies to major crises (such as the climate crisis, but also the Covid-19 pandemic or the deterioration of democracy), coupled with the human rights impacts caused by business activities, has meant that the ESG agenda has attracted the attention of civil society, especially in an international and domestic environment in which there is no real accountability for the negative impacts they cause. Thus, the ESG agenda, which was born with the DNA of pointing out environmental,

social and governance risks for companies, is undergoing an adaptation (or is intended to undergo an adaptation) to become the search for risks that economic activity represents for society and the environment. This work seeks to: a. identify and point out the changes in sustainability reports, by comparatively analysing the content of sustainability reports produced before 2010 and others produced after 2020; b. point out the demands of civil society; c. identify the incorporation of civil society demands in the most recent reports.

PANAGOPOULOS, IAKOVOS* (Assistant Professor, Greece)

Multidisciplinary Film Practice Research: Integrating Visual Sociology in Academia and Independent Cinema

This presentation explores the potential of film practice research as both a research tool and final output, with a focus on its applications in visual sociology. Film practice research offers a unique way to capture and express complex social realities, combining academic rigor with creative freedom. By integrating film into research methodologies, particularly in visual sociology, scholars can document and present social phenomena with greater depth, capturing emotional and contextual elements that traditional text-based research often overlooks.

The presentation will begin by outlining the evolution of film practice research and its growing relevance within multidisciplinary fields such as sociology, anthropology, and cultural studies. Visual sociology, in particular, benefits from film's ability to present lived experiences, social dynamics, and cultural environments in real-time. The discussion will highlight how film practice research enhances data collection and the presentation of findings through visual case studies or essays.

A key focus of the presentation is the case study of the "Third Path in Cinema" in Greece, an innovative approach that combines academic research with independent filmmaking. This model provides an alternative route for filmmakers and researchers who face challenges in traditional cinema and academia, encouraging collaboration between disciplines. The "Third Path" supports the role of the "Academic Filmmaker," blending visual sociology with creative film production to offer new ways of exploring and representing social issues.

In conclusion, the presentation advocates for expanding film practice research within academic contexts, particularly for visual sociologists. It emphasizes the potential for film to act not only as a research tool but also as a means of broadening the reach and impact of academic work, engaging both scholarly and public audiences.

PANARARI, MASSIMILIANO* (University of Modena and
 Reggio Emilia, Italy)

Archaeology of "Disasterology". Postmodern Environmental Atmospheres of the Lack of Future

Within this age of "poly-crisis" and "permacrisis", a more systemic and long-lasting one stands out. Namely, the environmental and climate crisis, one of the strongest expressions of the contemporary idea of dystopia and negative future is manifested.

This paper aims to analyse some of the narratives of a postmodern atmosphere in which visions of the apocalypse constitute one of the fundamental ingredients, and the genesis and diffusion in the last three decades (especially in French-speaking circles) of the vision of «disasterology». In particular by the French philosopher Paul Virilio (1932-2018), which has constantly confronted one of postmodernism's issue par excellence, namely technique. It identified the common thread that ran from his analyses on the impact of speed in the redefinition of society to his reflections on disasters as a sign of the times and the category of "stereoreality" (the 'augmented reality' resulting from the splitting of real and media experience). An elaboration always under the banner of a strongly critical vocation that led him to express very concerned judgements about the age of dromocracy and turbo-capitalism, summarized in the formulas of the disappearance of art, «epidemic of the imaginary» and museification of the world as an effect of the disappearance of reality. Many visions of a desolate Earth consistent with the catastrophism of the theoretician of the accident – from Chernobyl to stock markets crashes – as an ineluctable outcome of technological progress (and of the failure of technical rationality). A vision which is also at the basis of «collapsology», another cultural current with the ambition of thinking about the «post-collapse» future characterised by the catastrophe of «thermo-industrial civilization». This paper intends to analyze the framework of disasterology, and some of its most recent cultural outcomes (including the widespread idea of *zombification* extended to fields ranging from politics to economics).

PANARARI, MASSIMILIANO* (University of Modena and Reggio Emilia, Italy)

Généalogies Et Parcours De «l'Idéologie Californienne» Avant La Société De l'Intelligence Artificielle

Au milieu des années 1990 – dans un essai consacré à la « critique du néolibéralisme dotcom » – Richard Barbrook et Andy Cameron ont inventé le label de «Idéologie californienne», et, en suite, d'autres interprétations se sont stratifiées autour de cette formule.

Le paper vise à enquêter et à identifier certaines des composantes conceptuelles et thématiques sous-jacentes de cette contradictoire galaxie culturelle, qui peut également être décrite en termes de réseau (Castells, 2009) ou comme un rhizome (Deleuze et Guattari, 1980).

Le paper vise à analyser les éléments d'identification suivants de l'Idéologie californienne et de ses évolutions selon le paradigme généalogique, et avant de la diffusion généralisée de l'AI. On y retrouve, donc, le *self-help* and le «do it yourself» du XIXe siècle; le «néo-protestantisme» (Debray, 2017); le déterminisme technologique de l'École de Toronto; l'anarcholibertarisme et l'«objectivisme» d'Ayn Rand; la doctrine de la «destruction créatrice» schumpétérienne sous la forme de la disruption numérique; le techno-optimisme propagandiste de la revue «Wired» (selon le canon de la «mission évangélistique»). D'un point de vue connotatif, on retrouve l'importance de la formule sociale extensive du divertissement (Byung-Chul Han, 2018); la prédication d'une transparence absolue; la centralité du coding, prérogative du groupe social leader de l'innovation (celui qui, dans l'étape précédente, était qualifié de classe créative et a perdu certaines de ses caractéristiques; Casilli, 2015 et Lanier, 2010); le refus du hasard au nom d'une planification technologique intégrale qui tendra «naturellement» vers la résolution de tous les problèmes et questions sociaux; une vision pyramidale qui propose une conception organique de la société et un modèle hiérarchique (rempli des échos du positivisme, néo-naturalisme et darwinisme social). Et, donc, une conception apparemment «pacifiée» de la société fondée sur la neutralisation des conflits, l'appel à la collaboration totale et le partage engendré par la confiance (la *sharing economy*).

PANARESE, PAOLA* (Sapienza University of Rome, Italy)
AZZARITA, VITTORIA (Sapienza University of Rome, Italy)
GRASSO, MARTA (Sapienza University of Rome, Italy)

Making the Invisible Visible: Addressing Gender and Ethnic Vulnerabilities in Algorithmic Systems

Over the past decade, there has been a significant expansion in the application domains of algorithmic and artificial intelligence (AI) systems, which have profoundly influenced the representation and communication of social vulnerabilities (Noble, 2018). Research highlights that these systems can perpetuate forms of discrimination, particularly along ethnic, and gender lines (boyd et al., 2014). Indeed, algorithmic systems often reflect a reductive view of human complexity, systematically excluding historically marginalized identities and characteristics, which consequently remain invisible (Gross, 2023).

These discriminatory dynamics are rooted in several intertwined factors, including the biases of system developers, the partiality of the data used for training, and the actions of users who contribute to the data inputs. As a result, algorithmic systems often fail to adequately account for the diversity of individual experiences, narrowing the spaces of self-determination and self-expression (Waelen, Wiecezorek, 2022).

Building on this foundation, this poster focuses on a segment of a broader research project that explores the gender and ethnic inclusivity of algorithmic systems. The poster compares key findings from a systematic review of the literature on algorithmic systems and gender/ethnic biases alongside insights from developers, collected with 20 in-depth interviews. The goal is to offer recommendations for creating more equitable and inclusive algorithms.

While the studies acknowledge the social implications of biases in algorithmic systems, they fail to provide socio-technical frameworks that offer a shared definition of bias or address algorithmic discrimination systemically. Furthermore, developers show a limited understanding of the structural inequalities embedded in these systems (Cratsley, Fast, 2024) and the enduring belief in algorithmic neutrality (Natale, Ballatore, 2017), although this belief varies based on individual cultural and gender backgrounds. Therefore, the findings emphasize the need to establish guidelines that address the lack of representation of human diversity, by making the invisible visible (Shrestha, Das, 2022).

RC19-275.1

PANARO, ANGELO VITO* (University of Erlangen-Nuremberg (FAU), Germany)

The Politics of Social Spending in Authoritarian Regimes

This article investigates the political determinants of social spending in authoritarian regimes. The theoretical argument builds on the assumption that dictators utilise social benefits and services as a tool to acquire political consensus. However, I argue that not all dictators face similar incentives to distribute social policy concessions; these incentives ultimately rest on the presence of *de jure* multiparty elections and the political ideology of the regime. The empirical analysis reveals that, while there is no effect of *de jure* multiparty elections and ruling coalition size, authoritarian regimes legitimizing their position in power through a left-wing ideology are associated with higher levels of social spending. I conclude that political ideology is a key driver of social spending in authoritarian regimes. Thus, further attention should be devoted to legitimization strategies, rather than political institutions, when analysing policy decisions in authoritarian contexts.

PANDE, AMRITA* (Department of Sociology, University of Cape Town, South Africa)

Dystopia, Utopia, and the Desire for Perfection: Repro-Genetic Justice and the Anthropocene

New and emerging genetic technologies have the potential to redefine human health and well-being but also raise complex questions about ethics and justice. The use of these technologies for reproductive purposes, such as screening for desirable traits in future offspring, is rapidly expanding. However, this poses fundamental questions about societal values, power structures, and the construction of well-being, normality, ability and perfection in the desired next generation. I reflect on my decades-long ethnographic work in the industry of assisted reproduction in the Global South to theorise around how new reproductive and genetic technologies are shaping what we mean by humans, as well as our shared futures. More specifically, I will argue that capital-intensive biotechnologies—from DNA testing to genetic medicine, genetic testing and selection, —while seducing us with the allure of efficiency, innovation, progress, well being and increased choice, in fact, erode radical structural transformation to such an extent that even our visions of solidarities, change and utopia get delimited.

Digital Colonisation in Africa: Continuities of Colonial Exploitation through Knowledge Production

Big Techs such as Google and Meta have changed our lives drastically. They have provided new ways of connecting with others, trading goods and services, campaigning and influencing elections, advertising, and distributing news. These companies have, therefore, enormous influence and power over society, carrying out activities in different areas which can all be situated in the digital landscape. Hence, reference is made to the fact that today's colonialists are digital. These companies are, however, not focusing on the exploitation of foreign populations to access natural resources and raw materials, but rather creating digital technologies and infrastructures to make sure they exercise control over activities in the digital space. This new phenomenon, sometimes called 'digital colonialism', mainly threatens the developing world (including Africa) by imposing a Western digital ecosystem. This chapter explores whether colonialism is reinvented by the domination of Big Techs in the developing world using primary and secondary sources. This analysis is done by taking diverse perspectives of post-colonial literature and an interdisciplinary approach to examine the complex issues relating to digital colonialism in Africa. In doing so, the paper highlights the disparities in technology access and the perpetuation of colonial legacies, culminating in a comparative analysis between traditional and digital colonialism. Using an interdisciplinary lens, we integrate insights from various fields to offer a comprehensive understanding of the subject. This article evaluates whether digital colonialism could be considered a new form of colonialism and whether there are similar patterns between traditional colonialism and digital colonialism.

PANDOLFI MILANTA, JIMENA* (Facultad de Ciencias Sociales - Universidad de la República, Uruguay)

Trans Narratives and the Construction of Political Subjects: Political Generations in Three Cycles of Mobilization in Uruguay (1990-2023)*

La presente ponencia presenta avances de una tesis doctoral en curso. En un contexto de transformaciones legislativas y esfuerzos de los Estados por reconocer y garantizar el ejercicio de derechos de la población LGBT en países de América Latina, la investigación estudia los modos en que las identidades sexuales – en particular, la identidad trans* – se politiza. La propuesta coloca el foco en un caso de estudio: el movimiento trans* en Uruguay. Se persiguen dos objetivos. Un primer objetivo – de carácter sincrónico – es analizar las narrativas mediante las cuáles los/as activistas que participan en colectivos auto-identificados como organizaciones de lucha por los derechos de las personas trans* politizan estas identidades. Un segundo objetivo – de carácter diacrónico – busca situar en un contexto socio-histórico más amplio las narraciones analizadas en el punto anterior a partir de la identificación de posiciones discursivas de carácter generacional.

Para alcanzar estos objetivos, se realiza un estudio cualitativo de carácter cross-section con mirada retrospectiva a partir del discurso que surge en dos tipos de relatos: historias de vida y grupos de discusión. Se comparan tres cohortes de activistas definidas a partir de ciclos de movilización en que ingresaron al activismo político. El primero (1990-2004) se caracteriza por un trabajo activo por la legalización de la prostitución callejera, el cese de la represión policial y la mejora de las condiciones en que se ejerce el trabajo sexual. El segundo ciclo (2005-2013) contempla la movilización orientada a una “nueva agenda de derechos”, donde se destaca la movilización por el matrimonio igualitario aprobada en 2013. El tercer ciclo (2014-2022) se destaca por la lucha activa a favor de la implementación de una Ley integral para personas trans.

Painting Pink: How Authoritarian Capitalism Absorbs LGBTQ Movement in Post-2019 Hong Kong

This paper explores the intersection of Authoritative Capitalism and Pink Economy Critique within the context of Hong Kong's LGBT movement. As a unique blend of market-driven economic policies and strong governmental control in post 2019 era, Hong Kong exemplifies the complexities of navigating social justice and economic growth. The study analyzes how the local government's approach to LGBT rights reflects a broader strategy within Authoritative Capitalism, often prioritizing economic consideration over the justice of LGBT community. Despite the increasing visibility of LGBT issues in the market, the movement faces significant challenges due to state regulation. Combining the ethnographic data, in-depth interview and media report, this paper examines the contradictions inherent in Hong Kong's economic model, revealing how the commodification of LGBT identities can obscure deeper structural inequalities. This paper contributes to a nuanced understanding of the interplay between market forces and social movements, advocating for a critical reevaluation of movement strategies that prioritize economic interests while potentially undermining the fundamental goals of the LGBT rights movement.

A Human Community with a Shared Future : the Reconstruction of “Community” in Chinese Political Discourse in the 21st Century

Community is an important concept in the history of Western sociology. However, the concept of “community” is not only present in Western theoretical tradition, but also in the research paradigm of “community studies” formed in Chinese sociology in the 1930s. This paradigm was formed by Chinese sociologists Wu Wenzao and Fei Xiaotong after accepting the “field investigation” of British social anthropology and the urban sociology research of the Chicago School in the United States, forming a methodological sense of “Chinese community research”. But in today's theoretical discourse in China, the concept of a “community with a shared future for mankind” has emerged from political discourse. This paper attempts to clarify the different meanings of “community” and its ideological background in the discourse system of

Chinese social theory, and analyzes the new social theoretical significance of “community with a shared future for mankind” under the discourse system of the CPC through the Marxist theory of social conflict.

Intimidación Cultural y Sentidos De Justicia En Los Colectivos De Búsqueda De Personas Desaparecidas En México

Con base en el trabajo de campo etnográfico que realicé durante 2022-2023 en Guerrero, México, en esta ponencia analizaré la constitución dialógica e interaccional de innovadores sentidos de límite a la violencia y de justicia, que se reelaboran en los colectivos de familias que buscan a personas desaparecidas.

En el actual contexto en el que el Estado mexicano no logra administrar la justicia y es partícipe de las desapariciones forzadas (Lomnitz 2022), analizo una práctica aparentemente contradictoria al interior de los colectivos, identificada en el trabajo de campo: la exclusión-inclusión simultánea de ciertas víctimas mediante un lenguaje que llamo de pureza y contaminación.

En este sentido, analizo la práctica de ocultar, distanciarse o excluir a víctimas de desaparición debido al desagrado, vergüenza o temor que pueden causar en tanto se cree que cometieron actos prohibidos legal o moralmente, es decir, en tanto son categorizadas como víctimas “contaminadas”.

No considero esta exclusión como un mero reflejo de la violencia necropolítica y de los discursos estigmatizantes y criminalizantes que separan a las víctimas de desaparición de la comunidad política. Inspirándome en el concepto de *Cultural Intimacy* de Herzfeld (2017), planteo que el carácter desagradable, vergonzoso y temeroso de estas víctimas es lo que posibilita, precisamente, una inclusión orgullosa.

Así, argumento que la inclusión de víctimas “contaminadas” en los colectivos es una práctica que, por una parte, constituye al grupo, lo limpia y reafirma su integridad moral frente al Estado; y, por la otra, hace que las familias se involucren en un campo de lucha política, actualmente en curso, sobre cómo debe tratarse a las víctimas de desaparición y, por lo tanto, permite la reelaboración de visiones del mundo y condiciones para el futuro que marcan un límite a la violencia y demandan justicias no contempladas en los marcos de reparación actuales.

PAPADEMAS, DIANA* (State University of New York/ Old Westbury, USA)

Stewardship and the Future in the Anthropocene/Capitalocene

How do people on the local level in the context of global (un)sustainability participate in movements for greater equality, justice in the future in the anthropocene/capitalocene? The imaginative stewardship concept is pursued and the research for this project on stewardship has been developed from the engagement, ethnography and documentary methods over the last 50 years in “northern Appalachia”, USA. The New England region designation by the author indicates a geographic and cultural region defined by the Appalachian Mountains from Belle Isle in Canada to Cheaha Mountain in Alabama. Stewardship varies by region and locale, and the author's focus on the north is a way to dispel “Appalachian” stereotypes. Contemporary sustainable development goals are serious challenges, with a view from the transformation of land from the indigenous, to family farm settlements, to the industrial; land development shifted by both dairy to factory farms, and logging for commerce, transformation of forests and extraction of wood for paper products, the decline of paper mills, altered landscapes, energy challenges, and conflict with dominant corporate powers. Modern local movements have included ending the quest for hydropower transmission lines to current challenges by corporate controlled ‘carbon crediting’ programs from foreign and our-of-region corporate owner. Local stewardship concepts vision long-term into the future and reflect long-term practices from the past. The author is directly involved with a conservation project, working with local officials, and community members. Also, participation in the United Nations Stakeholder Engagement for Integrated Actions to Advance the Sustainable Development Goals (SDGs) & the Pact for the Future, globalizes these activities and adds to the conversation on the local level. Such movement “agency” addresses indigenous, workingclass, and other marginalized realities in order to promote greater justice and to “balance” idealism with realism about the future. The project poses comparative potentials for further research.

Addressing LGBTQ+ Bias in Forensic Evidence for Sexual Violence Cases

LGBTQ+ individuals face unique challenges within the criminal justice system, particularly in cases of sexual violence, where they are disproportionately vulnerable. Research indicates that gay men, for instance, are at a higher risk of sexual assault, often exacerbated by intentional or unintentional drug usage—especially with substances like GHB. Despite their increased exposure to such crimes, LGBTQ+ victims frequently encounter biased treatment, mishandling of evidence, and harmful stereotypes. This study explores the intersection of sexual violence against LGBTQ+ individuals and systemic biases within forensic procedures, with a particular focus on the role of Gamma-hydroxybutyrate (GHB) in these cases. The core research question investigates how institutional biases (in documentation and monitoring) and normative biases (in detection and interpretation) lead to the underestimation and mishandling of sexual violence cases involving LGBTQ+ individuals within the European Union (EU). A key challenge for the EU lies in developing a cohesive security framework—through initiatives like the EU Security Union Strategy and the European Multidisciplinary Platform Against Criminal Threats—that accommodates the diverse legal and institutional contexts of its member states. To address this, the study integrates insights from across the EU, acknowledging the various legal, institutional, and socio-economic landscapes. The research employs a triangulation of methods, combining: a) a literature review, b) context analysis of policy reports, and c) interviews with key informants from research institutions, law enforcement, legal, security, and technology organizations, ensuring a wide range of perspectives across the EU. The study yields practical outcomes, including guidelines for forensic professionals, policy recommendations to incorporate gender diversity into forensic training, and systemic reforms aimed at reducing bias. These recommendations align with broader legislative debates surrounding LGBTQ+ rights and contribute to ongoing reforms that promote the recognition of gender diversity within legal and policy frameworks across the EU and beyond.

PAPAKONSTANTINO, ANTIGONI ALBA* (National and Kapodistrian University of Athens, Greece)

School Parents' Online Groups: A Study on Active Participants' Characteristics

Using widely known social media, such as viber, what's app or messenger, Greek school parents, whose children are in the same classroom, form groups, through which, they attempt to set up a communication channel. The initial funding function of these groups seems to be the circulation of school information, but gradually they seem to turn to a community of interest (Lesser, Fontaine, Slusher, 2000), as participants brought together "interact extensively with one another on a specific topic" (Lesser, Fontaine, Slusher, 2000:87), which is school everyday life. The present study investigates parents' communication habits and implication to school parents' online groups (S.P.O.G.) and tries to describe the profile of parents participating actively to those groups.

A quantitative research was conducted using an original online questionnaire, which more than 200 parents of students in public and private schools fulfilled. Data were analyzed using SPSS program.

Results indicate that almost all participating mothers, mainly of primary school students, participate to minimum one SPOG. On the other hand a very few fathers declared participating to a SPOG and also few of them appear to know the exact content or purpose of a SPOG. The great majority of primary school students' mothers affirm exchanging or reading messages on SPOG on a daily basis, while mothers of high school students visit SPOG less often. Also, parents having one child demonstrate a more active presence to SPOG, comparing to parents of more than two children. Finally, mothers of children at first classes of primary school consider SPOG a necessary tool facilitating their children schooling, while mothers of older students affirm that communication through SPOG can also create misunderstandings and complicate family-school relationships or relationships among school parents.

PAPILLON, DANIEL* (Cardiff University, United Kingdom)

Gender and Health in the Discourses Around Polygenic Embryo Screening

The aim of this paper is to explore how notions of gender and health are deployed and impacted by discourses on technologies of embryo selection.

As pregnancies increasingly evoke anxieties regarding health risks for mothers and future children, various biotechnologies, including Preimplantation Genetic Testing for Polygenic Disorders (PGT-P), have emerged to assess and mitigate these risks. PGT-P is a new form of susceptibility genetic testing on embryos used during *In vitro* fertilisation. It provides embryos' risks to develop complex conditions (eg, schizophrenia, cancers or cardiovascular diseases) to help parents select the 'best' embryo for implantation. This paper investigates gender- and health-talk within discourses surrounding PGT-P.

Three key discourses are identified from discussions in a publicly available webinar hosted by Genomic Prediction, a US-based company providing PGT-P to fertility clinics: Gendered Defense of Technology, Technology Users (including gendered users), and Health as a Continuum.

This research sheds light on how selective reproduction technologies shape and are shaped by gender-related discourses. Finally, framing health as a continuum from less healthy to healthier (rather than as categorical healthy/ill), makes the idea of health more amenable to optimisation (rather than a focus on cure and treatment).

TG04-978.3

PAPILLON, DANIEL* (Cardiff University, United Kingdom)

"Choice over Chance" - the Discursive Construction of Polygenic Embryo Screening As a Risk Management Technology

This paper examines the intersection of risk, health, and choice in reproductive technologies through a Foucauldian discourse analysis of a webinar by the US-based company Genomic Prediction.

Genomic Prediction offers a novel form of susceptibility testing during IVF, known as Preimplantation Genetic Testing for Polygenic Disorders (PGT-P). This technology generates a risk profile for each embryo, estimating the likelihood of developing complex conditions such as schizophrenia, cancer, or cardiovascular diseases, with the goal of helping parents select the 'best' embryo for implantation.

The paper explores how webinar participants describe, justify, and defend PGT-P. Drawing on Science and Technology Studies and governmentality studies, three key discourses emerge: risk, ranking, and choice. These discourses shape and give meaning to various bodies of knowledge—genetics, statistics, bioethics, and medicine—and are tied to different forms of power: the authority of somatic experts and clinicians, the diffuse power of neoliberal governmentality, and the enabling and constraining power of genetic testing technologies.

Genomic Prediction's key innovation is the "Embryo Health Score", a single metric that estimates each embryo's overall health. This score, along with the use of a bell curve to visually represent risk, introduces a new way of measuring, ranking, and communicating risk. By ranking embryos, the technology echoes historical eugenic practices and influences parental choices by highlighting one outlier—the 'healthiest' embryo. In this sense, parental decision-making is "delegated" to the technology of PGT-P.

In conclusion, the discourses surrounding PGT-P shift reproductive decision-making toward a focus on probability and risk. These discourses position reproductive technologies within a framework where all levels of risk are to be intervened on and viewed as controllable, reinforcing what Finkler (2003) calls an "illusion of control."

Intimate Partner Violence Experiences of Filipino Women: Evidence from the 2022 Philippine Demographic and Health Survey

This study describes the different factors that influence the current experiences of intimate partner violence (IPV) of ever-married and never-married Filipino women. The study also examines the differences in perceived IPV experiences using the 2022 Philippine National Demographic and Health

Survey (NDHS) data. Only women age 15–49 who answered the Women's Safety Module and were either ever-married or never-married but ever had an intimate partner (N=13,362) were included in the analysis. The regression analyses, using Stata 18, were performed to analyze the relationship of physical, sexual, and emotional IPV to women's (1) background characteristics, (2) current life circumstances, and (3) immediate precursors. The results showed that IPV prevalence is steadily declining in the Philippines with 3% of women experiencing any form of physical IPV, 1% sexual IPV, and 11% emotional IPV in the last 12 months. The proportion of married women who are experiencing current IPV (aOR = 2.7, 95% CI [1.9–3.8]) is higher than their never-married counterparts. The women's situational contexts have shown to be the most significant risk factor for experiencing IPV. Overall, IPV is a significant social issue and public health concern that should be considered seriously through policy reforms and strengthening of community initiatives that focus on violence against women.

KAULARD, ANKE (Pontifical Catholic University of Peru, Peru)

Rethinking Climate Justice: Examining How Injustice Is Reproduced in Climate Action in Indigenous Peoples Territories

This paper argues that climate justice encompasses more than just the inequitable distribution of the biophysical impacts of climate change—a widely accepted perspective. While Indigenous peoples disproportionately suffer the consequences of climate change despite their minimal contribution to the crisis, our analysis reveals that climate action implemented in their territories often perpetuates injustice.

The article shows that the mechanisms reproducing these inequalities are deeply embedded in the practices through which climate action is applied in Indigenous territories, regardless of the progress and formal recognition Indigenous peoples have gained in global and national climate justice narratives and institutions. Drawing on Anibal Quijano's conceptual framework of the coloniality of power, which refers to the enduring legacy of colonial domination manifesting through structures, knowledge systems, and power relations, we identify and discuss three key mechanisms that sustain these inequalities: legalism, which imposes external normative frameworks that delegitimize Indigenous rights and knowledge systems; tutelage, which subordinates Indigenous decision-making to external actors, perpetuating historical dependencies; and blueprints, which implement generic solutions that disregard local cultural and territorial specificities. These mechanisms persist in the everyday practices of state officials, NGO professionals, and even Indigenous actors, often without formal acknowledgment of their colonial nature.

These injustices are examined in the context of climate conservation, focusing on three critical areas for Indigenous negotiations: territorial security, effective participation, and compensation for ecological services, such as REDD+. Data from the Rapa Nui in Chile, as well as the Quechua in the Andes and the Kichwa in the Amazon in Peru, convincingly demonstrate how climate action can reproduce injustice when it is embedded in the coloniality of power. The analysis also reveals that the impacts vary according to the specific organizational structures, scales of action, and ecological contributions of Indigenous territories, highlighting the need for more context-sensitive approaches.

Precarious Labor and the Performative Politics of Climate Governance in the Anthropocene: A Comparative Study of Texas, Florida, and Washington State

This paper examines how neoliberal governance shapes labor precarity and environmental protections through a comparative analysis of legislative debates in Texas, Florida, and Washington State. In the Anthropocene, where climate change intensifies existing socio-economic vulnerabilities, marginalized workers—particularly those working in sectors like agriculture, and construction—face disproportionate risks. Legislative interventions in these states reflect contrasting approaches to environmental labor governance, exposing the tensions between economic growth, state power, and worker protections. While Texas and Florida enact pre-emption laws that prevent local governments from implementing heat protections, Washington offers an alternative model, integrating labor safety within broader climate resilience frameworks.

This study employs Bourdieu's field theory (1993) to analyze legislative debates as performative arenas where narratives of labor, economic development, and environmental responsibility are constructed and contested. In Texas and Florida, the alignment of business interests with state governance frames labor protections as regulatory burdens that threaten

economic vitality. These discourses produce a paradox: workers are rendered essential but expendable, reflecting how neoliberal governance manages labor precarity by simultaneously extracting value from marginalized labor while withholding protections. Washington State's policy environment provides a contrasting narrative, where labor-environment coalitions advocate for climate and worker justice without compromising economic development.

This study argues that the performative nature of governance, as expressed in legislative discourse, serves not only to legitimize policy outcomes but also to reproduce or resist neoliberal logics. By analyzing how labor and environmental governance is performed across different state contexts, this paper contributes to environmental and political sociology. It offers insights into the evolving relationship between climate responsibility, labor regulation, and state power to show how the Anthropocene demands new frameworks for governing both environmental futures and worker welfare.

PAREEK, MONIKA* (Florida State University, USA)

Reimagining Urban Ecologies: An Ethnographic Study of Climate-Justice Activism in Seattle

This study presents an ethnographic exploration of how marginalized communities in Seattle contest environmental inequalities through grassroots activism. Despite the city's reputation for progressive climate initiatives; environmental benefits—such as access to green spaces, clean air, and ecologically sustainable infrastructure—are unevenly distributed, with low-income and racialized communities disproportionately facing environmental harm. This research examines how activists and community organizers in Seattle resist these structural inequities by developing alternative modes of environmental engagement, rooted in care work, solidarity, and place-based knowledge that challenges the ever-present colonial ontologies and materialities of a city that remains haunted by a settler-colonial and racist past (Asaka 2022, Henderson 2022).

Drawing on intersectional and decolonial methodologies (Escobar 2008, Fanon 1963, Quijano et al 2024), the study analyzes how urban ecologies of Seattle reflect broader dynamics of race, class, and power. It explores how community actors create spaces of resistance and resilience, developing strategies that counter mainstream sustainability narratives, which have often prioritized economic growth and ecological restoration in wealthier areas. By engaging with grassroots initiatives, the research reveals how marginalized groups reimagine urban environments and ecological futures that move beyond the technocratic frameworks of municipal governance.

Using participant observation and in-depth interviews with climate advocates and local organizers, the project documents the tensions between working within institutional frameworks and cultivating autonomous, community-led alternatives. The analysis highlights how these activists confront environmental injustice through everyday practices of resistance, care, and mutual support, while also navigating the contradictions of engaging with state-led environmental initiatives. This study contributes to scholarly debates on climate justice in the Anthropocene by emphasizing the importance of grassroots resistance in reshaping urban ecologies. It offers empirical insights into how communities most affected by environmental harm forge alternative pathways toward justice, revealing the transformative potential of climate activism to reconfigure relationships between urban space, nature, and inequality.

The Challenges of Integrating Alternative and Complementary Medicines into Care Systems: Professional Regulations in the in-between

Worldwide, the growth of Alternative and Complementary Medicines (CAM) has led to a reconfiguration of the health field. Despite very different socio-political contexts and healthcare systems, in Argentina and in France, the near absence of regulations concerning these practices has resulted in a significant heterogeneity in practitioners' backgrounds and educational trajectories. The analysis suggests that the internal segmentation of this CAM market makes recognition procedures complex.

This presentation is based on two sociological theses' fieldwork: Josefina Avelin's study of Argentine CAM practitioners, and Fanny Parent's research on Chinese medicine professionals in France. We explore the positions they take regarding potential regulation and integration into the formal health system, identifying two key aspects that emerge from this regulatory void.

Firstly, professionals with conventional health-related degrees (such as biomedical doctors), who already possess the necessary credentials, prioritize maintaining autonomy over seeking state legitimization. In Argentina, many professionals embraced heterodox approaches to health after recognizing the limitations of the system they were trained in, and thus are reluctant to reintegrate into it. A similar situation can be observed in France with biomedical doctors integrating Chinese medicine into their practice. However, since acupuncture is recognized as a medical act, acupuncturist doctors' organizations are trying to maintain their monopoly and reinforce the practice's legitimacy in the medical field.

Secondly, practitioners without conventional degrees often display ambiguous strategies to assert their expertise. The holistic approach allows them to navigate among the fields of health, religion and sports; emphasizing their proximity to professional codes of biomedicine or the cultural dimensions of their practices according to the context they are in. In this movement, different competition and alliances are formed with CAM practitioners from medical professions. Taking these dynamics into account is essential to understanding the tensions that arise when attempting to incorporate CAM into official health systems.

Activists As Theorists: Theorizing Race and Class in South Africa's Black Consciousness Movement

What roles do racism and capitalism play in generating inequality, and what kinds of transformative strategies might be effective in challenging it? In 2022 and 2023, we conducted oral history interviews with 53 activists who were involved in the anti-capitalist wing of the anti-apartheid movement in South Africa. We sought to understand how activists thought about the linkages between racism and capitalism, and what kinds of struggle and political orientation were needed for social transformation. At the root of this project is our conceptualization of *activists as theorists*. Academic writing frequently trails behind activist theorizing, and so, treating activists as theorists proves essential to generating the highest quality theory.

In this paper, we focus on a subset of 18 of these interviews with activists who were part of the Black Consciousness Movement (BCM) and its key affiliate, the Azanian People's Organization (AZAPO). What were they fighting against and for? We argue that BCM/AZAPO activists emphasized the deep entanglements of racism and capitalism, and thus believed that eradicating racism required an anti-capitalist challenge. Yet, within this common viewpoint there was a subtle but important contrast between two positions. One, which we refer to as the *equivalence position*, understood race and class as effectively synonymous. In this view, socialism and national liberation were inherently and necessarily one and the same. Conversely, those adhering to what we refer to as the *contingency position*, pointed to a more complex and variable relationship between racism and capitalism. From this perspective, national liberation was an important terrain of struggle between class forces.

These two viewpoints are useful for understanding a wide array of movements today, not just in South Africa but across the globe. More specifically, they are crucial for making sense of the meanings that activists produce and the alternative worlds that they envision.

PARISOT, VIKTORIA* (University of Vienna, Austria)

Normalizing Troubles, Troubling the Normal: Researching Divorce As a Contribution to Diversity in Future Family Research

In the renewed interest in diverse intimacies and family forms divorce as a topic of research has played a minor role. In my contribution, I argue that reinvigorating research on divorce can further diversity in future family research. I pursue that endeavour by researching divorce in a particular context: Austrian family law stands out in Europe because fault-divorces are still legally valid. These divorces include legal negotiations about the partners' fault on the disruption of their marriage. Fault is determined through the negotiation of the fulfilment or violation of the marital obligations. Thus, court files of fault-based divorces contain insights into the judicial and social boundaries between 'normal' and 'troubled' couples. I conducted qualitative case studies of 25 fault-based divorce files from the period between 2003-2019 of different-gender couples, and asked: *How do couples problematize their relationship in court files of divorce proceedings? Which practices are negotiated as marital obligation or misconduct?* Based on this work, I highlight how research on divorce can contribute to diversity in future family research in two ways: Firstly, I consider divorce not as the end of couple relations but as a part of them. This opens new research perspectives on the norms of being a couple. Since the couple-norm is at the heart of 'intimate citizenship regimes' in Europe, deconstructing 'coupledom' can be seen as a basis for diversity in family research. Secondly, I examine divorce through analyzing little-tapped data, and developed an innovative methodological approach that opens new perspectives on families.

PARK, CHUNWOONG* (Jeonbuk National University, South Korea)

Education, Exams, and Social Mobility in Colonial Korea Under Japan's Rule: Analysis on the Successful Candidates of the Colonial Korea Bar Examination (1922-1940)

By addressing how ethnicity and socio-economic background differently worked for social class mobility in colonial Korea under Japan's rule, this research explicates structured social paths in which Korean and Japanese practicing lawyers were produced. Separated from the examinations to produce lawyers in metropole Japan, the Colonial Korea Bar Examination (Chōsen bengoshi shiken) provided many practicing lawyers in colonial Korea where systematic education of law remained limited until the end of Japan's rule. As passing the examination was enough to be qualified as a practicing lawyer, both Japanese and Koreans with various socio-economic backgrounds endeavored to pass it. From the archives including the official gazette, classified attorney registration documents, and newspapers, I collected the candidates' age, ethnicity, family income, and education level, and constructed a profile of them. Two findings are significant. While it was similar that most candidates were the court-clerks of the colonial judiciary, Korean candidates were more educated and younger than their Japanese counterparts. Whereas candidates from a well-off family were the majority and tended to complete formal education, those from a relatively poor family came through various exams equivalent to a certain level of education in colonial Korea.

PARK, CHUNWOONG* (Jeonbuk National University, South Korea)

Underneath the Mutual Agreements: The Socio-Legal Changes on the Domestication of Patriarchy in Middle-Class Korean Families' Agreement Divorce Cases Under Japan's Rule (1920s-30s)

Introduced under the Japanese Civil Code to colonial Korea under Japan's rule (1910-45), the mutual agreement divorce was a legal institution that allowed couples to dissolve their marriages by submitting their agreed intention to divorce to local authorities. While previous research has focused on the divorce by trial and poor families' mutual agreement divorces, little research has yet been done on Korean middle-class families' mutual agreement divorces. This article analyzes Korean lawyers' family registers in the 1920s and 30s to argue that their agreement divorces reflect the socio-legal changes in colonial Korea which enabled Korean middle-class men to domesticate existing patriarchal family practices. Modern education and jobs, accessible to men from middle-class backgrounds, often led the men to separate from their wives, cohabited with new women, and had even extramarital affairs and illegitimate children. With a dozen of agreement divorce cases in the family registers attached to the documents that the

lawyers submitted to the Governor-General's Office for lawyer registration, I reconstructed the contexts and backgrounds of the divorces along with other archival sources. I found that the cases labeled as agreed in fact were intertwined with long separations between husband and wife, monogamy and illegitimate women, the children's legal status in the family register, and the birth of male children. This article demonstrates that underneath the label of agreement there was the domestication of colonial family codes by which some Korean middle class produced a novel set of family norms with reference to pre-colonial family practices.

PARK, HAENAM* (Keimyung University, South Korea)

Same Bed, but Different Dreams? Divergent Aspirations and Dream Habitus Among Youth in South Korea

South Korea has long been recognized globally for its high educational standards and ambitious youth. Historically, many young people sought upward social mobility and a stable middle-class life through higher education and securing prestigious employment.

The early 2010s saw the emergence of the "N-po generation" discourse. This concept, derived from the Korean word "po" meaning "to give up," reflected a growing reality where young people were relinquishing various elements traditionally associated with social advancement and middle-class stability. These included employment, marriage, family formation, and homeownership. As the number of factors being abandoned increased from three to five to seven, Korean media coined the term "N-po" to encapsulate this phenomenon.

However, does this trend apply uniformly across all youth? While young people generally share high aspirations for decent jobs, evidenced by the country's exceptionally high university enrollment rates, their family backgrounds and social statuses are diverse. The social strata individuals occupy significantly influence their aspirations, aligning with the sociological concept of "habitus." This presentation will analyze why South Koreans exhibit differing aspirations despite seemingly sharing the same educational "bed" of widespread university attendance.

Of particular interest in this study is the role of region as a parameter. South Korea's higher education institutions are hierarchically structured, with the most prestigious universities predominantly located in Seoul. Consequently, university admission serves as a gatekeeper on the path to desirable employment opportunities, creating different "dreams" within the same educational landscape.

Through in-depth interviews, this presentation uncovers the process by which different aspirations are formed among young people. Specifically, we will demonstrate how social status, including family background, influences individual aspirations regarding university enrollment. Furthermore, we will explore how universities and their geographic locations contribute to shaping young people's aspirations for quality employment and upward mobility.

Who Cares for Korean Children? Changes in Family-Based and Outsourced Forms of Childcare over Two Decades, 2000-2020

Who takes care of young children during the daytime in South Korea? Despite a comparably high level of educational attainment, a substantial share of Korean women continue to stop working due to childcare. Even though the government has set up more public childcare centers, the strong norm for intensive mothering and growing competition for children's educational success have prevented substantial reduction of childcare burden to mothers. Moreover, the rise of life expectancy has made grandparents available for childcare to a growing share of families. This paper investigates changes in the major forms of childcare among Korean families with young children over two decades between 2000 and 2020. Using individual- and familial-level data from 2% Census microdata, we examine how the use of family-based (e.g., parents or grandparents) vs. outsourced forms (e.g., childcare center) of childcare forms has changed or persisted over the two decades in the midst of rapid fertility decline. The study focuses on heterogeneity in the use of different forms of childcare by parental education. The preliminary results show that 1) the share of Korean parents who exclusively rely on family-based forms of childcare has increased, especially in 2020 (i.e., during COVID-19); 2) the increased use of family-based forms of childcare is more evident for parents with BA+ than for parents with high school or less; 3) mothers with BA+ increased their labor force participation but also increased their reliance on grandparents for childcare (among working mothers). Mothers

with BA+ who are not working have increasingly took care of their children by themselves. We discuss the implications of our findings for inequality in family life between those with lower and higher education.

Navigating Labor in Disaster Professions: Gender, Emotion, and the Role of Immigrant Workers in the Age of Climate Change

As climate change intensifies the frequency and severity of natural disasters, the demand for disaster professionals has increased, necessitating a deeper sociological inquiry into the complexities of labor. This study examines important aspects of labor in disaster industries—emotional, physical, skill-based, and professional—while specifically emphasizing the reliance on immigrant labor within the U.S. context. Existing literature tends to focus primarily on responders to emergencies, leaving a significant gap regarding those engaged at disaster sites, particularly in the aftermath of fatalities, demolition, and rebuilding efforts.

By situating this inquiry within a sociological framework, this study investigates the structural and cultural factors that influence labor practices in disaster response, including the roles and experiences of immigrant workers, gendered roles within the profession, and the dynamics of masculinity and femininity in trauma environments. Emotional labor in these high-stress settings often intersects with traditional notions of masculinity, compelling men to perform emotional labor while interacting with trauma victims. Simultaneously, the feminization of certain aspects of disaster work—such as caregiving and emotional support—can marginalize these roles and contribute to the gendered perception of labor in this field.

The methodology involves qualitative interviews with disaster professionals and workers, including demolition workers, builders, first responders, and recovery workers. This research aims to enhance an understanding of the challenges faced by disaster professionals, particularly immigrant workers. It seeks to inform policy discussions and improve support systems for those engaged in disaster response and advocate for more equitable and supportive labor practices within disaster response frameworks.

Energy Transition and Environmental Impact Assessment: When New Projects Collide with Indigenous Worldviews of Nature in South America

The environmental impact assessment in indigenous territories raises the issue of the lexematic distance between indigenous discourses and those of authorities and companies in the context of energy transition projects. Based on years of field research in the Southern Cone of America and employing an analysis based on typological reconstruction, this paper argues that indigenous worldviews stand as alterity against the referential frameworks of environmental impact assessments. The paradigmatic clash around the new projects assessment given the rights to Indigenous participation and consultation, explains numerous environmental conflicts on the ground. They can also severely delay energy transition processes due to the incommensurability of perspectives. Beyond the anthropological theories of the ontological turn that describe these differences, this paper proposes a political economy approach introducing the concept of *symbolic value*, which can comprehend these indigenous worldviews and facilitate a dialogue with the exchange value and use value of the territories. The symbolic value concept is coherent with ecological perspectives and it is capable of being operationalized in environmental assessment processes.

Lived Religion and the Transition Toward Gender Equity in the Chilean Christian Field

This paper explores the paradoxes and challenges of gender equity transitions within the Christian religious field in Chile and Latin America. It examines how feminist movements and gender studies have challenged the deeply ingrained patriarchal structures in both society and religious institutions. Traditionally, Christianity—both Catholicism and Evangelical Churches—has reinforced gender norms that limit women's autonomy.

However, feminist theology, has offered more inclusive interpretations of sacred texts, advocating for gender justice and women's rights.

A key paradox is the "feminization of religiosity," where women increasingly participate in religious practices as men move toward secularism. While power dynamics within religious institutions remain patriarchal, this growing female participation signals a broader transition toward gender equity.

The transition toward gender equity in churches, despite the challenges, has only been possible due to the emergence of new feminine spiritualities. These experiences of embodied mysticism can be considered forms of lived religion, which, through the redefinition of women's daily lives within the context of their families and communities, also challenge religious and social hierarchies. In this way, new expressions of faith emerge, blending traditional elements with innovative spiritual practices, thereby redefining the roles and identities of women in both churches and society. The presentation discusses the findings of recent qualitative research conducted in grassroots Catholic communities and Pentecostal congregations in Santiago, Chile.

Exploring the Impact of Namaste Care: A Systematic Review of Costs, Effects and Benefits

Background and Objectives:

Namaste Care is a daily multi-component palliative care intervention, for persons living with dementia. This systematic review explores its effects in multiple care settings, focusing on clinical and economic endpoints.

Research Design and Methods

This systematic search used three databases (PubMed, Scopus, and Web of Science) to find peer-reviewed studies on Namaste Care's impact on quality of life, costs, and health and economic benefits. Selection of included articles, data extraction and methodological quality assessments using the Mixed Methods Appraisal Tool were conducted by two researchers independently.

Results

Twenty-eight studies reported clinical and economic outcomes of Namaste Care. Studies reported mixed effectiveness in outcomes; four of nine studies evaluating quality of life (QoL) found significant improvements. Different outcome measurement instruments were used. QUALID was frequently used to measure QoL (n=8), with EQ-5D-3L/5L, ICECAP-O/SCM, QUALIDEM, and C-DEMQUAL each used once. Other clinical outcomes were pain, behavioral symptoms, and quality of end-of-life care, each measured by three instruments. The Medication Quantification Scale and Minimum Data Set showed reduced use in antidepressant and antianxiety medications. Six studies demonstrated significant well-being improvements, and family members reported reduced stress after three months of Namaste Care in one study.

Discussion and Implications:

Healthcare interventions may be worth pursuing even if cost-effectiveness is not confirmed. This may be due to non-economic factors, considering benefits for caregivers and patients. The findings suggest Namaste Care may improve well-being, reduce caregiver stress, and lower antidepressant and antianxiety medication use, but further research is needed to confirm these effects in randomized control settings.

L'identité Des Jeunes Ruraux Du Sud Du Sahara Au Maroc Et Son Impact Sur La Décision De Migrer Face Aux Changements Climatiques

Dans la sociologie classique, nous rencontrons souvent des distinctions claires dans les différentes branches de recherche, notamment en sociologie rurale. À partir des études réalisées sur une région ou un pays, le chercheur pouvait se faire une idée importante des caractéristiques et traits qui distinguaient la population de cette région, ou ce que l'on pourrait appeler leur "identité sociale". Cependant, cette distinction n'est plus valable aujourd'hui, en raison des changements divers que la réalité sociale a connus, en relation avec les changements climatiques d'une part, et la transformation qu'a connue la recherche sociologique d'autre part. Les jeunes ruraux possédaient autrefois des caractéristiques qui les

distinguaient des citadins, mais cette distinction a diminué ces dernières années sous l'effet de la mondialisation. De plus, l'activité agricole n'est plus perçue comme rentable ou attirante par les jeunes, qui la trouvent peu rentable et démodée, ce qui les pousse à améliorer leur situation en migrant. Les changements climatiques ont également conduit à la perte de beaucoup de main-d'œuvre dans ce secteur, en raison de la sécheresse et de la rareté de l'eau. Dans ce contexte, nous tenterons de comprendre le rôle de ces facteurs dans la migration en provenance du Sud du Sahara vers le Maroc puis vers l'Europe, c'est-à-dire vers la région méditerranéenne, à travers une étude sociologique de terrain.

PARRACHO SANT'ANNA, SABRINA* (Universidade Federal Rural do Rio de Janeiro, Brazil)

Inhotim Institute of Contemporary Art: Tensions between Museums and DIY Culture

This paper aims to discuss the relationship between museums and the DIY practices, that have been challenging established forms of recognition in contemporary art. Based on a case study on the Inhotim Institute, this research discusses how institutional criticism, through a public sphere permeable to visual culture, has contributed to the emergence of new institutional practices that blur the boundaries between art and politics and set in motion new social relations in the art system.

At the end of 2022, Maxwell Alexandre, a young rising artist, coming from the working classes of Rio de Janeiro, questioned the structural racism evident in the curatorial practices of one of the most important contemporary art institutions in Brazil, the Inhotim Institute. Following the controversy, the artist proposed the creation of new self-managed exhibitory spaces in Rio de Janeiro, also contributing to disruptions in the established practices of the Minas Gerais institution. The episode highlights new forms of institutionalization that articulate DIY culture, the public sphere, and discursive practices that challenge the hegemonic art system.

Complaints and Negotiations about Professionalism in the Social Welfare Sector in Germany. Ethnographic Insights from a Childcare Center and a Youth Vocational Assistance Service

In light of the societal and socio-political transformations currently unfolding in Germany, particularly with regard to managerialism, neoliberalism, and new public management, there is a diversity of discourses on the question of what constitutes professional work in the social sector. These discourses pertain either to the efficiency or standardization of professionalism, or to situativity, focus on individual cases, and aspects of care and relational work. Technical or organizational understandings of professionalism are either seen as threats to traditional professionalism, or as a complement to and extension of it. Lately, social work has been perceived by the critical public as an error-prone endeavor, resulting in a tendency to blame agents and their organizations. This has led to a heightened awareness of the necessity to act professionally in every situation. The emergence of competing conceptions of professionalism at the discursive level gives rise to the question of how organizations and their employees respond to the issue of improper performance. When complaints emerge from within or outside the organization, negotiations become evident regarding the version of professionalism that is upheld, criticized, accepted without question, or dismissed. This investigation employs participant observation in a day-care center and a youth vocational assistance service to demonstrate that the manner in which criticism is handled reveals which actors are recognized as having the authority to judge who is professional and which perceptions of professionalism gain common ground in each instance. These findings are situated within an organizational ethnography of the two organizations in question. A comparison of these two socio-pedagogical fields, which are subject to different forms of professionalization and regulation, reveals that negotiation occurs in a variety of ways, yet there are also notable similarities. This is primarily shaped by a set of conditions and structural frameworks that are both analogous and distinct.

PARULKAR, ASHWIN* (HELP USA, USA)

Integrating New York City's Migrant Refugees into Society amid National and Local Policy Challenges: An Asset Accumulation & Livelihood Capitals Perspective

This decade, foreign refugees fleeing violence and destitution comprise an increasing share of urban homeless populations in the United States. A record 2.48 million migrants entered the U.S. from Mexico in 2023. U.S. officials have failed to address the issue. Federal policies that barred migrants from applying for asylum at the U.S. border in 2018 preceded border crossing influxes in 2019, which have continued unabated (excluding 2020). In 2022, officials from southern states began "busing" migrants to northeastern cities like New York, which contributed to the 53% increase in that city's shelter population between July '22 (54,738) and October '23 (83,985).

How do organizations serving the homeless integrate this vulnerable population into mainstream society?

HELP USA serves over 600 migrants in NYC shelters. This talk details how staff responses to migrant needs have ensured better educational, employment, social service and housing outcomes for them.

A survey of 62 asylum seeking households conducted by HELP Research in August 2024 found that the asylum and temporary protected status (TPS) application services, facilitated by front-line staff, established the "housing readiness" of these clients. Over three-fourths of respondents (77%) had achieved work authorizations or asylum and were therefore eligible for housing subsidies and local residence.

This study applied an "asset accumulation" framework to understand how these clients muster or "accumulate" "assets", or "capitals", to overcome the vulnerabilities of their rapidly changed social, political and economic environments. The talk focuses on two interrelated findings. Social workers had provided a range of services that bolstered the capital base of the majority of surveyed clients. Migrants also had a substantial inherent capital base, such as university educations (human capital) and job networks (social capital), that they used to overcome barriers and secure jobs (financial capital).

PASCALE, HANCART PETITET* (TransVIHMI (Institut de Recherche pour le Développement, INSERM, Univ Montpellier), France)

"Birth in the Forest"

"Birth in the Forest" aims to explore, at various scales, the determinants that shape the spaces allocated to women during childbirth in remote rural areas of southern Laos. It offers a unique perspective on the experience of women giving birth in the forest, conveyed through the voices of the women themselves, a traditional birth attendant, village leaders, and healthcare workers. Beyond the act of childbirth, the film reveals the intricate web of factors influencing women's vulnerability, including social and gender inequalities, global and local health policies, the role of ethnic minorities, the local impact of international decisions, and the influence of the spiritual realm. This film is the result of a collaboration between an anthropologist and a filmmaker, grounded in anthropological data on childbirth in remote Laos, gathered over the past decade. It also draws on research conducted as part of the HEALTH project (2020-2024) in Katang villages, funded by Expertise France.

RC14-214.3PASTOR, RAQUEL* (University of Cadiz, Spain)
MARTÍN ARAGÓN, MARÍA DEL MAR* (Universidad de Cádiz, Spain)*Media Narratives and Gender in the First Murder Cases Sentenced to Revisable Permanent Imprisonment in Spain*

This study explores the media construction of gender identities in the context of the first two cases of permanent revisable imprisonment in Spain, analyzing how the media shape and perpetuate gender norms related to crime and justice. Both cases, which involve the murders of minors within the family setting, are emblematic due to their historical significance and the precedents they set in the Spanish judicial system. The research examines how the gender of the accused—a man in one case and a woman in the other—affects media narratives, focusing on identifying any significant variations in the portrayal of the perpetrators.

Using an interdisciplinary approach that integrates sociology, criminology, and media studies, this study analyzes media coverage from the disclosure

of the events through to the sentencing, including news articles, reports, and expert opinions. Special attention is given to how the media not only transmit existing gender norms but also actively contribute to the construction and reinforcement of gender identities within the criminal context. Additionally, the study investigates potential discrepancies between media representation and the judicial process, exploring the impact of these narratives on public perception and legal outcomes.

Positioned at the intersection of gender studies and media critique, this work provides a critical perspective on the role of the media in perpetuating gender stereotypes, as well as their potential to challenge and transform these norms in contexts of significant social importance. The findings are expected to contribute to a deeper understanding of gender dynamics in the media representation of criminality and their influence on power structures in contemporary society.

Conspiracy Theories and Disinformation about COVID-19: A Sociological Analysis in Andalusia

Recently, with the rise of the platform society, social problems such as the spread of conspiracy theories and disinformation on various topics, including immigration or LGBTQ+ individuals, have become increasingly prominent. This trend has shown a marked increase during the COVID-19 pandemic.

The data for this research were obtained through a survey administered to a sample of 1,550 individuals, representative of the Andalusian population aged 15 and older. The dependent variable selected was one of the main conspiracy theories regarding the origin of the pandemic: "The coronavirus (COVID-19) is a biological weapon created by scientists." Subsequently, in order to identify the impact of various sociodemographic variables on the degree of agreement with this statement, significance tests were conducted.

The results indicate a high level of significance in variables such as gender, with women showing a greater degree of agreement with the statement; age, where younger individuals are less likely to believe in these theories; educational level, with those possessing higher levels of education more likely to reject these narratives; and political ideology, where those leaning further to the right exhibit a stronger belief. Significant differences were also observed in media consumption: television and radio consumers show more agreement, whereas digital newspaper readers tend to be more skeptical.

In general, the results suggest the magnitude of the existing social problem, given the large number of Andalusians who share these beliefs. This study, therefore, provides valuable insight into the prevalence of conspiracy theories in Andalusia, highlighting the importance of continued research on how sociodemographic and media-related factors influence the spread of this type of misinformation. The findings offer a solid foundation for future comparative research and can contribute to the development of intervention strategies that address both misinformation and the processes of polarization it causes.

RC33-549.2PASTORA ESTEBANEZ, PABLO* (Universidad de Málaga, Spain)
TERUEL RODRÍGUEZ, LAURA (University of Málaga, Spain)
GARCIA-FAROLDI, LIVIA (University of Málaga, Spain)*Sentiment Analysis of the Spanish Press on X: The Case of the Gaza Conflict.*

In October 2023, the conflict between Israel and Palestine entered a new phase of violence with unpredictable consequences for the Middle East, raising global concern over the unfolding events. From a Social Sciences perspective, analyzing public opinion on this issue is a highly relevant subject of study, requiring a combined and multidisciplinary methodological approach to fully understand its complexity. Natural Language Processing (NLP), particularly sentiment analysis, provides technological tools to study large volumes of data. The goal of this proposal is to investigate the debate and sentiments generated around the conflict through social media platforms. Journalism is considered a key actor in shaping the public agenda regarding this international event. The ten most read Spanish newspapers during key dates — from October 7, 2023 (Hamas attack) to November 24 of the same year (ceasefire) — were selected, and using the web scraping tool TweetScraperR, the timeline of these media outlets regarding the conflict, as well as the comments generated by their content, were gathered. Through NLP, the sentiments that provoked the strongest audience reactions are inferred. Additionally, semantic networks are presented to identify the most relevant themes and hashtags. The hypothesis is that tweets with higher emotional content generate greater public interaction. These findings invite reflection on the importance of using new analytical techniques to study political communication in the digital public sphere, particularly regarding affective polarization processes.

Privileged Pathways: The Academic Elite in Europe

While the impact of social class background on academic career trajectories is widely acknowledged, direct research into class-based inequalities within academia remains sparse (see e.g. Hurst et al. 2023; Roscigno et al. 2023). In the U.S., not only do a small number of elite universities disproportionately supply the majority of academic faculty (Wapman, 2022), but faculty at prestigious institutions are also 54% more likely to come from PhD-holding families, signaling a troubling concentration of privilege (Morgan, 2022). This imbalance underscores a broader issue: academia, particularly at its upper echelons, continues to favour those from socioeconomically advantaged backgrounds. Similar concerns have been raised in the UK, where calls for systematic data on the social class backgrounds of academics have intensified (Wakeling, 2023). Yet, patterns of academic inequality across continental Europe remain underexplored. This paper examines the social and institutional backgrounds of recipients of a prestigious EU fellowship, often seen as a gateway to elite academic positions in Europe. Drawing on survey data from approximately 5,500 alumni across more than 30 countries, the study traces the career trajectories of fellowship awardees within the European academic workforce. The findings reveal a concentration of privilege similar to that in the U.S., though with notable cross-country variations. The reproduction of academic privilege is lowest in Southern Europe (e.g., Italy, Spain, Greece, Portugal), where around 10% of academics' fathers hold a PhD. In contrast, in countries like Germany, Austria, and Switzerland, the figure is around 25% or above. PhD-holders originating from Central-Eastern Europe and post-Soviet countries—often overlooked in academic inequality discussions—display even higher rates of privilege, with Slovakia leading at 43%, followed by Hungary and Russia at 28%. These figures underscore the entrenched inequalities faced by scholars from these regions in accessing prestigious fellowships and, consequently, elite academic positions in Europe.

SELLO, MATSHIDISO (Centre for Social Development in Africa, University of Johannesburg, South Africa)

Enhancing Child Wellbeing Outcomes through Communities of Practice for Social Systems Strengthening

South Africa has significantly expanded social protection, in the form of cash transfers, to the majority of eligible children, mainly through the Child Support Grant (CSG). Alongside this cash transfer children can access free healthcare, education and a national school nutrition programme. Despite these significant investments into reducing child poverty many children still face poor wellbeing outcomes including stunting (which still stands at 25%), food insecurity, and poor education outcomes.

Established in 2020, the Community of Practice (CoP) is an applied research initiative focused on enhancing children's wellbeing by bolstering social support systems around them. Grounded in extant research that underscores early childhood as a period of heightened responsiveness to interventions, the CoP leverages a multisystemic framework that integrates

health, education, mental health, and welfare sectors. With a specific focus on children in their foundational years of schooling (Grade R, Grade 1, 2 and 3).

Over a period of three years (2020-2022), data was gathered from a cohort of children across five schools in Johannesburg. The data served two purposes: a) to enable the school-based CoPs to implement tailored interventions addressing the needs of individual children, caregivers and families to enhance their wellbeing; and b) to track whether shifts in child wellbeing could be observed over time. Drawing on comparative analysis of a matched sample of 123 children, we demonstrate shifts in caregiver depression, food security, and health outcomes.

The study demonstrates how models of complementing cash with comprehensive welfare support provides opportunities to enhance wellbeing outcomes for vulnerable children. These insights provide important insights in the emerging cash plus field of study, and points to the importance of social service professionals.

RC19-JS-53.2

PATEL, LEILA* (Centre for Social Development in Africa, University of Johannesburg, South Africa)

Social Development, Electoral Politics and Welfare State Expansion: A South African Case Study

The literature suggests that the expansion of welfare policies, notably cash transfers in development contexts, is associated with the expansion of welfare states in the Global South. This is a pertinent question to consider as an unprecedented number of countries have held national general elections in 2024. In this lecture, I examine this proposition with reference to survey data from South Africa, a country that held a general election in 2024. It is also a constitutional democracy; it has a strong commitment to social rights and a fairly developed welfare system. Using data from five representative national cross-sectional surveys (2017-2024), findings are presented of what influences voter preferences. A range of factors are tested in a statistical model to identify predictors of voter choice such as socio-economic wellbeing (e.g. (un)employment; access to basic services; receipt of a cash transfer; governance, corruption, party loyalty, party leadership and specific demographic factors (age, gender and geographic location). Findings suggest that although indicators of socio-economic wellbeing are the four top reasons for choosing a political party, other factors matter more as predictors of party choice. I conclude that multiple and intersecting factors are important in voter choice. It appears that the relationship between social development policies and welfare state expansion in the Global South is not linear. A more nuanced understanding is needed that is shaped by specific country conditions.

Touch and the Emotions from a More-Than-Human Perspective: Discoveries in Frogs, Cats, Primates, ... and Humans

Pioneering neurophysiological experiments on frogs and cats from the 1920s in Cambridge and then Stockholm found unusual nerve fibres that responded to tickle, temperature, touch and pain. But these nerves acted differently, and much more slowly, than other sensory nerves in these animals. A new class of nerve fibres known as C Tactile (or CT) had been discovered, and opened up what seemed to be a distinct new pathway for touch which responded to slow contact at body temperature. Further experiments found them in other mammals, including primates. But it wasn't until the 1990s that their presence was confirmed in humans. Why was this? Since that time a slow revolution has been underway in the way we think about 'slow' or affective touch and its relationship to stress, bonding behaviours, and hormone release in mammals, and some neuroscientists offer a 'social touch' hypothesis. Come find out more about the world of touch and the emotions that we share across species, and get a free hug voucher.

PATERSON, MARK* (University of Pittsburgh, USA)

'More-Than' Human Senses and Sensations in a Time of Climate Change

The classic 1934 essay 'A stroll through the worlds of animals and men' by Jakob Von Uexküll remains fresh and is continually in print. Why do we return to it? First, it opens out the consideration of the senses beyond our anthropocentric limitations. The perceptual world of other species, based on different arrangements of senses, is endlessly fascinating. Second, it reveals not just the perceptual differences, but what is shared between humans and nonhumans, that is, 'interanimality'. As Merleau-Ponty remarks: "We study the human through its body in order to see it emerge as different from the animal, not by the addition of reason, but rather, in the *ineinander* (intertwining) with the animal ..." (2003, 214). What happens if we consider a larger ecology of sensing beyond the individual human subject, then, one which accommodates both human and nonhuman perceptual worlds? This is also what cultural geographers, anthropologists, and others consider a "more-than human world", and what Donna Haraway (2007) conceives as "multispecies entanglements". Meanwhile, there are intriguing artistic experiments that seek to escape the replication of human sensing through digital technologies, looking to nonhuman bodies and experiences for inspiration. Are such experiments a productive strategy for grasping the effects of climate change on nonhuman species?

Challenges of Alternative Food Initiatives in India: A Case of Community Supported Agriculture Confarm, Telangana

Alternative food initiatives have been studied in diverse regional contexts and their impact on the local food system. The discussion on alternative food initiatives is largely dominated by contributions from American and European contexts where the dominant capitalistic mode of production and consumption is challenged. However, reflecting on the intricacies of the Global South context like India, and the understanding of alternative food initiatives connotation towards creating an alternate impact on the food system is limited. Though India has been a champion of food sovereignty movement, translating the movement into alternative food initiatives have been limited in the Indian context. This study investigates a particular case of community supported agriculture, 'ConFarm', based in Telangana, to understand the functioning of community supported agriculture and challenges faced by the initiative. Structured and semi-structured interview schedules were used for the study. The key respondents of the study were the farmers and consumers who are associated with the network and the Deccan Development Society staff members under which the network operates. The study concluded that the main idea behind the network was to bring a 'producer-consumer partnership' supporting the organic and dryland farmers. This partnership is a transactional relationship and a fundamental aspect of the initiative's success, fostering trust and understanding between producers and consumers. The network has revived a relationship between producers and consumers based on trust and understanding however, during the pandemic there was a decrease in the operations of the network due to lockdown restrictions on transportation resulting in a sharp decline in the number of consumers and a decrease in orders. ConFarm still needs to work on maintaining the consumer base due to lower shelf life, lack of immediate access to the products, lack of staff to manage the network efficiently, and poor packaging of the products.

PATRA, ANKITA* (ICFAI UNIVERSITY, TRIPURA, India)

Divine Retribution & Justice in Anthropocene: A Study on the Iskon's Religious Subjects in Hinduism.

Extant scholarship on Hinduism and ecology states that Hinduism is intertwined with ecology. But the notion that Divine retribution as flood, cloud burst and pandemics is justice in popular Hinduism remains under researched. This paper is informed and is inspired by the forms of alternative modernity which refrains from the ills of modernity and discusses the nature of modernity in which new religious movements are social reality. The paper examines the efforts made by the ISKCON, an internationally acclaimed religious movement. Despite being labeled as 'not authentic' form of Vaishnavism, ISKCON is gaining prominence as the religious movement in India also. The author looks beyond the debates of the suitability of concepts and categories to label the ISKCON as sect or a movement in sociology of

religion. Rather, the paper discusses the religious subjectivity that is formed through the corporeal, kinesthetic, didactic ways of learning and unlearning. The followers undergo transformation in order to lead a life which is more adaptive to nature and restores the world. The paper blends Karen Barad's 'agential realism' and Saba Mahmood's rendition of Foucaultian 'technology of self' to explain the rationale behind the strict lifestyle which the ISKCON followers adapt to lead a life to lessen the consequences of divine retribution. Ethnographically, the study has taken place in Bhubaneswar, a South Asian city in the modern democratic India. The frameworks adopted above focuses on the intricacies, complexities and challenges of the religious subjecthood in the contemporary times of anthropocene era. This paper will benefit the students of sociology of religion, urban modernity food studies and social movements

The Tactical Displacements of the Rip-Off: An Analysis of Cocaine Exportation through Brazilian Ports

Research in cocaine destination ports, particularly in Europe, has identified the rip-off as one of the prevailing modalities of drug importation, in which illegal goods are hidden in containers with legal merchandise from exporters and importers not involved in the trafficking scheme. This article addresses the rip-off in origin ports in Latin America, qualitatively analyzing the tactical displacements of this modality in exportation. Based on fieldwork in the Brazilian ports of Santos and Paranaguá, we compare international typologies with local analyses, from which we distinguish the rip-off into classic, contemporary, and fake. We indicate that the displacements of this modality blur its typological definitions and illustrate the complexity of organized crime as an activity.

Subverting Precarity: Youth Tactics for Overcoming Barriers to Political Engagement

Most studies of political sociology show that socioeconomic precariousness leads to lower rates of political participation (Verba et al., 1995; Schlozman et al., 2012), also among younger people (García-Albacete et al., 2015; García-Albacete and Lorente, 2019). In this paper, we study the other side of the coin: how young citizens who suffer from precarious socioeconomic situations develop strategies that surmount -at least in part- their difficulties to have an active role. Departing from the inductive analysis of twenty-eight interviews with Spanish young activists, we open the black box of the concept of biographical availability (McAdam, 1986), to show how different approaches are developed at the individual and collective level, and across symbolic and relational dimensions. Four main strategies are identified: a) the personal conciliation model; b) the professional realization option; c) the mutual help scheme; and d) the symbolic recognition process. Furthermore, the conditions and contexts where the various arrangements appear are examined. In this respect, we argue that organizations both in terms of functioning, as well as in their very content, continue to play a crucial role in stimulating the inclusion of people with less access to politics.

International Students in Turkey: Consumers of Turkish Higher Education, Important Actors of "Soft Power" or Unwanted Future Migrants?

Turkey offers an interesting case for discussing the mobility of international students since the country with international university students now numbering over 300,000, is the eighth most popular destination for international students globally and a leading destination in the Global South. This paper discusses how international students are perceived in the public opinion in Turkey and how this relates to global and local issues. Firstly, international higher education is promoted domestically as an increasingly lucrative Turkish export in the global knowledge economy, with international students presented as consumers of Turkish higher education and competition between universities to attract those students. Secondly, international students are also presented as potentially important actors in the expansion of Turkish soft power in Africa, Central Asia, and the Arab world. This phenomenon is exemplified by the creation of the state-run Türkiye Scholarships Program (*Türkiye Bursları*) in 2012—a program that reportedly received 117,000 applications from 162 countries in 2023 and which now awards 5,000 undergraduate and graduate scholarships to international students annually. Thirdly, in the context of larger social controversy about foreign migration to Turkey (a country hosting the largest refugee population in the world, international students also become the targets of anti-migrant rhetoric. The paper argues that it is important to introduce migration-mobility nexus in the analysis since competing frames of "mobility" and "migration" similarly influence how universities, state institutions, and mass media understand and describe the situation of international students studying in Turkey.

Intersections of Inequality for People with Disabilities: Visibility and Programs to Close Gaps in Rural Municipalities of Guatemala

Based on a registry created with municipal staff and community authorities, a process was developed to identify people with disabilities in 29 communities in the municipality of Camotán, Chiquimula, Guatemala. This exploration investigates the barriers these individuals face and the effects of their inclusion in various social programs, revealing the complexity of their challenges. Identified barriers include limited access to healthcare, education, and rehabilitation services, as well as social stigmas that perpetuate exclusion.

The study evaluates how these gaps impact the quality of life for people with disabilities, highlighting the intersectionality of factors such as gender, socioeconomic status, and ethnicity. Notably, it compares the types of barriers encountered in urban versus rural settings, demonstrating that rural individuals often face more significant obstacles due to geographical isolation and fewer resources. Additionally, ethnic differences reveal that Indigenous individuals experience compounded disadvantages, facing both disability-related challenges and cultural barriers.

Despite existing public policies recognizing the need for inclusion, many lack a comprehensive approach that addresses the specific realities of this diverse population. This research aims to increase visibility for the needs of people with disabilities and propose effective programs to close these gaps. By focusing on the intersectionality of inequalities, we provide insights into how multiple identities influence the experiences of individuals with disabilities. The findings contribute to a deeper understanding of disparities in well-being and offer a framework for implementing more equitable interventions in rural contexts, ultimately fostering a more inclusive society for all.

PATTERSON, KENNEDY* (Northwestern University, USA)

The (In)Visibility of Unhoused Deaths: Tracing the Racialization and Gendering of Unhoused Deaths in Seattle, Washington, USA (2019-2023)

The tension between imagined realities of blackness (Hinton, 2016) and fabricated truths of poverty has historically mobilized discourse that dangerously misrepresents and normalizes the positioning of Black impoverished women in various states of vulnerability. Such racialized and gendered discourses become embodied by society, perpetuated within institutions, and manifested through policy- totalizing some realities of Black women. These falsehoods generate vicious cycles of social

disparities, making the unhoused black community, particularly, unhoused black women, disproportionately vulnerable to experiencing death. Understanding the life-threatening implications eugenic-informed ideologies of poverty and blackness hold, motivates my aim of uncovering the health implications inherent in unhoused experiences among Black women in Seattle, Washington, USA. By interrogating the relationship between the "undeserving" poor and the "undeserving" victim, I trace the embodiment of violence (Fuentes, 2017) inherent in the experiences of homelessness. First, conducting discourse analysis between both The City of Seattle's policies and public police records regarding the proliferation of homelessness, I reveal patterns of criminalizing narratives sought to disproportionately surveil and police unhoused Black women. And secondly, I analyzed, *The Women's Housing Equality and Enhancement League's*, death data of the unhoused, in Seattle, Washington (2019-2023). Creating an interactive Rstudio dashboard, I mapped existing health disparities, highlighted impacted communities, and identified not only areas where social inequities are most concentrated, but signified points of intervention with the most potential to "mitigate, resist and undo" (Geronimus, 1994) social inequities experienced by the unhoused. Preliminary findings suggest: (1) hyper-visibility of unhoused deaths illustrates how the "undeserving" poor become the "undeserving" victim; (2) rise of the carceral state reshapes public property as a site of city-ordained violence; and (3) black unhoused women who are victims of homicide disproportionately experience brutal deaths. Significantly, these findings draw visibility to communities often deemed disposable, holding the potential to ignite policy that decriminalizes poverty.

PATTINASARANY, INDERA* (Universitas Indonesia, Indonesia)

Food Insecurity and Social Class Disparities in Indonesia's Anthropocene Era

This study addresses social class inequalities in food insecurity in Indonesia during the Anthropocene. The study explores the relationship between social class, environmental degradation, and food insecurity, emphasizing lower-income households' compounded vulnerabilities in ecologically challenged regions. Given the significance of food insecurity in Indonesian welfare policy, the study aims to contribute to discussions on poverty alleviation and improving citizen well-being.

The research examines variations in food insecurity across different social classes and regions, focusing on environmental factors exacerbated by human activity. It hypothesizes that lower-income households experience higher levels of food insecurity due to limited resources, especially in regions with severe environmental degradation. Poor air and water quality, alongside degraded land, are expected to disproportionately affect food security among these households. This reflects the compounded vulnerabilities, which refer to the multiple factors such as income, employment status, and environmental conditions that contribute to food insecurity in the Anthropocene.

The study utilizes data from the National Socio-Economic Survey (SUSENAS) collected from 2019 to 2023, which involves approximately 1.5 million households. The study also applies the Food Insecurity Experience Scale (FIES), a reliable tool that assesses the severity of food insecurity by capturing individuals' direct experiences with food access challenges. Social class is determined by household income and employment status, while environmental degradation is measured through indicators of air, water, and land quality.

By framing food insecurity as a key indicator of welfare and inequality, the research contributes to broader global discussions on equity and sustainability. The analytical approach, which includes descriptive statistics and multilevel logistic regression, is used to explore the relationship between social class, environmental quality, and food insecurity. While the theoretical contributions are modest, the study provides empirical insights to inform policy efforts to improve food access for vulnerable populations and contribute to global discussions on equity and sustainability.

The Impact of Climate Knowledge and Ideology on Present Versus Future-Oriented Climate Anxiety

Climate anxiety is now entrenched in many societies, though the predictors and motivations behind it vary. Many population majorities now accept climate science, and the serious reality of the threat it poses. However, it is not clear whether such future-oriented concerns are being drowned beneath everyday concerns over material prosperity, particularly in times of high unemployment, rising prices, and housing unaffordability. We use data from the 2022-23 Australian Social Attitudes Survey, a nationally representative dataset, to examine perceptions about the greatest social challenges Australia faces today and into the future (i.e. over the next 30 years), with a particular focus on climate change as the most serious threat. Analysis reveals the importance of political voting patterns (i.e. ideology) over other factors, with left-leaning Green party voters significantly more likely to name climate change as the greatest challenge both today and in future, while right-leaning National Party/Other voters are significantly less likely to do so. However, when looking at 'future switching' - i.e. those who see climate change as the most important future but *not* present challenge - demographic effects are as important as political ideology. Higher education positively predicts switching to climate change as the biggest challenge, while experiencing financial hardship negatively predicts it, regardless of political ideology. This suggests that while political ideology may drive anxiety (or lack thereof) over climate change today, an informed self-interest (i.e. based on educated, material prosperity) may be starting to drive greater recognition of the danger climate change poses into the future.

Applied Sociology: Bringing Theory into Practice and Practice into Theory I

Sociology is at core a science of the social. From the earliest formation of the discipline, sociologists have sought to make sense of complex social realities and to find solutions to injustices, problems, and inequities encountered in the worlds that they study. Ours is therefore a practical academic pursuit, one that creates new knowledge in the pursuit of better ways of living together in ever more complex societies.

Yet there remains a tendency both within and beyond the discipline to understand applied sociology or social 'practice' as inherently outcomes oriented and lacking theoretical rigour. At the same time, social theory is often imagined as esoteric and arcane, untethered from practical solutions to 'real world' problems.

This professional development session disputes both assumptions. Our presenters demonstrate the value of applied sociologies that draw on theoretical concepts to creatively address wicked problems, while also exploring the generative potential of engaged intersectoral research to generate new insights that enrich social theory.

This professional development session targets scholars who wish to bridge the gap between theoretical and applied sociology. Drawing on the rich and diverse experiences of our presenters, all scholars of migration and diversity, session participants will be invited to consider the application of sociology to various sectors and across multiple scales.

Professor Anju Mary Paul is well known for research on migrant domestic care labour that bridges the gap between scholarship and activism. Her recent development of a Global Care Policy Index (GCPI) illustrates how theory that is grounded in rich empirical and comparative data can be harnessed to serve policy analysis at local, national, or supranational scales. Her emphasis on freely and publicly sharing the GCPI data and scoring frameworks also ties back to her belief that researchers can accelerate social change for the better via open collaboration and conversation.

PAULSEN HANSEN, MAGNUS* (Roskilde University, Denmark)
 PULTZ, SABINA* (Roskilde University, Denmark)

(In)Dignity at the Margins

Distanced from urban growth centers and prosperous careers, a significant part of populations living in the Western hemisphere find themselves worse off than their parents' generation. These 'left-behinds' are often portrayed as a dangerous class tempted to vote for authoritarian leaders promising restoring dignity for them and the regions they live in. However, most often, this linkage between large-scale socioeconomic transformations and macro-political tendencies is assumed rather than explored. This paper, firstly, argues for why dignity is an important concept for understanding major macro currents in the Western world and how these unfold in people's everyday lives. It is related to transformations in labor markets and the economy. How do people find dignity in work when jobs are increasingly precarious, when some regions and industries prosper while others stagnate or decline? It is also related to major changes in how the state responds to these socioeconomic transformations where states have moved from welfare to workfare moving from ensuring citizens' dignity by sheltering them from the whims of the market and to providing people with dignity by reintegrating them into the market. Western states' responses are, however, not unchallenged. Populist movements, most effectively from the right, thrive by promising the restoration of dignity of the 'left-behinds'. Secondly, the paper outlines an approach to dignity as rooted in experiences where people's value and worth are put to the test. We take the subjective lived experiences as a starting point and take seriously how the social psychology of everyday life allows for a complex analysis of this inquiry. To do so, we draw on Thévenot's concept of engagement to show how people maintain different goods in their everyday lives. These goods vary from intimate and often tacit issues of feeling at ease and caring to more moral issues of status and worth.

 PAVEZ LOAYZA, ANDRÉS* (Pontificia Universidad Católica de Chile, Chile)

De La Crisis a La Creatividad: Reconversión y Recursividad Entre Pequeños Productores Agrícolas Del Valle De Aconcagua

El Valle de Aconcagua históricamente ha sido uno de los principales centros de producción agrícola en Chile, potenciado aún más con el desarrollo de agroindustrias transnacionales desde la década de los 80. En paralelo, pequeños productores agrícolas han debido sobrellevar no solo los efectos que conlleva la industrialización de su rubro, tales como el encarecimiento de productos agrícolas, la competitividad en los mercados, el endeudamiento y la venta forzada de terrenos hacia la agroindustria. También, más recientemente, han debido enfrentar la proliferación de diversas crisis relacionadas al clima: megasequías prolongadas, desastres ambientales, pérdida y cambios en el uso de suelo agrícola. Frente a este escenario los pequeños productores agrícolas han generado respuestas creativas resilientes, las cuales se basan tanto en experiencias históricas previas como en adaptaciones estratégicas contingentes ante la precariedad socioambiental a la que se ven expuestos.

En base a materiales empíricos recopilados en el Valle de Aconcagua, se propone explorar etnográficamente los conceptos de "reconversión" y "recursividad", abordándolos en un sentido amplio. Así, se pretende abordar no solo las prácticas creativas concretas generadas por pequeños productores frente a la crisis (por ejemplo, la diversificación hacia otros rubros como la ganadería o el turismo, el tratamiento de aguas grises o el uso de energía solar para abaratar costos), sino que también sus reformulaciones constantes al momento en que dichas prácticas no tienen los resultados esperados. En este sentido, esta ponencia busca subrayar el carácter procesual, frágil e incierto propio de la adaptación a la precariedad socioambiental.

Indigenous Data Rights As a Tool to Interrogate and Counter Algorithmic Bias

As Artificial Intelligence (AI) systems become increasingly pervasive, the risks of algorithmic bias, discrimination, and data exploitation continue to disproportionately affect Indigenous peoples. In addition to amplifying existing data harms, AI systems provide new ways to sort, profile, exclude, exploit, and discriminate. Further, the complexity, opacity, and proprietary nature of AI systems make it difficult to access crucial information to

understand the system and its decision making processes. Indigenous Data Sovereignty (IDSov) offers a framework to address these concerns by empowering Indigenous communities to assert control over their data and advocate for transparency and accountability in AI systems.

This presentation will explore how IDSov principles, such as the First Nations Principles of OCAP® (Ownership, Control, Access, and Possession), can be applied to interrogate AI systems, particularly in terms of transparency regarding the training sets used and the input data accessible to these systems. While it may be impossible to eliminate bias from AI entirely, the application of Indigenous data rights can play a crucial role in surfacing and mitigating its harmful effects. IDSov provides tools to challenge and improve the design and functioning of AI technologies for Indigenous users and data subjects. Similar to efforts in Explainable AI (XAI), which aims to make AI decision-making processes more transparent and understandable, Indigenous Data Sovereignty advocates for greater accountability in how AI systems are built and deployed. By asserting ownership and control over their data, Indigenous communities can demand insight into the data sources and algorithmic structures of AI systems, scrutinizing the extent to which they reflect or exacerbate existing inequities. Indigenous Data Sovereignty is not only a protective measure but a proactive tool for creating more just and inclusive AI systems.

Who May Give Birth to a Citizen? Reproductive Justice, Temporality and Family Immigration Regime

In this paper, I follow two temporalities taking part in border crossing family making. Firstly, bureaucratic time embedded in the family reunification procedure, and secondly, biographic time focusing on reproduction within mixed citizenship status families.

Emphasising key aspects of family making within a restrictive immigration regime, this paper explores the impact of intersecting temporalities in migratory paperwork and citizenship status on reproductive (in-)justice for mixed status families in Denmark. This study is based primarily on semi-structured interviews with pregnant women living in mixed citizenship status families (all self-identified as women), and extensive participant observations within a legal advisory service (2014-23). The conceptual framework is informed by feminist STS and critical migration studies

The conflicts and conflations between bureaucratic and biographic temporalities within Danish family reunification policies raise questions about the imaginary of the national population, as one member in the relationship may be privileged by their national citizenship status, and therefore already considered a part of the social fabric, and desirable national citizen to reproduce the nation-state, whereas the other is perceived as the migrant-other, often associated with the racist idea of 'hyper-fertility'. This paper argues anti-immigration family reunification policy can be viewed as a tool for states to exercise selective pronatalism through bureaucratic 'waiting time'. By following the temporal processes of migrantisation of mixed citizenship status families, this paper brings forth the question of reproductive (in-)justice and extends it to the question: Who may give birth to a 'Danish' citizen?

The Advancement of Knowledge amidst Exit, Voice and Silence Responses to Scientific Intimidation

The production of knowledge in the Anthropocene is limited by the range of matters that are researched, public discussion of the outcomes of that research, and perceptions of the relevance of expertise in the public understanding of that research. All of these can be influenced by the intimidation of scientists and the extent to which this leads to them changing their focus and diminishing or expanding their voice. This paper reports on a global study of over 2000 scientists, investigating the forms that intimidation of scientists took, the extent to which the sources of intimidation were internal or external to the organisation, the perceived motivations for intimidations, the effects on scientific inquiry, voice, silence and exit, and the factors that shaped those responses. It also reports on analysis of participants' perceptions of the concept of 'expertise'. Amongst other findings, personal harassment was gendered, but other forms of intimidation did not appear to be strongly so. Intimidation often saw scientists exiting their research field, their job or the sector, and reducing the frequency with which they would

speak about their research. Yet for many the effect was the reverse, and so the overall proportion who spoke *more* about their research after the most serious incident, 20%, was almost as high as the proportion who spoke about it *less*, 23%. Two factors appeared to be critical in determining whether scientists spoke more, or less, about their research after the incident. One was the impact the incident had on self-confidence. The other was the role of organisational senior management in supporting the target or promoting a supportive culture of independent research. We also show how the effects of intimidation are not just individualised; they can actually damage the dissemination of information that would benefit society as a whole.

WG10-930.2

PEETZ, THORSTEN* (University of Bamberg, Germany)

Platform Membership and Digital Society

Sociological accounts of the digital society highlight the role of networks, data, and algorithms. While all these aspects of digitalization are important, I argue that they miss a crucial development in the digital transformation of society: the generalization of membership through platforms. Of course, platform organizations are harvesting user data for profit and are thus contributing to datafication and digital surveillance. But they also provide the infrastructure for digital social spaces for action. Within these spaces, users are not meeting as free and unconstrained actors whose interactions are developing the fundamental rules of digital conduct. They are meeting as members whose interactions are coordinated by the platforms.

By becoming a platform user, people acknowledge the terms of services and community guidelines of platforms. Terms and guidelines are specifying the rules for conduct whose observance is subject to peer control and content moderation. Breaking the rules may be sanctioned by restricting the distribution of user content – either by simply deleting it or through shadow banning – or by excluding the user from the platform. Platforms are thus textbook examples for using membership (as conceptualized by Barnard, Simon or Luhmann) as a coordination device.

The contribution discusses digital membership in platforms. It reconstructs the nature of digital membership by comparing membership in platforms with analog forms of membership in organizations, groups, and families. In addition, it investigates into the consequences of digital membership for society at large. By generalizing membership through platforms that are operating on a global scale, digitalization might contribute to the development of a world "society of organizations" (Perrow).

PEETZ, THORSTEN* (University of Bamberg, Germany)

The Shadow of Competition in Digital Human Mating

Discourses on contemporary intimate life are rife with "competition". In public as well as academic contexts, thinking about intimate life is taking the notion for granted that when people are mating, the social structure as well as the practices that people engage in when mating are "competitive". This is true, for example, for evolutionary psychology that argues that biological characteristics of people explain their value in dating ecologies and shape individual preferences of humans vying for reproductive chances (Buss). In the social sciences, the sexual fields approach (Green) translates Pierre Bourdieu's notion of social fields for studying intimate life. It also imports Bourdieu's conviction that social dynamics are characterized by differences in value and actors striving for status within social fields. Recent contributions to the sociological discourse on intimacy argue that the history of intimate life is characterized by increasing levels of choice and market like competitive dynamics (Illouz).

Taking competition for granted, however, is not an option for scientific analyses of social phenomena. I use concepts of competition from organization theory (Arora-Jonsson/Brunsson/Hasse) and sociological theory (Simmel) to analyze intimate life, in particular digital intimate mating on dating apps. The analyses show that, even though it is tempting to argue that online dating results in a "competitization" (Wolffmayr) of human mating, attending to empirical detail suggests that this is just a "shadow of competition: having the same outward appearance, but lacking its content" (Simmel). As dating apps organize the mating process, they systematically obstruct observations among competitors as well as regarding "third parties" (Simmel). Therefore, daters are unable to orient their behavior based on these observations. In digital dating, competition is a myth from which actual dating practice is decoupled. The contribution will show how platform organizations contribute to the digitalization of intimate life and discuss its consequences.

*External Engagement of Academics in the Baltic Sea Region:
 Partners Involved and Importance for Teaching*

Higher education institutions (HEIs) are expected to combine their core missions – teaching and research – with external engagement to foster social innovation (Bellandi, Donati & Cataneo, 2021). Yet, studies on external engagement have mostly focused on research commercialization and have largely ignored teaching-related engagement. Further, cross-national comparisons of academic engagement are rare. Thus, to understand the link between external engagement and teaching, we ask the following:

- Which collaboration partners are involved in the external activities of academics?
- How important are these external activities for teaching?

We focus on five countries bordering the Baltic Sea, Estonia, Finland, Germany, Lithuania, and Sweden, which constitute diverse cases (Seawright & Gerring, 2008). We draw on data from the representative survey of the Academic Profession in Knowledge-Based Society (APIKS) project (N=12.318) from 2017.

The findings show that while external activities are widespread across HEIs in the Baltic Sea region, their importance for teaching varies significantly by country. Finland demonstrates the highest levels of collaboration with partners outside the labor market, but academics place less emphasis on external activities in teaching. Contrary to this, academics in Estonia and Lithuania indicate that external activities are not only widespread but also important for teaching. Academics in Germany report overall moderate levels.

The study concludes by showing that external engagement in teaching varies across the Baltic Sea Region. Thus, national contexts shape how academics integrate external activities into their teaching, with implications for the role of HEIs in fostering social innovation.

*Mapping Community Vulnerability and Resilience: Insights from
 Participatory Risk Assessment*

In crisis management processes, the importance of the safety and resilience of communities is increasingly emphasized. The resilience of local communities is determined both by elements of spatial vulnerability related to physical location and by socio-psychological factors. Therefore, in order to strengthen the capacity of responding to crises, it is important to understand the distribution of different risks and the subjective perception of the local population about the threats specific to their residential area. For this purpose, the study 'Socio-spatial determinants of societal vulnerability and resilience to crises and strengthening the crisis response potential of communities (SERENITY)' is being conducted in two local communities in Lithuania, located in different geographical areas of complex risks. The research employs the method of participatory mapping, during which participants work with a map representing their geographical area. This method allows for a thorough examination of the local context, environmental nuances, and the knowledge and experience of local residents. During the oral presentation, the results of the research on the communities' spatial perception of risks, the level of vulnerability and the barriers to responding to potential crises will be presented.

Sociology and Veganism: A Systematic Literature Review

Veganism is a complex and multidimensional phenomenon. In addition to being viewed as a dietary choice, it is also studied in various disciplines as a cultural movement, lifestyle, or even as a climate change adaptation and mitigation strategy. Due to its complexity, there is a growing interest in studying veganism through sociological lenses, especially in the environmental sociology field. However, the expansion of the academic literature on veganism is quite sporadic. There is a lack of systemic analysis of sociological contribution to vegan studies. Such an analysis is crucial not only to outline directions and guidelines for further research but also to establish a greater use of sociological knowledge.

The aim of this research is to provide a systematic overview of the current sociological literature on veganism. This analysis follows the PRISMA systematic literature review protocol and includes academic articles published in English between 2000 and 2022. The study has been organized around 3 main research questions to reveal the scope and intensity of sociological research on veganism, its methodological aspects, and the conceptualization of veganism. The results suggest an emerging discourse of veganism as a lifestyle movement and the orientation of studies toward qualitative research. A variety of veganism concepts used in the sociological literature indicate the potential of different strands of research.

*Police Accountability in Times of Right-Wing Rise: Analyzing
 Narratives and Strategies of Defense and Resistance to Police
 Brutality in Brazil*

The aim of this presentation is to share the initial findings from our research on external mechanisms of police accountability in Brazil. Given Brazil's status as the country with one of the highest incidence of police brutality globally, our research illuminates the relationship between three state entities – the Military Police, the Public Prosecutor's Office, and the Public Defender's Office – and how their differing views influence their duties. We focus on two recent police operations on the Brazilian coast, "Operation Shield" and "Operation Summer," to analyze the actions of agents involved in investigating deaths resulting from these police interventions. Through a qualitative analysis of police reports and judicial documents, as well as interviews with public agents, we have reached several key conclusions. Firstly, our research highlights a significant tug-of-war between democratic and anti-democratic positions within these agents. This conflict began during Brazil's re-democratization process and persists today with evolving dynamics. Secondly, we observed that this dispute is reflected in the production of official documents. These documents often reveal underlying tensions and differing perspectives on accountability, as well as how different agents understand the role of public institutions in a democratic state. Lastly, our findings suggest that police and judicial practices can contribute to the dismantling of democracy when agents are influenced by anti-democratic ideologies. It is no coincidence that interest in police accountability has increased alongside the global rise of the right-wing, which has also escalated levels of police violence in Brazil. However, this does not occur in isolation; it depends on a lack of resistance from the entire group of public agencies. Our study has shown that such resistance is often present, particularly among public prosecutors and public defenders.

Gender Fluidity Versus Homophobia: How Young Chinese Male Fans Consume Athletic Romance

The de-pathologisation of non-heteronormative sexual orientations has transformed depictions of male bonding into a popular theme in global media production. This trend is also evident in China's orthodox sports fandom which shows growing visibility of non-heteronormative representations of romances among male fans. Against the rising popularity of queer media content in Chinese society, the reception of alternative narratives of athletic romances amongst male fans, which highlights the negotiation between the diversification of gender identities and the revitalisation of patriarchal doctrines, warrants academic investigation but remains underexplored in Chinese sports fandom studies. This article conducts a feminist investigation of how young Chinese male fans interpret and engage with mediated athletic romances, drawing from interviews with university students who follow sports games closely. The research uncovers complex dynamics wherein these fans simultaneously embrace and delegitimise the homoerotic aspects of mediated athletic romances as they navigate their sports consumption. This phenomenon reflects the multifaceted experiences of young men in present-day China, where the market and the party-state co-create a tapestry of overlapping, yet conflicting gender expectations. The findings illuminate the intricate relations between consumer culture driven by global capitalism and nationalist politics crafted in China, as well as their manifestations within the realm of sports fandom.

Rethinking Migrant Workers: Mismatch between Supply and Demand with a Focus on Care Workers.

The recent years have seen the combination of irrepressible population ageing and changes in family and gender structures in many high- and medium-income countries resulting in labour shortages in critical economic sectors such as social and healthcare, construction and manufacturing, leading to heightened dependence on migrant workers to address labour shortages, and increased global labour migration. According to the International Labour Organization, the stock of international migrant workers totalled 169 million in 2019, up by 19 million or 12.7% from 2013. While this may simply confirm the reality of our existing global economy, it is important to take a moment to consider two key issues: 1) what are the drivers of the global labour migration and how do they interact with government policies and institutional architectures to create, manage and regulate work and movement of workers across countries and regions?; and 2) do we see policy innovations and experimentations that are taking place to address labour shortages and labour migration, and how effective are they?

This paper examines global labour migration infrastructure, focusing in particular the supply and demand of migrant care workers. Using the concept of global labour migration infrastructure, I discuss factors that are driving the increased global demand for and the supply of these migrant workers, assess the state supply and demand mismatch, and offer examples of countries that are trying to address these issues through policy reforms. I then discuss the effectiveness of these policies in addressing labour shortages, and offers some suggestions for moving forward.

Structural Inequalities at the Intersection of Neoliberalism and Gender: Reinterpreting the Concepts of Freedom and Equality.

The study explores the intersections of neoliberalism, gender, and the communication strategies of radical right-wing populist forces, with a particular focus on the re-signification of the concepts of freedom, equality, and inclusion (Bobbio, 1994; Foucault, 2004). Building on the concept of *habitus* (Bourdieu, 1998), it explores how cultural and social dispositions shape the perception of freedom within a neoliberal framework that redefines this concept through market logics. This approach promotes an individualism centered on independence and competition, often neglecting structural inequalities. The study employs the notion of *performativity* (Butler, 2006) to interpret the role of gender and identity in populist narratives, which exploit national, ethnic, and religious identities to reinforce an exclusionary notion of the "people." The analysis will focus on significant national events and their media coverage, with special attention to audience engagement and digital publics. Using qualitative analysis software (Nvivo – Content Analysis), the proposed study will examine right-wing populist movements and related political and cultural groups. Additionally, it investigates how neoliberal *diversity management* – ostensibly aimed at promoting inclusion for economic gains—may, in fact, contribute to the normalization of gender and social inequalities rather than reducing them.

Questioning Oers Contribution to a More Quality, Inclusive and Just Education through the Lens of the Social Justice Perspective

As acknowledged by UNESCO (2023) and by the Cape Town Declaration, education is an inalienable human right. Being the place where knowledge is built and transmitted, where we connect to the others and to the world, education is the heart of every possible transformation, at both individual and social level (Bertoni Jovine 1964; Bell Hooks 1994, Pennacchiotti, Tudisca, Valente 2022; Carol V. 2018, Roberts-Crews 2024). Open Educational Resources (OER), routed on openness, may have a great potential in supporting an accessible, inclusive and quality education. But, is it accessibility a sufficient requirement to guarantee the capability of OER to contribute in making education more inclusive and of quality? One of the most powerful arguments in that sense, is that OER, garnering cost saving, can improve access to quality educational materials for students and educators in comparably poorer contexts. However, as evidenced by Hodgkinson-Williams (2018), several studies, mainly from the Global South (Disha, Vollman 2023; de Rosa, Robinson 2017, Craft, Brown 2024) suggest that these costs savings are not necessarily accompanied by real changes/improvements if they are not supported by a critical approach and actions aimed at overcoming status subordinations, changing power dynamics and acknowledging everyone the right to be heard and accorded a voice. Based on these reflections, we question the potentiality of OER to a more quality, inclusive, accessible education, exploring, as a case study, the European Project Open Learning for All (OLA), through the lens of Nancy Fraser and Iris Young's Social Justice perspectives. By analyzing OLA OER through a mixed method approach and content analysis technique, a set of indicators is developed to measure to what extent an OER meets the 3 dimensions of social justice (redistribution, recognition, representation) and to identify at what level ("neutral", "affirmative" or "transformative").

PERA, MARINA* (Universitat Oberta de Catalunya, Spain)

The Resilience of Democratic Innovations to Changes in Government

This paper examines the resilience of democratic innovations in the face of changing political will. Public-community collaboration is seen as an opportunity for enhancing citizen participation and fostering democratic innovation. The creation of spaces where organized citizens can collaboratively participate in the design and implementation of public policies that affect them represents a form of democratic innovation. This process involves the establishment of new mechanisms and institutions within public policy that contribute to "reimagining and deepening the role of citizens in governance processes, increasing opportunities for participation, deliberation, and influence" (Elstub and Escobar, 2019, p.11).

In this paper, we analyze the resilience of 'Patrimoni Ciutadà' program, approved by Barcelona City Council in 2016, which recognizes the capacity

of citizens to manage municipal facilities with the goal of fostering citizen participation and community empowerment. The implementation of this program enabled collaboration between the associations managing these facilities and the City Council departments overseeing 'Patrimoni Ciudadà' (Pera and Bussu, 2024). However, following the 2023 municipal elections, the Socialist Party of Catalonia (a center-left party) won the majority, deprioritizing the public-commons collaboration spaces that had been established. This paper explores the resilience and transformation of these spaces under the new political leadership.

The results indicate that, although these collaborative spaces have been marginalized with the new government, a social imaginary has been cultivated in which community organizations play an active role and have a voice in policy development. This empowerment of community organizations has led to demands for the reopening and continuation of these participatory spaces.

Pleasure, Awareness and Self-Knowledge: Contributions of Tantric Therapy to Sexual Health

Tantric therapy is an alternative health practice that integrates elements of Tantra, a philosophical and religious movement originating in India in the 4th century, with contemporary Western approaches, especially popularized by the counterculture movements of the 1960s and 1970s. Gynaecology, in turn, is the branch of medicine focused on the sexual health of women, intersex individuals, and transgender men. The marginalization of complementary and alternative medicines (CAM), such as tantric therapy, in comparison to hegemonic biomedical practices, raises questions about the power dynamics in knowledge production and in the relationships of care in sexual health. The aim of this study was to investigate how professionals in tantric therapy and gynaecology in Brazil contribute to sexual health. To achieve this, structured online questionnaires were sent out during the year 2020, resulting in the participation of 72 tantric therapists and 134 gynecologists. The majority of the participants were women, white, and heterosexual, with ages ranging from 26 to 67 years (median age of 41 years) for tantric therapists and from 25 to 75 years (median age of 45 years) for gynecologists. The results showed that gynecologists relate sexual health to sexual well-being, focusing on guidance and disease prevention. In contrast, tantric therapists understand sexual health primarily as experiencing pleasure and energy in the body, with an emphasis on body awareness, sexuality, and self-knowledge. The approach of gynecology may establish a heteronomous relationship, centered on disease prevention and treatment, while tantric therapy promotes autonomy by encouraging reflection on personal experiences and awareness. The findings highlight the contributions of tantric therapy and the relevance of an integrated care model that fosters synergy between disease prevention and the promotion of positive health components, such as the encouragement of pleasure, self-knowledge, and well-being.

Insights on Lived Religion from a Latin American Perspective

In recent years, a growing number of Latin American scholars have turned to the lived religion perspective to study religion across the continent. Through a literature review, this presentation will outline the background, key themes, and specific interests that have led Latin American scholars to adopt lived religion as a theoretical and methodological approach. Questions such as: What disciplinary fields and specific topics have been explored through the lens of lived religion? How does this perspective engage with other Latin American approaches to studying religion? What are the challenges of shaping a distinctively Latin American view of lived religion? These will be addressed in this work.

PEREIRA DA CUNHA, ALBINO* (ISCS, Portugal)
Mobilités Et Interactions Réelles Et Virtuelles : Jeunes Du Maghreb Et D'europe

Prendre les mobilités et les interactions comme des éléments générateurs de profonds changements devient un intéressant exercice théorique et pratique dans le monde dans lequel nous vivons et, en particulier, en ce

qui concerne les relations dites euroméditerranéennes, en même temps différentes et proches, que ce soit en termes économiques, politiques, sociaux, environnementaux, démographiques ou culturels. Pour appréhender ses relations dans toute leur complexité, il devient indispensable de regarder et d'étudier l'aire méditerranéenne dans le cadre de différentes logiques et interactions sociales, politiques, économiques et culturelles et qu'il faut savoir reconnaître, mettre en perspective et valoriser.

Ce que nous nous proposons de faire, compte tenu de notre champ d'intérêt de recherche sur les jeunes, l'éducation et l'interculturalité dans l'espace maghrébin et l'espace européen occidental méditerranéen, c'est de réfléchir sur l'impact que les mobilités, les circulations et les interactions (réelles et virtuelles) de (et entre) jeunes du Maghreb et de l'Europe, peuvent avoir dans la production de nouvelles altérités, d'innovations personnelles et sociétales et de nouvelles revendications politiques et culturelles.

Dans le contexte particulier de la Méditerranée Occidentale, la présence réciproque des peuples et des cultures des deux rives : passé, présent, futur implique une vision commune, intégrée, partagée, inclusive et durable. En récupérant la perspective dynamique et dialectique du « temps historique » de Fernand Braudel, perspective nécessairement présente dans toute recherche, puisqu'elle s'applique dans différents domaines: culturel, géographique, social, économique, politique, écologique et psychologique, entre autres, nous chercherons à montrer comment la valorisation et la connaissance d'un patrimoine culturel commun et la promotion du dialogue interculturel dans l'aire méditerranéenne, notamment à travers les nouvelles générations, et par des mécanismes de coopération et d'intégration à court, moyen et long, sont à travailler pour changer et faire évoluer les perceptions et les attitudes envers l'Autre et envers l'environnement commun.

PLAY As Activism: Collective Actions for Social Justice in the Anthropocene

Collective actions within educational systems can address complex drawbacks of social injustices related to epistemic, environmental and racial fields, especially in the context of global challenges exacerbated by the Anthropocene, a term proposed by scientists to describe a new geological era characterized by the profound influence of human activities. Education plays a critical role in shaping how societies confront the crises of our time. This presentation highlights the work of the "Researchers in Intercultural Actions" (R.I.A), an academic group fostering international collaborations to tackle educational inequities through intercultural practices and pedagogical collectiveness. R.I.A has been engaged in fostering tools to overcome challenges such as bullying, disconnected curricula, lack of collaboration and insufficient infrastructure. Besides promoting collective actions among educators and students, R.I.A's central approach is to reflect upon possibilities of reframing education as collaborative and intercultural practices that envisage critical analysis and transformative actions. R.I.A's initiatives are grounded in Vygotsky's theory of play, positioning it as a form of activism for social justice and transformation. One example is the response to the 2024 water catastrophe in Rio Grande do Sul, Brazil. R.I.A organized activities on the importance and dangers of rain at Brooklyn New School (BNS) in New York, USA, during an event called Ecorama, which featured interactive circuits focused on art, science, sustainability, and play, engaging teachers, students, families, and the community, representing the potential of collectiveness. This presentation aims to discuss the power of collaboration among Brazilian researchers, as well as teachers and students from BNS embedded in play activities developed within intercultural pedagogical actions regarding water-related issues resulting from environmental imbalance. As for the relation between environment and society, this study places education as a key site for confronting ecological crises, highlighting its contributions to planetary drawbacks and, theoretically, preparing communities for social and environmental future challenges.

PEREYRA, DIEGO* (Instituto de Investigaciones Gino Germani, Argentina)

Problemas y Desafíos Epistemológicos, Pedagógicos y Didácticos a La Hora De Enseñar La Historia De La Sociología En Perspectiva Latinoamericana.

En Argentina, pero también en otros países de América Latina, los diferentes seminarios (tanto de pre como de posgrado) que se orientan a reconstruir la historia de la sociología, desde la tradición clásica hasta el presente, se encuentran con una serie de desafíos intelectuales. En primer lugar, todo curso de este tipo está obligado a defender la existencia de la sociología latinoamericana como una perspectiva válida, legítima y autónoma de análisis sobre la realidad social. Al presentar los principales problemas ontológicos, epistemológicos y metodológicos implicados en toda explicación sociológica, los y las docentes no pueden escapar así a su propia situación regional. Por lo cual, deben lidiar todo el tiempo con la necesidad de lograr una superación o ruptura con el eurocentrismo. ¿Qué dimensiones de la teoría y la metodología sociológica son universales y cuáles locales? En segundo término, ese grupo de docentes debe concebir una serie de contenidos y actividades que permitan a sus estudiantes comprender cabalmente la reconstrucción de las prácticas de investigación sociológica, en perspectiva histórica y regional. De esta forma, esta ponencia sugiere que, al partir de una historia de las tradiciones sociológicas en combinación con perspectivas y herramientas de la sociología política, sociología de la educación y sociología de los intelectuales y las profesiones, se puede ofrecer una mirada comprensiva sobre la producción y el uso del conocimiento sociológico en América Latina. Por lo cual, se pregunta cuáles podrían ser algunas estrategias curriculares que posibiliten una contextualización de la producción sociológica a lo largo de diferentes procesos y períodos históricos y al mismo tiempo comprender los problemas de la sociología contemporánea en la región latinoamericana. También quiere proponer un debate sobre los principales conceptos, tradiciones y perspectivas que deben ser incluidos en estos cursos.

PEREYRA, DIEGO* (Instituto de Investigaciones Gino Germani, Argentina)

Sociological Methodology Questioned. Debates, Reforms and Continuities in the Teaching of Research Techniques in Sociology Courses in Argentina, between 1958 and 1983.

Between the late 1950s and early 1980s, one of the main conflicts over the meaning of sociology teaching in Argentina was the methodological issue. The differences between groups and perspectives had a clear epistemological basis, since they were based on different theoretical and methodological perspectives to analyse sociological objects. In addition, the crisis of the democratic project at that time, political radicalization and the emergence of the dictatorial government imposed a different teaching agenda. However, one may ask: Did teaching in the different methodology courses follow this linear path? What were the contents of the programs? How were the activities of the methodological subjects articulated with general training? When did the linguistic turn and the appearance of qualitative methodology appear and become consolidated in the courses? Who were the methodology teachers? This paper proposes a reconstruction of the teaching of sociology, through an analysis of the syllabus, activities and productions of the methodology courses that were taught in different Sociology Schools and departments in Argentina since its creation until the 1980s. A hypothesis that guides the work is the persistence of a curricular routine throughout the period, in which certain readings, contents and styles of methodological work did not undergo too many transformations, and only were some recommendations on the use of qualitative tools were lately introduced. In this way, no major changes occurred despite the reforms of the study plans and the renewal of teaching. Not even the emergence of strong criticism of empirical positivism absolutely questioned the imaginary of the scientific sociologist.

From Pests to Pets: Wild Boars Ambivalent Companions in Rural Uruguay

Multispecies and more-than-human approaches are key to broadening our understanding of interspecies relations in the Anthropocene. These

perspectives promote relational knowledge, showing how human and nonhuman worlds are intertwined through "encounters" (Lestel and Taylor, 2013). Accepting the contextual and paradoxical nature of human and animal categories requires us to understand how "empirical animality" emerges in shared spaces, bonds, and affects, co-produced and transformed into regimes of coexistence (Haraway, 2008; Ingold, 1992).

This paper, adopting a phenomenological approach and the idea of fluid, intersubjective animality, explores the relationships between humans and non-traditional pets, focusing on the wild boar in Uruguay. Although considered both a pest and an Invasive Alien Species, subject to eradication programs, wild boars are also raised as pets or companion animals in some rural households, where they participate in affectionate, care-based relationships despite their classification as pests.

Fieldwork conducted between 2023 and 2024 involved interviews and participant observation with farmers, hunters, veterinarians, and biologists who work with this species, some of whom have raised wild boars as pets. The findings present the wild boar as a potentially ambivalent pet, revealing the complex affective relationships established between humans and nonhumans. Key attributes, such as charisma, care, extensionism, and individualization, mediate these interactions. The wild boar case illustrates the ambivalence of how the same animal can embody different animalities, or how the same person can perceive the animal differently depending on the context. We propose that, as a pet, the wild boar blurs the boundaries between the wild and the domesticated, becoming part of multispecies kinship and family dynamics based on reciprocity and affection. This, in turn, highlights the complexity and ambivalence of human-nonhuman relationships and the richness of multispecies assemblages in the Anthropocene.

PÉREZ, MIGUEL* (Diego Portales University, Chile)

Pobladores' Right to Dignity: The Resurgence of Housing Struggles in Neoliberal Chile

Over the past fifteen years, poor urban residents (*pobladores*) in Santiago, Chile have strongly mobilized against neoliberal housing policies, which have promoted the segregation of low-income families in the peripheries. The resurgence of social protests around housing is closely related to novel demands for the right to *la vida digna* (a life with dignity) Based on seventeen months of ethnographic fieldwork, in this presentation I show *pobladores'* right to a life with dignity, a claim based on a moral category, allows housing activists to both ethically signify their everyday experiences with vulnerability and reshape the strategic orientations of their movements. To do so, I critically engage with contemporary anthropological debates on ethics and morality, which have been concerned with ethnographic analysis of the ways that practices of self-fashioning and self-subjection turn individuals into ethical subjects. Although these approaches examine how vulnerable populations' search for dignity results in ethical practices performed mainly in the private or domestic sphere, I hold that the quest for dignity also gives rise to political demands that are expressed in public. In this way, I maintain that moral concepts such as dignity, while allowing for the formation of ethical subjects, enable vulnerable people to signify their everyday experiences in political terms. I conclude that moral concepts can take the form of political signifiers, by means of which poor urban residents frame their claims to rights, equality, and social recognition in a context of neoliberal governmentality.

PEREZ AGUILAR, DANIELA* (LSE, United Kingdom)

Middle-Class Fractions within Professional Workers in Chile: The Persistence of Occupational Closure and the Limits of Social Mobility

The increasing levels of income inequality in post-industrial societies have been linked to an unprecedented demand for highly skilled workers to continuously drive knowledge and technological development (Acemoglu, 2002; Gasparini & Lustig, 2011; Morris & Western, 1999). Scholars have explored the complex relationship between education as a means of social and economic advancement and, paradoxically, as a primary driver of wage inequality (Brown, 2013; Rodríguez-Castelán et al., 2022). These trends challenge traditional understandings of meritocracy, social mobility, and economic progress.

Given the promotion of higher education as the major driver for social mobility and economic security, this paper scrutinises the role of professional occupations as social class markers and their internal fractioning in recent years. The analysis delves into the Chilean case, where the expansion of higher education has paralleled the reduction of inequality indices such as the Gini coefficient. While this might suggest a move toward a more egalitarian society (Torche, 2005), the massive social protests in 2019, as well as research

on structural issues of inequality, laid bare the shortcomings of the current neoliberal economic model, raising questions regarding the true nature of social progress and the stability of the new middle-classes (Garcés, 2019; Méndez & Gayo, 2018; PNUD, 2017).

Using data from CASEN, a national household survey, the results from a latent class analysis revealed the presence of at least three distinct classes within the professional occupations: insecure, middle-class, and elite professionals. To better understand the composition of these groups, the analysis includes in-depth interviews with six individuals, two from each sub-class, to explore their occupational trajectories further. The findings challenge the narrative that education acts as a leveller of inequality, instead highlighting the enduring barriers to upward mobility and the role of professional closure in maintaining class hierarchies, especially within neoliberal economies in the Global South.

Countering Propaganda, Disrupting Radicalization, Reducing Politico-Ideological Violence: Theorizing a Mechanistic Model, Using Prisma Scoping and Systematic Reviews of Evidence on Algorithmic Counter-Propaganda Tools

Scholars often focus on extremism as belief systems that excuse, justify, encourage, or engender the use of violence as a means to effect social and political change (i.e., politico-ideological violence (PIV), or "terrorism"). Whatever the "extremist beliefs" at issue, scholars agree that radicalization is a process, defined by an interlocked series of phenomena leading to a foreseeable result – precisely the kind of phenomenon amenable to mechanism-based explanation. We focus attention on propaganda, a "cog" cited across causal theories of radicalization. Researchers have developed a number of tools to detect and disrupt propaganda, thereby hindering radicalization and reducing PIV. Systematic reviews shed some light on the mechanisms underlying these tools: Celliers and Hattingh (2020) suggest what motivates propagandists in the first place (i.e., the initial cause), while Jahnke et al. (2022) suggest what might motivate otherwise "normal" individuals – as found by McGilloway et al. (2015) and Gill et al. (2021) – to engage in PIV (i.e., the outcome). Hassan et al. (2018) and Wolfowicz et al. (2022) show online connection as an effective means by which propagandists reach propagandees, and Williams et al. (2022) examine the content they use to persuade. In this study, we review the "most relevant" published studies over the last ten years (2013-2023) examining content detection and content moderation algorithms for their effectiveness against politico-ideological violence. We use findings from these studies to develop a mechanism scheme outlining what evidence suggests about how – and whether – counter-propaganda tools should work to reduce engagement in PIV. We discuss limitations (e.g., lack of data and algorithmic bias) in the scope and conclusiveness of the current science and directions for future research to address gaps and test our theoretical model.

PERNARELLA, MARCO* (University of Trento, Italy)

Knowledge Trajectories in Transnational Socio-Environmental Movements: Constructing Counter-Hegemonies and Alternative Globalities

Movements' epistemic potential has long been overlooked in social movement studies. Movement actors render subaltern experiences and knowledges visible, challenge and resignify dominant discourses, elaborate alternatives, and inform critical communities and experts. Socio-environmental movements cultivate new concepts and meanings to criticize, challenge, and ultimately dismantle the systemic roots of the climate and social crises of the Capitalocene.

While recent studies have begun recognizing this transformative potential, empirical research still needs to trace the dissemination of movement knowledge across scales and contexts and its creative appropriation, remobilization, or cooptation by powerful actors. The early-stage PhD project informing this contribution investigates movement knowledge trajectories in processes of diffusion, coalition-building, and scale shift within the transnational socio-environmental movements' field.

This contribution starts from transnational events centered on climate or environmental justice from an anti-capitalist perspective as attempts to construct alternative globalities across the diversity of socio-environmental movements. Then, I explore and map the relations and discourses of actors participating in the events as they unfold in digital spaces, which are key sites of knowledge dissemination. I illustrate a 'digital cartography', using social network analysis and quali-quantitative content analysis to map the evolution and recombination of these relations and discourses from 2019 to the present. I show how transversal themes underpin the building of alliances between local and transnational scales and between the Global North and South, while others reproduce old fractures and create new cleavages within socio-environmental movements.

To conclude, I use particular cases to reflect on criticalities intrinsic to theorization and transnationalization processes, as they open the gates for fragmentation, distortions, and appropriations of subaltern and critical knowledges both within the field and by external actors. Proximity to grassroots and contentious action and horizontal rather than vertical diffusion are strategies explored to preserve social movement knowledge's critical and transformative potential.

PERNETTI, ALESSANDRA* (Università degli Studi di Milano Bicocca, Italy)

This Is Not My Job: Italian Social Workers on the Edge of Workfare

Since the introduction of the Citizenship Income in Italy, up to the current Inclusion Allowance, the work of social workers has experienced an intensification of pressures, reshaping both their role and daily practices. On one hand, the new minimum income schemes have led to a significant increase in the number of users accessing social services; on the other hand, current regulations require social workers to be increasingly vigilant and responsive in monitoring irregularities and fraud, contributing to the identification and sanctioning of so-called "cheaters." Additionally, the growing use of digital platforms for reporting imposes further tasks of control and traceability of processes. This study utilizes the framework of street-level bureaucracy and focuses on a local context of policy implementation, recognizing its critical importance in the operationalization of these measures. Based on interviews and vignettes conducted with social workers in a metropolitan city in Northern Italy, the research investigates the effects of these changes on professional practices and the well-being of practitioners, highlighting the challenges and critical issues associated with the evolving welfare policies and digital tools.

Migrant Workers' Representation and the Appeal of Independent Grassroots Unionism. Insights from Britain and Italy

In the Global North globalization has been coinciding with the interconnected growth in precarious work and migrant workers. Often finding inadequate representation in mainstream unions, many of these workers have turned to (or even created) 'independent' and grassroots formations. This paper explores one understudied aspect of these emerging forms of labour mobilizations, namely the appeal that this type of unionism has to its own precarious and migrant workers' participants. Grounded in an interdisciplinary conceptual framework that draws on both social and labour movement studies, the paper contributes to shed light on the renewed significance that participatory labour organizing is having for marginalised groups in contemporary society, highlighting the importance of cross-disciplinary analysis. Methodologically, it follows an actor-centred approach (Alberti and Peró 2018) and draws on ethnographic fieldwork carried out with migrant members of four independent unions in London (IWGB and UVW) and north-eastern Italy (ADL Cobas and SI Cobas). Theoretically, the paper contributes to further the integration of social and labour movement studies through the reconceptualization of the idea of appeal in the study of collective contentious practices.

Perceptions of the Well-Being and the Future of Young Latin Americans during the SarsCov2 Pandemic.

This presentation explores the social experience of 18-24 year olds during the SARS-Cov-2 pandemic in the first months of 2021. Using representative statistical data from Argentina, Brazil and Chile (ECLAC), we constructed a qualitative sample by context and applied a semi-structured questionnaire during the pandemic in large and medium-sized cities in these countries (n=465). Then, by means of a multidimensional analysis and an Ascending Hierarchical Classification technique, the space of young people aged 18 to 24 years old was created. We examined how their work and study conditions influenced their perceptions of well-being and their plans for the future. We chose to include in our questionnaire items related to dimensions generally considered subjective: their feelings during the period of confinement, their plans for the next two years and their perceptions of these projects having been affected by the pandemic. The results show that perceptions of well-being and projects for the future were not randomly distributed. The well-being of young people at both social extremes (those who only study and those who only work) was counter-intuitive. Simultaneously, the results allow us to capture the perceptions of those in intermediate positions (studying and working), most of whom are moving up in the social structure: they are children of manual workers and occupy administrative positions. It was these young people who were more optimistic and more confident about the future than the others. As far as future plans are concerned, we note that the expansion of access to secondary school, with all the limits pointed out by the literature, was able to lead even young people from the lowest income quintiles to aspire to obtain a job in line with the diplomas they had obtained.

PEROSINO, LIVIA* (Cardiff University, United Kingdom)

Addressing Social and Environmental Challenges in the Jordan Valley: What Future Are We Cultivating?

This presentation provides an overview of the social (de)composition of rural areas in Jordan Valley, analysing power relations, the ability to access resources, and the trajectories of several categories of actors involved in agricultural production. Through different political phases, the valley has undergone a profound agrarian transformation, and is now characterized by intensive and largely export-oriented agriculture. The transformation has also changed the social fabric of these rural areas, and the sustainability of the sector. In the context of the dramatic environmental crisis that the valley is facing, national and international policy makers promote market-oriented solutions. According to these narratives, a greater integration to global markets, the adoption of the latest technical innovations and strategies to adapt to climate change are the only possible solutions in this context.

Building on three years of qualitative research, I discuss the possible outcomes of such market-oriented solutions by replacing them in the social and environmental reality of the valley. By analysing power dynamics between food producers I show that the impoverishment of the rural population is part of a wider process of dispossession of local producers in favour of wealthy urban elites, that has accelerated after the economic liberalisation of the early 2000s. The livelihood of commercial farmers is more and more precarious, with negative repercussions on the incomes of agricultural workers. Environmental degradation and climate change appear as aggravating circumstances that further casualize rural populations, rather than being the root of the problem. In this context, the solutions currently promoted might further the polarise and impoverish rural areas, while exacerbating the negative effects of the environmental crisis.

Labour Contention for a (an environmentally) Just Transition: State Regulation Processes, Private Property and Trade Unions Strategies in the Ilva Steel Plant in Taranto (Italy)

The just transition perspective has gained a generalized attention in conjunction with the increasing pressures that Western societies are under to green their economies. In this perspective the role of trade unions is central as they are encouraged to drive the socio-technical transformation

to avoid the intensification of the dilemma between the protection of jobs and environment. Indeed, when dealing with the environmental challenge, unions come to be caught in a tension between the protection of current jobs and the search to make jobs more environmentally responsible. Studies on industrial relations and the anti-austerity protests have shown that during the Great Recession, in Italy, this increased a conflict concerning economic, political and environmental issues between unions and the state. This can be explained, inter alia, by the pivotal role played by the state in social regulation processes, particularly through public investment in industrial sectors defined as strategic in the global value chain.

The main objective of the contribution is to explore how different regulatory frameworks affect industrial and social conflict. The empirical analysis refers to the area of Taranto, home to the largest steel plant in Europe (ILVA), that is facing a serious environmental and health crisis. In 2012 Taranto became a national and international public case following the evidence of the environmental disaster caused by the steel plant.

Empirically, we use an original data set of workers' collective actions, built through protest event analysis (PEA) by examining worker and social movements protests during the wave of labour contention that occurred in Italy and Taranto between 2008 and 2018. Furthermore, we will carry out a case study of the ILVA through the analysis of official documents, technical reports and depth interviews addressed to union representatives and social movement leaders.

PERUGORRÍA, IGNACIA* (University of the Basque Country, Spain)

GARCIA MARTIN, JOSEBA (University of the Basque Country, Spain)

Re-Politicizing Religion: The Mobilization of the Spanish Anti-Rights Field Against Progressive Moral Policies (1978-2024)

The paper analyzes the cycle of protest (1978-present) of the Spanish field of Catholic-inspired secular organizations of neoconservative ideology (CISO-N) against progressive moral policies in the areas of family; life and death; gender and sexuality; and religious freedoms. To do so, it relies on a historical-comparative and relational approach, focusing on the evolving interplay between (1) cultural and political opportunity structures; (2) the network structure and dynamics of the CISO-N multi-organizational field, and its 'extended anti-rights field,' composed of religious (the Spanish Episcopal Conference) and political organizations (VOX and the ultra-Catholic paramilitary organization El Yunque); and, (3) their tactical-discursive triangulation. Our research is based on a 8-year qualitative study comprising in-depth interviews (n=20), participant observations (n=5), and netnography (2022-present). Data show that CISO-Ns are far from being mere "translators" and "transmission belts" of the ecclesiastical message, or "at the service" of conservative political parties, supplying vocabulary, arguments, votes, and even activists. On the contrary, CISO-Ns lead a complex strategy of 're-politicization of religion' following a logic of their own, and in stark opposition to the 'politicization of the private sphere' led by the feminist, LGTBI+, and secularist movements.

Social Movement Networks and Intersectional Activisms: Bilbao's Festive Social Movement in Relational and Historical-Comparative Perspective

My presentation will analyze the historical evolution of a rare kind of 'intersectional activism' combining cultural, political, and 'right to the city' claims intermingled with notions of carnival, humor, and irony. This is, the activism developed by Bilbao's 'multi-actor' 'festive movement,' formed by "purely recreational" and more politicized *comparsas* [festive troupes] tied to cultural cooperatives, neighborhood associations, "new" social movement organizations (e.g. feminist, environmentalist, squatter, anti-specieist), and even political parties within the Basque separatist and non-nationalist Far Left.

Involved in the annual organization of the city's massive 9-day popular festivity since 1978, for almost 5 decades Bilbao's festive movement has managed to preserve a unique large-scale model of 'participatory culture' based on social movement-City Council festive co-management and co-creation. In doing so, it has also functioned as a true 'social infrastructure,' bridging deep socio-political cleavages in key historical junctures. One of such coordinates was the process initiated in 2009 by the Abertzale [Patriotic] Left to put a definitive end to ETA's violent activity, and to transition into a "purely democratic" path—context in which much of my ethnographic fieldwork was conducted.

Based on a historical-comparative and relational perspective, my presentation will attempt to address the following questions: How have changing political and 'urban opportunity structures' affected Bilbao's festive activism? And, how is it related to the changing structure and dynamics of Bilbao's 'festive collective action field,' composed by comparsas, their 'mother social movement organizations,' and also all political parties represented in Bilbao City Council?

Data come from a multi-methods approach combining the analysis of primary and secondary data covering the last 5 decades, a three-year political ethnography conducted in Bilbao between 2009 and 2012, and follow-up research carried out in 2023-2024. Information collected through these multiple methods is analyzed following the principles of both network and qualitative content analysis.

Exploring Digitalized Realities: Relational Well-Being of Youth in India and South Africa

This study explores the impact of digitalization on the relational well-being of youth in India and South Africa, examining how increased access to digital technologies influences social relationships, identity formation, and overall mental health. As digital spaces increasingly become an integral part of young people's lives, understanding the role of technology in shaping interpersonal connections is crucial. Utilizing a mixed-methods approach, this research investigates the nuances of digital engagement through surveys and interviews with youth aged 15-24, highlighting cultural differences, socio-economic disparities, and contextual factors that mediate digital interactions. Findings reveal that while digital platforms offer opportunities for social connection and self-expression, they also exacerbate issues of digital divide, online safety, and mental health concerns. By focusing on relational well-being, the study underscores the need for context-specific digital literacy and support systems that promote healthy digital engagement. The research contributes to global youth studies by providing insights into how young people in diverse contexts navigate the complexities of digitalized realities.

PERUMAL GOVENDER, JAYANATHAN* (University of KwaZulu-Natal, South Africa)

From Diasporic Migrant to Citizen Subjects

The (Indian) diaspora is arguably the most widespread on practically every continent. Three migrations include ancient trade, colonialization and post-independence flows. Indians in South Africa historically navigated inexorable human rights violations, made worse by the brutality of economic exploitation, political exclusion, racialized and gendered dissections. Yet, the diaspora has transmuted the sociological dangers of influx, cultural clash and threat to political hegemony into assimilation, exchange and participation. There is evidence globally that societies have been reconstructed and that new generations of the diaspora are mainstreamed and normalized.

Social and migration theories do not fully address this fantastic burst of human creativity amid othering, neo-pollutants and violence. Diasporic theory highlights inequality. Migration theory is about what motivates movements and flows. Sociological theories on migration underscore human circumstances impelling geographical movements. The absence of underlying intersecting forces that define, enable and capitalize on vulnerable transitory persons to diffuse xenophobic hostility is limited in a theoretical framework. A theoretical context constructed on building generational capability, for migrants to live in freedom, unencumbered by time and ontological baggage, is imperative.

The approach is to turn towards the east. Eastern notions bobbing across the oceans deliver the appreciation of 'Chinese characteristics,' i.e., the dialectical unity of scientific socialism and historical logic of social circumstances, characterizing the *zeitgeist* intrinsic and extrinsic to Chinese society. The Indian diaspora logic is framed in stages of human development and social developmental parallels that floresce as tolerance, positivity, humanism and determinism. The Chinese and Indian experience, the *sine qua non* of cultural flow creates innovative social organization.

This presentation interrogates Eastern cultural tenants for theorizing the dramatic shift from diasporic migrant to citizen subjects.

Multispecies Families in Italy. A Cartography of the New Practices of Intimacy

In 2023, 65 million pets will live in Italian homes, compared to 59 million people (Istat 2023). 4 out of 10 households have at least one animal companion, and the pet-food market is growing at an impressive rate (+13.4% in 2023 alone) (Assalco 2024). There is a growing presence of animals in public spaces (supermarkets, streets and gardens, trains, hotels, beaches) and in the media (dedicated columns in newspapers and social media, pet influencers, advertising). While vegans and groups for animal rights are becoming most popular, the practices of exploiting and killing farm animals have become invisible because they are intolerable to public opinion.

Despite the magnitude of these phenomena, sociological studies on the human-animal relationship in Italy are still very few and almost all devoted to animals as an oppressed category.

The proposed paper recounts the results of the first sociological research conducted between 2022 and 2024 in Italian households to investigate the transformations of intimacy and new lifestyles produced in living with pets. The main body of analysis consists of 135 in-depth interviews with women (99) and men (36), living with at least one dog or cat, of different ages and cultural backgrounds. Added to this are more than 150 photographs of their pets, made available for the occasion. Thematic and interpretive analysis focused on searching (both in the stories and photos) for key words, linguistic contradictions, recurring or emblematic themes, aiming to understand and reconstruct the meanings the interviewees attributed to the perceptions and actions narrated.

The results confirm the widespread tendency for subjectification of the non-human animal and a plurality of new relationships and patterns of cohabitation. Within this framework, the authors construct a cartography of roles of humans and non-humans living together, new practices of intimacy and new situations that characterize the life of multispecies families in Italy.

PESET, CHARLOTTE* (GERME (ULB), Belgium)

Facing Administrative Limbos: Conditions of Administrative Liminality and Individual Resistance Strategies of Foreign Applicants for Belgian Citizenship

The paper deals with the agency of foreign applicants for Belgian citizenship during the file compilation phase in interaction with the municipal administration in charge of checking the application's legal requirements. Knowing that there are inequalities in access to public policies and that interactions with state institutions represent 'administrative burdens' (Burden et al., 2012) for citizens, I ask how and to what extent applicants for Belgian nationality can be in a zone of administrative limbo, and how it is possible to face limbo individually and collectively. To do so, I draw on a series of semi-structured interviews with applicants for Belgian nationality, intermediaries (lawyers and associations) and Brussels local authorities. Firstly, I show how Brussels local authorities use their discretionary powers, and examine how some of these practices create situations of administrative liminality for certain applicants during the file compilation phase. Secondly, I highlight the way in which applicants resist administrative limbo by examining a particular form of capital: administrative capital (Masood and Nisar, 2020). I show how this capital is acquired both through repeated interactions with street-level bureaucrats and with intermediaries (lawyers and associations). By showing how intermediaries help applicants to understand and appropriate the law, I highlight their role in strategies for resisting situations of limbo. This analysis shows the administrative limbo that emerges from the implementation of Belgian nationality, and the hidden face of the strategies used by applicants to cope with an onerous policy. Postulating that applicants resist in these situations of limbo, by resorting to intermediaries, I argue that one needs to open up studies on migration and vulnerable groups by analyzing the implementation of public policies and the interactions between different heterogeneous actors, taking into account the way in which individuals' administrative capital is built up.

KILLIN, ANTON (University of Bielefeld, Germany)

Diversifying the Society-Nature Paradigm within One Health and Planetary Health: Embracing 'Symbiosis' and Unlearning 'Distance' for Just Social-Ecological Trajectories

The discipline environmental public health increasingly addresses the relationship between society and nature, including non-human entities. This is exemplified in frameworks like One Health and Planetary Health, serving as pivotal epistemological guides for sustainability efforts. We observe that both concepts align with a predominantly Western, Educated, Industrialized, Rich, and Democratic (WEIRD) worldview and begin this perspective by outlining how these WEIRD characteristics unfold. In this course, our first argument posits that, rather than representing the full diversity of existing society-nature paradigms that guide interactions with nature, the WEIRDness embedded in One Health and Planetary Health is focusing on and reinforcing a questionable conceptual separation of society and nature. We find that is due to various dynamics such as hazard frames of nature coupled with capitalist-driven practices of nature commodification. On this basis, our second argument posits that the distanced society-nature conception leads to epistemological and practical environmental injustice along hegemonic asymmetries within One and Planetary Health. We show this by analyzing public debates, research narratives as well as global policy implications from an intersectional environmental justice lens. Acknowledging the differences of society-nature paradigms existing within and beyond Western spheres, our analysis considers a series of possible conceptions arranged on a continuum, from rather separate to symbiotic. We use these insights to advocate for a diversification of the dominant society-nature paradigm within both health concepts. Drawing on insights from non-Western, traditional, and Indigenous examples, we propose trajectories for an advancement of One Health and Planetary Health that incorporate versatile knowledge and sustainable living practices. In this way, we not only want to contribute to the refinement of the concepts in the wake of the planetary crisis, but also to spur more epistemologically inclusive discussions of environmental justice that interrogate the value and rights of nature, which society is a part of.

PESSL FALKENSTEINER, GABRIELE* (Institut für Höhere Studien, Austria)

Cold-Shouldering the Discourse: Findings From a Biographical Study on Early School Leaving (ESL) in Austria

Besides a NEETs-discourse, one on Early School Leavers can be traced back to the early 2000s. The definition is based on a deficit approach: They are defined as 18-24 years olds without upper secondary education who are currently not in education. Accompanying policy efforts, ample research has been conducted to explore reasons for leaving school early and provide evidence for remedial policies. Early School Leavers have thus been addressed as a problem group.

In my PHD thesis I challenge this mainstream view by not pre-supposing ESL as one or 'the' life event in their biographies. Beyond that, I approach ESL as discourse which can have an impact on youths – to be explored empirically. Hence, I combine biographical case studies (Rosenthal 2008) and discourse analysis of policy documents from the EU and Austria (Keller et al. 2018). Analyzing 16 biographical interviews with early school leavers aged 16 to 22, I ask how they appropriate (or don't) the ESL discourse whereas my interest regarding the discourse analysis is on how early leavers are constructed as subjects of policies and assigned specific models of behavior.

In the realm of Austria's ESL-policy, the dominant discourse claims compliant integration into a system of supportive measures, contested by a discourse on empowerment. Both discourses aim at improving the employment prospects of the subjects. In the biographical study, I developed a typology along how the biographers appropriate the ESL-discourse. One out of five types is the 'cold-shouldering': The discourse has been set irrelevant throughout their experiences and their narrations. They develop own life projects regardless of educational requirements.

RC04-56.4

PESSL FALKENSTEINER, GABRIELE* (Institut für Höhere Studien, Austria)

The Discursive Construction of Early School Leaving in EU-Policies

Early school leavers (ESL) – 18-24-years olds without upper secondary qualification – have constituted a problem group in the realm of educational policies since 2000. Applying a sociology of knowledge approach to discourse (SKAD, Keller et al. 2018) I explore how ESL has become a public problem (Gusfield 1981) and ask for the 'true knowledge' about it and how to be solved by whom. My focus is on the early school leavers as subjects constructed within the EU-policy discourse. Starting with the Lisbon Strategy as a key-event I analyzed 18 policy documents from the European Commission, Parliament and Council, the most recent dating back to 2020.

In the 2000s, ESL has been mainly constructed as a matter of lacking efficiency. Within a broader discourse on global economic competition, early school leavers fail to efficiently develop their human capital thus hindering the economic flourishing of society. In the context of the financial and economic crisis 2008, the true knowledge about ESL has been subject to conflicts about the responsibility for social problems aligned to ESL. ESL as a matter of individual risk has become the dominant discourse. Individuals have the duty to prevent future risks via education. Education systems have the duty to promote resilient subjects who can participate in education despite their problems. By contrast, within an opposing discourse on ESL as a matter of equity the (school-)citizen has the right to education and early school leavers are deprived this right. ESL has thus to be solved by improving school quality and redistributive measures.

Restarting from Craft: The Case of European Neo-Potters. Insights from the Erc Project 'Craftwork'

The so-called 'third wave of craft' (Jacob, 2012), characterised by the centrality of handmade, sustainable, and small-scale forms of production, often repurposed from a pre-industrial tradition to cater for the modern economy, has emerged prominently in the West as an appealing option for many, especially young workers, in the search for fair and decent work (McCracken, 2022). Within it, 'neo-craft' work (Gandini & Gerosa, 2024; Land, 2018) carries a promise of 'good work' that expands the distinctive features of craft work as traditionally intended, embedding them in a new and complex set of discourses and practices (Bell et al., 2018; Ocejó, 2017) which directly challenge established notions of the 'meaningfulness' of work (Schwartz, 1982). Based on the ERC funded project CRAFTWORK (2021-2025, see: <https://craftwork.unimi.it>) consisting in a set of in-depth interviews to neo-craft workers and participant observation within their workplaces in Europe, our contribution will explore in particular the experiences and narratives of European neo-artisans which reconvert professionally into pottery. There, 'using hands' and the possibility to unleash creativity through the modeling of a natural raw material such as clay is an interesting case study to delve into the features of contemporary handicrafts. This reveals a romanticised understanding of neo-craft work as meaningful work, that is constructed in opposition to other forms of (especially corporate) work and is principled upon the engagement in manual work as a conveyor of purpose and *resonance* (Rosa, 2010) in the broader context of "the struggles for recognition" affecting modernity (Honnet, 1996). However, the social distribution of opportunities (in terms of both material and immaterial resources) in the struggle for a more meaningful work that underpins these processes is often underestimated, insofar as it perpetuates and reinforces social inequalities in access to these new forms of production and work opportunities.

PETERSEN, CAMILLE* (University of Tennessee, Knoxville, USA)

Hi, I'm Settler Colonial Barbie? the Heteronormative Gender Binary, Pinkwashing, and Settler Colonialism

The Barbie movie was praised as feminist and a celebration of women. People dressed in hot pink and posed inside a life-size Barbie box as if sitting on the shelf of a big-box store. The plot of the movie itself involved commercialism come to life, with humans travelling in and out of a 'girls run the world' fantasy made out of commodities. But how feminist was the Barbie movie, and to what extent was it a critique of patriarchy? In this paper I argue that the Barbie movie reproduced settler colonial tropes of heterosexuality, femininity, and Whiteness that reflect broader international pinkwashing (Lugones, 2007; Puar, 2013) and lifestyle/commodity feminism. Settler colonialism and racial capitalism have seductive power through gender and sexuality, and the Barbie movie is an example of how capitalism consumes its own critique. Feminist critique in the movie is not only limited but it is also subsumed within consumerism and doesn't consider liberation from capitalism or biopolitical hierarchies (there is a Black woman as president but she is a mere token in the film itself, and America Ferrera's character is completely whitewashed). There is not substantive critique of the gender binary-Barbie world is a simple cis and hetero world, Ken's discontinued boyfriend doll is a joke and the only non-conforming doll is labeled "weird" Barbie, a condition to be fixed. The Barbie movie is a story of a nation, one told through the gender binary.

PETERSEN, CAMILLE* (University of Tennessee, Knoxville, USA)

The Heritage Industrial Complex

Heritage in itself is difficult. What are the reasons for hanging on to the past? In this paper I argue that heritage in the Western world should be understood as a colonial modern phenomenon born in the context of White supremacy, which began as Christian White nationalism in Europe (Mignolo 2002, 2008; Robinson 1983). Whereas the military and prisons are used to manage populations, and they are justified through racist ideology, the heritage industrial complex is used to teach colonial biopolitics to the public through leisure and thus manages White supremacist capitalist patriarchal (hooks 1984) ideology itself. Moreton-Robinson (2015) argues that colonialism operates through "the racialized application of disciplinary knowledges and regulatory mechanisms" (129), where Whiteness is conceptualized not as a right of White people but, following Foucault, as the reproductive method of racial thinking and practices of racial subjugation. If mass incarceration and war are the two most thoroughly implemented social programs of our time (Davis 1998), Heritage is the third. The heritage industrial complex is entrenched in a lucrative political economy of tourism but also the body and in nature, seductive because it is paired with beauty and pleasure. But White nationalist historical storytelling doesn't have to pervade leisure spaces. We should start by calling Heritage what it is—it is not contested or difficult, it is White supremacy.

PETERSON, GRETCHEN* (University of Memphis, USA)

Understanding Conceptions of Fairness in a Leisure Activity: Comparing Attitudes Towards Cheating in Adult Recreational Softball between 2008 and 2024

The problem of cheating in sports has received some attention in the sociological literature, but far more attention in popular media as news stories about sports cheating gain national and international attention. In sociology, studies have examined cheating in a variety of sports, including junior tennis (Casper 2006), professional running (Mewett 2002), and recreational softball

(Peterson 2016). One of the themes that emerged from Peterson (2016) was that adult recreational softball players did not always embrace the technical definitions of cheating. Athletes argued that certain acts were not cheating even though those actions violated the rules. They also argued that cheating was often a response to perceived cheating by opponents. Peterson (2016) drew from an online survey originally conducted in 2008. Since that time, many softball organizations have implemented rules designed to tackle cheating in softball as well as to improve player safety. The focus of this study is to examine how attitudes towards cheating have changed in the past 15 years and how players now view cheating in light of these changes made by various organizations to combat cheating. For this study, new data was collected in early 2024 assessing the attitudes of adult recreational softball players on cheating in their sport as well as their own engagement in cheating. The survey was presented online by posting in various softball Facebook groups and there were over 2500 respondents. While the sample is not representative, it is large enough to provide important insights. Results from the 2024 survey will be compared with the 2008 survey which had over 1700 respondents. This presentation ties to the conference theme through its focus on cheating and, consequently, fairness and justice. Understanding how people view cheating can provide insight into what we "know" about fairness in recreational activities.

PETERSSON, FRIDA* (University of Gothenburg, Sweden)

Language, Policy and Problemrepresentations: Analyzing Front-Line Workers' Talk on Minors Injecting Drugs in Sweden, Switzerland and Wales

A significant amount of research highlights the discrimination, stigma and exclusion facing people who use drugs in contemporary welfare practices across the world. This presentation shares findings from a cross-national study comparing welfare policy and practices aimed at legal minors injecting drugs. Focus group interviews are used to analyze how front-line workers in three high-income EU countries - Sweden, Switzerland and Wales - discuss the needs of and make assessments regarding interventions for minors who inject drugs.

Harm reduction (the prominent drug policy approach in Switzerland and Wales) is often rhetorically cast as an emancipatory and inclusive approach to drug use and contrasted with a prohibitionist, exclusionary system (represented by Sweden). This paper set out to explore if and how the values embedded in distinct drug policy contexts and child protection systems appear in front line workers' talk regarding children who inject drugs, and whether articulated values might be associated with differential institutional responses.

Our vignette-based comparative analysis reveals significant differences between countries regarding the perception of the problem and how it should be addressed. In Sweden, the focus was squarely on drug use and injecting, a behavior assessed as very serious and alarming, irrespective of the child's social situation. Swiss front-line workers also focused on the minor's drug use, but with a firm medicalized harm reduction approach guiding their needs assessments. In Wales, on the other hand, drug use was seen as secondary in all three cases, with social context and relational dimensions being at the forefront of discussions. These different perceptions were in turn linked to diverging institutional reactions across settings. Issues regarding communicative aspects of the research process will also be discussed.

PETROPOULOU, EUGENIA* (UNIVERSITY OF CRETE, Greece)

PETOULI, VASILIKI (University of Crete, Greece)

Gender, Identity and Women's Involvement in Livestock Production: The Case of Greece

Research and policy increasingly recognize women's role in sustaining pastoral societies in the Global South, yet women pastoralists in the Global North have received scant attention. In Greece, like other countries in the Global North, their actual social integration and appreciation as pastoralists can be questioned. In many cases, livestock families promote their female members as heads of the farm but in reality the male members of the family own and have the decision making power over the farms. Albeit this development women are still being treated as an invisible force, housekeepers and mothers in addition to the acceptance of their role as real pastoralists. This social challenge manifests itself in many rural territories especially those with cultural characteristics of male dominance and patriarchal structures as in the case of Crete in Greece. Drawing on qualitative research (e.g. one focus group, two group interviews and six in-depth interviews) this research addresses the empirical gap in studies of women pastoralists in the Global North by investigating Greek women pastoralists' roles and identities. It focuses on 3 levels of social organization: the private and domestic level, the

livestock enterprise level and the local community level. Although interviewees revealed that their role within the family and local community significantly improved in the last decades, the analysis also revealed key contradictions in women's material and discursive practices shaped by age and family socio-economic status. It is recommended that future research and policy take a more deeply intersectional approach to analyzing the diversity of Greek women pastoralists' experiences to include a more explicit focus on the experiences of women of different age and socio-economic and cultural factors and how these factors interact to shape their realities and decisions.

PETROVA, GERGANI NEYCHEVA* (University of Guanajuato, Mexico)

Educación y Alienación Social

En su texto "Educación para la emancipación" Theodor W. Adorno señala muy pertinentemente que cada época produce tanto a las personalidades que socialmente necesita como los hombres tecnológicos que el avance técnico requiere. Esto, puede considerarse como una sentencia en la cual cobra vital fuerza el carácter desesperado de la lucha contra la barbarie, cuando ésta es engendrada en el seno de la sociedad misma y nos pone ante el paradigma de cómo podríamos lograr un cambio cualitativo en una sociedad que reproduce sus propias condiciones. Para profundizar en el tema es importante referirnos a lo que Freud ya había postulado, y quien nos explica que para que el individuo sea capaz de vivir en una comunidad, la prohibición constituye la esencia de la acción cultural socializante. Ésta comienza impidiendo que ciertas tendencias impulsivas espontáneas e inmediatas se expresen libremente, y es así como surge la función represiva de la educación como algo fundamental para lograr la unidad y la preservación del todo social. En efecto, tan pronto la conciencia cultural pública se impone en el desarrollo del infante, éste empieza a perder referencia con su propia conciencia, con su Yo, para identificarse exitosamente como un ser cultural moldeado por y para la sociedad existente. Cobra, entonces, relevancia la relación maestro-alumno, que al ser mediada por la razón instrumental convierte al maestro en un instrumento para forjar buenos ciudadanos para la sociedad. La presente propuesta indaga por la alienación como proceso que se da en la relación maestro-alumno.

PETROVA KAFKOVA, MARCELA* (Masaryk University, Faculty of Social Science, Czech Republic)

Men at the Start and in the Finish: Negotiating Masculinity and Age through the Example of Athletes

Racing and competing are domains associated with youth and masculinity. We generally do not associate sports and sports competition with older age. Moreover, in top-level sports, a person becomes "old" a few decades earlier than we generally understand older age. At the same time, many sports are expanding the opportunities for participation at older ages in disciplines primarily designed for the young rather than disciplines explicitly created for older people. In the master categories of the races, the predominance of male participation is high.

In my presentation, I look at racing and sports competitions as a specific area where age and older age are negotiated and viewed through a different lens than usual. I observe how this sporting optic of age interferes with and adjusts the ageing coping of athletes and their perception of themselves as (pre-) older people. And how masculinity is conceptualised in this context. To do so, I use data from in-depth interviews with men (aged 50-75) who participate in competitions in different sports disciplines as a part of the project Institutions of Ageing Men (GA23-050475). My sample is heterogeneous regarding the participants' sports biographies and motivations for participating in competitions, but sport seems to bring about a different perception of age identity. I discuss this specific lifestyle in the context of notions of 'successful' ageing and pressure on older people's productivity.

PETROVA KAFKOVA, MARCELA* (Masaryk University, Faculty of Social Science, Czech Republic)

Pleasure and/or Mundane Burden: Meanings of Food in the Everydayness of Older Adults

Eating is an essential component of quality of life and contributes to the identity of older adults. In older age, many events, transitions and changes occur that affect eating patterns and bring the need for their change.

The pleasure from food comes from two sources. From the pleasure of the taste of the food itself. The second source is its social aspect, the possibility

of sharing the food. Food is also used as a means of care. At the same time, preparing food is often seen as a demanding and mundane burden. As something that is no longer achievable when health deterioration comes. Buying food or delivering ready-made lunches is often one of the first activities that a person in need of care delegates to others. This transforms their mealtime routine and challenges their autonomy in their choice of what to eat and when.

To explore these meanings of food in the lives of older adults, I use data from the project Meanings of Food Intake in Old Age (GA23-063485). Specifically, 23 in-depth interviews about food with home-dwelling older people and a multi-case study from 5 care homes (video recordings in dining rooms, interviews with users, and interviews with staff) in the Czech Republic.

In my presentation, I focus on how these two sources of pleasure in food are enabled, supported and negotiated through the transitions and changes of older age (retirement, widowhood, health limitations, care needs). What meaning do the actors themselves ascribe to food and the changes in food routine? I explore the importance of food in the lives of the ageing and how the pleasure of eating is sought or claimed in changing life contexts.

PETROVIC, IRENA* (University of Belgrade, Serbia)

An Analysis of the Political and Economic Elite in Serbia during the Post-Socialist Era

Studying the upper social classes is one of the central themes in empirical sociological research on social structure. However, this is one of the most challenging topics to research, which makes such studies particularly valuable.

In Serbia (and previously Yugoslavia), empirical research on social stratification has a tradition of over fifty years. The first comprehensive study of the Yugoslav elite was conducted in the 1970s (Barton et al., 1973). Subsequent research took place in the late 1980s (1989) with a large-scale study of the social structure of Yugoslav society titled "Social Structure and Quality of Life in the SFRY." This survey included sub-samples for the political and economic elite. Over the next three decades, research on stratification in Serbia continued almost on the same theoretical and methodological basis, which enables comparative analysis. Research on the economic and political elite was conducted by the Institute for Sociological Research in 1993, 2003, 2012, and 2015. Notably, such research is rare in this part of Europe, which makes the importance of this research even greater.

The paper aims to present research on the political and economic elite in Serbia during the post-socialist period. It analyzes various aspects contributing to the consolidation of this social group as a privileged class that controls political and economic resources. These aspects include intergenerational and intragenerational mobility, economic position, value patterns (such as political and economic liberalism), etc.

By analyzing the systemic transition from socialism to capitalism, and the changes that followed the collapse of socialism, the broader aim is to assess whether the consolidation of political and economic elites has progressed to the point where we can speak of the emergence of a new capitalist class and full establishment of the capitalist social system in Serbia (including other social classes and groups).

PETTIT, HARRY* (Radboud University Nijmegen, Netherlands)

The Politics of Cash Circulation and Epistemic Tangles of Work in Beirut

In this paper I trace the emergence of a new infrastructure of money circulation in Beirut, Lebanon in the aftermath of a financial crisis. This includes a new set of practices, actors, and systems for handling and storing cash in a context where banks have become largely unusable. I examine the struggle over the means of this money circulation as it moves between different actors in the realms of labour and debt. In particular, I describe the intimate struggles of undocumented Syrian delivery drivers and Filipino and Cameroonian domestic workers to secure enough cash to survive in the context of multiple overlapping dispossessions. I adopt a methodology of following the cash, going with these men and women as they interact with friends, colleagues, customers, employers, money lenders and transfer services, state officials, landlords, and shopkeepers. In doing this, I argue that following the cash can help reveal the operational relations of power that govern the ability of certain actors to extract value from these marginalized inhabitants, as well as the ability of these inhabitants to cope with and combat this through networks of fractured solidarity and resistance. I also want to use this methodology of tracing forms of extraction and survival as cash circulates to break down boundaries between work and social reproduction.

PETTIT, HARRY* (Radboud University Nijmegen, Netherlands)

The Struggle over the Means of Money Circulation in a Cash(less) World: Stories from Beirut

Academic scholarship is shifting towards a focus on the emergence of the cashless economy. But Lebanon in recent years has experienced an opposite phenomenon, a sudden surge in the use of cash in the aftermath of a insolvency crisis and large-scale theft of savings which has led to a deep distrust of banks. This has produced the rapid construction of a material infrastructure that enables the storage and movement of cash around the economy and country – itself always shifting in the context of rapid inflation and currency devaluation. Focusing on the city of Beirut, I use ethnographic fieldwork to ask how this infrastructure of cash is impacting different groups – from migrant workers, petty investors, small-business owners, delivery platforms, digital wallet start-ups, and money lenders and exchangers. I specifically ask how relations of power between these groups are being reconfigured through the materiality of cash. By following some of these figures on a day-to-day basis as they navigate the cash infrastructure, I reveal how Beirut's cash economy is opening up new forms of extraction and exploitation, but also new forms of resistance and survival.

Navigating the Evolving Landscape of Higher Education in Spain:

This contribution aims to analyze the path taken by Spanish governments from the end of the Franco regime and the 'Transition' to the present day, in response to the emerging broad demand for knowledge—and higher education qualifications—and to assess the strength of the connections this journey has built and continues to build with society as a whole. We will focus on several aspects such as governance choices and the complicated balance between varying degrees of autonomy and centralization of Spanish universities, the characteristics and transformations of the accreditation systems that define the quality of academic programs, and the career progression of the faculty. We aim to understand, through the lens of the priorities identified by the systems themselves, how the university mission may be redefined. Finally, we will delve into three specific focal points: university rankings, the internationalization of Spanish universities, and the development and quality of the third mission.

P.O.V. on the Contested Identity between Contexts: Alienation in the Construction of Identity between School and Digital Media

The communicative, relational, and informational processes of Generation Z are marked by an "onlife" dimension (Florida, 2018) and a continuous interaction between physical and digital environments, often referred to as 'phygital' (Andreula, 2020). This generation is recognized as hyperconnected (Twenge, 2018) or digitarian (Apuzzo, 2015), especially in the post-pandemic landscape (Ferrazzoli & Maga, 2021). The acronym P.O.V. (Point of View) is frequently used by young people in social media videos to indicate the perspective from which they narrate their experiences. This raises questions about how young individuals perceive the connection between reality and media, specifically examining the role of digital technologies in shaping their understanding. The digital sphere encompasses various actors, spaces, and relationships, necessitating adaptation to the expectations arising within this context. Such dynamics are pivotal in shaping personal identity and meaning while introducing risks and challenges associated with feelings of alienation. This alienation can lead to disconnection from one's offline self, particularly in the increasingly digital realm (Turkle, 1995). These platforms can be viewed as reflective environments that facilitate self-examination (Cooley, 1902). Additionally, advancements in digital technology enable the creation of a 'hyper-creative Other' through artificial intelligence, while posing challenges such as misinformation and fake news that can exacerbate feelings of alienation.

From 2020 to 2024, 40 classes from 12 secondary schools in Florence are engaged in a course aimed at developing digital and communication skills. Approximately 600 students, aged 14 to 18, are participating in this ongoing project. The research specifically focuses on how these interactions influence identity construction, media literacy, and the overall engagement of Generation Z with digital realities.

PEZZOLO, MARINO* (Università degli Studi di Napoli, Italy)

The Role of Healthcare Occupational Welfare in "Special Italian SMEs"

The last thirty years have represented a period of deep change in the Western welfare system. In Italy, the crises of public systems and the success of neoliberal doctrines have led to a growing priority placed on occupational welfare (OW). The study of the literature has developed a research hypothesis in the field of healthcare OW: The issue of Italian occupational healthcare is now under the attention of many companies with implications even outside the academic field. In this vein, the paper tested the following hypothesis: employees of the SMEs under examination conceive the OW healthcare model as a method of access to care that is supplementary and not an alternative to the state healthcare system.

The hypothesis will be tested in this paper which is based upon 90 semi-structured interviews with employees in 30 "special" Italian SMEs under study. The firms are defined as special because they are selected through two databases ("Best Place to Work" and "Welfare PMI index") which include companies that offer a high level and choice of corporate welfare services and have attention to the human capital. The employee point of view represents essential details of the research since a lot of the literature on OW in Italy focuses its attention on the governing bodies of companies, the role of unions, and institutional actors.

The paper showed several aspects of interest and change in the OW healthcare system. First of all, from the interviews, it emerged that there is a positive perception of health funds and, at the same time, there is a perceived problem, widely described in the literature, of waiting lists and poor investments in public health. Finally, this study could be useful for some managerial and policy implications of SMEs. It may be beneficial to develop a positive path to increasing OW.

RC54-833.1

PHILIP, SHANNON* (University of Cambridge, United Kingdom)

Femme Phobia: Men's Violence Towards Women, Trans and Effeminate Bodies in India and South Africa

In this paper I explore the ways in which heteropatriarchal men, seek to establish and create a sense of masculinity through violence and femme phobia towards women, trans and effeminate queer bodies. In so doing, the very construction of a 'man' within heteropatriarchal and heteronormative contexts are critically addressed in this paper. Theoretically I argue that we need to understand the role heteronormative masculine violence and phobia towards various forms of femininities as an attempt to create and 'become a man'. The process of 'becoming' heteronormative masculine subjects requires phobia towards femininities.

Methodologically this paper draws on empirical qualitative material from long term fieldwork in New Delhi, India and Johannesburg, South Africa. Qualitative data was collected through ethnographic observations as well as interviews with young men, women, queer and trans people in India and South Africa from 2020-2022.

A major contribution of the paper is the theorisation of Femme Phobia to understand forms of men's gendered and sexual violence towards women, trans and effeminate bodies in the Global South. The paper provides evidence for the 'continuum of sexual violence' within heteropatriarchal contexts where women, trans and effeminate bodies are located hierarchically with men and masculinities at the intersections of race, class, caste, and sexuality. Through this lens, the paper reveals which types of femme bodies are acceptable and in what contexts, and which types of femme bodies create 'gender trouble' and hence also face intense violence.

PHILIP, SHANNON* (University of Cambridge, United Kingdom)

"Rich Women Don't Get Raped": Capitalism, Class Formation and Wealthy Men's Violence Towards Women

In this paper I explore how capitalist accumulation and the formation of the middle classes in India and South Africa, shape the experiences and discourse of gendered violence for wealthy and middle class men and women. Theoretically this paper demonstrates the complex relationship of capital accumulation with masculine domination, postcolonial inequalities, gendered relations and gendered violence.

Empirically I demonstrate how the accumulation of capital and 'becoming wealthy' in the Global South, hides certain forms of masculine power and privilege by framing wealthy and educated men as 'respectable' and 'non-violent'. As a consequence middle class and wealthy women who experience violence at the hands of these wealthy men are not believed. Amongst the police, service providers as well as the broader public discourse, only poor men are imagined to be violent men, and poor women are imagined to be the victims of violence. This situation creates paradoxical gendered vulnerabilities for wealthy and middle-class women who have gained upward social and mobility through capital accumulation, but are also rendered vulnerable and invisible due to their class position, with various dangerous tropes about how rich women do not experience violence. A further contribution of this paper is to demonstrate how patriarchal masculine privilege is compounded with class privilege for wealthy and middle class men through capital accumulation. Hence this paper looks at the complex and paradoxical relationship of capital accumulation with patriarchal power, masculine domination as well as questions of men's gendered violence towards women in transforming economies like India and South Africa.

Methodologically this paper draws on empirical qualitative material from long term fieldwork in New Delhi, India and Johannesburg, South Africa. Qualitative data was collected through ethnographic observations as well as interviews with men and women in India and South Africa from 2020-2022.

PHILIPPS, JOSCHKA* (University of Bayreuth, Germany)
TOUBGA, PAALA (Université Joseph Ki-Zerbo, Burkina Faso)

Uncertainties and Post-Truth Politics in the Central Sahel

Since 2015, Burkina Faso is confronted with an unprecedented security crisis and (geo)political upheavals. After the coup d'état in Mali in 2020, the now-Sahelian crisis has morphed into a complex amalgamation of conflicts between multiple parties, including jihadist forces, military governments, foreign powers and other armed groups. Information warfare looms large, as government propaganda and spurious information leaks circulate abundantly via various circuits of social media. In this post-factual reality, people pick sides without being able to verify much of the information that such positioning is based on. Accusations against Western imperialism and French neo-colonialism have emerged as major narratives, resonating with decolonial thought on a global geopolitical scale. The impact on the region's political and security dynamics is significant, with the arrival of Russia as a new player in the situation, and Ukraine recently following suit. Understanding the influence of post-truth and the process of its emergence in this context is crucial to grasp the informational aspects of current and future counter insurgency and the possibilities of stabilization and depolarization. Moreover, highlighting post-truth dynamics outside the global north seeks to critically reflect on the normative simplifications that reduce post-truth issues to moral problems.

PHILIPS, MIRAY* (University of Toronto, Canada)

Political Polarization, Religious Difference, and US Foreign Policy and Advocacy on Behalf of Christians in the Middle East

This paper grapples with contested claims-making about religious difference and calls for religious rights. In particular, I examine how the politicization and polarization of religious freedom in US foreign policy has fragmented advocacy on behalf of religious groups, with a specific focus on Christians in the Middle East. Based on 18 months of ethnographic fieldwork in Washington, DC among conservative American Christian religious freedom advocates, I argue that transnational advocacy on behalf of Middle Eastern Christians is powerfully shaped by domestic culture wars on religion. Advocates localize the suffering of Christians in the Middle East to claim that Christians everywhere, including in the United States, are persecuted. In positioning themselves as the protectors of Christian kin, they grapple with accusations of Christian favoritism and anti-Muslim bias. This advocacy ultimately frames the plight of Christians in the Middle East through the narrow lens of religion, blaming terrorism while absolving authoritarianism. At the heart of these politicized claims is the instability of the categories of religion and religious difference, as well as the polarization of religious freedom, paving the way for interest groups to construct representations of Christian persecution in line with their political interests.

WG11-JS-229.4

PHILIPS, MIRAY* (University of Toronto, Canada)

The Social Construction of Christians As the Most Persecuted Religious Group Worldwide in American International Religious Freedom Advocacy

A perception that Christianity is under attack has animated American political culture, driving domestic policies that advance Christian political power and foreign policies to protect Christians globally. Policymakers, advocates, and scholars have turned to quantification to make claims about the scope of Christian persecution globally. This paper attends to the social construction of Christian persecution—specifically its *quantification* and *amplification* as a social problem—within the International Religious Freedom advocacy field. Based on eighteen months of ethnographic fieldwork in Washington, DC, I show how actors employ discursive strategies to claim that Christians are the most persecuted religious group worldwide, relying on the perceived objectivity of quantification to transcend their political and ideological motivations. In doing so, however, actors mistranslate data by Open Doors and the Pew Research Center in order to claim that Christians are the *most* persecuted religious group worldwide. Given their credibility and access to channels of communication, actors amplify the problem of Christian persecution, sedimenting the claim that Christians are *most* persecuted, impacting both US domestic and foreign policies on religious freedom.

Peer-Led Mobile Health Design: A Critical Examination of 'empowerment' in MS Management

Multiple Sclerosis (MS) management requires responding to highly variable presentations and disease trajectories, which relies on the effective exchange of knowledge between patients and healthcare providers (HCPs). Patients must convey their lived experience of symptoms and HCPs must explain the physiological aspects of MS and negotiate appropriate clinical recommendations. In this paper, we explore the potential for digital technologies to facilitate this knowledge exchange by supporting the significant administrative undertaking ('the work') of living with MS. This work includes self-monitoring and self-reporting, as well as bridging some communication gaps by creating personalised 'objective' biomarkers. Peer-led semi-structured interviews were conducted with 12 people with MS to better understand two questions: 1. What barriers are people with MS facing navigating the medical system and accessing relevant health information? and 2. What features are required to create digital technologies that are useful for navigating those barriers? These questions concretely address the meaning of 'justice' in health and medical care and in this context, we make practical recommendations for the ethical co-design of mobile health (mHealth) technologies. Transcripts were analysed through reflexive thematic analysis by three researchers with different forms of disciplinary expertise, 'power' and 'knowledge'. Two findings emerged from the analysis. First, broader issues of trust in relation to medical systems were found to be a significant obstacle to the development of effective digital tools. Second, digital tools have the potential to challenge the jurisdictional expertise of HCPs, however the likelihood of this is contingent on a broader program of consciousness raising, namely: patients *understanding themselves to be experts in their health* and HCPs *recognising and valuing lived/ living experience knowledge* as critical to the applied outcomes of medical knowledge. We conclude that mHealth designers face challenges in securing the trust of potential users, which limits the transformative potential of their designs.

The Presence and Absence of Gender and Intersectionality in the 2023 NDIS Review: A Content Analysis

Public policy increasingly applies the term 'intersectionality' to describe overlapping forms of discrimination that result in inequitable outcomes. The inconsistent use of 'intersectionality' can however exacerbate inequities by displacing the systemic origin of barriers. This paper interprets key documents from the 2023 Review of Australia's National Disability Insurance Scheme (NDIS) to illustrate the understandings and representations of real-world

impacts of 'intersectional' disparities. While a world-leading initiative, the NDIS has received criticism for its design and implementation. There remains a significant issue of gender inequality in access to supports and services. In this paper we respond to the question: was the 2023 NDIS Review successful in addressing the persistent problem of gender inequality? To answer this question, we present a content analysis of key documents produced through the 2023 NDIS Review, to investigate whether and how the Review acknowledges and integrates gender inequality into its recommendations. The analysis assessed the frequency and conceptualisation of gender-related terms and of the Review's preferred term, 'intersectionality.' As a concrete case study of broader trends in the development of health and disability policy, this analysis found that the Review documents have limited references to gender-specific terms, often replacing them with 'intersectionality'. However, this preferred term lacked an explicit definition and was operationalised inconsistently. Through this example, we conclude that dilutions of 'intersectionality' as a concept in public policy continue to obscure the gendered foundation of issues to the level of individuals or groups, sidelining systemic critique. This means that both the recommendations and the findings of the Review largely ignore gender inequalities that people with disabilities experience. Importantly, our paper highlights the need for policy makers and researchers to operationalise the term 'intersectionality' deliberately and consistently.

Digitalisation, Remote Work and Gender Equality: The Role of Unpaid Domestic and Care Work for the Reproduction of Inequalities

The unfolding digital transition has powerful transformative and disruptive effects on labour markets and employment relations. Crucially, these developments do not unfold in a social vacuum, but are embedded in current social structures and are shaped by social relations, including gender relations. Drawing on postulates put forward in particular by feminist scholars, this paper focuses on how changes in employment related to technological developments interact with persistent gender inequalities in paid and unpaid work. While the potential challenges related to the digital economy no span many domains, this study focuses on remote work performed in the European context, including both telework arrangements in standard employment and gig work performed online through digital labour platforms. The key characteristic of these arrangements is that the workplace is brought, in general, into a private sphere of a household. In such contexts, the gendered division of labour in the household and gender roles in relation to employment have direct implications for engagement in paid work and the quality of working life.

The empirical analysis is based on two large-scale and representative European surveys: the Internet and Platform Work Survey (IPWS) and the European Working Conditions Telephone Survey (EWCTS). The analysis aims to identify gender differences in remote work, firstly in terms of its incidence and secondly in terms of job quality outcomes. Remote work is considered in terms of opportunities and risks for progress towards gender equality in paid and unpaid work, with a focus on its interaction with the household division of labour. The results show that the impact of digitalisation, which increases flexibility in terms of time and place of work, is firmly embedded in the intersections of occupational segmentation, gender roles and unequal division of labour in the household.

PIASNA, AGNIESZKA* (ETUI, Belgium)

Online Labour Platforms, Social Policy and Regulation: The Examination of a Disruptive Effect on Traditional Labour Market Actors

Online labour platforms are transforming work and employment relations in many ways. Importantly, their disruptive effect materialises through the restructuring and extending the boundaries of the firm, leading to a reshaping of power relations between traditional actors in the labour market. Not only are (mostly precarious) platform workers effectively considered as small businesses with limited representation rights, but at the same time platforms are abdicating the role of employer. The consequences of this role redefinition are directly experienced by workers in the form of limited access to labour rights and social protection, and difficulties in holding platforms accountable in any strive towards better terms and conditions. As a result, the debate on possible regulatory responses has focused on the employment status of workers. This study takes a complementary focus by considering the employer side as a key counterpart in a functioning employment relationship. It is argued that the renunciation of the employer role by platforms is leading to a redefinition of traditional categories of labour market actors and their roles in social policy and social dialogue, with important implications for

future policymaking, legislation and collective bargaining, and with potential spill-over effects beyond the platform economy. The empirical testing of this argument is carried out using the actor-approach to analyse the views and positions of social partners during works on the European Union proposal for a directive on improving working conditions in platform work (in the period 2021-2023). The analysis reveals how actors' prerogatives are affected by the blurring of the role of the employer and the redefinition of traditional categories of actors in social policy.

The Return of Student Mobilizations: The Acampadas and the Global Pro-Palestine Protests in the Universities, from the USA to Sicily

For a year now, we have witnessed the unexpected return of student protests in universities and streets around the world. In fact, since the invasion of Gaza by the Israeli army as a consequence of the attack on October 7, 2023, many students, together with some professors and researchers, have mobilized against the war policies of the state of Israel, in support of the resistance and the right to self-determination of the Palestinian people. If the protests had already begun in the fall of 2023 in universities, especially in Europe, it is with the first *acampadas* in US colleges in the spring of 2024 that the pro-Palestine student movement spreads throughout the world, first in other American colleges and immediately after in the universities in many Western countries as well as Arab ones. Since then, the protesters have been asking the academic authorities to boycott Israeli universities and weapons manufacturing companies, considered complicit in the "genocide" in Gaza and, more recently, in the war in Lebanon. Except for the partial acceptance of the requests by some universities, the repression by the police and pro-Zionist groups, especially in the USA, and the instrumental accusations of anti-Semitism have been the responses of political and academic institutions. Why have students returned to mobilize diffusely after years of relative calm on an issue that does not directly concern the student condition? What characteristics have their mobilizations assumed? How do they differ from past ones and what are the elements of continuity? I have therefore tried to answer these questions, based on literature, reading documents and online sites, participant observation and some interviews with activists, starting from the empirical case of the protests at the University of Catania, in Sicily, to broaden the view to other mobilizations in Italy and beyond.

Social and Spatial Inequalities Under Pressure

This research examines the medium- and long-term effects of the COVID-19 pandemic on mental health in Italy, with a focus on its temporal evolution and the differential impact across various social groups, defined by gender, age, socioeconomic status, and occupation. We utilized longitudinal data from three waves (2019, 2020, and 2023) of the ITA.LI – Italian Lives survey. The

data were collected through a mixed-mode approach (CAPI, CATI, and CAWI). We modeled mental health trajectories using multilevel (growth curve) analysis. ITA.LI is a nationally representative longitudinal survey of Italy, enriched with spatially-based administrative data from various institutions.

By integrating individual survey responses with time-varying information at the geographical level (e.g., multidimensional deprivation index, infection rates, death rates, population density, age distribution, hospital capacity), the paper assesses whether COVID-19 exacerbated pre-existing inequalities in Italy or created new ones. Additionally, the study estimates whether the direct and indirect effects of COVID-19 persist over time and whether these effects are moderated by individual, family, and contextual factors.

Preliminary findings reveal heterogeneous impacts, with young people, women, individuals of lower socioeconomic status, and those living in deprived areas experiencing the most severe negative outcomes. The study highlights the need for targeted interventions to mitigate the long-term mental health consequences, particularly for the most vulnerable groups.

Marital Selectivity, Gender Roles and Housework Division in Comparative Perspective: Does National Context Matter?

The second demographic transition describes, among other phenomena, the transformations that have occurred in societies regarding fertility and new family configurations in terms of more symmetrical gender relations (e.g., Lesthaeghe, 2010). However, studies show that this is not a linear and synchronous process across different countries. Comparative research indicates that, regardless of the national context and its indicators of fertility, Human Development Index (HDI), and Gender Inequality Index (GII) (Picanco, Covre-Sussai, Sento-Sé, and Araújo, 2024), women continue to assume the majority of domestic and care work, with variations arising from having more egalitarian gender attitudes. This article aims to analyze the relationship between educational marital selectivity and the number of children, gender attitudes, the housework and care work division, and work-family conflict, as well as any variations across national contexts. The data comes from the "Family and Changing Roles" module (2012) of the International Social Survey (ISSP), from which we propose indicators to measure gender attitudes, the housework and care division, and work-family conflict. To measure contextual characteristics, we use the Human Development Index (HDI) and the Gender Inequality Index (GII). To analyze educational marital selectivity, we classify marital arrangements into the following categories: homogamous with high education (when a person with a higher education degree is married to another person with a higher education degree), homogamous with medium and low education, hypogamy I (when a person with a higher education degree is married to someone with medium education or below), hypogamy II (when a person with medium education is married to someone with low education), and hypergamy (when a person with low or medium education is married to someone with a higher education degree). Preliminary results indicate that homogamous couples with high education distribute tasks more symmetrically than other couples.

 SERINO, MARCO (University of Naples Federico II, Italy)

Anticipatory Knowledge and the Tensions of Anthropocene in Outer Space Research

In recent years, space exploration research has emerged as a field for building anticipatory knowledge to address the challenges posed by the Anthropocene, such as the lack of resources for a planet on which the risks associated with climate change are raging. This contribution investigates the promises, imaginaries and tensions inscribed in MELISSA (Micro-Ecological Life Support System Alternative), a research project aimed at developing 'Bioregenerative Life Support Systems' (BLSSs), by testing farming systems in extreme conditions, such as those of outer space. Through the theoretical framework of Science and Technology Studies (STS), the study analyses the scientific literature on BLSSs to investigate: a) the narrative infrastructures (Felt, 2009) aimed at legitimating technoscientific research on outer space; b) the 'sociotechnical imaginaries' (Jasanoff and Kim, 2015) that underline scientific writings proposing forms of anticipatory knowledge concerning representations of the future and horizons of expectations of life in outer space and on Earth; c) what forms of renegotiation of coexistence between humans and plant organisms are prefigured.

The analysis of these narratives shows how the transformative visions of the future underlying BLSS projects are in tension with the same ecological concerns predicated in those visions; they are oriented by two apparently conflicting, but dialectically linked drives (Scharmen, 2021) - one towards the Earth, the other beyond the latter's orbit - held together in a single scientific proposal that addresses the challenges for the future of human existence. In the social sciences, this tension gained momentum in the debates over the opposition between different emancipatory futures, emphasised by Bruno Latour's contrast between the 'Terrestrial' - i.e. an orientation towards the recovery of Earth - and the 'Out-of-this-world' (Latour, 2017), which could mean to 'escape' from the Earth, i.e. to gain freedom from the limits and constraints of our home planet.

Conocimiento Situado y Encarnado: Reflexiones Metodológicas y Hallazgos Para Pensar Una Etnografía Institucional Aplicada a Los Cuidados.

La presente ponencia tiene por objetivo analizar diversas estrategias y herramientas de investigación en cuidados desde una mirada epistemológica y metodológica crítica.

Se parte de la trayectoria investigativa del equipo autor de los últimos 15 años en la región iberoamericana. En base a una sistematización realizada de diversos encuadres metodológicos señalados en diversos proyectos de investigación, se analiza la temática de cuidados en relación a diversos programas sociales y comunitarios. Se transita por abordajes cualitativos, cuantitativos y mixtos donde se permite abordar desde la mirada crítica e interdisciplinaria enmarcada en las ciencias sociales, la perspectiva de cuidados desde los aspectos materiales, emocionales y morales.

Se parte de estudios de carácter exploratorios, descriptivos y comprensivos, donde como estrategia de investigación se basa en el estudio de caso simple y comparado desde un abordaje que contempla la multidisciplinariedad de los cuidados y el ciclo de la vida (infancia, juventud, adultez, y personas mayores). Para ello, resulta fundamental partir de una premisa de reflexividad de las prácticas hacia la validez y el rigor metodológico.

Finalmente, se proponen hallazgos que apuntan a la generación del proceso de ruptura y vigilancia epistemológica hacia la construcción de objetos-sujetos de estudio situados y encarnados que promuevan la mirada holística que pueda dar cuenta de una construcción del objeto dinámica y flexible. Para ello, se desarrollan aportes y recomendaciones desde la mirada de la etnografía institucional aplicada a los cuidados, abordando desafíos sobre cómo fortalecer su utilización y sobre cómo contribuir a la formación de futuras generaciones en torno a ella.

People-Environment-Public Health: How Transdisciplinarity Can be a Bridge in Participatory Research

Based on the proposals of Citizen Science (Cooper and Lewenstein, 2016; Hecker et al., 2018) and Post-normal Science (Funtowicz and Ravetz, 1993, 2020), the OHCS project is implemented in seven case studies in Italy. The project is an ongoing research endeavour that aims to develop an intervention model for the National System for Health Prevention and Environmental Protection, capable of characterising the environmental quality, assessing the exposure of the population and measuring the impacts of the contamination and remediation scenarios. One of the case studies concerns Porto Marghera - Venice (Italy), one of the most contaminated areas in central and western Europe, and involves human biomonitoring, with the participation of individuals at all stages of the research process, extending beyond the role of test subjects.

The joint work of the social sciences and epidemiology represents one of the first and main lines of enquiry that implements participatory approaches (Kullenberg and Kasperowski, 2016), recognising the richness of the interplay of different knowledge and the need to broaden the gaze to the stakes and uncertainties that environment and people-related issues pose (Malavasi et al., 2023).

Both CS and PNS prioritise the inclusion of various stakeholders in the research process and challenge traditional notions of "expert knowledge", promoting a more democratic and transparent approach to knowledge production (Ravetz, 2006; Haklay et al., 2023). This work shows, from a methodological point of view, a way of implementing transdisciplinarity and supporting knowledge exchange across scientific and non-scientific stakeholder communities: citizens, local administrations and "experts". Using a concrete case, it would be step-by-step guide to a continuous understanding, reflection and advancing work, in the awareness that each case study needs to be contextualised in space and time and that doing participatory research is not just a matter of ticking boxes.

Exploring Neighbourhood Together: The Role of Creative Moments for Multisensory Connection with Place in a Participatory Study in Rotherham (UK)

Neighbourhood exploration as a methodological tool allows for a holistic connection of research participants with a place: cognitive, emotional, participatory, and also increases a sense of belonging (Bazuń & Kwiatkowski 2022). 'Crossing the Frontier' project (UKRI Research England, 2024) explored the potential of collective movement and artistic expression as the basis of constructive interaction at the community-policy nexus. Centred on three neighbourhoods in Rotherham (UK) with a substantial and diverse migrant population, we built on the findings of, and relationships established in the 'Life at the Frontier' research programme (ESRC/Nordforsk, 2020-2023), and organised three collective walks/movements including neighbourhood exploration in partnership with residents, community organisations, government representatives and Rotherham-based artists. An emotional connection with and reflections on the place during the walks was facilitated by two artistic exercises: area sketching (led by artist Uzma Rani) and landscape canvassing (artist Lora Krasteva). Overall, our research demonstrates that neighbourhood exploration with short and easy creative activities is a powerful tool for the co-production of visual, textual and artistic data, while meaningfully connecting residents and decision-makers in action, with a potential to improve social cohesion in diverse and deprived neighbourhoods. Our commitment to continue the study and long-term research agenda are driven by the principles of emancipatory social science, whereby scientific rigour is accompanied by a central moral purpose to create a more equal and just society (Wright, 2020).

Trajectories and Turning Points: A Mixed Methods Exploration of the Role of Migration and Race for Unequal Ageing

We employ the life course perspective seeking to understand how migration and race shape people's life outcomes as they age, and how disadvantages accumulate over time. Our work relies on insights from a large and multi-stage mixed methods project on experiences of social inclusion / exclusion across the life course among older people (50+) with migration backgrounds in two English urban settings (project 'Ethnicity and Unequal Ageing', UKRI, 2022-2025, <https://www.ethnicityandunequalageing.ac.uk/>). We integrate quantitative and qualitative data analysed in the project - a sequence data analysis of work-life statuses (British Household Panel Study & UK Household Longitudinal Study, 1991-2020) with life history interviews with four different racialised groups (Roma, Muslim, African and Irish, N=80) - to explore complexity of paths and turning points for life outcomes. In our data integration process we follow principles of the pillar integration process, so the way we merge results is data-driven and inductive. While statistical data allows us to identify different work-life trajectories for people with and without migration experience, life histories provide illustration on how racism-induced disadvantages accumulate over time as people age, and how in later life they are still affected by meaningful turning points which they experienced earlier. We also explore intersectional aspects between race and gender, socio-economic status and place as affecting life outcomes. Our study contributes to sociology of ageing by conceptualising racism as an important turning point in life course which shapes ageing inequalities in an asynchronous way.

Understanding and Changing the Power Dynamics of Disaster Creation and Mitigation in Pandemic Response

Pandemics are recurrent threats that have the potential to disrupt entire systems and societies, creating sudden crises that resonate forcefully beyond the realm of medical outcomes.

The practice of securitisation against such far reaching disasters are increasingly reliant on the intensification of surveillance and the rapid sharing of data. Readiness in the face of pandemic threat is often tested against a cycle of scenario modelling and simulation exercises, each leading to more modelling and simulations.

The focus of pandemic threat response and investment remains also largely centred around technical and individual fixes, especially pharmaceutical innovations, like vaccines, antivirals and rapid diagnostics. It does not sufficiently consider disaster root causes and risk creation processes, especially where these may be anthropogenic, for example those stemming from our agri-food systems.

Despite many attempts at WHO-level to draw attention to the One Health approach, which highlights the interdependencies between animal health, human health and the environment, the prevailing disaster practice cements the status quo of dealing with these domains and their risks in isolation. Yet, we are increasingly fighting outbreaks that are insect-born, carried by mosquitos that, due to the rising temperatures and effects of climate change, extend their habitats to new regions, carrying Zika or Dengue to areas previously free of these diseases. Alongside various forms of environmental depletion, human practices that create or intensify pandemic risks also include deforestation, monoculture and intensive agriculture, rapid urbanisation, poor or lacking sanitation. Inadequate animal husbandry can also result in misuse of medication in animal rearing, which increases risk of pathogens becoming resistant to known antibiotics.

A different and participatory approach to understanding the power dynamics of disaster creation and response is needed to overcome policy responses which are not conducive to socio-environmental reflection, nor to the transformations that would reduce the risks of future crises.

Investigating Cultural Stratification through Music Listening Data: An Initial Exploration with Machine Learning

Relying on a mixed-method survey design, we jointly analyze, at the individual level, observational data on music listening histories from streaming platforms alongside sociodemographic data from questionnaire surveys. This approach allows us to capture an unprecedented level of granularity and precision in the music listening habits of over 15,000 respondents over a period of more than five years, while connecting these observational data to the individuals' sociodemographic characteristics. We explore the potential of machine learning methods to revisit the relationships between social positioning variables and cultural practices. Our goal is to critically assess models of distinction, omnivorousness, and generational differentiation, in order to further examine contemporary forms of cultural stratification in the digital age.

Policrisis: How Can Feminist Thought Illuminate Paths through Complexity?

If it is true that the contemporary Anthropocene scenarios are characterized by interconnected global crises (economic, climatic, health/pandemic, and geopolitical) that interact in such a way that the whole is more oppressive than the sum of its parts (Tooze 2021), we must consider the implications of potential actors and their various paths through complexity. How do they activate the "fundamental connection between all living beings" theorized by Teilhard de Chardin? Furthermore, in a more radical sense, we must explore the extent to which this connection can alter the course of events in favor of a multispecies alliance (Haraway 2019), thereby transcending the anthropocentrism that has led the planet to experience multiple points of no return.

Policrisis supports and exponentially amplifies, alongside conflicts and divisions, discrimination and violence against women—a structural phenomenon within society that adapts to modernity, remaining a legacy of ancient patriarchal heritage that neither struggles nor norms have fully eradicated. This unprecedented chain of crises, exacerbated by "headless" technological progress, presents an unmanageable complexity that intensifies violence against women, despite the resolutions of international bodies and the good intentions of various agendas.

A number of studies have already documented the impact of each crises on the lives and bodies of women, frequently resulting in discrimination. This was notably observed during the pandemic. While these areas of focus are of significant importance, particularly in the context of disasters, resource scarcity, environmental crises, global warming, and wartime sexual violence,

Morin (2017) notes that “the advancement of knowledge is unable to conceive the complexity of reality”. Therefore, although these contributions are crucial, it is essential to conduct a holistic, feminist, and intersectional analysis to identify the impact of policrisis on women, to understand and cope with its complexity, and to explore potential solutions.

PIGNATTI, GIULIO* (Università degli Studi di Padova, Italy)

Sur Le Rapport Entre Réflexivité Politique Et Réflexivité Sociologique. De Durkheim à Bourdieu

La présente communication vise à poser, d'un point de vue de la philosophie des sciences sociales, la question du rapport entre la réflexivité sociologique et la réflexivité politique, en particulier chez Émile Durkheim et, en conclusion, également chez Pierre Bourdieu, en reconnaissant une problématique commune entre les deux sociologues. Chez Émile Durkheim, la fondation de la sociologie est accompagnée d'une forte thèse épistémologique et méthodologique concernant la rupture de la pratique scientifique avec les prénotions du sens commun. Cependant, en même temps, surtout dans une phase plus tardive de sa pensée, la sociologie est comprise – en contradiction partielle avec les préceptes des *Règles de la méthode sociologique* – comme un relais de conscientisation des sociétés modernes et comme un prolongement des représentations des acteurs sociaux. Une fonction similaire est jouée, selon les *Leçons de sociologie*, par l'État, que Durkheim considère comme « organe réflexif de la société ». La question qui se pose est donc celle du rapport entre une réflexivité politique, qui trouve dans le gouvernement son lieu d'élaboration et qui a avant tout un objectif pratique, et la réflexivité scientifique, celle du sociologue, qui doit à la fois rompre avec le sens commun mais qui ne peut que partir de ce dernier, étant son objet le plus propre. L'objectif de la communication est de montrer comment la réflexivité scientifique et la réflexivité politique ne peuvent pas être superposées chez Durkheim, bien qu'elles maintiennent une articulation problématique à bien des égards. En prenant appui sur la dette de Bourdieu envers Durkheim concernant la définition de l'État comme détenteur du pouvoir symbolique, ainsi que sur le plan de la perspective épistémologique de rupture avec la sociologie spontanée, il sera vérifié en conclusion si la sociologie réflexive de Bourdieu constitue une solution pour sortir de l'impasse durkheimienne.

Food As a Vehicle of Sense of Place in Ecomuseums Practices

Food is a medium for conveying intangible culture and local identity. It creates a connection between eating habits, familiar flavours, and an individual's cultural background, which includes identity, sense of place, emotions, and memories (Pravettoni, 2010). Ecomuseums are “locally-driven, place-based organizations that encourage sustainable community development, based on *in situ* heritage conservation and interpretation,” and “they enable communities to preserve cultural practices” for local development (Saskatchewan, 2015). Through their active work, ecomuseums address a wide range of themes relevant to the local community, fostering a sense of place, a concept that involves the social dimensions of place and the emotional investment and meanings that local people attach to it (Hummon, 1992). Ecomuseums thus support the development of empathetic communities by strengthening the sense of place (Pigozzi, Borrelli, 2023). Food can be considered a “cultural touchstone,” a special feature of our environment that we cherish (Davis, 2005), serving as an extension of community identity, telling the story of one's roots, heritage, and connection to a community. Each cuisine embodies a system of practices, values, and meanings shared by that community, representing a vital aspect of identity and a repository of traditions that shape an invaluable intangible heritage (Coloma, 2024). The purpose of this abstract is to explore how ecomuseums, through various food-related actions, can contribute to conveying and strengthening local identity and community cohesion, ultimately enhancing the sense of place.

Labor Protests As Political Responses

The paper aims to explore the impact of political reforms on labor protests, and on the unions and organizations supporting them. In doing so, we complement theories centered on economic factors and workplace organizations as key dimensions influencing labor action. Drawing on insights from contentious politics, we argue that political reforms not only lead to an increase in labor protests but also broaden the spectrum of unions and

organizations mobilizing workers, as they pose a threat to a diverse range of actors. We focus on labor protests in post-2008 Italy (2008-2023), a country deeply affected by the 2008 recession and the COVID-19 pandemic. In response to these crises, a series of reforms was implemented, significantly impacting workers' rights, wages, job precarity, and overall working conditions. Using a dataset built through protest event analysis (PEA), we analyze changes in labor protests and the unions and organizations involved from 2008 to 2023, with particular attention to variations during periods of reform implementation. The results indicate that spikes in labor protests are closely linked to the passage of reforms throughout the period, with the field of actors expanding significantly during these moments. In particular, reforms introduced in the aftermath of the 2008 economic recession led to greater intersectionality, fostering increased collaboration between labor unions and other social movement organizations. During the Covid-19 period, non-working categories and professional groups intensified their involvement as well. The conclusions explore how the changing landscape of worker mobilization, driven by the involvement of diverse actors, both revitalizes labor movements and simultaneously challenges their internal unity, as differing actors' agendas can strain the unity and cohesion of labor movements.

PILLINGER, ANNA* (Johannes Kepler University Linz, Austria)

Shaping Technology – Shaping Care Work? a Social Shaping of Technology Analysis on the Digitalization of Care Work.

In the past decades, care and care work have undergone a drastic economic shift, accompanied by the emergence and implementation of a variety of digital technologies in the field. Studies researching the technologization of this – often imagined as rationalization-resistant (Aulenbacher 2021) – sector show, how these technologies result in an intensification of work (Moore and Hayes 2017), being a means of control (McDonald et al. 2021), foster new divisions of labour, and creating gender(dis)order (Fahimi 2022) in this highly feminized sector. However, looking into the everyday work experiences of care-workers draws an ambivalent picture. I therefore ask, *how are digital care technologies socially shaped and how does this shape care and care work?* My theoretical framework draws from the concept of the Social Shaping of Technology (SST) (MacKenzie and Wajcman 1999), which emphasizes a myriad of aspects that are intertwined in the shaping of a technological artefact, such as economic factors, the state, gender and inequalities as well as technology itself and path dependencies. This is combined with concepts of the sociology of work and labour process theory to also understand how these technologies are shaping work. My contribution draws from qualitative interviews with care and tech workers as well as a document analysis of care technologies (i.e., robotics in care and digital documentation systems). Based on this research, I aim to give an insight in how these digital care technologies are shaped socially and explicitly by technology development, and thereby shape care and care work. My findings show, how digitalization of care work plays out differently depending on the technologies and the settings. The gendered division of labour, however, seemingly stays cemented since although technology moves into the workplace, the capacity to act on it, remains little.

WG10-936.2

PILLINGER, ANNA* (Johannes Kepler University Linz, Austria)

Technosolutionism in Care Work? Myths and Realities of the Digitalization of Care Work.

Myths and promises around the digital transformation of work do also occur beyond sectors that are typically associated with “high-tech” or industry 4.0. With the entry of digital technologies in the field of care and care work, myths, imaginaries, promises and fears surrounding these technologies are appearing. In my contribution, I want to scrutinize the role of technosolutionism (Morozov 2013) in the field of care and care work. Drawing on the concept of technological “Leitbilder” (e.g. Wolf 2021) and empirical data (qualitative interviews, document analysis) on platform mediated cleaning work and digitalization of care work, I analyse the narratives and practices around three technologies: platforms, digital documentation systems and robotics in care. Delving into these narratives and practices for the aforementioned technologies show that i) platforms mediating cleaning work promise a formalization of informal domestic work, but can perpetuate it; ii) digital documentation systems in senior care should lift the burden of analogue documentation, but is putting pressure on the care workers as well; iii) robots in care work should support the overworked staff, but require care and work themselves, such as maintenance and cleaning. Zooming into these contradictions enables both, to confront a technological determinist understanding of the digitalization of work and to understand how these myths are shaped by and shaping the everyday work practices of these workers.

RC30-474.4

PIMENTEL FERNANDES SOBRINHO, ISAAC* (Unicamp, Brazil)

Poor Region, Precarious Teachers? Labor Relations in Acre, Brazil

The objective of this paper is to examine the methods employed by the governments of Acre, one of Brazil's most impoverished states situated in the Amazon region, for the recruitment of public education teachers (IBGE, 2023). The central hypothesis guiding this study suggests that objective precariousness (Linhart, 2009) predominantly impacts the most socially vulnerable communities. The research aims to elucidate the influence of capital on the structuring of labor within the public sector, particularly in the context of flexible accumulation, which is characterized by a neoliberal political-economic framework that has intensified the exploitation and loss of workers' rights in Brazil (Harvey, 2008). It is recognized that flexible labor relations are defined by the implementation of policies promoting market freedom, often through managerialist approaches. Analysis of data from the school census revealed that approximately 74% of educators in the final years of primary and secondary education were employed on a temporary basis in 2020, with a significant concentration in rural and indigenous regions. This finding underscores the government's insufficient commitment to public service, particularly concerning the provision of quality education for these populations. Our findings confirm the initial hypothesis, as evidenced by the identification of 166 schools in Acre, that employed 100% temporary teachers. Consequently, we raise the question of whether the education provided to these communities, staffed by precariously employed professionals, aligns with the principles of justice articulated in both national and state legislation.

Migrant Labour in the Face of Rising Far-Right Politics in Germany: A Historical Materialist Policy Analysis of Migration Policies

This research primarily aims to examine the development of immigration and integration policies in Germany and the political-economic background of migrant labour policies. Historical materialist policy analysis (HMPA) will be used to understand and explain the migration policy preferences of the German government. HMPA views policy processes as a contested arena where various class interests are reflected in statecraft. Consequently, policies emerge as the result of these intricate processes, which are ultimately guided and shaped by the state apparatus.

The study posits that labour market policy and labour regime preferences are key factors in the social integration of migrants. This premise allows us to link migrant integration and labour market policies. In the aftermath of the 2008 global crisis, a strategic overlap emerged between refugee reintegration and labour market policies in the European political economy.

The policy documents of government and business sectors present an explicitly pro-migration stance, with very positive and supportive discourse regarding immigration processes. Analysis of these documents and integration processes reveals a coherent and unified attitude among policy actors, rather than a contradictory one. However, recent European elections and state elections in Saxony, Thuringia, and Brandenburg have shown a rise in support for the anti-migrant, far-right AfD party. Public discussions about refugees reveal a less positive attitude. An anti-migrant sentiment is gaining ground in society and, increasingly, in the political sphere as well. This contrast between official policy and public sentiment poses a complex challenge for German policymakers. They must balance maintaining an open, welcoming stance towards immigrants—crucial for addressing labour shortages and demographic challenges—with addressing the concerns of a growing population segment uneasy about the pace and scale of immigration. This paper examines this contradiction and analyses how it's reflected in the governance of migration policies.

RC30-475.3

PINEDA RAMOS, CARLOS ANDRES* (University of Bristol, United Kingdom)

Empathy As Global Emotional Currency

This research examines the economic, social, and emotional inequalities in global service provision, focusing on the case of call centre workers in Colombia. It highlights how international outsourcing perpetuates these inequalities and reinforces the power imbalances between the global North and South. The study argues that empathy, seen as emotional capital, is a key requirement for call centre agents in the global South to meet the emotional

demands of clients in the North. These emotional requirements reflect broader inequalities and precarious working conditions in international service provision.

By analysing the dynamics within Colombian customer contact centres, the study reveals how empathy functions as a form of emotional capital, commodified to meet commercial goals and reinforce unequal global relationships. It draws on the work of scholars like Illouz, Hochschild, and Bourdieu to explore how emotions are embedded within the capitalist system. The findings demonstrate that empathy, often viewed as a non-negotiable requirement, is reduced to a commercial tool yet remains ambiguous in practice.

This research is based on fieldwork in Bogotá, carrying on 46 semi-structured interviews, showing how empathy shapes service interactions and reveals the disparities in global outsourcing. Call centre agents are acutely aware of their position within the global service hierarchy, recognising the link between their working conditions and broader economic inequalities. This research underscores the importance of recognizing the emotional power imbalances within global hierarchies, as it is a crucial step towards addressing and rectifying these inequalities. Ultimately, this research contributes to understanding the emotional dimensions of global service provision, challenging individual responsibility for emotions, and calling for recognition of the emotional power imbalances within global hierarchies.

Afrotourism in Brazil: Open Dialogue for Human Rights

Cais do Valongo, the largest port of arrival for enslaved Africans in Brazil, located in the city of Rio de Janeiro, was recognized as a World Heritage Site by United Nations (UNESCO). Its recognition is linked to a place that marks of the colonization and slavery. The transatlantic trade in enslaved Africans represented one of the most extreme violations of human rights in history and left consequences for Brazil. It is now part of the Historical and Archaeological Circuit of African Celebration, due to its historical and cultural importance. In 2020 the racial agenda emerged in Brazil and Afrotourism has emerged as a segment, which brings the racial agenda, the valorization of the African heritage in Brazil and the emergence of the anti-racist. It brings a demand for tourism to bring Afro-Brazilian narratives, memories and knowledge of quilombola communities in the country. Brazil is the country with the largest Afro-Descendant population outside the African continent. The UN General Assembly has proclaimed the period 2015-2024 as the International Decade of People of African Descent, with main objectives: to promote knowledge of and respect for the heritage, culture and the contribution of people of African descent. The aim of this article is to analyze the role of in promoting human rights and the anti-racist. Since the Durban Conference in 2001, which sought to raise global awareness of racial discrimination and the growing global demand for diversity and the importance of narratives, we will analyze the role of Afrotourism, which brings a perspective of the protagonism of the black community in telling their story and how this can change the perspective of the tourist's experience of Brazil. In addition to analyzing the role of tourism in the 2030 Agenda, which brings together action plans for the promotion of economic and social development.

PINKOW-LÄPPLE, JANINE ISABELLE* (Humboldt Universität zu Berlin, Germany)

MÖLLERS, JUDITH (Leibniz Institute of Agricultural Development in Transition Economies (IAMO), Germany)

"I Don't Need a Man in My Life" – Changing Gender Norms Among Highly-Skilled Female Return Migrants in South East Europe

Research on international migration has predominantly concentrated on immigration and its effects on destination countries, often overlooking the impact migration has on the social and cultural dynamics of migrants' countries of origin. Within this broader gap, the intersection of gender and return migration remains particularly underexplored. This is especially true for the experiences of highly skilled female returnees, whose migration journeys have the potential to challenge and transform traditional gender norms in their origin countries (King and Lulle, 2022; Wong, 2014).

Our study addresses this gap by examining how the return of highly skilled female migrants to patriarchal societies in South East Europe influences local gender norms, focusing on the cases of Kosovo and Romania. Drawing on the theoretical concept of intangible remittances, a refined version of Peggy Levitt's (1998) concept of social remittances, we explore how these women experienced migration to North America or Western Europe, and how their experiences abroad influenced gender norms upon their return.

Based on 65 qualitative in-depth interviews, our analysis shows that nearly all participants found their time abroad empowering. They embraced progressive ideas of gender equality, sexual identity, and family-friendly concepts like parental leave. Upon their return, most sought to leverage this empowerment and introduce these newly acquired ideas and practices to advocate for gender equality. However, many participants encountered significant conflicts and resistance from the local population, which hindered the transfer of intangible remittances. We conclude that the return migration of highly skilled female returnees has the potential to drive socio-cultural transformations in their origin countries. However, support mechanisms are crucial to ensure their efforts are not stifled by challenging local environments.

PINNA, GABRIELE* (University of Cagliari, Italy)

Precarity and Labor Dynamics in Italian Tourism: The Case of Sardinia

This study examines the working conditions in the tourism sector in Sardinia (Italy), focusing on labor precarity, exploitation, gender disparities, and limited social mobility within the seasonal and sea tourism. Drawing on interviews with workers and entrepreneurs, the research highlights the deep-rooted challenges of seasonality, low wages, and informal work practices. Workers report long hours, job instability, and partial compensation, often exacerbated by the predominance of short-term contracts. Many also face informal work arrangements, where only a fraction of the labor performed is officially paid. The findings also reveal significant gender inequalities, with women frequently relegated to lower-paid and less visible roles such as housekeeping, while men occupy managerial positions. Despite high levels of participation, women struggle to break through the "glass ceiling," often facing barriers to upward mobility due to both structural and cultural constraints. These gendered labor dynamics, coupled with the high demands of balancing family responsibilities with work, create additional burdens for female workers. Furthermore, the sector offers limited prospects for professional growth and long-term stability, pushing many to migrate abroad for better opportunities. This lack of social mobility is compounded by inadequate training programs that fail to meet the needs of the local job market, particularly in regions, as Sardinia, heavily dependent on tourism. Ultimately, this study calls for structural reforms in the tourism sector to address labor exploitation, support gender equality, and provide workers with meaningful opportunities for professional advancement, thus ensuring a more equitable and sustainable future for the industry of tourism.

PINNA, GABRIELE* (University of Cagliari, Italy)

Teaching in "Frontier" Schools: The Challenges and Experiences of Vocational School Teachers in Italy

This paper examines the professional experiences of teachers working in vocational schools in Italy, institutions often associated with high levels of social marginalization and educational challenges. The study draws on qualitative and quantitative data from vocational schools, where teachers face complex interactions with students from working-class backgrounds, often marked by academic underperformance and behavioral issues. Vocational schools are positioned at the margins of the Italian educational system, a sector characterized by declining enrollment, violent incidents, and media attention on teacher-student conflicts. This marginalization reflects broader societal undervaluation of manual and technical education compared to academic tracks. The research explores how vocational school teachers navigate these difficulties, balancing traditional educational goals with the immediate social and emotional needs of their students. Using frameworks from both the sociology of education and the sociology of work, the study highlights how teachers' professional identities and teaching practices are shaped by daily interactions and the institutional demands of "frontier" schools. Teachers' experiences are analyzed through the lenses of class, gender, and career trajectory, revealing the emotional labor involved in maintaining classroom order and fostering student engagement. The study also addresses the pressures of recent reforms aimed at aligning vocational education with labor market needs, raising questions about the impact of these policies on teaching practices and professional ethos. The findings contribute to ongoing debates about the crisis in professional meaning within education, suggesting that vocational school teachers play a crucial role in mediating between educational objectives and the socio-economic realities faced by their students.

Intercultural Training for Social Justice in Organizations: A Research-Action in Italy

In today's rapidly evolving socio-political landscape, organizations encounter new challenges in managing their workforces. There is an increasing demand for recognition and social justice from historically marginalized and disadvantaged groups, which organizations must address effectively to ensure fairness, equality, and, consequently, employee well-being. One of the key strategies that can be employed is training in intercultural competence—starting with managers and supervisors and eventually extending to the entire workforce. This initiative is vital for developing the organization's ability to address specific cultural and religious needs, thereby fostering greater social justice.

Such practices are integral to diversity, equity, and inclusion (DEI) policies, which are primarily adopted by large companies but are relevant for all organizations—both public and private—given that no sector is exempt from increasing diversity. While these policies are often driven by the economic benefits of diversity, they also reflect a normative commitment to social justice. This is not a mere return to affirmative action; rather, it emphasizes compliance with anti-discrimination standards aimed at effectively addressing the needs of minority groups.

The purpose of this paper is to present an action research intervention conducted as part of a Ph.D. project. Following qualitative research focused on managing cultural, ethnic, and religious diversity in small and medium-sized enterprises (SMEs) in Italy, one participating company was selected to receive intercultural training. The goal of this training was to introduce the ISO 30415 framework of 2021, a tool designed to guide organizations in implementing diversity, equity, and inclusion policies.

PIOTROWSKI, GRZEGORZ* (University of Gdańsk, Poland)

New Strategies of Migrant Labour Movements

Despite the scale of migration of Poles into the UK (around 1 million people, as a rough estimate), there are only few studies that look at the migrants' political involvement and none regarding the migrants' involvement in labor issues. In the presentation I am looking at labor activism from the perspective of social movement studies, as majority of workplace-related initiatives of Polish migrants in the UK takes place outside of conventional trade unions and more often within radical and movement-connected trade unions (often with syndicalist heritage) or by migrant self-help networks that expand their scope of activism to labor issues. Despite the growing academic interest in issues of migration and migrants' involvement in politics, there are substantial gaps in scholarly literature on the topic. One of the issues is the relations between migrant communities and the organisational side of the host society, in other words, how migrants use the already existing tools - such as trade unions in this case - for their purposes, or rather they create their either by creating local chapters of organisations and initiatives from their home country or created in the host country. In my presentation there are two main findings: the first one is the realisation that the issue of dignity of the worker is the key factor for migrant workers, an issue that pushes some of the migrants towards social movement-like activism, rather than conventional trade union activism (perceived as focused on wages increase). The second finding is a typology of several strategies adopted by migrants when dealing with workplace-related issues.

Building Grassroots Infrastructures, Enacting Professionalism. Exploring the Nexus of Knowledge Production, Technology and Medical Professionalism in Times of Epistemic Uncertainty.

"Healthcare infrastructures" evoke the result of efforts by healthcare organizations and institutions to support the many facets of clinical and administrative work. Such infrastructures are often designed largely without involving healthcare professionals in the process.

We introduce here the concept of 'grassroots infrastructures' to refer to socio-technical systems, invisible to formal procedures and rationalized representations of work, created through the artful tinkering with available

resources. The widespread diffusion of personal communication technologies has enabled healthcare professionals to independently create services that would have once required significant institutional efforts. Instant messaging platforms offer an excellent opportunity to observe how healthcare professionals are capable of creating new configurations of relationships with patients or among themselves to overcome the limitations embedded in the tools provided by organizational technologies.

We argue that acting as grassroots infrastructure builders represents a form of a different professionalism, and that analyzing the processes of creating and using such infrastructures is a promising gateway to understanding the evolution of professionalism in healthcare.

This presentation aims to demonstrate how this analytical lens can be fruitful by examining the relationship between the creation of grassroots infrastructures and knowledge production. In this work, we refer to two different contexts characterized by epistemic uncertainty: the early stages of the Covid-19 pandemic and the limitations of guidelines in the field of breast cancer. The study will analyze how these different communities used an instant messaging platform to discuss therapeutic alternatives, share clinical experiences, and act as epistemic communities to gain recognition from the scientific community for the knowledge produced.

We intend to show that making and using grassroots infrastructures can be considered a trait of new organizing professionalism (Noordegraaf 2015) and a strategy to address the crisis of expertise (Eyal 2018) in the medical field.

PIRAS, ENRICO MARIA* (Fondazione Bruno Kessler, Italy)
LUSARDI, ROBERTO (University of Bergamo, Italy)
BRONZINI, MICOL (Università Politecnica delle Marche, Italy)
Qualitative Research in Healthcare in the Age of Data Work.

The practice of medicine is increasingly characterized by forms of data production and management and is accompanied by the growing use of digital devices for data collection, storage and analysis. In a context in which the clinical encounter becomes one of many moments in the activity of health professionals, social research in the medical field is deprived of a privileged locus of observation. Called upon to observe the traces of work found in various technical systems that are usually inaccessible, often coded in an inaccessible language, researchers can only partially reconstruct an overall picture or access the minute details of medical practice that are essential for understanding it.

This presentation, drawing on an ongoing research, aims to reflect on an approach to the analysis of work in health care in which traditional qualitative research techniques are flanked by forms of collaborative research with doctors as a means of accessing otherwise inaccessible portions of their work experience.

The case consisted of research conducted on different networks of doctors using instant messaging systems (WhatsApp) to share information on clinical cases, discuss them and obtain suggestions from the peer group.

The research was conducted in three stages. By means of semi-structured interviews with the participants, the genesis of the network, the forms of exchange and the meaning it takes to support clinical practice were reconstructed. A brief ethnographic observation conducted during a workshop made it possible to see professionals, working in different structures, construct a shared sense of their sharing practice. The third moment is the analysis of the instant messaging chats conducted collaboratively with the healthcare practitioners.

The presentation will illustrate the results of the research and focus on the implications, complexities and opportunities offered by collaboration with doctors, from analysis to joint scientific production.

PIRES COELHO, OLIVIA* (Universidade Estadual de Campinas, Brazil)
A (self)Portrait of the Indigenous Woman As a Young Researcher

This presentation, based on a doctoral thesis defended in 2024, investigates how Indigenous peoples use artistic practices to challenge invisibilization and marginalization. Based on the familial and political relationship between the author and Indigenous artists, a broad overview of the contemporary Brazilian Indigenous movement is outlined, observing and highlighting resistance strategies that challenge white and Western hegemony in artistic and political spaces in Brazil. It also addresses the author's own process of self-recognition as an Indigenous person from the Kambeba people, and presents art as a vital strategy in ethnic resistance, preserving Indigenous identities and ways of life.

Methodologically, the thesis adopted an Autoethnographic perspective, drawing from the author's experiences within her own Indigenous family and artistic context. Additionally, it explored Arts-Based Research to engage with Indigenous artists from other contexts.

A (self)Portrait of the Indigenous Woman as a Young Researcher is a presentation of the results from a doctoral thesis, while also exploring the author's own process of self-recognition and affirmation as an Indigenous researcher within the context of the precarization of academic labor and personal experiences as an immigrant woman.

Indigenous Social Media Influencers on Instagram: Personal Narratives and Social Movements in Brazil

This presentation analyzes the presence of personal narratives among indigenous social media influencers in the context of the Brazilian indigenous social movement. To begin, preliminary research and content analysis of the twenty most-followed Brazilian indigenous influencers on Instagram was conducted, where a significant amount of personal narratives was observed. This content analysis was part of my doctoral thesis, defended in January 2024, which focused on Brazil's indigenous social movement from a broader perspective. However, the personal narratives' aspects of digital activism from the thesis were not sufficiently explored until more recently. In these narratives, indigenous individuals (mostly young adults) have the opportunity to explore and share their unique points of view and fuel new forms of participation in the political discussion regarding the indigenous social movement in Brazil. Personal narratives are particularly significant in this context because they have the potential to humanize marginalized indigenous communities online, fostering empathy and connection with a broader audience (both indigenous and non-indigenous). For this discussion, we will work with posts publicly shared on Instagram by three young social media influencers and indigenous activists: Kauri Waiāpi (@daldeiaorei), Tukumã Pataxó (@tukuma_pataxo), and Alice Pataxó (@alice_pataxo). Our goal is to bring a fresh perspective on digital activism, where social media influencers choose to combat racism and misinformation about indigenous peoples by exploring strategies for humanizing their online presence and personalizing their narratives, opening up aspects of their personal lives and routines. In the theoretical framework, we will work with the concepts of alter-activism (Pleyers, 2009), alongside Baniwa (2009) for the contextualization of the indigenous social movement in Brazil, and Rios & Silva's (2023) work to explore the relations between personal narratives and digital activism in the indigenous social movement.

PIRHAYATI, NARGES* (ku Leuven, Belgium)

We Don't Want Grandmothers with Fancy Noses and Brazilian Buttocks.

This study explores the role of cosmetic surgeons in Tehran as cultural intermediaries who integrate diverse cultural repertoires—related to ethnicity, gender, age, class, and religion—into the practice of cosmetic surgery. In particular, the research foregrounds the gendered dimensions of beauty and sexuality, focusing on how these procedures contribute to the medicalization of beauty and the construction of gendered and sexualized bodies in late modernity.

Drawing on Kuipers' (2022) theoretical model, which is based on Lamont's cultural process model (Lamont, Beljean & Clair (2014) of inequality, the research highlights how surgeons mediate ideals of beauty and contribute to reinforcing social inequalities in Iranian society. Cosmetic surgery is widely accepted, for women but also increasingly for men, as part of a widely accepted beauty regime (Kuipers 2022).

Through semi-structured interviews with 20 cosmetic surgeons, in-depth interviews with three project managers of cosmetic clinics, 27 days of observation (4 to 6 hours per day), and participation in cosmetic surgery conferences, the study reveals how surgeons' recommendations, often shaped by socio-economic background, gender, age, religion, and ethnicity, affect decisions regarding cosmetic procedures. These decisions, in turn, reflect the pervasive medicalization of beauty and its impact on the construction of modern sexual self.

The research highlights the gendered and sexualized dimensions of these interactions, showing how cosmetic surgeons, by acting as gatekeepers to specific standards of beauty, contribute to the medicalization of bodies and the reinforcement of symbolic boundaries. Ultimately, cosmetic surgeons not only integrate cultural ideals into their practice but also actively participate in the reproduction of social stratification and the construction of sexualized selves, thereby deepening cultural divides within Tehran.

"Leaving Everything behind to Open a Casa Particular in Cuba!" the Case of International Entrepreneurs in Socialist Havana: Negotiating Inequalities in the Global South

This presentation is based on an ethnographic research conducted in Havana over a nine-month fieldwork period (2019-2024). Grounded in a transnational perspective, it explores the globalization processes reshaping (post)socialist Havana, with a focus on the complex interplay between international mobility and urban entrepreneurship. Since the 1990s, Cuba has embraced economic reforms, opening key sectors to private investment, and tourism. This shift has attracted international investors, many from Italy, who are increasingly settling in Havana either permanently or temporarily. Their entrepreneurial ventures, such as *casas particulares* (guest houses), restaurants, boutique hotels, bars, and tourist agencies, contribute significantly to the urban transformation of the Cuban capital.

These entrepreneurs often follow diverse migratory pathways—tourist, entrepreneurial, cooperative, or even activist—and come predominantly from the Global North. They are typically white, economically privileged men, a profile that seemingly aligns with patterns of postcolonial domination. However, the Cuban context complicates this narrative. Cuba's unique socio-political fabric, shaped by decades of revolutionary ideals rooted in socialism, anti-imperialism, and national sovereignty, creates a distinct environment where the privileges associated with being from the Global North must be constantly renegotiated.

To succeed in the Havana tourism industry, these transnational actors cannot rely solely on their economic capital or international status. Instead, they must engage in complex processes of negotiation with local stakeholders, who possess valuable indigenous, cultural, and social capital. These interactions reveal a dynamic where privilege is neither static nor absolute but rather contingent on socio-spatial contexts and personal networks.

This paper delves into the economic, social, and intimate negotiations that international entrepreneurs must navigate to achieve their migratory and business careers in Havana. By examining these processes, the study sheds light on how global inequalities are both reproduced and contested within localized frameworks, and how privilege is constantly redefined through transnational mobilities and urban transformations.

PRAT, ROMANE* (EHESS, France)

The Transnationalization of Labor Markets: Tourism, Inequality, and Revolutions in the Global South—a Comparative Ethnographic Study in Havana (Cuba) and San Cristóbal De Las Casas (Mexico)

This multi-site ethnographic research, conducted in Havana (Cuba) and San Cristóbal de las Casas (Mexico), explores the entrepreneurial practices of privileged migrants from the Global North. Attracted by the unique political and social contexts of these destinations, many of these migrants rely on tourism-related income to sustain their livelihoods. They run a variety of activities, including *casas particulares* (guest houses), hostels, restaurants, tourist agencies, guided tours, open spaces for workshops, yoga and language classes, and more. This paper investigates how these migrants leverage their privilege to integrate into local markets, analyzing the strategies they use to navigate the distinct political, economic, and social conditions in Cuba and Mexico.

The research highlights how, in the aftermath of the Covid-19 pandemic, different forms of capital—economic, social, and cultural—enabled these migrants to adapt and thrive in challenging environments. By focusing on their privileged positions, the study sheds light on the power asymmetries between international migrants and local populations. While their activities contribute to the local economy, they also reinforce inequalities and perpetuate neo-colonial dynamics. These phenomena raise critical questions about the nature of globalization and tourism, which, despite being spaces of opportunity, also foster resistance and conflict. Local actors increasingly challenge these unequal power structures, underscoring that the globalized tourism industry remains a site of ongoing struggle in both the Global North and South. This research ultimately contributes to a deeper understanding of how transnational migration reshapes labor markets and social relations in tourism-dependent regions.

PIRONNET, QUENTIN* (School of Advanced Study, United Kingdom)

Morality According to Bruno Latour

Bruno Latour famously studied everything, but not directly morality. However, a philosophical approach towards morality can be found in his work. To find where morality lies in Latour's 'infra-language', we have to proceed in three steps: unmodernising, flattening and existentialising. **Unmodernising.** Modernity has created a thrive for absolute certainty that started with Socrates, who took away from the Athenians their morality seen as a practical know-how, to substitute it by Reason (*Pandora's Hope*, 1999). Since then, modern epistemology, born out of the bifurcation of Nature (Whitehead), has attached morality to Science in counter-productive relationships. "Science proposes, morality disposes," but the latter always loses since it has no take on our common cosmology (*Politics of Nature*, 2004). **Flattening.** If the know-how of morality has been destroyed, it's because we've obscured all the practical mediations through which morality was patiently and casuistically constructed. If, in Kantian terms, we define morality as *uncertainty* about the proper *relation* between means and ends, those relations have to be accounted for. Latour does that by flattening our ontology to trace 'networks of associations of actors', whether human or nonhumans (*Reassembling the Social*, 2005). Indeed, object can also create 'morality' ("On Technical Mediation", 1994). **Existentialising.** However, we will never reach a fruitful understanding of morality if we don't switch from substance to action, from 'morality' to 'morally'. Moral beings move and act a certain way, with their *own mode* of existence, that of the *reprise of scruples* (AIME 2013). For now, economics has claimed morality under its own mode, leading to utilitarianism. In conclusion, a "Latourianised" theory of morality could lead to a new empirical turn (really!) and allow us to move away from false dichotomies that are just as many obstacles to the 'diplomatic' composition of a new collective (*Facing Gaia*, 2015; I. Stengers, *Cosmopolitics*, 2010).

Legal Issues Raised By Secondary Use of Research Data for Biographical Research/Oral History Purposes.

Biographical research and oral history are among best paradigms of research, where there is a vivid discussion about the benefits of secondary use of research data. One of the challenges that researchers will encounter is how to be compliant with data protection regulations, particularly when it comes to the secondary use/ storing to research infrastructures of data without the explicit consent of research participants. Biographical research data such as interview transcripts, biographical narratives, testimonies of oral history or personal stories often include sensitive and confidential information. Although researchers express fears that data protection regulation could put obstacles to the above mentioned research activities, on the contrary GDPR includes specific provisions that allow the further use of research data under specific safeguards in order- at the same time- to ensure that fundamental rights of data subjects are respected.

In this paper, we will analyse specific provisions for further use of research data in data protection laws in EU and UK. Emphasis will be given to the guidelines given from the European Board of Data Protection to better balance between data protection right and the right to access research data and scientific freedom. Finally, we will discuss potential challenges for researchers, best practices they can use, and guidance on how to evaluate risks in various biographical research/oral history paradigms.

Egocentric Networks As Determinants of Health Inequalities in Adolescence

This study investigates the relationship between socioeconomic status (SES), migration status, and health among adolescents in Europe, using data from the Children of Immigrants Longitudinal Survey in Four European Countries (CILS4EU). We investigate (1) whether adolescents from different social groups — particularly migrants versus non-migrants and those from different SES backgrounds — systematically display unequal health outcomes (including both mental and physical aspects); and (2) to what extent egocentric social networks operate as moderators and mediators of this association. Among social network factors, we consider both the structure and composition of personal networks (withing and beyond school) and classroom egocentric networks.

The study employs statistical network analysis, in conjunction with multilevel regression models, to assess whether network characteristics, including the density of friendships within the classroom and the proportion of same-ethnicity or similar-SES friendships, influence the impact of SES and migration status on health outcomes. The moderating role of network ties is explored to understand whether they amplify or buffer the effects of socioeconomic and ethnic disparities. In addition, the mediating role of network structure is examined to determine if characteristics of the social connections themselves underlie the mechanisms through which SES and migration status affect health.

Preliminary results suggest that adolescents with more socioeconomically or ethnically homogeneous networks may experience different health outcomes, indicating that social networks play an important role in shaping health disparities among adolescents. These findings contribute to understanding the intersection of SES, migration, and health, emphasizing the importance of considering social network dynamics in efforts to reduce health inequalities.

The Self-Made Effect. What Is Hidden behind Education Effect on Work Ethic

Numerous studies have explored the relationship between work ethic and education offering different explanations. Some suggest that the experience of economic insecurity in youth leaves lasting effects on values. Others argue that education only plays a mediating role: less-educated working-class parents prepare their children for an inflexible work environment, while more-educated middle- and upper-class parents foster creativity over conformity. Finally, some claim that a strong work ethic emerges when individuals see opportunities for upward mobility, which may explain why the work ethic is so high during periods of economic transition. The 5th wave of EVS offers variables that may shed light on this, such as parental education levels and experiences of economic hardship during adolescence (age 14). We therefore test three possible sources of explanation according to international literature: economic insecurity effect during youth (classic modernization theory), education levels of parents (intergenerational transmission of value), upward social mobility (perceived opportunities). Using multilevel modeling, we examine the effects of these variables in different countries, and try to identify what might reduce education estimates. The results show that parents' education is a stronger predictor of work ethic than respondent's education, highlighting family influence on socialization. In addition, challenging early life experiences and the constructed variable of upward mobility both have significant positive effects. People from lower socio-economic status display a stronger work ethic, especially when they experience upward mobility.

RC20-296.1

PITERS, RAPHAËL* (GEMASS, France)

Twenty Years of Work Ethic in Europe: A Multilevel Analysis of the Effect of Economic Security and Education on Work Ethic

The negative correlation between socio-economic indicators and the strength of work ethic at country-level is well documented. However, the mechanisms driving this correlation remain unresolved. Modernization theory implies that a lack of economic security at individual-level increases the priorities for materialistic values, such as the work ethic. Indeed, the work ethic is an essential component of a materialistic value system, as it highlights the importance of hard work, discipline and economic success. However, we argue that even if Inglehart always considered education as an excellent indicator of one's economic security, there is only weak evidence that the effect of education on a person's work ethic is due solely to economic security. Drawing on three waves of the Europe Values Study (EVS) and using multilevel modeling, we separately examine the explanatory power of education and economic security on work ethic between 1999 and 2017. The results show that economic security is weakly related with the level of work ethic, while the effect of education is significant and consistent. In discussion, we propose an alternative to modernization theory to explain the evolution of work ethics in Europe.

PITLUCK, AARON* (Illinois State University, USA)

Exploring Innovations in Islamic Banking to Interrogate the Concept of Social Innovation

Since 2022, there appears to be a growing consensus as to what constitutes the social and solidarity economy (SSE) by a number of global bodies, including the International Labour Organization, the United Nations, and the Organization of Economic Cooperation and Development.

These working definitions have emphasized innovative organizations and work arrangements such as cooperatives, associations, mutual societies, foundations, and social enterprises. These definitions also emphasize 'social' motivations that transcend profit-oriented motivations, such as the primacy of people over profits, democratic and/or participatory governance, and the reinvestment of profits to pursue the public good (OECD 2023 "What is the Social and Solidarity Economy? A Review of Concepts").

A potential problem with this emerging consensus is that this conceptualization excludes the world's largest cases of solidarity-like organizations seeking to pursue social objectives: the self-described Islamic economy, and particularly Islamic finance and banking. This moralized market has been measured as encompassing \$2.29 trillion of annual consumer spending, with an additional \$3.96 trillion of assets held in Islamic financial institutions. Rather than othering the Islamic economy as 'neoliberalism' (a fair description) or as 'social entrepreneurship,' how might we reconceptualize SSE if the Islamic economy became our modal case study? More narrowly, focusing on the topic of this session, how would case studies of financial innovation in the Islamic banking and finance industry alter our understanding of what constitutes social innovation? Conversely, how might we re-interpret Islamic financial innovation if we reconceptualized these firms through the lens of the SSE literature?

Although the paper is conceptual and seeks to improve our theorization of social innovation in the social and solidarity economy, as well as how best to conceptualize Islamic finance, it is grounded in the author's extensive ethnographic interviews on financial innovation in Islamic banks in Malaysia, focusing on two case studies.

Alternative Food Networks (AFNs) and Urban Food Prosumption in Indonesia: A Case Study in Bandung Urban Areas

Over the past two decades, there has been a surge in discussions and movements aimed at addressing food system challenges. The concept of Alternative Food Networks (AFNs) has been the focus of numerous studies. Yet, there remains a dearth of exploration into AFNs and their unique characteristics in Southeast Asian countries, including urban areas in Indonesia. The interface of agriculture with residential and industrial development on the peripheries of major Indonesian cities has resulted in distinctive food distribution and logistics challenges. Furthermore, urban residents in Indonesia have a historical tradition of cultivating their own food in their yards, positioning them as both producers and consumers (prosumers) of food. However, the scholarly discourse in food studies has inadequately engaged with the concept of prosumption. This paper, using prosumption and AFNs frameworks, focuses on AFN practices and their influence on urban food systems in the Indonesian urban context, specifically in the urban areas of Bandung. Bandung was selected as a case study due to its early involvement in the Milan Pact and the development of local food policies at the municipal level. The study examines two forms of AFN initiatives in urban areas of Bandung: 1) institutionalized integrated urban farming initiatives, such as *Buruan Sae*, and 2) community-based food initiatives, such as *Seni Tani*, *Kebun Belakang*, and *Lab Pangan*. Through in-depth interviews with key actors and narrative analysis, the study reveals that the concept of prosumption in AFNs transcends mere production and consumption. It also serves as a platform for the political empowerment of urban inhabitants. For *Buruan Sae*, it involves collaboration with the local government in urban food provisioning. Furthermore, in the Indonesian context, the "alternative" in AFNs is not about challenging the mainstream; rather, it is about regenerating collective prosumption, which has long been taken for granted.

RC47-731.3

PITROSO, GIULIO* (Griffith University, Australia)

"the Internet Is Right-Wing". Gamers' Opinions about Politics and Politicisation of Gaming Spaces in Italy and Australia

The acknowledgement of identities that were previously ignored by gaming industries engendered online confrontations in gaming communities, including the #Gamergate (Kidd & Turner, 2016; Burgess & Matamoros-Fernández, 2016), the so-called Twitter Incident (Tomkinson & Harper, 2015), and the "Dickwolves case" (Salter & Blodgett, 2012). Alt-right ideologues, including Steve Bannon, built a sophisticated media system based on strategies and ideas emerging from such controversies. Links between gaming and Alt-right have been described (Bezio, 2018; Khan, 2019; Duarte, 2021; Fleet, 2022) in terms of media strategies, online coordination among activists, and commodification of controversial opinions (Wodak, 2020).

At the same time, video games have been used by extreme right-wing groups so as to recruit new members, including adolescents (Newhouse & Kowert, 2024). Far right-wing parties in Italy have attempted to use video games like *Gioventù Ribelle (Rebellious Youth)* and *Rimbalza il Clandestino (Bounce off the Clandestine)* (Cappai, 2015, pp. 104-105; Cleger, 2015) for recruitment, albeit with limited success. Conversely, far right online activities have worried Australian authorities, especially in relation to teenagers' recruitment on *Roblox*. The Australian Alt-right has its own unique characteristics and groups (Young & Boucher, 2022), albeit it is strongly linked to its US counterpart.

This study investigates how gamers considered the politicization of gaming spaces and the influence of the Alt-right. It is based on 40 semi-structured interviews to video games players between the ages of 18 and 30 years in Italy and Australia. The research shows that Italian participants mostly view the connection between gaming and politics under the lens of institutional engagement (e.g., laws to support gaming industries), whereas Australian participants express concerns related to the politicisation of gaming spaces and avoid online "toxic environments".

RC14-217.3

PITROSO, GIULIO* (Griffith University, Australia)

Mafiosi in Video Games As Low-Intensity Myths for Cosmopolitan Consumption

This research is based on online and in-person semi-structured interviews of young video games players (VPGs) living in Italy and in Australia. The considered sample is made up by 40 participants (20 for each country) who played video games portraying members or enforcers of the Mafia as main characters. Participants have been recruited through hybrid snowballing process, which relied on digital spaces and on offline and online networking. Participants were asked to describe how they imagine organised crime networks and to relate their ideas to the sources they were based on.

VPGs rarely mention video games as a valid source of information to think of organised crime in real life. Australian participants rely on TV series, cinema, and documentaries. Italian participants mentioned news and personal experience as an important source of information. Both Australian and Italian participants referred to consistent links between representations in video games and other media. Participants underlined how fictional cultural products shaped the global image of Italians and the Mafia. Though, they also considered themselves able to identify ethnic stereotypes and to understand stereotypes' narrative functionality.

Drawing on these interviews, I argue that the Italian Mafia can be framed as a low-intensity myth, as for the definition of Ortoleva (2019). I discuss how gaming industries have relied on old and new stereotypes about Italians and organised crime so as to create an oversimplified version of the Mafia. This is a mix of misrepresentation of Southern Italy, "a paradise inhabited by devils, positive stereotypes about the North, defined as the "Tuscan fetish" (Pugliese, 2007), and North American pop culture. Finally, I argue that the interviews data confirm the importance of aesthetic-cultural features of Mafia representation in a way that can be understood through Cicchelli and Ottobre's (2018) research on cosmopolitan youth consumption.

Technostress and Coping Strategies of Older Academics: Findings of Scoping Review

Accelerated technological development at universities is changing working conditions for academic staff, especially for older ones. Technostress in education has been researched from various perspectives: among school teachers (Siddiqui, Arif, 2022), university students (Alvarez-Risco et al., 2021; Upadhyaya, Vrinda, 2021; Kulikowski et al., 2022), non-academic staff (Aida et al., 2007), university teachers (Estrada-Muñoz et al., 2021; Penado Abilleira et al., 2021; Wang et al., 2020). However, limited research is done about technostress experienced by older academic staff at universities (Rasticova et al., 2022).

The aim is to discuss findings of scoping review about technostress of older academics in higher education, answering research question - How did older academics deal with challenges caused by technology?

Scoping review was registered on Open Science Framework (Pivoriene et al., 2024). It was done using PRISMA for Scoping Reviews (Tricco et al., 2018). Initially, 803 articles from five databases (WOS, Scopus, PubMed, ProQuest, IEEE) were identified, after deleting duplicates and exclusion with reason, 41 articles remained for data extraction.

Coping strategies employed by older academics and recommendations provided by the authors of reviewed articles highlight necessity of a comprehensive approach to managing technostress in higher education. Older faculty members have demonstrated resilience and adaptability by making the most of digital tools, creating supportive job environments, utilizing flexible work schedules, engaging in continuous professional development. These strategies, coupled with institutional support, facilitate a balanced work-life integration and enhance overall job satisfaction. On the other hand, recommendations emphasize the importance of addressing digital anxiety, reinterpreting technostress as opportunity for growth, implementing supportive organizational practices. Providing specialized training, promoting mental health initiatives, fostering positive work environment are crucial for mitigating the adverse effects of technostress. Additionally, enhancing digital literacy and ensuring robust technical support are important in enabling older academics to navigate the challenges posed by technological advancements.

Different Understandings, Different Responses: Experiences of Racism Among Highly Educated, Second Generation Black Germans

This paper argues that there is a close relationship between individuals' understandings of specific incidents of racism, their ideas of how racism operates, and their (repertoires of) responses to such incidents. The argument is based on a qualitative interview study with 21 highly educated Black Germans. The analysis specifically explores two contrasting types of interviewees: Type 1 felt that they were constantly and potentially always affected by racism and had a broad knowledge of racism. These interviewees recounted many different incidents, many of which they clearly labelled as, for example, "racist". Type 1 interviewees reported a variety of response options, with direct confrontation being one of them. In stark contrast, Type 2 respondents tended to normalise the relatively few incidents they mentioned or indicate only feelings of unease. They also believed that they were largely unaffected by racism, had a less deep understanding of racism and tended to respond to incidents of racism in ways that allowed the encounter to continue without disruption. Overall, the study calls for greater attention to racialised people's meaning-making in relation to concrete incidents of racism and to their knowledge of racism. This requires methodological adaptations to qualitative interview research. In particular, the study highlights the importance of understanding the ways in which respondents talk about their experiences (categorisation, indication of feelings of unease, and normalisation). It also emphasises the need to go beyond considering only interviewees' responses to direct questions about their experiences of racism and/or incidents clearly categorised by interviewees as, for example, "racist" or "discriminatory". Moreover, reconstructing interviewees' knowledge about racism offers a path toward understanding not only their sense-making but also their repertoires of responses. This, in turn, provides insight into why individuals of comparable class position and educational background respond to racism in different ways.

PIZZETTI, BARBARA* (Università Cattolica del Sacro Cuore, Italy)

Social Theatre As a Research Method in Shelters for Women Victims of Violence

The talk takes its cue from performing studies to question the effectiveness of social theater as an investigative tool aimed at examining and understanding the experience of anti-violence shelters, from the perspective of the researcher and that of the social actors involved. In the panorama of the new international teatrology, social theatre is considered as the Italian variant of applied theatre: an "umbrella title" (according to Judith Ackroyd's definition) that stands for a theatrical practice enacted by a group of non-professional people, guided by specially trained facilitators, who work together to discuss, represent and solve their existential and social problems. In applied theatre different techniques (improvisation, theatre games, forum theatre, ...) are used to promote the well-being, expression, empowerment and change of the person, group, and community.

Starting from the study of a social theatre workshop aimed at an integrated group of women shelter workers and women victims of violence, the intervention focuses on the use of performance practice as a means to: reach inaccessible targets (because they are institutionalized within protection circuits) and open new communication channels with those involved; to represent the multiple points of view and needs of social actors and express incomprehensible and unexplored meanings.

Since knowledge does not have an exclusively cognitive-rational foundation and indeed cannot be detached from the individual's entirety (including its emotional, relational, and bodily dimensions) theatrical practice as a means of training both guests and service workers and as a research tool on the effectiveness of anti-violence centers can foster the overcoming of the emergency perspective, service innovation and the development of a more holistic approach to users and their needs, including unexpressed ones. In doing so, it promotes "embodied ways of knowing" (Barbour, 2011): a total involvement of the researcher in the research context and process.

Oases in Tunisia: Food Sovereignty Under Threat – Global Challenges, Climate Change, and Local Fellahin Resistance

With the rise of neoliberal development policies and the modernization drive pursued during the Green Revolution, Tunisia's agricultural system has undergone a profound transformation. The relationship between farmers, nature, and food production has been compromised and shifted towards an industrial orientation. Moreover, these changes are closely interconnected with another global phenomenon, namely the advancing risks associated with climate change, which are already altering agricultural production and disproportionately affecting rural communities and traditional ecosystems such as those found in the oases. Specifically, the interplay between agro-industrial and water policies and the risks related to climate change—such as decreased and increasingly irregular rainfall, rising temperatures, and prolonged drought periods—has dramatically impacted and reshaped the Oases territory and production. However, despite these challenges posed by the interconnectedness of the issues mentioned above and the consequent effects on land and agricultural work, the Oases systems have always represented poles and examples of resistance, through the propagation and preservation of their local knowledge and the importance of social capital.

This paper aims to explore and document the balance of oasis ecosystems and the agriculture of its fellahin, focusing specifically on the Oases of Tameghza, Chbika, Mides, and Cheninni, where we have conducted extensive field research. It will highlight current challenges and their impacts on the ground and food production. Additionally, it will seek to demonstrate how, by drawing on local knowledge, social capital, and traditional practices, oasis farmers have shown their ability to adapt and resist in the face of adversity. This resistance serves as a testament to the importance of preserving and supporting traditional agricultural systems, not only for their ecological value but also for their role in sustaining rural livelihoods and communities and ensuring food security.

SASSATELLI, MONICA* (University of Bologna, Italy)

Drawing Oneself through Time: Investigating the Potentialities of Research Participant Narrative Drawings in Workshop Settings

Drawing, while not entirely absent as a method (as well as an object) of social research, is marginal even within visual methodologies. When it is used, it tends to be either integrated into 'data collection', especially in research with children and vulnerable subjects who are not considered capable of full verbal expression, or into dissemination beyond the scholarly essay. The recent development of comics-based research both draws on and seeks to extend and problematise the use of narrative drawings in particular as enabling different 'ways of seeing' and processing alongside the verbal (Sassatelli, 2024). This has contributed to an interest in drawing as an active, creative method - centred on process, participation and circularity - that is relevant at every stage of research, from question formulation to data collection, analysis and presentation (Pizzolati, 2022). With this in mind, in this paper we propose to report on a co-designed narrative drawing workshop conducted with students in two Italian universities. The drawing workshops were articulated in three parts: warm-up, narrative drawing, feedback. The student participants were involved in a process aimed at eliciting diachronic representations of

past and future experiences, in which the narrative dimension is created through individual drawings, their sequence and the possibility of combining them with words, as well as with comments and a brief individual feedback interview. In exploring how this rapid way of constructing personal history works to elicit and unveil meanings and offer keys to understanding them, we highlight how layers of reflexivity were expressed, particularly in relation to emotions, relational life, routine/eventful storytelling. Alongside substantive reflections on the different modalities of representing and performing these biographical dimensions through drawing, the material also offers insights into the specificity of narrative drawing as a research tool in collective settings.

Mysteries and Conspiracies in Pre-War Warsaw: Network Analysis of Conflict and Stability in Crime Novels

In his book *Mysteries and Conspiracies*, Luc Boltanski explores the modern detective novel as an expression of political imagination. He argues that this genre was a specific product of the 19th-century nation-state. Detectives and investigators served as guardians and controllers of the nation-state's function of maintaining and enforcing justice, whose stability was threatened by both external and internal enemies.

The English and French states developed different ways of exercising power, which is reflected in their crime novels. In England, detectives – most notably Sherlock Holmes – navigate social spaces primarily within the elite classes. The detective acts as a guardian of the hierarchical class order, protecting the elite from the exposure of scandals affecting them. In the French context, represented by Inspector Maigret, the source of order is found in the administration. The investigator disregards class differences and strives to ensure "objective" order for all citizens.

My focus is on the Second Polish Republic – a state that existed from 1918 to 1939. The society of the Second Polish Republic resembled a mosaic of classes characterized by enormous stratification and conflict. The aim is to reconstruct the map of social relations of main characters in the novels and to answer the question: to what extent they serve the republic or private interests of the elites?

I use a corpus of crime novels to reconstruct the map of relationships in which the detectives and investigators engage. I employ the extraction of interpersonal relationships within the text. This involves the automatic detection of individuals appearing in the text and the verb phrases linking them. The next step is to reconstruct the relational network in each novel, where each character in the text is a node, and the direct actions involving two or more individual form the edges.

Protesting Parties in Poland, 2020. Temporal Analysis of Coalitional Protests

In my presentation I will investigate the participation of political parties in social protests in Poland throughout 2020, a year marked by significant socio-political polarization and mass mobilization. The study challenges the differentiation hypothesis demonstrating that social movement parties in Eastern Europe also perform specialized functions during protests despite of greater involvement of parliamentary political parties and opposition parties. Visibility emerges as a critical strategic goal for parties, influencing their decisions to join high-profile protest events but social movement parties are pivotal in mediating between street protests and parliamentary actions, often serving as initiators or consistent participants in protest campaigns.

To show social movement parties functions in protests I employ dynamic networks for incorporating time directly into the analysis. Bi-dynamic line-graph is an innovative way to visualize the evolution of actors' participation in successive events. The main implication of this method is that all time steps corresponding to events, are, in fact, directly taken into account, and actions, linked together by the common participation of actors, are represented as a chain, in a sort of continuous social process. This will allow for a closer analysis of the strategic moments in which parties decide to join protest campaigns. The presentation will also provide an opportunity to discuss the combination of qualitative and quantitative methods in studies on social movements.

Drawing the Risk. Communicating and Preventing the Online Identity Theft through Art-Based Methods.

Contemporary risks take on new characteristics and their effects are potentially unlimited. The digitalization of society has provided criminals with new opportunities to obtain and misuse personal identity information. The emergence and spread of Online IDentity Theft (OIDT) is an example of this. As users, we, directly, generate data and assume risks, not always consciously. Very little is known about the profile, needs, experiences, risks of people whose identity information has been compromised or misused. European victims of OIDT often do not report the crime, believing that the harm suffered is not significant enough or lacking adequate resources to counteract it.

With the aim of expanding information and awareness towards the importance of understanding the risk and avoid its underestimation but also supporting "a preventive" communication, an interdisciplinary team (sociologists and artist) has conducted an experimental project at the University of Bologna developing art-based projects.

The narrations, practical and emotional dynamics, risks' perceptions have been outlined by 23 semi-structured interviews with OIDT experts and 47 structured interviews with victims. Key informants' perspectives were the starting point to understand how to draw the risk. As a direct outcome, sociologists and artist realized: (1) a care kit cards (2) a comic strip (3) an infographic "riskymeter".

In this scenario, visual projects which merge social research and art, were designed to 1) stimulate reflection on the issue of OIDT's risk in everyday life 2) offer pedagogical resources to OIDT's victims and professionals 3) propose different modes of engagement for communicating the risk and raising awareness to the widest audience.

Assessing the Longitudinal Stability of Network Size Using Nsum: Evidence from Chile

The Network Scale-Up Method (NSUM) is widely used to estimate egocentric network size, but its longitudinal stability has been questioned. Variability in survey responses may arise due to recall bias, changing social ties, or methodological inconsistencies. This study investigates the temporal stability of NSUM measures and examines the factors influencing changes in network size, composition, and structure. We specifically compare NSUM outcomes over time across socioeconomic variables (education, class, SES) and gender to understand the robustness of these measures.

Using data from the Chilean Social Longitudinal Survey, which has tracked a national sample of 3000 adults since 2016, we focus on three survey waves (2016, 2018, 2021). The survey includes 25 items estimating the number of acquaintances across occupations, social groups, and named individuals. Person-level, index-level, and item-level analyses were conducted, using descriptive statistics and multilevel models to assess the reliability of the responses.

Our findings reveal moderate inter-wave correlations for egocentric network items (ranging from 0.3 to 0.6), indicating some stability in network reporting. The correlation for the aggregate network size index, particularly McCarty et al.'s Scale-Up estimator, was 0.46, suggesting caution when interpreting longitudinal network data. Regression models indicate that response stability in attitudinal measures strongly predicts changes in reported network size. This points to individual differences in response behavior, such as survey satisficing, as key contributors to the variability in network size estimates.

These insights challenge the assumption that network reporting is inherently stable and highlight the need for careful consideration of survey reliability in longitudinal studies of egocentric networks. The study also provides critical evidence on the effects of survey mode, with 2021 data collected via telephone due to the COVID-19 pandemic.

Networked Inequality: The Role of Changes in Network Size on Attitudes Towards Inequality

Existing research on attitudes toward inequality has predominantly focused on individual class or socioeconomic positions, with little attention given to the role of personal networks. The limited research available has primarily examined the socioeconomic composition and network heterogeneity, while neglecting an essential aspect: network size. Moreover, the lack of quantitative data containing information about socioeconomic standings, network configurations, and attitudes over time for the same individuals has hindered the accurate testing of personal networks' influence on attitudes toward inequality. To address these gaps, the main goal of this paper is to examine the extent to which changes in the size of acquaintanceship networks affect attitudes toward inequality in Chile—a middle-high income country with high levels of income and wealth inequality. We utilize two waves (2016-2018) of unique and representative panel data from the urban Chilean population—the Social Longitudinal Study of Chile (ELSOC), and we use the position generator instrument to compute the network scale-up and diversity measures. Our cross-sectional analyses indicate that network heterogeneity and network size both enhance perceived income inequality and egalitarian preferences, while decreasing meritocratic perceptions. In the fixed effects regression models, however, network size is more closely linked to an increased perception of inequality, while network heterogeneity is more strongly associated with higher egalitarian preferences. These findings suggest that network size are complementary network characteristics in explaining attitudes towards inequality.

Beyond Protest and Latency. What If Social Movements Main Contributions Arise in Their Quieter Periods?

Social movements and their contributions to social change have too often been reduced to their most visible and contentious stages. Drawing on case studies from different countries, this paper will point to four categories of social movements' contributions to dealing with global issues and the Anthropocene: developing social and economic projects, transforming subjectivities, developing arguments and expertise and shaping alternative worldviews.

Unveiling these contributions and the continuities between these quieter periods and the eventful protests requires to extend the perspectives of social movements beyond protests and to question (or deepen) the concept of latency.

Thrifty As a Sustainable Urban Practice? (Re-)Inventing Social Infrastructures and Economies

Mass consumption (or consumerism) presents major challenges to the environment and society, because of the connection to extractive, exploitative industries and excessive waste. Consequently, a vast media commentary and academic literature discusses different types of ethical, reduced/minimalist or sustainable consumption, offering a critique of dominant models of growth-driven capitalism and inequalities within and between societies (Humphrey 2013; Colwell 2023; Gregson 2023; Meier 2023). An important strand of literature captures a rekindled interest in thrift, identifying its contemporary 'reactionary' or 'green' variants (Yates and Hunter 2011: 14-15).

This paper takes up the concept of thrift denoting, broadly, resource/money-saving to examine alternatives to linear/wasteful modes of consumption. However, instead of assigning thriftiness to individual or everyday household economies, we explore thrift in relation to well-established practices of sharing inscribed into the 'low-budget urbanity' (Färber 2014) of any city. Drawing on examples of public initiatives based in the cities of Warsaw and Vienna, including public libraries and programs designed to increase circularity and community connectivity, we raise the question if sharing resources makes those communal (sometimes activist) spaces into models for 'thrifty commoning'.

This paper contributes to the consumption scholarship by dovetailing the ideas of 'urban commons' (Özkan & Baykal Büyüksarac 2020; Petrescu et al. 2021, Volont et al. 2022) with the conception of thrift as 'a condition of thriving' addressing thrift's purpose and application in light of 'present economic, environmental and social challenges' (Yates and Hunter 2011: 11). We reveal values and operational, infrastructural characteristics of the select initiatives, and advance an empirically-informed theorisation of thrift, centred on the principles of the common good, access and inclusion, for urban thriving and sustainability.

POE POE, JOCELYN* (Cornell University, USA)
DIDLA, NOEL (Center for MS Food Systems, USA)

Exploring Reparative Methodologies in the U.S. South

Long histories of colonial violence (Woods, 2017) and plantation logic (McKittrick, 2017) still haunt Mississippi lands, impacting present-day realities for Black and Indigenous people who are fighting for food sovereignty. While overt violence is no longer the dominant means of control, new forms of plantation logic have emerged to maintain the status quo. Thus, territorial violence continues through land use policy, racial planning processes, and unjust development practices. In this context, the Center for Mississippi Food Systems and Choctaw Fresh Produce, partnered with Cornell University to engage in an experimental workshop on reparative methodologies. Through community partnerships and collective study, we ask what is the role of planners in facilitating territorial reparations?

In a community of co-teachers, co-knowledge producers, and co-learners, we engage in critical urban pedagogy, as understood by Ortiz and Millan (2022). We contextualize current food struggles to colonial histories, understanding they ways food has been used for oppression and as a means of freedom. We apply theories and practices of reparations to the food systems context in Mississippi and develop reparative methodologies rooted in local knowledges. Learning from these local histories, we build a reparative framework that identifies theories, skills, and practices that planners can use to facilitate territorial healing (Ortiz and Gomez-Cordoba, 2024). We argue that reparations can only be realized through worldbuilding that makes place otherwise.

POKROVSKY, NIKITA* (National Research University "Higher School of Economics" (HSE), Russian Federation)

Post-Agrarianism and De-Urbanization. a New Look at the Non-Urban Perspective: History, Models and Theoretical Approaches

The paper deals with the philosophical and cultural origins of "anti-urbanism" (presented by Theocritus, Virgilius, Rousseau, Jefferson, Emerson, Thoreau, Tolstoy), characterized with the aid of using the choice to create a set of values primarily based at the consciousness-cleaning effect of nature and rural labor. The paper highlights the long development of this discourse in both classic and modern works, discussing urbanites' and rural residents' social life, in particular, its phenomenology. It is proven that nowadays society, typically in Russia, the metropolis more and more demonstrates the tendency of centrifugal migration and the go out of city citizens to the so-called "small territories" and lengthy distances from the megalopolis. This process is seen as potential major social change and is the main focus of the presented study.

Meanwhile, the territories, typically within the Near North of Russia and within the Non-Black Soil ("Chernozem") Region, having in large part misplaced their former dominant agricultural purpose, are beginning up new horizons of post-agrarianism primarily based on new kinds of modern type (typically online) labor, ecologization, and recreation.

These data and tendencies open a probable destiny prospect of a brand-new hypostasis of urbanization dialectically transitioning into its opposite, which is mentioned as postagrarian.

Based on the social drivers of rural changes (rural crisis and urban expansion, community effects, and social effects of economic activity), two models of migration to the rural areas are examined — agricultural-

archaic and post-agrarian-recreational, each with specific personal goals and subjective senses of migrants' urban life. The paper also mentions the common postagrarian transition of Russian rural landscapes tendencies and speculates on the ways postagrarian changes may be witnessed in the future. Particular attention is paid to the interaction between communities of citizens leaving megacities and local residents, and rural tourism issues and other recreation forms are discussed.

From Marginalization to Integration: Turkish Governments' Regulations on the CAM

Turkish government has recently adapted an active policy to integrate CAM into modern medical practices. Beginning in 2014 with the establishment of a directorate dedicated to CAM under the Ministry of Health, the government created new laws and regulations about CAM practices. While the first legal regulations date back to acupuncture in 1991, the Turkish state since 2014 actively supported conferences, education and training, as well as application of complementary and traditional medical practices in Türkiye. However, representatives of biomedicine, particularly the Turkish Medical Doctors Association, did not only harshly criticize these policies but also associated them with a conservative government. Yet, what the practitioners and defenders of biomedicine ignores is the fact that the Turkish state follows WHO's CAM policies, and also its legal acknowledgment of CAM is not simply an acceptance of CAM. On the contrary, many of the bylaws and regulations reflect the modern state's drive to control, to regulate, to standardize alternative medical practices, and to integrate them into standards of biomedicine. In this regard, in this presentation, we will provide a brief outline of Türkiye's legal reforms concerning the CAM and discuss the content of these regulations to trace how the state on the one hand tries to integrate CAM into modern biomedical knowledge and institutionalization, on the other hand this "attempt to save CAM's marginalization" can be read as a way to modernize CAM, to render its distinct epistemological and practical presumptions commensurable with those of biomedicine. The paper presentation is based on an analysis of written, legal documents shared on the Directorate of CAM as well as interviews conducted with high-level health bureaucrats and doctors that were involved in drafting CAM regulations and policies in Türkiye.

Comparative Insights on School Inclusion: A Rapid Narrative Synthesis Methodology

This paper proposes a systematic review methodology based on Rapid Narrative Synthesis (Amog et al., 2022) to analyze the processes of inclusion and exclusion within educational organizations. The analysis specifically focus on school contexts, encompassing primary and lower secondary education, and aims to investigate how educational practices influence the school inclusion.

A total of sixty-five articles were meticulously selected through a systematic search across the ERIC, SCOPUS, and Google Scholar databases, applying stringent inclusion criteria. These criteria includes peer-reviewed articles published between 2014 and 2024, exclusively in English, that address the theme of school inclusion at the micro (classroom and individual), meso (school and community), and macro (national and international educational policy) levels. The year 2014 was selected as a temporal boundary due to its significance as the publication date of the last comprehensive systematic review in the field of school inclusion (Loreman, 2014).

To facilitate the analysis, a comprehensive data collection grid was developed, emerging from an iterative process of continuous review and recursive refinement. The sixty-five articles were thoroughly read and assessed by four researchers, ensuring a robust and rigorous evaluation. The data collection grid encompasses various analytical dimensions, including: definitions of inclusion, models for assessing quality, indicators of inclusion, and educational processes.

The primary objective of this review is to elucidate the models and instruments utilized to evaluate the quality of school inclusion, highlighting the ways in which organizational practices and educational policies may either perpetuate or mitigate existing inequalities. The findings indicate that school inclusion is significantly influenced by the availability of resources,

community support, and the effective implementation of inclusive policies. This methodology offers a valuable framework for comprehending how educational organizations can confront the structural and cultural barriers that impede inclusion, thereby presenting pathways toward enhanced social equity.

POLIANDRI, DONATELLA* (INVALSI - Italian National Institute for Educational Evaluation, Italy)
GIAMPIETRO, LETIZIA (INVALSI (Italian National Institute for Educational Evaluation), Italy)

Fostering Inclusive Education: A Model of Participatory Peer Evaluation

The Italian school system aims to promote inclusive education, as defined by UNESCO, supporting the participation of all individuals and groups by removing barriers to access. Evaluation serves as a crucial tool for transforming educational institutions into more inclusive and equitable environments. The Nationally Significant Project *Evaluating School Inclusion: A Shared Quality Index for Developing a More Inclusive Education for All* is currently trialing a peer participatory evaluation pathway that focuses on inclusive processes within schools. This pathway combines social research techniques typical of participatory evaluation with peer review models between schools.

Participatory evaluation offers valuable insights into social contexts and related processes. Similarly, peer evaluation fosters transformative learning, enabling school staff to gain insights from observing different educational settings, thereby enhancing their professional development. In this field study, groups of three schools, totaling 15 institutions, participate in peer evaluation activities to analyze the inclusive processes implemented in each school.

Each school organizes a remote "visiting," hosting the other two schools via videoconferencing and also participating in the remote visits of the other institutions. The primary goal is to present and critically assess the host school's inclusive practices, focusing on innovations and potential challenges. The visiting schools are guided through a virtual tour to observe the host school's inclusive processes during a three-hour session, which includes an introduction, observation of spaces and activities, interviews, and a follow-up discussion among participants. Presentations are enhanced by multimedia materials, including photographic and video evidence of school spaces and the surrounding community.

The anticipated outcome of this study is the development of a model of peer evaluation that supports the implementation of inclusive practices, facilitating broader community involvement and sharing of best practices among schools. Additionally, it aims to establish a more participatory governance structure, promoting accountability and shared responsibility in implementing inclusive policies.

Equity in Maternal Care during Pregnancy, Birth and Postpartum

Racism and discrimination can affect different domains of the everyday, but some of them are studied much more than others. Here we examine healthcare provision with a particular focus on pregnancy, birth, and postpartum. Using a mixed-methods design in the Swiss healthcare system, we examine a case with high-quality maternal care, yet consistently higher mortality and morbidity for minorities. We document systematic differences in the treatment of women in vulnerable positions, notably people read as immigrants or socioeconomically disadvantaged. Empirically, we draw on 30 expert interviews in maternal care, migration, and health, as well as 30 semi-structured interviews with obstetric-gynaecological specialists and midwives. These interviews are used to design an experimental vignette study, in which a large-N population of healthcare professionals assess different situations that the qualitative part identified as sites of discrimination and exclusion. Preliminary results identify widespread stereotypes related to pain, good motherhood, health literacy, language and communication skills, as well as being 'problematic' in the sense of complicated and expensive consultations. These images are associated with the reading of patients as immigrants, ethnic minorities, and low socio-economic status. Considerations of deservingness and 'social worth' seem to influence how

healthcare professionals assess patients. Health equity is undermined by a normalization of differential treatments of people read as immigrants and ethnic minorities. While we can identify efforts to counter this situation, these vary greatly between institutions, are often depend on individual initiatives and informal exchanges between healthcare professionals rather than being formalized and institutionalized.

Youth Mobility and Social Bonds: Towards Relational Elasticity?

The high mobility characterizing contemporary times invites reflection on social relationships and their development processes. Those individuals experiencing such mobility are called to redefine the geography of their interpersonal networks, impacting the very way they understand and live their relationships, thus reshaping their relational habitus.

Noticing a gap in contemporary literature on youth mobility, mostly focusing the period before the departure and the time of the staying abroad, we decided to focus on the experience of young students returning to their home countries after a study period in Paris or Perugia as part of the Erasmus project. This led to an empirical study consisting of n.9 qualitative interviews, which serve as the basis for the present contribution. We propose the following hypothesis: mobility and the subsequent return influence how individuals invest themselves in their present, past, and future interpersonal relationships. These relationships do not seem to dissolve but rather become more fluid, leading to the development of a form of "relational elasticity" that enhances the capacity to withstand the challenges and obstacles posed by neoliberal society.

Social ties are tested by contemporary imperatives of speed, efficiency, and the precariousness that characterizes both the labor market and personal relationships, which seem to thin out connections. However, the empirical data gathered for this research suggest that mobility—specifically, the departure from and return to one's habitual environment—alters the way young people conceive their relationships with significant others (family and peers). They become aware of the plastic and mutable nature of these bonds, but this does not result in a weakening of their strength. Instead, a greater flexibility emerges, allowing relationships to adapt to various situations and needs.

Racial Discrimination and Mental Health Inequality in France

The study explores the impact of origin-based discrimination on mental health among immigrants and their descendants in France, addressing a significant gap in the literature. Based on data from the "Trajectories and Origins 2" (TeO2) survey, conducted by INSEE and INED and drawing on Pearlman's Stress Process Model and Bronfenbrenner's Ecological Systems Theory, this study tests two main hypotheses: (1) origin-based discrimination is associated with increased depression among immigrants and their descendants in France, and (2) mental health is negatively affected by both personal experiences of discrimination and the perception of belonging to a discriminated group. The dependent variable is self-reported depression, measured by two survey questions assessing depressive symptoms over the past 12 months. Key independent variables include self-reported origin-based discrimination, being the target of racist insults, and identifying as part of a stigmatized group. Logistic regression models are applied to assess the association between these discrimination measures and depression symptoms across different groups based on gender and migrant generation. Logistic regression models preliminary reveal that discrimination significantly increases depression rates, with variations by gender and generation. Racist insults and group-based discrimination also elevate depression risks, particularly for women. Protective factors like higher education, stable relationships, and employment reduce depression, while unemployment, single-parent status, and low socioeconomic status increase it. These findings confirm the hypothesis that both personal and group-based discrimination are associated with adverse mental health effects. By focusing on the French context, this study provides crucial evidence on the mental health inequalities faced by immigrants, complementing existing research from other European nations and the U.S.

Factors of Increasing and Decreasing Lay Public Interest in Science and Technology: Sociological Analysis Using Panel Data

Despite the prevalence of pro-science views among adult population and the generally positive lay public assessment of science and technologies (S&T) development effects on everyday life, the level of interest or engagement with S&T remains low. As previous studies suggest, the relationships between public attitudes towards science and other S&T-related indicators can vary across countries. However, most changes in public opinions get overlooked as cross-sectional monitoring surveys can't fully grasp laypeople's engagement with science. Therefore, we need to look more into the panel researches. For example, a study by Klinger et al. (2022) found that over time engagement with science can change upward (become more positive) and downward (become more critical).

Overall, researchers in science communication field suggest that popularization of science should aim not only at dissemination of scientific knowledge, but at fostering of lay public interest as well. Therefore, current study investigates the factors driving the changes in lay public interest in S&T. The panel dataset covers a five-year period. Three waves of a nationally representative survey on the topics of Science, Technology and Innovation (2018, 2020, 2023) analyzed. The sample size is around 4000 respondents aged 18-65 (as of the first wave). The analysis revealed that pronounced interest in science is less stable compared to low or moderate interest. It was also found that more than one third of respondents experienced a (usually downward) change their level of interest in S&T news. The results of between-group migration analysis suggest scientific literacy, S&T awareness, trust scientific findings and other S&T-related factors to be significant predictors of lay public interest in science. Overall, the outlined findings expand our knowledge regarding the nature of interest in science. The results can also be used for science communication improvement among different social groups.

PONCE, AARON* (Indiana University, USA)

Whiteness, Religion, and Secularity: Islam and Muslims in Europe

Whiteness has been framed as a defining feature of a 'racialized modernity' (Hess 2007). Europe's relationship to Islam and Muslim populations is longstanding, reaching back to Muslim occupation of Iberia, the Crusades, and the later colonization of the Middle East and North Africa. However, post-war immigration from predominately Muslim countries casts the definition of whiteness into relief in new ways. Whiteness has shifted from its origins in religious holy war and forced civilization through Christianization to a process of hierarchization rooted in secular modernity. Understanding how whiteness operates in the context of Muslim mobilities gives us the opportunity to critically examine the underpinnings of whiteness and its perceived epistemological adversaries. I argue that the transformation of valued knowledge away from religious ways of knowing toward Enlightenment-rooted secularity was pivotal in defining whiteness and continues to give it power. This gravitation toward what I term *controlled and controlling rationality* positioned groups with different epistemologies outside the boundaries of whiteness. This is perhaps most clearly exemplified by mainstream Europe's views of Islam and Muslims but is also endemic to how whiteness positions other groups with different ways of knowing the world, like indigenous groups or other minorities that adhere to traditional worldviews.

This research is motivated by the question: How is whiteness implicated in the problematization of religious—and specifically Muslim—ways of being?

Green Startups as Drivers of Sustainable Change: Entrepreneurial Responses to Environmental and Economic Crises in Chile and Tunisia

This presentation examines the role of green startups in Chile and Tunisia as key players in the transition toward a sustainable economy. It analyzes the profiles and motivations of entrepreneurs who, amidst environmental and economic crises, develop innovative solutions in sectors such as energy, recycling, and sustainable agriculture. By balancing profitability with ecological commitment, these startups are reshaping local development

while challenging traditional extractivist models and conflicts. The research that is based on this presentation adopts a sociological perspective to explore how these initiatives contribute to the creation of more equitable and environmentally sustainable economies in the Global South. This work highlights the potential of green entrepreneurship in driving social change and offers insights into the broader implications for global sustainability efforts.

Voices of Resistance: Students from the University of Chile United in Solidarity with Palestine

Since October 7, 2023, the Israeli occupation of Palestine has entered a critical new phase, triggered by a terrorist attack by Hamas and subsequent military responses from Israel, backed by various global powers. By May 2024, the conflict has resulted in over 35,000 deaths, including approximately 15,000 children, and has displaced 1.7 million individuals, leading to severe repercussions for Palestinian educational and cultural institutions. Global protests have erupted, calling for a ceasefire and a political resolution to the crisis. In response, around 174 student solidarity camps have emerged, initially in the United States and subsequently expanding to Europe and Latin America (PalestinelsEverywhere.com, 2024). This exploratory study aims to investigate the solidarity camp at the University of Chile, focusing on its demands, organizational structure, and the conflicts arising between the camp participants, the university administration, and the media.

Finding 'Who' Is Imagined As 'the Normative Indian': A Study of School Textbooks

It is widely accepted that knowledge production and circulation in schools are not neutral but selective (Apple and Christian-Smith, 1991). The politics of knowledge in education has a significant impact on school textbooks reflecting the "educational ideals" and aims of a particular society (Mannheim and Stewart, 1962). The educational ideals, however, imagined in educational policies are different from what constitutes curriculum and correspond more to the unequal realities of society. The privileged sections of society find more space inside these textbooks when compared to the marginalised. The dominance of the normative Indian - the able-bodied north Indian Hindu male- that these textbooks represent leads to the marginal representation of marginalised identities such as women, differently-abled persons and minorities, tokenistic in nature. The textbooks also exclude Dalits from the textbooks' social space, which shows how school knowledge reproduces the unequal relations of society. This paper examines the textbook as a site of curriculum to understand the type of knowledge is provided to students in India. On these lines, I look at the questions of representation, inclusion and exclusion of various identities by analysing English language textbooks published by the National Council of Educational Research and Training (known as NCERT) for classes I to VIII i.e. elementary levels of education. In addition, I also discuss how these textbooks constitute a hidden curriculum (Jackson, 2004) and a null curriculum (Moore, 2015) when representing identities.

Building Employment Support Ecosystems in Response to Challenges in the World of Work

In many countries, the Public Employment Service (PES) plays a key role in shaping labor market policy, with its activities focused on protecting the rights and guarantees of both citizens and employers in the field of employment. For this purpose, a wide range of measures is implemented to assist in finding jobs, supporting entrepreneurship, improving professional training, assisting the unemployed, selecting necessary personnel, providing information on the labor market situation, etc. In times of socio-economic instability, the importance of the PES is becoming increasingly significant. However, its activities frequently face criticism, as job seekers tend to prefer informal employment channels and online services, while employers express dissatisfaction with the quality of personnel selection. Using the example of a model region of Russia, the study proposes an ecosystem model for the functioning of the PES as a response to global challenges related to ensuring

the sustainable development of local territories. The essence of the idea is to form a network of partner organizations (government bodies, businesses, educational institutions, NGOs, etc.), which will allow for a timely response to the various needs of job seekers and employers. As a result, the PES can become a link uniting the interests of diverse parties to address a wide range of labor market and related issues. Moving in this direction will require close cooperation within the local community and the development of new methodological approaches to structuring such activities. The findings served as the foundation for developing proposals for implementing an ecosystem approach in the activities of the PES, which involves enhancing mechanisms of cooperation between stakeholders, creating new forms of collaboration, redefining the role of employment departments, developing digital platforms, and other innovations.

The research was carried out at the expense of a grant from the Russian Science Foundation No. 24-78-10168, <https://rscf.ru/en/project/24-78-10168/>.

POPOV, ANDREI* (Vologda Research Center of the Russian Academy of Sciences, Russian Federation)

Older People in the Russian Labor Market: The Dilemma between Necessity and Life's Imperatives

In modern Russia, older people regularly face challenges that significantly worsen their position in the labor market and hinder them from securing decent working conditions. Despite their extensive professional experience and accumulated skills, older individuals are forced to accept less prestigious jobs, temporary contracts, or work in the informal sector. The widespread nature of this phenomenon is due to the insufficient level of pension provision, which compels many to continue working in order to maintain an acceptable standard of living. Employment flexibility is becoming an increasingly important factor for older workers, especially in situations where companies seek to reduce working hours or offer less stable forms of employment. Based on secondary data analysis and the results of our own sociological research, it has been found that a significant proportion of older workers in Russia are compelled to choose low-paid jobs or self-employment, which increases the risks of precarization and negatively impacts the quality of their working life. This, in turn, creates preconditions for broader social instability that extends beyond employment issues. The report pays particular attention to analyzing ways to mitigate the negative consequences of precarization and explores prospects for creating more sustainable employment conditions for older people, which represents an important step toward social and economic stability in the context of an aging population.

The research was supported by Russian Science Foundation grant 23-78-10128, <https://rscf.ru/en/project/23-78-10128/>.

Structure & Agency: Ukrainian Refugee Children As the Agents of Change in Poland

Transnational transitions (Pustulka & Trąbka, 2019) are complex, mobility-affected processes, during which migrants mediate between the fields of references that are "here", "there" and "in-between". In that sense, they engage with home and destination countries and cultures, which are interactionally and institutionally represented by multiple agents (Faist, 2009; Popyk et al., 2019). Investigating crucial moments, turning points and agents of socialization in various fields (social, cultural, structural, or educational) help to better understand the lives of forced migrant adolescents in a relatively homogenous Polish society. The number of foreign-born schoolchildren in Polish schools has grown fivefold since Russia's invasion of Ukraine in 2022, which resulted in 1.6 million Ukrainians (mostly women and children) arriving in Poland (UNHCR, June 2023).

Education of forced migrant adolescents requires particular attention, as they have already been prone to multiple educational disadvantages caused by their migration status and traumatic experiences. The unequal chances of migrants for education rise when educational institutions cannot deliver equal educational opportunities or serve their primary functions due to functional changes or disturbing educational processes. Besides, children out of school are more likely to experience multiple disadvantages and later fall into the NEET (Not in Education, Employment, or Training) category. It is particularly important during the development period of becoming/being an adolescent, which itself causes various challenges in the formation of identity, sense of belonging, friendships, and psychological and social maturation and has significant effects on the adaptation, socialization, and integration in a new society.

This paper presents how Ukrainian refugee children navigate their transnational lives in times of war and uncertainty. The research is based on a four-year research project "Structure & Agency: Transnational and School Transitions of Ukrainian Forced Migrant Adolescents in Poland". The analysis is based on qualitative interviews with refugee children, their parents, teachers, and stakeholders.

POPYK, ANZHELA* (University SWPS, Poland)
STYSLAVSKA, OLENA (University SWPS, Poland)

Ukrainian Refugees in Poland: War, Migration, Uncertainty and Education

Due to Russia's full-scale invasion of Ukraine in 2022, millions of Ukrainians left their homes in search of safety abroad. After two years of war, some returned home, while others stayed abroad. In 2024, approximately 1.6 million Ukrainian refugees are still residing in Poland. The European Union has implemented the Temporary Protection Directive for Ukrainian refugees, which grants them a temporal legal right to stay, and access to healthcare systems, the labour market, and the education system. Thus, 200,000 Ukrainian refugee children entered Polish schools, while another 400,000 were out of school while residing in Poland. Since September 1st, 2024, the Polish Government posed an obligation of education for children under 18. As such, the number of Ukrainian children in school is expected to grow.

This uncertainty regarding the legal status, war, and education in a new academic system has left millions of refugees in a state of insecurity, unsure whether they can continue building their lives abroad or if they will soon lose their legal rights and be forced to return to Ukraine. As a result, this instability has had a significant impact on children, affecting their education, adaptation, and sense of security and belonging—all of which are crucial for their development and future prospects.

This paper examines how Ukrainian refugee children navigate and construct their lives in Poland by entering a new academic setting. The paper highlights both academic achievements and constraints, and socializing/adapting difficulties (which are fundamental for a successful learning process) of forced migrant children in Poland. The findings are drawn from a four-year qualitative longitudinal study, EduMAP, conducted with Ukrainian refugee children, their parents, and stakeholders in two cities -Warsaw and Lublin, funded by the National Science Center, OPUS.

Local Resilience to the Variability of Extreme Heat: Implementing Risk Management Strategies in Chilean Urban Communities

Climate change has intensified the frequency and severity of heat waves, generating significant risks for the environment, urban infrastructure, and especially people's health. However, heat is often not perceived as a direct threat, which has limited the adoption of adaptation and risk mitigation policies. In Chile, the effects of this phenomenon are particularly severe among vulnerable populations, such as children, the elderly, pregnant women, and individuals with chronic illnesses. Given the variability of heat waves across different territories, effective risk management requires a local approach, positioning municipalities as key actors in implementing targeted strategies.

This study proposes an extreme heat risk management manual to assist municipalities in adopting preventive and adaptive measures. Through a benchmark methodology, heat practices in 18 cities with similar climatic contexts were analyzed, identifying

replicable elements. Additionally, interviews with municipal workers and experts provided insights into local capacities and key challenges in risk management.

The manual offers tailored solutions, recommending practices such as establishing cooling centers, identifying at-risk population with local information and promoting green infrastructure. This adaptive approach strengthens the role of municipalities in reducing risks and building urban resilience to extreme heat, considering the specific needs of each community.

Interrogating Environmental Justice in the Cities of the Global South: Locally-Led Climate Adaptation for Building Community Resilience

Rapid urbanization, intensified capitalist development, services-driven economy, and consumption-driven lifestyles have heightened environmental and climate justice issues and challenges in the Global South. These development patterns drive the social-ecological transitions of cities, exacerbating the intertwining climate and disaster impacts on existing environmental inequalities and gendered intersectionalities (socio-economic status, migrant/non-migrant, etc.) in vulnerable communities. While the poor have contributed the least to global warming, they incur the most losses and damages yet receive very little public-private support. In response to these environmental and social challenges, local government units (LGUs), NGOs/CSOs, academia, and the private sector have collaborated on climate and disaster resilience innovations towards community resilience and environmental justice. Moreover, this paper interrogates the intersections of increasing climate and disaster risks, urban development, and the widening of social-environmental inequalities alongside the multiple layering of social intersectionalities in the risk governance systems of the metropolises.

Behind the Curtain and in the Pot: Visual Duo-Nkwaethnography and Recipe-Building for/By/about Black Motherscholars

This paper peels back the curtain of a yearlong collaborative visual duo-nkwaethnography (Allen-Handy, 2021) and photovoice project that explores how we construct and make sense of our identities as Black motherscholars. Here we explore the everyday ways that our lives are shaped by the interlocking effects of race, gender, class, and our laboring positions as motherscholars in and around higher education in the U.S. using weekly video diaries, semi-monthly photovoice prompts, photo-elicitation interviews (Wilson & Flicker, 2015), as well as critical reflections on our care practices. We are especially focused on the 'graphy' (process) and the 'ethno' (culture), wherein we use our own life stories and experiences as research methods and dialogic narratives (Lund & Sawyer, 2016). Using duo-nkwaethnography helps us draw out the hidden scripts embedded in our academic training and social conditioning as women, Black people, and scholars.

In this paper we provide a "backstage" view of our process (Goffman, 1959), pulling back the curtain on our lives and offering what we learn back to other motherscholars as a recipe of sorts. The focus of this paper is on the process of open ideation and the (un)learning that this methodological and epistemological approach affords. Drawing on Black and Indigenous ancestral wisdoms and practices of communal and familial survival – wherein resources, knowledge, and processes were/are openly shared and valued (Harrell, 2022) – we invite others to the table/pot to share and change the "recipe" ad nauseam. Our dialogic approach resists the capitalist impulse of information hoarding (Hersey, 2022), centering our intellectual exchange and meaning-making sessions as knowledge in and of itself (not as a derivative). Ultimately, we see this work as a catalyst for conversations on how gender, race, and politics interplay in care work at various scales in and around higher education and other scholarly spaces.

Being a Transnational Muslim in Australia in an Era of Hyper-Security

The general response to the threat of terrorism has been to institute Countering Violent Extremism policies and legislation that facilitate powerful regimes of surveillance. Whilst such legislation is purportedly neutral in its construction, it implicitly and disproportionately targets and impacts upon Muslim communities. Concomitant with this turn towards hyper-securitisation has been a retreat from multiculturalism, where in Australia the Muslim immigrant 'other' has been targeted as the main catalyst. Some Muslims have begun to self-censor for fear of unwanted attention from the authorities and have formed their own ethno-religious groups online, as 'safe spaces' to avoid 'microaggressions' from a hostile public that questions their national identity. This fight against violent extremism has often been invoked as a platform to curtail and silence political opponents.

Cutting across this climate of securitisation, suspicion, and rejection, there has been an increase in 'umma consciousness' amongst young Muslim thinkers. This has been facilitated by processes of globalisation and the rapid development of technology, particularly of the internet which has allowed for the formation of a 'virtual umma'. This functions as a post-national community wherein members who have never met each other can engage in collective identity construction and create a sense of belonging that subverts their lived reality. Based on qualitative data from an Australian Discovery Grant (DP220101722), this paper details the lived experience and diverse responses of four ethnic groups in Australia under these conditions – the Lebanese in Sydney, the Turkish community in Melbourne, Indonesians in Perth and the emerging community of Rohingyas in Brisbane. The results not only provide comparison and contrast between these groups but also reveal differences across cities in Australia, and across first and second generation migrants. We demonstrate the complexity of influences over these responses, but also underlying shared themes, including resilience and a desire for invisibility.

PRADEL MIQUEL, MARC* (Universitat de Barcelona, Spain)
CLOT-GARRELL, ANNA (CECUPS-UB, Spain)

Imagining Climate Futures: Civic Practices and Socio-Political Responses in Southern European Cities

Sociological debates on the mobilising force of imagined futures are crucial to the ecological crisis we are currently facing (Adloff & Neckel, 2021; Cantó-Milà & Seebach, 2024; Mische, 2009). Since 2018, the framing of a "threatened future" has emerged as a central driver behind climate mobilisations worldwide (Cassegård & Thörn, 2018; Friberg, 2022; Clot-Garrell, 2023). While the rise of these new climate movements and protests has gained significant scholarly attention, less research has focused on how these climate concerns impact specific contexts and translate into socio-political agendas (Han & Ahn, 2020; Martiskainen et al., 2020; Pradel, 2024). Drawing on a research project that examines how Southern European cities confront environmental challenges (ECOSOCITIES), we contribute to debates on societal agency in climate politics by focusing on the local level and examining civic initiatives developed to address the ecological crisis in peripheral and central neighbourhoods of two Spanish cities (Barcelona and Sevilla). On the one hand, we explore how social conditions shape people's perceptions of climate risks and threats, leading to various ways to articulate representations of the climate futures. On the other hand, we analyse how these different imagined climate futures, rooted in specific social realities, drive not only different social and political responses to the ecological transition but also articulate diverse practices to address it—such as the development of energy communities, solidarity-based community centres, and community gardens—that hold, in turn, different meanings in context. This paper aims to offer empirical insights into how social and ecological justice intersect differently within situated imagined climate futures and related practices, thus highlighting the importance of accounting for material conditions to comprehend societal agency in climate politics.

PRADEL MIQUEL, MARC* (Universitat de Barcelona, Spain)

Redefining the Relation between the City and the Sea: Tensions and Conflicts in the Transformation of Barcelona's Coastal Neighbourhoods

Over the past five years, in line with the growing efforts of the United Nations and the European Union, the city of Barcelona has developed an overall economic strategy based on the "Blue economy". This strategy aims to foster new economic sectors and redefine the existing ones, aligning them with sustainable development goals. This strategy is framed in a long-term attempt to reconnect the city with the sea, including the reshaping of its seafloor, which started in the 1980s with the opening and integration of beach areas to the rest of the city, creating new public space for citizens. This paper explores the crucial role that remaining coastal communities play in this transformation and how coastal neighbourhoods are shaping their relationship with the sea. To do so, the paper analyses two coastal neighbourhoods: the traditional fishermen's neighbourhood of Barceloneta, which in the last 10 years has developed a community-based economic development plan based on social and solidarity economy around marine-related activities, and the recently created neighbourhood of Front Marítim del Poblenou, which is proposing new connections with the sea.

Drawing on empirical research based on in-depth interviews to representatives of city administration and coastal neighbourhood communities, as well as observation, this paper examines the contrasting narratives and practices between the blue economy strategy of the city council and the initiatives of coastal communities. While the city's strategy focuses on

economic development and competitiveness based on the green economy and resilience against climate change, urban coastal communities rely on other narratives and practices. Despite existing governance mechanisms, tensions between different approaches are far from being solved and are the result of long-term conflict on the regeneration of Barcelona's seafloor.

PRAKASH DWIBHASHYAM, SARAN* (Tata Institute of Social Sciences, Mumbai, India)

ANDHARIA, JANKI (Tata Institute of Social Sciences, Mumbai, India)

The Silent Harvest: Women on the Frontlines of Food (In) Security in Global South

Global conflicts, particularly in the Global North, have exacerbated environmental damage and worsened food insecurity, with disproportionate effects on the Global South. For instance, the Russia-Ukraine war has disrupted global exports of wheat, corn, and fertilizers, leading to shortages and price hikes. This has severely impacted countries in Africa and the Middle East, such as Egypt and Yemen, that rely on these imports, deepening their food insecurity. Furthermore, the conflict has diverted international resources from climate action and aid, compounding the challenges faced by vulnerable nations in the Global South.

This paper examines the gendered dimensions of these crises, focusing on how women in the Global South manage food production and household food security amid increasing environmental degradation. Climate variability and extreme weather events exacerbate existing gender inequalities by reinforcing patriarchal norms and marginalizing women in agricultural economies. Using ethnographic research from rural Himachal Pradesh, India, the paper highlights how women have assumed leadership roles in food production and sustenance despite climate-related disasters and food scarcity.

Applying the polycrisis framework, the paper argues that while "climate-smart" technologies from the Global North promise to enhance food security, they often overlook structural inequalities. At the local level, these inequalities exacerbate women's vulnerabilities and limit their agency. The study explores how these technologies can be adapted to empower women and enhance local democratic processes, offering new opportunities for economic participation and decision-making. By emphasizing women's agency in crises, this paper provides insights into the interconnectedness of food insecurity and gender concerns, offering practical recommendations for gender-responsive strategies in the Global South.

PRASAD, SHWETA* (Banaras Hindu University, Varanasi, India, India)

SINGH, ARYA* (Banaras Hindu University, India)

Daayan Bisahi: A Study of Witchhunting in Jharkhand Region of India

Witch-hunting in Jharkhand, India, remains a deeply entrenched social practice, particularly affecting marginalized communities like tribal populations and Dalits. Despite legislative measures and awareness campaigns, the belief in witchcraft continues to thrive, fuelled by superstition, poverty, caste oppression and illiteracy. This phenomenon is largely driven by underlying socio-economic conditions, where vulnerable women—often widows, elderly, or those owning land—become accessible targets of accusations. Witch-hunting is used as a tool to settle personal scores, perpetuate gendered violence, and resolve land disputes. The violence associated with these accusations ranges from ostracization and public humiliation to brutal murders, social exclusion often committed with impunity in remote areas.

Jharkhand's tribal communities, steeped in traditional belief systems, regard witches (locally referred to as "daayan bisahi") as responsible for crop failures, illnesses, or unexplained deaths. These accusations are frequently made by local healers or community members seeking scapegoats. The state's legal framework, though prohibiting witch-hunting, remains inadequate in addressing the underlying socio-cultural factors. Law enforcement often fails to intervene in time due to social pressures or lack of access to rural regions.

This paper explores the socio-cultural roots of witch-hunting in Jharkhand, the role of gender and caste dynamics, and the state's response to this practice. Based on case studies collected using in-depth interviews, observation and key informant survey, the paper argues that sustainable solutions must go beyond punitive measures, focusing instead on education, economic empowerment, and the eradication of deep-rooted superstitions within tribal communities.

TG03-960.3

PRASAD, SHWETA* (Banaras Hindu University, Varanasi, India, India)

Female Feticide: Human Rights Framework

Female feticide in India, the deliberate termination of female fetuses due to societal preference for male offspring, constitutes a grave violation of human rights, specifically as a form of gender-based violence. Rooted in patriarchal norms, economic burdens associated with daughters, and cultural practices such as dowry, female feticide reflects a systemic devaluation of women. Despite legal frameworks like the Pre-Conception and Pre-Natal Diagnostic Techniques (PCPNDT) Act, which prohibits sex-selective abortions, the practice persists, revealing significant gaps in implementation and enforcement.

This paper examines female feticide through the lens of human rights, arguing that it constitutes a violation of the fundamental right to life, equality, and non-discrimination. These rights, protected under both national law and international conventions like the Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW), are routinely undermined in India due to societal pressures and the misuse of medical technologies. The systematic elimination of female fetuses perpetuates gender-based violence by reinforcing the marginalization and oppression of women, beginning before birth.

The paper also discusses the long-term demographic consequences of skewed sex ratios, which have led to increased violence against women, trafficking, and social instability. A critical examination of grassroots interventions and policy reforms highlights the need for stronger legal enforcement, community-based awareness campaigns, and gender-sensitive education to challenge entrenched patriarchal values. By framing female feticide as a form of gender-based violence, this paper advocates for a more robust human rights approach to address the crisis.

Relationship between the Formation of Dalit (Scheduled Castes) Identity and Politics of Recognition in India

Caste is an important demarcation factor of Indian society since the notion of purity and pollution is attached with the ascribed status of an individual born in a hierarchical structure that is regulated by the principle of 'graded inequality'. Annihilation of caste system is impossible as it requires its divorce with the principle of hereditary occupation which is the foundation of caste system. But regardless of the caste history, little do we know how the constant effort is made by the powerful caste groups in the neoliberal era by getting control over education. This control decides 'who', 'what' and 'how' of the accessibility to quality education. First, the access to education in itself seems to be distant dream for Scheduled Castes (S.C.) despite the existence of 'Positive Discrimination Policy' in India. Second, when they do get access to it, the narratives of education from the lens of the dominant high caste groups make it difficult for S.C. students to relate it with their culture and personal experiences. This forceful imposition of high caste group narratives on S.C.'s often leads to a lack of critical thinking skills and leadership qualities among them, hindering their ability to understand manipulation and combat the oppression they have been subjected to for years.

Against the backdrop of this issue, this paper sheds light on the systematic dominance of high castes on the S.C., which is not just difficult to see but it is ingrained in the minds of S.C. people in such a way that to challenge it seems to be a humongous task. This paper examines the formation of Dalit identity in India, focusing on various factors such as caste-based discrimination, cultural hegemony, exclusion of Scheduled Caste students from educational institutions, and the role of educational politics in shaping the consciousness of the Dalits.

Media without Borders: The Rise of Democratic Platforms in a Globalized Era

Democratization of media tools and platforms is the basic need for contemporary world. After the hit of covid-19 pandemic media platforms and tools have grown up in the diverse situation to serve the humanity. It has shown some tremendous result to the globalized world and also shown that media too can give great contribution in the process of democratization. The rise of democratic platforms emphasizes on the rise of new media. Where platforms like; podcasts, digital media, augmented reality (AR), virtual reality (VR) and

blogging provide platforms to express the emotions and feelings. Democracy related to media gives the right to public to participate in media activities by extending media's relationship to the public sphere. It also transcends the accessibility of technology to the less trained groups. Democratization of media platform mainly focuses on the access of media tools to the layman for preparing its content for themselves. This paper delves deep into the access of different media tools to the non-professional media content developers. The term 'democratization of media platform' mainly states that the tools or platforms for media should be easily available to anyone in this globalized village. Quantitative research method has been used in this paper to analyze the data from secondary sources. The data used to analyze the access of media platforms to the public is gathered from the official websites of the governments and other media agencies in the national and international market. Researcher also seeks the importance of internet and their role in the democratization of media tools and platforms. Some suggestions have been given to the media market and governments on the basis of highest used media platforms and their types of content after the pandemic in conclusion to fill-up the gap between the users of media specifically, the users of social media.

PRATAP, BHANU* (University of Lucknow, India)

V. MATIJEVIĆ, MILICA (Institute of Comparative Law, Serbia)

Non-Alignment and Third-World Approach to International Law: A Case of Legal 'Alterity'

Born as a reaction to the post-war global polarisation, the Non-Aligned Movement (NAM) gathered developing countries with different geopolitical positions, ideologies, and socio-political systems, most of whom had just escaped the vestiges of colonialism. A country's determination to pursue an independent foreign policy based on active and peaceful coexistence was an essential criterion for the NAM membership. Active and peaceful coexistence did not mean a neutral stance towards third-party conflicts but an active involvement in preventing and maintaining international peace.

The non-alignment movement finds a legal corollary in the TWAIL (Third World Approach to International Law). Both the Non-Aligned Movement and TWAIL are instances of 'alterity' in international law that challenge the neo-imperialist nature of international law. TWAIL, when interpreted as a legal counterpart of NAM, challenges the patronising tone of humanitarian intervention and "responsibility to protect" (R2P). It is argued that a selective application of R2P is nothing but an instance of 'imperial gaze'. Both NAM and TWAIL dwelled on the importance of 'economic self-determination'. The third dimension of R2P, i.e. "responsibility to rebuild", which focuses on a post-conflict situation, says very little about the economic hardships a society may face after an intervention. An argument will be made that instead of focusing on a Eurocentric state building in a post-conflict society, the world community shall resort to the 'local ownership' of societal assets espoused by NAM and TWAIL.

The paper aims to contribute to contemporary research on alternatives to the "responsibility to protect" doctrine, reflecting non-Western views of international law paths towards global peace.

WG08-JS-93.1

PRATESI, ALESSANDRO* (University of Florence, Italy)

The Politics of Love: Rediscovering the Contribution of Black Feminist Thought

Defined in terms as different as emotion, affective disposition, passion, act, practice, labour, power, system of exploitation, ideology, historical code, commodity, energy, bond, revolutionary force, and methodology, the concept of love seems doomed to suffer from an irreconcilable divergence between academic and lay conceptions. Nonetheless, precisely because of its manifold and complex nature, the subject of love has become a reputable and increasingly important academic area of study on its own terms for both feminist and non-feminist scholars.

For the feminist theorists, the subject of love has been a political and intellectual issue for a long time. Despite the wide variety of perspectives and approaches, the common denominator of such theorisations has been a focus on the deeply oppressive nature of love as a site of reproduction of inequalities and discriminations. Nevertheless, this complex field of study can also include a political and social ideal of love in terms of emancipation, social inclusion, liberation from oppression, and empowerment.

Until recently, several gaps have characterized such field, among which the gap between limited, reductive interpretations of love and more complex, (post-)intersectional analyses of love and its multiple implications. With regard to this latter point, the insights of US Black feminist thought have been crucially important, but consistently overlooked.

Without ignoring the vastity and the complexity of love studies, this contribution focuses on one specific aspect of them, i.e., the *politics of love*, and has four main goals: 1) relocating the roots of love studies in the longstanding and still largely ignored contribution of Black Feminist thought; 2) bridging different conceptions of the subject of love as theory and method; 3) shedding light on the alleged limitations of identity-politics and intersectionality; 4) advancing and queering current debates on the theoretical, methodological, and political implications of Black Feminist politics of love.

PREISSING, SONJA* (IU Internationale Hochschule, Germany)

The Photo Walk Method (Itinéraires) for Researching Youth Spaces. Opportunities and Challenges for Childhood and Youth Studies.

The interest in youth spaces has gained prominence, particularly due to the COVID-19 pandemic (Preissing 2021). In the exploration of how young people construct and engage with space, a variety of methodological approaches are applied in childhood and youth studies, including qualitative interviews and participant observation. Methods related to socio-spatial analysis, such as subjective cartography, are also used to examine the spatial engagements of children and adolescents.

In my presentation, I will highlight the extent to which photography, as a visual research method, can be useful for researching the spatial dynamics of young people and their spatial production. I will introduce the "Itinéraires" research method developed by Jean-Yves Petiteau, which has been employed in urban research since the 1980s and has seen further development since. These are so-called photo-walk interviews, in which an interview conducted during a walk is documented ethnographically as well as photographically and presented as a composition of text and imagery (Cuny/Färber/Preissing 2020). This research method is particularly suitable for researching the appropriation and production of space as well as self-positionings by subjects.

Furthermore, I will explore the method's efficacy in analyzing how young people engage with and produce (urban) spaces. What research opportunities does the visual approach offer in studying youth spaces? What challenges must be considered when applying visual methods to research with children and adolescents?

Artificial Intelligence (AI) and Institutional Trust: Promise or Peril?

The adoption of Artificial Intelligence (AI) has exploded in recent years from across the private sector. Similarly, albeit not as developed today, the public sector will almost certainly widely adopt AI. There are already signs of this with countries from across the world, including Italy (Algorithm Watch 2020). Despite the importance of the topic, current knowledge is extremely limited. *What consequences will such a widespread adoption of AI in the public sector have on society?*

This study focuses on a specific consequence of AI adoption in the public sector on society: *institutional trust*. We explore key mechanisms driving not only people's trust in algorithms but their overall trust in public welfare systems implementing AI to profile and categorize citizens.

Existing theories and empirical research on *algorithmic perceptions* ignore two elements that we argue are essential for understanding the consequences of AI: *awareness* and *experiences* with institutions. Specifically, we argue that both factors are key to help understand how AI will shape institutional trust.

This work applies a vignette experiment combined with survey measures to test the effect of these two factors on AI adoption and trust in Italy. In the experiment, people firstly provide their trust without knowing the decision-making process of the welfare institution. After, they are revealed whether the decision was made by a human, a hybrid system, or an AI. Our core argument is that, in contrast to what existing theories assume, *the effect of revelation should depend upon people's prior experiences and trust in institutions*.

Results will contribute to understand the broader discourse on AI adoption in the public sector as a possible game-changer for citizens' institutional trust and we will provide theoretical and empirical insights into what the future may hold for Italy and beyond as AI adoption in the public sector occurs.

Commoning after Disaster: (re)Building Shared Spaces in Türkiye's Southern Regions

The dual earthquakes that hit southern Türkiye and Northern Syria on 6th February 2023 were simultaneously a natural disaster and a (hu)man-made crisis, with poor building regulations and exploitative practices contributing greatly to both the initial destruction and the chaotic and ongoing reconstruction process. This proposal aims to address questions around the larger scope of post-disaster recovery in southern Türkiye through discussing a series of projects in the earthquake hit regions of Kahramanmaraş and Antakya, co-completed by the authors as members of Herkes için Mimarlık derneği (Architecture for All association), an organisation whose practices have been investigated previously in the context of commoning within Türkiye.

The case studies are three community spaces built with varying degrees of participation from locals and community members, as well as other organisations and groups, and their narratives of success in terms of realising commons-based systems and communities. Discussing these projects we examine the temporal commons that emerged amidst the inbetween spaces of chaos and normality following the earthquakes and the ability of various groups to come together in solidarity with common goals. Through a critical reflection on our own experiences in co-producing these three built projects, we will also discuss the real risk of common practices failing to enable a sustainable production of common space in these turbulent times; how normality, bureaucracy, and apathy can lead to shared efforts being usurped by other interests, and how the most recent case study in Antakya has endeavoured to avoid this. A project whose long term sustainability and 'success' is yet to be seen. By commoning *with*, through shared practice, shared knowledge, shared agency and various levels of contribution that allowed different parties to participate, we hope to bring fresh insights from practice-based research to this discussion in the geo-political and socio-cultural context of Türkiye.

The Evolution of Lifelong Learning: Diversification of Educational Spaces and the Role of Universities in Promoting Well-Being and Social Belonging

Since the 1980s, sociological studies have increasingly focused on the diversification of educational and learning spaces, responding to the decline of the traditional "school-centric" model. In this shift, the concepts of formal, non-formal, and informal learning have gained importance in distinguishing the various learning contexts and achieving an educational continuum.

Following the introduction of Law 92/2012 and demands related to lifelong learning (LLL) from the National Evaluation Agency, the Italian university system began seeking innovative governance solutions. This institutional framework positions universities as central actors in building the national LLL system, certifying competences, and participating in Territorial Networks for LLL.

In 2022-2023, the Italian University Network for Lifelong Learning (RUIAP) initiated a mapping project of lifelong learning services offered by associated universities, through an online survey. The evaluation of these services aimed to explore the actual continuity between formal, non-formal, and informal learning and how this can be operationalized within services dedicated to ensuring individuals' right to lifelong learning. This prompted an empirical investigation into how universities are occupying their assigned roles in the LLL system.

Scholars like William James and Simmel, as well as those studying the sociology of emotions, have emphasized how emotions can help decode an individual's internal and external world. Emotional vitality can be a powerful tool for overcoming discomfort, surpassing the limitations of rationality.

The emotional and personal investment people make in rebuilding their life trajectories - from work to education, seeking recognition - finds a counterpart in the universities that, with a strong sense of social belonging, promote LLL services for both individual and community well-being, contributing to territorial welfare. The French validation des acquis de l'expérience system offers both a comparison and a challenge for Italian universities to rethink their role as educational spaces that address fundamental human needs like happiness.

Legal Deserts, Spatial Inequality, and Criminal Legal Systems: A Study from Rural Washington USA

This paper draws on a mixed methods study to sketch stresses on the criminal legal system in rural Washington, USA. It reveals how the dearth of attorneys available to do the work of prosecuting and defending cases is subjecting defendants to delays and leaving them vulnerable to ineffective assistance of counsel. Another stressor on the system is its heavy reliance on local governments to finance not only indigent defense, but also substantial portions of prosecutorial and judicial functions.

Rural lawyer shortages are typically associated with dwindling numbers of attorneys, which in turn typically correspond to overall population loss. Yet historical data suggest that the number of active attorneys in most rural Washington counties has grown in recent decades, commensurate with population growth. Thus, the problem we identify is specifically a shortage of attorneys equipped and willing to do indigent defense and prosecution work.

While shortcomings in indigent defense delivery nationally are widely documented, this paper reveals what those deficits look like in a rural context in which the constitutionally mandated service is often provided by relatively inexperienced attorneys subject to scant oversight. The paper also reveals new challenges arising from the fact that indigent defense attorneys increasingly live far from their clients and appear only remotely in the courthouses where their clients are. Deputy prosecutors, too, are increasingly absent from rural courthouses, appearing only by video feed.

Some of the stresses on these legal systems could be alleviated by increased funding from the state, which could be used to attract more attorneys to work in these roles in rural places. Meanwhile, with virtual appearances proliferating, safeguards to foster meaningful and confidential attorney-client communications are necessary.

Co-Producing Knowledge, Pluralising Policy Imaginaries for Sustainable and Healthy Food Systems

In recent years, a 'cognitive turn' has become increasingly important in configuring research and policy for sustainability. Concepts such as 'knowledge transfer' and 'knowledge exchange' signify a shift towards 'impactful' research that would bring research closer to policy and would, thus, make 'a demonstrable contribution to society and the economy' (RCUK, 2014). This is not unrelated to the broader vision of 'engaging' 'the industry' and 'the public' in configuring research and policy processes and outputs for sustainability (Barry et al, 2008; Viseu 2015). However, in many cases, a narrow approach to 'knowledge transfer' and 'knowledge exchange' prevails, prioritizing certain knowledges and 'assum[ing] an unproblematic transfer of knowledge from academics to partners' (Munro, 2016:45).

However, can we do 'knowledge transfer' differently? Whose knowledge is important in configuring 'impactful' research and policy for sustainability? And what are the challenges when attempting to emancipate those processes from established knowledge hierarchies and epistemological/methodological trajectories?

This paper aims to address those questions specifically by focusing on the idea of 'research co-production' as a framework that aims to pluralize knowledge and impact in research and policy processes. More specifically, I share experiences and findings from the policy research I conducted as part of the UKRI 'Co-producing healthy, sustainable food systems for disadvantaged communities': a project that had 'knowledge co-production' at its heart – for example, by partnering with community organizations and appointing 'community researchers' for co-designing research objectives, methodologies and impact outputs. In this paper, I describe these processes of 'co-producing knowledge'; I discuss the possibilities they have opened up for pluralizing constructs of 'sustainability' and 'health' and, thus, policy imaginaries for 'impactful' food system change. However, I also reflect on challenges of delivering impact through research co-production, raising questions about time and labour as well as power and competition, especially within shrinking public funding landscapes.

Work and Environmental Awareness at the Bottleneck of Global Trade: Perspectives of Port Workers on the Ecology of the Global Division of Labor. Conceptual Remarks and Preliminary Empirical Evidence

Ports are hubs of the global economy, handling around 80% of international trade. They connect economic areas, production sites and markets and secure the global supply of energy, raw materials, production inputs and consumer goods. At the same time, ports reveal the inequalities of the world market and the global division of labor. Many see the world market as an expression of structural dependencies between economically weaker countries of the 'Global South' and economically stronger industrialized countries of the 'Global North'.

The inequalities of the world market do not only concern macroeconomic issues. Flows of goods are always linked to material flows. Behind economic inequalities are therefore also ecological inequalities, which are linked to unequal access to natural resources and the unequal distribution of CO₂-emissions. The growth and prosperity models of the 'Global North' are therefore structurally linked to the expansive access to natural resources in other parts of the world. In ports and port work, therefore, not only economic but also ecological inequalities and environmental injustices of the global economy are condensed.

The targeted research project examines how employees in the port sector, who deal with the import and export of goods on a daily basis, perceive the ecological inequalities objectified in goods and linked to the world market. It explores the question of whether port workers develop environmental perceptions related to their position in the global division of labor. Do port employees in countries that are heavily dependent on the export of raw materials to industrialized countries think differently about the ecological inequalities of the global market than employees in seaports of industrialized countries that unload these raw materials and in return export highly processed goods to the 'Global South'? In the session I will present conceptual considerations and preliminary empirical evidence.

Castaways in Their Own Country: State Power and Internal Exile

State violence as an exercise of state power leading political dissidents, journalists and artists amongst other groups to flee their home country and go into exile is well understood. What has received less attention is what I call internal exile. Internal exile is a dynamic process whereby the State uses its power (symbolic and material) to exclude those who are deemed unworthy of full citizenship from civil space. It casts these groups as not belonging to a nation's social imaginary and as threatening its social order. When successful, internal exile is totalising and determines the entire experience of citizenship.

This presentation aims to conceptualise internal exile as communicatively constructed and materially translated. Communicatively, the State uses its symbolic power to cast certain groups as 'the other' through language that stigmatises, stereotypes, dehumanises and inferiorises. Ultimately, such language infiltrates everyday judgements, everyday language and civil norms. When this happens, internal exile becomes banal and the internally exiled become disattendant and thereby lose audibility, visibility, individuality and civil status. This, in turn, legitimises the material translation of internal exile: the expulsion of these groups from civil space. The expulsion from civil space has, as this presentation will show, urban, physical, educational, social, legal, political and cultural consequences.

Previous approaches have for example focused on exclusion based on race gender or class – but failed to capture that these are illustrations of a social fact in the Durkheimian sense and that is, that internal exile is the defining dynamic of 'the dark side of civil society' and shows the partiality of the social contract.

Exploring the 'zone of Contestation': Quality of Working Life amid Technological Change in the Automotive Industry

The paper contributes to debates on technological change by tackling these voids. It uses a comparative qualitative cross-national design of two German- and one Swedish-based multinational leading companies within automotive assembling cars and trucks respectively, and with plants of similar size in Belgium and the Netherlands. We conducted five plant-based case studies: three in Belgium and two cases in The Netherlands, in both same first tier suppliers in automotive and truck manufacturers.

We found that the potential scale of workplace change due to the transition to Industry 4.0 in the automotive industry in Europe have made workers protagonists of what Marsden (2013) terms the employment relation's 'zones of acceptance', i.e., the scope employees allow employers in setting their duties. We introduce the term of 'zones of contestation' which we define as the scope for employees to push firms to better establish their rights for meeting both production goals while better securing their QWL. Overall, the extent and nature of frameworks facilitating both collective and individual channels for workers' voice, were often solidified through the 'zone of acceptance', and play a crucial role in creating a platform for both workers and unions to actively engage in navigating the transition to new technologies. The degree to which workers can enhance their participation in negotiations and influence the outcomes of this transition particularly concerning the QWL, however, is contingent upon workers' building 'zones of contestation' aside 'zones of acceptance', reflecting workers, management and unions diverse interests and power within distinctive local contexts. In essence, how far and how workers can make the subjective experience of work more democratic and participative is affected not only by institutional arrangements of collective workers voice but also by product complexity, flexibility and horizontal market pressures across organizational locates.

Governance and Water Policies Innovation: Reflections on IWRM and IoT Solution in a Changing Mediterranean

Water resources management is a key priority for global policies to promote sustainability and support adaptation to climate change. This paper is based on preliminary results from the ACQUAOUNT research project (PRIMA 2021-2025), which analyzes integrated water resources management (IWRM) and the introduction of IoT (Internet of Things) technologies in selected Mediterranean areas. The analysis focuses on four countries—Jordan, Lebanon, Tunisia, and Italy (Sardinia)—and evaluates the feasibility of implementing IWRM and technological innovation through IoT tools to improve climate change adaptation.

The research, conducted through the analysis of policy and governance frameworks, as well as focus groups and workshops with water managers and farmers, highlighted critical issues related to institutional fragmentation and a lack of coordination across sectors and in international cooperation. In particular, the paper reflects on the difficulties of introducing IoT technologies for water resources monitoring and management, especially in the most vulnerable areas, and on the social and political implications of IWRM implementation.

The results emphasize that, to respond effectively to the challenges posed by climate change, adopting technological tools must address the institutional and socio-environmental differences between countries and be accompanied by flexible water governance models capable of involving local actors and promoting forms of international cooperation.

Hegemony and Fields. Dialogues through Gramsci and Bourdieu.

Within the disciplinary fields of the humanities and social sciences, several well-established and globally flourishing research traditions have produced, and continue to produce, exegetical and theoretical studies on both Antonio Gramsci and Pierre Bourdieu. Alongside these lines of research, various attempts have been made to extend and empirically apply elements or aspects of each author's intellectual oeuvre, taken separately. However, the fact is that research practices inspired by them have frequently circulated loosely leading to questionable conflation and parallels. The two authors have also been used by researchers attempting to distance themselves from them to promote their own theories. We think we should move beyond these approaches and create the conditions for a structured epistemological, theoretical and methodological dialogue; this means systematically identifying points of convergence and divergence.

This context provides an opportunity to account for terrains, trajectories, strategies and ties, with their related developing potentials and criticalities, by which we have sought to initiate outlining a dialogical space between Italian and French scholars, and between France and Italy as national spheres that produced Gramsci and Bourdieu as intellectuals organic to their own times, but whose social trajectories and histories of critical reception and circulation show significant connections and homologies.

One of the underlying objectives of this project is to illustrate the operativity and the potential of certain nodes, conceptual tools, epistemological and methodological perspectives drawn from a close dialogue and interaction, not so much between Gramsci and Bourdieu's works (*opus operatum*), but more specifically between their respective *modus operandi* – that is, their thought styles and interpretative and analytical perspectives on the production and reproduction of the multiple articulations of legitimation processes – mainly through a discussion of the complementarity between the epistemological framework of hegemony and the analytical infrastructure of the field.

Landscape As a Commodity or Panacea for the Locals: A Case Study of Daringbadi Hill Station, Odisha

Existing studies on landscapes have primarily focused on their geographical significance. However, landscapes also hold social, cultural, and symbolic meanings. This paper addresses a broad understanding of landscapes by exploring their diverse meanings and their role in the tourism industry. In the Anthropocene epoch, tourism protocols not only committed to achieving a more sustainable economy but also aimed at the effective management of the environmental landscape. In doing so, these policies reconceptualise the meaning of landscape as a shared source to enhance community participation. Although the commencement of a neoliberal economic principle in the tourism sector supports the stakeholders to achieve the first one, however, conservation strategies often fall short because of the institutional regime and disproportionately favour a few while the participation of the broader community is largely overlooked. Drawing from a qualitative study considering Daringbadi Hill station as a field site, this paper explores the different meanings attached to this specific landscape for which this place is referred as the "Kashmir of Odisha". Further, it explores how these meanings influence in reshaping of local tourism. It also analyses whether this build discourse resulted in the commodification of nature and capital accumulation, or have positive impacts on the locals and their areas. The analysis reveals that Daringbadi is unique because of its cooler environment. However, calling it as "Kashmir of Odisha" is not complementary. The sole purpose for promoting this place in this way is for branding of tourism, which contributes to capital accumulation by the prominent social elite. Additionally, engagement does not necessarily promise the upliftment of the locals but rather contributes to the commodification of tribal culture.

The Making of a Tribal Landscape As a Hill Station: A Case of Daringbadi in Odisha, India

Located in high hills with milder climate, the British Raj in India created numerous hill stations throughout the Indian subcontinent. These locations were exclusive to the white British officials and their retinue with the native Indians relegated to the margins of the social, economic and political landscapes. Most often than not, prior to the arrival of the British Raj, these locations were inhabited by various tribal groups. The creation of a network of infrastructure and other facilities for the elites of the Raj witnessed the dispossession of indigenous tribal groups from the regions. While the post-colonial Indian state has witnessed the democratisation of access to these landscapes with native Indians ruling the hills, however, the lifeworld of the dispossessed tribal groups has not witnessed many changes. The present study looks at the contemporary making of a similar hill station in the tribal landscape of Daringbadi in post-colonial Odisha. Situated at a height of 3000 ft above the mean sea level and densely wooded, Daringbadi is inhabited by the Kutia Kondh tribe with its unique language and culture. However, neoliberal transformation of the state meant that the Kutia Kondh tribe are not at the frontlines of decision-making processes to transform the hills into a touristy landscape for the tastes of urban middle class Indians. The study engages with multiple stakeholders in understanding the dynamics of making of this new hill station in central India.

From Migrant to Taxi Driver: Navigating the Intersection of Formal and Informal Practices

In paper, I am looking the flexible non-codified informal rules within the preview of taxi occupation, which help migrants to get (comparatively) easily access to the occupation. The taxi occupation in Mumbai has historically been the occupation of migrants, with the faces of drivers evolving over time as different waves of migrants, from Chhillias (migrants from the state of Gujarat) to Bhaiyas (migrants from the state of Uttar Pradesh), have taken up the trade. Currently, drivers from Uttar Pradesh hold a monopoly in this occupation. The state government has consistently increased control over the industry, introducing more regulations periodically to formalize the occupation. As part of these formalization efforts, potential drivers are required to avail certain prerequisites and for that they need to have 15-years domicile and a working knowledge of the Marathi language, among other conditions. The implementation of such stringent policies has compelled potential drivers, particularly those migrating from other states, to resort to informal means to meet the necessary requirements for driving and to circumvent these restrictions. Therefore, in this paper I tried to understand how the informality has proven to be a boon for migrants seeking entry into the taxi occupation. In order to achieve primary objective, I used qualitative methodology. Approaching migrant taxi drivers for the conventional interviews were practically and ethically not possible. For the conventional interview method, the researcher and participants need to sit at assigned time and space. However, participants of this research do not have the luxury of time and space to give interviews at one sitting. Ethically also it was awkward for researcher to approach the participants at the time of their earnings. Thus, the researcher relied on the method of 'interviewing on move' with migrant taxi drivers across the city. The method comes within the framework of ethnographic methodology.

First Brexit, then COVID: Exploring Unsettling Events in the Lives of Young Lithuanian and Polish Migrants in the UK

This article applies the concept and framework of unsettling events (Kilkey, Ryan 2021) to explore how young Lithuanian and Polish migrants to the UK narrate their experiences of the spillover effects linked to macrostructural crises, namely the Brexit process and the global Covid-19 pandemic. The analysed data stems from the CEEYouth project, specifically interviews and asynchronous exchanges with 77 young migrants collected over the five waves

of a qualitative longitudinal study. The study began during the period of the post-Brexit referendum negotiations (2019) and ended during the pandemic (2021). Looking at material, relational and subjective dimensions of unsettlement, we demonstrate variability in terms of consequences of these two events on life course transitions and migrants' life circumstances, including material situation and relational dynamics. Moreover, since the subjective dimension of unsettlement is closely tied to the sense of belonging among the CEE migrants in the UK, the paper shows that mobility and settlement, like other life plans, are embedded in macrostructural disruptions and their resulting uncertainty.

Professionals' Perspectives on Barriers for Timely Antenatal Care for Migrant and Ethnic Minority Women in the UK and the Netherlands

Background

Antenatal care (ANC) is provided to women during pregnancy by healthcare professionals and is important to promote health and well-being of women and babies. Women from ethnic minority and migrant backgrounds are likely to start ANC later and to attend fewer appointments than recommended compared to white women in high-income European countries. These women and their babies are more likely to experience negative health outcomes. This study explored the perspectives of maternity care professionals on barriers for timely ANC initiation for ethnic minority and migrant women in the United Kingdom (UK) and The Netherlands.

Methods

We conducted qualitative semi structured in-depth interviews with 19 maternity care professionals (eight and eleven from the UK and The Netherlands respectively) including nurses, midwives, general practitioners, obstetricians and NGO representatives. All interviews were conducted virtually on Teams or Zoom and were recorded, transcribed and analysed using a thematic approach.

Results

Professionals in the UK and The Netherlands perceived more or less similar barriers for ethnic minority and migrant women for timely ANC initiation. As reflected in the accounts, these barriers operated at individual, health system and wider societal levels, and included negative interactions with antenatal care providers, women's and community's lack of trust in the health system, differences in spoken language between women and professionals, cultural differences, role of family and wider networks, and difficulties in reaching care. Perceived measures to facilitate access included skill development of healthcare professionals; educating women and building awareness in the community about how to navigate the healthcare system; integration of preventative psychosocial care into maternity services and continuity of care.

Conclusion

Similarity in perceived barriers and mitigation measures indicated the potential for developing and implementing targeted cross-country strategies and programs to facilitate timely healthcare access for ethnic minority and migrant women in high-income European countries.

Enhancing Social Protection Targeting through Socio-Economic Data: A Pathway from Social Assistance to Economic Empowerment through Better Graduation Programs

This paper explores the potential of Socio-Economic Registration Data (Regsosek) as a crucial tool in supporting Indonesia's adaptive social protection reform. This reform focuses on integrating comprehensive socio-economic data, harmonizing programs, and digitalizing service delivery while leveraging innovative funding schemes. Regsosek will play a pivotal role in transitioning beneficiaries from social assistance and protection programs to economic empowerment initiatives.

Indonesia's adaptive social protection aims to enhance resilience by ensuring that programs are effectively targeted and can evolve with the changing needs of marginalized communities. By integrating Regsosek, government interventions can be better aligned with labor market demands, ensuring

that vulnerable groups, including women and people with disabilities, receive the support they need. This data will facilitate precise targeting, equitable resource distribution, and greater inclusivity while addressing disparities in access across different regions.

This paper evaluates the accuracy and efficiency of targeting within existing programs—both social protection and economic empowerment—assessing whether current interventions effectively reach intended beneficiaries, from the poor and vulnerable to the middle class. It also identifies potential areas for improvement in targeting strategies, ensuring that resources are allocated more effectively and that programs achieve their desired impact.

The recommendations emphasize leveraging Regsosek to enhance data-driven decision-making, improve outreach, and continuously refine program implementation. These strategies aim to support individuals in graduating from reliance on social assistance toward economic independence, fostering an inclusive and prosperous society.

By integrating Regsosek, Indonesia can ensure better coordination of its social and economic programs, delivering more effective, efficient, and sustainable results aligned with the country's vision for equitable and inclusive development.

PUTRI, RANI* (Australian National University, Australia)

Chase the Hereafter, the World Will Follow: Defining an Ideal Future Among Young Salafi Women in Indonesia

Salafi is a transnational fundamentalist movement(s) that endeavours to bring the purest version of Islam by strictly following the Qur'an and Sunna based on the model of the Prophet Muhammad and his companions – that have had a profound impact on the Indonesia's public since 1980s. Its teachings are promulgated through various educational spaces, ranging from formal to non-formal systems that mainly target young people. Building on Arjun Appadurai's notion (2013) on "capacity to aspire" as a "navigational capacity", this paper analyses how Salafi-based education shapes a specific social imaginary of imagined futures. It focuses on the educational experience of young Salafi women in Bima, West Nusa Tenggara. Based on an intensive four-months ethnographic fieldwork, I found that the school ideology (in this case, drawing upon Salafi teachings) and other aspects of educational experience such as material learned and social interaction between the practitioners, including 'emergent emotional feature' work to narrow and specify the range of what they see as an "ideal success" that is increasingly framed within the lens of a possible synergy between spiritual and material progress – on which Lara Deeb (2006) labels as "an enchanted modern". This idea is then articulated through their career aspiration to become a teacher. These young women believe that this type of work would grant them continuous rewards from God that likely secure them in the afterlife and at the same time also bring about "material prosperity" in this world.

WG08-JS-16.5

PUTRI, RANI* (Australian National University, Australia)

Hungry for Knowledge: Affective Experience in the Quranic Learning Practices Among Young Salafi Women in Indonesia

The Qur'an is holy symbol among Muslims. Learning (and teaching) the Qur'an is then considered as pietistic activities that yield abundant rewards from God and bring the learners to a higher level of spirituality. With non-Arabic-speaking context, the Qur'anic learning practices among Indonesian youth, however, are not always a facile trajectory, instead filling with struggles and emotional ambivalence. The research explores the experience of Salafi young women in participating in the Qur'anic learning practices provided by Salafi-based educational institutions. Salafi itself is a transnational fundamentalist movement that endeavours to bring the purest version of Islam by strictly following the Qur'an and Sunna based on the model of the Prophet Muhammad and his companions. The research focuses on Yayasan Mar'atun Shalihah (Mar'atun Shalihah Foundation, YMS), a female Salafi-based educational institution in the West Nusa Tenggara, Indonesia. This institution organises non-formal education programs such as *tahsinul* (perfecting) Qur'an recitation, Arabic training, and Islamic boarding school for young women. During my intensive four-months ethnographic fieldwork, I found that these practices relate not only to cognitive abilities through which young women transform themselves as a competent and knowledgeable subject – thus enhancing their public roles in the community and critically engage with Islamic discourses around them. But they also involve emotional attachment to the material learned, other members of school, and the institution. This emotion emergent in learning practices is also amplified through their affective experience outside the context of education. Drawing upon work of Anna Gade (2004), I argue that the latter point is important component representing "an affective motivational mechanism" that ground voluntary ongoing engagement and long-term religious transformation of the self and community.

PUTTERGILL, CHARLES* (University of Pretoria, South Africa)

Perspectives of a Privileged Racial Minority: Justifying Entitlements

With the demise of apartheid at the end of the 20th century South Africa held the promise of a better life for all of its citizens. Its newly adopted constitution acknowledged the injustices of the past, a legacy of a fragmented society. To rectify this, it endeavoured to build a society based on reconciliation, striving for equality and human dignity by protecting fundamental rights in order to ensure social justice, whilst upholding individual freedom and recognising diversity. Within the context of the countervailing forces of globalisation, neo-liberal policies led to greater inequality in the post-apartheid era in South Africa. This paper sets out to look at how a historically privileged racial minority, attempts to maintain its position, and its exclusionary consequences as a result. Justifying entitlements reveal how privilege is concealed, by drawing on notions of colour-blindness, merit, efficiency and equity to diffuse perceived threats.

MIRZAIE, AYAT (Institute for Humanities and Cultural Studies (Iran), Ruhr-University Bochum, Iran)*"Social Policy Development and the Fragility of Social Cohesion in Iran"*

Social cohesion is frequently regarded as a direct outcome of effective social policies, with the state assuming a pivotal role in fostering and sustaining this cohesion through its policy determinations. While extensive research exists on social policy development, there needs to be more focus on the barriers that hinder this process, which are crucial to understanding the relationship between social policy and social cohesion. Decreasing social unity may indicate the government's failure to develop and execute effective social policies. The available evidence in Iran, particularly regarding key indicators of social cohesion such as "social capital" and "equality in the distribution of opportunities," indicates a vulnerability in the country's social fabric. The fragility described here shows a broader deficiency in the formulation of social policies, a core responsibility of the Islamic government of Iran.

Despite making promises over four decades following the 1979 revolution to prioritize "social welfare" and "social justice," the political system has not fulfilled these objectives. This paper explores the factors that obstructed social policy development during this period. Applying a theoretical framework centered on the state, the study utilizes secondary data and document analysis to investigate political patterns and policy results. The central argument is that the ideological structure of Iran's political system has served as a significant barrier to social policy development, ultimately undermining social cohesion. With its specific interpretation of "citizenship rights," this ideological framework has constrained the state's ability to address social needs and ensure equitable access to resources effectively.

A Critical Review of Public-Private Partnerships in the COVID-19 Vaccine Supply Chain

The coronavirus (COVID-19) pandemic has significantly and negatively affected the global economy and societal structures. Vaccination is considered the sole strategy capable of concluding this health crisis. Enhancing the efficiency of the vaccine supply chain is the key to controlling the pandemic, with public-private partnerships assuming critical responsibilities at nearly every phase of the supply chain. Most of the researchers agree that public-private partnerships are an important way to achieve international vaccine equity. During the COVID-19 pandemic, there are many public-private partnerships in the field of vaccines emerging, such as OWS, COVAX, ACTIV, etc. During the pandemic, the public sector provides funding to pharmaceutical enterprises through advance purchase agreements as the main form of cooperation to stimulate vaccine research and development. COVAX is the main platform for achieving equitable international vaccine distribution, but whether its role has been fully utilized remains to be seen. This study seeks to review prior studies on the involvement of PPP in the COVID-19 vaccine supply chain, identifying key participation mechanisms and leading stakeholders in different stages.

Post-Return Emotions: Everyday Food Practices of Overseas Returned Students in Shanghai

Taking post-return everyday food practices as the primary analytical lens, this paper interrogates how the emotions of transnational returnees are structured by shifting spatio-temporalities in the process of return. Based on ethnographic fieldwork in Shanghai, the empirical discussion examines the experiences of overseas returned students in Shanghai through three cases. These respectively highlight how practices and emotions relate to the persistence of hometown tastes throughout migration, the embrace of host foods while studying overseas, and the adaptation to new dietary patterns after return. These cases of post-return exemplify the intricate connections between food, place, and emotions. There are two implications drawn from the empirical discussion. First, from the spatial perspective, the post-

return emotions of transnational return migrants are intricately linked not only to the place to which they return and currently reside in but also to the places they previously experienced as emigrants. Second, the emotions of transnational return migrants should be comprehended under specific temporal frameworks, which, in this paper, refer to transitional life stages. By investigating the post-return place-related emotions indicated by everyday food practices, this research contributes a more intricate understanding of the emotional worlds of transnational returnees and sheds light on the emotionality of transnational return migration.

Does Low Fertility Rates Lead to Women's Political Empowerment? a Global Analysis

What is the relationship between fertility rates and women's political empowerment? While numerous quantitative studies have suggested that lower fertility rates promote democracy and increase women's political participation, recent qualitative research has shown that motherhood can be a powerful motivator for women to engage in political affairs and social movements.

I collect data from over 170 countries over the past decade, analyzing variables such as fertility rates, the Women's Political Empowerment Index, GDP per capita, average age at first marriage, female tertiary education enrollment, and religion. Most existing indexes that measure women's political empowerment have focused narrowly on women in the political elite or overly broad categories. However, I use a new Women's Political Empowerment Index from V-Dem, which breaks down the concept into three critical dimensions: women's civil liberties, civil society participation, and political participation.

Using fixed effects model and bringing quantitative and qualitative findings into conversation, I re-examine the relationship between fertility rates and women's political empowerment. I argue that this relationship, whether positive or negative, potentially legitimizes political control over women's reproduction to achieve state goals. Therefore, this study challenges the simplistic conclusions of previous quantitative studies, aiming to deepen our understanding of the complex relationship between women's reproduction and political empowerment.

Redefining Marriage: The Impact of College Education on Youth Marriage Purpose in China

A trend of rising ideal age for marriage and declining marriage intentions in China has garnered significant attention. Previous studies have emphasized constraints such as finances and time the youth face, however, the transformation of culture underlying this trend has been less explored. This study argues that college, as a cultural field, plays a crucial role in shaping youth culture, and could systematically influence marriage purpose through two forms of cultural capital: embodied and institutionalized. Embodied cultural capital refers to the values and beliefs shaped by one's education, different academic disciplines within universities have their own distinct norms and value systems, which in turn cultivate different attitudes toward marriage. On the other hand, the college degree serves as a form of institutionalized cultural capital that influences the acquisition of socio-economic status, which in turn shapes marriage values. Utilizing data from the 2021 Chinese General Social Survey, this study finds that college-educated individuals are more likely to reject materialistic and traditional family-oriented marriage purposes. Specialized education, understood as embodied cultural capital, also has an impact, with humanities students being less likely to endorse materialistic marriage purposes compared to those majoring in social sciences or STEM. Furthermore, socio-economic status mediates the relationship between college education and marriage purposes, demonstrating the impact of institutionalized cultural capital. The findings indicate that youth culture is undergoing a profound transformation, shifting from a focus on material and familial obligations to prioritizing individual happiness and emotional fulfillment. This study contributes to understanding the mechanisms of youth cultural change within the marriage domain in the Chinese context and offers new insights into declining marriage intentions.

Measuring Intergroup Trust with Social Media Data: A Case Study of How Americans Evaluate Chinese before and during the COVID-19 Pandemic

Intergroup trust, a crucial element of social cohesion, is the focus of this study. We introduce a novel computational method, guided by theory, to measure intergroup trust using social media data. This method, unlike traditional questionnaire approaches, is both simple and effective. Using Google News Word2Vec embeddings, we represent six dimensions derived from three classical theoretical models in social perception. This semantic space representation allows us to assess the possibility of synthesis using principal component analysis. The key finding is that the six dimensions can be combined into two fundamental dimensions: Warmth-Communion (WC) and Competence-Agency (CA). The WC dimension emphasizes subjective assessments such as trustworthiness and moral character. On the other hand, the CA dimension emphasizes objective abilities. Consequently, the WC dimension offers a new way to measure intergroup trust using textual data.

We used this new measure to analyze the perception of the Chinese by Americans before and during the COVID-19 pandemic. Our analysis was based on a dataset of 3 million tweets from Twitter originating from American IP addresses. These tweets underwent screening by an automated algorithm to identify those that were relevant to expressing opinions about the Chinese. Each tweet was scored based on the WC and CA dimensions. The results show that Americans' trust in the Chinese declined significantly after the pandemic outbreak. Specifically, (1) there was a statistically significant drop in Americans' evaluation of the Chinese in the WC dimension, but (2) no significant change in the CA dimension. The results confirm that there is a growing trend of discrimination against Chinese individuals by Americans. However, Americans' perception of the competence of Chinese individuals has remained consistent even after the onset of the COVID-19 pandemic. This study also confirms the validity of utilizing a theory-guided computational approach to assess intergroup trust through textual data.

The Dimensional Structure of Interpersonal Trust: Basic Dimensions and Implications

Interpersonal trust is a key concept in social theory, but there is still ongoing debate about how to measure it and what its core dimensions are. There is no consensus on whether there are two or three core dimensions. This paper introduces a word-embedding approach to discovering the dimensional structure of interpersonal trust based on a comprehensive list of trust-related keywords. The starting point is to identify useful keywords based on a computational analysis of (1) 14 widely used traditional questionnaires of Likert scale items for measuring interpersonal trust and (2) a supplementary data resource—a unique Twitter-based dictionary of interpersonal trust (Hu et al. 2023).

Two studies were developed to identify keywords useful for measuring interpersonal trust expressed in textual data. (1) Study 1 used natural language processing (NLP) analyses to synthesize two data sources, extracting keywords from the 14 questionnaires with the Term Frequency-Inverse Document Frequency (TFIDF) algorithm and identifying relevant keywords from the Twitter-based dictionary through a clustering algorithm (Fiske et al. 2022). The results indicated that 51 most common words (16 words from the questionnaires and 35 from the dictionary) can be used for representing interpersonal trust and further classification. (2) Study 2 extracted the spatial coordinates of these 51 keywords in the 300-dimensional pre-trained Google News Word Embedding space. These spatially represented keywords were subject to a K-means clustering algorithm. The clustering analysis resulted in three distinct clusters, each corresponding to a different continuous dimension of interpersonal trust.

These clusters represent a nuanced view that captures traditional elements like competence and integrity while highlighting a continuum of trust, from caution and skepticism to full distrust. This study demonstrates how computational methods can help identify fundamental dimensions of interpersonal trust and offer new opportunities for trust research, especially using digital and open-ended data.

Caught in the Cultural Dilemma—Cohort Differences in Behavioral Reconciliation of Filial Piety

This research employs mixed methodologies to elucidate the impact of cultural lag between generations on the retirement saving behaviors of older migrant workers. Utilizing surveys of 699 participants and 30 in-depth interviews with elderly migrant workers, this study examines the connection between cultural and social factors and retirement saving behaviors. The results uncover variations in retirement saving behaviors among different cohorts of migrant workers. The first cohorts of migrant workers find themselves caught between the dilemma of cultural expectations of filial piety and actual cultural lag of intergenerational cultural transmission. The retirement saving behaviors of migrant workers demonstrate a positive correlation between factors such as social support, peer influence, and optimism regarding retirement. The authors posit that the implementation of social policies is imperative to foster awareness and encourage retirement-related behaviors among rural migrant workers in the social context of shrinking family size in China. Crafting social policies aimed at incentivizing retirement savings among migrant workers should be the strategic approach to mitigate the cultural and structural lags experienced by elderly migrant workers.

A Life Course Approach to Income Inequality: Age-Graded Wage Returns of STEM Majors

While scholars have long investigated the heterogeneous returns to college, they often overlook how the various returns, particularly those shaped by horizontal school tracking (such as academic disciplines), change with age. The present study aims to address this gap and explore how the wage gap between STEM and non-STEM majors evolves over the life course, including corresponding gender differences. Data from the American Community Survey (ACS) and the National Longitudinal Study of Youth 1979 (NLSY79) will be analyzed using age-period-cohort (APC) models and Growth Curve models. Additionally, Oaxaca-Blinder (OB) decomposition will be employed to unveil underlying mechanisms.

The objective of this study is to investigate three interconnected research questions. First, it aims to analyze how the wage gap between STEM and non-STEM majors evolves throughout individuals' careers, shedding light on the dynamics of wage disparities. Then, it seeks to examine gender differences in the age-graded wage returns to STEM majors, incorporating a heterogeneity analysis. Lastly, it aims to identify the mechanism and decompose the factors, particularly encompassing endowment effects (occupation, industry, and major-job matching) and coefficient effects (such as personal values, discrimination, and bias) that explain the wage gap between STEM and non-STEM majors over the life course and the corresponding gender differences.

Collaborative Disaster Preparedness for Foreign Residents in Japan: The Role of Npos in Promoting Equity

Research Background:

With the growing population of foreign residents in Japan, ensuring equitable disaster preparedness for these vulnerable groups has become a pressing concern. Foreign residents face distinct challenges during disasters, such as language barriers, social isolation, and limited access to essential resources, placing them at heightened risk. Non-Profit Organizations (NPOs) have emerged as critical actors in addressing these disparities by advocating for social justice and equity in disaster preparedness.

Research Objective:

This study aims to explore the role of NPOs in promoting equity in disaster preparedness for foreign residents in Japan. By applying governance theory, the research will analyze how NPOs collaborate with governmental agencies, local communities, and other stakeholders to deliver fair and inclusive support during disaster events.

Research Methodology:

Literature Review: This research will review prior studies on governance theory and the role of NPOs to build a robust theoretical framework.

Case Study: The study will conduct case analyses of NPO activities in selected areas of Tokyo (e.g., Shinjuku and Shinagawa wards) to examine how these organizations provide fair and equitable support to foreign residents during disasters.

Interview Survey: Interviews will be conducted with NPO representatives, local government disaster officials, and foreign residents to gain insight into the practical realities and challenges of providing equitable support.

Research Significance:

This study will provide a deeper understanding of the critical role NPOs play in ensuring equitable disaster preparedness for foreign residents in Japan. It will also demonstrate how governance theory can be applied to facilitate collaboration among diverse actors in disaster management, focusing on the promotion of justice and fairness.

Health Support Networks on Instagram for Polycystic Ovary Syndrome (PCOS): Influencers and Their Strategies to Build Trust

Individuals with polycystic ovary syndrome (PCOS) turn to Instagram influencers as an alternative or complementary PCOS support source to their physicians. However, the ambiguous qualifications of influencers, and contradicting claims regarding how to manage PCOS, make it difficult to identify credible sources. Using a directed qualitative content analysis, we examined the range of strategies that 10 Instagram PCOS influencers used to signal trust. We found that influencers utilized a range of pseudo-trust strategies. Another key contribution of the study is a description of how PCOS influencers reference sources as a way to signal their status and authority. We also found that Instagram PCOS influencers discuss what it means to be healthy with PCOS, and we describe how they contribute to a wider cultural participation in healthism. The findings build upon the source credibility literature to identify novel cues of trust and emotionality used by influencers as social media platforms evolve, and further, reveal the underlying healthism-centric discourse of PCOS influencers.

Influencers Mobilization for Feminist Digital Activism: A Thematic Analysis of Iran's 2022/2023 Protests on Instagram and Twitter (now X)

Social media has become an important tool in feminist hashtag movements. When examining feminist movements, there is a core group of users, referred to as influencers, that post often and engage with content and other users. These central players have many followers and, as a result, have greater influence on the spread of the social movement and its focus. Knowing that influencers can be central catalysts in activist efforts, there is a need to study how influencers contribute to the spread of a social movement including the type of content they post, and what function their content has. With feminist causes spreading globally and influencers playing such a central role, it becomes important to understand the functions of influencers who operate in censored environments. In this paper, we focus on the 2022/2023 Masha Amini Iranian protests. In the 2022/2023 Masha Amini Iranian protests activist influencers have not only encouraged and created spaces for "generating discourse on various social, cultural, and political issues in Iran" (Tahmasebi-Birgani, 2017, p. 186), but they have also fueled the movement's spread from both inside and outside of Iran. In this study, we draw from Lovejoy and Saxton's (2012) theoretical framework of microblogging functions to examine the types of functions of activist influencers' content. The present study investigates the diffusion of protest-related content across social media platforms to investigate cross-platform differences. These differences create a need for a comparative lens that challenges the notion of social media as a homogeneous and undifferentiated unit (Matassi & Boczkowski, 2023). The present paper has two goals:

1. To understand the communicative functions microblogging serves for activist influencers in the 2022/2023 Iranian protests on X (formerly Twitter) and Instagram.
2. To identify and describe the similarities and differences between how activist influencers use X and Instagram for their activism.

QUARTA, SERENA* (University of Salerno, Italy)

The Educational Pathway of Young Neets between Cultural Deprivation and Risk of Social Exclusion.

The young people who are not in education and employment in Italy are a deep-rooted phenomenon among the young population. If on the one hand there is a constant decrease of NEET, with a shift from 25% (2018) to 18.4% (2023); on the other hand, in Europe, Italy remains at the bottom, with an average of about 10 percentage points more.

According to Eurostat data, educational opportunities greatly affect the condition of the youngest.

In Italy in 2022, 19% of 15-29 year olds were NEET. The percentage drops to 14% among those with a university degree and rises among those with lower (19.4%) and higher (20.3%) secondary education.

These data signal the difficulty of the education system in developing the skills and competences of young people and has a direct impact on their life paths.

Within this framework, the emotional states that accompany young people on their educational paths have a negative impact on their lives. Very often, they are convinced that they are victims of a system that leaves them waiting perennially for a job, they are actually the architects of a self-exclusion resulting from the internalisation of biographical careers marked by social isolation and cultural deprivation. They seem to be afflicted by the 'Donald Duck syndrome' because they live in a condition in which passivity, disorientation, and recrimination are combined with vague and confused ideas about the possibilities of social integration. They live in a disillusioned perception of work of which they can only see the most painful side instead of experiencing it as a drive towards self-realisation. The element that weighs even more heavily in these situations is the certainty that the longer they 'wait' in the family, the less chance they will have of developing the ability to get out of conditions of immobility.

SALVATI, ARMIDA (Università degli studi di Bari Aldo Moro, Italy)

The City Hall and the Territorial Social Services: A Total Institution?

The City Hall and the Territorial Social Services: a total institution?

The research was carried out as part of the PhD project and involved the exploration of the social dynamics of the City Hall of a Metropolitan city in Southern Italy and of the local social services as a backdrop to interactions with other public bodies and social actors in the area. The professional culture and organisational dynamics within and outside the institution were investigated, as well as the strengths and weaknesses of the network dynamics, which affect the service to citizens.

The municipality is a complex organisation, a collective actor (Boudon 1996), made up of actors who make individual choices (Cavalli 2001), whose actions and interventions are aimed at providing services and benefits to the community, which require collaboration and networking.

However, the organisation observed presented certain characteristics and dimensions similar to those of a total institution (Goffman 1961). The drawbacks of this model lie in its low propensity for networking, despite the fact that this appears to be fundamental and necessary for the very mandates of social services. The fieldwork lasted seven months, from July 2022 to January 2023. For data collection, an ethnographic approach was adopted (Cardano and Ortalda 2021): overt participant observation, in-depth ethnographic interviews, and shadowing (techniques accompanied by the examination of the records from the entities under investigation) were conducted.

The main findings that emerged indicate peculiarities of closed, self-referential systems (Luhmann 1984), with their own culture, and are reticent, resistant, and defensive (Tomelleri 2004), which affect the quality of interventions for citizens. The researchers developed a SWOT analysis model, highlighting these characteristics of closure, as well as opportunities for openness, obstacles, and strengths of the municipality and its social services.

Reconfiguration of Labor Relations and Union Action in Uruguayan Context

The aim of the presentation is to reflect from the Labor Sociology perspective about changes in labor and, more specifically, in the Uruguayan labor relations system, in the context of alternation of left-wing and right-wing governments in Uruguay. From a configurational methodology, it is proposed to identify those aspects that define the current labor relations system, emphasizing on which were the strategies or actions that the unions carried out in order to face the new challenges of this change of scenario. A relevant theoretical sustenance for this purpose is the revitalization theory as the power sources one.

Among the most outstanding aspects that can be taken from the analysis of this period, is the revitalization of the union movement, which renovated its strength, recovering its role of the leadership and channeler of several demands existing on society. Secondly, it is observed how, when changing the labor context, because of the turn of the government, the unions have rebuilt the value of labor. Not only from a monetary perspective and/or instrumental, but especially moral one, which has also led to orientate fights morally motivated by different groups.

Based on this idea, the presentation rebuilds the demands of the unions, understood as demands of reciprocal appreciation (moral) between labor actors. A novelty is how the unions connect with different ethics (bio-ethic, environmentalist, feminist, economic, spatial and labor) as frames of reference of their action and social changes proposal. In this context, is approached their posture about issues like climate change, labor time, caregiving economy, environment, among others that are the axis of the union debate nowadays.

Reconfiguración De Los Vínculos Familiares Para Las Funciones Parentales En Parejas Con Hijos Con Discapacidad Intelectual. Una Aproximación Desde Las Narrativas Biográficas.

La familia se concibe como una construcción social en relación con los roles y funciones que desempeñan sus integrantes. Esta noción de familia está profundamente influenciada por el contexto espacial, temporal, cotidiano y sociocultural, lo que la convierte en una construcción dinámica. Pensar en la familia implica reflexionar como sujeto situado dentro de una estructura social y un tiempo determinado, entendiendo el concepto de familia a través de las experiencias e interacciones durante la biografía.

Los roles establecidos en el seno familiar pueden cambiar tras una separación parental, lo que exige una reinterpretación y reconstrucción de las funciones familiares. Aunque existe poca información sobre cómo se reconstruyen los vínculos familiares después de una separación y cómo las historias de vida se entrelazan en este nuevo escenario, la comprensión es aún menor en el caso de familias con hijos con discapacidad intelectual. La discapacidad, al igual que la familia, es también un fenómeno socialmente construido, y en situaciones de separación, la reconstrucción de los vínculos de cuidado adquiere una relevancia crucial.

Las personas con discapacidad intelectual suelen requerir un mayor tiempo de cuidado, debido a las barreras sociales que limitan su autonomía y participación plena en la sociedad. Ante esto, la investigación se enfoca en comprender cómo se reconfiguran los vínculos familiares en torno a la parentalidad y el cuidado, específicamente en padres y madres separados con hijos en situación de discapacidad intelectual. Este estudio se abordará utilizando un diseño narrativo-biográfico identificando los hitos y procesos claves en las historias de vida, y cómo estos influyen en la construcción y reinterpretación de los vínculos familiares, con especial atención a las lógicas de cuidado vinculadas a la discapacidad intelectual. Se llevarán a cabo entrevistas narrativas biográficas. La información será reportada mediante un análisis abductivo. Los resultados se encuentran en proceso de construcción.

Regional Gender (in)Equality in the EU. Beyond Achievement and Development

The research question that this study seeks to address is as follows: how does gender equality at the regional level relate to economic indicators such as GDP per capita and other indicators of a more social, cultural and political nature in the European Union?

The objective of this paper is to conduct a comparative analysis of the gender equality situation in three EU countries: Spain, Italy and France. Furthermore, we examine the methodology employed in the Gender Equality Index (GEI) of the European Institute for Gender Equality (EIGE). In this study, we build upon the analysis conducted by López-Roldán and Fachelli (2023) and the methodological critique presented by Permanyer (2010, 2015) to develop a novel approach to examining gender inequality.

In order to achieve this objective, we have applied a structural and articulated methodology (López-Roldán & Fachelli, 2015) combining Principal Component Analysis techniques that identify the attributive characteristics of the social space and then a cluster analysis that identifies and classifies the regions into groups associated with higher or lower gender inequality. Subsequently, we will examine the extent to which this multidimensional and relational reality of gender inequalities is associated with economic and societal factors. To this end, we will conduct a linear regression analysis between the GEI and a range of economic and social indicators. Finally, we will discuss our results and comment on our main conclusions in light of them.

Authors Meet Critics Book: "Trabajadores, Sindicatos y Actividades En La Frontera Norte De México. Un Mapeo Laborar Actualizado"

Cirila Quintero Ramírez nos brinda un relato oportuno y magistral de las relaciones laborales en cinco centros de exportación de manufactura distribuidos a lo largo de la frontera norte de México que colinda con Estados Unidos. Dentro del contexto más amplio de la reestructuración económica, la reforma de la legislación laboral y las relaciones comerciales con nuestro vecino norte.

La autora ofrece una exploración, matizada y localizada muy necesaria de las condiciones de trabajo, la heterogeneidad de los actores sociales y a sus patrones de resistencia, así como las diferenciaciones en el uso de trabajo femenino. Este extraordinario trabajo se basa en más de tres décadas de investigación y análisis profundamente arraigados. Es una lectura obligada tanto para académicos como activistas.

Labor Movements in Mexico: From the First to the Last Movement during President Amlo.

This paper analyzes the first and last labor movement during government of Andrés Manuel López Obrador (AMLO). The first movement that was considered as the beginnings of the Labor Spring because 40,000 workers in maquiladoras (assembly plants) of Matamoros were mobilized to asked economic bonus and change of unions, they won the first, but the result to the second was ambiguous; the last movement was in Volkswagen of Mexico, in Puebla City, the result was the denial to accept any violation of company to the rights of workers according with Mechanisms or Rapid Response, however the company the reinstallation of workers, proves that they unjustified fires. Different to Matamoros, workers in VW needed to resort to possibility of strike to get an increase of salary, they get it but the plant announced economic problems and the possibility to fire more workers. The contrast between both movement shows the small advances in the labor issues and unions in Mexico in spite that President AMLO promised that labor will be better with him. The changes introduced in the labor justice, as the formation of Center of Conciliation and Labor Register, seems to be one of the most important obstacles in the improvement of workers in Mexico.

RC05-74.4

QUINTERO SUÁREZ, TATIANA* (GCSC, Germany)

Collective Memory in Colombia: A Strategy to Reconstruct Historical Recounts, Resist and Re-Exist in Black Territories.

From a multidisciplinary perspective, this proposal focuses on collective memory. The multilayer concept allows the study of cultural subsistence in complex contexts of violence, discrimination, and marginalization. A general definition of collective memory as "a social construction constituted through a multiplicity of circulating sign forms, with interpretations shared by some social actors and institutions, and contested by others in response to heterogeneous positions in a hierarchical social field" (French, 2012, p. 349), allows us to assert that collective memory is a suitable theoretical framework to explore the role of grassroots organizations and communities in post-conflict contexts where racial exclusion and discrimination are decisive.

Colombia is an illustrative case. Its internal conflict endures a complexity that intermingles multiple variables: the role of history and its contrast with collective memory narratives, the different levels of appropriation of those narratives, and their relevance in changing political frames. One of the significant recent results is the recognition of structural racism as one of the ground reasons for the differential impacts of the armed conflict by the Colombian Commission of Truth. It is the result of the confluence of social mobilization and prioritizing the victims' voices as a basis for the report with which the Commission ended its mandate.

Thus, this proposal addresses the questions of what is the role of collective memory and how it operates within grassroots organizations and Black communities regarding political positioning, cultural resistance, and re-existence and how these local narratives generate impact across institutionalized memory initiatives, using as a reference the Colombian Commission of Truth.

This inquiry aims to reflect on the power of narratives and discourses arising from powerless sociocultural spheres to confront and dispute narratives about the past. It also offers the opportunity to transcend the individuality of social studies to focus on collective action, belonging, and self-positioning.

RC42-JS-64.2

QUINTERO SUÁREZ, TATIANA* (GCSC, Germany)

Critical Methodological Approaches for Social Research: A Tool to Cope with Field Challenges and the Contributions from Latin American Thought.

To deal with the colonial past that founded social research, disciplines such as anthropology and sociology have developed strategies to call for committed research. In this process, the contributions from Latin American thought are crucial. During the 1960s and 1970s, Latin American social research led the analysis of difference and diversity from critical perspectives (Krotz, 2005).

One of the markers of this phenomenon was the Barbados Statement. It focuses on the colonial structure that shapes research and proposes a call for liberation, altogether with social and political commitment. This statement embraces a wide spectrum of critical thinking: Popular Education, Liberation Theology, Alternative Communication, and Participatory Action Research, among others. This shows a disciplinary convergence of social sciences aiming to produce knowledge in favor of subaltern sectors. Hence, the basis was understanding socio-cultural complexities and a serious commitment to reality transformation. As Gustavo De Oliveira Figueiredo (2015) explains, these academic efforts were named the 'emancipatory paradigm', a reference that highlights a relationship with political takes.

This proposal aims to vindicate the 'emancipatory paradigm' as a tool to face the researchers' challenges in the field and as a mechanism to use subjectivity, defeating the modern perspective of individuality and, rather directing it to the assurance for two sides communication, exchange, and knowledge production. This approach contributes to materializing the differences between a social researcher and a natural observer recognizing the researcher not as a neutral knowledge source but as a part of the social landscape explored.

Focusing on the questions of how critical social research and decolonial perspectives dispute the role of subjectivity directing the researcher's character into a constructive play in favor of political and socio-cultural affirmations, this proposal wants to reflect on ethical criteria analyzing methodologies such as committed anthropology, public anthropology, militant ethnography, participatory action research, or cooperative research.

QURASHI, FAHID* (University of Salford, United Kingdom)

Knowing and Not Knowing about Israel's Genocide in Gaza.

In an Anthropocene characterised by the instantaneous flows of monumental amounts of information, when knowing about the world has become possible for the majority of the world's population, how is it possible for Israel and its allies to sustain genocide denial in the face of copious amounts of evidence of war crimes and violations of international law, that even the International Court of Justice could not ignore in its ruling of a plausible case of genocide in Gaza perpetrated by Israel? How has the UK navigated its own arms export regime, which prohibits the sale of arms where there is a clear risk that the arms could be used to commit or facilitate violations of international humanitarian law, to continue selling arms to Israel whilst it is perpetrating a genocide in Gaza? In short, how is it possible to simultaneously *know* and *not know*?

In this paper, I use Cohen's (2001) 'culture of denial' to analyse the multifaceted ways in which *not knowing* about Israel's genocide in Gaza is deliberately cultivated. As an active practice, *not knowing* was cultivated by European colonial states to deny and rationalise colonial crimes and to sustain a civilised image of Europe. As a settler colonial state, Israel has, out of a necessity to justify its existence as a free and democratic westernised nation, refined the practice of genocide denial, despite continuously perpetrating atrocities. In this paper I analyse various practices of denial used by Israel, from the destruction of evidence, the politicisation of language, to the spiral of denial.

Economic 'migration' Push and Pull Factors for Ocean Island Bases: The Cases of Okinawa and Diego Garcia

There is a rich interdisciplinary literature on the sociology and politics of (military) base economies, ranging from seminal interventions such as Cynthia Enloe's "Bananas, Beaches and Bases", to Marxist critiques represented by Wendy Matsumura's "The Limits of Okinawa", and eclectic approaches in the ilk of Gerald Figal's "War, Peace and Tourism in Postwar Okinawa". Yet, the intersection of the economics of migration, as a key aspect affecting how base societies are constituted, with the great power interests of regional geostrategy have rarely been examined in a comparative context. To address this lacuna in the literature, this paper adopts a transdisciplinary methodology in examining how ocean island base communities have responded to the impact of those great power interests in terms of forced and voluntary migration and the resulting socio-economic and geopolitical effects.

The central research question addressed is to what extent can the economics of migration be viewed as a symbiotic process in the context of relatively remote ocean island bases, such as in the cases of Okinawa and Diego Garcia? In other words, to what extent, and through what means, are base communities able to exercise agency in responding to changes imposed upon them as a function of great power (e.g., US, Japan, UK) interests? Moreover, to what extent does any such agency manifest itself in positive, democratically led outcomes or unexpected effects?

In the cases examined, it emerges that despite dramatically differing historical and socio-economic circumstances, the economics of migration (forced and otherwise) offer unique insights into unexpected effects, caused more by the framing of issues advanced through agencies of the great powers who impose their authority on these vulnerable communities than by the actors of the communities themselves. Conversely, localised agency relating to movement and relocation is typically misrepresented or manipulated for politically motivated and geostrategic ends.

You Don't Choose Your Family: Analysing the Links between Incarceration, Gang Membership and Family Relationships in South Africa

In the Western Cape in South Africa, gangs are often described as substitute families for especially young men who are raised in difficult circumstances associated with precarious communities, vulnerable families and different forms of abuse. The powerful South African gangs within prisons (correctional centres) developed a strong hold on individual members which is well documented in popular and academic literature. As gang members grow older, they often have repeated stints of incarceration which may eventually lead to long incarceration periods ("lifers") due to violent crimes which carry lengthy minimum sentencing periods in South Africa. Such incarceration patterns (trajectories) reinforce a particular form of "brotherhood" or loyalty to other gang members where a particular masculine hierarchy is cemented. Yet, incarcerated gang members may also have families outside of prison and this paper will focus on nuanced interdependencies between family life and prison gang membership over the life course. An in-depth analysis of selected face-to-face interviews with formerly incarcerated men in the Western Cape, together with a review of existing literature based on qualitative research with incarcerated men in South Africa, will form the basis of this paper. A life course perspective will be used as the theoretical starting point for this analysis as the transitions between developmental phases and dramatic turning points are useful indicators for a greater understanding of links between violence, vulnerabilities and the individual and family life course.

Social Transformation from below: Childhood, Children and the Quest for Justice

This contribution discusses how childhood, albeit a divisive positionality with regards to prerogatives of social power and public social decision, stands

as a relevant vantage point to foreground a critique of the present adult-centred society and forward insights of social transformation. Children, though consisting of up to a third of the world population, have been recurrently disregarded as a social category concerning their claims of material well-being, educational demands, and above all, political participation in public life. As a dominated social group, children's voices do not resonate and affect to enlarge adults' understandings about collective life rather they are often taken as babbles, grumbles or noises. However, in their own terms, children have shown the diversity of social harms they suffer pointing at fairer and more equal social relationships and social conviviality. Relying on a decolonial inspiration, the particularities of generational domination, intersected by so many others, are unravelled, as children's movements of 'slow' opposition, resistance and insurgence point at needed social changes as seen from below. The empirical examples drawn here from childhoods of the Global South offer an instigating entry point to analyse how the quest for justice and equality by children is interweaved in the politics of intergenerational relationships.

Expert Authority and Regional Governance - a Comparative Analysis of the Arctic Council and the International Council for the Exploration of the Sea

We combine international relations and meta-organization theory (Ahrne & Brunsson, 2008; Berkowitz et al., 2022) to explore expert authority as a key feature of global and regional governance actors (Barnett & Finnemore, 2004). We are particularly interested in how these actors maintain expert authority and how they sustain their influence on their organizational environment in the long term. We argue that expert authority is closely linked to the level of expertise, the way knowledge is produced, and the way it is disseminated in the respective organizational environment.

To put this research interest into practice, we compare two meta-organizations from the field of international ocean governance in terms of their respective levels of expert authority: the Arctic Council (AC) and the International Council for the Exploration of the Sea (ICES). Arguably, knowledge and expertise are vital to both meta-organizations, and both display expert authority in the governance system. At the same time, however, there are also differences. To name just two examples: ICES is responsible for producing scientific advice for its member states and other 'clients' on request, while the demand and political transfer of the scientific recommendations produced by the AC takes place directly within the organization. Or another example: While ICES' knowledge production is based almost exclusively on the natural sciences, the AC's scientific output is based not only on scientific findings, but also on indigenous knowledge contributed by indigenous groups within the organization. Our analysis draws on a wide range of empirical material - from secondary literature to published reports and interviews with the experts involved.

How Do Meta-Organizations Make Grand Challenges Actionable? the Case of the Scientific Organization for the Prevention of Adverse Impacts on Vulnerable Marine Ecosystems

In this presentation, we combine meta-organization theory and the literature on grand challenges and ask how meta-organizations make grand challenges actionable.

To answer this question, we look at a particular grand challenge and a specific type of meta-organization. We choose a grand challenge that has been on the UN agenda since at least 2004, but which has received relatively little public attention. This grand challenge is related to the oceans: the prevention of adverse impacts on vulnerable marine ecosystems (VMEs). The specific type of meta-organization we look at is one that generates knowledge on this topic and makes it available to political decision-makers.

We draw on a single case study and trace how the *International Council for the Exploration of the Sea* identify VMEs on behalf of its clients. Based on different components of organization as developed by Ahrne and Brunsson, we show how a comparatively abstract and ambiguous Grand Challenge is made actionable and what difficulties arise in this process.

The VME case is particularly suitable because the challenge appears relatively clear in abstract terms, but at the same time poses difficulties in terms of implementation: the definition and identification of VMEs are just as complicated and controversial as the measures to safeguard them. Not only political and scientific, but also economic and ecological actors influence this process. Such a constellation almost inevitably leads to 'unsatisfactory' compromise solutions, which are quickly criticized for good reasons, but on closer inspection turn out to be more 'reasonable' for equally good reasons than is sometimes portrayed. With this in mind, this presentation attempts to provide a rather sober account of organizational processes required for making grand challenges actionable.

Geopolítica De Las Preferencias Latinoamericanas En Netflix

En sólo un cuarto de siglo de existencia, Netflix ha modificado todas las dimensiones del campo audiovisual internacional: desde las condiciones de producción, los modelos de distribución, la cronología de los medios y los circuitos de circulación audiovisual, así como los mecanismos de consumo audiovisual. La plataforma ha adquirido creciente poder de definición y re-orientación del gusto audiovisual a través de su sistema algorítmico Cinematch para individualizar la oferta a sus usuarios. No obstante, la curaduría algorítmica que le ha dado el sello distintivo a la plataforma; es muy notoria la creciente centralidad en las recomendaciones de la producción "Netflix originals" en la interfaz de los usuarios y la nueva sugerencia "Top 10 Global" que impulsa el visionado tras de la popularidad global y el gusto de masas, así como tras de sus propias apuestas productivas.

La plataforma se ha instalado y crecido sostenidamente en América latina desde 2011. De acuerdo a Statista para final de 2023 el número de abonados de Netflix en América Latina roza los 43 millones de personas. En ese contexto cabe preguntarse ¿Qué origen tienen las producciones más populares en Netflix para los latinoamericanos? ¿Qué lugar tiene la producción norteamericana en nuestras preferencias? ¿Y el cine regional y nacional? Se parte de la hipótesis que las coproducciones regionales no logran revertir la centralidad de las producciones anglosajonas (siguiendo estudios previos de Lobato:2019), aunque sí lograron asentar una nueva agenda de preferencias producto de los flujos mediáticos transnacionales (Thussu, 2010) de los hubs de la semi periferia global (Wallerstein) como Sur Corea y Turquía.

La metodología utilizada es cuantitativa a partir de una reelaboración de datos del Top10 Netflix en cuatro países latinoamericanos (México, Colombia, Brasil y Argentina), de una muestra de semanas de los últimos dos años, incorporando datos desde otras fuentes (IMDB, Film Affinity).

Communicating Whistleblowers' Messages: The Role of Media in Exposing South Africa's State of Capture

The phenomenon of state capture significantly impacted South Africa's socio-political landscape during Jacob Zuma's presidency (2009-2018). Simply put, state capture is when private actors influence the state through illegal and non-transparent forms. State capture in South Africa transpired largely because of an unethical nexus that formed around Zuma, those in government loyal to him, and the powerful business family – the Gupatas. Revelations of state capture came to the fore because of independent media. Independent media was reliant on whistleblowers to communicate a complete narrative, which resulted in a mutually beneficial collaboration between independent media and whistleblowers. A qualitative research approach employing two methods was utilized to examine this collaboration. The dominant source of information for this study stems from semi-structured interviews conducted with whistleblowers and independent media outlet affiliates. The semi-structured interviews were further supplemented with document analysis, in order to corroborate the findings emerging from the interviews. This study found that independent media played a key role in supporting South African state capture whistleblowers. Support manifested in three forms, namely: defensive; emotional; and offensive support. Defensive support entailed legal, financial and security aid. Emotional support was provided in the form of informal counselling. Offensive support entailed using media exposure to make the whistleblowers' narratives public, and mediating between whistleblowers and official commissions of inquiry.

RADVANSZKY, ANDREA* (Institute of Biomedical Ethics and History of Medicine, University of Zurich, Switzerland)

Normalizations in Microsociological Dementia Research

Qualitative methods shape the selection of theories used to explain findings, meaning researchers actively construct the phenomena under study. In this presentation, I address the role of subjectivity and self-reflection, which, for example, the Grounded Theory Methodology, has been drawing attention to, using microsociological dementia research as a case. I also discuss its implications for care ethics.

Praxeological studies, based on observations and video data, often conclude that meaning-making in dementia is secured through the body. Even when cognitive abilities and verbal communication decline, prereflective knowledge enables interaction, suggesting that a person's selfhood can still be embodied.

However, my social phenomenological study, based on 25 semi-structured interviews with family caregivers of people with dementia, points in a different direction. Analyzing these interviews interpretatively, I demonstrate how dementia disrupts "normal" interaction processes. When the idealizations necessary for successful interaction are suspended, the subjectivity and responsibility attributed to the other person are profoundly affected. Family caregivers must navigate these disruptions and the challenges to sociality they present.

I argue for replacing the dominant constructivist and victim-perpetrator model in dementia discourse with Alfred Schütz's social phenomenology, which acknowledges the critical role of the body and everyday consciousness in sociality. Rather than normalizing dementia as a condition where the body independently shapes reality, dementia care ethics must address the vulnerabilities and disruptions of the body schema. This shift emphasizes the transformative potential of social relationships in dementia, highlighting the importance of integrating both the body and mental processes in understanding social interaction.

Navigating Love and Relationships in Uncertain Times: Qls of Youth & Family Transitions

In the context of rapid social change, increasing uncertainty and recurring crises, qualitative longitudinal research provides an apt framework for examining how youth and family transitions unfold. This paper contributes to key debates on young people's relational lives, offering insights into how young adults negotiate personal relationships within partnering processes (i.e., singlehood, dating, cohabitation, engagement, marriage).

The data stems from two waves of a qualitative longitudinal study (QLS) called ULTRAGEN: Becoming an Adult in Times of Ultra-Uncertainty: Intergenerational Theory of 'Shaky' Transitions. Specifically, the analysis was done on individual in-depth interviews with young adults (aged 18-35) and their parents (121 interviews in total) conducted in 2021 and 2023.

We explore the interplay of two pillars of young adults' romantic lives in Poland. On the one hand, we track external pressures, framed as challenges caused by subsequent social crises (e.g., pandemic, war in Ukraine, economic destabilization), which affect thinking about love and possibilities of commitment. On the other hand, we discern shifting social and intergenerational norms as engendering varied views on this realm. The study identifies three key stances: those who seek relational stability/commitment, those who reject it, and those who are ambivalent. The longitudinal approach allows us to track how these stances change over time, revealing how young people's views shift between the two data collection waves in relation to the aforementioned structural and personal circumstances.

Longitudinal data shows that despite devaluation of traditional pathways towards marriage, love remains a stabilizing force for many young people, offering hope amid widespread uncertainty. Nevertheless, rising structural barriers (e.g., wedding costs) and persistent personal ambivalence about partnering (e.g., contesting traditional family), complicate decisions about long-term relationships. The study illuminates the value of QLS for understanding how uncertainty impacts transitions.

RAFFA, VALENTINA* (University of Messina, Italy)

Anti-Gender Campaigns and Feminist Mobilization in Italy: The Role of Anti-Violence Centers

The contribution analyzes the political conflict through the topic of gender-based violence. In particular, it focuses on the role of Anti-Violence Centers (CAV) as actors in the regeneration of the democratic project, which is at risk of progressive erosion due to the advance in Italy of anti-gender movements. Anti-violence centers represent a necessary force for the realization of genuine models of democracy. They work to uncover gender-based discrimination and inequalities and promote awareness and empowerment processes for women.

The aim is to identify the configurations that the political role of Anti-Violence Centers assumes today in Italy and their transformative horizon. This is done in relation to, on one hand, the conservative ideology of Giorgia Meloni's government and, on the other hand, the anti-gender ideology that attacks the two key principles of the Istanbul Convention: the idea of gender as a social construct and that violence against women is a product of gender power asymmetry. This ideology tends to produce cultural and political backlash, challenging liberal democracy.

Using qualitative data from in-depth interviews with operators of various Italian CAVs, predominantly belonging to the D.i.R.e network, this contribution attempts to reconstruct some of the best practices in prevention, education, and awareness by Anti-Violence Centers. It particularly focuses on their practices of defining a public discourse on violence that contrasts with its stereotyped and prejudiced social representation, within a patriarchal, anti-gender, and populist ideological framework that tends to influence Italian political culture on gender issues.

The reflection presented here is part of the research of the Messina unit within the PRIN 2020 project "Stereotypes and prejudices: the social representation of gender-based violence and contrast strategies ten years after the Istanbul Convention" (PI Prof. Flaminia Saccà, Sapienza University; local unit leader Prof. Milena Meo, University of Messina).

RC26-428.4

RAFFA, VALENTINA* (University of Messina, Italy)
GAROFALO, SABRINA* (University of Calabria, Italy)

Gender Based Violence and Institutional Violence Against Women

The objective of the proposal is to highlight how the escape paths from gender-based violence are crossed by institutional violence and how such experiences serve as obstacles to the processes of awareness of rights and freedoms. The research conducted on anti-violence centers in Italy reveals a diversification of forms of violence experienced or perceived by women, shedding light on a complex picture of formal and informal relationships. Women who live in situations of violence are marked by stereotypes and prejudices that influence and sometimes condition their choice to break free. These stereotypes are evident in their relationships with local social services, whose involvement has often focused on mediation and conciliation, giving less importance to women's lives.

The same dynamics can be observed in access to reporting (lawsuits), where, even today, the lack of training among police officers leads to an institutional reception steeped in role expectations and prejudices that too often undermine women's testimonies. The court trial, particularly concerning the actions and words of lawyers and judges, still represents a space for secondary victimization, using language, phrases, and references that blame women, making them even more vulnerable. All this, as constructed in the public debate, poses an obstacle to the very process of seeking justice, demotivating women from undertaking a difficult path. Furthermore, institutional violence results in a lack of access to rights, in a cause-and-effect relationship that translates into complex bureaucratic activities, even over the long term. What is intended to be shared is, therefore, the declination of male violence against women in institutional forms that perpetuate power dynamics: institutions are still predominantly male, which perpetuates positions that are too closely tied to imagery, stereotypes, and prejudices against women.

Baladi Politics: The Social Life of an Untranslatable Agri-Culinary Category in Palestine/Israel

Amidst the vibrant culinary scene in Israel and Palestine, the concept of "Baladi" emerges as a polysemic and untranslatable term, deeply rooted in Arabic language. It represents a multifaceted range of meanings, encompassing notions of domesticity, earthly connections, communal identity, and local authenticity. However, this concept is not only a culinary marker but is also charged with profound socio-political significance, especially in the Israeli-Palestinian context. Our presentation delves into the "social life" of Baladi in Palestine and Israel, exploring how this concept operates ontologically and epistemologically within various culinary-agricultural fields. Through socio-historical analysis, multi-sited ethnographic fieldwork (including participant observations in farms and restaurants in the Palestinian villages Al-Walaja and Battir, as well as Beit Jala in the West Bank, and in the village Ein Rafa in Israel), and in-depth interviews (N=33) with Israeli chefs, Palestinian farmers, environmental activists, entrepreneurs, and conservationists, we trace the major moments in the evolution of Baladi. As the Baladi discourse moves back and forth between Palestinian and Jewish-Israeli culinary spheres, it encapsulates the complexities of culinary identity, cultural resistance, and contested spatial narratives. Thus, we describe the dialectical processes of its appropriation and commodification in the Jewish-Israeli context, while in the Palestinian context, the concept of Baladi acquires new meanings related to heritage, gastro-national resistance, and environmental decolonization. Theoretically, our presentation contributes to the discussion of untranslatable culinary categories within the context of a global market economy, ongoing colonialism, political violence, and the struggle over space and identity.

GUTKOWSKI, NATALIA (independent researcher, Jerusalem, Israel)

Dual-Use Politics: Cyber Sensors, the Emerging Military-Agri-Tech Complex in Israel/Palestine, and the Battle Against the Red Palm Weevil in Middle Eastern Date Plantations.

This paper examines the concept of "dual use" by analyzing how military technologies are repurposed for environmental and agricultural management in date plantations in Palestine and Israel, particularly in combating Red Palm Weevil (RPW) infestations. Through this case, we explore how former Israeli military intelligence professionals, alongside Israeli and Palestinian farmers, deploy high-tech tools like IoT sensors to combat invasive species. We investigate how technologies originally designed for security and surveillance are adapted for agro-environmental purposes, blurring the boundaries between military and civilian applications. We extend the idea of "dual use" beyond military-economic contexts to encompass its socio-political and ecological implications, particularly in settler-colonial settings.

Drawing on interdisciplinary literature, including research on more-than-human relations, political economies of agriculture, the plantationocene, and critiques of Global-North military-industrial complexes, we highlight how military discourse and practices are reconfigured to address environmental crises while reinforcing power asymmetries in conflict zones. Additionally, we demonstrate how the dual use of military technologies not only transforms agricultural practices but also reflects broader socio-political dynamics, where power and control are exercised through both human and non-human agents.

Our analysis illuminates the intersections of technology, agriculture, and political conflict, showing how control over non-human species, plant life, and agro-technological systems forms a complex assemblage of power, control, and ad-hoc collaborations. This paper contributes to discussions on technology and more-than-human agency in capitalist systems, innovation ecosystems in agriculture, and the complexities of addressing Anthropocene challenges through technological interventions in agri-food systems.

Bias in Recruitment Processes

Although technology has become an integral part of our lives and has come to define who we are and how we live (Wajcman, 2004), most scholars agree that women and men are not on equal footing when it comes to technology. This holds true for both its development and use (Cech and Blair Loy, 2019; Young, D'Ignazio and Klein, 2023; Wajcman and Sprejer, 2023). At the conference we will introduce our results from our research on the topic of gender and the use of AI in management across Europe. We have analyzed the perception and experience of women and men of discrimination related to the use of AI applications. We have also investigated whether AI developers and human resource (HR) specialists in Europe believe that using AI algorithms in management creates diversity biases, and whether they have identified any strategies to mitigate potential gender bias.

For the purpose of analyzing perceptions towards and experiences with the use of AI in management, we analyzed quantitative and qualitative cross-country datasets collected in 2023, first a survey dataset of almost 5000 answers from across Europe, and secondly expert interviews AI developers and HR managers in eight European countries that were asked about possible bias connected to AI in recruitment and management.

Our results shine a light on gender patterns in the survey data and on how AI developers and HR managers address gender and diversity in relation to the use of AI in recruitment and management as well their experience of potential mitigating strategies to improve diversity in workplaces.

Myth of Individual Effort: Cultural Underpinnings and the Reproduction of Economic Inequality within Iranian Upper-Middle Class

This study investigates the persistence and justification of economic inequality among different social classes in Tehran, particularly in the wake of the COVID-19 pandemic. Amidst the lower class burdened by inflation, the impoverished middle class, and the increasingly wealthy elite, the upper-middle class maintains relative stability. This research explores how mental archetypes and cultural knowledge (beliefs, values, and social norms) among Tehran's upper-middle class contribute to the perpetuation of inequality. Employing historical analysis, key elements of Iranian mental archetypes, collective ethos, and Persian proverbs about injustice were identified. Semi-structured interviews with 21 upper-middle-class Tehran residents revealed that these individuals are largely unaware of the severity of economic inequality. Their adherence to the myth of individual effort and a culture of poverty reinforces this inequality. These individuals occupy a paradoxical position as both oppressors and oppressed. Factors such as severe economic pressure, selfishness, fear of repression, despair, cultural roots, and benefits from the status quo lead to the acceptance of economic inequality. For this group, belief in fate makes submission more appealing than resistance. Economic Inequality is basically not their concern because they consider the economic and social situation of each person within the framework of personal responsibility and because they consider inequality as one of the main causes of social harm, they oppose it, not for humanitarian reasons. Therefore, they contribute to the reproduction of inequality.

Revolutionaries Contradictions: Anti-Colonial Rhetoric and Colonial Alliances in Iranian Revolutions

National liberation movements worldwide often face significant obstacles due to the decisions and interests of colonial powers. This study explores the impact of colonialism in non-colonial countries, focusing on Iran, which has never been formally colonized. Despite this, strong anti-colonial sentiments and discourse were evident during Iran's two major contemporary revolutions (1905 and 1979). Although these revolutions primarily aimed to address internal issues, colonial forces frequently intervened at critical moments, diverting the trajectory of national movements. During the Qajar era, Iran suffered under imperialist control and internal mismanagement. Popular protests were fueled by dissatisfaction with customs issues and high inflation

caused by integration with the global market system. While anti-colonial rhetoric was prominent in the constitutional revolution, internal issues remained the primary concern. Some argue that Great Britain instigated Iran's constitutional revolution and Tsarist Russia later thwarted it. Despite their anti-colonial slogans, revolutionaries staged a sit-in at the British Embassy and achieved their goals with British support. This paradox of internal revolutionaries aligning with colonial forces are traceable until 1979 revolution and after while in the tensions between eastern and western blocs. Employing historical analysis and document review, this research investigates this contradiction and traces its implications to the present day. One key finding is the explanation of how alliances between revolutionaries and colonial forces can lead to political crises, revealing how those seeking freedom often end up under the shadow of colonial powers.

RAHMAN, AMBER* (Princeton University, USA)

Imagining Beyond the Artificial Intelligentsia

Carceral technologies are increasingly being deployed to expand and exacerbate state violence and surveillance, aided by private companies. ShotSpotter is a faulty AI-powered acoustic "gunshot detection technology" used by over 120 police forces across the United States, South Africa, Jamaica, the Bahamas, and, as of 2021, Occupied Palestine. ShotSpotter's scope extends beyond local police departments: is also used, has been tested, and it is funded, by the U.S. federal government, including the military. These various carceral contexts led me to interrogate the central marketing claim of ShotSpotter: that it exists to reduce gun violence. I build upon the tradition of Black Internationalism to assess how ShotSpotter is actually a carceral, settler-colonial tool used by the U.S. police, military, and Israeli Occupation Forces to control, oppress, and surveil "occupied" communities of color both "internal" to the U.S. empire and "external" to it. I offer the term imperial pre-occupations to illustrate how prediction (pre-) is a tool for the occupation of racialized communities and policing racialized populations is a preoccupation of the imperial state domestically and internationally, using ShotSpotter as a case study. My paper explores how these imperial preoccupations materialize in the similar and differing language and logics of ShotSpotter's use by U.S. police, military, and the Israeli Occupation Forces due to their related settler-colonial projects; via the tools and techniques employed to make the technology useful to the state in different contexts, whether it be attached to drones in occupied Palestine or the streets of the Southside of Chicago or on U.S. military bases in Afghanistan and Iraq; and the marketing & funding of the ShotSpotter technology. By situating how ShotSpotter functions as an imperial tool globally, a portal to envision and enact transnational resistance against ShotSpotter emerges.

RC05-JS-174.3

RAHMAN, HIBA* (Aligarh Muslim University, Aligarh, India)

Identifying Invisibilization of Women Workers in the Handloom and Power Loom Industry

The objective of the proposed research paper is to investigate the invisibilization of women labourers in the handloom and power loom industries, where their substantial contributions are frequently overlooked and undervalued. In the family-based production process, women are essential to the process, performing duties such as weaving, feeding spools, cutting threads, and adding decorations. Nevertheless, their labour is frequently regarded as merely assisting male family members, a category that undermines the significance of their work and reinforces the notion that their contributions are secondary. This marginalisation is further exacerbated by socio-cultural norms that limit the employment opportunities available to women, limiting them to low-paying or unpaid home-based work. Consequently, their economic roles are obscured, and their labour is exploited in both informal industries and the household.

The objective of the paper is to examine the character and extent of women's involvement in the small-scale handloom and power loom industries with a particular emphasis on the invisibilization of these contributions by socio-cultural norms and gendered labour division. The research employs a mixed-methods approach, involving the accumulation of quantitative data on work hours, production activities, and income, as well as qualitative interviews with women workers. Case studies from handloom and power loom clusters will provide localized insights into the lived experiences of these women workers. The research also examines the dual burden women bore, balancing unpaid domestic responsibilities along with economic production activities, and how this impacts their recognition in economic assessments.

The study ultimately promotes the formal recognition of women's work in family-based industries, emphasising the necessity of inclusive policies and labour classifications that accurately reflect their contributions. By addressing the systemic invisibilization of women's labour, this research will provide critical insights for policymakers and industry stakeholders to support gender equity in these informal sectors.

RAHMOUNI, NOUSSAYBA* (Patrimoines locaux, Environnement et Globalisation (PALOC), France)

Vers Une Coproduction Décolonisante Des Savoirs Spatiaux Et Environnementaux Au Maroc

La littérature récente sur la planification spatiale et environnementale met en avant son potentiel en tant qu'action collective communicative, capable de créer et de transformer les discours afin de concilier des intérêts et des valeurs divergents. Cependant, la pratique professionnelle de l'urbanisme au Maroc demeure profondément influencée par une culture coloniale qui réduit la discipline à une simple gestion physique du territoire. Bien que les processus décisionnels étatiques soient souvent marqués par un degré d'informalité, les pratiques professionnelles restent enracinées dans des structures formelles et bureaucratiques, déconnectées des réalités sociales.

Cette déconnexion reflète en partie la manière dont la planification spatiale est conceptualisée dans les milieux académiques et professionnels. La majorité des enseignants et des praticiens sont issus du même système, perpétuant ainsi une approche centralisée du développement territorial, qui tend à marginaliser la contribution potentielle des populations locales. Par conséquent, les visions spatiales produites se révèlent souvent inadéquates pour répondre aux besoins réels sur le terrain.

Dans ce contexte, cette étude s'appuie sur nos travaux antérieurs, plaidant pour un rapprochement des pratiques professionnelles avec l'informalité et, par extension, avec les citoyens. En mobilisant l'institutionnalisme sociologique, nous analyserons comment les cultures professionnelles héritées de l'ère coloniale et celles de l'urbanité populaire influencent les contraintes et opportunités institutionnelles au Maroc. Par le prisme de l'institutionnalisme discursif, nous explorerons également comment les discours peuvent transformer des idées individuelles en actions collectives dans le cadre des recherches participatives, tout en examinant l'équilibre entre la capacité d'agir des professionnels, souvent sous l'emprise des structures étatiques, et celle des populations marginalisées par un système peu ouvert à la participation citoyenne.

L'objectif final est d'explorer le potentiel de la coproduction des savoirs spatiaux et environnementaux en tant qu'outil de résistance face aux récits coloniaux qui ont longtemps structuré les environnements urbains et régionaux marocains.

A Systematic Review on the Role of Digital Technology in Accessing Healthcare Services and Its Association with the Well-Being of Older Adults

Digital technologies can be innovative solutions for healthcare access for rapidly-increasing ageing populations. Older adults are increasingly adopting digital technology for benefits such as healthcare access and social-connectedness. However, they encounter barriers such as digital-literacy and user-friendly interfaces. The aim of this systematic review is to synthesize the current evidence on the impact of digital technology use on healthcare-services and utilization among older adults and to study the various barriers that affect the adoption of different digital technologies. An electronic literature search (Medline, PsychINFO, Scopus, Web-of-Science, and PubMed) was conducted to identify relevant studies published from January 2003 onwards. Studies examining the use of digital technologies (mobile-apps, wearable-devices, telemedicine) by older adults. We identified 1,356 potentially relevant studies and 22 publications met the inclusion criteria. Sixty-three percent explored telemedicine use, 28% focused on mobile-apps, and 27% looked into wearable-devices. Results shown that digital technologies, particularly health-apps and telemedicine, have improved healthcare access for older adults by providing timely consultations and better management of chronic conditions. However, use of these technologies varies, with older adults in urban areas showing greater proficiency. The review identified several barriers to adoption, with digital-literacy being the most frequently reported. A lack of user-friendly interfaces was found as a barrier in 31% studies followed by poor access to devices (27%). Studies also reported 42% of availability of digital-literacy training, social-support from family members (35%) and affordability of devices (37%) as adoption barriers. Study found that digital-platforms foster social-connectedness, reducing feelings of loneliness and isolation impacting on mental well-being. Study suggests that the successful integration of digital technologies into the lives of older adults requires a multifaceted approach that addresses both technological and socio-economic and cultural factors. Further research is needed to understand the long-term impacts of cost-effectiveness of digital technologies for healthcare system to support healthy-ageing.

Fatema and the Demons of War and Militarism: Towards a Decolonial Feminism

In this context of genocidal horrors and colonial terror perpetrated against the Palestinian people, in which we have seen once again the weaponization of feminism, and/or its complicity, questions such as how has feminism ended up providing bullets for such weaponization, or how has it become an escort to colonial wars, a cheerleader of military invasions, and an agent of neoliberal imperialist projects, became open again for discussion. In Morocco and the region, the question has often been formulated as: do we need feminism in the first place? Is it at all relevant? One way of answering these questions has been in the affirmative, while identifying the culprit as being a colonial, Orientalist, liberal, white feminism, and recognizing the necessity of delinking from this tradition; that is, constructing (or reconstructing) a decolonial feminism. The objective of this paper is to contribute to this discussion by invoking the example of Fatema Mernissi undeniably one of the most important figures of feminist theory in the region. The examination of Mernissi's work from the perspective of decolonial theory is doubly interesting as, on the one hand, it allows us to identify the sort of bullets that a well-meaning feminist such as Mernissi unwittingly supplied to neoliberal imperialism, and, on the other hand, it helps us recognize inspiring decolonial concepts and strategies.

Resettlement and Disaster Risk Creation

Disasters have become a common point of reference to legitimise urban housing resettlements. Often, these resettlements are in the periphery disconnecting and pushing the urban poor outside the city. Using the case of the Indian Ocean tsunami of 2004 (20 years ago), this presentation traces recovery journeys of tsunami affected and relocated people and places it within the housing capitalism discourse in India. The aim is to unpack how after 20 years, recovery continues to be an illusion while risk creation has materialised in the resettlement of the urban poor. Using interviews, participatory mapping and focus groups, this paper traces how recovery is placed within a cycle of recurring disasters from floods to the pandemic to ongoing heatwaves. People impacted by disasters cope with recovery primarily through the concept of self-recovery. Yet, various actors ignore long term consequences of disaster risk reduction, recovery and how risk creation unfolds within ongoing recovery for different vulnerable groups. The paper places this discussion within an ongoing urbanisation that excludes the poor. Further, the analysis presents a new understanding of recovery taking into account the necessary conversations on climate change.

RAJU IYER, PROF.DR.SARASWATI* (Acharya Nagarjuna University, India)

Livelihoods of Indian Adivasi Women in Andhra Pradesh - a Sociological Discourse

The livelihoods of Indian Adivasi women in Andhra Pradesh form a crucial part of their community's socio-economic and cultural fabric. These women are central to the sustenance of their families and communities, engaging in various economic activities such as agriculture, forest-based livelihoods, and wage labor. However, their socio-economic status remains precarious due to limited access to resources, education, healthcare, and social services. Adivasi women in Andhra Pradesh predominantly rely on subsistence agriculture, collecting forest products, and working as daily wage laborers. The encroachment of commercial interests into forest areas and the displacement due to developmental projects have significantly impacted their livelihoods. Land alienation, deforestation, and a decline in biodiversity have led to a reduction in the availability of resources traditionally accessible to these communities. Moreover, gender discrimination within both their communities and wider society further restricts their economic independence and decision-making power.

The influence of state policies and development programs, while intended to provide support, often fails to adequately address the specific needs of Adivasi women. These programs sometimes prioritize male-centric development models, marginalizing women and limiting their participation. However, women's self-help groups (SHGs) and grassroots organizations are emerging as important platforms for economic empowerment.

In this study by using the descriptive research design 600 sample respondents were randomly selected by adopting systematic random sampling method. Primary and secondary data were collected. An attempt

is made to examine the complex interplay between the traditional and contemporary livelihoods of Adivasi women, focusing on the challenges and opportunities they face through an Interview Schedule. The data was analyzed and interpreted with the help of graphs, tables and diagrams. Appropriate statistical tests were used. The study highlights the need for a more inclusive approach to development policies that recognizes the cultural, economic, and social contributions of Adivasi women.

RAMABULANA, FULUFHELO* (University of Cape Town, South Africa)

Legislation, Sex Work and Voices of Children.

While the injustices and vulnerabilities of sex workers have been extensively studied on a global scale, there is a critical lack of data on the realities of children of sex workers living in the world of transactional relationships. This early exposure to transactional sex significantly impacts the way these children understand, experience, and express their sexualities, underscoring the urgent need for research in this area. Global discussions on legislative change for the sex work industry have been groundbreaking, and South Africa has been an active participant. Notably, South African President Cyril Ramaphosa has committed himself and his government to the decriminalization of sex work in South Africa as part of the country's fight against Gender-Based Violence. This commitment underscores the role of political leadership in visualizing the experiences of sex workers and creating the urgency for their protection through legislative change. The proximity of children of sex workers to the world of sex work introduces them to vulnerabilities of enhanced sexual exploitation in comparison to their peers. Studied through the lens of an intersection, young people's proximity to their parent's experiences enhances children's vulnerability, given that violence experienced by women tends to become the violence experienced by the child. The lack of data about the experiences of children of sex workers creates a significant gap in our understanding of their realities. This silence mutes their voices and makes this vulnerable community completely invisible. By allowing affected children to share their own stories and experiences, this study can bring visibility to their lives and impact the fight for their protection and the overall effort to make their experiences known.

A Bibliometric Review of Heteronormativity in Healthcare and Its Implications on the Health and Well-Being of LGBTIQ+ Persons in Africa

This bibliometric review explores the prevalence of heteronormativity in healthcare systems across Africa and its impact on the health and well-being of LGBTIQ+ individuals. A comprehensive research strategy was implemented using the SciVerse Scopus database to accomplish the objective of the study. The study period was all times up to 2024. VOS viewer program was used for mapping of frequent author keywords, journal citations and research collaboration. By analysing publications from major academic databases, the study identifies key trends, influential authors, and research gaps in the discourse on LGBTIQ+ health and heteronormativity in Africa. The findings underscore the urgent need to address these barriers in alignment with the United Nations Sustainable Development Goals (SDGs), particularly SDG 3 (Good Health and Well-being) and SDG 10 (Reduced Inequalities). Addressing heteronormativity in healthcare is essential for promoting equitable, inclusive healthcare systems and improving health outcomes for LGBTIQ+ populations across the continent.

RAMBELL, ALESSIA* (Catholic University of the Sacred Heart of Milan, Italy)

Narratives of Resistance and Re-Existence of Young Migrant Women Welcomed into Humanitarian Corridor Communities in Italy: An Intersectional Research

This intersectional research focuses on young migrant women between 18 and 35 years old who arrived in Italy through humanitarian corridors and are hosted by solidarity networks. This program was introduced in 2016: the State allows civil society to transfer people, selected on the basis of vulnerability criterion, and to welcome them in Italy at the expense of civil society. This admission pathway is based on the "widespread reception", a micro-reception

which aim is to create an adequate environment for an effective insertion of each person received, daily accompanied not only by a team of professionals but also by a network of volunteers, in order to facilitate the integration process. This form of hosting focuses more on the quality rather than on the quantity of the welcoming. This project has a double-faced potentiality: on the one hand, it can accompany women in facing and overcoming what they lived during their journey before being involved in the project, a local community of reference and a new intercultural start in a new context; on the other hand, being a bottom-up initiative it can represent an important opportunity for the local communities involved for broadening their horizons and for interweaving their own narratives with those of the people received, and creating a new one together.

The methodology employed a qualitative analysis drawing from semi-structured interviews and life stories collected in Italy in 2023.

From the initial evidence, in an equal relationship, re-generative dynamics seem to be created both for the women and the territory itself. Lights and shadows emerge from the research with respect to the reception project, highlighting some strategies for navigating intercultural spaces as well as elements that hinder an exchange. At the same time, elements for creating a symmetrical a relationship as possible between the two parties are outlined.

RAMÍREZ LÓPEZ, ANABEL* (Pontifical University of Comillas, Spain)

Gender-Based Violence and Psychoactive Substance Use Among Women

The intersection of gender-based violence (GBV) and drug use among women presents a critical public health challenge, exacerbated by structural inequalities and social stigma. This communication explores the reciprocal relationship between violence and psychoactive substance use among women, focusing on how these two phenomena are mutually reinforcing. Drawing on qualitative data from interviews with women in Spain who have experienced both violence and drug use, this study examines the unique vulnerabilities faced by women drug users. Research indicates that women who use drugs are disproportionately affected by various forms of violence, including intimate partner violence, sexual abuse, and structural violence. These experiences often perpetuate substance dependence as a coping mechanism for trauma.

The findings highlight how GBV against women who consume psychoactive substances often goes unrecognized or is downplayed by societal and institutional frameworks, which fail to consider the compounded stigma of both drug use and being a victim of violence. Moreover, trauma related to violence is frequently managed through increased substance use, creating a cyclical pattern that exacerbates social and health vulnerabilities in these women. The study underscores the need to integrate gender-sensitive approaches in legal, health, and social services to address the complex interactions between violence and psychoactive substance use. Coordinated interventions that include both addiction treatment and support for GBV victims are essential to breaking this cycle of victimization.

This research advocates a reassessment of drug policies and violence prevention strategies, emphasizing the importance of a gender perspective in the pursuit of environmental and social justice.

Retos y Oportunidades De Las Mujeres Artesanas Microempresarias En Perú- El Caso De Chinchero

La presente investigación realiza un estudio del ecosistema de las mujeres artesanas y microempresarias en Perú, tomando el caso particular de Chinchero, Cusco, Perú. El estudio analiza el contexto social, cultural, económico en el cual se desenvuelven las mujeres artesanas y el rol de los diversos grupos de interés que forman parte del ecosistema: gobierno, academia, empresa, ONG, etc. El estudio se analiza desde las ODS 4, 8, 5, 10, 16 y 17.

El estudio analiza el rol de la mujer microempresaria analizando 3 tipos de mujeres artesanas: mujer artesana independiente, la mujer artesana que pertenece a una asociación de artesanas y las mujeres artesanas que trabajan para un centro artesanal y son dependientes.

El estudio ofrece recomendaciones puntuales para los diversos actores que forman parte del ecosistema de las mujeres artesanas de zonas rurales en el Perú,

Contributions of the Theory of Communicative Acts to Social Justice

The analysis of social interaction is crucial in the understanding of social justice. Accordingly, the theory of communicative acts contributes clarifications about whether there is freedom or coercion in a relationship (work-based, social, friendship, intimate, etc.). Communicative acts overcome the limitations of Searle's approach to speech acts and Habermas' use of speech acts in his theory of communicative action. Unlike them, it involves verbal and non-verbal communication, the dialogic and power interactions in the social structure and the ethics of responsibility, beyond intentionality. Within power interactions, beyond physical or psychological power, we distinguish between institutional power and interactive power (Racionero, Puigvert, et al 2022). When a subordinate is invited for coffee by her superior after work, she may accept the invitation, but an institutional power exists in the hierarchical relationship that constraints the subordinate's freedom. When a young adolescent is accepting to participate in a risky viral challenge prompted by peers, is he/she taking a free decision? There is here an interactive power which emerges from peer pressure. When a Roma girl says she does not want to study because she wants to marry young, is her assertion free? The analysis of communicative acts, with all its dimensions, is embedded in the theory of the Dialogic Society (Flecha, 2022) developed from the School of Barcelona. Therefore, it must be done with a dialogic orientation, in co-creation with all actors involved, through a dialogue that transforms the constraints identified resulting in increased social justice.

*Environmental Human Displacement and Socio-Economic
Vulnerability with Special Reference to Kerala Landslide
Disaster, India*

The proposed paper critically examines environmental human displacement and socio-economic vulnerability. The project is of immense significance to, since several regions in India severely affected by the environmental disasters in one or other kinds in every year even though the nature and extent of human displacement varies in these regions. The proposed project thus specifically examines as to (a) the nature and extent of the environmental human displacement (b) how national development policies of India help to resolve the issue (c) what strategies for mitigating the environmental disasters are available for India to minimize the human displacement. The core concern of this paper is an exploration of the ways and means to mitigate the impact of disasters and make environmentally sustainable, one that meets material, social and environmental protection needs. This goal is pursued by an in-depth study in the contexts of southern state Kerala in India. The particular focus of this paper is to understand the environmental disasters, human displacement, social costs and its impact on vulnerable communities, resilience and rehabilitation initiatives.

*The Unspoken Crisis- a Culture of Burnout Among Women in
Leadership*

South Africa has supportive legislation for developing women in leadership, including the Broad-based Black Economic Empowerment Act 53 of 2003 and the Employment Equity Act 55 of 1998. Statistics verify that only one woman CEO in the Top 40 Johannesburg Stock Exchange (JSE) listed companies yearly, with six currently in the top 100 JSE companies. While there is much literature on the external challenges women face in executive positions, executives are hesitant to speak about the unspoken crisis that is becoming a culture of burnout. Women become isolated and overloaded because they desire to succeed and prove themselves in the traditionally male-dominated C-suite. This paper seeks to advance the knowledge surrounding burnout and women in leadership. It will follow a qualitative desktop methodological approach seeking recommendations to enhance the support of women in these roles. Scholarly resources, including Google Scholar, newsworthy articles, credible statistical-driven websites, and LinkedIn posts, were used to identify key themes. Although the topic of burnout is a vast area of research and engagement, the key focus of this study was women in leadership, its impact on their health and challenges to success. Key themes were narrowed to include the effects on mental health, chronic stress and gender bias. There is a direct correlation between burnout and the great resignation phenomenon within the C-suite. The principles of appreciative inquiry will underpin a clinical sociology intervention to address the challenges. Recommendations and success indicators were honed to examine future strategies for sustained women in leadership.

*Military Officers and Politics: An Analyzes of Officers Elected to
the Brazilian Congress*

Recently we have observed an increasing role of Military Officers in Brazilian institutional internal politics. A representative number of military personnel in the Armed Forces in executive, legislative, and even some judicial advisory positions. A less careful reading may suggest that this participation started to happen after the election of the former president, Jair Bolsonaro (2018-2022). However, the enrolment of Military Officers in politics is well documented in the Brazilian social sciences and has continued even after the Brazilian Military Dictatorship (1964-1988), mainly in the context of public safety. especially with Guarantee of Law-and-Order operations. In this sense, the present work seeks, starting from a theoretical framework built on the interpretation of the political performance of the Armed Forces in Brazil historically; and from the reflection that has been built in the field of sociology about the militarization of public security in Latin America, to analyze the cases of military officers elected to the Brazilian National Congress. To this end, we will carry out an analysis – in the light of the framework above – of the data from the officers' candidacy between 2014 and 2022. Using available documents, files, and data

from Brazilian Electoral Court, we analyzed data from 3 national elections and examined the cases of officers elected that mobilize a punitive discourse. We argue that those officers who obtain electoral success are those who mobilize crime and punishment discourses. This paper presents part of an ongoing research that examines the enrollment of Military Officers in internal public safety operations in Latin America.

*Healthy Food in Spanish Urban Adolescents from a Qualitative
Perspective*

Cities are unhealthy environments that determine our diet. Young urban adolescents have a poorer quality diet than adults or older people (Anderson et al., 2011). This vulnerability increases as we descend in social class (Stephens et al., 2015). These inequalities are observed from educational centres, schools and high schools, which become food environments during the time that adolescents are there ((Diez et al., 2019; Kenstens and Daniel, 2010).

The objective of this work is to understand the perception of teachers and educational centres about the lifestyle of adolescents associated with food habits in two Spanish cities (Madrid and Bilbao). In addition, we compare social discourses between educational centres according to the socioeconomic level of the neighbourhood where they are located.

This work is based on the results obtained in 24 focus groups carried out with teachers from public and private schools in Madrid and Bilbao, selected based on the socioeconomic level of the neighbourhood. The 24 centres gather together students between 13 and 16 years old who are studying Compulsory Secondary Education (ESO) and, between 16 and 18 years old, who are studying Bachelor's Degree in Madrid and Bilbao. The fieldwork was carried out between November 2022 and April 2023.

The results show that the teachers' speeches, who observe unhealthy food habits of adolescents, do not differ by social class. In addition, teachers point to families as responsible for this, accusing them of not exercising control over their children's food habits due to intense working day. Therefore, teachers and educational centers say they are the ones who assume this control and are committed to teaching healthy eating.

*What to the Undocumented Migrant Is a Border? an Analysis of
Migration and Borders from the Immigrant Point of View*

What's described as an "immigration problem" is only perceived as such because it is apprehended from the point of view of the capitalist state, which has in turn become hegemonic. Framing the issue of migration in this way, limits the realm of possible "solutions" to ones that further affect human ability to migrate, while leaving the capitalist system intact. If the fact of humans moving across space is to be understood as a problem, the problem is not the mobility of people, but rather the presence of capitalist borders. In this paper I aim to reframe the issue from a perspective that de-reifies these capitalist conceits. Most analysis of migration reflects, wittingly or not, the bourgeois perspective or the perspective of the state. This paper seeks to present an alternative perspective by analyzing the issue from the perspective of an immigrant, hence the title of the article, "what to an undocumented immigrant is a border, inspired by Frederick Douglas's powerful reflection "What to The Slave is the Fourth of July?". This paper frames the issue from my own perspective as sociologist and a scholar of migration, but just as importantly from the perspective of an undocumented immigrant. The paper therefore reflects my personal experiences as migrant, but also the experience in general of being a migrant. It is at once analytical and autobiographical.

WG11-949.5

RAPIOR, RALF* (Bielefeld University, Germany)

Contested Understandings of Violence and Entanglements of Epistemic, Symbolic and 'Bare' Violence

Violence is always contested. It is the object of cultural struggles that determine which violence is legitimate and which is illegitimate and, therefore, which experiences of violence can be publicly expressed, receive attention and recognition, and which are silenced. Thus, hegemonic narratives can themselves appear violent to those whose experience of violence is not recognised. They are epistemologically violent when victims are silenced and they are symbolically violent when the victims' experiences of violence and trauma are ignored, denied or disavowed. Symbolic and epistemological violence can also legitimise physical and psychological violence retrospectively or in advance, e.g. by disqualifying and dehumanising victims or reversing the victim-perpetrator dichotomy by presenting victims as (potential) perpetrators (e.g. as 'terrorists').

Cultural struggles over the interpretation of violence are sociologically revealing because they negotiate how violence is socially defined and what is recognised as an experience of violence. They are sites where the social conditions of what violence 'is' are challenged and contested. Since violence is socially thematised in these struggles, they also show how violence is socially formed and expressed.

I will explore these entanglements of epistemic, symbolic and sheer violence in the struggles over the interpretation of violence in the Israeli-Palestinian conflict. After 7 October, the violence in the conflict was no longer forgotten, but became the subject of heated debates in the global public and questioned the self-image of Western states as liberal, democratic and non-violent orders. By regarding Israel/Palestine as a conflict of world society I will put the often neglected meaning of violence at the centre of the sociological analysis of world society and analyse the conflict as a long-term consequence of European imperialism.

Online Communication from the Perspective of Older ICT Users

Research suggests that the use of information and communication technologies (ICT), especially for communication purposes, can have a positive impact on the emotional health and subjective quality of life of older people. However, older people are little willing to engage in online communication. This article analyses the attitudes of older ICT users towards online communication. The study is based on 36 interviews with older ICT users, conducted in 2022. The results of the study are in line with the theoretical Technology Acceptance Model. It is found that older people have positive attitudes towards online communication when they perceive its benefits. In contrast, public and private online communication are also criticized. Results reveal concerns that the rise of online communication is disrupting face-to-face communication, and that it is addictive and time-consuming. There are expressions of internalized ageism that such communication is more suitable for young people. The study results align with the Media Richness Theory, with older people emphasising the irreplaceability of live communication as the richest form of communication.

Eating the Other: Understanding Processes of Racialisation in London's Multicultural Pop-up Restaurant Scene

London is a gourmand's paradise (Rhys-Taylor 2014), reflecting its status as a superdiverse, global city in terms of the sheer variety of food available. As home to countless different restaurants and food markets, there is an ever burgeoning 'foodie' scene which includes food bloggers and pop-up restaurants where keen amateur cooks host 'supper clubs'. Many supper clubs have sprung up offering what might be described as 'ethnic' food. In 'Eating the Other', bell hooks (1992) suggests that "the commodification of Otherness has been so successful because it is offered as a new delight, more intense, more satisfying than normal ways of doing and feeling". This paper is based on research which examines the intersectional dynamics of 'ethnic commodification' within the pop-up restaurant scene amongst the producers

(hosts), and the phenomenon of 'food adventurers' (Heldke 2003) amongst the consumers (guests). As in New York, the scene in London is intimately tied to gentrification (Zukin 2014) and multiculturalism plays a significant role in this process. The paper looks at how race, gender and class dynamics play out in the scene and how, despite the veneer and commodification of diversity, these contribute to processes of racialization, othering and ultimately, continue to centre Whiteness.

RATHZEL, NORA* (Umeå University, Sweden, Spain)

Workers As Agents of a Transformative Just Transition – the Everyday Vs. Utopias of Hope

The discipline of Environmental Labour Studies has broadened across the globe, and there is now a lively debate about labour and its role in a just transition. How well-paid, safe, and well-organized are the expected new jobs in the "Green Economy"? Which jobs will need to transform and how? Will there be jobs for everybody? How can trade unions influence the changes that are happening to protect workers? What does a just transition mean for workers in different sectors and globally? And yet, in all these necessary debates, something is missing: the voices of rank-and-file workers. It seems clear: they want to keep their jobs. Trade unions have fought to slow down closures of coal mines, arguing that workers need their jobs. However, 85% of workers in the oil industry in Scotland said they wanted to work somewhere else - if they only could. When we asked workers in Spain and the UK in what kind of society they would like to live, they stressed community, access to nature, locality, and working less, living more. Using the voices of workers from my latest research, I want to discuss the needs of workers across sectors and beyond the pressures of the everyday. What kind of future do workers want? How can they become the agents of change as opposed to being perceived and perceiving themselves as its victims? Can environmental policies connect with the desires of workers for another kind of life? Are there perspectives for democracy at work and is there any hope that utopias can become real?

Pathways Towards a Circular Society: Connecting Consumption, Demand and Everyday Practices

The inherent unsustainability of current systems of production and consumption urgently require a sociological understanding of their dynamics as well as potential opportunities for their transformation towards greater circularity and radically reduced demand for material resources. While significant progress has been made in research and theoretical development of the design and overall principles of circularity, such work has largely focused on the organisation of production. In contrast, conceptual and empirical work on circular consumption and resulting shifts in demand remains underdeveloped. Adopting a practice-theoretical approach that shifts attention to circular consumption and its roots in everyday practices, this paper offers an empirically grounded, critical contribution to debates concerning the transition towards a circular economy/society debate. Fusing conceptual considerations with an integrated analysis of twenty qualitative interviews and representative survey data collected in Germany in 2023/24, the paper explores if and how people adopt or reject particular practices linked to circularity, including sharing, commoning and purchasing second hand goods. Focusing on the areas of mobility and housing as well as the ambiguous role of digital tools in promoting circularity, our analysis reveals distinctive pathways towards circular consumption that reflect people's engagement in particular constellations of practices. Importantly, the paper also highlights the significance of deliberate non-engagement in resource-intensive practices as a key step towards circularity rooted in sufficiency.

Asylum in Us: The Present Challenges of Brazilian Psychiatric Reform in the Context of the History of Deinstitutionalization in the Global South.

During the 1960s, complaints of abuse against psychiatric patients emerged in several countries, driving movements for new treatment paradigms that prioritized reducing hospitalizations and reconfiguring mental health. In Brazil, psychiatric reform gained strength in the 1970s, influenced by events in Italy and developing amid the effervescence of social movements. The mental health workers' movement incorporated urgent demands of the time, such as the fight against the military dictatorship and the expansion of human rights. In this scenario, Health Reform and the Unified Health System (SUS) stood out, encompassing mental health with a focus on social security and universal access. This process unfolded into a) epistemological constructions of deinstitutionalization and b) democratic achievements of psychiatric reform.

With the expansion of Brazilian Psychiatric Reform and the implementation of substitutive services to the asylum, oriented toward care in freedom "outside the walls," psychiatry expands its borders, entering daily life and the private sphere, establishing new forms of self-governance. This process, however, is marked by a constant tension between hegemonic psychiatry, strongly influenced by imported practices from the Global North, and reform-oriented psychiatry, based on genuinely Brazilian practices. The latter resists the disqualification of thought produced in the South and the perpetuation of the asylum as a technology of control.

Considering this scenario, our proposal aims to rethink deinstitutionalization not as mere dehospitalization but as an ethical praxis within the political disputes inherent in psychiatric reform in Global South. Basaglia's (1968) proposition to put disease in parentheses reflects the contemporary use of the prefix "des" in our traditional care practices. This manifests in four interconnected fronts: a) the 'depsychiatrization' of vocabulary associated with suffering, b) the 'dediagnosis' of life experiences, c) the 'deprescription' of medications, and d) strategies for collective care actions.

RAY, SAWMYA* (INDIAN INSTITUTE OF TECHNOLOGY GUWAHATI (IITG), India)

Gender Violence, Legal Pluralism, & Inter-Generational Experiences in Assam, India.

Constitution of India grants right to practice customary & personal laws besides state law. Legal pluralism thus is an integral part of several indigenous & religious communities in Northeast India, impacting women's lives significantly. In the last four decades, changing socio-economic scenario, & novel political progressions have affected conceptions of identity, culture, & standing of personal & customary laws. Within this larger context this paper attempts to trace the continuity & changes in experiences of gender discrimination & violence among three generations of women (aged 18 to 75 years), & their access to law in Assam, India. It is based on three larger feminist ethnographic studies on women's lives, gender violence & law (2015-2022). Data was collected through unstructured interviews of women, legal personnel, gender & legal rights activists, researchers, cases studies, court cases, FGDs, observations in the field, among others. It brings forth women's various gendered experiences, choice of & hurdles to approaching different legal orders & the ways these legal orders respond to women's cases. This study illustrates significant alteration in women's lives in terms of access to education, employment, public spaces, & decision making across generations. Such access though does not necessarily translate to reduction in gendered experiences across spaces. It shows that contrary to the longstanding claim various forms of gender violence marks women's lives across generations & religions, & both within indigenous & non-indigenous communities. The paper agrees with the strand of feminist legal pluralists who emphasize that legal pluralism does provide women with better choices to address their issues. It is observed that women belonging to indigenous communities comparatively have easier access to grievance redressal. However, given the overall gendered milieu & increasing homogenization of culture, despite the presence of multiple legal forums, women's access to law & legal relief, remains constrained.

Urban Governance and Climate Disasters: Space Regulation in Brazilian Cities

The present research, still in progress, aims to investigate how urban governance through the regulation of public spaces shapes responses to climate disasters in Brazilian cities. The intensification of extreme weather events, such as floods in Porto Alegre and wildfires in the Amazon, reveals weaknesses in urban infrastructure and inequalities in the distribution of risks. The central issue lies in how urban legislation and governance mechanisms can be adapted to promote resilience and socio-spatial justice in vulnerable contexts. The proposed methodology combines document analysis – focusing on legislation, urban plans, and public policy documents – with semi-structured interviews involving public managers, urban planners, and community representatives. Document analysis will offer insights into how the law influences spatial occupation and urban infrastructure, while interviews will provide perspectives on the challenges and practices of governance during crises. Expected results include identifying gaps between legal planning and urban management practices, as well as proposing collaborative regulatory strategies that integrate multiple social actors. The research also seeks to demonstrate that, beyond emergency responses, it is necessary to rethink urban space regulation with an emphasis on equity and social participation. This study will contribute to the field of sociology of law by articulating the dynamics of urban governance and climate disasters, proposing a regulatory model capable of strengthening urban resilience and promoting socio-spatial justice in the face of climate change.

Reimagining Feminism in a Time of Genocide Against Palestinians: Beyond Intersectionality

In the ongoing genocide against Palestinians in Gaza, feminists have been explicitly singled out for censure by states, universities and individuals for our condemnation of the genocide. The targeting of feminist groups for censure and specifically for an alleged failure to care about Israeli women who may have been sexually violated, rests on several assumptions, chief among them the idea that the sexual violation of Israeli women counts more than any violence done to Palestinians. More concerning, the idea that Hamas committed mass rapes on October 7, a situation about which it is impossible to even ask questions without incurring censure, is meant to render the genocidal violence in Gaza legitimate and acceptable. An obvious racial distinction is in place in this political calculus: one group of women, Israelis (popularly understood as Jewish and white/European in contradistinction to Palestinian women who, in turn are always understood as non-white and Muslim) counts more than the other group of women. The broader analytical foundation that supports this racial hierarchy is the idea that feminists should care the most about sexual violence, leaving other forms of violence to others to think about. The exigencies of the present moment demand that we examine how narratives of sexual violence are apprehended through race and what an alternative analytical framework about violence should be in this time of genocide. In effect, what does feminist solidarity look like in this time of genocide?

Redefining What Is at Stake: The Rise of Intersectionality in Youth Movements in Italy

Intersectionality has recently become both a central issue and an interpretative key in social movements practices, since at the heart of the processes of construction of collective identities are battles over meaning and over the interpretation of social categories, including their intersections. This is more evident in transfeminist and ecological movements, where intersectionality has simultaneously a strong epistemic, practical and political value; even though intersectionality has become a methodological and epistemic approach relevant to all forms of collective action. Especially in contemporary youth emancipative movements, the fight against patriarchy and homophobia, against the climate crisis, against racist and neocolonial postures, the opposition to capitalist exploitation and the claims against intergenerational inequalities intertwine and emerge as forms of intersectionality embodied in the practices, discourses, and worldviews of activists.

In this presentation we focus on a longitudinal empirical study that we have carried out over the last 7 years, both in the pre- and post-pandemic period, and in different parts of Italy. Based on more than 150 in-depth qualitative interviews and several ethnographic study phases, we highlight the way in which an intersectional approach arises from the youth movements in Italy on which we focused, that is students' movements and environmentalist mobilizations. Gender, ethnicity, education, technology, environment and existential threats are no longer isolated issues, rather they intersect, in practices and political frameworks, re-signifying the stakes of the mobilizations and highlighting the connections among the different sites of struggle. From an analytical point of view, intersectionality also emerges as a heuristic tool capable of innovating the approach to the study of contemporary mobilisations.

The Social Imaginary As a Site of Hope: The Case of the Climate Change Threat

The aim of this presentation is to explore theoretically and empirically the connections between a critical sociology of hope and the development of a new imaginary related to climate change with its existential threat.

The climate crisis is generating new forms of social imaginary that contrast, and sometimes mix, dystopian and utopian visions. The new generations are strongly involved in the creation and diffusion of these new imaginaries in which concern and hope intersect in original ways and generate awareness of the extent of the threat and new impulses for collective action.

Social imaginaries on climate change are a clear example of how criticism, dissatisfaction and fear of the present, but also hope for the future, produce complex scenarios. They are simultaneously a criticism of the past – of the causes that have led to the current situation – an accusation of the present – of the responsibilities of those who maintain the status quo and do not intervene to avoid future risks – and a hopeful elaboration of the future – of the common necessity to address possible solutions. They give shape to hope, to possible different worlds beyond the constraints of the given present.

A critical review of the concept of social imaginary – starting from the relevant contributions of Castoriadis and Taylor – can be useful to show how the elaboration of the future opens up possibilities of critique of the present fostering a new approach to the sociology of hope. The social imaginary can be understood as a field of constant production of critique of the existing that mixes hope and concern and articulates in an original way a vision of alternative reality.

Continuity and Change in Human Transnational Mobility before and after the Covid-19 Pandemic: Evidence from a Global Dataset

This presentation draws on a version 2.0 of the Global Transnational Mobility Dataset created at the Migration Policy Centre (MPC) of the EUI, which merges data from different sources to estimate the volume of cross-border population flows between all country dyads worldwide since the early 2000s. Version 1.0 (Recchi et al. 2019) – which covered the period 2011-2016 – showed an almost constant rise of international travel, but also two additional trends: the concentration of transnational movements along corridors and hubs and the regionalization of mobility. Version 2.0 of the dataset will include earlier years, thus expanding on the historical reading of cross-border mobility, as well as the post-Covid period (2022-2023), thus evidencing to what extent the pandemic paused the trend or rather reverted it. Preliminary analyses show that the first hypothesis (that is, reversal to the mean) prevails, but with some exceptions in certain world regions.

Poor Work Around the Streets of Milan: An Ethnographic Study of the Informal Street Vending Sector

This study contributes to the literature on dirty jobs by examining informal work in the street vending sector. The research aims to explore the economic and legal constraints that regulate the sector, and how these affect the working conditions of street vendors and their precarious and unstable career trajectories.

The empirical material is drawn from extensive ethnographic research conducted between 2020 and 2021 in five open-air markets in the city of Milan. Fieldwork observations and in-depth qualitative interviews involved not only unlicensed and irregular street vendors, but also law enforcement agencies that monitor markets compliance and economic actors that contribute to defining the economic and regulatory framework within which street vending operates.

The empirical findings highlight how many of the difficulties that street vendors face on a daily basis stem from repressive urban policies and economic constraints. On the one hand, 'security-oriented' urban policies aimed at maintaining decorum and public order condition the daily surveillance activities of open-air markets and of work irregularities. In addition, the sector is subject to specific administrative constraints related to licensing procedures, which in turn shape the precarious and uncertain career trajectories of street vendors. In response, informal workers – who are often criminalised – adopt innovative strategies to cope with the daily challenges, creating informal support networks that enable them to withstand pressure from both the market and local authorities.

By examining the daily conditions of informal street vendors in the city of Milan, the paper contributes to a well-established academic debate aimed at broadening policy instruments to guarantee the dignity and rights of those working in the shadows of the formal economy. It also contributes to a wider debate on the structural factors that underpin dirty jobs in different economic sectors.

PACETTI, VALENTINA (University of Milano-Bicocca, Italy)

The New Centrality of Work and Work (re)Organisation with the Emergence of Hybrid Work

The paper examines whether and to what extent the extensive use of 'emergency' remote working during COVID-19 and the subsequent consolidation of hybrid working models in the post-pandemic phase are contributing to changing workforce needs. Moreover, it explores how companies are responding to these changes.

The empirical material comes from extensive research carried out in northern Italy. In 2020, about 190 interviews were conducted with people who were working from home during the first emergency period. In 2021, the partial return to the office was studied through a survey of about 900 workers. Finally, in 2024 in-depth qualitative interviews with HR and managers in 15 large companies were conducted, focusing on the city of Milan. Here the focus is on strategies implemented by companies to deal with the challenges of 'non-emergency' hybrid work.

Research shows how hybrid work has contributed to a redefinition of employee preferences, challenging the centrality of work in people's lives. Workers, especially the younger generations, ask for more possibilities to manage the equilibrium between work and other spheres of life. Remote work plays a role in this change, both blurring the boundaries between time and space for work and private life, and allowing new strategies for work-life balance and well-being. In this scenario, companies need to rethink their organisational models. Ensuring a high degree of work flexibility while addressing the challenges of hybrid work, such as the impact on retention and recruitment, are strategies that many large companies are adopting in the current post-pandemic phase.

The research contributes to the investigation of the changes resulting from the implementation of hybrid work, including changes in the negotiation of the employment relationship and new strategies to ensure the spatial and temporal flexibility of work.

RECKINGER, RACHEL* (University of Luxembourg, Luxembourg)

Food Policy Councils As Strategic Tools for the Co-Creation of Values-Based Territorial Food Networks. Structural Analysis and Empirical Strategies of Eight European Cities' Food Policy Councils.

Despite inertia from the mainstream hegemonic corporate food regime, there is growing consent and evidence of values-based territorial food networks (Reckinger, 2022) that aim for sustainable transformations of food systems. They often come together in participatory Food Policy Councils (FPCs). The urban scale has emerged as a meaningful meso-level to implement such transformative projects with a certain impact at a political scope that is in direct touch with its territorial realities.

Based on eight empirical examples from European cities that collaborated in the H2020-project FUSILLI, we draw on the framework developed by Michel et al. (2022), to start by providing a systematic analysis of the considered FPCs' processual and substantive contributions to food system sustainability. We will in a second step scrutinize the considered FPCs' commitment towards food democracy. Finally, we will consider the considered FPCs' efforts and implementations of good governance. Those three key areas will be exemplified by the considered FPCs' goals, their processes in terms of governance and activities, their outcomes and their outputs.

The diversity of the considered FPCs will in particular allow us to enrich the distinction between 'invited' and 'invented' spaces for transformative action: instead of being distinct they are complementary strategies, and elements of each of those ideal-types can be found in co-created initiatives of FPCs, to be considered as being situated on a spectrum rather than on poles. This will allow us, on one hand, to distill key 'must have' features of efficient FPCs and optional 'nice to have' ones, to be perpetuated in the face of political change and hegemonic resistance. On the other hand, we will gain a clearer structural understanding on not only 'why' but 'how' and 'with which impact' FPCs *can* have realistic means to set up values-based territorial food networks at various levels and with varying partners.

Knowledge Transfer Competence As an Objective of Higher Education: The Curricular Transfer Orientation of Urban Planning Programs and Their Effects on the Development of Transfer Competence

In recent years, universities have increasingly been expected to facilitate knowledge transfer, which applies not only to academic research, but also to teaching. In dual higher education systems, universities offered primarily discipline-oriented programs, while universities of applied sciences (UAS) focused on more application-oriented programs. Against the backdrop of traditional institutional differences between types of higher education institutions and reforms-induced processes of institutional alignment (Bologna Process), this study examines the transfer orientation of study programs in urban planning at universities and UAS in Germany. The transfer orientation of 63 curricula towards knowledge transfer was operationalized by categorizing and combining a) teaching-learning formats and b) competence development objectives. Contrary to the expectation of institutional diversity, there are no statistically significant differences in the transfer orientation of master programs between universities and UAS. This isomorphism can probably be explained by the practice-oriented self-conception of the profession of urban planners. To validate this result, we conducted expert interviews with graduates of study programs in urban planning from both institutional categories who are currently working as urban planners in private planning offices or public administration. The interview results indicate only minor differences in the transfer orientation between graduates of universities and UAS. At the same time, the reconstruction of their professional biographies shows that it is not so much the type of university that influences the development of transfer competence, but rather transfer tasks that are presented to them by their sector-specific working life.

Striking the Balance: Understanding Cross-National Trends in Sample Composition within Self-Completion Web and Paper

The European Social Survey (ESS) is transitioning its mode of data collection from face-to-face interviewing to self-completion web and paper. Round 12 of the ESS, planned to begin in the autumn of 2025, will have samples randomly allocated to each mode, with Round 13 in 2027 being conducted entirely with self-completion. To date, the ESS has implemented over a dozen self-completion surveys across Europe that have seen a varying blend of web and paper questionnaire completions, with the web portions comprising of completions on different device types such as tablets, phones, and computers. Understanding the variation in sample composition between web and paper is vital to achieve a representative sample, and evidence from the ESS shows that some trends are not always applicable cross-nationally. For example, whereas paper completions have so far always brought in older, less educated respondents, in some countries they also tend to bring in a notable overrepresentation of women. The breakdown of web completions by device types also vary by country and are sensitive to particular methodological choices in designing invitation letters, such as including QR codes. The ESS has found that completions on mobile devices tend to bring in more younger respondents with notable country-specific differences. This paper will describe trends in sample composition by self-completion mode of completion (paper versus web) as well as by device type among web completions.

Navigating Contested Spaces: Strategic Action Field Analyses of Challenges and Possibilities for Addressing Intimate Partner Violence and Problems with Alcohol/Other Drugs Together

Intimate Partner Violence (IPV) and problems with Alcohol/Other Drugs (AOD) are frequently intertwined, with studies showing that 25 to 70 % of people affected by one are also affected by the other. Each is a stigmatized condition; many costly societal, family, and personal consequences are associated with each separately, and are more severe when both are present. IPV and AOD are rarely addressed in coordinated ways, within communities, human services, or social policy, despite growing evidence that doing so reduces barriers to change and improves outcomes. Separate intervention fields for IPV and AOD exist, with different origins, histories, conceptual paradigms, and organizational forms as well as significant controversies within each field. Both fields are gendered, but differently. Practitioners report many conflicts/problems in working across fields and creating "hybrid" approaches (addressing IPV and AOD together in ways appropriate for particular people, circumstances, settings and communities).

This paper presents data from a mixed methods study of practitioners and organizations endeavoring to address both IPV and AOD together when most do not (survey, N=211, 36 organizational case studies, 14 comparative case study databases). We employ frameworks from Strategic Action Fields (Fligstein & McAdam, 2011) applied/expanded by Evans & Kay (2008) to conditions of field overlap, Goldstone & Useem (2012) emphasizing organizational differences, values and norms, Skelcher & Smith's (2015) work on organizational hybridity, and Bourdieu on field theory. Spaces feature predominantly in both barriers and innovations identified: Navigating physical and conceptual spaces between organizations within communities, uses of physical and conceptual spaces within organizations, different types of power (e.g., cultural, economic, social) negotiations within/across organizations and action fields to leverage resources and work to change/bridge paradigms, and also lived experiences of those working to understand and navigate these two fields to produce hybrid organizations/approaches that no span older spaces and create new spaces.

Legitimising Inequality: How Elites Navigate the Symbolic Market for Ordinarity and What It Means for Concerns about Economic Inequality

British Elites want to come across as ordinary and regular people in part because there is a symbolic market for ordinarity which means elites are seen as more legitimate and authentic if can convince others they are just like them. One implication of these findings is that, at a basic level, the illusion of solidarity forged by expressions of ordinarity potentially obscures very real class inequalities. The existence of this symbolic market raises two important questions for research around social polarization. First, does the performance of ordinarity reduce concerns about the level of economic inequality, that is, does it reduce affective polarization because people are more likely to accept that these inequalities are grounded in notions of merit? Second, what happens to perceptions of legitimacy and affective polarization when the performance of ordinarity fails? We examine these data using experimental data from a UK sample, finding that ordinarity does reduce concerns about high levels of inequality and that perceptions of legitimacy are undermined when the performance of ordinarity does not land or indeed is shown to be only partially true.

The Effect of Forced Displacement on Children's Health Outcomes: Evidence for Nigeria

Nigeria is one of the poorest countries in the world. In 2018, nearly 46.7% of the people were living in absolute poverty. Nigeria is also the most populous country in Africa, with an estimated population of 216.7 million inhabitants in 2022 (UNFPA, 2022). This paper examines the role of internal forced displacement for child's health outcomes. We exploit the Boko Haram insurgency in Nigeria which resulted in the internal displacement of over 2 million people to neighboring safe places. The paper aims to provide the first causal estimates for the impact of forced internal displacement in one of the poorest countries in the world on different health outcomes for children under 5 years old, such as mortality, morbidity and nutrition indicators. We find increased child mortality rates in areas reporting a strong inflow of internally displaced individuals. The point estimate turns statistically insignificant when focusing on communities with separate camp sites built to provide immediate protection and assistance to the forcibly displaced. We observe very similar results pattern when examining contagious diseases but not other health outcomes in children. This suggests that there are important health consequences of integration efforts for children that require further attention by public policy.

Social Movement Participation and Change in Citizenship Beliefs: Insights from Longitudinal Research Among Hong Kong Youth

Many Hong Kong youth participated in anti-government demonstrations in 2019/20, but the political context has changed significantly in the years since. Opposition voices have become relatively quiet, and electoral reforms have further contributed to limited political activism. These changes beg the question of whether young people's attitudes towards citizenship have also changed and how citizenship norms are related to young people's social movement participation. This paper examines longitudinal data of Hong Kong youth over a four-year period, showing that both traditional and postmodern norms have declined markedly after that unsuccessful protest movement of 2019/20. The analysis also identifies three citizenship norms profiles reflecting distinct perceptions of 'good' citizenship. Among youth holding a 'Dutiful' profile, perceptions of good citizenship remained relatively stable over time. Youth with an 'Engaged' profile supported postmodern values initially, but their endorsement of all types of citizenship norms declined after the demise of the 2019/20 anti-government social movement.

Finally, citizenship norms deteriorated most markedly and especially quickly among youth in a 'Disengaged' profile compared to those in the 'Engaged' group. Citizenship norms were also linked to political participation, efficacy, and satisfaction, providing further evidence of an ongoing process resulting in young people's political disillusionment and subsequent political disengagement following the unsuccessful social movement and subsequent reforms limiting political activism in Hong Kong. These findings are discussed with respect to the potential causes of politicization and depoliticization and broader implications for social movement participation in semi-democratic and authoritarian societies.

Developing New Understanding of the Concept of Family Capabilities: Emerging Themes and Innovations from Family Research in South Africa.

This paper reports on ongoing work to develop new knowledge of Family Capabilities – a development of the Capabilities Approach (CA) based on the writing of Sen (1999, 2004, 2009) and Nussbaum (2011) – rather than resilience as a framework for understanding how families address challenges and improve their wellbeing.

South African policies explicitly recognise families as a central institution for socialisation; a source of emotional, material, and instrumental support; which is shaped by and shapes society. Significantly, policy promotes the concept of family capabilities, yet the concept is not defined and is open to interpretation. For us, family capabilities, the examples of choices made by families and the freedom to achieve those choices, are developed from the everyday experiences and doings of people in families, so that their priority, sequencing, and value arise from family social realities that in turn explicate differences within and between families. We are utilising multi-modal creative methods to co-design new understanding of family capabilities with two communities, one rural and one urban, in the Western Cape Province. Our objectives include development of a framework for interventions and research based on what families 'do' (Morgan, 2011).

At the time of writing, we have begun to analyse data from pilot fieldwork and will present our initial findings and conceptualisation for discussion. The work is supported through South African National Research Foundation funded research at the University of the Western Cape and a Leverhulme International Research Fellowship.

REINBOLD, JUDITH* (Zeppelin Universität Friedrichshafen, Germany)

Between Civilianization and Cyborganization – a 'Zeitenwende' in Depicting German Soldiers on Facebook?

After WW2 topics related to the military are sensitive issues in Germany. The civil society is still suspicious regarding armed operations (Jacobs & Pötzschke 2021) and the use of military force. Thus, in his studies on heroism Koch (2021) notices a "trend to civilize the military hero" in Germany: Soldiers may still be presented as strong individuals with exceptional skills, but meanwhile avoiding the use of force and appear as helper. On the other hand, Shim & Stengel (2017) observe a 'cyborganization' of German soldiers, a strong display of technology and weaponry, in the pictures of the Afghanistan mission published by the Bundeswehr. Overall, only few studies deal with the self-representation of the Bundeswehr – and even less with the depiction of German soldiers and armed forces nowadays.

However, this is of high interest, because when Russia fully invaded Ukraine in 2022, Chancellor Scholz declared a 'Zeitenwende' and correspondingly the political and societal awareness of the military shifted (Graf 2023): The German minister of defense e.g. claimed to get the Bundeswehr combat-ready. Therefore, the question rises, if also the way in which the military represents itself changed. Thus, this contribution proves if Koch's thesis about the civilianization of military heroes is valid for the self-representation of the Bundeswehr nowadays or if weaponry gains relevance. A visual

framing analysis of pictures and videos published by the Bundeswehr on Facebook after March 2022 shows the soldiers are still depicted as helpers in need, but also technical representations gain relevance. This can ease the society's growing feeling of insecurity, because emphasizing technical aspects insinuates control (Shim & Stengel 2017). Finally, the visual self-representation of the Bundeswehr on Facebook equally addresses the attempt to avoid armed force and the attempt to maintain control in uncertain times.

Revising Africa, Remaining Normative Power: Verbal (Re-) Production of National Identity in German News Coverage on Minusma

Democratic journalism is meant to be balanced, providing 'neutral' information in order to enable citizens to form their own opinion. Nonetheless, news coverage is influenced by cultural and historical contexts, which affect and are mirrored by the language used. This contribution provides an outlook on which (historically developed) ideas about 'western' and 'non-western' countries appear in German online newspaper covering the UN peacekeeping mission in Mali, MINUSMA. Beneath the thematic content of the news coverage linguistic devices like metaphors, catchphrases and labels have major impact on the perception of the intervention as well as the nations and actors associated with it (e. g. Mamadough 2022). I argue that, even though the idea of a powerful global north that enables the capacities of the global south is not made explicit in German news, the popular idea of the non-western Other which needs "either to be feared [...] or to be controlled" (Said 2019: 301, Thomas-Olalade & Velho 2011) is subliminally reproduced by several linguistic devices. Most striking in the coverage I analyzed are the diametrically opposed membership categorization devices (Peter & Chilwa 2022) used to describe Malian and German actors and the family metaphor (Lakoff 1995). The former portray the separatist from Northern Mali as inhumane terrorists and the UN soldiers as empathic rescuer. The latter replicates the idea of Germany being the superior mature "grown-up", either caring for the (inferior) Malian civil society ("child") or trying to rear the (morally inferior) military government ("teenager"). Overall, German actors are described as subjects being capable to act purposeful, while the Malian civil society is the passive object and the separatists are acting haphazardly. Overall, the coverage reflects the idea of Germany being part of 'Normative Power Europe' which distinguishes from the Other framed as inferior and / or threat (Diez 2005).

Institutional Trust and Support for Redistribution: The Views of the Wealthy and of the General Population in Brazil

Comparing and understanding the attitudes of the wealthiest toward inequality, their level of trust in the State, and how these factors influence their support for redistributive policies is crucial to understand the dynamics of inequality and garner support for redistribution. Our paper examines variations in these attitudes across different sociodemographic segments in Brazil and addresses key gaps in the literature. Specifically, we focus on the top income earners in comparison to other population groups, based on a unique dataset, with an oversampling of the top 5% of the wealthiest. To investigate trust in the State, we assess various levels of trust across different state institutions and agents of government (bureaucracy, the judiciary, and the police), to examine how these trust levels relate to redistribution preferences. Additionally, we employ measures of redistributive preferences that account for perceived costs, diverging from the "free lunch" assumptions commonly found in the literature. This allows us to explore how trust in state institutions affects the relationship between wealth and support for redistribution. Our findings indicate that economic self-interest significantly drives the wealthy's opposition to redistribution, despite their acute awareness of inequality. Moreover, distrust in the State agent's capacity to effectively redistribute wealth emerges as a critical factor shaping their preferences, underscoring the crucial role of trust in explaining the legitimacy of redistributive policies. We discuss some theoretical implications of our empirical findings, emphasizing the role of perceptions on inequality, on how the State works, and ideological orientations toward wealth.

The Tensions of Four Scientific Imaginaries in Science Policy Reforms

In this presentation, I will introduce a concept of four imaginaries of science inspired by Charles Taylor's theory. These imaginaries are: the imaginary of the pursuit of truth, the imaginary of the game of the scientific community, the imaginary of the evaluative game, and the institutional imaginary. Each imaginary has distinct approaches to valuing, justifying claims, and assessing the worth of scientific work. My doctoral research demonstrated that these imaginaries serve as universal reservoirs of ideas influencing evaluative processes, such as promotion reviews. Notably, broad terms like "scientific value" and "excellence" are subject to reinterpretation by different imaginaries.

I will connect this theory to science policy, highlighting how evolving research assessment policies create tensions among these four imaginaries. By examining Polish science reforms from 2011 and 2018, I will illustrate how the understanding of "scientific value" and "excellence" has shifted from being grounded in the pursuit of truth and the dynamics of the scientific community to being increasingly shaped by evaluative processes and institutional frameworks.

The Role of Social Media in Facilitating Collective Action for Risk Response during Disasters: A Case Study of the 2021 "Henan Floods" in China

With the rise of an interconnected society, risk communication during public emergencies has increasingly shifted to social media platforms. Individuals in high-risk environments adopt risk communication to reduce risk perception and guide decision-making (Prybutok & Ryan, 2015). Social media provides an open platform for information exchange, shaping risk response (Yoo, 2019). Unlike stable communities, emergency groups focus on sharing information and disband once the crisis ends, forming 'temporary publics' (Bruns & Burgess, 2011). How does social media play a role in this process?

Our study explores this phenomenon using the example of the 2021 Henan Floods, during which people used Weibo for risk communication. Weibo, China's leading social media platform, uses hashtags to connect communities and disseminate information, forming strong connections between dispersed users (Bennett & Segerberg, 2013). Hashtags enhance searchability and visibility, bringing users with common interests together (Saxton et al., 2015). Emotions play a key role in risk communication, as personalized content triggers emotional mobilization, which can influence public risk perception (Gu, Guo, & Zhuang, 2021). We propose a framework where weak connections emerge through risk communication topics, and strong connections form through hashtags, creating stable issue spaces during public emergencies on Weibo.

We analyzed 51,442 Weibo posts about the 2021 Henan floods using Python for data collection and STM in R for topic modeling, identifying eight topics and constructing a hashtag co-occurrence network. We reveal four findings: (1) Weibo users form weak connections through shared topics, driven by specific information needs; (2) hashtags create strong, locally centralized yet distributed topic networks; (3) weak topic connections and strong hashtag connections shape a locally centered, distributed issue network; and (4) issue network structures influence emotional communication, with overall emotional contagion but varied emotions within topics. These four findings illustrate the role of social media in shaping risk communication dynamics.

*Future-Proofing Climate Boomtowns: Public Policies and
 Community Actions in Chicago, Toronto, Geneva and Zurich*

This talk will present findings from a trans-Atlantic group project on urban climate adaptation. Most scholarship on urban climate governance has focused on cities facing immediate risks or places after extreme climate events have happened. This project focuses on "climate boomtowns," urban regions in cool climate zones which do not face immediate threats and may even become destinations for climate refugees. The talk will examine climate adaptation strategies in the infrastructure sector (energy, water, transport and buildings), and their impact in improving equity and resilience. Although not focused on the Global South, it will draw comparative lessons by thinking with the Global South, to identify common themes on climate governance and the remaking of urban territories.

*Digital Wellbeing and Safety for Children and Pre-Adolescents:
 The Milan Recommendations*

This paper presents the "Milan Recommendations for the Digital Wellbeing and Safety of Children and Pre-Adolescents," a collective effort to address the complex relationship between digitalization, education, and childhood development. Initiated in 2022 as part of the MUSA project, this research-action initiative engaged over 15,000 individuals, including parents, educators, health professionals, and students, to collectively create a framework for safe and beneficial digital practices. With increasing evidence of the risks associated with early digital exposure—such as negative impacts on mental and physical health—this initiative sought to balance the benefits of digital tools with the need for protective measures.

The recommendations draw from extensive data collected through focus groups, public discussions, and surveys involving 6,500 families and 2,000 educators. Key findings reveal parental concerns about excessive screen time and the early use of smartphones, as well as a desire for clearer institutional guidelines. The recommendations emphasize the importance of adult awareness, responsible digital autonomy, and the prioritization of physical and interpersonal experiences over digital ones. They also propose policies such as age-appropriate digital use, the promotion of digital literacy, and the enforcement of existing regulations, such as GDPR's restriction on platform usage by minors.

By fostering collaboration between the educational, health, and legal sectors, these guidelines aim to equip future generations with the tools necessary to navigate the digital landscape safely. This research highlights the role of local governments, schools, and families in establishing sustainable, long-term strategies for digital education and well-being.

*Half a Century of Change? Analyzing Gender Integration at the
 Belgian Defence*

This paper explores the evolution of women's integration into the Belgian Defence over the past 50 years, with a focus on the challenges and progress that have defined their experience. From a sociological perspective, the study investigates how women have increasingly been included in diverse roles within the military, while examining the social and institutional barriers that persist. Key moments of progress are juxtaposed with the resistance to change, which continues to shape the experiences of women at the Belgian Defence. The paper also looks into broader issues of diversity, equity, and inclusion (DEI) within the military context, assessing how these principles are applied to women's integration. By critically assessing these elements, the article sheds light on the ongoing challenges and identifies necessary steps toward achieving genuine equity within military organizations.

*Desafíos y Oportunidades En La Investigación Feminista e
 Interseccional: Un Análisis Comparativo Entre Chile y Alemania
 Desde Una Perspectiva Sur-Norte*

Este trabajo explora los desafíos en la promoción y desarrollo de la investigación con perspectiva de género e interseccional en Chile y Alemania, destacando la importancia de establecer un diálogo Sur-Norte para fortalecer estos esfuerzos. A través de entrevistas en profundidad con académicas de la Universidad de Chile y el análisis de documentos sobre el estado actual de la investigación de género en Alemania, identificamos cuatro áreas clave donde persisten obstáculos: posicionamiento disciplinar, financiamiento, institucionalización y profesionalización, y la respuesta social ante los avances en estos campos.

En el contexto chileno, las académicas señalan avances notables en ciertas disciplinas, pero destacan la falta de recursos económicos y las resistencias en algunos departamentos como factores que limitan un progreso significativo. Por su parte, en Alemania, aunque se observan avances en diversas áreas, se subraya que sin una infraestructura especializada que apoye la investigación feminista e interseccional en todas las disciplinas, estos logros pueden ser difíciles de sostener en el tiempo.

Los hallazgos subrayan la importancia de que el financiamiento esté acompañado de una infraestructura institucional robusta, que incluya personal especializado y fondos dedicados. Además, el establecimiento de un diálogo entre los contextos del Norte y el Sur global es crucial, ya que permite intercambiar lecciones aprendidas, generar redes de solidaridad y colaboración, y promover una perspectiva decolonial que considere las experiencias y necesidades específicas de cada región. Este diálogo es esencial para enfrentar los retos compartidos y avanzar en la construcción de una investigación feminista e interseccional más inclusiva y sostenida en el tiempo.

*Labor Unions and Gender Gaps in Political Participation in
 Latin America*

Existing research shows that unions play a key role in stimulating workers' political participation (Hadziabdic & Baccaro, 2020; Kerrissey & Schofer, 2018; Pérez-Ahumada & Astorga-Pinto, 2024). This is because unions foster political awareness and leftist orientations among workers (Kerrissey & Schofer, 2013; Pérez-Ahumada & Astorga-Pinto, 2024), and act as "schools of democracy," providing workers with civic skills (e.g., leadership abilities) that facilitate participation in political activities outside the workplace (Terriquez, 2011; Verba et al., 1995). Additionally, scholarly research has provided ample evidence suggesting that, compared to men, women are less likely to engage in political actions—particularly in contentious actions such as marching and protesting (Desposato & Norrander, 2009; Espinal & Zhao, 2015; Persson, 2015; Teorell et al., 2007).

In this paper, we analyze the extent to which labor unions help reduce this gender gap in political participation. To fulfill this goal, we use data from the World Values Survey, waves 3 (1995-98), 5 (2005-09), 6 (2010-14), and 7 (2017-20), and analyze three Latin American countries: Argentina, Chile, and Uruguay.

Consistent with previous literature, our regression models indicate that, in all three countries analyzed, women exhibit lower levels of political participation than men. Similarly, in all three countries, union members display higher levels of political participation than those who are not unionized. Finally, our analysis of interaction effects reveals that although union membership does not reduce gender gaps in political interest, it does reduce the gap in participation in political actions (e.g., marching, protesting, etc.) and in civic involvement. These "equalizing effects" are particularly noticeably in Chile, and less clear in Argentina. Differences aside, and building on previous research (Terriquez, 2011; Verba et al., 1995), we speculate that unions' equalizing effects occur because union participation provides women with civic skills (e.g., leadership capacities) that facilitate political participation outside the workplace.

What Makes a Dignified Urban Life?: Perspectives from the State, Civil Society, and the Street Dwellers

This paper synthesizes two connected street dweller studies in Metro Manila. The first was a survey of policies and programs of state and civil society groups relating to street dwellers. The second was a series of dialogues with street dwellers, partly tackling the findings on policies and programs from the first study.

The idea of what constitutes a dignified urban life for street dwellers has been contested mainly by state and civil society actors. Street dwellers are subject to hostile actions from state agencies, from periodic displacement from staying places, street surveillance, to their non-recognition as citizens leading to their exclusion from services. But they are also the target beneficiaries of predominantly social welfare programs at the national and local levels of government. On the other side, civil society groups have focused on feeding programs, rehabilitative efforts, and advocacy work to protect dwellers from state violence.

These interventions have been mostly framed through varying formulations of rights and or/dignity. In the process, they have provided divergent yet sometimes convergent understandings of what constitutes a dignified urban life for street dwellers. This paper outlines what these actors emphasize as necessary in achieving this, as well as lays out points of convergences and lines of debate as seen in their policies and programming.

As a consequence of being the primary actors that serve and define who the street dwellers are, the state and the civil society groups have dominated this conversation. Street dwellers have been relegated as the subjects of policies and talks. This prompts the questions: What do street dwellers think about their condition? And what makes a dignified life for them? This paper synthesizes the insights from dialogues with street dwellers, in an attempt to (re-)introduce their perspectives in the discourse regarding their own lives and dignity.

REYES BENAVIDES, JESUS ANTONIO* (Universidad Nacional de San Martín, Colombia)

Organization and Planning of the Social Space of the Farc-EP in Medellín, Colombia (1990-2000): The Militias and the Frente Urbano Rural Jacobo Arenas

This article examines the forms of social planning and organization implemented by the FARC-EP through its militias and the Jacobo Arenas Urban-Rural Front. The militias were divided into two types: Bolivarian and Popular. Conceived as non-uniformed armed structures, they played a crucial role in consolidating territorial control. Far from being mere auxiliaries, the militias acted as intermediaries between the civilian population and the guerrilla leadership, carrying out logistical tasks, intelligence operations, and social coercion (Kalyvas et al., 2008; Della Porta, 2013; Malešević, 2017).

This analysis reveals how the FARC-EP structured its militias into clear hierarchical levels with defined leadership and specific roles. These structures enabled efficient coordination in both rural areas of Medellín and the urban center, where the militias were responsible for activities such as intelligence gathering, organizing community events, and managing resources, people, and materials (Arjona, 2016; Gutiérrez Sanín, 2015).

The article is based on 15 interviews with various FARC-EP members across different ranks. Additionally, the information was cross-checked with public interviews and judicial rulings.

The article also explores how the FARC-EP utilized the militias to implement "social justice" projects, including the enforcement of sanctions against those who failed to comply with their rules. Through these dynamics, a process of bureaucratization is evident, allowing the guerrilla organization to maintain a partially effective social control, consistent with its strategy of prolonged warfare. Finally, the article reflects on the inherent contradictions in this form of organization, particularly regarding the centralization of power and the tensions that arose between the FARC-EP's interests and the needs of local communities (Arjona et al., 2015).

Ideologically-Driven Perception of Claims and Experts

The political polarization over science is often attributed to conservatives' distrust of scientific institutions and people conducting research, while liberals are seen as more trusting. Drawing from Cultural Cognition Theory and the Four-Level Model of Science Polarization, this study investigates how political ideology interacts with expert sources to shape perceptions of expert claims. We hypothesize that distrust in science is not a conservative-exclusive trait and manifests itself in ideology-dependent preferences for research fields and specific claims. To test this, we conducted a randomized online experiment with U.S. participants (N = 1054) who evaluated four typically contested claims: the lack of a connection between immigration and criminality, the existence of the Laffer curve, the safety of genetically modified organisms for consumption, and the anthropogenic nature of climate change. We manipulated the expert uttering the claim—either from commercial or basic research fields—to assess how political identity interacts with expert sources to influence the perceived accuracy of the claim. Participants then indicated how much trust they placed in five experts in a separate battery of questions. Our results show that liberals rated most claims as more accurate than conservatives, specifically in the context of immigration, climate change, and genetically modified organisms. Additionally, liberals reported significantly higher trust in experts than conservatives. We found no significant difference in perceived accuracy between claims made by experts from commercial versus basic research fields. Notably, mentioning an expert as the source of a claim increased its perceived accuracy, even when the content of the claim conflicted with participants' political beliefs. These findings suggest that expert endorsements can bridge ideological divides in the perception of expert claims.

Promesas De Movilidad Social Ante La Racialización: Relatos De Migrantes Afrolatinoamericanos y Caribeños De Clase Media En El Área Metropolitana De Santiago De Chile

La presentación retrata trayectorias de movilidad social de migrantes afrodescendientes, y los usos y negociaciones que realizan a diario sobre su posición en el área metropolitana de Santiago. Una ciudad que cuenta con alta segregación residencial del espacio urbano y, donde vivir en una comuna con mayor prestigio social implica una ganancia simbólica y material en las trayectorias residenciales, por lo que será entendida como una movilidad socioespacial ascendente. Así, el lugar de residencia y el conocimiento sobre el valor de las comunas del área metropolitana de Santiago (Fuentes & MacClure, 2020; Otero et al., 2021) es un dato clave dentro de las trayectorias de movilidad de las participantes. En la investigación se observa desde una aproximación interseccional situada (Yuval-Davis, 2015) cómo las participantes elaboran una subjetividad y posicionamiento de clase que interpela la racialización que subyace sobre su presencia como cuerpos fuera de lugar (Puwar, 2004) en los espacios residenciales de clases medias y altas, identificadas éstas como blancas mestizas (Pavez, 2016) en el relato nacional. Para ello, las participantes generan estrategias que implican el uso creativo de su diferencia encarnada (Hill Collins, 1996), estableciendo relaciones interpersonales (Zelizer, 2009) que aportan a sus movilizaciones socioespaciales ascendentes en destino.

REYNOLDS, MATTHEW* (London School of Economics and Political Science, United Kingdom)

The Comfort of a Familiar Face: Concierges' and Porters' Care Work in London's Elite Neighbourhoods

Elites increasingly inhabit defensive homes to 'protect' themselves from the public, and many scholars have explored how architecture and planning enables this. Elites, however, also require the labour of non-elites to achieve this social withdrawal. Despite this, apartment block staff have remained marginal in the literature, as figures who are often described in the background, but rarely actually spoken to. As part of a broader project on cleaning and security work for the wealthy, this paper draws upon 31 interviews with porters and concierges working in London's most expensive apartment blocks, the elite residents they serve, and the professionals who

mediate between these two groups (e.g. recruiters, estate agents). Some interviewees confirmed previous conclusions on the elite: that they prioritise *distinction*, insisting on smart uniforms and deferential demeanours; and, that they help elites *disconnect* from public interactions, such as their handling of mail and waste. Surprisingly, however, interviewees also described these elite/non-elite relationships in terms of *care*, from being on-call in the case of health emergencies, helping elderly residents with shopping, to the simple reassurance of a 'familiar face' at their building's entrance. I contrast these accounts with those from Grenfell Tower, a public housing block in the same borough of London's elite neighbourhoods, and where 72 residents died in a fire in 2016. Testimonies describe how the block used to hire a concierge who provided similar *care* services to those in elite blocks, but the council cut this four years before the fire. By going beyond critiquing elites' use of concierges as disconnection and distinction, then, I suggest that their labour is not only a 'luxury', but a form of infrastructural care which is unequally distributed in cities like London which have been captured by the super-rich.

NERO, KRISTI (University of Tartu, Institute of Social Sciences, Risk and Resilience research group, Estonia)

Innovation in Disaster Risk Management: Barriers and Success Factors in Adopting Participatory Decision-Support Tools

Natural and man-made disasters have become a major threat to urban areas. The increasing intensity and recurrence of disasters is overwhelming Disaster Risk Management (DRM) efforts unravelling crucial implementation gaps and structural inequalities. This raises a question of how to innovate and transform DRM systems in support of urban resilience.

The literature highlights enhancing lateral and vertical coordination in risk governance as the key to overcoming DRM shortages. Participatory decision-support tools have the potential to accomplish this goal. These tools offer a space for different stakeholders to collaborate in risk assessment, goal setting, and planning. However, existing governance frameworks rarely exhibit the flexibility to integrate such tools in DRR planning, and very little research explores the process and the barriers of adoption of such tools.

This research follows a multiple cases study approach to investigate the barriers and enablers of the adoption of a participatory disaster vulnerability triage tool. This scenario-based vulnerability triage tool helps emergency response planners identify and prioritise the communities in vulnerable situations that most likely need support before, during and after a hazardous event. We investigate the adoption of this vulnerability triage tool by risk managers in two European cities: Tartu, Estonia and Rotterdam, The Netherlands. Feedback sessions on the use of the tool and interview with experts were conducted to understand the contribution of the tool and barriers of its adoption.

Our results show that participatory vulnerability triage tool can enhance the alignment of disaster support needs and response efforts. Experts indicated that such tools need to be more adaptive and have different levels of complexity to permit vertical coordination and inclusion of communities. Despite the acceptance of participatory decision-support tools by different stakeholders, resistance to change in ingrained risk analysis frameworks and practices are the key impediment of the wider adoption of such tools.

RIORDAN, CHRISTINE* (University of Illinois at Urbana-Champaign, USA)

From Rhythms to Stop, Drop and Roll: The Impact of Algorithmic Management on Discretion in Hotel Housekeeping Work

The spread of algorithmic management (AM) technologies in traditional organizational settings suggests that the automation of managerial processes will extend far beyond gig or platform work. A key concern in this new landscape is the extent to which AM, which is more opaque, interactive, and instantaneous than previous technologies, will reshape workers' autonomy and discretion, the latter of which is defined as latitude to make decisions that control different aspects of the work process. We develop a grounded model of AM's impact on discretion with extensive qualitative data collected from hotel housekeeping, showing that AM's impact on discretion hinges on three dimensions: the point at which AM intersects with the labor process, the varying degrees of uncertainty in task bundles, and the salience or frequency of tasks. We link these changes to changes in job satisfaction and performance by tracing the effects of AM on these task bundles to changes in cognitive and physical workload of GRAs, and discuss moderating factors that influence

the relationship between AM and discretion. Our model underscores the importance of paying close attention to characteristics of the labor process in settings where AM is integrated into preexisting organizational practices and social relationships, and where AM augments, rather than substitutes, for managerial decision-making.

Rural Youth Facing the Anthropocene: Everyday Practices for a Resilient Future

Young people living in rural areas face a unique set of challenges in the Anthropocene, an era defined by significant human impact on the Earth's ecosystems and climate. These challenges stem from both environmental degradation and socio-economic changes, which are deeply interconnected.

Climate change, causing rising temperatures, unpredictable weather patterns, droughts, and floods affect farming put touristic and agricultural activities at stake, increasing the already dramatic rural migration to urban areas. The exodus from rural regions exacerbates social and economic issues such as depopulation, aging communities, and the loss of cultural heritage tied to traditional farming practices. As much as young people would like to stay or return to these territories, limited access to education, mobility deficits and unreliable access to modern technologies make it increasingly difficult. For those who stay, these gaps limit their opportunities to learn new skills and engage with innovative networks that could help their communities adapt to environmental changes. However, although being marginalized and underrepresented in discourses concerning climate activism, rural youth does participate ecological protection actions and practices, provided they have the means and the opportunity to do so.

This presentation focuses the narratives of 12 young people, aged between 15 and 17 years old engaged in an environmental activism program in Gouveia, Serra da Estrela, Portugal, between the years of 2019 and 2021. Adopting the lenses of the resonance theory, the analysis focuses on the ways that rural young people relate to non-human nature, provide a portrait on the lives of youngsters who live in rural contexts, of their everyday encounters and debates. It argues although environmental activism for youth in rural areas is dependent on resources and infrastructures, it can also be found in solitary and slow resilience practices.

MISIASZEK, GREG (Beijing Normal University, China)

Are Human Rights Enough? – Extending Hre Frameworks through Ecopedagogical Perspectives

What if humans learned to listen to Earth? What if we learned to understand Earth? Would there be emergency summits on supranational levels, like the UN, to address the urgent need for world-Earth de-distancing? Would there be adjustments to long-standing, yet in their orientation almost unquestioningly anthropocentric frameworks, such as the Universal Declaration of Human Rights, to accommodate Earth's rights as a fellow citizen?

Applying ecopedagogical and posthumanist lenses, this conceptual paper argues that Earth's rights are integral to human rights (HR) discourses because the tackling of social issues and environmental injustices is not a contradiction, not an either/or-decision – the two dimensions are inseparably linked (Smith/Pangsapa 2008: 1). Ecopedagogies, grounded in criticality and the work of Paulo Freire, are based on the inherent connections between environmental violence and social injustices that are essential for critical global citizenship education (GCE), and vice-versa (Misiaszek 2020). Ecopedagogical widening to planetary citizenship holistically reinvents citizenship for all of Earth, beyond humans (Misiaszek 2022). Our presentation will ecopedagogically unpack the contested terrains of needs, possibilities, and challenges of HR founded upon humanization with Earth's rights' from expanded planetary views, including (re)constructions of citizenships (local-to-planetary citizenship spheres).

To do so, we will proceed in three steps. First, we unpack what Torres (2023) calls 'elective affinities' – a relationship of mutual reinforcement – between concepts such as human rights and their education, global citizenship and its education, and ecopedagogy. Then, we apply critical ecopedagogical and posthumanist lenses to existing HR frameworks, such as the *Revised 1974 recommendation* (UNESCO 2024), to identify and discuss possibilities, challenges, and contested terrains vis-à-vis Earth's rights. Finally, we call for bottom-up learning for world-Earth de-distancing and the expansion of the human rights framework to include more than human rights, using examples from education praxis for illustration how it might be done.

SCARDIGNO, ANNA FAUSTA* (University of Bari, Italy)

Rethinking Vulnerability in Migration: From Passive Protection to Gender Empowerment

The purpose of this study is to analyze the way the concept of "vulnerability" is construed and applied in migration policies and practices, particularly concerning migrant women and return migrant women. While vulnerability is often invoked as a ground for offering protection and aid, it can also perpetuate disempowering narratives by framing women as passive recipients of support. The research thus explores vulnerability and agency as poles of a dichotomous dynamic within the satellite model of migration, in order to overcome this opposition by emphasizing the importance of a relational and intersectional approach that highlights women's resilience and empowerment.

The paper thus aims, on the one hand, to critically examine the traditional use of "vulnerability" to determine whether it reinforces dependence and undermines the agency of migrant women. On the other hand, it sets out to explore alternative approaches that emphasize resilience, strength, and empowerment, encouraging a shift from viewing women as vulnerable beings to recognizing them as key agents in their migration and reintegration journeys. The research will also consider how this shift in perspective might influence migration policies, advocacy efforts, and support networks, promoting a more robust and accurate reflection of the diverse experiences and strengths of migrant women. This final research stage will benefit from an exploratory field research phase conducted by the authors providing empirical insights into how such shifts in perspective can impact migrants.

Rationality, Irrationality and a-Rationality: The Legacy of the Frankfurt School on the Debate in Contemporary Society

Still nowadays Frankfurt School inspires a variety of insights for social theorizing. The crucial wound in modernity embedded in the division between rational and irrational is still to be recovered and probably one of the most rich and promising insights for contemporary social conditions. In *Eros and Civilization* Marcuse writes that increased progress seems to be linked to an "increasing restriction of freedom" and included in this repressive form is the Western distinction between reason and emotions, between rationality and irrationality. Moreover, in *One-Dimensional Man*: "What could be more rational than the suppression of individuality in the mechanization of socially necessary but painful performances" (Marcuse, 2007:1). On closer inspection, in contemporary society, emotions are not only what clearly distinguishes the human being from the machine, but also what seems to be most reliable in social relationships. Rationality in many relationships, especially institutional ones, has an uncanny aura of manipulation in contemporary societies, from which emotions seem unscathed. Emotions feed on memory and experience. Moreover, emotions are social and political facts, because they are inscribed in the memory of the body and therefore give rise to forms of acting. In a society dominated by rationality or the exactness of machines, emotion becomes a form of rationality that is part of social issues to be faced.

How do social phenomena manifest contemporary contradictions by incorporating previously unseen forms of dialectics between reason and emotion?

In this context, the role of social sciences is to investigate the jointly rational and emotional nature of the social processes in which the Frankfurt School was already strongly engaged and to grasp their potential future repercussions. This article intends to take up the Frankfurt School's observation on those collective activities and practices that through expressive media convey forms of resistance and social critique, revealing their crucial importance for understanding contemporary society and its dynamics of change.

RICCIONI, ILARIA* (Free University of Bozen, Italy)

Social Theory and Social Aesthetics

The imaginative power of reasoning inherent in critical theory is also at work in aesthetic reasoning. The use of the imagination is not only a matter of understanding the real situation, but of being able to predict what goes beyond it. This paper will inquire the potentiality of aesthetics for social theorizing and research methodologies starting from the work of Adorno and Marcuse. The power of aesthetics is to create an imagination that makes social transformation possible. Works of art writes Adorno "emerge from the empirical world and produce one that is opposed to it by a peculiar essence, as if it were also something essential" (Adorno 2009: 4). These new worlds produced by works of art are related to the profound impulses that animate social change. If imagination is a means of transcending the actual towards what is possible, but not yet realised, it is also the key to a possible new turn in contemporary sociological argumentation and capable of breaking down fences that divide the two worlds: that of logical rationality and that of sensory rationality, which come together in the concept of social embodiment. The aesthetic dimension, writes Marcuse, cannot validate the reality principle. Like the imagination, "the realm of aesthetics has retained its freedom from the reality principle at the price of losing its efficacy in reality. (...) In Kant's philosophy, the aesthetic dimension occupies the central position between sensoriality and morality - the two poles of human existence. If this is the case "the aesthetic dimension must contain principles valid for both realms. Since it was civilisation that inflicted this wound on modern man, only a new form of civilisation can heal it." (Marcuse 1955: 194-205). This paper inquires a sociological approach able of inquiring emotions, a-rational phenomena and how they are linked to the rational irrationality of contemporary society.

Person-Driven Mixed Methods Single Case Study Design - Rationale and Feasibility Study of a New Evaluative Service User Perspective Approach

The evaluation of psychiatric services from the perspective of service users faces considerable methodological challenges. Usually, the samples are small, there is a lack of control groups and recovery instruments are generally not reliable outcome measures. The person-driven mixed methods single case study design is an approach that attempts to deal with these methodological problems. Study participants are interviewed several times longitudinally using qualitative and quantitative interviews. The first interview acts as a control condition. In contrast to conventional mixed methods studies, the quantitative part is also defined from the perspective of the participating service users (PSYCHLOPS methodology). The paper explains the methodological background of the approach and reports on a feasibility study.

The Questionable Legitimacy of Mental Health Laws

Mental health laws require certain criteria to be met in order to apply involuntary measures. These are essentially the following criteria: (1) the demonstrable existence of a mental disorder; (2) the effectiveness of psychiatric measures; (3) the use of coercion as a last resort and as the least possible restriction; (4) the benefit of the person affected to be achieved through the coercive measure; (5) the restoration of the affected person's autonomy. This paper contrasts these requirements with the recent research literature on these topics. Given the current state of research and the recent discussion of fundamental concepts such as 'free will', the analysis suggests that none of the criteria mentioned are clearly met. This means that, in principle, psychiatric coercion can hardly be justified any longer and that the legitimacy of mental health laws is questionable.

Intersecting Struggles? Nonreligious, Queer, and Feminist Activism in Morocco

This presentation poses the question of what counts as nonreligious activism. Drawing on patchwork ethnography, carried out intermittently between 2016 and 2023 in Morocco and with the Moroccan diaspora in Western Europe, I explore what nonreligious activism among former Muslims can look like. Hereby it becomes clear that nonreligious activism is not always clearly identifiable and distinguishable from other forms of activism. Among others, queer and feminist groups share many struggles with nonreligious Moroccans. Solidarity is visible because many queer and feminist issues are related to (non)religion. As a consequence, nonreligious activists often do not target nonreligious topics directly but are often involved in advocating for related causes, such as LGBTQ+ rights (e.g., abolishing Penal Code, §489), sexual liberties (ending Penal Code, §490), and the right to abortion (reforming Penal Code, §453). These topics are not nonreligious in themselves, but most nonbelievers would consider these aspects essential and argue that they indirectly link back to religion. This connection is also made by Moroccan authorities, who often label activists, who are advocating for liberal rights, as atheists. This became evident during the Moroccan version of the Arab uprisings, the February 20 movement, when protesters were accused of being atheists. Similar accusations have surfaced in generalising statements about Morocco's younger generation. Overall, this presentation aims to foster our understanding of how nonreligious activism intersects with other movements for justice, illustrating how different struggles blend into each other.

Becoming Adults As Part of a Religious Minority: Comparing and Contrasting Local Policies and Generational Attitudes

The paper will discuss ways and means of managing religious identity in the transition from the first to the second generation through an investigation in various European immigration cities, which are internationally recognized as privileged areas in the field of intercultural policies and the promotion of the dynamics of religious coexistence (Turin, Barcelona, Lisbon, Amsterdam, Berlin). Through an in-depth qualitative study with a random sample of 50 foreign and/or foreign-born young people who identify themselves as Muslims (balanced by gender, origin from Morocco, Senegal and Egypt and mainly students or already in the labor market, aged between 20 and 29) and 15 privileged witnesses belonging to the first generation, the dynamics of religious socialization in migration are presented. By comparing the two points of view, I enable the comparison of the *modus vivendi* of being Muslim in a context where Islam is a minority religion and where the dual affiliation of Muslims and children of immigrants/immigrants' descendent is likely to lead to discriminatory practices and dynamics. The findings show that young people develop strategies for adapting their religious identity to everyday life that lie between attempts at ethnic identification and practices of secularization, while the first generation seeks legitimization of their parental authority through the next generation's adherence to religious values.

IE for Philanthropy- an Approach to Identifying Opportunities for Grants, Collaborations and Policy Advocacy.

Sociology has been called the basic science of philanthropy much like math is the basic science of engineering and biology is the basic science of medicine. However, there are different types of sociology and some are more positivist than others. Philanthropy has often been considered a top-down approach to solving problems and has long utilized government surveillance data as a resource for decision making and the creation of initiatives. However, growing community philanthropy and community foundations have added large elements of democratic process. These philanthropic efforts stand to benefit from a sociology that is less positivistic. In this presentation I focus on the many uses of Institutional Ethnography and how it can help direct the day to day work of philanthropic professionals in seeking to address problematic aspects of everyday life that people experience in the communities they serve. I examine how IE has been helpful in creating grantmaking, collaboration and policy advocacy in such areas as housing safety, early childhood education, and racial equity. Building from this I explore the use of IE as a potential standard approach for philanthropic professionalization and training and highlight its use for such popular approaches as collective impact, community coalitions, community indicators, and policy work.

Uses for a Real Time Well Being Data Infrastructure Pilot

As Social indicators and quality of life research has matured, one problem has persisted: the time lag between data collection and data availability (Ridzi et al 2022, Ridzi et al 2020). This has often been a problem as governments, NGOs and philanthropic organizations seek to move from data to action to improve quality of life and then seek to measure the impact of these interventions. However, recent technological innovations have offered new opportunities for monitoring individual and collective well-being. In this session I focus on the emergence of the Life Needs Assessment in New York, USA and examine how this new real-time data infrastructure built in the cloud using G-suite technology offers a role model to other communities seeking to build a low-cost (virtually free) infrastructure for well-being data collection, automated data processing, and fast tracked analysis, and reporting. Elucidating the inner workings of how this infrastructure works I then examine some of the benefits of using such a system that can be adapted to a wide range of well being conceptualizations and measures. Specifically, I examine how this real time well being data infrastructure has already been useful for community engagement, crisis response, needs assessment, participatory budgeting, participatory grantmaking, and policy advocacy. I further explore the implications for integrating this approach within a broader well being ecosystem that includes classic approaches to well being measurement.

Energy Saving in Low-Income Households: Synergy or Misery for Climate Justice Objectives?

Energy consumption and its carbon footprint are known to increase with household income. Yet it is low-income households that are being encouraged to save energy by a German energy-saving program under the National Climate Initiative. Although such a policy approach can be seen as problematic from a climate justice perspective, the program is widely regarded as a flagship project of socially just climate policy. This is due to the fact that low-income households benefit more financially from energy savings in their homes: they have to spend a larger proportion of their income on energy costs than high-income groups. This raises the question of whether the program effectively mitigates social inequalities in the realm of climate justice, or whether it exacerbates them.

The paper studies the implementation of the "Energy-saving-check" in Germany. To reduce CO2 emissions, the program advises low-income households on sustainable energy consumption through peer-to-peer coaching. Funded by the German Federal Ministry for the Environment and run jointly by energy agencies and the charity organization Caritas, it trains long-term unemployed people to coach welfare recipients on domestic energy saving. Since 2008, the program has coached about 412.000 households nationwide and claims to have saved more than 720.000 tons CO2.

Using qualitative evidence from semi-structured interviews with politicians, local coordinators, and participants (N = 45) and ethnographic observations of household coaching sessions (24 days), we provide systematic sociological insights into the practices and normative attributions of energy saving in low-income households at the different program levels. In particular, we show how environmental goals at the political level are decoupled from the local practice of the household coaching, which is strongly embedded in a value framework of charity and social counseling. In doing so, we contribute to the ongoing debate on environmental inequality and climate justice in the Anthropocene.

RC38-JS-118.3

RIEKER, PETER* (University of Zurich, Switzerland)

Biographical (De-)Thematization of Vulnerability from a Historical Perspective

The question regarding the significance of experiences made in the (distant) past for a current biographical positioning will be discussed in the planned contribution with reference to a study for which biographical interviews were conducted with people who were to be recruited as unofficial collaborators by the state security services in the GDR as adolescents. Decades after these experiences were made as well as after the end of the GDR, a total of eight women and men from very different backgrounds were interviewed, who showed a wide range of ways of dealing with these experiences. This makes it possible to analyze the significance of biographical experiences over longer periods of time and social transformations.

The evaluation of these interviews, on the one hand, makes clear references to the biographical positioning within the context of contemporary historical events and developments. On the other hand, these narratives show how early experiences are linked to biographical possibilities and decisions in later phases of life. It also becomes clear that the interviewees have developed the habit of making certain experiences invisible or allowing them to be silenced by reactions in their social environment. In the planned contribution, these aspects will be presented in a comparing manner and further reflected upon on the basis of two case studies.

RC42-679.5

RIEKER, PETER* (University of Zurich, Switzerland)

Family – Still an Important Instance of Political Socialization?

Traditionally, family is considered as an early and important instance of socialization in childhood and adolescence. However, due to social modernization processes, the significance of the family in the field of political socialization seems to have become questionable, especially since the focus is increasingly on the positioning and demarcation that takes place in the context of peers as well as on communication in social media. The question of the significance of the family for political socialization in adolescence is explored in the planned contribution on the basis of biographical interviews conducted in the research project "Biographical Experiences and Political Engagement in Adolescence".

The life stories of adolescents who show different degrees of political (dis-)engagement reveal the central aspects of their political socialization. In some cases, the family is explicitly attributed significance with regard to the development of political interests or political engagement, but this significance can only be inferred implicitly in other cases. This makes it necessary, however, to use a broad concept of politics so that different dimensions of social relationships (e.g. hierarchy, dominance, care) can be considered as aspects of the political. These aspects are explained and their significance is reflected upon in the context of a comparative case study.

Rethinking Left-behind Places through Remote Working? Insights from Remaking Project

The transition to digital work, accelerated by the COVID-19 pandemic, may create opportunities for left-behind areas affected by population decline, limited access to high-quality jobs and essential services. Indeed, RW offers the potential to attract skilled workers, diversify local economies, and stimulate development. If RW can be seen as a means of sustaining rural communities, both by encouraging people to remain in or relocating to communities suffering from population decline, it cannot be assumed that this "rediscovery" of left-behind places will result in a long-term, significant revival of these areas. Indeed, it is unclear whether the process of urban dwellers relocating to rural areas will continue in the future, and what impact this will have on rural development; moreover, it is also likely that some territories will prove to be more attractive than others for urban dwellers, resulting in an uneven distribution of benefits between rural areas within and across different metropolitan regions. New risks of competition, "colonization" of left-behind places by urban centers, new services demands, are only few of the challenges connected to RW framed as an opportunity for territorial development.

Building on the initial findings of the Horizon Europe project "REmote-working Multiple impacts in the Age of disruptions: socioeconomic transformations, territorial rethinking, and policy actions" (REMAKING), our contribution assesses the social-spatial implications of RW in mid-sized European cities, focusing in particular on Bologna (Italy) and its Apennines. Here, the comparative advantages of left-behind areas (e.g. housing affordability) represent a significant driving force behind RW implementation: while remote workers gradually "repopulate" shrinking areas, new challenges have to be addressed. Using a mixed methods approach based on a survey and qualitative fieldwork, the project critically examines how "left-behindness" is transformed by and through remote working implementation programmes.

BACIO, MARCO (University of Palermo, Italy)

When Social Workers Deal with LGBTQI+ People. the Employment of Anti-Oppressive Practices to Combat Discrimination and Inequalities.

This oral presentation provides an analysis of the material collected for the Italian project "Contrasting violence against LGBTQI+ people: Towards innovation of territorial policies". Alongside a quantitative survey dedicated to social and welfare workers, most of the data collected were qualitative, coming from focus groups with social workers and interviews with LGBTQI+ volunteers. All these data were collected in Sicily, south of Italy, making them particularly interesting from both national and international perspectives.

The starting point of this project was the high level of discrimination, marginalization, and lack of power that LGBTQI+ people experience in their everyday lives, especially when dealing with the state and its apparatus. Indeed, Italy lacks specific policies devoted to non-heterosexual people (from marriage equality and adoption to contrast and criminalize violence and discrimination). This long and steady attitude of Italian politics comes from every political area, explained mainly by the influence of the Catholic Church.

This project focused on social and welfare workers and their attitudes towards LGBTQI+ people and their needs. We wanted to study whether and how practices (due to the lack of policies) were implemented to counter discrimination, violence, and marginality. As we know, social and welfare workers are at the forefront of battling inequalities and exclusions in our society.

In this presentation, we will highlight the results of the project and the outcomes that might become institutional practices (even policies) for social and welfare workers in Italy and beyond. What appears clear is that they need better instruments and tools to contribute to the growth of LGBTQI+ people. For this reason, we suggest the employment of anti-oppressive practices. Indeed, achieving social justice through social change is the only successful mechanism for LGBTQI+ people to become members for all intents and purposes of our society.

When Words Wound: Navigating Moral Disengagement Associated with Documented Institutional Abuse

This presentation showcases how an academic-community partnership with a local Community Living chapter (Community Living Brant, CLB) worked to describe experiences of moral disengagement (Bandura, 2016) in disability service workers, a moral disengagement bound up in organizational structures that re-produce violence.

This partnership has roots in long-term research on the structural conditions of violence endured by intellectually disabled people who survived forced institutionalization. These survivors spearheaded a string of class action lawsuits against provincial governments for negligent facility management resulting in widespread and severe neglect, and physical and sexual abuse, documented through administrative records. These records catalogue years of extreme violence, but also violence that becomes quotidian, borne out in the dynamics of total institutional culture and made possible by staff who learned to disengage. Concomitant with these efforts, Canada's Community Living movement advocated for the closure of large-scale facilities and fostered care in quasi-institutional spaces such as group homes and day programs. When Community Living chapters worked with institutional survivors to read the records accessed through lawsuits, the work exposed frontline staff and managers to damaging accounts of harm, while simultaneously demanding that they continue to provide care within spaces that themselves may foster forms of disengagement.

This presentation documents a project wherein researchers worked alongside frontline workers and managers from a local Community Living chapter. Drawing from a series of focus groups with CLB staff, we explore salient differences between on the one hand the vicarious trauma, burnout, and compassion fatigue felt from reading documentation of abuse; and on the other the moral residue, distress, or injury experienced when the institutional conditions depicted in records resembled current community living conditions. While facilities at the centre of class actions may have closed, alternative forms of disability care have work to do to resist the re-entrenchment of institutional violence.

RIO, ANNA* (University of Milano-Bicocca, Italy)

From Europe to the Street. Challenges in the Multilevel Governance of Welfare Reforms Introduced Under the Recovery and Resilience Facility

This contribution examines the coordination mechanisms across European, national, local and street levels within the governance of welfare reforms introduced under the Recovery and Resilience Facility (RRF). It uses Italy as a case study and focuses on the field of active labour market policies (ALMP), where a systemic reform was introduced with the National Recovery and Resilience Plan. The research examines how renewed multilevel governance frameworks develop and how related dynamics unfold through policy implementation phases. Based on a broad analysis of European and national documentation, alongside interviews with key policy stakeholders, the study reveals an informal rescaling of power despite the largely unchanged formal distribution of competences. Traditionally, ALMPs have been under national jurisdiction, but the implementation of RRF-driven reforms indicates a shift in control towards supranational authorities, particularly the European Commission, which plays a key role in approving and monitoring these reforms. Within Italian national borders, this informal rescaling takes the form of increased centralisation, with the introduction of central policy directives in a system historically known for its decentralised and regionally driven policies. This centralisation seeks to ensure the achievement of performance targets tied to the RRF reform, but it also exerts considerable pressure on local and street-level actors responsible for delivering these measures. Ethnographic research conducted in three Italian public employment offices reveals the challenges faced by local service organisations in meeting the demands stemming from this integrated multilevel governance framework.

Socials Theories of Hate: Geopolitical Analysis and Pedagogical Approaches

Throughout history, hatred and evil have been recurring phenomena, manifesting in various forms, from wars and genocides to discrimination and interpersonal violence. These deep and multifaceted sentiments have captured the interest of the social sciences, primarily sociology and psychology, with the goal of understanding their roots and mechanisms.

In this communication, we propose a review of the main theories that have addressed hatred over time, from Sigmund Freud's psychoanalytic perspectives to Philip Zimbardo's situational experiments. Our focus is on analyzing how hatred has been theorized from the 20th century to the present, highlighting the various explanations that thinkers have proposed to understand this complex phenomenon.

The work also explores the role of education in combating hatred, presenting contemporary pedagogical approaches that draw on theories of hatred to develop effective strategies. Among these approaches are Responsible Cultural Education, feminist pedagogies, and even movements such as the pedagogy of discontent, linked to punk rock.

By integrating sociological theories with educational proposals, we aim to contribute to a better understanding of hatred and highlight the initiatives currently being undertaken to combat it in educational contexts. These prevention-focused strategies have the potential to create more inclusive and aware spaces, capable of reducing the negative impacts of hatred on societies.

Non-Participants and Symbolic Reparation in Colombia

Symbolic reparations—such as apologies, memorials, and commemorations—are intended to acknowledge victims of human rights violations and social exclusion, while also challenging the narratives that justify their dehumanization. A common challenge in transitional justice is the inability to reach all victims, leading to frustration. However, symbolic reparations are still regarded as a valid way to address victims' needs because they are believed to foster psychological identification and symbolic extension between those directly affected by violence and those who were not.

This paper examines the case of Colombia, where efforts to promote peace and reconciliation are carried out through education, media, and the arts by both civil society and official organizations. These efforts aim to transmit narratives that support symbolic reparation. However, a significant portion of the population does not participate in these initiatives.

The paper explores the role of non-participants in transitional justice—specifically, those who do not engage with the discourse of transitional justice in Colombia. It investigates how to study this diverse group and considers their impact on a society that is increasingly viewed as post-transitional. By studying non-participants, the paper seeks to assess the effectiveness of transitional justice mechanisms, such as symbolic reparations, in transforming public narratives about the past.

Assessment of Pre-Service Teachers' Professional Development in Norwegian University-Based Teacher Education

The teaching practice is considered to be an essential arena for pre-service teachers' professional competence development in university-based teacher education. According to Norwegian policy documents, assessment is a central principle of the teaching practice, with school-based mentor teachers conducting assessments of pre-service teachers learning and development for both formative and summative purposes. While assessment in the teaching practicum is meant to enhance and assess pre-service teachers' professional competence development, we know little of what competencies mentor teachers and other teacher educators assess during the practicum. Recent reports show that perceptions of what professional competencies the teacher education should equip pre-service teachers with vary greatly among teacher educators. This study aims to empirically elaborate this knowledge.

Using an institutional ethnographic approach, this in-progress study explores the social organization of assessment and professional competence development from the standpoint of school-based mentor teachers. Through interviews and observations, I will investigate the mentor's everyday work and experiences with assessing pre-service teachers' practice. I seek to gain insight into mentors' assessment knowledge, and the ruling relations of teacher education that influence and shape this knowledge. In a broader sense, the study aims to investigate what professional competencies the teacher education equips future social studies teachers with. In this presentation I will further discuss the implications the findings of the study can have on university-based teacher education, and the insights to be gained from using an institutional ethnographic approach in the field of teacher education research.

RISTIĆ, DUŠAN* (University of Graz, Austria)

Museum Speaks: Discourses of Digitalization and Transformation of Museum Practices

This paper explores the evolving discourses surrounding the digital transformation of museums. It presents results from the fieldwork study done in Graz in 2024. Using a mixed-method approach that integrates qualitative and digital methods and tools, i.e. Situational Analysis, Foucauldian Discourse Analysis and Topic Modelling, the study investigates the inconsistencies and discrepancies in the digitalization of cultural heritage practices. Research sample consists of interviews with experts in the field, as well as data scraped from the websites and social media platforms, providing a comprehensive view of the museum discursive practices. Drawing on Conal McCarthy's indicators of museum practices, and Michel Foucault's notion of discursive practices, this research starts from the hypothesis that digitalization of cultural heritage in museums involves both technology and discourses, allowing for its recreation and recontextualization, as well as its non-localized, interactive and innovative use. The aim is to demonstrate that digitalization of cultural heritage and digital transformation of museums are not merely technological shifts but are deeply embedded in broader discursive networks and social practices that shape and influence museums. The study confirms that discourses of digitalization are intertwined with ongoing transformations and debates about power, access, and reconfiguration of cultural spaces in a digital age. The findings also contribute to a better understanding of how museums negotiate digital change, revealing opportunities and challenges in fostering more inclusive and participatory digital environments in their practices.

RIVAS VENEGAS, MIGUEL* (Universitat Oberta de Catalunya, Spain)

Un Antes Que Es Ahora: Masculinidad, Urtypen y Arquetipos Heroicos. Derechas, Héroes y Restos Fósiles.

Mi propuesta pretende generar una suerte de aproximación breve (de ejercicio combinativo, en cierta manera) de todos los temas de investigación que me han ocupado en los últimos tres años, íntimamente relacionados: culturas políticas de las derechas, espacios de reunión-exclusión; tiempos idénticos (entendidos como una suerte de temporalidad *Zeitlos* en la que parecen coincidir y convivir diferentes arquetipos heroicos, que las culturas políticas de las derechas mezclan militantemente) y la propia idea de la pervivencia o postvida de la cultura (*nachleben*, en su formulación Warburgiana) que aborda los elementos culturales como fuentes freáticas que reaparecen, sobreviven y toman nuevas formas. Desafiando la temporalidad natural y demostrando que la cultura (y la cultura política, naturalmente) se rige por normas que con mucho superan los conceptos de nacimiento, desarrollo y muerte, antinaturales a cualquier manifestación cultural. Como movimientos esencialmente nostálgicos, nuestras nuevas derechas pretenden generar un *retour* a un tiempo mejor que no es otra cosa que un reinicio cultural que demanda, como es habitual, una criatura sacrificial y un héroe imbuido de una *Leistungsfähigkeit* masculina que lo podrá todo. En mi análisis, quisiera retornar al espacio de reunión de nuestras viejas-nuevas derechas, el valle de Cuelgamuros (antes, valle de los Caídos) analizando la manera en la que este espacio fantasmal poblado de hombres victoriosos se reactiva y adquiere sentido en el contexto hipermasculino de la *nouvelle droite* ibérica.

RIVAS-SÁNCHEZ, HÉCTOR ELOY* (Athabasca University, Canada)

Reinventing Citizenship: Canadian Migrant Justice Activism in the Post-Pandemic Border Regime

Post-pandemic capitalism in North America has given rise to a new border regime that intensifies immigrants' precarities and disrupts their welfare and social citizenship. In Canada, this post-pandemic border regime has led to an increase in deportations and heightened the deportability of undocumented migrant families while also amplifying the exclusion, surveillance, discipline and exploitation of other precarious status immigrants, including asylum seekers, international students, and temporary migrant workers.

In response to this trend, a network of migrant justice activists and movements across Canada has emerged from below. They have been actively contesting the post-pandemic border regime through a variety of survival non-capitalist strategies, mutual aid practices and contentious politics that have helped precarious-status immigrants to partially alleviate economic and legal precarity while reinventing alternative forms citizenship.

Base on qualitative research conducted with migrant justice activists in 4 major Canadian urban centers (Montreal, Vancouver, Toronto and Calgary) as well as in 8 rural towns before, during and after the COVID-19 pandemic, this presentation will discuss how migrant justice activism in Canada is paving the way for a broader, more universal, and radically inclusive understanding and practice of citizenship.

RC15-219.2

RIVERA-NAVARRO, JESUS* (University of Salamanca, Spain)

Difficulties, Dilemmas and Controversies in Empirical Work in Qualitative Methodology.

Background/Objectives

Scientific literature indicates a series of guidelines that must be respected in the techniques applied in qualitative methodology. Thus, for example, focus groups must be held in neutral spaces, they must last between 60 and 120 minutes, and their composition must range between 5 and 10 members. Similarly, semi-structured interviews are considered to last an ideal time of between 30 and 60 minutes. The objective of this work is to analyse possible deviations from the guidelines described and how to resolve them.

Methods

In 2021, a study was launched to analyse the determining factors of adolescents' eating behaviour. To this end, twelve secondary schools were selected in neighbourhoods in Madrid and Bilbao, with different socioeconomic levels (SES), two in each SES. 36 semi-structured interviews were carried out with key informants - school principals, adolescents and parents, and 24 focus groups with adolescents, parents and teachers.

Results

Research work in schools is extremely complex, due to the activities carried out there and the time they have for their work activities. This reality makes it difficult to comply with the premises that govern the application of qualitative techniques. Dilemmas arise, such as what to do if you only have 45 or 50 minutes to conduct a focus group? How to proceed if in a focus group of adolescents their teacher stays to observe its dynamics? What decision should we make if only 4 individuals attend a focus group? What is the best position to adopt?

Conclusions

The guidelines that direct the application of techniques in qualitative methodology should be considered as far as possible, but a certain flexibility is required in specific settings or with certain groups, such as schools or students. Without such flexibility, it is very likely that the approaches in these settings and groups cannot be carried out.

RIVOIR, ANA* (Universidad de la República de Uruguay, Uruguay)

MORALES, MARIA JULIA (Universidad de la República, Uruguay)

Older People's Perception of the Use of Personal Data By Private Health Services.

The paper addresses the perception and meaning attributed by the elderly to the accumulation and use of their personal data by private health care providers in Uruguay, the need for this use for the benefit of their welfare and the treatment and safeguarding given to them for their protection. Research results are presented (Reilly & Rivoir, 2023) that the accelerated process of

digitalization and digitization of health services leaves the elderly facing the possibility of deepening inequalities.

The development of digital competencies is essential for older people to avoid their digital exclusion in a context of progressive digitization of society and services (Llorente et al, 2015; Lüders et al, 2017) especially considering the specific characteristics of the digital divide in this sector (Hunsaker & Hargittai, 2018) Due to the Covid19 pandemic and the increasing use of platforms, these issues became more important.

The paper is based on a case study in Uruguay that sought to learn about personal data literacy processes to identify the needs of older people in the use of data and characterize their knowledge about the implications of sharing personal data through digital platforms. Cumulative digital literacy workshops were conducted through the Zoom platform and discussion forums via WhatsApp.

We conclude the existence of limitations on the freedom to choose whether or not to provide their data versus the services provided in return. On the other hand, visualizing that the development of digital capabilities of the elderly improves the possibilities to manage their personal data within the health systems and promote citizenship and their rights.

Exploring Gender Dimensions in Urban Food Environments: A Systematic Scoping Review

Food environments play a crucial role in shaping dietary patterns and health outcomes (FAO, 2016). However, the intersection of gender and these environments remains underexplored. This scoping review addresses this gap by summarizing current knowledge on gender dynamics in urban food environments and identifying future research needs. Using Arksey and O'Malley's (2005) methodological framework, a systematic search across three academic databases initially retrieved 702 records, of which 57 met the eligibility criteria for analysis.

The literature reveals a significant gap in addressing gender, with only 10.5% of studies clearly outlining a gender framework. This review explores four key questions: a) Where has research on urban food environments and gender been conducted? b) How is gender conceptualized in the literature on urban food environments, and which groups are targeted for gender analysis? c) Which domains and dimensions of urban food environments are most frequently examined? d) At what stages of the human lifespan do the studies primarily focus?

Our findings underscore eight thematic areas. In high-income countries (HICs), particularly the U.S., research tends to focus on health outcomes like obesity, while studies from low- and middle-income countries (LMICs) highlight food vendor roles, market dynamics, and the impacts of COVID-19 on food access. Notably, women play a central role in food provisioning, caregiving, and maintaining household nutrition, often shouldering unequal physical and emotional burdens. Social support networks are particularly vital for migrant women navigating new food environments.

In conclusion, this review offers a comprehensive synthesis of global literature on gender and urban food environments, highlighting the urgent need for robust gender frameworks in future research. These frameworks are essential for shaping public policies that foster more equitable and inclusive food systems.

A New Vision of Masculinity?: Activism Against Sexual and Gender Based Violence in Egypt, 2010-2015

The current global authoritarian wave with its anti-feminist and anti-sexual rights rhetoric has seen right wing movements gain strength including reemerging in the countries that had experienced uprisings in 2010 – 2013 in the MENA region. Deniz Kandiyoti (2020: 148) no longer uses the term patriarchy but instead uses the phrase, "masculinist restoration", to describe "...the novel forms of enforcement of male dominance and forms of resistance to it..." The increase of SGBV in public spaces has elicited condemnation and resistance in Egypt, for example. Since 2005, activism has increased in response to the documented high rates of everyday sexual violence in public spaces and intensified when female protesters became targets of what appeared to be organized mass sexual assaults during the demonstrations from 2011-2013. Kandiyoti argues that these new patterns of SGBV and collective responses are not part of the routine operations of patriarchy but rather of a new phrase where patriarchy is no longer stable and requires more force and intimidation, particularly from the state, to maintain it. And the resistance to masculinist

restoration has taken a political form which is the focus of my research. My project explores how the various groups in Egypt that emerged to end public sexual violence during the period of 2010-2015 dealt with masculinities and engaged men based on in depth interviews with 30 staff and volunteers (half women/half men) conducted in 2015-2016 with independent initiatives, non-governmental organizations (NGOs), national and international organizations based in Cairo. More specifically, the findings will explain why men became active participants as staff members and volunteers in anti-sexual harassment campaigns and how some of these groups tried to reconceptualize masculinity in ways that are not traditionalist nor patriarchal.

Unruly Waters. Mobility and Fisheries Development in the Celebes Sea

A small segment of the Western Pacific, the Celebes Sea constitutes today the maritime border between Eastern Indonesia and the Philippines. Despite centuries-old attempts at domesticating the frontier between the two territories, the maritime region remains porous to legal and illegal trespassing of people and goods. In recent years, these liminal waters have been the subject of more forceful discourses and government practices that have tried to curb circulation and economic activities occurring outside of extant legal frameworks, particularly in conjunction with Indonesia's swelling tuna fish economy. Governmental initiatives and industrial plans have been of particular consequence to the communities on both sides of the border. While the hardening of national boundaries had produced ethno-identity shifts in the course of the 20th century, the recent infrastructural developments have also altered in dramatic ways the economic lives and the demographic make-up of the region, especially on the Indonesian side of the Celebes Sea.

The paper aims at underlying the multiple ways in which the historically mobile coastal communities today gravitating around Bitung (Indonesia) navigate the conditions of precarity and illegality issued amidst blueprints of economic development based on fisheries extractivism. It points at the wider socio-economic changes occurring in the region at the core and at the margins of the industrial projects mushrooming in the coastal areas of the southern Celebes Sea and what worldmaking means in their shadow.

Examining the Social Status of the Teaching Profession in Chile from the Visual Rhetoric of Universities

Introduction: This research explores the global dual crisis facing the teaching profession: low social status and declining appeal to new applicants. Using the theory of social status characteristics (Berger and Webster, 2018), the study analyzes social status iconography presented on Chilean universities' websites of elementary teachers programmes. The research focuses on how universities visually construct the teaching profession to appeal to prospective students.

Method: Based on visual analysis of rhetorics, as a context to interpret the presence of social status characteristics found in literature, we analyze a random sample of 48 images that derived from an initial census universe of 78 images anthropomorphics representing teachers that come from the websites of all universities in Chile that have initial teacher educations programmes (35 universities). The code book included iconographic characteristics of social status such as physical appearance, dress, gender, objects of knowledge (disciplinary, technological, etc.) and postural clues, as well as indicators of leadership.

Results. Three main rhetorics emerged from analysis: "Undifferentiated university student," "Student-teacher hands-on," and "Teacher in the classroom role." In this rhetoric we found characteristics of high social status, such as active postures and leadership roles, but mostly neglect key attributes like expertise, mastery of technology, and broader societal impact, which are essential in attracting future candidates to professions.

The study's findings underscore a feminized portrayal of the teaching profession, even today associated with maternal care logics. The absence of more contemporary status characteristics, such as technological proficiency and scientific expertise, is a significant revelation. The discussion points to universities' failure to construct a modern image of the teaching profession that reflects its high level of expertise and transformative societal role. This revelation may contribute to the profession's ongoing struggle with its status and appeal in today's workforce, providing crucial insight for educators, policymakers, and academics.

ROA TAMPE, KARIN* (Universidad de los Andes, Chile, Chile)
Visual and Verbal Rhetoric about Teachers in Chile: An Opera in Two Acts.

This research explores a methodological approach combining visual and verbal rhetoric as investigative resources to analyse teachers' social status in Chile. Traditionally, visual and verbal rhetoric have developed independently in sociology, with minimal interaction. The study proposes a sequential use of both, analysing verbal rhetoric through interviews elicited by images that represent visual rhetoric developed earlier (Danesi 2017). This approach seeks to understand how teachers, from an agency perspective, respond rhetorically to the visual portrayals of their profession, as depicted by universities and the media in virtual environments.

The method we used adopt an abductive approach (Thornberg 2022), considering for initial codification and analysis of visual rhetoric the iconographic characteristics of social status of professions, obtained from empirical literature; but leaving (retaining) open the possibility that these icons may adopt a different configuration inside of verbal rhetoric that Chilean teachers, and open also to listen emergent semiotic clues.

For the visual rhetoric analysis, two image banks were created with a random sample, comprising images of teachers from university websites and virtual media press selected in 2023. A method adapted from Greenwood et al. (2018) was used to analyse images and elaborate 4 visual rhetoric regarding the teaching profession. Eight representative images from these categories were chosen for the next phase.

In the second phase, photo-elicited interviews were conducted, during which teachers selected and ranked images based on preferences or social status clues and legitimacy. They were also asked to explain and reflect on their choices and analyses.

This methodological exercise allows us to propose that visual rhetoric is a valuable tool for photo-elicitation. It activates interpretive frameworks that, once recognised, can reveal their contingent and constructed nature, enabling teachers to develop rhetoric efforts that erode or explains societal consensus, fostering persuasive agency to construct their own sense of legitimacy.

Family, Housing, and Me: How Identity Changes Around Gender and Sexuality Reshape Family Dynamics and Experiences of Housing Stability

Theories about lesbian, gay, bisexual, transgender, and queer (LGBTQ) youth and housing instability often document "coming out" to the family as a one-time event and often focus on parental acceptance or rejection as a singular event as well. However, youth's gender and sexuality can change, and family relations, including experiences of staying housed by family members, are often complex. This project is the first U.S. longitudinal study of LGBTQ youth, housing, and family relations. We followed 83 LGBTQ youth participants for two years with qualitative interviews in summer 2022, 2023, and 2024 that examined changes in gender, sexuality, housing, and family relations. The youth were 16-19 years old at the start of the study, and the youth participants come from either South Texas or the Inland Empire of California – two understudied areas in LGBTQ and housing research. By following the youth for two years, this study shows how housing processes and family dynamics unfold over time, capturing the complex dynamics of gender, sexuality, family support, safety, and housing stability during emerging adulthood. More specifically, we show how many youth changed their sexual and/or gender identity over this study's two-year period. Furthermore, these gender and sexual identity changes often reshaped family dynamics and experiences of housing. For instance, when one youth moved back home after a breakup, they changed their sexuality from gay to bisexual to appease their parents and to ease tensions at home. Additionally, youth who changed their gender identity during the study often did not disclose this change to parents, as youth did not want to risk losing the housing support that family members provided. Ultimately, qualitative longitudinal work is necessary to capture and understand the actual complexities of youth's lives, including their dynamic experiences of gender, sexuality, housing, and the family.

Exploring Teamwork As a Tool for Knowing, Healing and Responding to Critical Incidents in Higher Education

Process-oriented teamwork pedagogy has received significant attention in the scholarship of teaching and learning. Its known benefits include increased engagement, cognitive development, belonging, welfare and motivation to learn. However, there is limited research on how students respond to critical incidents –such as triggering topics, social injustice or oppression –in team settings. Hence, we redesigned a university course around team-based and critical pedagogic principles to examine how group members influence students' perception and response to self-identified social problems. The results in this paper are based on qualitative formative feedback from students (n=339) across three academic terms. In alignment with Mezirow's transformative learning framework, we found that teamwork sparked realization and awareness, critical reflection, healing, increased self-beliefs and agency. However, students also reported fear, opposition, reticence and discomfort with teamwork, which caused them to devalue the impact of collaboration. We therefore recommend strategies to help educators improve team work in classrooms, and respond to students' fear and opposition.

Toward a Decolonial Pedagogy for the Global South: Reflections from a Caribbean Perspective

Educators in the global South are being overwhelmed by perspectives of decolonized pedagogy from the Global North (Dei, 2022). A global systematic review of decolonized pedagogy has found disproportionately little representation from the global South and none from the Caribbean (Shahjahan et al., 2022), despite them being strong producers of postcolonial knowledge, discourse and theory. This is threatening to reproduce the marginality, subjugation and epistemological violence from colonization that countries in the global South have and continue to experience. Given the relevance of decolonized pedagogy to the development of the global South, this raises critical questions about whose knowledge counts, and what are the implications for the development of the subaltern, marginalized and excluded. In response, this paper highlights how geographies constitute and are constituted by decolonial praxis. Further, grounded in an autobiographical account of my educational experiences and drawing on the Caribbean's history and political geography, I propose strategies toward a decolonial global South pedagogy centered around: (a) resisting subalternity and domination; (b) amplifying local knowledge and relevance to local context, (c) the pursuit of global justice and development; (d) an emphasis on relationality, humanity, unity and love. Finally, I evaluate the possibilities and challenges of reimagining higher education for development and transformative outcomes in the global South. I also offer suggestions and questions for advancing a vision for a decolonial global South educational futurity.

Trasformers for Social Network Analysis in Social Sciences. the Case of the Ecological Transition and Climate Change Denialism in Spain.

The analysis of online public debate processes has become a central axis for applied research in social sciences. The possibility of studying digitally mediated public opinion with data science tools and social network analysis can be a step forward for sociological research. However, it also represents a test bed for new AI computational tools such as Transformers.

This work presents some technical keys to improve our understanding of how we apply AI to social research. Additionally, and as an applied example,

the results of the application of this type of techniques to a central public debate process in today's societies are summarized; how citizens perceive the process of climate change and how certain groups position themselves against the existence of the change itself, as well as against public policies promoted to reduce the effect of economic and industrial development on the environment.

We show the structure of this debate on X, Facebook, and Instagram during two waves of downloads (one coinciding with the dates of the world summit against climate change and the other at a time without events of such relevance), focusing on the affective disposition (sentiment analysis) of the participants, the main topics discussed and identifying the denialist discourses.

Militancy of the Soul: A Biographical Approach to Former Revolutionaries Turned Spirituality

This proposal stems from my doctoral thesis research, which explores the life stories of former communist militants from the late Francoist period who later embraced a spiritual path. My presentation seeks to provide sociological insights drawn from these biographical trajectories.

The testimonies of my informants hold particular value because of the exuberance of cultural proposals that characterised the 1970s, coupled with the moment of political transition and the end of the dictatorship in Spain. However, my research does not aim to contribute to the existing mythification of that generation, but rather to assess the extent to which personal involvement - first political and then spiritual - emerges as a consequence, as well as a symptom, of the evolution of collective expectations in the contemporary society.

In a plural world, Peter Berger's concept of 'alternations' - as a secular variant of traditional conversions, which resonate with the religions of the Book or revealed religions - invites us to rethink the cases studied within a complex symbolic landscape, marked by a shared utopian vision and a countercultural stance toward society. Without wanting to identify a single cause to explain the spiritual drift of my informants, we can recognise strategies of maintaining a sense of 'authenticity' and a commitment that have changed register to keep pace with a world that has been transformed in a direction that has not always met the expectations they had in their revolutionary past.

Intersections between Traditionality, Territoriality and Reterritorialization in Urban Fishing Communities: A Study of the Bode Community (Recife - Brazil)

This research focuses on the intersections between traditionality, territoriality and reterritorialization in urban fishing communities, with a focus on the Bode Community (Recife - Brazil). Starting from the premise that the fishing territory in Brazilian cities is projected in a *continuum* between traditionality and modernity, we investigate how everyday practices are guided by logics that constantly reconfigure their territorialities. The community, located on the urban-oceanic interface, faces challenges arising from urbanization that casts its territory as a "non-place", corresponding to the city's mangroves, being constantly the target of deterritorializing processes, which include the removal of residents, a lack of incentives for traditional activities and a prohibition on access to the surrounding mangroves. In the meantime, the refusal of local individuals to continue developing traditional activities, entering the city's commercial and service sectors, confronts the fact that there are parallel internal movements that seek to maintain traditional practices and territorial connections. Thus, many other individuals act politically by claiming their territory as a "traditional fishing community", as a form of resistance to these pressures. We argue that the claim to traditionality represents a form of reterritorialization, as described by the Brazilian geographer Rogério Haesbaert, revealing ontological conflicts within the group. Projecting the discussion beyond modern epistemologies, based on the contribution of authors such as Arturo Escobar, Marisol de la Cadena and the Brazilian philosopher Ailton Krenak, we seek to understand the ontological nuances of the community members and how, based on these worldviews, they negotiate their identities and practices. The study thus highlights the importance of incorporating these voices and knowledge into debates on new urban territorialities, recognizing the territories from their intrinsic condition of transitional land-sea.

The Evolutionary Masks of Love: Continuities between Judeo-Christian Religious Love and Modern Secular Love. a Sociological Genealogy

The aim of this proposal is to make a sociological approach to the evolution of love, establishing a series of links between some of the main religious the formulas that arise in axial Judaism and Christianity, and the romantic and confluent love, characteristic of modern societies. To carry it out, firstly, we analyze love in historical axial Judaism, reflection on the Ahab Ahavah formula, the predominant one in this new religious scenario. Secondly, to study the Christian drift of love, we first analyze how the emergence of this new religious faith (Christianity) provokes a change in the Jewish way of understanding it (love). Subsequently, we analyze some of the three main formulas in which love materializes in Christianity: Agape, Caritas and Amor Sui. Regarding modern love, we first carry out a contextualization focused on the processes of secularization and individualization, and their impact on it. Afterwards, we present the main features that define both romantic and confluent love, and finally, we analyze the Judeo-Christian characters inherited for such types of love. The methodology used focused on the literature review and theoretical reflection based on this review. The research carried out allows us to establish sociological continuities between Judeo-Christian religious love and modern secular love in the terms used throughout the paper.

WG08-906.3

ROCHE CARCEL, JUAN A.* (Universidad de Alicante, Spain)

World War I As a Cause of Ephemeral Hope in the Artistic Avant-Gardes

The proposal shows, first, how Sociology has approached the concepts of "Hope" and "War". Second, the paper analyzes how and why avant-garde artists understood the First World War as a motif of utopian hope to annihilate a civilization in crisis and to transform it through its aesthetic formalization. Thirdly, the proposal tries to find out whether that hope was preserved over time or, on the contrary, was soon dissolved as a result of the drama of the events.

It is shown here that the savagery of the fighting dissolved all European values of modernity and progress, including artistic ones. In fact, theoretical and stylistic conceptions, aesthetic categories, ethical postulates, and artists' aspirations for conscience to rule the world were blurred. For the artistic avant-garde, utopian promises of a better world broke down. Consequently, this obliges sociologists to pay more attention to both phenomena - that of the war and that of the avant-garde - and to seek a more objective and critical interpretation of modernity, calling for its actualization, and of Sociology itself.

RODRIGUEZ, SARA* (Birkbeck, University of London, United Kingdom)

Wembley Park: Belonging and Community in Purpose-Built Mixed-Tenure Housing

In an era of third-way governance, private housing developers are increasingly tasked with the construction of core social and community services. Contracts between representatives and developers frequently stipulate the delivery of key social impact indicators, such as health services, educational institutions, green spaces, and community centres. Amenities previously provided by state agencies are now outsourced to developers, and in certain cases, these same developers continue on as managers - directly or indirectly - exercising control over services types and terms of access. Where developers' interests shape the provision of services, barriers to social engagement can arise, calling into question how and for whom social goods are provided.

This presentation will consider the presence and absence of social engagement in the neighbourhood of Wembley Park, London. Wembley Park is the UK's largest mixed-tenure, build-to-rent housing development. To date, a single firm is responsible for the majority of the area's land development, including management of the local community centre, cultural and social amenities, as well as providing the majority of housing. Adopting a Lefebvrian positionality, the aim of this presentation is to identify patterns of amenity and service provision by interrogating systematic and systemic barriers to social engagement, including between insiders (those with access to 'club goods') and outsiders (existing community members and non-residents). Access conditions, whether physical or technological, are shown to at best hinder

and at worst prohibit community organisation and involvement. In turn, by conspicuous absence, developer-directed engagement illuminates the disjunction between the agenda of planners and developers and the nuanced needs of everyday communities. This research will provide an overview of the Wembley Park redevelopment project and present findings from interviews with local residents, business owners, and government representatives.

RODRIGUEZ ANAIZ, PAULINA* (University of Oxford, United Kingdom)

Exclusionary Inclusion: Cultural Repertoires and Equity Categories in Elite Universities

This paper examines how staff and students at an elite university in Latin America draw on cultural resources to make sense of widening participation (WP) efforts and their implications. Specifically, it asks: How do institutional actors at elite universities understand WP initiatives, and what are the consequences of these understandings for students admitted through these programmes? Common portrayals of institutional actors in elite settings suggest they are ideologically unified in their efforts to maintain status and exclusion, often overlooking heterarchies of value and the differential power actors have to shape institutional practices. While cultural sociologists acknowledge multiple grammars of worth and their links to (e)valuative processes, much of the focus has been on outcomes—identifying winners and losers of these processes. This article addresses these gaps by staying close to the multiplicity of evaluative criteria within WP initiatives and the equity categories that stem from them.

Drawing on interviews and observational data, the study reveals how different cultural repertoires of merit and prestige coexist with those of inclusion and diversity. Results illustrate the cultural meaning that emerges—'talent and inclusion'—is enshrined in equity that produces open-ended and ambiguous outcomes. While the WP programme has expanded the understanding of talent and who belongs in elite education, it has also introduced hierarchical classifications where equity categories are imbued with ordinal value, particularly around meritocratic boundaries. This has significant implications for how WP students are perceived and how they understand their own place within the institution. Importantly, this locally produced classification system can lead to 'exclusionary inclusion', undermining the recognition and status of low-income students. The paper underscores the importance of engaging with institutional contradictions, as they reveal how inclusion and exclusion coexist. By paying attention to the cultural foundations of inequality, more equitable repertoires for future admissions processes can be developed.

Hate Speech in University Environments: The Use of Social Media

Hate speech in university environments is an escalating issue that significantly harms coexistence, psychological well-being, and freedom of expression within educational institutions. These settings, which should foster respect, diversity, and critical thinking, are increasingly witnessing acts of intolerance and verbal abuse directed at vulnerable groups based on gender, ethnicity, religion, sexual orientation, or political beliefs. This paper delves into the root causes, manifestations, and consequences of hate speech in universities, emphasizing how social media and political polarization intensify these behaviors. Additionally, the study examines institutional responses, both preventive and corrective, as well as the pressing need for inclusive educational policies that cultivate an atmosphere of respect and constructive dialogue. The findings highlight the importance of strengthening awareness programs and offering robust support to victims in order to mitigate the damaging effects of hate speech on university life.

An Intersectional Analysis of the Justification of Differential Rights in Women's Access to Paid Work in the World Values Survey and the European Values Study (2021)

In this paper we present the results of an analytical framework of intercategorical intersectional analysis with the aim of investigating the underlying factors (gender, age, educational level and economic status) that influence the justification of differential rights in women's access to paid work. For our analysis, we used the joint dataset EVS/WVS 2017-2022 (EVS/WVS, 2021) and the question "Do you strongly agree, agree, disagree or strongly disagree? v81. When jobs are scarce, men have more right to a job than women". The original sample included 153,595 participants (70,696 men -46.03% and 82,899 women -53.97%) from 88 different countries. After selecting only valid cases for all analysis variables, the sample size was reduced to 139,301 subjects, including 64,595 men (46.4%) and 74,705 women (53.6%).

We conducted an intersectional analysis to examine both the role of the variables as main factors and their interactions in order to explain the influence of socio-demographic factors on the differences in the justification of the right to access to work between men and women. The results indicate that the highest risk of justification was found for the strata of men with low-middle income and low education, followed by the stratum of women aged 30-49 with low-middle income and low education. The differences in the justification of the prevalence of the right to work in relation to the social class to which one belongs vary between the different countries studied. Encouraging men, and especially women, to achieve a high level of education is the best strategy to ensure that women's equal right to access to paid work is not called into question.

A Machine Learning and Life-Course Approach to Protecting Student Trajectories

Chronic absenteeism, grade repetition, and school dropout represent significant risks for students' lives and academic paths, both in the medium and long term. These events often trigger adverse effects on socioemotional well-being, limit access to higher education opportunities, and delay labor market insertion, affecting economic stability and mental health in adulthood.

Therefore, any education system should try to estimate the risk students have to interrupt their trajectory to protect them from interruption. Exploiting the vast potential of administrative data from school systems and current advanced data science tools and machine learning techniques, we propose developing a **Risk of Trajectory Disruption Index (RTDI)**, which estimates the probability of occurrence of any of these disruptive events for each student in the school system: Chronic absenteeism, grade repetition, and school dropout.

To create the RTDI, we train machine learning algorithms (specifically, a gradient boost forest model) with individual trajectories of students created using the data available from the General Student Information System (SIGE) in Chile. Each trajectory considers 73 academic and demographic variables created from a longitudinal analysis of each student trajectory.

By estimating individual risk based on their life course and using students' geolocation, we made visualizations that identify neighborhoods where a higher risk of students suffering trajectories' interruption concentrates. This is of utmost importance, given that in the Chilean educational system, each family can choose the school without restrictions as to where they live, and the challenge for decision-makers is taking action at the local level when students leave school. Another application uses the RTDI along with model calibration techniques to estimate the effect of each school in protecting the student trajectories to identify schools that need additional support or learn from them for replicating and scaling up actions for protecting trajectories.

Using Machine Learning to Estimate the School Effect on Student Trajectory Protection to Support Data-Driven Decision-Making

Turning points in students' educational trajectories are crucial moments that can significantly impact their academic and life paths. Some of these turning points are chronic absenteeism, grade retention, and school dropout, which significantly affect students' academic and socio-emotional outcomes, e.g., in educational achievement, stigma, decreased self-esteem, increased likelihood of suicide, antisocial behaviors, and detrimental effects on future economic stability and health. Therefore, there is a need for mechanisms to protect students' trajectories at the school level.

However, one of the underlying difficulties is assessing how well individual schools protect students' trajectories to determine the support they need. To this end, we propose a machine-learning model that predicts trajectory interruption for a given year based on students' characteristics.

The model is calibrated so that the estimated probability corresponds to the actual incidence of the phenomenon. The calibration allows us to interpret the results at the school level in terms of the proportion of students who interrupt their trajectories each year to compare them with the actual results. We correct this difference by the general error of the model and express it in terms of the percentage of the predicted students suffering from trajectory disruption, determining which schools perform better (or worse) than expected, creating a School Trajectories Protection Index (STPI).

Using the STPI, we identify differences at different levels (e.g., gender, nationality, grade, administrative dependence, and socioeconomic level) and their evolution on time that we make available in an interactive visualization tool that allows us to identify territories where educational trajectories are less protected, and need support and (or) intervention by authorities. Also, identifying schools with better protection than expected (especially on differences before and after the COVID-19 pandemic) is a case study to learn from their practices through qualitative studies and encourage collaboration network development for school improvement.

RODRÍGUEZ-MUÑIZ, MICHAEL* (University of California, Berkeley, USA)

"Our Struggle from within": Theorizing the Diasporic Anticolonialism of the Movimiento De Liberación Nacional, 1977-1992

In recent years, a cadre of historians and sociologists have worked to unearth marginalized histories of U.S.-based radicalism. Here, I focus on a largely forgotten anticolonial project, the Movimiento de Liberación Nacional (MLN). Part of what has been called the "hidden 1970s," the MLN was founded as a response to intense repression against alleged militants and supporters of the Fuerzas Armadas de Liberación Nacional, an armed clandestine organization formed in the Puerto Rican diaspora that carried out over 100 bombings across the United States and Puerto Rico. In many respects, the MLN shared important features with other radical movements that emerged during this period, particularly those rooted in colonized and minoritized communities. However, unlike most of its contemporaries (e.g., Black Liberation Army, the American Indian Movement, and the Young Lords), the MLN's primary focus was not a single struggle or community. Rather, it brought together, in an unprecedented fashion, Chicano activists seeking the socialist reunification of the U.S. Southwest with Mexico and Puerto Rican activists fighting for Puerto Rican independence and socialism. Drawing on oral history interviews and archival records, I document and analyze the political formation and intellectual foundations of the MLN, paying close attention to the ways its diasporic positionality shaped its particular fusion of insurgent nationalism, internationalism, and Marxist-Leninism. I argue that this political project elaborated a form of "diasporic anticolonialism" that complicates reigning theorizations of the anticolonial.

Access to Justice in Times of Crisis: Experiences from Family Proceedings during the COVID-19 Pandemic in Switzerland

The COVID-19 pandemic, which put pressure on the entire justice system in Switzerland as elsewhere, has drastically and critically complicated access to justice. In family law, separating and divorcing individuals with minor children who were already in an unstable situation experienced increased material and emotional vulnerability.

To avoid delays and deal with emergencies, the Swiss government opened up the use of remote hearings in civil cases, as it was the case in other countries. While digital justice has several advantages (e.g. speed, cost reduction), it also raises several practical and ethical concerns (e.g. technology, confidentiality). Given the federal organisation of the Swiss justice system, the use of remote hearings and the associated social distancing measures have been uneven across the different cantonal civil courts, leading to an inequality in access to justice.

This interdisciplinary project entitled "*The practice of family law during the COVID-19 pandemic: digital justice and gender inequalities*" aims to investigate the practices and challenges associated with the shift to digital justice during the COVID-19 pandemic in family proceedings in Switzerland, with a focus on separations and divorces. It consists of a legal text study of the changes in Switzerland with an international comparison (1), coupled with a qualitative study of three case studies of court practices (2) and a quantitative survey of family judges and lawyers (3). Based on these three types of data, this presentation focuses on professionals' practices to understand how they have contributed to mitigating/increasing/decreasing gender and social inequalities in access to justice during a major crisis.

Enacting Citizenship through Radical (Self-)Care: How Migrant Campaigners in London Assert Their Rightful Presence

When migrants are denied legal citizenship, scholarship sees participation in political life as an alternative way to claim citizenship. This paper argues that migrant campaigners' practices of radical self-care could be interpreted as a form of claiming citizenship as self-care asserts their rightful presence.

Based on 14 in-depth interviews with migrant campaigners in London and participant observation in the two migrants' rights groups they organise with, this paper looks at how campaigners with experience of precarious immigration status assert their political subjectivity within and beyond professional campaigns.

For some participants of this study, professional organising offers a space to use their own story to address structural issues whilst simultaneously drawing on professional organisers' knowledge of the 'system'. In line with existing scholarship, this shows that professional organising spaces can offer an opportunity for migrant campaigners to claim citizenship.

However, this study also demonstrates that particularly for those continuing to experience precarious immigration status, self-care as a politics of survival is a more accessible form of political participation. In a context where their presence is put into question through denial of legal status and their existence is being precarified through exclusion from state support, I interpret migrants' self-care practices as an act of claiming citizenship. This citizenship act, however, tends to go unrecognised in professionalised campaigning spaces. In order to involve migrant campaigners more equitably in professionalised campaigning spaces, self-care should be recognised as a citizenship claim.

Artist As a Member of an ART Group. the Oneiron Group's Journey through Communist Poland

The aim of this paper is to present the activities of the ONEIRON art group, which were conducted during the period when Poland was under the influence of the Soviet Union. At that time, the country was designated the Polish People's Republic (PRL). The group, which combined various fields of art, served as a significant point of reference for artists seeking a shared intellectual and artistic space for the creation of works and for the realization of the postulate for self-education. This was a period during which Poland was neither a sovereign country nor fully open to the world, particularly to countries outside the Eastern Bloc. In the context of restrictions and censorship, ONEIRON artists employed collaboration as a means of transcending barriers, providing a refuge for the realization of their creative and intellectual needs. However, working in a group is also associated with a number of tensions, which, from the perspective of sociological analysis, represents an intriguing case study in the interplay between individual and group identities, both in human and artistic terms. Moreover, when the group operates within a specific political or social context, these processes are also evident in the group's attitude towards the surrounding reality. This presentation will demonstrate how the relations between the artists in this group were shaped, what their worldview and artistic attitudes were, and what individual and group priorities emerged as a consequence. To facilitate a sociological analysis, in-depth interviews (IDI) were conducted with living members of the group and their families. In order to conceptualization the findings, reference was made to Charles H. Cooley's notion of the primary group (Cooley 1909), collective action in the art world (Becker 1974), and the role of habitus (Bourdieu 2001).

Epistemic Objects and Creative Collaboration: Unraveling Distributed Knowledge in Architectural Education

This study, part of the DIGART project, investigates the creative processes in architectural education through a multimodal analysis based on *photoelicitation*, video recordings of project presentations, and in-depth interviews with professors, associate professors, professional architects, and their students. The ethnographic approach reveals how creative innovation emerges from distributed knowledge (Goodwin, 1994; Lozares, 2007; Muntanyola-Saura, 2014), where these actors coordinate actions at key moments in the creative process. By analyzing epistemic objects and the use of technology, the study uncovers the "black box" of creation—conceptualization, execution, and evaluation phases.

The research draws on Kirsh's (2007) concept of "intelligent use of space," observing how architecture students employ objects and space as cognitive tools to project their artistic intentions and develop creative processes. These interactions, combined with insights from in-depth interviews, are crucial to understanding collective knowledge production and epistemic protocols (Knorr-Cetina, 1999) in this context.

The study provides real-time analysis of distributed cognition in artistic education, focusing on memory, attention, and motivation. Additionally, incorporating a gender perspective, it examines the verbalization, timing, and modes of interaction during the creative process, highlighting differences arising from the use of digital technologies.

The results offer a deeper understanding of the stages of creation in architecture compared to other fields, such as film editing or photography, where significant changes occur earlier in the conceptualization phase.

This research contributes to discussions on artistic knowledge paradigms and creative production in educational settings, providing novel insights into the interaction between humans and technology in collaborative processes.

Qui Trompe-t-on? Family and State in the Brazilian Political Process

The rise of contemporary right-wing movements has been followed by dramatic political conflicts in Brazil. Clashes within families are among the most severe. They display a surprisingly varied morphology, ranging from avoidance and rupture of social relations, well into open threats and violence. Their underlying motivations are not any less diverse, including economic interest, political loyalty, and libidinal aspects. This presentation elaborates on results from preliminary interviews on this subject, carried mostly in São Paulo, in preparation for my current research. It draws on the material available to me to advance a particular conjecture on alienation: namely, that subsumption under a social power (as it presents itself here) must be conceived, not as immediate, one-sided estrangement, but as a twofold exchange of social forms. This is illustrated by a selection of instances in which the contradictions between the form and content of political conflicts among kin become apparent – such that politics appear as the form of kinship strife, but also kinship relations as the form of political strife, according to the case. A corresponding phenomenology is sketched, reporting particular affections to those underlying discrepancies, and leading to a final outline on the form of alienation at stake here – in the relation between families, as they are for the state or as moments of the political process, and the state, as it is for families or as a moment of family life.

ROMANETTO, MATHEUS* (University of Kansas, Brazil)

What Is an Object, or: A Critical Theory of What?

This presentation argues that a new conception of the object of critique is a condition of possibility for contemporary Critical Theory. Earlier Critical Theories granted the unity of their object by considering them under particular conceptions of history, society, and logic. The unity of these premises enabled first-generation theorists their methodological pluralism, which in turn allowed posing the object of critical theory as a constellational one – a complex of inexhaustible aspects, or *open unity*. Working within and against a disciplinary division of scientific labor, this generation conceived of their task as an "interdisciplinary" materialism, grasping the object as singularity in the horizon of generality. Habermas' approach engendered a different form of unity: it segmented objects according to their inner spheres of legality, posing them as related, albeit *closed unities* – particularities in the horizon of generality. Today's prevailing division of labor poses the objects of critique as *closed multiplicities*. They are treated as the material for particular "studies", whose unity is secured, either by the immediate categories they belong to, with a corresponding multiplicity of possible points of view (feminism, queer studies etc.) – or by the point of view under which they are considered, with their corresponding partialization as objects (post-colonial theory, new materialisms etc.). Thus conceived, they appear as singularities in the horizon of particularity, corresponding to today's prevailing forms of political mobilization. I suggest that a contemporary Critical Theory is contingent on the elucidation of the *forms of historical determinacy* characteristic for our time. This suggests posing the object as *open multiplicity*, or generality in the horizon of particularity. A critique thus conceived starts from the forms of concretion immanent to the contemporary historical process, and searches for objects as its complexities – that is, as strategic, albeit finite points of condensation of the social process.

BARBERA, FILIPPO* (University of Turin, Italy)

Unlocking Innovation: Overcoming Challenges and Harnessing Enablers in Agri-Food Systems

The NextGenerationEU investment plan in Italy allocates significant funding for research to foster innovations such as digital agriculture, cellular and gene technologies, and resource recycling within a circular economy. However, the adoption of these technologies by producers and consumers faces social and psychological barriers. Producers often perceive them as costly, both financially and in practical terms. This study explores the challenges Italian farmers encounter when adopting new technologies. We surveyed 684 producers of both permanent and non-permanent crops in Italy. Such surveys are rare, as the National Statistics Bureau (ISTAT) provides census data on farmers but does not examine innovation barriers or enabling factors. While an EU-wide survey addresses innovation barriers in corporations, it excludes farmers, who are often overlooked in innovation studies, particularly in Italy.

Our survey addresses this gap by providing an integrated approach to

innovation and food systems research. We gathered data on innovations adopted by farmers over the past three years, as well as their knowledge, adoption (or adoption intent), perceptions, and diffusion within farmers' networks for technologies such as digital agriculture, wastewater reuse, enhanced efficiency fertilizers, nanotechnologies, and blockchain technology.

We found a low correlation (pworth 0.4) between the total innovations adopted for sustainability and the new technologies studied. Adoption rates are generally low: 34% of farmers in our sample use enhanced efficiency fertilizers, 16% use digital agriculture, and fewer than 10% have adopted other technologies. Consistent with Diffusion of Innovation theory, membership in farmers' associations predicts higher innovation adoption, especially among smaller farms (interaction effect). Social factors, such as association membership and knowing other farmers who have adopted these technologies, also are strong predictors of adoption of the new technologies studied. In line with the UTAUT model, other key predictors include knowledge and perceptions of technology efficiency, while the main barrier remains cost.

ROMANOVICH, NELLY* (The Russian Presidential Academy of National Economy and Public Administration (RANEPA), Russian Federation)

Blogger – Is It a New Profession or a Hobby?

A blogger today is a specialist who creates a blog and publishes content on the Internet in order to attract the audience attention. Nevertheless, the results of sociological surveys show that this new type of activity remains unknown to the part of population despite its popularity. The author compares the materials of the All-Russian survey with the survey results obtained by the author in the city of Voronezh in January 2024 which was intended to identify the bloggers audience size among various socio-demographic groups. According to the survey results it turns out that the largest bloggers audience is among young people.

Public opinion is ambiguous about the information in Internet blogs, since plenty of people believe that you can find both truth and lies in equal proportions there. However, not everyone can distinguish truth from falsehood, so the question arises about the possibility and necessity of blogging state regulation. The population majority is in favor of the government regulation of individual blocks content on certain topics, especially those related to national security. But there are also the opposite opinion supporters, so this topic is debatable.

Blogging can be just a hobby or it can turn into a profession. A blogger's job is about publishing content and communicating with subscribers. The income of bloggers registered as freelancers can reach high level depending on the number of views and subscribers on their channels. If this is a profession, then one of the questions that determines its prestige if one would like to see their own children or grandchildren involved in this type of activity. As a result, the author emphasizes the problematic nature of blogging activity, which has ceased to be just a hobby, but has not yet become a profession.

ROMANOWICZ, *ANNA* (Jagiellonian University in Krakow, Poland)

Between Development and Survival: Climate Change Attitudes and Class Location

On the one hand, it is well established that extreme weather conditions and other consequences of climate change disproportionately affect people in the Global South. On the other hand, these same people are caught between the need to prevent the worst outcomes of climate change are considered to be in need for socio-economic development, which unfortunately exacerbates carbon dioxide emissions. This is particularly acute in Mumbai, a low-lying metropolis where yearly floods and changing weather patterns serve as daily reminders of climate change. Mumbai is also highly congested; its limited land area and abundant job opportunities attract migrants from across India. To address these challenges, mega transportation infrastructure projects, such as the sea link and metro systems, have been proposed and implemented.

The author - based on discourse analysis and preliminary ethnographic fieldwork in Mumbai - analyses conflicting attitudes and beliefs toward climate change (protecting the natural environment versus prioritizing infrastructure and other investments). She argues that these beliefs and attitudes correspond to different positions within the class structure within the Indian urban middle class. In other words, different fractions of middle class perceive climate change and the ways to tackle its impact differently. Unexpectedly, these differences serve to reproduce inequalities - within the middle class itself and beyond.

ROMERO, PRISCILA WALQUIRIA* (RC05 Racism, Nationalism, Indigeneity and Ethnicity, Argentina)

Nuevas Formas De Racismo y Discriminación Racial: Un Análisis Teórico

El racismo contemporáneo ha adoptado formas más sutiles y complejas que los modelos explícitos de discriminación racial que predominaban en siglos pasados. Este trabajo analiza teóricamente cómo las nuevas formas de racismo se han reconfigurado en las sociedades actuales, especialmente a través de mecanismos estructurales e institucionales. Partiendo de enfoques decoloniales y críticos, se argumenta que, en lugar de desaparecer, el racismo ha mutado en expresiones que operan de manera velada y que se normalizan en las dinámicas sociales, políticas y económicas.

Una de las claves de este proceso es el concepto de **racismo estructural**, el cual se manifiesta en la reproducción de desigualdades a través de instituciones que aparentemente operan de manera neutral. Ejemplos de ello incluyen la segregación socio-espacial, las disparidades en el acceso a recursos como la salud y la educación, y la discriminación en el mercado laboral. Además, el análisis se enfoca en el **racismo cultural**, que se expresa mediante la naturalización de estereotipos y prejuicios étnicos a través de la cultura y los medios de comunicación, consolidando una jerarquización étnico-racial en la conciencia colectiva.

Asimismo, se revisa el impacto de la **xenofobia racializada**, fenómeno que ha cobrado fuerza en un contexto de migraciones masivas, donde ciertos grupos étnicos son construidos como "amenazas" a la identidad nacional. Finalmente, el estudio explora la noción de **discriminación racial simbólica**, un tipo de exclusión que opera a través del lenguaje y las representaciones sociales, consolidando desigualdades raciales sin recurrir a la violencia explícita. Este marco teórico permite comprender cómo las formas contemporáneas de racismo continúan reproduciendo estructuras de poder racializadas bajo nuevas lógicas discursivas y materiales, que son menos visibles pero igualmente perniciosas.

RUIZ FLORES, JUAN (Universidad Tecnológica Metropolitana, Chile)

Decolonizing South – South Migration in Santiago De Chile: The Role of Images in the Experience of Dwelling the City.

Chile has tripled the number of migrants entering the country in recent years, becoming a main destination for migrants seeking to improve their living conditions. This increase involves not only a larger migrant population living in the country, but also challenges for the dynamics of the cities and living conditions of the people. At the same time, migrants are regarded in the public debate as the main source of violence and organized crime rising. Thus, the urgency to engage with "the Colonial" permeating the contemporary world is especially relevant today. We explore how the colonial past and the post- and neo-colonial present shape contemporary migrations. This research studies South-South migration in Chile, from a problematization focused on the ways that South Americans migrants experience their process in Santiago de Chile, to analyse the process of bordering they construct between their home country and the host communities. Throughout visual narrative analysis and crossing disciplinary boundaries we focus on how migrants imagine their past and future mobility, and the ways in which these processes draw a line of knowledge production embedded in the coloniality of power. One way of thinking decolonial is consider migrants no longer as an object overwhelmed by structural decisions that make them a subaltern subject and rather subject aware of the implications that may arise from the relationships established at destination, as well as the conditions in which the labour demands are inscribed in the place of arrival. Therefore, the definition of migrant is constructed by integrating the variety of experiences that make sense. In turn, the landscape is much more than a particular image, it is full of meanings where the emotional is articulated as an element that guides and orients the construction of such landscapes, according to their lived experiences.

ROMERO-LANKAO, PATRICIA* (University of Toronto, Canada)

Creating a Cerc Network for Equity in Sustainability Transitions

While climate change impacts the quality of life and economic prosperity of societies across divides of race, gender, and class, it disproportionately affects those least responsible for its causes and least able to cope with its consequences. Cities are central to the sustainability transitions needed to respond to climate change. Still, local authorities' pervasively technocentric transition approaches fail to consider the lived experiences of their residents, particularly in underserved and vulnerable neighbourhoods. In this presentation, I will introduce the CERC Network for Equity in Sustainability Transitions (CERC NEST). The CERC NEST seeks to find ways to bridge the gap between climate and sustainability imperatives and communities' and individuals' values, priorities and aspirations by developing knowledge co-production methodologies, focusing on the concerns of communities and city actors and using creative strategies to address these concerns. Our attempts to achieve ambitious climate and sustainability goals will likely succeed. Using a transdisciplinary, equity, and comparative approach, we will seek to operationalize three equity-centred objectives: 1) enable communities' self-determination and full participation in decision-making about programs, investments, services, technology, and practices (procedural justice); 2) understand and redress inequities in regulations and practices related to investment, lending, planning, and energy technological innovations (ETIs), such as heat pumps, rooftop solar, and electric vehicles (recognition justice); and (3) analyze how addressing (1) and (2) can foster equity in access to benefits and protection from harm (distributional justice). Context specificity is a common tenet of scholarship; problems and solutions within or across neighbourhoods differ across cities. We will explore how to enhance our capacity to overcome patterns of exclusion and unequal distribution of benefits and harms. We will also examine how we can scale or go beyond a neighbourhood or a pilot to achieve broader social and intellectual impact at multiple levels.

SHARMA, PREETIKA (University of Toronto, Canada)

Equity and Justice in City Climate Initiatives - Insights from Toronto, Mexico City and Los Angeles

Climate actions such as regulations, mitigation targets and social and technological innovations that foster equity and justice in sustainability transitions are receiving growing attention. Cities are leading the way. For example, Toronto adopted strategies to reduce community-wide emissions to net zero by 2040 and to navigate climate change and chronic stresses. Los Angeles plans a net-zero grid by 2035 and net-zero transportation, buildings, waste, and wasted water by 2050. While Mexico City lacks net-zero targets, it has a long tradition of localizing climate action, most recently as part of its solar, mobility and disaster risk programs. However, actions can (re)create pre-existing inequities in participation (procedural injustices) and the distribution of benefits and harm (distributional injustices) if they don't redress past and current inequitable structures and legacies (recognition injustices). We present results from a comprehensive review examining how equity is integrated into city climate policies and initiatives; in particular, what equity and justice in sustainability transitions means by governmental and non-governmental actors in the cities of Toronto, Los Angeles and Mexico City; how it works (or doesn't) on the ground, and how it relates to equity and justice. Since equity, justice, and sustainability transitions are often subject to incompatible approaches, this review will map a wide array of theoretical frameworks, understandings, theories of change, tools, and empirical data that are very diverse.

ROMERO-PORTILLO, DANIEL* (Universidad Pablo de Olavide, Spain)

ORTIZ BARQUERO, PABLO (Universidad Pablo de Olavide, Spain)

The Unproud. Political Representation and the LGBTQ+ Backlash

This study analyses the relationship between public opinion and political representation of LGBTQ+ people in democratic societies from 1980 to 2022. Despite advances in LGBTQ+ rights and visibility, there has also been an increase in violent reactions and hate speech. This reflects tensions in public opinion, as progress in LGBTQ+ rights generates resistance in some social sectors that promote hate speech or perceive these rights as threats. The study

seeks to understand how the presence of LGBTQ+ political representatives (descriptive representation) and pro-LGBTQ+ laws and policies (substantive representation) influence perceptions of sexual diversity.

Using data from over 50 democracies from various sources (WVS, QueerPolitics, Equaldex, CSES, ParlGov) the relationship between public opinion and LGBTQ+ representation is examined. The analysis uses a regression model with cross-lagged variables to explore causalities between LGBTQ+ representation and reactions against it. In addition, variables such as traditionalism, religiosity and the influence of radical right-wing political parties are incorporated.

The results reveal that views towards LGBTQ+ people influence political representation, not the other way around. These views are conditioned by traditional conceptions of roles and resource distribution. The anti-LGBTQ+ backlash shares characteristics with other traditionalist backlashes, but has particularities. Although in hostile contexts the number of LGBTQ+ representatives increase, legislative progress depends on the relative increase of these representatives, not only on their absolute number. Pro-LGBTQ+ movements achieve progress through awareness-raising, lobbying and mobilisation of demands, which drives legislative change and improves the acceptance of sexual diversity in public opinion. Finally, these results are useful both for improving our understanding of the democratic process and the non-linear development of progress and social inclusion, and for identifying more effectively how to mitigate rejection and aversion towards LGBTQ people and the recognition of their rights.

RONCO, SARA* (University of Insubria, Italy)

Global Bioeconomy: Unveiling the Biotrade Dimension and Regional Trade Dynamics with a Mediterranean Focus on Climate Justice

The bioeconomy has become a focal point for policymakers and international organizations as a strategy to tackle global challenges. Despite growing scientific focus on the local bioeconomy, its global dimensions, particularly in trade, are less explored. Integrating trade into the bioeconomy introduces trade-offs and spillover effects, emphasizing the need to balance economic growth with sustainability. This aligns with Davis's concept of "strong vs. weak sustainability," where strong sustainability maintains natural capital, while weak allows substitution with economic or human capital. Specialization of countries in bioeconomy sectors, based on comparative advantage, can lead to excessive resource exploitation, undermining climate change mitigation and food security, particularly in developing countries.

The analysis addresses: How is sustainability managed in bioeconomy trade literature? What are the most relevant sectors? How does innovation influence bioeconomy trade development? What are the specific challenges and opportunities in EU-Mediterranean trade relations concerning climate justice?

The approach used is a systematic literature review based on the SPAR-4-SLR protocol, expanding the PRISMA framework. The data collection in September 2023 on Scopus and WoS yielded a database of 114 documents. We also analyzed biotrade using UNCTAD data, assessing its share in total trade across regions and calculating the Revealed Comparative Advantage (RCA) for Mediterranean countries. This research offers a detailed examination of bioeconomy trade, filling a gap in the literature, focusing on the Euro-Mediterranean area and implications for climate justice.

Preliminary findings show biomass is a dominant, growing sector. Socio-environmental sustainability is critical, highlighting risks of the "green growth" narrative neglecting social justice. Technological innovation is essential but requires substantial investment. Biodiversity-based trade forms a significant share of total trade, especially in Southern Europe and North Africa. A joint EU-Mediterranean strategy could promote bioeconomy trade but requires coherent policy alignment to address climate justice challenges.

RONJA, TRISCHLER* (TU Dortmund, Germany)

Moderating Digital Societies

Whether in work meetings, professional conferences, media broadcasts, panel discussions, or social media groups: across practices and media, moderation is an important social practice for mediating different positions, accesses, and expertise. This makes it a powerful discursive method for collaborative work on societal challenges. However, as an evaluative practice, it also carries the risk of preventing or excluding issues, contributors or positions from public (or private) discourse. While moderation has long been an important social practice, its scope has expanded in digital societies. The paper presents a praxeological approach inspired by Science and Technology

Studies (STS) to examine how moderation enables, limits, and organizes the coordination of discursive cooperation under digital conditions.

Moderation, understood from its Latin origin as regulation and control, refers to the ordering of social discourses and interactions. Today, it encompasses socio-technical processes in their practical variations between online and offline, as well as varying degrees of automation and professionalization of collaboration. There is an ongoing technification of moderation and public discussion more broadly, as well as its infrastructures through the use of algorithms and artificial intelligence, including semi-automated content moderation on platforms. On the human side, this includes both paid work and unpaid volunteer work. In social and media science research, moderation is usually understood as the skill and task of individual humans who are faced with technological alternatives (such as bots, content moderation, etc.). In contrast, the proposed STS-inspired praxeological approach locates moderation as a distributed, temporalized socio-technical practice, i.e. as material semiotic, interrelated, situationally unfolding activities between human and non-human participants. This allows not only to trace the practical organisation of moderation (and when it fails), but also to consider how the subject being moderated contributes to moderation.

RONNY, EHLEN* (University of Hohenheim, Department for Sociology, Germany)

Dealing with Sustainability Paradoxes: Organizational Quality Standards in German Food Retail and Their Application in Organizational Practice

Food retail faces paradoxical sustainability demands. On the one side, providing food that meets legal and customer demands for fresh and good-looking food is crucial for the food retailers' economic sustainability. This especially holds for perishable food like fruits and vegetables. On the other side, fulfilling these demands is sensible to ecologic sustainability since it contributes to food waste and thus, contradicts societal demands – manifested in SDG 12 – and the self-commitment of the majority of the (German) food retail groups in this respect.

Food retailers navigate through these paradoxical sustainability demands by defining organizational quality standards for food. However, existing research in the context of German food retail has shown that these standards are defined rather roughly and therefore need to be interpreted. This is up to the shopfloor workers who apply the standards in daily organizational practice by evaluating the food and thus, dealing with the paradoxical economic and ecologic demands in food retail.

Only little is known about how shopfloor workers apply organizational quality standards for food in organizational practice and which factors influence their (e)valuation of food in this respect. While the study focuses on this issue, research indicates that non-quality-related factors (e.g., amount of food on stock, expected food sales, etc.) might influence the application of organizational food quality standards. Moreover, the presence of third party actors that explicitly address food waste (e.g. Foodsharing, Too good to go, etc.) might paradoxically relieve food retail (workers) from a stronger ecologically oriented application of their organizational quality standards.

Against this background, the study investigates dealing with sustainability paradoxes by workers in German food retail through the lens of the sociology of (e)valuation. It empirically focuses on the definition and application of organizational quality standards for food by conducting problem-centered interviews with shopfloor workers and participating observations.

Public Opinion, Providers', and Older Adults' Perspectives on Gentrification, Older Adults, and Health and Well-Being

Introduction

We investigate gentrification's detrimental effects on the physical and mental well-being of older adults in Colorado, emphasizing racial and ethnic minority populations. Our research elucidates how gentrification-induced changes in housing, transportation, healthcare and food access, and social engagement adversely affect this vulnerable demographic.

Methods

We sourced data from United States of America's newspaper databases (including Newsbank, Access World News, and Gale Onefile News), individual newspaper websites, and three health and social service provider (n=8) and older adult (n=5) focus groups. We used content analysis with newspaper databases (public opinion) and thematic analysis for focus group data in Atlas.ti, to identify themes related to gentrification and its impact on older adults' health and well-being.

Results

Our content analysis revealed that gentrification was closely associated with disruptions in housing stability and healthcare access for older adults, particularly within minoritized communities. These disruptions contributed to elevated stress levels, declining mental health, and exacerbated chronic conditions among older adults. Our focus groups triangulated the prior findings, mentioning stress related to older adults' increased housing and food costs, difficulties accessing transportation, increased customers and demands on service providers for assistance, and service providers' decreased funding and support staff numbers. One participant mentioned a lack of community in her neighborhood, speaking to how gentrification has dispersed people, particularly in minoritized neighborhoods. Subsequently, gentrification contributed to social isolation and transportation issues with changing neighborhood demographics.

Discussion

Our findings highlight the need for policy and program interventions aimed at mitigating the adverse effects of gentrification on older adults, especially within minoritized communities. Ensuring stable housing and accessible healthcare for this population is essential to preserving their physical and mental well-being in the context of rapidly evolving urban environments.

ARKAINA, CHARLENE (University of the Philippines Los Baños, Philippines)

Reimagining Resilience: Co-Producing Just Social-Ecological Futures in the Southern Sierra Madre, Philippines

This paper presents insights from the ongoing project *"The Futures of People and Forest: Co-production of Knowledge for Just Social-Ecological Transformations in Southern Sierra Madre,"* which seeks to explore equitable adaptation strategies for communities in the southern portion of Sierra Madre, the longest mountain range in the Philippines. The project is anchored on the co-production of knowledge among various stakeholders—including local governments, civil society organizations, academic institutions, and local communities—to examine the region's key drivers of change. These drivers include climate change impacts, economic transformations, and the ongoing development of a multi-million dollar mega dam project (the Kaliwa Dam) designed to secure water resources for the country's capital. Using a transdisciplinary approach and participatory future scenario methods, the project facilitates collective reflection on the multiple possible futures for communities living alongside the Kaliwa Dam and the identification of just adaptation pathways that align with community preferences and sustainability goals. In this paper, we will share initial lessons from the project, including insights from the future scenario and backcasting workshops and the politics of co-producing knowledge of alternative futures. A key focus is the potential trade-offs between short-term gains and the long-term climate resilience of these vulnerable communities associated with emerging and envisioned socio-technical pathways. We will also explore the implications of these findings for climate adaptation policy and planning, particularly in the context of securing the long-term social-ecological resilience of forest-dependent communities amidst new risks and uncertainties. The paper emphasizes how co-production of knowledge, combined with futures thinking, enables stakeholders to anticipate long-term challenges and opportunities, ensuring that adaptation strategies are not only just and community-driven but also resilient to emergent conditions.

WG01-888.4

ROSA, MARCELO CARVALHO* (UFRRJ, Brazil)

Decentering the Hegemonic Subject: Denise Ferreira Da Silva's Contribution to Reshape "Global" Sociology

The paper departs from the idea that global sociology is currently nothing but an analytical exercise of onto-epistemological imperialism. Regarding the fact that theory is the discipline's common ground, most of the recent progressive debates revolve around the process of how to assemble a general subject able to better include the lives of the global peripheries (the majority of the world) without displacing the hegemonic standpoint of the global north.

In order to think about reshaping this biased structure of knowledge, this proposal explores the work of Denise Ferreira da Silva, suggesting that her writings can be read as an outstanding advancement in the current trends of disciplinary transformation. The argument is divided into two chronologically complementary sessions. First, it explores the author's explanation of the rise and consolidation of the notion of *homo modernus* as the governing subject of humanities as sciences. The focus is on the exclusionary and hierarchical consequences of restricting the social and sociological relevance to an ideal Western faculty of self-determination. The second part draws on the author's recent assembling of an analytical ontology, "the wounded *captive body* in the scene of subjugation", to methodologically assess the collective existences of the majority of the world's population. From the perspective of this paper, Ferreira da Silva's proposal draws on the violent and exclusionary consequences of modernity to suggest the possibility of breaking with the hegemonic narrative. In my reading of her work, the possible alternative is based on investigating and producing existences that are not bound by the structures of time/history and space that conceived the global as an extension of Western colonial concerns.

Interpreting and Writing Field Data (Qualitative and Quantitative)

This presentation will address early career researchers (graduate students and young post-graduate researchers) interested in how social scientists "translate the field" in academic writing. It will focus on the following aspects:

- On manners of objectifying "viewpoints" and "subjective positions."
- On the critical analysis of one's scientific practices (e.g., operations performed, tools used, the relationship between the investigator and the respondent or interviewed, etc.)
- On modalities of choosing quantitative and/or qualitative data to be included in publications.
- On ways to avoid the trap of classical substantialist typologies.
- On the art of presenting qualitative and/or quantitative data within the body of a scientific article.

The presentation will consider both qualitative and quantitative data and will be adapted for both anglophones and francophones.

Transnational Investment and Territorial Dynamics in Moldovan Rural Areas

In this presentation, I will focus on the influence of international migration from the Republic of Moldova to different European countries on the Moldovan rural territorial dynamics. I am adopting an approach that considers the transnational social ties and investigates the effects of these migrations on exchange practices, entrepreneurial forms, transnational investment strategies, and their impact on the socio-economic and cultural evolution of Moldovan rural areas.

Employing an interdisciplinary and empirical approach and using original field data, in this presentation I will show the link between the individual action of Moldovan migrants and the rural territorial dynamics of their home country. The main hypothesis concerns the influence of the internalized social structures of both the host and home societies, as well as transnational networks, on the transnational investment strategies of migrants, the impact of these practices on local economic integration, and the lasting effects on the territorial dynamics of rural communities in Moldova.

Bridging the Micro-Macro Divide in Empirical Research. Moving Beyond Empirically Calibrated Agent-Based Models to Study Aggregation Processes.

While empirical methodology to examine contextual drivers of individual behavior is well developed (e.g., multilevel regression framework), few approaches exist to empirically study real-world aggregation processes. Building on the 'multiple membership' extension of the multilevel regression framework (Goldstein 2011), I develop a conceptually reversed multilevel

model that allows examining aggregation processes with regression analysis. By including a weighted sum in the regression equation and endogenizing the weights of this sum, the generalized multiple membership multilevel model (MMMM) allows studying complex nonlinearities of micro-level effects on macro-level outcomes. Using a threshold model of collective behavior as an example, I demonstrate by simulation that the generalized MMMM is able to capture this aggregation process while both micro- and macro-level regressions lead to erroneous conclusions. I also discuss advantages of the generalized MMMM vis-à-vis empirically calibrated agent-based modeling as an alternative approach to the empirical study of micro-macro linkages. Finally, I illustrate how to fit the generalized MMMM for a variety of outcomes (linear, logit, conditional logit, Cox, Weibull) in a user-friendly way using the developed R package 'rmmm'.

Socioeconomic Segregation in Adolescent Friendship Networks: A Network Analysis of Social Closure in US High Schools.

Adolescent friendship networks are characterized by low interaction across both socioeconomic and racial lines. Using data from the National Study of Adolescent Health and a new exponential random graph modeling approach, this study examines the degree, pattern, and determinants of socioeconomic segregation and its relationship to racial segregation in friendship networks in high school. The results show that friendship networks are overall less socioeconomically segregated than they are racially segregated. However, the exclusion of low-SES students from high-SES cliques is pronounced and, unlike racial segregation, unilateral rather than mutual: many friendship ties from low-SES students to high-SES peers are unreciprocated. The decomposition of determinants indicates that about half of the socioeconomic segregation in friendship networks can be attributed to differences in socioeconomic composition between schools. The other half is attributable to students' friendship choices within schools and driven by stratified courses (about 13 percent) as well as racial and socioeconomic preferences (about 37 percent). In contrast, relational mechanisms like triadic closure – long assumed to amplify network segregation – have only minor effects on socioeconomic segregation. These results highlight that SES-integrated friendship networks in educational settings are difficult to achieve without also addressing racial segregation. Implications for policymakers and educators are discussed.

Land Rights through Infrastructure: The Role of Water and Mobility Delivery in Practices of Land Formalisation in Arequipa, Peru

This paper explores the role of infrastructure delivery and availability for the process of land formalisation in Arequipa. Using the concept of hybridity, understood as the unique configurations of formal and informal practices in urban development we analyse the various forms of infrastructure production in three neighbourhoods of the secondary city in southern Peru. Conceptually, we argue for deconstructing the dualism of "formal" and "informal" in this context, proposing instead a perspective that sees both as powerful social constructs influencing urban planning practices, rather than as accurate reflections of the far more diverse lived realities in various global and local contexts. Practically, this paper explores how state regulations towards land formalisation influence practices and attitudes of citizens in new neighbourhoods towards the (auto-)construction of infrastructure. In doing so, the proposed paper is contributing to answering the following questions:

- How are state regulations connecting infrastructure provision to land formalisation?
- Which practices of hybrid infrastructure delivery can be found in the three neighbourhoods?
- How are the identified state regulations influencing the hybrid infrastructural realities?

Using a qualitative design, fieldwork included extended stays in the neighbourhoods, complemented by interviews with residents and non-resident experts. Focussing on the studied infrastructures—water and mobility—we identified complex interconnections and dependencies between the requirements of land formalisation and the lived realities of infrastructure delivery in the different neighbourhoods. Building on examples from fieldwork, we present existing delivery solutions produced by individual and complex hybrid arrangements. Our approach allows to unveil conflicts

between different actors, in particular between private actors and the state, but also between private actors with different interests in the context of land formalisation, especially housing versus profit. In reconstructing the often conflicting rationalities of the different actors, this paper contributes to a better understanding of the links between infrastructure, urban development policies and social inequalities.

ROSEN, RACHEL* (University College London (UCL), United Kingdom)
DICKSON, EVE (University College London, United Kingdom)
Bordering Social Reproduction: Care Circulations and Immobilities in the Shadows

In this paper, we build on the notion of care circulation offered by Baldassar and Merla to consider what happens when migrants subject to policies that seek to deny them the means of life nonetheless endeavour to make and sustain caring lives. We draw on rich ethnographic insights to explore the everyday lives of mothers who come from Britain's former colonies, their children, and their often-spectral transnational family members. Due to their insecure migration status in the UK, they are subject to 'no recourse to public funds' (NRPF). The NRPF immigration condition prohibits access to housing assistance and most welfare benefits even for the most impoverished. This welfare bordering produces enforced destitution and debt alongside other technologies of migration control by the racial state. We argue that while social reproduction is thus bordered, and strategies of care are fractured and often immobilised geographically, materially and psychically, a narrative of depletion and victimhood or care-less lives does not speak the complexities of these family's efforts of sustenance and concern. Instead, we advance the novel concept of weathering to comprehend mothers' and children's caring practices under duress: the navigating, calculating, strategizing, hiding, and dreaming that animate daily life as well as the time, energy, and labour required to sustain it. We argue that these practices are neither solely symptomatic of lives rendered disposable nor acts of heroic resilience, but indications of the fragilities of repressive migration regimes and, on occasion, the refusal to accept their terms of existence through continual reassertions of careful and caring lives.

Pushbacks to DEI and ESG and Corporate Law Firm Responses

Corporate law firms are guided by the profit principle. Profits per Equity Partner is the basis for their competition. As a result, it is argued, their professionalism is reduced to following client directions.

Law firms tout their DEI and ESG efforts. Research has revealed that there were pushed to DEI by the demands of their clients. Many law firms have found a profit center in ESG consulting.

In the U.S., under political pressures, about 20% of large corporations are scaling back on DEI. Leading corporate actors have retreated on ESG. Shareholder proposals on these subjects are being defeated in increasing numbers. Republican State Attorney Generals wrote to the 100 largest law firms advising them to discontinue their ESG and DEI efforts. Some law firms have been sued over their DEI policies.

This article analyzes how the 100 largest U.S. law firm have responded to the changing market and these political pressures. Through scraping their websites, I will describe their responses. For example, are law firms following some of their clients and firing their DEI staff? Where firms have acted in ways that appear inconsistent with their market and the political pressures to which they are subject, I will engage in ethnographic analysis.

This data will enable a better understanding of law firms as businesses. It also will enable a finer understanding of the legal professionalization project. The pushback against DEI and ESG in corporations not only changes their demands from law firms but also their conceptions of business ethics. What do law firm responses tell us about the relations of business and legal ethics?

In the Anthropocene, there will be pushbacks against necessary changes and retreats from commitments to them. This article describes how law firms responded.

Digital Statecraft Meets Financial Citizenship: The Case of the Eudi Digital Wallet

As modes of digital payment spread (Caliskan 2023; Prasad 2021), a pressing concern for banks is verifying the identities of those making transactions. One way banks are doing this is by linking digital payment systems with state-sponsored digital identity initiatives. These programs have emerged in such diverse locales as Sweden (Schwarz 2017), India (Carrière-Swallow et al. 2022), and Singapore (Yeong and Hardoon 2022). However, we still have much to learn about the specifics of these linkages; how they change the relationship between states, banks, and citizens; and the ways in which these changes are justified.

To explore these developments further, this paper considers another such case of this linkage: that of the EUDI Wallet Consortium, a program which is meant to provide all EU citizens with a smartphone-based "Digital Wallet" by 2025. This wallet is meant to help facilitate cross-border payments by linking existing digital identity programs with digital payment infrastructures. It has also been identified as a possible model for the Digital Euro.

This paper seeks to further our empirical knowledge of how this initiative functions, and how it is justified. Drawing on publicly available planning documents, it first identifies the actors involved in developing the project, details the way the Wallet operates, and considers the changing relations between states and banks that result from its adoption. Second, it explores the reasons given for pursuing the program and the ways the program is justified.

These policies and their associated justifications have implications beyond the European case, as many non-democratic regimes are also pursuing similar initiatives. This suggests a disquieting question: are we observing a convergence in political and financial governance between liberal democracies and non-liberal, non-democratic countries?

RC15-238.1

ROSSI, ELISA* (University of Modena and Reggio Emilia, Italy)
Analysing Peer Support in Oncologic Self-Help Groups Meetings

In the last decades, literature on doctor-patient communication described and promoted an interaction more centred on patients as persons and on their care needs (Castro et al., 2016; Epstein & Street, 2007; Mead & Bower, 2000), also in order to encourage their treatment acceptance and to improve their quality of life (Blanch-Hartigan et al., 2016; Maynard 2003, 2005; Heritage et al., 2007). However, patients' unmet concerns are still a recurring but less known aspect of medical communication, especially in oncologic contexts (Sansone-Fisher et al., 2000). This paper presents some of the main results found within an innovative research project on spontaneous interactions produced during twelve meetings in four oncologic self-help groups. These peer support groups, based in four different hospitals of the region Emilia Romagna (Italy), involved patients, ex-patients or family members. The twofold aim of the research project was: 1) to investigate patients' needs and concerns connected with the disease and the treatment; 2) to identify the form of communication that facilitate the expression of these needs and concerns within self-help groups. In order to achieve this objective, each meeting was video-recorded following the ethical indications of EC and then transcribed using a simplified version of the Conversation Analysis conventions of transcription (Jefferson 2004). Data analysis combined a constructivist approach of communication (Luhmann 1995) with studies on dialogue (Abramovitch & Schwartz 1996; Bohm 1996; Gergen et al 2001; Littlejohn 2004; Pearce & Pearce 2003) and studies on narratives (Baker 2006; Bamberg 2006; Georgakopoulou 2007; Halkowski 2006; Norrick 2007; Waring 2009). The main outcomes presented and discussed in this paper refer to some recurring dialogic actions produced by peers within interactions, which were observed and identified as effective in facilitating participants' personal expressions and supporting narratives of unmet concerns, while discussing diagnosis, treatment and doctors' approach during the care process.

ROSSI, FEDERICO M.* (Universidad Nacional de Educación a Distancia (UNED), Spain)
Capitalist Models of Development and Social Movements in Latin America

Social movements are crucial actors in producing transformations in society. One important dimension in this regard is certainly capitalism. The goal of this paper is to analyze social movement dynamics across the capitalist models of development that predominated in Latin America from independence from colonial rule until the early twenty-first century. This is done through the lens of a political economy of social movements, understood as the substantive and theoretical recoupling of the political and

economic spheres in the relational study of social movements and capitalist dynamics. If an economically determinist approach is avoided and the North Atlantic mainstream narrative is decentered, a political economy of social movements reveals multiple struggles for the expansion of the socio-political arena and the resistance to this expansion with plutocratic retrenchment periods that contract that arena. In Latin America there has been an enormous development of research since the 1980s linked to protest and the transformations of capitalism. However, this accumulated research has not yet been systematized into models of development to understand the impact of capitalism on social movements, and even less so, the role played by social movements and protests in economic change.

ROSSI, FEDERICO M.* (Universidad Nacional de Educación a Distancia (UNED), Spain)

Studying Labor Movements Beyond Unions in Latin America

The history of Latin America cannot be understood without analyzing the role played by labor movements in organizing formal and informal workers across urban and rural contexts. This paper analyzes the history of labor movements in Latin America from the nineteenth to the twenty-first centuries. After debating the distinction between "working class" and "popular sectors," the paper proposes that labor movements encompass more than trade unions. The history of labor movements is analyzed through the dynamics of globalization, incorporation waves, revolutions, authoritarian breakdowns, and democratization. Taking a relational approach, these macro-dynamics are studied in connection with the main revolutionary and reformist strategic disputes of the Latin American labor movements.

Empowering Gender Equity and Social Justice in the Global South through Digital Humanitarianism and Participatory GIS

Following a theoretical and methodological analysis of the scientific literature on the role of digital Humanitarianism in promoting social justice in the Global South, this study explores the under-researched potential of INGOs in leveraging digital humanitarianism and participatory Geographic Information Systems (PGIS) to advance social justice, with a specific focus on gender equity. INGOs can use platforms like OpenStreetMap (OSM) to empower marginalized communities, particularly women and gender minorities, through data collection, analysis, and dissemination, enabling them to advocate for their rights and push for equitable, gender-sensitive solutions.

The concept of "digital humanitarianism" intersects with new socio-technical practices, alternative knowledge systems, and evolving institutional frameworks. INGOs play a critical role in utilizing digital tools such as PGIS to address gendered aspects of social justice, including climate justice, disaster relief, and human rights. Platforms like Ushahidi, HOTOSM, and Missing Maps showcase how INGOs facilitate crowd-mapping and geospatial data-sharing efforts, amplifying the voices of vulnerable populations, especially women, and fostering community resilience.

A case study highlights the contributions of INGOs and academic institutions such as OfficinaSocialeCOPE and the Universities of Catania and Palermo in supporting victims of the September 2023 earthquake in Morocco. This initiative integrates OSM-based crowd-mapping in a rural post-emergency setting, with training programs and virtual mapping environments aimed at addressing individual and collective vulnerability, with a particular focus on the disproportionate impact on women. The case provides empirical evidence of INGOs' role in mobilizing digital humanitarianism to promote gender-sensitive social justice in the Global South.

ROSSMEISSEL, FELIX* (Fulda University of Applied Sciences, Germany)

Violence-Related Forms of Life. the Case of Western Jihadism

The lives of those who practice violence as profession or vocation, i.e. soldiers, militiamen, mercenaries or terrorists, cannot be reduced to acts of violence. They have families and friends; they mostly live everyday lives; and they pursue cultural or other leisure activities. At the same time, however, these lives are not unaffected by the preparation for, participation in and processing of physical violence. They become members of organizations, groups and subcultures that take a hold of their lives; they are comrades and brothers in arms with obligations that reach far into private spheres; they

align their family life and social relationships with the necessities of the violent missions; they adopt the languages of violent groups; and they emotionally and physically adapt to the challenges of physical violence. It can be said that forms of organized violence - both state and non-state - come with forms of lives that are built around and related to the conduct of violence: "violence-related forms of life".

In my contribution, I will develop this concept of "violence-related forms of life" and its biographical relevance. Therefore, I will refer to my biographical research on jihadist careers of young men from Germany. I will show that this concept can be used to address two questions. First, it helps to answer, how participating in forms of organized violence affects people's lives and biographies. Adapting to these forms of life often leads to tense and conflict-ridden biographies. Second, the concept offers new ways of explaining why people participate in forms of organized violence. Beyond a psychological or organizational reductionism, it focuses on the entire lives of violent actors and shows how they are socialized into the practice of violence and its psycho-social conditions.

MITCHELL, TANIA D. (University of Maryland, College Park, USA)

Wrestling with Paradoxes of Social Justice and Decolonization in Community Engaged Learning

Studying and enacting decolonization requires considering its contestations, for there is much at stake. Not only do the movement of people and resources, access to jobs, housing, and health care, and surveillance and enforcement of borders lie in the balance, but so does the imagination that animates these realities. The nuances of decolonization become more accessible for students when paired with community engagement.

We center two community engaged projects as pedagogical opportunities that allow for 1) disrupting colonial institutions and 2) wrestling with intersecting contradictions of labor, migration, citizenship, and decolonization. One partnership is with a domestic workers alliance advocating for a domestic worker bill of rights that would guarantee much needed higher wages for workers yet potentially create financial hardship for elders and people with disabilities who rely on caregiving services. The second features a hotel workers union in Hawai'i that primarily consists of immigrant laborers fighting for improved working conditions in a context where reliance on tourism conflicts with efforts toward Native Hawaiian sovereignty.

Both projects feature difficult paradoxes. Immigrant worker rights are easy to align with on the surface (everyone should be paid a living wage!), but become much more complex when examining the interlocking issues and changes required to support this position, such as migration and migrant worker policies, claims to indigenous sovereignty, and the concept of nationhood itself. We highlight the ways in which these projects can probe sociological questions around labor, migration, citizenship, and decolonization.

While community engagement projects nor educational institutions are in-and-of-themselves decolonizing, we utilize la paperson's (2017) idea that decolonizing efforts have always disrupted colonial structures from within. As such, the featured projects relocate the source of knowledge and power to immigrant laborers; invite students to join in social movement building; and can move all workers toward deeper solidarity.

La Implicación Social y Responsabilidad Con Las Familias Extensas De Las Personas Migrantes

Este trabajo presenta los resultados previos de la encuesta sobre el emprendimiento de las personas migrantes afincadas en Tenerife (Islas Canarias) y que parte de la investigación acción participativa llevada a cabo por las asociaciones de las personas migrantes y Cátedra Cultural, Globalización, Migraciones y Nuevas Ciudadanía (Universidad de La Laguna). Los resultados parciales que se presentan en esta ponencia centran su atención en las variables diseñadas para contextualizar las motivaciones y las condiciones sociales de las personas migrantes que emprenden sus negocios. Entre estas variables, la ponencia examina: la involucración en las acciones de voluntariado, las colaboraciones y redes empresariales o las remesas. Los resultados previos indican que se trata de un colectivo con mayor implicación social que grupo general de referencia, en este caso la población tinerfeña. Los análisis disgregan los resultados obtenidos según los sexos, los países de procedencia, estatus legal y arrojan luz sobre los perfiles laborales, niveles de formación y lugares de ejercicio de la actividad empresarial de las personas migrantes.

Los Itinerarios De La Contemplación Artística y Sus Derivas Sociales En La Obra De Zygmunt Bauman

Los esfuerzos de imaginar la civilización, al menos en los mitos fundacionales de nuestra época, han sido precedidos por la añoranza de añadir a la existencia humana más belleza y más trascendencia. En cambio, nuestro desarrollo cultural, en vez de ir colmando los deseos de alcanzar los ideales marcados, nos ha llevado al creciente distanciamiento y a la disolución de cualquier absoluto. De esta afirmación de Bauman, expresada en su obra *Miedzy chwila a pieknem, o sztuce w rozpedzonym swiecie*, (2010:45, *en traducción*), y que condensa una serie de itinerancias de las emociones ligadas a la contemplación del arte, se ocupa este trabajo. Concretamente, este estudio extrae de la obra mencionada las interpretaciones de las dinámicas del acontecer de los sentidos del arte a partir de la movilidad emocional que impone la contemplación artística. La movilidad que nos interesa acontece entre la obra y el espectador, el artista y su ideal, o entre la producción artística y la estética de los grupos o tiempos sociales. Tras estos nodos, el espectador tan emancipado como Bauman, distingue una multitud de tránsitos peculiares y vagancias emocionales tan singulares como: los deseos del acontecer y la persistencia de la percepción de vacuidad, la pérdida de la seguridad y merma del valor de imaginar o la trasposición de los objetos de los esfuerzos y de los sueños, entre otros. El fin último de la descripción de estas resonancias emocionales de la contemplación del arte, son las contingencias sociales que Bauman induce de tales dinámicas y que le permiten afirmar que la vida cotidiana no es otra cosa que campos de cultivo de las estéticas que en la época de la modernidad líquida se han convertido en fuentes de sentidos de la existencia.

A Comparative Analysis of Reddit Discussions on Meat Reduction in Portugal, Poland, and the United Kingdom

In recent years, diets that minimize meat and animal-derived products have garnered considerable attention and popularity in the Western world. This shift is largely due to the results highlighting the negative health effects of animal-based products and the environmental impact of animal farming (Willett et al., 2019). Although many countries have recently recognized the benefits of plant-based diets and reduction of meat intake for human health and environmental issues, a great majority of the population is still skeptical about reducing or removing animal-derived food.

In our study we use the COM-B model as a theoretical framework. According to the model, behavior originates from the interaction of three components: capability, opportunity, and motivation (Michie, Atkins & West, 2014). Using the model, we analyzed Reddit discussion data to investigate the motivations, opportunities, and capabilities involved in adopting plant-based, vegetarian, or reduced meat consumption diets in three European countries: Poland, Portugal, and the United Kingdom. Although all these three countries once belonged to the European Union they differ in terms of geographical location, economics, and culture.

Considering all 1,151 comments from the three Reddit threads, motivations were the most frequently discussed, with 291 comments (25%), followed by opportunities with 195 comments (17%). Capabilities were the least mentioned component, appearing in 90 comments (8%). The conversations on the topic were fairly similar, yet there were striking differences in the proportion of some topics mentioned. Furthermore, the manner these topics were discussed shows how the factors influencing meat reduction vary somewhat across countries and are affected by the physical, social, economic, informational environment, as well as intrapersonal factors such as attitudes, beliefs, social norms, and cultural norms specific to these locations. The study highlights and contextualizes the similarities and differences in barriers and enabler across the countries, considering their unique cultural, economic, and social environments.

ROTHENBERG, JULIA* (Queensborough Community College, CUNY, USA)

Adorno and Durkheim Go to the Blue Note

Theodor Adorno offered powerful interventions into the sociology of aesthetics and art in late modern societies. However, recent appraisals from within cultural and music studies have rightly found his work in both popular music and jazz, to be totalizing, elitist and tone-deaf. Theorists continuing the Frankfurt school tradition such as Axel Honneth and Jurgen Habermas attempt to confront and correct Adorno's refusal to allow for emancipation or resistance in collective or intersubjective experience. Such criticisms of Adorno should be mindful of jettisoning his unrelenting and still-relevant social critique as well as his attention to the social nature of artistic form.

My research focuses on jazz from the period in which Adorno was writing and later developments. I am interested in how elements of jazz both internal to the form of the music and in terms of "art worlds" have emerged from the identity, collectivity and subjectivity unique to the Black experience in the US. Drawing on explorations of subaltern identity such as those found in W.E.B Dubois' "double-consciousness", Franz Fanon's account of the psychic dimensions of colonization and resistance, Black feminists such as Angela Davis and Hortense Spillers, who explore gender in the context of America's racialized social system, Amiri Baraka and the Black arts movement and building on work of Fumi Okiji, I contend that what Adorno gets wrong about jazz can be traced back to his totalizing account of bourgeois subjectivity and his insistence that any form of identification with the collective is by necessity false, regressive and oppressive. Finally, I confront Adorno with Durkheim's notion of collective effervescence, which, if considered (albeit contra Durkheim) as a tool through which marginalized communities can generate condensed social energy with which to resist domination, helps to generate a dialectical regeneration of Adorno's contributions to aesthetic sociology.

Contractualization Policy in Moroccan Public Universities: Context, Mechanisms, and Outcomes

This paper examines the context, mechanisms, and impact of contractualization reforms within Morocco's higher education sector, focusing on the period from the Emergency Plan 2009-2012 to the Esri Pact 2030. These reforms aimed to cultivate a results-oriented culture by enhancing the quality of budgetary systems through performance-based contracts between universities and the Ministry of Higher Education. Utilizing the OECD-DAC evaluation criteria, the study assesses the relevance, efficiency, effectiveness, and sustainability of the reforms, with particular emphasis on improvements in financial management. The evaluation framework incorporates the Public Financial Management (PFM) Theory of Change, identifying key institutional and contextual factors that contribute to the success of these reforms. The findings highlight the conditions, strategies, and outcomes that drive the effectiveness of the contractualization process, offering insights into the relationship between policy design and enhanced financial governance in higher education. This research provides critical implications for policymakers and stakeholders involved in education sector reforms and public financial management.

WG01-880.1

ROULLEAU-BERGER, LAURENCE* (Research Director Emeritus at CNRS, France)

Migration, Precarious Work and Emotional Capitalism in Europe and in China

In Europe and in China new generations of migrants are most likely to have to cope with uncertainty and social disqualification on labor markets (Rouleau-Berger, Liu Yuzhao, 2021). They are compressed (Chang, 2017) in a plurality of local and transnational spaces. In Chinese and European societies less-qualified migrants are subjected to domination, symbolic violence, racism, contempt and humiliation in precarious work.. The emotional capitalism (Illouz, 2006) has produced moral "grammars of indecency" within the framework of economic devices that govern the capture of "weak" migrant bodies; these grammars are reinforced by processes of casualization, ethnicization of labor markets and predatory economies. The phenomenon of "precariat" has created global collective disillusionment and anxiety resulting in a structural discrepancy between social aspirations and chances to get social qualification, fracturing subjective identities

In China and in Europe, sociologists have clearly shown that migrants are facing to social and moral risks in economic and social situations of double-

bind, how they do refuse precarious work and loss of social status, how they are demanding respect, recognition, and social justice.

If the new migrants are dealing with strong injunctions to self-government in a context of emotional capitalism, they also are able to develop mobilization competences and can produce economic cosmopolitanism in material and virtual transnational spaces. To resist to these injunctions and to make their voices audible migrants are also producing local and transnational geographies of protest.

By crossing sociological perspectives on the topic of migration, precarious work and emotional capitalism in Europe and in China, we are using the *post-Western theory* (Rouleau-Berger, Li, Kim, Yazawa, 2023) to analyze how common knowledge and indigenous knowledge interact between European and Chinese sociologies, to draw theoretical continuities and discontinuities between "Western" and "non-Western" knowledge, and identify assemblages, hybridization, ruptures.

RC34-576.2

ROULLEAU-BERGER, LAURENCE* (Research Director Emeritus at CNRS, France)

Sociology of Chinese Youth and Post-Western Theory

In China, the sociology of youth as such did not really exist before the 2000s (Li Chunling, 2021). Its contours first appeared in the form of large national quantitative surveys, and then qualitative research with specific research programs. The boundaries of sociology of youth are becoming increasingly clear with research on employment, education, urban issues, migration and digital life.

The process of socialization for young Chinese has profoundly changed in the last 40 years (Li Peilin, 2015). In a context of surging economic insecurity and precariat, unemployment, poverty and growing inequalities Chinese youth are confronted with manifold double-binds situations, structural deskilling and collective disillusionment. The risk of downward social mobility has affected the young middle-class and has also increased precarity among young people of rural or working-class origins. And internal migrations are producing biographical bifurcations and fragmented identities in a "partial individuation process" (Yan, 2010). Young Chinese internalize the injunction to be "heroes" in a context of "compressed modernity" (Chang, 2017) and an authoritarian regime, exposed to risks faced with flexibility and the injunction to achieve social success. So we can speak about "compressed individuals" facing to collective anxiety (Rouleau-Berger, Su, 2023). The socialization process of young Chinese appears to be particularly complex and dynamic owing to the heterogeneity; we will retain the idea of a plurality of socializations that collide and propagate in the context of compressed modernity.

To analyze the compressed socialization process of youth in China, Western sociological theory is not well-adjusted, we should need *Post-Western theory* (Rouleau-Berger, Li, Kim, Yazawa, 2023), more especially "non-Western" knowledge. It means autonomous knowledge in Chinese sociology but also common knowledge between Western and "non-Western" sociology to be able to produce a non-hegemonic and dialogic sociology of youth in a process of hybridation of concepts and production of new theoretical approaches.

ROUSE, SHAHNAZ* (Sarah Lawrence College, New York, USA)

Politics of/As Representation: The Feminist Poetics of Fatima Mernissi and Assia Djebar

As someone who until the 70's had worked primarily on class and political economy, it was the Pakistani military coup that brought not only another military regime but also an Islamist general - Zia ul Haq - to power, that I turned my attention to women's struggles. It was this turn, and the emergence of a nationwide feminist movement that brought me to the work of Fatima Mernissi and Assia Djebar, both from North Africa. In my paper, I address several themes: the on-going necessity to take seriously one's address, both material and discursive; and the relation of struggles to space and time. It is not a coincidence that Mernissi and Djebar both have texts that use 'Shehrezade' in their titles, and others that complicate and trouble history. It is also worth noting that Mernissi - a sociologist - turned to (auto)biography and history; and Djebar - a historian and a writer of stories - turned to film when language itself became a problem. By refusing disciplining and disciplinary power each leaves a powerful feminist legacy guiding us into the future, one I hope to tease out.

ROUTRAY, SANJEEV* (Universiti Brunei Darussalam, Brunei Darussalam)

Space, Caste Capital, and Occupational Monopoly: Labor Market Inequality Among Plumbers in Delhi

The historical context underpinning migration, housing and caste sociality shape labor-market inequality among plumbers belonging to two different castes in Delhi. Drawing on ethnographic research, I explore the overlaps between caste and labor-market inequalities by examining a) how enduring spatial relations, especially with respect to housing segregation produce labor-market inequality; and b) how caste trust and networks shape differential outcomes for plumbers belonging to an intermediate caste and an oppressed caste (*dalits*) in Delhi. After arriving in Delhi, the intermediate caste members deployed their caste networks to find housing in urban villages in south Delhi, which are underpinned by caste relations that in turn deterred the entry of members of oppressed castes who experienced rampant untouchability in the city. Dalits found jobs as "helpers" rather than plumbers and arranged "temporary" housing accommodation in unfinished buildings at construction sites and subsequently in a *dalit* village, which testifies to the segregation of neighborhoods along caste lines and the correlated lack of avenues for economic opportunities in the city. The intermediate caste members used their caste networks to learn skills, build a client-base, and receive plumbing contracts through informal apprenticeships and spatial proximity to initially gain monopoly over this occupation. The possession of differentially distributed economic, social, and cultural capital congealed as a distinct form of caste capital shaped the labor-market outcomes. The possession of relative economic capital, intricate knowledge, and linguistic sophistication and demeanor obtained through intergenerational accumulation of advantages gave the intermediate caste members a head-start in establishing relationships with architects, hardware store owners, and builders, which remained paramount to receiving plumbing contracts in the city. While intermediate caste members deployed their caste trust to receive loans, advance payments, and supervisory jobs from contractors belonging to their own castes, *dalits* faced literacy and numeracy challenges and experienced generational exclusions.

The Work of the Imagination: Art and Socio-Ecological Futures in Argentina

In this paper I ask what ideas, memories, arguments, imaginaries, and stories, Argentinian visual artists and collectives who have publicly exhibited artworks that address environmental issues mobilise to articulate their visions of socio-ecological futures. Using a cultural sociology approach and drawing on interview material, I consider the imagination to be an individual capacity to facilitate action and direct the research lens to what artists actually do to produce alternative imaginaries of better socio-ecological futures. We will see that artists pursue the latter not by imagining future possibilities and re-defining the present in light of such future possibilities, but by developing artistic explorations and artistic ways of knowing that entail a critical evaluation of the relation between the human and the more-than-human worlds, a strong consciousness of the past as a frame of reference to make sense of current environmental problems and challenges, and a questioning of modern notions of progress, development, and socio-historical time. I show that these artists do the 'work of the imagination' by locating their individual and collective agency and their aesthetic action in concrete places and times and by working towards the production of alternative imaginaries that seek to unsettle and challenge dominant capitalist, neo-colonialist and extractivist imaginaries.

Digital Identity in the Age of AI: From Datafied Selves to Digital Twins

As digital technologies increasingly mediate our daily lives, users' understanding of digital identity has evolved from simple notions of online anonymity or multiplicity to more complex constructs, such as the datafied self. It now encompasses different facets of users' online presence, ranging from personal identification and self-presentation to the datafied self (Rowland & Estevens, 2024). These evolving understandings are essential for unpacking the socio-technical dynamics of how digital technologies not

only mediate our identities but also reshape our understanding of selfhood and subjectivity in the digital age. Each viewpoint can be seen as a metaphor, representing distinct perspectives on the interplay between identity and digital information (Søe & Mai, 2022).

This presentation explores the rise of AI-driven constructs, particularly digital twins or AI agents—virtual replicas of individuals that continuously mirror, simulate, and predict human behavior—further transforming the relationship between individuals and their digital identities. Unlike the dataset—largely opaque and unknowable to the user—human digital twins offer a more tangible and comprehensive simulation of physical, cognitive, and behavioral characteristics, by collecting and integrating vast amounts of data through artificial intelligence, machine learning, and simulation technologies.

By integrating the concept of digital twins into existing frameworks of digital identity, this presentation examines the social, theoretical, and alienating implications of AI-mediated identity construction. Through media analysis, it investigates how discourses surrounding digital twins resonate with current notions of digital identity, potentially reshaping concepts of personal autonomy, privacy, and the broader socio-technical fabric of digital societies. In doing so, it highlights the profound shifts in how individuals perceive and engage with their digital selves, and the emerging forms of alienation that accompany these shifts.

Engaging Citizens in Climate Change Transitions: Insights from Two European CO₂ Storage Projects at Different Stages of Technological Maturity

As the urgency of addressing climate change intensifies, sustainability transitions have become a central topic in global discussions. Carbon Capture and Storage (CCS) technologies are increasingly promoted as important components in decarbonization efforts. However, public engagement with these emerging technologies poses significant challenges, particularly given their controversial nature, scale, timelines, and the inherent uncertainties that often accompany their development.

This presentation examines the methodological strategies used to engage citizens in discussions around CO₂ storage technologies, drawing on two European Union-funded projects: CO₂ Geological Pilots in Strategic Territories – PilotSTRATEGY, which focuses on mature geological carbon storage with site-specific proposals, and CEEGS – Novel CO₂-based electrothermal energy and geological storage system still in its early stages.

These projects present distinct engagement challenges due to their differing levels of technological readiness, perceived risks, and social impact. We will explore the strategies used to define target populations, and the tailored engagement approaches. The presentation will also reflect on how these strategies influenced the outcomes of the citizen engagement.

By addressing these questions, this presentation aims to provide insights into the challenges of integrating citizens perspectives into the socio-technical dynamics of research on climate change and energy transitions. It will highlight both the opportunities and limitations of public engagement in the context of large-scale climate infrastructure projects, offering lessons for future initiatives.

ROY, NANDITA* (Indian Institute of Management Calcutta, India)

Logos Ex Machina: Policy Implications for AI-Driven Consumer Systems

The rise of artificial intelligence (AI) is transforming consumer products from mere intermediaries—tools people interact through—into active communicators, enabling more direct and immersive actor-to-actor engagement. This shift introduces new opportunities for co-creation, agency, and value exchange, but also exacerbates issues such as algorithmic bias, surveillance, and ethical dilemmas. AI-driven systems, particularly those reliant on black-box models like large language models (LLMs), raise profound questions about transparency, accountability, and user trust.

In this research, we explore the evolving digital ecosystem from the perspective of AI consumer products, focusing on user engagement with both

explainable and opaque AI. Through five exploratory studies, we examine the complex interaction between consumers and AI technologies, highlighting the challenges posed by black-box systems and their broader societal implications. We identify the varying outcomes shaped by differential access to AI resources and regulatory frameworks, particularly in global contexts. Our framework for understanding AI-consumer interactions informs a set of considerations for policymakers, emphasizing the need for global, comparative perspectives on regulatory interventions.

Ultimately, this research contributes to ongoing debates about the social shaping of AI technologies, offering propositions for future investigation into how AI may exacerbate inequalities or foster new forms of empowerment in different geopolitical regions.

ROY, NANDITA* (Indian Institute of Management Calcutta, India)

The Paradox of Digital Leisure

This paper explores the evolving boundaries between work and play, beginning with the foundational theories of Johan Huizinga and Roger Caillois, who identified play as a distinct, voluntary activity marked by freedom, non-utilitarianism, and separation from ordinary life. Huizinga's *Homo Ludens* posits that play is an essential cultural function, while Caillois' typology distinguishes between agon, alea, mimicry, and ilinx, each representing different dimensions of human play. Historically, play and work occupied discrete spheres, with play functioning as a respite from the utilitarian rigors of work. However, with the advent of algorithmic cultures, these boundaries have blurred, leading to a profound reconfiguration of leisure in contemporary life.

In today's digital age, what appears to be play—scrolling through Instagram, engaging with social media, or interacting with open systems—constitutes a form of labor. Users unwittingly participate in data mining, where every interaction, click, or like becomes a commodifiable data point for multinational corporations. This paradoxical engagement with digital platforms complicates our understanding of work and play. The leisure activity of browsing social media, often perceived as an escape from the demands of labor, is, in reality, a covert mechanism of exploitation wherein users generate valuable data without remuneration or awareness.

Drawing on theoretical frameworks from critical media studies and digital labor theory, this paper interrogates how algorithmic cultures reconfigure the relationship between leisure and labor, effectively transforming play into a form of immaterial labor. By examining this paradox, the paper raises critical questions about agency, exploitation, and autonomy in the digital age. Ultimately, it asks: How do we navigate the commodification of our leisure in a world where play has become indistinguishable from work, and how might we reclaim autonomy in the face of this algorithmic co-optation?

RC02-JS-178.3

ROY, RIANKA* (Wake Forest University, USA)

A Gendered Subclass within the CEO MDR: Indian Tech Workers on Nonimmigrant Visas in the US

In this paper, I build on Rina Agarwala's (2022) concept of the Migration-Development Regime (MDR) to examine the relationship between the Indian state and high-skilled Indian tech workers who hold temporary visas in the US. These workers belong to the CEO MDR, and share an "elite class pact" with the sending state. This means, the sending state offers favors and incentives in exchange for the elite emigrants' consent to liberalization. Agarwala (2022) also discusses how gender inflects the "elite class pact" with the Indian state offering more opportunities to male than female migrants.

I extend the discussion on gender—but by focusing on the emigrants' visa or citizenship status in the host country. I draw on 30 in-depth interviews with Indian tech workers in the US who hold or have held temporary visas (H-1B, L-1, F-1 OPT). I also draw on participant observation of events hosted by three organizations of Indian tech workers in the US (Immigration Voice, Bengali Women's Forum, and Origin Discriminated Immigrants' Group).

I contend that in CEO MDR, elite emigrants who hold temporary or "nonimmigrant" visas, end up as a "gendered subclass." By "gendered subclass" I mean a marginalized position within the "elite class pact" due to the emigrants' (1) political, (2) economic, and (3) legal vulnerability (see Banerjee 2010) in the host state. I also identify three discursive approaches adopted by the "gendered subclass" in their activism and interaction with the sending state: (1) entitled dependence; (2) mutual rejection; (3) subnational alternatives.

ROY, RIANKA* (Wake Forest University, USA)

High-Skilled Immigrants Organizing in the US: A Case of Indian Tech Workers

Immigrants have been recognized as a revitalizing force of labor movements globally, and also in the US—the largest destination country for migrants. Labor unions, worker centers, and various immigrant organizations have been instrumental in mobilizing immigrants and their families in the US. However, in the literature on immigrant workers' movements, attention to "high-skilled" immigrants' participation and contribution remains woefully limited (see Roy 2022). In this paper, I will discuss Indian tech workers' activism in the US.

The US started welcoming skilled immigrants since 1965, and in 1990 introduced the H-1B visa program, which brings mostly tech workers, other than doctors, lawyers, academics and other high-skilled professionals in high-income jobs. Indian workers have the highest representation (almost 70% in 2023) in this visa category since 1990. Other visas like F-1 OPT and L-1 which also supply skilled foreign-born labor to the US, Indian nationals have significant representation. These workers hold elite class positions with a median income of approximately US\$ 120,000. Yet, some recent studies have highlighted their precarious conditions including underemployment, underpayment, travel restrictions, family separation, and surveillance (Banerjee 2022; Purkayastha and Roy 2023).

Adding to these insights, I will discuss how Indian immigrant tech workers in the US pursue rights and solidarity, and seek protection for their families and their jobs. My research is based on 30 in-depth interviews with Indian tech workers and activists of three immigrant organizations in the US. I also draw on over years of ethnographic fieldwork, and virtual ethnography on social media and messaging platforms.

ROYBAL, CARMELA* (University of New Mexico, USA)

Kwi'Je -Walking the Lady: Native American Maternal Health, Policy and Rebuilding Healthcare Delivery Systems for Indigenous Women Globally

There are over 5.2 million Native Americans, making up approximately 2% of the United States population. Native American women historically have been subject to centuries of policy that has altered the U.S. Native population indefinitely. This includes but is not limited to the forced sterilization of women (Blakemore 2016), the lack of obstetric facilities, criminalization of breast feeding, and the federal definition of an American Indian (Spotted Bear and Soboleff 2024). Today Native American women have higher rates of pregnancy-related deaths than White women (CDC 2023) and are at risk for severe maternal morbidity (Koshimannil 2020). The current study examines the policies that have shaped both infant and maternal mortality rates and offers pathways for addressing the disparate outcomes.

Poverty, Profit, Pills: How Extractive Industry Shaped America's Opioid Crisis

While the global impacts of extractive industry and environmental colonization have become more understood in recent years, research has yet to explore how the collective and cultural trauma of exploitation has helped shape the contemporary opioid epidemic. This comparative analysis focuses on the politics of extractive industries, environmental colonization, the genesis of poverty, and widespread overdose death in the United States by examining two states that historically have led the nation in opioid-related overdose deaths per capita: West Virginia and New Mexico. In 2021, while the average age-adjusted opioid overdose death rate in the United States was 24.7, West Virginia and New Mexico were well above the average with a rate of 77.2 and 37.2, respectively (Centers for Disease Control, n.d.). Riddled

with unemployment, poverty, and educational disparities, New Mexico and West Virginia share a legacy of political disenfranchisement that has laid the foundation for decades of excessive death. Findings suggest that the policies that drove nuclear colonization in New Mexico and the coal mining boom of West Virginia fueled the opioid crisis experienced today. We argue that extractive industries, coupled with the introduction of "big pharma" and failing healthcare systems - fueled by neoliberalism - help explain why these two states have had, and continue to have, the highest opioid-related death rates in the United States.

ROZENA, SHARDA* (University of Sheffield, United Kingdom)

Experiences of Security Among the Last Secure Tenants in the UK

In the UK an activist called Helen Holdsworth protected 'thousands of often elderly, private tenants' in rent-controlled accommodation from 'being targeted by developers' (Levy 2006). Before she died in 2006, she founded The Campaign for Fairer Fair Rents, which fought against the extortionate rent increases that forced regulated tenants to leave their homes, and successfully campaigned for the government's 1999 maximum fair rent order. Regulated (or secure) tenants are those in the UK private rental sector (PRS) that have been renting their homes from before 15 January 1989, their rent is capped, and they are protected from no fault eviction. Given the date of deregulation, these renters are an older demographic in the UK. Using in depth interviews from some of the last secure tenants (of which there are estimated to be less than 75,000) I explore both the implications of this security, including experiences of harassment or neglect from landlords waiting for tenants to die, and the strength of secure tenancies to challenge corrupt landlords and create lifelong homes. Given the reducing number of these renters, now is the time to explore how resistance, activism and mobilisation (or lack of it) has occurred since Holdsworth's landmark campaign. I will also be drawing on global comparisons of housing precarity and regulation in the PRS. This research develops new knowledge about security in relation to housing tenure and contends that in-depth research on the lived experiences of those in the last secure tenancies should be central to discussion about future controls and how they might work in practice. In doing so, this paper advocates for an alliance between private renters suffering housing precarity and older regulated tenants holding on to their rent-controlled homes.

ROZENDO SOUZA, CIMONE* (Universidade Federal do Rio Grande do Norte, Brazil)

Construyendo Identidades y Territorios a Través De La Conservación De Semillas Criollas: La Experiencia De Rio Grande Do Norte (RN), Brasil

El mantenimiento y la conservación de las semillas criollas son aspectos fundamentales del modo de vida de las comunidades tradicionales, especialmente de las comunidades campesinas. En la literatura, la práctica se asocia a la ancestralidad, a la expresión de la identidad (Hall, 2006), pero también a estrategias de autonomía y reexistencia de grupos que han quedado marginados y considerados atrasados en el contexto de las llamadas sociedades modernas. Manifestación de reexistencias plurales y de otras formas de sustentar la vida (Rozendo y Brandenburg, 2022; Dal Soglio y Pereira, 2020), la salvaguarda de estas semillas se concibe como potencialmente rehabilitadora de la relación hombre/naturaleza y, consecuentemente, de los agroecosistemas (Shiva, 2003); amenazados por la agricultura industrial estandarizadora que mercantiliza y limita la reproducción de la vida con sus «biotecnologías». Bajo la presión de los movimientos sociales rurales, en 2019 el gobierno de RN creó la Política Estatal de Semillas Criollas, a través de la cual adquiere y distribuye semillas a los agricultores, creando un importante espacio para el diálogo de saberes con repercusiones socioambientales, culturales y políticas que analizaremos aquí. ¿Qué referencias identitarias desencadena esta experiencia? También tomamos como referencia empírica el mapeo de los llamados guardianes de semillas realizado por los proponentes de este artículo, en el que participaron cerca de 500 agricultores, así como técnicos agrícolas y actores estatales. Los resultados preliminares muestran que las semillas son un catalizador de fuerzas sociales que reiteran el papel de los agricultores de la región semiárida en la reconfiguración de sistemas agrícolas más sostenibles. Desde un punto de vista teórico-metodológico, privilegiamos un enfoque decolonial (Santos, 2002; Mignolo, 2015; Ferdinand, 2003) en diálogo con una perspectiva de stakeholders (Giddens, 1997).

RU, FRANCESCA* (Institute for Housing and Urban Research (IBF), Uppsala University, Sweden)

A Market at the Crossroads: Sociological Insights into the Displacement, Urban Struggle, and Renovation of the La Plaine Market in Marseille

This article examines the transformation of the Marché de la Plaine in Marseille, focusing on urban struggles, gentrification, and regeneration during the controversial renovation of Jean-Jaurès Square. Initiated in 2018, the renovation displaced the market for three years, provoking widespread public protests and highlighting its contentious role in Marseille's urban transformation. Markets like La Plaine are vital public spaces that offer affordable goods, employment, and social interaction, serving as essential resources for vulnerable urban populations, including the elderly, single women, and migrants. As noted by Gonzalez and Waley (2013), markets are at a "critical juncture," facing decline due to competition from shopping centers and neglect while simultaneously being rediscovered as tourist attractions and valuable assets in urban regeneration. The city administration's depiction of La Plaine as run-down prior to renovation underscores this tension.

The aim of this research is to analyse the socio-political mechanisms that drive the transformation of the market and the extent to which the renovation of the square has a social impact on the users of the market and the inhabitants of the surrounding area. In addition, the role of the market in the regeneration process is to be understood, whether as a brake on the gentrification process of the area or as its driving force.

The article operates on two levels. At the bottom level, it analyzes the experiences of the "market-scape" (Blennerhassett et al., 2022), focusing on market vendors, shopkeepers, customers, and residents through ethnographic methods such as interviews and observations. At the top level, it examines the perspectives of regulators and investors, incorporating interviews with city councillors and private stakeholders, alongside an analysis of official documents. This dual approach provides a comprehensive understanding of the complex dynamics at play in the renovation and its implications for the community.

RUBINO, GIANFRANCO* (Luiss Guido Carli, Italy)

Education for a Sustainable Future: An Ecoai Framework for Target 4.7

In the last two years, the massive diffusion of GenAI and LLM had worldwide shockwaves, opening new horizons in various fields, including ecoliteracy and ecopedagogy. In their new spring, AI and LLMs are at the service of teaching, therefore Ecoliteracy is fuelled by a new strength in helping to achieve the goals of Education for Sustainable Development (ESD) and Global Citizenship Education (GCED), pivotal in realising the United Nations' Sustainable Development Goals (SDGs) by fostering informed, responsible global citizens equipped to tackle contemporary challenges. However, despite the latest use of these tools for teaching and learning, there's still a gap between ecoliteracy and AI models. My contribution aims to show the first attempt of an ecoliteracy "and" AI, to use all the potential of the technology, and an ecoliteracy "of" AI, aware of the impact from its use to the environment. The current situation of the literature and theoretical contributions clearly states the lack of a specific framework focused on these two axes. An "EcoAI" framework that should be integrated into school programs to best exploit the chance to connect both ESD and GCED to work synergistically to create a holistic educational approach that addresses environmental, social, and economic dimensions of sustainability. Research indicates that data science can significantly enhance HEIs' efforts in sustainable development by providing insights into educational practices and community impacts (Filho et al., 2023). Integrating digital technologies into ESD can enhance student engagement and understanding of sustainability issues, bridging gaps between technology and sustainability education (Amballoor, 2023). Supported by dissemination data and specific theoretical studies, the EcoAI model represents the junction point where global citizenship education extends its event horizon on environmental sustainability using new AI techniques. Lastly, UNESCO monitoring progresses on Target 4.7 remains challenging, a methodology has not yet been adopted for the global indicator

RUBINO, GIANFRANCO* (Luiss Guido Carli, Italy)

Emotional AI and the Onlife Self: A New Dawn of a Novel Human-Machine Paradigm

With hyperconnectivity defining the prevalent linkage between artifacts, information, and individuals in Western societies (Hoskins, Tulloc, 2016), the connection between emotions and development of AI is essential, particularly as newer generations struggle increasingly to differentiate between online and offline activities within the infosphere (Floridi, 2014). In this new summer of AI, which will be cyclically followed by a predictable winter (Schuchmann 2019), the difference with the previous ones is that it requires a greater adaptive capacity from the identity, because the virtual environment invades every social and personal sphere in an unprecedented digital/analogue interweaving, in a chiasmus dangerously favourable to false mythologies, forcing us to manage our "user agenda" (Costa, 2018).

The myth of AI is subject to this cyclical nature of analogies and discursive changes, through ideas and concepts coming from other fields to describe its functioning or with the rhetorical use of the future, imagining that current shortcomings and limitations will soon be overcome; Finally, the relevance of controversies over claims of artificial intelligence, which should be considered as an integral part of the discourse surrounding the myth of AI, it increases doubts and false beliefs in public opinion. Technology not only evokes emotions in users, but it also shapes how this affect is expressed, experienced and exhibited.

This dynamic has implications for how the AI myth is formed. The emergence of new narratives is inherent to this new paradigm, in which engagement with artificial intelligence has the potential to influence individual identity, pushing considerations related to human self-determination.

Cultural discourses regarding digital technologies through concepts such as modern imagery or myths as well as the recognition of underlying patterns can provide useful suggestions for examining the rise of more than just the specific myth of AI, but also of technological myths built in other contexts.

WAGNER, ALEKSANDRA (Jagiellonian University, Krakow, Poland)

Navigating the Currents of Decarbonisation: Embedding Justice in the Journey(s) Towards a Post-Transition World.

In the Anthropocene, where climate change presents unprecedented threats, societies globally are searching for sustainable pathways to transition. The increasing recognition of the interconnectedness between social and natural systems, combined with the complexities of social and environmental justice, challenges the capacity for effective and predictable governance. Yet, despite these challenges, the global pursuit of climate neutrality continues, with decarbonisation emerging as a key strategy.

This paper examines the role of models and modelling in decarbonisation as a pathway toward a post-transition world. It moves beyond technical considerations to explore how justice—both as an input and an outcome—can be meaningfully integrated into modelling practices. Grounded in the conceptual approach of the PANTHEON project, an EU-China initiative focused on integrated assessment modelling of global decarbonisation pathways, this paper investigates how diverse stakeholders experience decarbonisation processes and how their perspectives can be embedded in complex modelling frameworks.

Through reflexivity and stakeholder engagement, PANTHEON captures the intricate web of actors involved in decarbonisation, including dominant and marginalized groups. The project contextualizes decarbonisation across local, regional, and global scales, considering cross-sectoral, cultural, and behavioral dimensions alongside issues of temporality, path dependency, and the capacity for transformative change. This paper underscores the importance of reflexivity and stakeholder engagement in assessing knowledge production around climate justice and its pathways, offering insights into governance's role in navigating these complexities. Ultimately, it raises the question: what kind of world(s) might emerge at the end of this pathway?

Just Transition and Labour Movements: Theory and Practices from a European Action-Research Project

This paper reflects on the principle of "just ecological transition" as a means by which, by incorporating the social sphere into decarbonization strategies, the "work versus environment" conflict that has characterized the advent of the climate question can be overcome. The decarbonization of the capitalist system and the need to govern in a fair and "just" way the major technological, political and cultural transformations that derive from it is becoming a key focus of contemporary social struggles.

The work presents the main findings of a European project REJenerAXION (Energy for a just and green recovery deal: the role of the IR in the energy sector for a resilient Europe), which analyzes the role of industrial relations and social dialogue in supporting a just energy transition in eight countries from Northern, Southern, Central and Eastern Europe. The methodology is based on desk analysis and 24 case studies with a comparative approach. The study aims to understand how union action is being reconfigured in response to the socio-technical transformations generated by the ecological crisis to assume a pro-active, rather than reactive, role in favor of an environmentally and socially responsible transformation of the development model. In this regard, a work-oriented narrative of the ecological transition is proposed, rather than a market-based or ecological modernization-oriented one, with the aim of giving voice to those who are affected by the distributive effects of the transition (workers, communities, territories) and who are the concrete agents of eco-social change.

Emociones En Movimiento: Contranarrativas De Migrantes Sudamericanos En Santiago De Chile

Diversos enfoques dan cuenta de la dimensión relacional y construida de las emociones en contextos sociales, históricos y culturales. Asimismo, el reconocer el carácter relacional de las emociones, permite considerarlo un recurso analítico para enfrentar y entender la realidad social. En la migración, las emociones se encuentran profundamente vinculadas, por su carácter excepcional y complejo, en donde, se ponen en juego las acciones desplegadas en torno a ellas en la vida cotidiana. Por ello, el objetivo del presente artículo es entender los mecanismos de resistencia emocional de los migrantes sudamericanos residentes en Santiago de Chile. Para ello, se desarrolla una metodología decolonial narrativa, centrado en la comprensión de las diversas formas de movilidad que tienen los migrantes sudamericanos en Santiago de Chile, y por tanto, de experimentar su habitar migrante en la ciudad, su relación con las trayectorias vitales, y sus emociones. Los principales resultados de este trabajo proponen que es posible identificar cómo la fluctuación emocional es parte de una serie de estrategias para abordar las exclusiones hacia las personas migrantes. Se aprecia el despliegue de su agencia como sujetos que migran, en directa relación con las estructuras imperantes. La migración se constituye en una más de sus experiencias, la cual marca significativamente a estas personas, desde la transformación y flexibilidad, sin desconocer la complejidad que esta implica.

Problematising "Home Alone" Cross-Culturally

Around the world, children spend time unsupervised by adults. Both positive and negative outcomes may ensue for children and families. Large household surveys in low- and middle-income countries often use the term *home alone* to investigate instances when children are "alone" or "supervised by another young child" in very different settings, drawing conclusions and comparisons which may be problematic. The extent and consequences of the *home alone* phenomenon vary, partly (we argue) due to different understandings of what being *home alone* means in different contexts. The perspectives of children are often not captured either, further hindering the interpretation and utilization of results.

We conducted participatory workshops with 127 boys and girls aged 6-10 years in rural and urban settings in the Northern and Eastern regions of Ghana (n=63) and in Luang Namtha and Vientiane provinces of Laos (n=64). Through dialogue and visual methods (i.e., community mapping and the Participatory-Photography Assessment Tool (P-PAT) (Ruiz-Casares, et al., 2013)), we explored children's understandings and experiences *home alone*. Children's views largely reflected time spent with siblings and peers and mobility within the community, thus raising questions about isolation and other common elements of *home alone* in Western contexts. Positive and negative feelings about supervision emerged from supervisors and supervisees. Appreciation for children's caring roles and concerns about safety and wellbeing in the community coexisted with disclosure of violence and disregard from siblings. Critically engaging with the concept of *home alone* across different cultural contexts is crucial to ensure that research and measurement tools are both relevant and accurate, capturing variations across cultures and urban/rural planning. In line with theories around care, agency, and childhood as a social construction, this paper will present findings from our study and explore the potential and limitations of this approach.

Questioning Underlying Assumptions of Ethical Practices and Regulations in Co-Research with Children and Young People

Involving children and young people as research participants has been testing for our ethical institutions and regulations; to involve children in further and other roles, such as co-researchers and child-led researchers, has raised additional and even more testing issues. This presentation will explore challenging ethical dilemmas in our research experiences within the International and Canadian Child Rights Partnership (ICCRP), which involves academic teams, organisations and children and young people in numerous countries around the world. In particular, we will share dilemmas on payment for children and young people who are ICCRP advisers as well as navigating multiple ethical committees across countries. These reflect on the key concepts for this session – decolonisation and epistemic justice – raising questions about the underlying assumptions of our ethical practices and regulations.

"Allegados": A Historical, Political and Comparative Description of the Doubled-up Households of the Global South

According to the Royal Spanish Academy (RAE), "*allegado*" means "close or near" in space or time, and in Argentina, Uruguay, Puerto Rico, and Chile, it refers to someone living temporarily in another's house, often not a relative. In Chile, however, "*allegados*" has become a significant housing, social, and political issue, describing people or families who live informally with relatives or friends due to the lack of their own housing. This is linked to the housing crisis, elevated prices, social housing shortages, and difficulties in obtaining loans, exacerbated by recent waves of migration. "*Allegados*" often live in overcrowded conditions, impacting their quality of life, and is an indicator of extreme poverty.

The phenomenon arose in the 1980s during Chile's Military Dictatorship, when land seizures were severely repressed, and the newly established ABC model for social housing (□*Ahorro*□, □*Bono*□, □*Crédito*□: savings, subsidy, mortgage) failed to address the growing deficit. While in other Latin American countries the poor were massively establishing in informal settlements, in Chile this was not possible. Hence, "*allegados*" is considered a primarily Chilean phenomenon, at least within the region. In addition, "*allegados*" in Chile became a central phenomenon and a political actor in the protests against the dictatorship. In the 1990s, "*allegados*" were instrumentalized and channeled into committees for accessing housing subsidies, although towards the 2000s they re-emerged as political actors in a new era of politicization.

This paper explores "*allegados*" in Chile through (1) its historical origins in the dictatorship, (2) the political role of housing actors in different periods, and (3) comparisons with other Latin American countries.

From Linked Lives to Entangled Biographies: Intergenerational Transmission and Transnational Transitions in Biographical Trajectories of Migrant Families

Research on transnational families has highly contributed to the understanding of cross-border life worlds beyond the methodological nationalism. It, however, has seldom engaged with the question of temporality of transnational practices from a longitudinal intergenerational perspective. In my paper, I take up this issue and discuss it from a life course informed, reconstructive biographical research perspective. I ask how and when transnational transitions take place, how they are biographically narrated and what role cross-border practices, family memories and intergenerational transmission play in these narrations. In consequence, I argue for the need to research the life worlds and biographical trajectories of the members

of migrant families from a longitudinal, temporal perspective in order to understand the pivotal role of intergenerational transmission in biographical, transnational transitions. I focus my discussion on exemplary life course transitions and family trajectories. I draw on biographical-narrative case studies from a multigenerational research project on social upward mobility experiences and their intergenerational negotiations in the context of labor migrants and their descendants living in Germany.

Mental Health Challenges in the Socio-Cultural Context: The Study of Suicide Attempt Among Women in Marginal Neighborhoods

In this research, we have studied suicide attempt among women in the marginal neighborhoods of Khorramabad (a city in Iran) using the phenomenological methodology. Through purposive sampling, data were collected through in-depth interviews with 20 participants who had experienced suicide attempt. Clayse method was used to analyze the data. In understanding the participants' perceptions of the causes and contexts of suicide attempt in these neighborhoods, we reached seven main themes, each of which has more detailed categories and concepts. These themes are: 1. Poverty and economic issues; 2. domestic violence; 3. Forced and early marriages; 4. Continuation of difficulties; 5. Incompatibility with traditions; 6. Social pressure; and 7. Lack of social support. Semantic constructs indicate that the research participants experience a complex, insecure and difficult living environment according to their specific socio-cultural background, which damages their mental health and leads to their weakness in dealing with the stresses and pressures of life and reducing their decision-making power. In addition, the results indicate the presence of psychological disorders and issues such as depression, anxiety, stress, trauma, social stigma, low resilience, personality disorders, and impulsivity among these women. Therefore, mental health centers in marginal neighborhoods should regularly examine and screen women's thoughts and behaviors related to suicide in order to provide psychological interventions if necessary.

Telework and the Aging Workforce: Navigating Flexibility and Caregiving in Italy's Quaternary Sector

The rapid expansion of telework during the COVID-19 pandemic has triggered substantial shifts in work practices, particularly in economies with aging populations like Italy. While existing literature has explored the impact of telework on gender dynamics and work-life balance, the experiences of senior workers aged 55 and above have been underexamined. This article addresses this gap by investigating how telework affects senior and pre-senior workers in Italy, where remote work is on the rise against the backdrop of demographic aging.

Drawing on a qualitative study of teleworkers in Milan's quaternary sector, the research highlights both challenges and opportunities posed by telework for this demographic. Many senior workers belong to the "sandwich generation," balancing paid work with caregiving for both children and elderly parents. While telework affords flexibility and reduced commuting time, it also exposes these workers to risks of overwork and intensifies the demands of unpaid care work. However, contrary to conventional views, this study finds that senior workers also leverage telework as a strategy to "quiet quit" by redefining work-life boundaries without opting for early retirement.

These findings emphasize the need for targeted policy interventions that address the distinct challenges faced by older workers, acknowledging both the benefits and limitations of telework in fostering sustainable labor force participation among aging populations.

Fostering Eco-Citizenship through Nature Immersion in Higher Education: A Case Study of the Transdisc Project

The mission of environmental education includes developing a critical, competent, and committed eco-citizenship that recognizes the interdependence between society and nature. Experience in nature is crucial to this approach. While 'nature-based' education is popular in basic education, higher education courses and training often emphasize a managerial or expert perspective on sustainability, focusing on cognitive skills.

The TransDisc research project (2021-2023) designed an experimental nature immersion program for higher education students to address this gap. The project aimed to test the value of an ex-situ activity prototype inspired by ecoformation practices (Nicolas, 2023) developed within civil society networks, particularly the Work-That-Reconnects (WTR) and Psychosocial Intervention through Nature and Adventure (IPNA). The WTR approach, rooted in environmental activism, seeks to use nature connection as a catalyst for social transformation (Macy & Johnson, 2018). IPNA, a social innovation process, aims to provide sustainable responses to social needs. Group adventures in nature can raise awareness and foster individual change. Interventions are aimed at the overall development of the individual and the transformation of society by focusing on values linked to solidarity rather than profitability. (Rojo & Bergeron, 2017).

These approaches emphasize the bond of interdependence with living beings, emotions, imagination, and the body. The team of "professors-researchers" collaborated closely with societal actors throughout the process, from observing their work to co-designing a pedagogic prototype tailored to higher education, and finally, facilitating the program with a group of volunteers. This paper focuses on a case study of this social innovation.

Integrating Time in Environmental Sociology: Research Avenues from Various Time Epistemologies

While space has been a central focus of environmental sociologists, less attention has been devoted to time. The sociology of the environment and the sociology of time emerged during the same period. In the 1970s, both disciplines started to challenge the prevailing tendency to consider the biophysical environment and time, respectively, as unquestioned background conditions. A similar, longstanding debate exists between a realist and a constructivist approach in each of these two fields. The dearth of scholars who developed a socio-ecological theorization of time (Elias 1992; Adam 1998; Urry 2000; Murphy 2001; Newton 2003; Bansal and Knox-Hayes 2013; Lockie 2014; Lockie and Wong 2018) share a common concern for the need to reconsider the dualistic distinction between "social" and "natural" time. The analysis should not only deal with human beings and their relationship to time, but also with the specific temporality of biophysical processes in their interlinkage with the multiple temporalities of social processes. Time related concepts (sustainability, transition, the Anthropocene...) as well as specific temporal features of Earth system processes (acceleration, tipping points, uncertainty, irreversibility...) are key to deepen our understanding of the constraints we face when tackling the current socioenvironmental threats, as well as to envision new potential pathways to social transformation. The paper argues that socio-ecological theorization of time would enrich several strands of research in environmental sociology. More temporal thinking entails theoretical and empirical scholarship that explicitly engages time as a central dimension of analysis or object of study. I will draw on an original epistemological quartet (*time conceived, perceived, imagined and planned* in Ruwet, 2021) highlighting two major dimensions of knowledge production and reception around time (institutional-subjective and contextualized-decontextualized) to illustrate the interest of this framework for new directions in environmental sociology.

RYAN, TOM* (University of Sheffield, United Kingdom)

Humour As an Act of Resistance: Learning Disability and Siblinghood

Humour can be seen as an essential part of family life that is used in a number of ways, some that bring closeness and others that can be more exclusionary. Family sociology provides an understanding of siblinghood that is understood as 'backstage' and consisting of almost simultaneous closeness and ambivalence. This insight brings with it reflections around the role of humour in sibling relationships, one that when growing up with a sibling with learning disabilities can lead to interesting reflections around disability humour- as distinct from disabling humour. The relationship between disability and humour is one that has historically been controversial, with disabled people often on the receiving end of jokes culturally and socially. Acknowledging this context, it is also important to note the more radical potential of humour to be used in acts of resistance. Drawing from 14 narrative interviews using creative methods with siblings of people with learning disabilities this talk will explore how families use humour as an act of resistance. This resistance comes in two areas, firstly in more active resistance against structures of exclusion with participants using jokes and humour to highlight their dismay and frustration, bringing unity in the process. Secondly humour will be discussed in relation to resisting deficit narratives with the potential of humour to reject dominant pathological narratives of learning disability being explored. This section will draw on Goodley's (2023) conceptualisation of learning disability as human praxis to explore the radical crip potentials that disability humour can bring through its role in sibling relationships. Through this talk the resistive potential of humour will be centred looking towards more affirmative understandings of siblinghood and disability that are holistic and centre the human.

"Digital Nomads" As a New Form Form of International Mobility Born By the COVID-19 Pandemic

The phenomenon of "digital nomads" was manifested during the COVID-19 pandemic, when many people "hung out" in other countries, but continued to work for their employers online. Digital nomads are a socio-demographic cohort comprising predominantly young, creative, business and active people with high migration mobility and business activity, capable of generating innovative ideas, attracting investment and creating job places. Mostly digital nomads are men between 30 and 40 years old (64%). About 90% of digital nomads have a college degree. The study is based on the sociological method: secondary analysis of online survey data of digital nomads (Digital Nomad Database, 52160 cases); 45 in-depth interviews in 2022-2024 (ten countries).

Five socio-economic effects of digital nomad migration are highlighted. First, multiplier effects for the development of the digital economy (Estonia). Secondly, the recovery and stimulation of tourism, which is the most important economic sector of many developing countries and was severely affected during the COVID-19 pandemic (Thailand and Indonesia). Third, some countries and localities can partially "rejuvenate" the age structure of the population and compensate for the "brain drain" by attracting young and highly educated migrants, attracting representatives of the creative class, young people, increasing the level of education of the population, expanding cultural diversity, revitalizing the labor market, increasing the population (province of Estremadura in Spain). Fourth, generating direct and indirect revenues from digital nomads (Latin America). Digital nomads, while residing in the country, spend a significant amount of money on rent, running costs, and in addition, invest their own money in real estate, investments and development funds of the host countries. Fifth, attracting insurance funds into national health care systems (Malta, Costa Rica).

The study shows that the cohort of digital nomads, although small in number compared to other categories of migrants, is an important component of socio-economic development.

Entanglements of Sexuality & Anonymity of Children in the Digital SPACE: Children's Encounters with Strangers on Omegle

As internet accessibility surges globally, with 71% of children aged 5-18 online in developing countries (UNICEF, 2020), concerns about online safety escalate. Global reports suggest online exploitation of children at alarming rates, 1 in 5 children report being asked to engage in sexual activities online (UNICEF, 2020). This study investigates children's interactions with strangers on Omegle, a popular anonymous videochat platform.

The qualitative research was conducted with a framework characterized by 'Online Participant Observation' where the researcher engaged in videochatting with strangers on Omegle in the pretext of a regular user. The sample of the study was found on the platform by providing 'Interests' (an option like that of keywords, where Omegle tries to match users with similar interests). The research was carried out between 2021 & 2022 with the target population through online engagements where the platform matched significant number of users that were under the age of 18, with 14 children under 13 years. The keywords that targeted children matched adult men exposing nudity, masturbating etc.

The observations on Omegle revealed distressing exposure to:

Children being subject into soliciting sexual fervours

Explicit content and nudity

Children's self-exploration of sexual desires and nudity

Findings underscore children's vulnerability in using digital platforms for self-exploration of sexuality and the self can be a major threat to child protection. This scenario can be further worse in low-income and developing countries where limited digital literacy and inadequate parental oversight exacerbates online risks of grooming and trafficking. Omegle was permanently shut down in 2023 due to accusations of facilitating online child abuse, but the anonymity and real-time experiences of the digital world continues to be a hotbed for children. This study contributes to re-thinking of child's perception of sexuality, online risks to childhood and the need for parental involvement.

The Evolution of the Tunisian School of Thought in Arab-Islamic Civilization

Numerous Tunisian thinkers have established a humanistic and theologically progressive discourse on justice that seeks to make human rights norms compatible with the core values of Islam. This paper examines the intersection of culture and law, utilizing critical research and the sociology of Islam. It will shed light on the "Tunisian School of Thought in Arab-Islamic Civilization" and its evolution from the historical Tunisian school that focused on the objectives of Islamic law within the Maliki Madhhab. In modern times, it highlights the contributions of the thinker Tahar Haddad (1899-1935). It will underscore the contribution of Professor Abdelmajid Charfi and historians of Islamic civilization such as Hisham Ja'it and Mohamed Talbi, noting the variety of approaches among selected academics. It then focuses on women academics, such as Zahia Jouinou, Amal Grami, and Olfa Youssef, who earned their Ph.D. degrees under the supervision of some of these scholars. These academics belong to the first generation of women scholars of Islamic civilization and graduates of Tunisia's modern higher educational institutions. Through their knowledge production using applied Islamic studies, teaching, and activism, they have fostered academic mobilization. The paper delineates their relationship to mainstream Islamist and secularist positions on topics related to Islam and social justice. The paper seeks to answer these questions: What are the key epistemological assumptions underlying the work of these contemporary Tunisian scholars? How do Tunisian feminist scholars engage with classical and modern texts, and how do these engagements reflect broader societal transformations? The paper first sets the emergence of this wave in a historical and sociological context within a theoretical framework. Then, it examines their various assumptions and discusses their broader societal, ethical, and political implications. The paper is based on a monograph that explores the intellectual depth and the ideological effect of this school of thought.

Transnational Muslim Feminist Approaches to Reimagining Family Law and Ethics for Social Justice

A crucial aspect that can enhance the quality of life for Muslim women, men, and children involves the reform or reimagining of Islamic family law and ethical values within families. Islamic Studies Scholar Juliane Hammer emphasizes that progress hinges on convincing enough community members of the authenticity and significance of discourses.[1] While her statement is rooted in the American Muslim context, the need for consensus extends beyond any single setting, crucial for the success of feminists. Interdisciplinary approaches within academia provide the intellectual framework to address social justice and gender equality effectively, encompassing deliberations on the common good and justice grounded not only in an Islamic framework but also in scientific advancements. This paper focuses on transnational feminist activism in Muslim family law and familial ethics in the twenty-first century. Building trust in family law reformation benefits both families and society. Women's initiatives like organizing women's Friday sermon speeches,[2] Islamic feminist theorizing, rooted in Islamic tradition promote care while balancing roles and responsibilities in the family amid societal changes. Notable Islamic feminists including Sa'diyya Shaikh, Amira Abou-Taleb, Nevin Reda,[3] and Roshan Iqbal[4] have explored gender norms and laws in the family. Their insights, that can lead to a new consensus for social justice, will be synthesized and presented in this research paper.

Palestinian Art after the Nakba

The presentation explores Palestinians' representations in visual art of the existential crisis they faced following the destruction of Palestinian society during the 1948 War, known as the Nakba. It also delves on how this colossal event has been conveyed artistically, and discusses artworks that revolve around Palestinians' subsequent states of being. In particular, it assesses how various motifs were used to convey varied, and even opposite, states of being and consciousness, as well as survival strategies, that go beyond commonplace views and perceptions about Palestinians. Moreover, this presentation discusses how the allegorical language of these artworks augments their meanings and might open a window into the world of the Palestinians, who lack archives, official historical narratives, and institutions of remembrance.

RC36-591.1

SA'DI, AHMAD* (Ben Gurion University, Israel)

Whither Sociology of the Vanishing Human

Whether adopting methodological individualism or structuralism, sociology's primary interest has been the human subject's living conditions, behaviors, and interactions under capitalism. In mainstream sociology, this individual is taken to be largely rational and enjoys a certain degree of freedom, autonomy, and privacy. However, many of these attributes are challenged in the current data-driven neoliberal mode of production. The individual is no longer considered an all-inclusive entity. Instead, s/he is regarded as an assemblage of data, decomposed and recomposed to serve the needs and interests of external entities. Thus, the "dividual" (as an assortment of data) has substituted the individual as the basic unit of analysis in many policy-oriented and marketing research. Furthermore, the increasing reliance on algorithms, AI, and the intensifying human-machine interface are likely to render many of the above-mentioned values untenable. In a datified and mass-surveillance governed societies, the human agency is compromised. Privacy, personal autonomy, and freedom are no longer guaranteed. Moreover, the virtual world no longer occupies a specific portion of the person's time; instead, it has become the "real" or the primary reality in which humans live. Not only are various platforms used for shopping, interacting with other humans (maybe!), and getting help and services, but also machines (robots) are entrusted with fulfilling caring functions. They might also be assigned in the near future jobs that demand discretion..

The compelling role of external factors in affecting social relations or human consciousness and behaviors - whether economism or technologism - has been realized long ago in sociological thought. In this regard, Georg Lukacs, for example, employed the concept of reification. Yet, existing sociological theorizations are unable to grapple with the unfolding reality where the virtual world, which is increasingly automated and run by machines, is taking over humans' lives.

SAABNEH, AMEED* (University of Haifa, Israel)

The Commodification of Lands and Housing within Palestinian Society in Israel: The Evolution of a New Stratification Mechanism and the Expansion of Spatial Mobility?

This project explores a recently emerging process of commodification of land and housing in Palestinian localities in Israel and the socioeconomic and demographic consequences of this process for the Palestinian community. While in a narrow sense commodification involves the transformation of private land into a commodity and the development of a housing market in Palestinian localities, in a broader sense it entails a transition from the set of social, economic, and spatial relations that emerged due to the dominance of a housing regime based on extant land ownership and characterized by self-building on private land—and thus highly independent from the state and the housing market—to the new set of relations that will emerge in the context of the incipient market-based regime. The project examines both the forces propelling the commodification of land and housing and the consequences of this transition. The project adopts a multi-method approach, combining qualitative and quantitative research methods.

I argue that commodification constitutes a new mechanism of social stratification that impacts socioeconomic inequality within Palestinian communities. A significant decline in the family's ability to transfer land to the younger generation pushes younger family members to rely more heavily on the mortgage market, and thus home ownership becomes more stratified. In addition, the transition to a housing market allows young Palestinians more flexibility in residential location; they will have to choose whether to live within or outside the community based on multiple factors including job opportunities, distance to their workplace, and proximity to parents. Lastly, the commodification of housing will likely modify social relations—specifically gender relations and intergenerational solidarity, which were strongly influenced by the previous housing regime.

SAADI ADEL, SABRY* (University of Québec in Montréal, Canada)

Supporting IPV Survivors: Experiences, Services, and Needs

In Québec, intrafamilial homicides account for 29.5% of all homicides, with the majority being cases of domestic violence-related killings by men of their female (ex)partners (MSP, 2023). Coercive control is a prevalent dynamic in these cases. Retrospective reviews reveal that many women sought help before their murder, underscoring the need to understand and address their help-seeking experiences. Our research focuses on the often-neglected needs of survivors and their close ones, especially during the post-separation period, emphasizing self-determination and the ability to protect themselves and their loved ones.

This study aims to reveal the complex psycho-socio-judicial needs of survivors and their close ones in the post-separation period, highlighting their help-seeking strategies. It aspires to enhance understanding of self-determination and agency, underrepresented aspects in the domestic violence literature, with the goal of improving comprehension of coercive control and domestic violence dynamics.

We conducted in-depth interviews with survivors of near femicide and proxies of women killed. Data was collected from the Canadian Initiative for the Prevention of Domestic Homicides, focusing on Indigenous, rural, immigrant, and child-exposed populations. Using 26 interviews from Québec, we employed a narrative research framework, probing participants on their help-seeking experiences, barriers, and reflections on their journeys.

Phenomenological analysis was used to interpret the intimate experiences of individuals, ensuring methodological rigor through open-ended, narrative interviews. The author brings a unique perspective, combining personal and professional experiences in the field of domestic violence, offering sensitivity and empathy to survivors' narratives.

The research aims to illuminate the post-violence journeys of survivors and to influence interventions and policies. By identifying specific needs and examining self-determination strategies, this study proposes a framework for improving support systems and for creating more effective public policies. The ultimate goal is to provide essential information to strengthen the protection and support of survivors of attempted femicide and their close ones.

SAALFELD, ROBIN* (Friedrich-Schiller University Jena, Germany)

From Renters to Investors? Residential Property and the Asset Economy in German Couples' Lives

This paper explores the asset economy's influence on Germany's housing market through qualitative interviews with couples, utilizing a praxeological approach informed by Karl Mannheim and Pierre Bourdieu. The study uniquely positions the German housing market as a critical case study, contrasting its historically rental-centric tradition with the rising asset appreciation trends. Analysis of in-depth interviews with 47 German couples, employing a qualitative approach with the Documentary Method, unveils distinct orientations towards residential property, significantly influenced by generational and socioeconomic variations. While a minority of couples have embraced investment-focused strategies consistent with broader assetization trends, the majority still perceive residential property as a stable, long-term family investment. Additionally, confronted with escalating property prices and limited to renting, younger couples are increasingly turning to alternative financial avenues such as ETFs and stock shares. This shift is not only accompanied by greater financial autonomy within intimate relationships but also highlights the pivotal role of financial literacy as a form of cultural capital essential for overcoming economic obstacles and modifying social inequalities. The findings indicate an impact of asset economy trends on German couples, demonstrating an interplay between enduring traditional values and evolving financial behaviors. Overall, the paper stresses the critical role of cultural knowledge on property in molding economic behaviors and class dynamics, advocating for further research into how cultural endowments and preferences intricately shape economic outcomes in a stratified society.

SAALFELD, ROBIN* (Friedrich-Schiller University Jena, Germany)

What's Mine Is Yours: A Qualitative Study on Private Property Among German Couples

This poster presents findings from a study on property inequality within the intimate lives of couples in Germany. Using Karl Mannheim's sociology of (tacit) knowledge as a theoretical and methodological backdrop, the study analyzes 47 dyadic interviews with couples employing a qualitative-reconstructive approach. The investigation identifies six distinct collective orientations toward private property, nospanning from wealthy couples employing investment-focused strategies, to middle-class couples prioritizing stability or experience-seeking, and onto more marginalized groups adopting either critical consumption perspectives or ad-hoc "muddling through" strategies in the absence of significant property assets. Each orientation is distinctively shaped by factors such as property portfolio, ownership mode, investment and consumption behavior, debt management, property-related relational dynamics, and gendered division of labor. The findings also reveal cohort-specific variations that emphasize a marked generational shift toward more individualized and diversified approaches to managing property in intimate relationships. This not only points to changes in relationship concepts over time, but also to a substantial transformation within the domain of private property, challenging its traditional role and significance in the social structure. By documenting these shifts at the micro-level, the study not only highlights the diverse strategies couples employ to navigate their economic realities but also raises critical questions about the role of property ownership in understanding patterns of social stratification and inequality.

The Critical Role of Case Managers in the Vocational Rehabilitation Process: Areas of Tensions and Challenges

Case management is a client-centred approach that plays a central role in transitioning to vocational rehabilitation, particularly for individuals with complex needs. It has become a critical intervention for helping individuals navigate the pathways to employment, especially for those facing significant barriers: disabilities, long-term unemployment, or chronic illnesses. The primary goal of case managers is to support insured individuals in integrating the knowledge and experiences gained during rehabilitation into their everyday lives, thereby fostering a sustainable return to working life. This support includes guiding them from inpatient or full-time outpatient care to their regular work environment (DRV Bund, 2023).

In vocational rehabilitation, case managers play a central role in identifying the individual's vocational goals, assessing their functional capacities and barriers, developing a personalized intervention plan, and coordinating services across various health, social, and employment systems. Accordingly, case managers often operate in a field of tension between pedagogical-therapeutic expectations and their frequently non-pedagogical or therapeutic training.

The effectiveness of case management is often limited by systemic challenges, resource constraints, and external socio-economic factors, which are contradictory to a practical and individual case management approach, or the fact that effective case management requires seamless coordination across various systems – health care, social services, and employment agencies – which can be a significant challenge, especially for case managers. A concerted effort is needed to enhance intersectoral collaboration, increase resources, and address systemic barriers that impede vocational rehabilitation to maximize its potential. Moreover, empowering clients to take an active role in their vocational rehabilitation is essential for fostering long-term success in employment. This presentation examines how case managers deal with the limitations and challenges of case management in vocational rehabilitation. Using the Grounded Theory Methodology (Strauss & Corbin, 2010), expert interviews with case managers are analysed to highlight professionals' strategies to deal with these tensions.

RC43-JS-72.5

SAARISTO, SAILA-MARIA* (Iscte - Instituto Universitário de Lisboa, Portugal)

Navigating Displacement: Housing Precarity and Migrant Survival Strategies in Luanda

This proposal builds on prior research on housing precarity in the Lisbon Metropolitan Area (LMA), where housing financialisation, rising housing prices, and wage stagnation have limited access to adequate housing for low- and middle-income workers and the unemployed. Our previous findings showed that housing exclusions are influenced by gender, race, and class-based barriers (Saaristo, 2022). Migrant women often encounter exploitative labour conditions in the care sector, which affect their ability to secure decent housing due to low wages and precarious employment, forcing many into conditions of displaced survival (Soederberg, 2021).

Public policies often fail to address these needs, leading migrants to develop their own housing strategies in the LMA: self-built neighbourhoods on occupied land, unauthorised council housing occupations, and shared living arrangements like bed-sharing. Each of these options presents serious security of tenure challenges: self-built areas face eviction, unauthorised occupations encounter legal issues, and shared living arrangements result in overcrowding and limited legal protection.

The proposal at hand takes one step back in this cycle of displacement by examining Angolan women's – a significant immigrant group in Portugal – previous migration and dwelling routes, analysing them as survival strategies and forms of popular entrepreneurship, in line with the notion of 'neoliberalism from below' (Gago, 2017). In Angola, four decades of war caused a major demographic shift when people from rural conflict areas fled to the urban settlements on the coast, resulting in rapid urbanisation in coastal cities like Luanda. Migrants often live in environmentally hazardous areas with no tenure security, facing risks of climate-induced displacement and eviction. The ongoing research with the Angolan NGO Development Workshop employs methods like self-census, social cartography, and interviews in three Luanda neighbourhoods to understand displacement cycles and the housing needs of migrant communities, aiming to inform policies that promote dignified living and combat exclusion.

Poderes Judiciales Bajo Acecho: México En Perspectiva Comparada

El acecho de los poderes judiciales, particularmente de las cortes supremas y los tribunales constitucionales, es una de las características del proceso de declive democrático que ha experimentado un número creciente de países en los 15 años más recientes. Aunque la experiencia mexicana de los tiempos recientes pareció durante un tiempo un caso prototípico de este proceso, el proceso de aprobación y los alcances de la reforma judicial de septiembre 2024 indican que en realidad se trata de un caso extremo, en la medida en que la reforma supone una purga judicial completa, introduce el voto popular como mecanismo de elecciones de todos los juzgadores, e instaura un

tribunal con amplias facultades para disciplinar a todos los jueces. El objetivo de esta ponencia es describir el proceso que desembocó en la aprobación de la reforma y utilizar el caso mexicano para analizar la forma en la que las características y respuestas de los poderes judiciales inciden los procesos de acecho judicial.

The targeting of judicial powers, particularly supreme and constitutional courts, is one of the characteristics of the process of democratic decline that an increasing number of countries have experienced over the past 15 years. Although Mexico's recent experience initially appeared to be a prototypical case of this process, the approval process and the scope of the judicial reform of September 2024 indicate that it is, in fact, an extreme case. This is because the reform involves a complete judicial purge, introduces popular vote as the mechanism for electing all judges, and establishes a court with broad powers to discipline all judges. The aim of this paper is to describe the process that led to the approval of the reform and to use the Mexican case to analyze how the characteristics and responses of the judiciary influence judicial targeting processes.

Working for Pleasure, Not Money: Cairo's Associative Literary Scene and Its Alternative Value System

In Egypt, as in many other places, literary stardom is rare. For most writers, literature serves as a "second profession" (Lahire 2015), pursued out of passion alongside their primary jobs, which offer financial stability. The tradition of literary symposiums – where book launches, poetry evenings, and honoring ceremonies take place – helps the amateur literary scene to flourish. Centered around literary clubs, self-publishing, and restricted readership circles, Cairo's associative literary scene is entirely sustained by the voluntary work of writers who invest their personal resources, such as time, finances and social connections, to help this world thrive. Based on a long-term ethnographic study of literary clubs in Cairo, this presentation explores the motivations of writers to invest significant resources into their literary hobby. Drawing on the anthropology of value (Graeber 2001) and the notion of literature as the product of imaginative and material "surplus" (Schielke, 2021), this paper argues that amateur literary practices create an entire literary ecosystem outside the mainstream commercial market, driven by the economy of literary fame and the ability to "live by one's pen." This presentation contends that this alternative literary ecosystem operates under a unique set of values derived from Egypt's cultural bureaucracy shaped by socialist welfare objectives. Unlike the commercial market, these values perceive literary work as driven by the goals of community activism, knowledge transmission, social improvement, and the power to dream and aspire.

Bifurcated Consciousness and the Defense of Colonial Violence

This paper explores the concept of "bifurcated consciousness" in the context of Israeli settler colonialism, focusing on the social and institutional mechanisms that create epistemological divides in understanding violence and political reality. Drawing an historical throughline between early Zionist colonization during the British Mandate and contemporary moments (the protest movement that sprouted in 2023 against the right-wing judicial overhaul, and then October 7 Hamas incursion and Israel's genocidal war), I analyze how the Jewish society in Israel/Palestine has experienced a fragmented perception of self and other. Through analysis of primary historical and contemporary sources, I demonstrate how settler colonial mobilization reinforces social cohesion and a nationalist moralism. Bifurcated consciousness, as I explain here, refers to a mode of claims-making in which individuals and groups obscure or deny the connections between settler colonialism and systemic violence. This epistemological apartheid underpins the social structures that legitimize colonial domination and exclude Palestinians from the realm of political and collective rights. It is institutionalized in Israeli academia, state policies, and public discourse, manifesting in social sanctions against those who challenge the dominant narrative. The talk situates this within broader theories of settler colonialism and collective action, arguing that such bifurcations sustain ongoing cycles of violence and impede pathways to true decolonization. Arguing through archival sources on the Hashomer Hatzair movement that bifurcated consciousness first emerged amid the initial moment of colonization, I then turn to the consequences of epistemological apartheid in contemporary times, where violence is understood through racialized and dehumanizing lenses, leading to a broader dismissal of the Palestinian right to life. By addressing the role of culture and cognition, this presentation calls for a critical and historical understanding of colonial violence and resistance, theorizing intellectual interventions that dismantle the perpetuation of supremacy and exclusion.

SABBAGH-KHOURY, AREEJ* (Hebrew University of Jerusalem, Israel)

On the Monopoly of Violence: Ideal Types of Settler Colonial Violence and the Habitus of Sumud

Political sociologists have long articulated state-making as the concentration of power and violence within state apparatuses. However, classical theories have often overlooked distinctive characteristics of settler colonial nation-state formation, whose *raison d'état* is the preservation of settler sovereignty and supremacy. Unlike traditional states that centralize violence within formal institutions, settler colonial states are marked by the dispersal of power and violence to settler-citizens, effectively blurring the boundaries between state and society. These states rely on practices of dispossession, appropriation, and elimination to assert and maintain settler domination, often empowering civilians as extensions of state authority. This paper takes Israel as a case study, identifying four divergent ideal types of settler colonial violence to analyze the state's unique features. In particular, it argues that Israel's settler colonial project is characterized by a relatively dispersed form of sovereignty, wherein violence is not solely the purview of the state but also enacted by settlers themselves, in collaboration with or at times in defiance of state institutions. This dynamic complicates classical theories of sovereignty and state violence, prompting a reevaluation of the state's monopoly on violence in such contexts. The paper further investigates how the application of violence in Israel is contingent upon specific political and social dynamics, and dialectical interactions with the indigenous Palestinian population's *sumud* (steadfastness) and decolonial resistance. By tracing these interactions, the analysis highlights the ways in which state violence in Israel operates through both formal mechanisms of governance and informal, diffuse networks. Central to this discussion is an exploration of the "Dignity Intifada" in May 2021 and the genocidal war since October 7, 2023, which serve as critical moments. By comprehending material and symbolic processes shaping the persistence of settler colonialism in its different formations, the article contributes to a nuanced understanding how "war-by-other-means" and indigenous resistance both endure.

A New Public Sphere? the Unfulfilled Promise of Social Media for Political Communication in Ghana

Social media is widely viewed as the new channel for political communication and debate. During the Arab Spring, Facebook developed as the main channel for mobilization. Politicians use social media to address voters directly without the mediation of newspapers and TV. E-government promises direct and interactive communication channels between the administration and the people. There is little research on how this promise works in the everyday life of local administration in Africa. With Ghana among the leading African countries regarding access to the internet, we ask two questions: do local governments in Ghana use this communication channel, and how do local people react? What topics are discussed and do these topics represent the political priorities discussed in everyday life? Our research includes data from before, during, and after the Covid-19 pandemic and includes fieldwork results and interviews in three Ghanaian districts. The comparison between topics communicated on district platforms and those discussed in real life shows some overlaps. However, the posts are often a kind of self-representation of politicians rather than an offer for e-government in the public sphere. Even more striking is the low frequency of the posts, especially in rural areas. Put bluntly, loudspeaker announcements are as important as social media communication.

SABETTA, LORENZO* (Sapienza-University of Rome, Italy)

How Does Normality Feel like? the Case for Unmarked Emotions

How do ordinary situations feel like? Which feelings do people have most of the time? What kind of sensations are more recurrent in everyday life? Affective regularity – the intermediate (mild, moderate, subdued) region of our emotional routine – is quite disregarded. Indeed, when we talk about emotions/sensations, we talk about a marked fraction of our emotive/sensorial mindscapes: Emotions with capital E, visceral and "strong feelings." Although there's no consensus in defining emotions or affect, sudden discontinuities often cause emotional arousal, and several definitions factor change in. But what emotions are there before (and after) those changes? If change is emotional and emotions are change, some emotions (or at least

moods, emotional tones) must be attached to the unchanged. Without usual, "middle" zones, it is impossible to make sense of any intense, noticeable peak. (The exception that proves the rule is boredom, the most marked among unmarked emotions, the only one that keeps getting academic and non-academic attention).

Accordingly, this paper makes three points:

(1) By analyzing the process of re-marking already conspicuous capital-E Emotions, I argue that this analytical blindspot does not influence just our understanding of unmarked emotions, also influencing the evaluation of marked ones too (e.g., neglecting dead times implies misrepresenting the (few) moments of drama and excitement we actually experience).

(2) States of calmness, sort of zero-degree emotional condition, are thus addressed, for both their ontological frequency and social significance. Several cases are parsed: from absentmindedly scrolling to what neuroscientists define as *resting states*, from daydreaming to what Ifaluk people call *Maluwelu*, from Simmel *blasé attitude* to Leibniz *petites perceptions*.

(3) The counterintuitive/unmarked process of emotional contagion of "calming other people" is finally considered, as the most recurring reaction to other people displaying emotions, accounting for the difference between different mechanisms (e.g., de-escalation, cooling out, etc.).

SABIDO RAMOS, OLGA ALEJANDRA* (Universidad Autónoma Metropolitana - Azcapotzalco, Mexico)

Making Empathy with Noses. Emotions and Senses in Nursing Personnel.

In this paper, I am interested in showing the meaning of empathy as a bodily, emotional, and sensory practice. I recover the idea of empathy from the first woman sociologist, Harriet Martineau, for whom empathy is both an epistemic and methodological resource for social research. At the same time, for Martineau, empathy is described by sensory metaphors such as the fact that a researcher who lacks empathy cannot understand a scene in its entirety and acts 'like one who, without hearing the music, sees a room full of people begin to dance.' In this sense, the aim of this paper is to reflect on the caring practices and empathy of nursing staff in a public hospital in Mexico City. We collect the findings of a sensory workshop applied in a public hospital that I designed and titled 'Making empathy through smell' in the framework of the 'Commemoration of the International Nurses' Day' on 09 May 2024. Thirty-nine female nurses and eight male nurses participated. Among the participants, ten female nurses elaborated a visual and written narrative associated with their patient care practices, focusing on the idea of empathy as an act of bodily accompaniment related to the unpleasant tolerance of sick bodies. Emphasis will be placed on what nurses experienced during the COVID-19 pandemic and what they experience daily in caring for sick bodies. The nurses highlighted the somatic and emotional work (Vannini, 2012 et.al.) they do daily in relation to the unpleasant body odors of sick people. In other words, for them, understanding the sick person's situation and tolerating emotions such as disgust and dislike of bad smells becomes part of the somatic and emotional work of their care practices.

Senses, Emotions and Gender Violence in Public Spaces. Reflections on a Sensory Workshop

This paper analyzes the reception of a fanzine that was part of the "Siento luego resisto" exhibition. Trans-sensorial landscapes of gender violence* (Mexico City, Mx.; Brighton, UK, 2023, 2024). This exhibition was part of a larger project involving artists and social science researchers from the University of Brighton and the Universidad Autónoma Metropolitana to raise awareness of gender-based violence. This paper aims to identify some sensory and emotional elements that the artistic narrative detonates and the strategies of resistance they inspire. The methodology we used for the analysis of the reception of the fanzine gathers the findings of the workshop "Sensorial maps of violence: experiences, listening and feminist resistance" that we designed and taught in the framework of the exhibition. Our workshop was attended by 51 people, of which 84.3% (n=43) were women and 15.7% (n=8) were men. As for the average age of the participants, the majority group is between 18 and 25 years old and represents 64.7% (n=33). The majority profile of the people who participated in the workshop were university urban middle-class women. We want to discuss the methodological and ethical implications of this work, as well as the strategies employed to carry out care and self-care for

the participants and ourselves. One of these strategies was to ask participants to talk and discuss collectively not only their sensitive experiences of violence in public spaces but also how they imagined a world free of gender-based violence in the future.

Who Is Brokering the Gap? or How Does Music-Didactic Research Find Its Way into Music-Didactic Teaching?

Current situation

Music teaching and the associated discipline of music didactics is often described as a 'poorly structured domain' (Puffer, 2021, p. 14) due to its strong practical orientation, as well as its weak scientific foundation and weak networking with related disciplines (Huber et al., 2021; Kranefeld, 2021). Accordingly, incorporating research findings from relevant disciplines such as music education into the subject- didactic training of teachers is a challenge (Blanchard & Huber, 2014).

Theoretical approach

Based on Shavelson's (2020) considerations on 'Brokering the Gap', and the assumption that teaching should not be unidirectional but multi-perspective and reciprocal way, this contribution discusses how the gap between practical orientation and scientific foundation can be bridged in the field of music didactics. As Shavelson also assumes that this can only happen through participatory processes, I argue that local time-spaces (Joyce, K. E., & Cartwright, N. 2020) are needed in which the transfer of research and application can be organised according to the specific circumstances, such as content, formats and structures of the respective didactic events.

Empirical and methodological approach

Based on interviews with lecturers, a possible (successful) transfer of research knowledge in a continuing education programme is reconstructed. Subsequently, the findings are then compared with an auto-sociological analysis of the author's experience as a potential mediator (or broker). As Bourdieu describes this process as participatory objectification, which involves a continuous comparison of critical self-reflection and objectification of one's own everyday (social) experiences (Bourdieu, 2002/2017, p. 133 in Martinsich, 96), the aim of 'the return to one's own person' (Rieger-Ladich & Grabau, 2018, p. 791 in Martinsich, 2024, S. 96) is to access implicit knowledge. This opens up the field in which the impact of participants (learners) and the self-assessment of the educational researchers as a 'broker function' can be worked out.

School-to-Work Transition of Young People with Special Needs. Results Form the German BA/Bibb Applicant Survey

This contribution aims to examine the transitions of young people with special needs after leaving general school in Germany. The focus lies on special schools for young people who are classified as more or less severely disabled in their educational, development and learning opportunities (e.g. due to a learning or mental/cognitive disability, a sensory and/or physical disability; ger.: Förderschulen).

To what extent do School-to-work transitions of young people with special needs differ from those without disabilities? Can the majority of them choose a suitable profession they really like? To what extent is support or career orientation taken up? How satisfied are young people with special needs with their job situation? What impact does the overall-situation in the German training market has on the training opportunities of young people in need of support?

The analysis is based on empirical data of the BA/BIBB-Applicants survey.[1] The BA/BIBB Applicant Survey is a representative, extrapolated written-postal random sample survey of young people who were registered as training place applicants with the Vocational Guidance Service of the Federal Employment Agency. BIBB conducts the survey jointly with the BA on the instructions of the Federal Ministry of Education and Research (BMBF).

The survey consists of a standard programme of questions that is repeated in each survey in order to answer central education policy questions and to be able to identify developments. In addition to the standard questions, a current education policy topic is addressed in each survey.

Vocational Education and Training Reporting Indicators in Germany

Vocational education and training reporting uses various indicators, rates and guidance values to describe developments and problem areas in VET. Nevertheless, the construction and significance of these indicators vary considerably in some cases.

This contribution aims to provide a systematic description of some indicators for vocational training. The indicators focus on the transition from the general education system to the training system in Germany.

We refer to the BIBB survey "Newly concluded training contracts as of September 30th." This survey is carried out annually in collaboration with the bodies responsible for vocational training. The newly concluded training contracts that were concluded between October 1st of the previous year and September 30th of the survey year and which were concluded on September 30th are taken into account.

Based on this data, two indicators are presented to describe the annual conditions on the training market (supply-demand relationship and Index-fit-problems). We describe the current results of 2024 as well as the development in recent years and point out the advantages and disadvantages of indicator formation.

SABUGAL PAZ, PAULINA* (University of Bologna, Italy)

Amor, Migración y Política: Una Etnografía

En los últimos años se ha producido un aumento de la legislación relativa a la migración matrimonial en Europa. Las parejas se enfrentan a una economía moral de la sospecha y a prácticas de control que se amplían a toda una nueva gama de actores (servidores públicos, miembros de la iglesia, caseros y vecinos que pueden confirmar la convivencia efectiva de las parejas investigadas). Esto también implica a nuevos actores burocráticos, unidades y canales de comunicación que crean nuevas estructuras relacionales de sospecha, información y vigilancia. Los defensores de este tipo de políticas argumentan que este «derecho al amor» individual debe sopesarse siempre con el bienestar de la nación y que las parejas siempre pueden amarse en otro lugar.

En una época en que la migración se reduce cada vez más a un objeto de seguridad estatal, resulta interesante y urgente estudiar la relación jurídica, política y, sobre todo, emocional entre las instituciones y los migrantes por matrimonio. A través de una investigación etnográfica con parejas mixtas en España, Italia y México se ha buscado explorar principalmente dos preguntas: 1) ¿Cómo examinan las burocracias estatales las relaciones amorosas en sus procesos de toma de decisiones sobre la migración matrimonial? 2) ¿Cómo viven las parejas mixtas estos encuentros burocráticos? El objetivo es comprender cómo los encuentros cotidianos de los migrantes matrimoniales con las burocracias estatales afectan los significados y prácticas del amor a través de las fronteras.

RC22-JS-176.5

SABUGAL PAZ, PAULINA* (University of Bologna, Italy)

¿Te Quieres Casar Conmigo? Economía Moral y Matrimonio Católico En La Migración Por Amor De México a Italia

En el contexto de una investigación etnográfica interesada en la migración por amor de México a Italia, emerge cómo este fenómeno puede representar una posibilidad de emancipación de la sociedad de origen sin ofender el código de honor local ni perder los lazos familiares. La condición para dar este paso es el matrimonio católico.

Las normativas migratorias en Italia afectan a los migrantes, en su mayoría mujeres, que forman pareja con un ciudadano italiano. Con el fin de proyectar un futuro común, se ven obligadas a casarse para obtener un permiso de residencia más estable y poder llevar a cabo un proyecto sentimental. Desde un punto de vista jurídico, en Italia no hay diferencia entre el matrimonio civil y el religioso. El sacerdote oficiante da lectura a determinados artículos del Código Civil relativos a los derechos y deberes de los cónyuges y el acto matrimonial se transcribe en los registros del estado civil.

Pensar cómo el amor romántico se ha convertido en la base de una economía moral (Fassin, 2009) incrustada en la gubernamentalidad de los migrantes permite examinar cómo la pareja «románticamente unida» se ha convertido en una unidad en torno a la cual se despliega y moviliza regulación y aprehensión a nivel macro y micro. Se crea una suerte de "marcación

emocional" que se produce cuando los cuerpos se sitúan y comprenden en relaciones de poder más amplias que se entrecruzan con narrativas sobre lo que son el Estado, la nación y la iglesia católica y quiénes deberían componerlos. La mixidad de la pareja se convierte en un criterio de sospecha fluido y subjetivo que capta la reacción emocional de una comunidad ante una determinada forma de diferencia que pone en duda la relación amorosa pero que de algún modo se legitima a través del rito religioso.

RC26-431.1

SACCA, FLAMINIA* (Sapienza, University of Rome, Italy)

Himpathy. a Social Representation of Gender Inequalities

In order to reveal the stereotypes and prejudices underlying the social representation of gender-based violence and lurking in its journalistic and judicial narration, with a research team from Sapienza and Tuscia universities we have analyzed over 70.000 thousand Italian newspaper articles on male violence against women and almost eight hundred court judgements on the matter (years 2017-2024).

Indeed, in seeking to solve problems, societies start by *framing* them. If the framing is wrong and distorted, the solutions will be inadequate, too.

The results of our research project are quite striking: transversally the material we analyzed shows that our culture, in Italy, is filled with what philosopher Kate Mann called "himpathy": the flow of compassion, understanding and empathy that is removed from the victim, in favor of the perpetrator. Distributing responsibilities between the two as we will demonstrate with various examples from the Italian press, arguing that this asymmetry in the narration of facts regarding men and women is the outcome of gender inequalities. A manifestation of historically unequal power relations between women and men that survived to our days, distorting public discourse, and, when it comes to gender violence, distributing responsibilities between the culprit and the victim.

RC26-428.3

SACCA, FLAMINIA* (Sapienza, University of Rome, Italy)

Institutional Violence in Italy: Blaming Women in the Courts and the Press

This paper moves from three research projects on the stereotypes and prejudices that underly the social representation of gender violence in Italy and will analyse how women are exposed to secondary and tertiary victimization. Women keep on being blamed for the crimes committed against them, both in the courts and the press. After having investigated almost eight hundred court judgements on male violence against women (years 2017-2024), we will argue how the results show a clear tendency to redistribute the responsibilities of these crimes between the perpetrator and the victim, leading not only to secondary victimization but also to tertiary victimization. A process that implies that men and women are not treated as equal citizens even when it comes to the judiciary sphere, where for women it harder to obtain justice ones a crime has been perpetrated against them. We will see how this unequal treatment in court ends up affecting the quality of Italian institutions as well as the democratic fiber of the nation.

RC37-603.4

SACCO, RICCARDO* (Università di Urbino Carlo Bo, Italy)

The Space of Sound in Ethnography. Sound, Im/Mobility and Solidarity Along the Western Balkan Route

This paper stems from the interaction of engagement, observation and "ethnographic ear" (Western, 2020) during my fieldwork at two "crossroads" (Queirolo Palmas & Rahola, 2020) of the Western Balkan route: Sarajevo (Bosnia-Herzegovina) and Zagreb (Croatia).

The aim is to draw theoretical and empirical connections between sound in ethnography and mobility studies. To do so, the article raises methodological questions on the incorporation of field recording in ethnography, and the interpretation of non-linguistic and non-musical aspects (Maeder, 2014) characterizing migrants' im/mobility and its support. Exploratory answers are proposed by dwelling on the role of listening in social research and the interpretation of sound as qualitative data, through the display in the text of the field recordings and soundscape (Schafer, 1977).

Conducting research with a microphone in a context characterized by migrants im/mobility in peripheral European countries has generated several considerations concerning ethics and positionality (Gershon, 2013), but not only. Indeed, while in Sarajevo the encounters with migrants were characterized by the narrative of the often convoluted and dangerous

journey, in Zagreb the most visible dynamic was that of people experiencing a condition of temporary immobility related to their asylum application. How to sonically explore these differences?

To address these research questions and dilemmas, it is proposed to consider the importance of the audibility of the sounds we are usually led to describe, as qualitative data themselves. These "malleable traces" (Gallagher, 2019), part of the field notes that make up the ethnographic account, can be interpreted and unpacked to analyze the complexity of the social processes under investigation. Through these differences, the Balkan route (Bužinkić & Hameršak, 2018) will emerge not only as a 'through' space (Collyer & De Haas, 2012), but rather as a space in which different mobilities, struggles for rights and forms of support coexist and overlap.

SADIKOĞLU, ZEHRA ZEYNEP* (Istanbul University, Turkey)

The Value of the Child in Türkiye: Prospective Human Capital

The shift from viewing children as economically valuable contributors to emotionally priceless beings, a process known as the "sacralization of the child" (Zelizer, 1985), has become more evident throughout the 20th century. This shift has reshaped parental investments in response to societal and economic changes. With the rise of knowledge, technology, and human capital as drivers of social mobility, parents are increasingly focused on ensuring their children's future success in an uncertain world. Neoliberal shifts have individualized concerns about the future, prompting parents to dedicate more time, resources, and emotional energy to their children's development. The ideology of intensive parenting (Hays, 1996) reinforces this trend, emphasising close monitoring of a child's growth and decision-making based on expert guidance, which demands substantial financial and emotional investments. This study examines the impact of cultural and economic trends on the value of children in Türkiye, with a particular focus on the role of human capital and intensive parenting in shaping public policies and cultural perceptions of the child. The descriptive data from the Turkish Statistical Institute (TurkStat) and the Ministry of National Education (MoNE) after the 2012-13, the year of transition to the 4+4+4 education system, demonstrate a shift in the activities in which children engage, with a reduction in child labour and household reproductive work, and an increase in goal-oriented activities with parents and extra curricular activities. Schooling rates and investments in education have both steadily risen, with contributions from both the state and private households. As a result, it is suggested that this reflects the growing view of children as useful and valuable for their human capital, combining both economic and psychological elements, and highlights the child's human capitalisation (Bandelj & Spiegel, 2023) in Turkish context.

SADIQI, FATIMA* (University of Fez, Morocco)

What Does Security Mean for Women and Gender Equality in the Maghreb?

Starting from the theoretical standpoint that women and feminisms easily navigate the boundaries of the local, the regional, and the global, I problematize the concept of security and underline ways in which it relates to gender equality and women's rights with a focus on the Maghreb.

Using the intersections social variables of geographical origin (rural/urban), class (upper, middle, lower, and destitute), level of education (educated, non-educated, illiterate), job opportunity (forma/informal), linguistic skills (monolingual, bilingual, and multilingual), and social status (married/unmarried), etc. I adopt a methodology that consists of interviews, a working session with a women's NGO, a questionnaire, discussions with two focus groups, and my own analysis of sociological facts.

My findings so far may be summarized as: (1) The need for more conceptualization of security in the light of the above sociological intersections, (2) the relevance of gender equality and women's rights in this conceptualization, and (3) Ways in which (1) and (2) can inspire policy-making.

Risk of Death during Police Encounters in France across Age, Gender and Racial Groups

Social tensions in France are increasingly related to fatal interactions between minority populations and the police. In this study, we for the first time investigate racial disparities in the risk of death during police encounters in France. To overcome the absence of official data on race in France, we compile information from media reports on police-related deaths over the past 30 years and match them with official death registries. Our dataset comprises information about gender and age of the deceased as well as name-inferred race. To estimate relative mortality risks, we combine this data with national mortality data, accounting for gender and age mortality dynamics, and draw on recent estimates of the racial composition of the French population based on a large-scale survey. Our preliminary findings indicate that young men of North African, Sub-Saharan African, and Asian descent face a disproportionately higher risk of dying in police encounters compared to European men. Our findings highlight the pressing need for more comprehensive data to better understand and address these inequalities in police-related deaths in France.

SAFONOVA, MARIA* (National Research University "Higher School of Economics", Russian Federation)

Academic Parentage and Academic Careers in Russian Social Sciences

How significant are the advantages of being raised in an academic family for pursuing an academic career? I use the results of a survey of Russian academic economists (N = 2763), combined with a bibliometric dataset from the Russian Index for Scientific Citing, to study the effects of a parent's PhD degree (a proxy for an academic career) on one's own trajectory. There is a clear tendency for academic professions to reproduce within families. Overall, 13.3% of respondents reported that their father held a degree, and 7.3% had a mother with a degree (in 2020, less than 0.5% of the Russian population held degrees, according to the national census).

However, the effects beyond increasing the likelihood of entering academia are much less pronounced. Children from academic families do not report higher grade point averages in school, although they do exhibit a slightly higher proficiency in foreign languages. Controlling for age, they are slightly more likely to work in top-tier universities and publish in high-impact journals, but their likelihood of publishing in international editions is not significantly higher. There is only a marginal tendency for them to complete a PhD earlier or earn higher salaries (controlling for the city of residence). In all cases, a mother's degree is a stronger predictor of career success than a father's degree.

The overall conclusion is that, while having parents in academia significantly increases the probability of pursuing an academic career in Russia, there is no strong evidence that it greatly facilitates one's career progression. Various explanations for this seemingly counterintuitive finding are discussed, such as the selection effect among children from less educated families and negative selection among descendants from higher-status families

Neither Classes, Nor Micro-Classes: The Occupational Composition of Cultural Strata

While there is broad consensus among sociologists that high culture is used in modern societies to draw social boundaries between elite and non-elite groups, there is much less agreement on which elite groups these boundaries demarcate. The most widespread view is that it is the upper classes in general who use culture to distinguish themselves from others. However, Bourdieu's later work suggests that, rather than entire classes, it is the fraction of the upper class rich in cultural capital (such as artists and university professors) who use culture to differentiate themselves from the fraction rich primarily in economic capital (e.g., bankers). At the same time, recent work on "micro-classes" (Grusky) suggests that individual occupations are the natural sites of lifestyle differences.

While sociologists usually define classes empirically based on the occupations of their members, there have been few attempts to study the tastes of specific occupations or to analyze inductively which grouping of occupations best aligns with cultural boundaries. We address this gap by using a dataset from the public library system of St. Petersburg, a major Russian city, containing over 2 million records, including information on the employment of the readers. This dataset allows us to study the preference for high-brow literature among members of specific occupational groups and to develop an inductive three-part cultural stratification schema, which contrasts (a) working-class and clerical occupations, (b) professional occupations, and (c) literary specialists—journalists, editors, copywriters, translators (ISCO-88 group 2451). This last category occupies a position between class fractions and micro-classes, representing a group of diverse occupations disproportionately recruited from graduates of literature departments. The three-part schema outperforms various occupational groupings traditionally used to capture taste differences between classes and class fractions (e.g., EGP, ORDC). The theoretical implications suggest building connections between the sociology of taste and the sociology of expertise.

Military Takeover in West Africa: The Enigma of Popular Euphoria

International observers have expressed astonishment at the scenes of popular euphoria following the advent of the military in power since 2020 in some West African countries. These euphoric expressions are variously assessed: anti-French sentiment, threat to democracy, support for authoritarian regimes, Russian influence, etc. This paper analyzes the popular euphoria of Conakry's inhabitants following the arrest of President Alpha Condé by the Groupement des forces spéciales and the seizure of power by the Comité national du rassemblement pour le développement (CNRD) on September 05, 2021 in Guinea. Based on the principle of situated knowledge, the paper supports the argument that euphoria is the expression of an attitude of "insignificance" given the spectacular nature of the regime change. A citizen of Conakry ironically sums up this state of affairs: "In our country, you go to bed on Saturday night with a president. And you wake up on Sunday morning with a new president". This paper draws on an ethnography of information nodes carried out in Conakry in September 2021 and March 2022 to (i) describe and characterize the insignificance of the widespread euphoria of September 05, 2021; (ii) contextualize, historicize, and analyze the logics underlying popular euphoria; (iii) interpret the limits and ambiguities of this insignificance.

Family Life with Disability: Resilience and Creativity in Everyday Experiences

The daily experience of living with a child with intellectual or global developmental disabilities profoundly impacts family structures, roles, and overall quality of life. These families often face discrimination and stigmatization, alongside challenges specific to the type of disability, which can negatively affect family life. However, few studies have explored the positive meanings families attribute to having a member with intellectual disabilities, as well as the internal and external mechanisms they use to adapt.

This research focuses on the resilient and creative processes families develop as they navigate daily life, addressing both the challenges posed by disability within family dynamics and the broader societal structures they interact with, such as schools, healthcare systems, and urban environments. Using a biographical approach grounded in symbolic interactionism, this study explores how families construct meanings around disability, care, parenthood, and family life. The biographical cases examine how these families interpret their daily interactions, revealing both the struggles they face and the strategies they employ to foster resilience in their lives.

Adopting Sustainable Practices: Tensions between Policy Design and Implementation in Chilean Small-Scale Agriculture

In recent decades, government programs and public initiatives in Chile have aimed to integrate sustainable practices into small-scale agrifood production. Following recommendations from international organizations such as the FAO, small-scale producers have been encouraged by the Ministry of Agriculture to adopt agroecological approaches and environmentally sustainable practices in areas such as irrigation and livestock management.

Using an Anthropology of the State and Institutional Ethnography framework, this presentation will analyze how these guidelines have been incorporated into public policy documents and reflected in the discourses of public officials and consultants involved in program design for small-scale producers. Drawing on data collected through document analysis, observations, and interviews with small-scale producers, peasants, and local public officials, I will examine how sustainability guidelines are implemented at the local level and the extent to which producers adhere to them. The use of ethnographic techniques enables the identification of gaps between policy design and the actual adoption of environmentally sustainable practices among small farmers. Based on the data, three main groups of small-scale farmers can be identified: (i) those whose lack of resources prevents them from transitioning to agroecological production or adopting sustainable practices; (ii) those who had already been implementing these practices and use public programs to further develop their skills and knowledge; and (iii) those who have recently begun adopting sustainability guidelines and are weighing their individual benefits and drawbacks.

SAGREDO AYLWIN, MARIA PAZ* (El Colegio de México, Mexico)

Food Sovereignty and Food Security: Conflicting Models in Chilean Agriculture

The concept of food sovereignty has long been used by peasant organizations in Chile to voice their dissatisfaction with an agricultural industry that since the late 1970s primarily produces food for export and that has had detrimental effects on the environment. Many of these organizations have advocated for agroecological practices, short supply chains, and the protection of critical environmental resources essential for food production, such as land and water. On the other hand, the COVID-19 pandemic and the fertilizer crisis triggered by Russia's war against Ukraine brought the issue of food security to the forefront of public debate in Chile. This concept was mainly embraced by the government at the time, as well as by agricultural guilds, which argued for the need to protect and promote the agricultural industry.

Drawing on document analysis, press coverage, and interviews with peasant leaders, agricultural guilds, and public officials, the paper will examine how food production and availability have been used as political tools to support different models of agriculture and advocate for state protection. Using a food regime framework and contrasting the agroecological and agro-export models, I will analyze the diverse discourses surrounding different forms of agrifood production, the destinations of agricultural outputs, and the channels of commercialization. Consequently, I will explore the political positions and demands of the diverse actors involved in agrifood production and distribution. The paper will also discuss how the government of Gabriel Boric (2022-2026) has sought to prioritize the promotion of small-scale family agriculture as a key strategy to ensure both food security and sovereignty in Chile, while simultaneously maintaining policies and public incentives that have supported the expansion of the agricultural industry since the late 1970s, thus aiming to reconcile the demands of various stakeholders.

The Nexus of Migration, Climate and Gender in the Light of Internal Mobility from the Rural Areas of the Moroccan Souss Massa Region to Coastal Cities

The aim of this contribution is to examine the climate-migration-gender nexus through the lens of Moroccan internal mobility, to grasp the spatio-temporal scales of these movements, and their lived experience in the context of climate change. The extreme meteorological phenomena (droughts,

floods) that Morocco has experienced, affecting land productivity and the sustainability of livelihoods (Bassou, 2016), lead us to question the weight of environmental factors in driving internal mobility (Gemmene, 2009) in an attempt to shed light on the reconfiguration of migratory trajectories and projects while accounting for gendered inequalities and migration autonomy (Mezzadra, 2004). As a counterpoint to instrumental or securitarian approaches to migration, we favour a decentralized approach and the infra-political prism (Scott, 1990). Through the analysis of biographical narratives of locally displaced individuals and families, we explore how perceptions of climate variability interact with migration decisions. Drawing on focus groups and interviews conducted in several villages in the Taliouine region (Souss Massa) affected by water scarcity as well as with young men and women having left for bigger cities such as Agadir and Casablanca, we seek to shed light on who is able and who is willing to undertake such internal mobilities, and for what reasons, as well as to understand whether immobility is voluntary. We equally rely on an immersive ethnography conducted with internal migrants and territorial intermediary bodies (village associations, agricultural cooperatives, NGOs, political actors). Particular attention will be paid to the gendered dimensions of this internal mobility and their articulation with ecofeminist struggles (Hache, 2016) allowing us to interrogate gendered, classist and racialized processes (Maazouz and Lépinard, 2021) so as to understand how gendered inequalities in land ownership and usage relate to specific mobility practices and how in turn these mobilities affect gender relations in the villages of origin.

Positionality in Action and Revolutions

In this paper, I investigate three main features of the role of positionality in relation to researching revolutions. These features are: 1) positionality as multilayered and contradictory; 2) positionality as temporally shifting; and 3) positionality as involves a complex power relation with researcher's self, the revolution as an object of study, other revolutionary actors, and dominant scholarly and disciplinary paradigms of uprisings. I present how I navigated these dimensions during my research on the Egyptian Revolution of 2011 and its aftermath. While addressing the challenges in their ongoing research journey, I will end the presentation with sharing the mistakes and the role of reflections and some of the advice in doing this research.

Beyond Dyadic Care: Ethnographic Insights into Community-Based Care Practices in Japan

This study transcends the traditional caregiver-care receiver dyad by examining how care unfolds within complex relationships in Japanese communities. Utilizing ethnographic methodologies, we explore how the meaning of care is shaped and transformed across multiple local contexts, revealing how care practices adapt to different social and cultural settings.

Japan illustrates these dynamics, particularly its increasing focus on community-based care systems amid an aging population. A notable example is the Toyama-style daycare service in Toyama Prefecture—a unique model that welcomes all community members, including the elderly, disabled, and children. For instance, one center supported a resident with mental health challenges who frequently engaged in confrontations. Rather than exclusion, the center established a space where various participants—not just care workers—could come and go, instilling a sense of community and shared responsibility. This inclusive environment allowed community members to interact organically, fostering relationships where even conflicts between staff and residents became part of an evolving dialogue, transforming the meaning of care. Remarkably, this approach extends beyond a single facility; multiple centers collaborate to share responsibility and knowledge, offering cohesive care across the region.

Ethnography was essential in capturing these complex dynamics, allowing us to observe interactions not just from the perspectives of individuals or caregivers, but within the larger communal 'space' where relationships evolve among diverse participants. This immersive approach uncovered nuanced, context-specific meanings of care that conventional sociological methodologies might overlook. Our findings highlight the limitations of current institutional care models, particularly their rigidity and lack of adaptability to individual needs. This study suggests that embracing community-based relational approaches can inform more effective health policies by shedding light on these overlooked realities. Our study contributes to a deeper understanding of care practices in health sociology and emphasizes the critical role of qualitative methodologies in uncovering such insights.

Obstacles and Opportunities for Transformative Social Policy in the Nordic Welfare State – Lessons Learned from Finland

The paper investigates how social security policies could be utilised as transformative social policy in response climate crisis in the Nordic welfare state. Western welfare states should be reorganised in such a way that they significantly reduce their impact on biodiversity while still ensuring the conditions for the well-being of citizens, both now and in the future.

The Government Programme of Antti Rinne and later Sanna Marin's (2019-2023) set the ambitious goal of making Finland the first carbon neutral welfare society by 2035. Additionally, it established a parliamentary committee (2020-2027) to reform the social security system. We interpret the carbon neutrality target as an opportunity to convert social security policy into transformative social policy. Our interest lies in the question: How was social security reform utilised as support for transformative social policy? What were the obstacles and opportunities for transformative policies that have arisen in this process?

Our empirical research material includes policy documents like the government programme and documents from the parliamentary social security committee's first period (2020-2023). Using content analyses carried by Atlas.ti, we identify both the opportunities and obstacles for transformative social policy in the process of aiming to achieve the carbon neutrality. We then discuss how social security reform has been leveraged to support transformative policies and whether it could have been utilised better.

According to preliminary analyses, the parliamentary committee has the potential to reach a consensus on this complicated matter. However, much greater attention should be paid to implementation. The current social atmosphere is not conducive to the long-term decision-making, likely required for transformation. In the current polarising political environment, the differences of opinion have deepened. In Finland, which contrasts sharply with the previous, traditionally consensus-seeking political culture.

"You Are the Ambassadors of Islam": Stories Told By Women Who Wear Hijab

Kazakhstan is a multinational country whose state policy in the religious sphere is based on the principles of separation of religion and state power. In recent years, the hijab (Muslim headscarf) has become one of the most discussed topics in public and academic discourse. According to the 2021 census, Almaty has a population of 2,030,285, of whom 1,172,838 are Muslims. Even though about 60 percent of the city's residents are Muslims, until recently, only a few women living in Almaty wore the hijab, a traditional Muslim female garment that covers the body except for the face and hands. In rural areas of Kazakhstan, married women usually covered their heads with a headscarf in the presence of older relatives. However, this tradition was rare in urban areas, and the hijab remained rare and almost invisible. Nevertheless, in recent years, there has been an increase in the number of women in Almaty who, regardless of their marital status, have begun to wear the hijab. Almaty is one of the largest cities in Central Asia and the former capital of the Kazakh SSR, the center of the political and scientific elite.

The study, which involved fifty in-depth interviews with women practicing hijab between 2022 and 2024, aims to provide insights into the factors influencing the decision of young Central Asian Muslim women living in Almaty to wear the headscarf (hijab) and how they interpret its symbolic meaning. The application of P. Bourdieu's habitus theory allowed us to see how social and cultural structures learned from childhood influence women's decision to wear the hijab. W. Bronfenbrenner's ecological theory emphasised the importance of family, relatives and society in how young women interpret and integrate the hijab into their daily lives.

Ethnic Identity of Mixed Japanese-Thai Young People in Thai and Japanese Medium Schools in Thailand

Globalisation has positioned Thailand as a significant economic partner of Japan, contributing to the growth of substantial Japanese communities and an increase in Japanese-Thai families within the country. Recognising education as a critical component of child development, this study examines the role of schooling in shaping the ethnic identity of mixed Japanese-Thai young people in two distinct educational settings: Thai and Japanese medium schools. The research participants are 23 mixed Japanese-Thai young individuals (aged 12-30) who have attended either Thai or Japanese medium schools in Thailand. I employed narrative inquiry, utilising the life story method, to identify key turning points in their educational experiences that shape their ethnic identity. The findings reveal that peer and teacher relationships of mixed Japanese-Thai young people within school contexts reflect Japan's significant cultural and economic influence over Thailand, resulting in variations in ethnic options that are critical to their ethnic self-identification. The study indicates that the ethnic identity of mixed Japanese-Thai young people in Thai and Japanese medium schools is shaped in contrasting ways. This underscores that ethnic issues do not necessarily involve phenotypic differences but rather present distinctive ethnic debates within the Asian region.

SAKAI, CHIE* (Kansai University, Japan)

The Rise of School Absenteeism in Japan: How Should Students in Japanese Schools be Guaranteed Learning Opportunities?

In Japan, the number of students who are absent from compulsory education has increased by about three times in 10 years. The Ministry of Education precisely regulates the school curriculum so that the educational system will maintain a consistent level of quality. However, institutions outside the system, such as international schools, have not yet been incorporated into the official curriculum. School absenteeism was previously regarded as a matter affecting solely individual students. When students withdrew from elementary and junior high schools, teachers and parents would encourage them to return.

In 2016, the Ministry of Education enacted legislation to ensure access to educational opportunities during the compulsory education stage. This was to be achieved by utilizing a new range of systems and facilities instead of reintegration into the traditional school system. To achieve this, various reforms have been implemented, including the establishment of dedicated spaces within schools to serve the needs of non-traditional students or giving them the choice to attend private unconventional schools.

However, the national education system has not undergone a significant change, resulting in the establishment of non-traditional educational institutions being concentrated in large cities. Some new institutions are expensive in contrast with the free compulsory educations. Furthermore, it is unclear whether traditional schools will recognize non-traditional educational backgrounds. Furthermore, there is a prevailing perception among educators in conventional schools that absenteeism must primarily be a consequence of student apathy or parental negligence.

This report will discuss the present state of absenteeism in Japanese schools through an examination of macro data, media reports, personal accounts from those affected, and auto-ethnographic data from the perspective of parents with truant children. Additionally, it will discuss recent positive developments in education administration and the challenges that remain, and it will compare Japanese education with systems in other countries and regions.

Restoring Masculinity through Multiple Displacements Vs. Struggle for Dignity in Istanbul's Transformation

Gentrification of lower-class neighborhoods in Istanbul has disproportionately affected women and queer communities, disposing them not only from their homes but also from their social networks, workplaces, and access to the city. By altering gender norms, relations, and the safety of public spaces, gentrification has led to isolation, dissolved collective care networks, and increased material and emotional labor for women and gender minorities. Additionally, the AKP's urban agenda, marked by flagship projects like the construction of a mosque in Taksim Square, a symbolic site of feminist, LGBTQI+, and working-class movements, has furthered the reclaiming of urban spaces for a conservative, patriarchal agenda.

This paper argues that these displacements are deeply gendered, racialized, and classed, and it traces these processes of multiple displacements as spatial manifestations of what Deniz Kandiyoti (2010) referred to as the "restoration of masculinity" within the framework of authoritarian housing and urban politics in Turkey. Multiple displacements not only marginalize women and gender minorities, reshaping their dignity, but also reconfigure social boundaries among them, positioning some as "undeserving" or "irresponsible," which decreases opportunities for solidarity among the dispossessed.

This paper approaches housing and gender politics as mutually constitutive: gender politics inhibits housing politics, and housing politics reinforces gender dynamics. It maps the processes of displacement at the intersection of housing and gender politics, alongside the everyday struggles of women and gender minorities to reclaim their contested dignity and urban spaces amidst gendered, classed, and racialized dispossessions. The research draws on a triangulation of data from interviews with feminist and urban housing experts and activists, longitudinal fieldwork on displacement in Istanbul, and document analysis of housing and gender policies.

A Challenge to Patient and Public Involvement: The Rise of Biomedicine and the Changing Relationship between Users and Health Professionals

This paper traces from a neo-Weberian perspective the historical development of the relationship between patients and healthcare practitioners in the modern world, as exemplified by the case of Britain. In early nineteenth century 'bedside medicine' patients held considerable sway over diagnosis and treatment in a more pluralistic healthcare environment. This changed with the development of 'hospital medicine' in which the focus was on the classification of diseases by doctors in an increasingly professionalized hospital environment. The rise of 'laboratory medicine' linked to the strengthening of medical monopolies in the twentieth century further removed patients and the public from healthcare decision making, as underlined by the counter cultural resurgence of complementary and alternative medicine from the latter part of the twentieth century onwards based on more holistic client engagement. This paper discusses constraints on patient and public involvement (PPI) in light of such cosmological shifts in modern societies, in which the healthcare division of labour is now dominated by biomedicine. Although the ascendance of a medical profession centred on technological and scientific knowledge largely seems to preclude user engagement, this paper argues there is still scope for PPI. It is now increasingly acknowledged by health professionals that more dialogue needs to occur with patients at a micro-level and there are stronger collective user lobbies, as well as opportunities for greater consumer choice based on publicly available performance data. These trends have been fuelled by the rise in availability of information through the internet and social media – despite limited patient

and public representation on health committees and the medical capture of some lay social movements in healthcare.

SAKS, MICHAEL* (University of Suffolk, United Kingdom)

The Medical Profession and the Modern State: Socio-Political Diversity and the Public Interest

This paper takes a comparative overview of the regulatory position of the medical profession in relation to the state in a selective range of modern societies – from the more autocratic to the more democratic. Here the regulatory framework of medicine nospans from a lack of autonomy in Russia through the close interweaving of the profession and the state in continental Europe to a higher level of independence in the Anglo-American context. At the same time it is recognized that the current spectrum of regulatory positions, which reflect both ongoing and historical socio-political issues in each society, are subject to change – not least in the shifting relationship between the medical profession and other practitioners in the healthcare division of labour. In providing a comparative overview, this paper adopts a neo-Weberian and neo-institutionalist perspective on the medical profession characterized by the concept of exclusionary social closure underwritten by the state in the market and by its place among a number of competing institutions in an ecology of forms. Through these interlinked theoretical lenses, the influence of contemporary trends such as hybridization and corporatization on the position of medicine are considered. The pros and cons of diverse forms of medical regulation involving the state are then finally considered from the viewpoint of health policy and the public interest.

Japan's Political Religion of Rent-Seeking: Changes in Politics and Religious Relations for Recent Thirty Years

Former Prime Minister Shinzo Abe was killed by a young man who held a grudge against the Unification Church on July 8, 2022. Since then, (1) the damage caused by its psychic sales and excessive demands for donations has attracted attention in Japan, (2) the Unification Church and other second-generation followers of this new religion have issued demands for safety in their homes and religious freedom, and (3) the collusive relationship between political parties and religious groups has become a social problem. The Unification Church issue has led to media coverage and social awareness in Japan that re-examines the relationship between politics and religion.

In this paper, I will classify the forms of political participation by religious organizations into three categories: 1) support for specific political parties and politicians by traditional and new religions, 2) the formation of political parties by religious organizations such as the Soka Gakkai and the Kōmeitō, and 3) underground political participation by organizations such as the Unification Church.

Focusing on the Unification Church's strategy to expand its religious and social influence by taking up political power and receiving patronage, I will present the concept of rent-seeking political religion. I will also discuss the trends of the Soka Gakkai, the most influential religious organization in Japan that maintains political organization.

Bridging Divides: The Social Power of Empathy and Love in Fostering Inclusive Communities

Empathy and love are often seen as private, individual experiences, but emerging research highlights their broader social roles in fostering solidarity and cohesion. In a world marked by division across cultural, racial, and gender lines, understanding the public dimension of these emotions becomes crucial. Existing studies suggest that social empathy and love can bridge these divides, but their full potential remains underexplored. This review aims to critically evaluate how empathy and love function in social contexts, focusing on their role in fostering inclusive relationships across differences. It explores the

transformative power of these emotions beyond personal interactions and examines their contribution to collective well-being and social cohesion. The review is based on an analysis of scholarly articles and books addressing social empathy and social love, drawn from databases such as PubMed and Google Scholar, with an emphasis on contemporary studies. The review synthesizes theories of social empathy and love, emphasizing how these concepts transcend individual experience to impact broader social dynamics. It highlights their role in promoting understanding across cultural and social divides and critiques the ways in which they are often reduced to marketable skills. The review also addresses the limitations of current research and suggests areas where further study is needed. This review shifts our understanding of empathy and love from personal emotions to social forces capable of fostering inclusivity and solidarity. It underscores the need for future research to explore how these emotions can be harnessed to counter social fragmentation, offering potential applications in both policy and practice.

Empathy Unveiled: Exploring Its Complex Role in Social Relations and Power Dynamics

Empathy, traditionally viewed as a compassionate response to others, has evolved into a multifaceted concept deeply embedded in social interactions. While empathy fosters meaningful connections and understanding, it can also be leveraged for manipulation or control. As empathy gains prominence in public discourse, its complex roles in shaping power dynamics, social relations, and human interactions require deeper exploration. This review aims to examine the dual nature of empathy in social relations, addressing both its positive and negative impacts. By analyzing how empathy influences power structures, social interactions, and its transdisciplinary relevance, the review seeks to provide a comprehensive understanding of empathy's broader implications in modern society. The material for this review was gathered through an extensive search of scholarly literature on empathy, including studies from psychology, sociology, and philosophy. Relevant articles were sourced from academic databases such as PubMed and Google Scholar, with a focus on recent works. The review explores the varied roles of empathy in social relations, including its capacity to enhance understanding and cooperation, while also recognizing its potential for exploitation in power imbalances. It delves into the concept of positive and negative empathy, analyzes its role across disciplines, and critically evaluates the different levels of empathy observed in social research. The complex interplay between empathy and social dynamics, particularly in power-laden contexts, is also highlighted. This review broadens the understanding of empathy beyond a simple compassionate response, offering insights into its multifaceted nature. By addressing both its constructive and harmful effects, the review challenges traditional views of empathy and encourages further research into its ethical and social implications in modern relationships and social structures.

Negotiation, Margins and Social Exclusion: Understanding the Informal Space in Ima Keithel (Women's Market) Manipur, India

Ima Keithel (Mother's Market) of Manipur, India is known to the world as a unique center and symbol of women's empowerment. This 500 years old market has been an important meeting space and trading hub of Manipur, India. The significance of the market is that only women perform various economic activities and women are the only buyers and sellers of this particular market. Owing to social norms, men are restricted from entering the market even as buyers. Existing data shows that majority of the economically active women in developing countries are engaged in informal sector. The proposed research attempt to explore the expanding informal space with the influx of more women primarily engaged as street vendor in search of meagre income and consistent livelihood. An increasing number of street vendors around this market has been witnessed over time and there is a need for a deeper understanding of their economic vulnerability in the context of growing urbanity. This study focuses on the unique traditional ways of negotiating economic spaces by these diverse marginalized women groups with the state and policy makers. The present work will employ ethnographic method, follows intersectional feminist perspective while analyzing the prospects and challenges faced by the marginalized women in informal sector. The ethnographic data that I am going to analyze is collected from August 2021 to July 2022.

Research into Preventive Health Services in France: The Contribution of Case Studies

A current research program (Julhe, Dir) is looking at the reorganisation of occupational health and prevention services in France since the advent of the new 'occupational health' law (2021), which reinforces the objectives of prevention and workers' health. In order to describe and analyse in detail the different work configurations and inter-professional collaborations, we opted for the methodological choice of case studies. On the basis of individual interviews with several categories of health service staff, the study highlights the heterogeneity of the dynamics of the transformation of prevention and health services in France, as well as their various influences on the work of occupational health professionals (doctors, nurses, assistants, ergonomists, etc.). At the same time, our proposal will return to the methodological difficulties raised by such an approach : in particular, access to health services undergoing transformation, the mobilisation of professionals for research purposes in a context of work intensification, and the observation of unstable and plural multi-professional collaborations.

Within occupational health and prevention services, this research therefore examines the social conditions for implementing the multi or inter-professional collaborations promoted by the various reforms affecting occupational health and prevention services (Marichalar 2010; Barlet, 2015). The form of these multi-professional collaborations has as much to do with the legislative framework which traditionally governs prevention in companies in France (Brissy, 2022), as with the managerial configurations specific to prevention and occupational health services.

SALAS GUADIANA, EMILIO* (Universidad de Barcelona, Spain)

Social Effects of Biotechnology in the Dairy Industry in Northern Mexico

This study aims to critically analyze the excessive growth of the dairy industry in the Laguna region of Mexico, emphasizing its social and environmental impacts. Through 30 semi-structured interviews with business owners, local workers, and public officials, the social reality of the inhabitants of La Laguna and the social consequences of the dairy industry in their lives were investigated. The findings reveal that the expansion of the dairy industry affects the environment by contaminating drinking water sources with its waste. In addition, it was documented how genetic modifications to cattle generate a spiral of economic dependence that lowers the cost of meat and subjects cows to intense pharmacological treatments, which has serious consequences for the soil where cattle deposit their waste, making it infertile for agriculture. On the other hand, the inhabitants of rural areas of La Laguna feel alienated due to the economic dependence on the dairy industry, where they have lost their peasant identity by becoming proletarians with precarious wages. In addition, the inhabitants are affected by health problems derived from the industry, such as arsenic contamination of the aquifers, skin and pancreatic cancer, and infections transmitted by flies from cattle slaughterhouses that mainly affect children. The study shows that the growth of the dairy industry in the La Laguna region is not an isolated phenomenon, but is intrinsically linked to old power structures and social dynamics between the government, industry, and local chieftains. It concludes with an analysis of this extractivist logic of progress and makes recommendations for the future in terms of public policies for social welfare and environmental regulation.

Unity in Diversity: Women's Groups Navigating Religious Nationalism in Malaysia

Across Europe, North America, and Asia, social groups align with political parties to battle over a range of hot-button culture war issues related to gender, sexuality, race, and national identity. This global trend of populist politics, often marked by the "othering" of out-groups based on religious difference, is further compounded in multi-ethnic societies like Malaysia. The growth of religious nationalism in Malaysia fuels the perception that majoritarian Islamic views over moral authority, beliefs, and values are non-negotiable. In this context, polarizing contention over Islamic law and gender are reinforced by toxic ethnic politics, (un)civil society activism, and media narratives, which erode social trust and push different social and political groups into oppositional and distrustful stances. Malay women's civil society

groups of differing ideological orientations (secular multiracial feminism, Islamic feminism, Islamic revivalism) have historically taken oppositional stances, contributing to this divide.

This presentation discusses the potential for Malay women's groups to build trust and form cross cutting solidarity across ideological divides, despite their history of opposing stances. Drawing on in-depth qualitative interviews with Malay women activists, findings reveal that tensions over religious authority remain a key barrier to trust-building. However, there is evidence of inter-group engagement and social learning among younger Malay women. Some younger women from Islamic revivalist groups share remarkably similar views with their secular feminist counterparts on controversial issues like teenage pregnancies, sex education, and early marriage. It is argued that women's personal experiences in advocacy, coupled with pragmatic decision-making framed in religious terms, enable them to overcome prejudiced beliefs and be more open to finding common ground. It is argued that the women's shared experiences of resistance to sexism, labelling, and polarized politics create a foundation for building trust, which is essential for cooperation and compromise in more complex areas.

Cultural Memory and the (re)Production of Identity Among Refugees: A Case Study of Rohingya Cultural Memory Centre (RCMC) in Bangladesh

The Rohingya, a Muslim minority from Myanmar, is one of the world's largest stateless populations. In August 2017, a wave of violence in Myanmar's Rakhine State forced over 700,000 Rohingya to flee to Bangladesh's Cox's Bazar region. Recently, the International Organization for Migration (IOM) launched the Rohingya Cultural Memory Centre (RCMC) in one of these camps to preserve the cultural heritage and identity of the Rohingya people. This study explores the RCMC's role in maintaining and reproducing the cultural memory of Rohingya refugees. The research examines (i) the types of cultural artifacts the RCMC collects and the narratives behind their selection, (ii) the processes and stakeholders involved in preservation activities, and (iii) how these preserved memories are disseminated within the community. Data were gathered through field visits, in-depth interviews, and feedback from RCMC visitors. The RCMC, under the theme "Arar Rosom, Arar Elom" (Our Culture, Our Wisdom), serves as a powerful reminder of home for many Rohingya. It connects visitors to their heritage, featuring unique stories, artifacts, and memories created by refugees in the Cox's Bazar camp. Feedback from elders, youth, staff, and volunteers highlighted the center's emotional and educational impact, evoking a strong sense of connection to their homeland, Myanmar. Unlike in Myanmar, where no similar cultural center existed, the RCMC offers the Rohingya community a platform to preserve their identity through various art forms, including tapestries, artifacts, songs, and architectural models. The RCMC not only sustains Rohingya heritage for future generations but also empowers the community to advocate for their recognition and ensure their issue is not forgotten.

The 'local Turn,' in Refugee Governance: An Ethnography of Refugee-Led Organizations (RLOs) in the Rohingya Refugee Camps in Bangladesh.

The 'local turn', 'localisation' and 'global-local dynamics' have gained renewed interest and importance in understanding peacebuilding, humanitarian policy and refugee governance. For some time, particularly in the UN system and their allies, we have seen the use of 'local governance', 'local capacities', 'local ownership', and 'local agency'. However, recent research has shown that the use of 'the local' was rather rhetorical, and, in reality, it has been neglected. The 'local' has also been used as an instrument in promoting a (neo)liberal agenda and hence requires a critical reflection on the use of 'local'. Thus, taking the 'local' turn in humanitarian and refugee governance as a point of departure, this paper aims to explore the grassroots mobilisation by the Refugee-Led Organizations (RLOs) in refugee camps to understand how 'localisation' unfolds in humanitarian and refugee governance in the global South. This paper is based on an ethnographic study of the world's largest refugee camps in Bangladesh. This paper shows the acknowledgment of the existence of the RLOs is almost non-existent. Yet, some of the RLOs are recognized by the international system. Therefore, a preference towards bigger and 'important' RLOs indicates a discrimination to the others and

thus has produced a complex interaction process that can be termed as 'friction'. In addition, national institutions have emerged as a coercive actors in refugee governance and imposed strong surveillance on these RLOs. Using a decolonial lens, it is obvious that power relations between (inter)national institutions and the local are asymmetrical. International institutions still use a 'capacity development/building' approach rooted in colonial modernity, to work with the RLOs. Despite the huge potential of grassroots mobilisation by the camp-based community organizations (RLOs) in different Rohingya camps in Bangladesh, partnership and mutual respect and learning trajectory between the international, national and the local are absent there.

SALEJ, MONIKA SYLWIA* (University of the Basque Country UPV/EHU, Spain)

Literary Writing and Design of Experience As a Research Device in Social Science

Firstly, an avant-garde novel is used as a source of knowledge about social reality. Witold Gombrowicz's *Ferdynand* (1937) is presented as an instruction book about the disruption or breach of the order of common sense or social norms (Garfinkel, 1968). The adventures of the protagonist are narrated examples that unravel the techniques of deconstructing the meaning of social frameworks (Goffman, 2006). It provides a different perspective on sociological theories about the actor (Latour, 2008) that causes the disorientation of what we consider normal and common.

Ferdynand's protagonist, a man in his thirties, begins to be treated like a teenager. He goes to school, stops living alone and moves out. He is unable to overcome the absurd social label given to him by others. Then he begins to plot devices to disrupt what others consider "normal". Literary writing, thanks to its fictional and non-literal character, is able to construct coherent worlds on imaginary premises in order to reach perspectives that real reality does not provide (García Blanco, 2012).

Secondly, it is a social laboratory work where art and sociology are introduced into everyday life, in the framework of an event related to literary writing. The aim is to confuse the participants and to observe how they make sense of a situation that does not make sense. Literary writing is used to capture the experience of human actors.

The experiment is based on the semiotic-material design of the installation and the dramaturgical-performative design of the situation, both inspired on *Ferdynand*. Special attention is paid to the emotional dimension of the situational or Situationist design (Guy Debord, 1977) and of the subsequent writing of the experience of disruption. The starting point of both are emotions. The bizarre, the confusing and the inexplicable emotions are the key to the breaching experiment's design.

SALEM QUBAILAT, REQA* (International Graduate Centre for the Study of Culture (GCSC) Justus Liebig University Giessen, Germany)

Invisible Camps: The Case of Al Mafraq Improvised Refugee Camp

'Random', 'wild', and 'unofficial' are among the various terms used within the displacement discourse to describe improvised refugee camps. In Jordan, these clusters of makeshift accommodations are usually located in isolated areas lacking infrastructure and access to municipal services. While this phenomenon is not new in a country that has been responding to wars and political crisis for over 80 years, it has notably increased since 2014, following the arrival of Syrian refugees. Despite the rapid international aid response and the existence of three official camps where healthcare and education services are accessible, some refugees turn to unofficial improvised camps that lack basic services such as sanitary facilities and roads. There, they face higher risk of violence, disease, exploitation, detention, and deportation (Obi, Chinedu Temple, 2021). This paper documents the experience of an improvised camp located in north-eastern Jordan. It relies on working with the inhabitants of this camp using participatory methods which enable them to steer the research focus and co-formulate its recommendations. This choice of methodology stems from a commitment to prioritising participants' interests and agency, by acknowledging the uniqueness of their experiences and complexity of their circumstances, especially in a context where lives are often characterised as either crisis or potential.

This paper is a part of a bigger project that investigates economic, political, and social factors which drive refugees to leave official camps and join makeshift settlements. It asks, how can global aid efforts and local response policies be reformed to eliminate the factors which push refugees to improvised camps, while documenting the innovative ways in which

these refugees 'recreate' their lives and interact with host communities. This contribution is an effort to bring focus to improvised camps and an invitation for feedback and collaboration with individuals and institutions who engage with similar phenomena around the world.

RC21-325.4

SALES PEREIRA, VERÔNICA* (UNESP, Brazil)

An Uncomfortable Absence: The Meanings of Destruction/ Demolition and Popular Presence in the Patrimonialization of Cotton Manufacturing Rodolfo Crespi, in the City of São Paulo.

The Cotton Goods Manufacturing Rodolfo Crespi, located in the old working-class neighborhood of Mooca, in São Paulo city, was the protagonist of four important conflicts in local and national history: the first general strike of 1917 (LOPREATO, 1997); the civil wars of 1924 (COHEN, 2007) and 1932; and its refunctionalization into a hypermarket in 2004 (RUFINONI, 2005).

Its refunctionalization and preservation mobilized media, neighborhood's middle class and institutions of heritage and justice in a conflict with the hypermarket. While it led to the destruction of the internal part of the building and its "scenographic" restoration (CARRILHO, 2007), this episode also constituted a way of constructing identity and collective memory (HALBWACHS, 1997), repressing a hidden subject: the popular presence.

According to Dolff-Bonekammer (2008), conflicts around refunctionalization/ preservation reveal a "discord value", in which present positive values of heritage cannot repress social and political disputes of the past.

Thus, understanding the processes of symbolic appropriation of buildings and urban space involves the articulation of their multiple temporalities, which occurs through the ways of "presentification" of the past, involving their relationships between architectural forms and their uses (LEPETIT, 2001), and by "spatial marking", which articulates patrimonialization, demolition/ destruction and remembrance/commemoration (VESCHAMBRE, 2008).

We will address how partial destruction and demolition of the Manufacturing in different historical conflicts produced forms of symbolic violence (VESCHAMBRE, 2008), inscribed in the representation of popular presence in urban memory. It swings between instrumentality, discomfort and effacement of the working class (1917), of civilian victims (1924), and the homeless population and the housing movement (2004).

Meanwhile, we will analyze how the association of images of the bombing with the "scenographic" restoration reveals a paradoxical "anachronic" survival (DIDI-HUBERMAN, 2012): refunctionalization as an unusual symbol of the "repair" of destruction, but also as traces of the continuity of this destruction in the present.

Navigating Identity: The Role of Skin Tone and Peer Victimization in Adolescent Well-Being in Chile

This research investigates the complex interplay between skin tone, peer victimization, and life satisfaction in Chilean adolescents, contributing to the ongoing discourse on social inequality and adolescent well-being in Latin America. Anchored in social identity and discrimination theories, the study explores how adolescents' self-perceived skin color influences their experiences with peer victimization and its impact on their overall life satisfaction within the school environment. The data were sourced from the National Survey on Student Trajectories and Transitions, conducted from 2017 to 2018, with a sample of 466 students (aged 14-18) from 58 urban schools across Chile.

Through the application of hierarchical multivariate ordinary least squares (OLS) regression and interaction models, the study evaluated the effects of peer victimization, school climate, and skin tone on adolescents' life satisfaction. Control variables, such as family structure and levels of parental involvement, were also included in the analysis. The results reveal that peer victimization negatively influences life satisfaction, with lighter-skinned students experiencing a more pronounced decline in well-being. Although skin tone alone did not predict life satisfaction, its interaction with peer victimization amplified the negative effects, especially for students identifying with lighter skin tones. Conversely, a positive school environment and high levels of parental involvement, particularly maternal, were linked to higher life satisfaction and mitigated the negative consequences of victimization.

These findings underscore the importance of addressing racialized experiences and their impact on adolescent well-being in educational settings. The study offers critical insights for developing inclusive school policies that promote equity and foster positive outcomes for all students, regardless of their skin color.

Decisions in Motion: Rural Women's Labor Migration in Morocco.

The progressive impoverishment of rural areas in Morocco largely contributed to enhancing internal migration flows, typically framed as a male-driven phenomenon due to the perception of women as guardians of the domestic economy. Yet, rural migration is both common and significant, though often overlooked, among women who migrate to pursue employment opportunities frequently tied to agricultural and informal labor markets. Based on a sociological study conducted among migrant women working as farmworkers in the agricultural production systems and food chains within two agricultural regions in Morocco, this paper contributes to a comprehensive understanding of the transformative potential of agricultural labor migration as a means of socio-economic empowerment for rural women. By shedding light on women's migration decision-making processes, the research findings reveal that although family dynamics, social norms, and community expectations heavily influence their decisions, women's active involvement in organizing their migration spurred a reconfiguration of traditional power relations within rural families, as women take on breadwinning roles through their paid agricultural work. These rural women use both social constraints and opportunities within the patriarchal system to enhance their autonomy and assert their agency. Rural women's labor migration serves as a pathway to renegotiate their status, make choices about their livelihoods, and achieve their empowerment.

SALHI, SAMIHA* (FLSH, University moulay Ismail, Meknes, Morocco)

Women's Family Arrangements and the Pursuit of Property Ownership.

Based on a sociological study of women working in agricultural production systems and food chains in Morocco, we analyze how housing-based wealth accumulation affects the reconfiguration of traditional gender roles within families. Indeed, the integration of women into the agricultural labor markets has provided them with access to seasonal and irregular income, yet this income remains unequal compared to men's. Despite this disparity, women actively contribute to the household economy and, more importantly, assert their agency through property ownership. In this respect, this paper examines the intersection of work stability, wage income, and property acquisition while highlighting the dynamics of housing ownership and inequalities. Our findings reveal that despite the instability of their work, women's economic contribution has led to the creation of new arrangements in which they become the primary income earners while securing access to real estate or land ownership. Engaging in microcredit, informal financial practices, mutual tontines or savings are, among others, common strategies for acquiring property. Through productive accumulation, women gain decision-making and negotiating power, which can potentially challenge the embedded gendered disparities in access to housing and financial autonomy.

SALIDO CORTES, OLGA* (Universidad Complutense de Madrid, Spain)

Assessing the Role of Welfare States in Reducing Inequality and Poverty: Evidence from EU Countries in the Face of Recent Global Crises

This paper examines how different social policy models can reduce inequality and poverty in capitalist democracies, confronting the structural forces that have driven inequality worldwide in recent decades. Building on Korpi and Palme's well-known "paradox of redistribution," this study contributes to a longstanding debate among social scientists and policymakers: How should welfare states and social policies be designed to most effectively reduce poverty and inequality?

To assess how different configurations of socio-political institutions can counterbalance economic forces, state interventions can be divided into

three main components: contributory transfers, non-contributory transfers, and direct taxation. Since contributory transfers (primarily old-age pensions) represent the largest share of public transfers in most countries and are often viewed as deferred wage payments, this analysis focuses on social assistance and taxation, treating contributory transfers as part of market income.

By employing various redistribution and progressivity indices, this paper empirically evaluates the state's capacity to reduce poverty and inequality in European countries—where welfare states have long been established—across two critical periods: the global financial crisis of 2008 and the COVID-19 pandemic. This approach facilitates a comparative analysis of the performance of different social protection models, particularly targeted versus universal approaches, over approximately the last two decades.

In light of this, the original research question is reformulated into two key inquiries: (i) To what extent are different social policy models capable of mitigating the inequality-generating dynamics of the market within the European Union and its member states? (ii) Has this capacity been altered by recent global crises?

This analysis will be expanded in the future to include non-European countries, enriching the debate by examining a broader range of institutional configurations and social models and allowing to show similarities and differences among different conglomerates of EU and non-EU countries.

FERNANDEZ ESQUINAS, MANUEL (Consejo Superior de Investigaciones Científicas, Spain)

Gender Equity and Institutional Policies: The Impact of Spain's 'Knowledge Transfer & Innovation Sexennium' Program on Academic Careers

Academic evaluation policies play a critical role in shaping career progression, and the design of such frameworks often has unintended consequences for gender equality. This paper critically examines Spain's "Knowledge Transfer & Innovation Sexennium" initiative, a public policy designed to assess knowledge transfer (KT) activities in academic careers. Through an institutional and policy-focused lens, this study highlights how academic evaluation frameworks can unintentionally reinforce or intensify existing gender biases, particularly in the context of KT activities, which are central to universities' third mission.

The analysis draws on data from the 2018 pilot call of the "Knowledge Transfer & Innovation Sexennium" offering empirical evidence of gender success rates across various scientific fields. It addresses both vertical (career-stage) and horizontal (discipline-based) forms of discrimination, providing a detailed account of how KT policies intersect with broader social, economic, and institutional factors to shape academic careers and societal outcomes.

By investigating the institutional structures and stakeholder agendas shaping these evaluation policies, this paper contributes to a larger discussion on the role of public policies in promoting gender equity within science and innovation systems. It argues that addressing gender biases in KT assessments is essential for achieving genuine equity and sustainability in academic institutions.

In conclusion, the paper calls for the integration of a gender perspective into the design and implementation of institutional frameworks that guide knowledge transfer policies. By doing so, it seeks to enhance the capacity of universities to fulfill their broader social missions, ensuring that ST&I policies contribute to a more equitable academic system and, by extension, society.

Race As Index for Other Matters: Gender and the Language of Land Rights in Morocco

In a groundbreaking lecture entitled "Race: The Floating Signifier" Stuart Hall defined race as a signifier that forbears all attempts of fixation around biological differences, religious, or scientific truths. Hall emphasized the fluctuations and permutations that complicate any stabilization of the meaning of race. I build on these insights to explore how the terms, race and racism, have articulated rural women's quest for land rights in Morocco. I explore these articulations in the Sulaliyyat Movement for land rights, as a grassroots, nationwide mobilization which started in the Gharb region, Northwest Atlantic, in 2007. In this paper I focus on the case of Mina, a 60-year-old *Sulaliyya* from the Gharb, and show how she mobilized race in her quest for land rights. Mina articulated her experience about sexism, corruption, and patriarchal

oppression, as racism. She did not have a name for these interlocking systems of domination, but she perfectly understood how women as a dispossessed gender were situated at their nexus. She racialized a process that was detached from any proper racial formation. This is what I term, race as index for other matters. In the Sulaliyyat Movement the term racism indexes this nexus of patriarchal laws, state corruption, and economic exclusion. Race becomes a powerful metaphor that provides gender with political valence while pointing to the discriminations collectively and individually experienced by women as a marginalized gender. In this paper, I focus on the everyday language that the Sulaliyyat use to articulate their struggle for land rights. I look at how the semantic of racism permeates women's perceptions of their condition as an oppressed gender.

Silence and Trauma: A Story of Water Privatization in Morocco Atlas Mountain

When I first visited Bensmim, on a hot summer day in 2018, this village of 3000 residents felt still, deeply silent, and uninviting. Bensmim was the battleground of a militarized intervention that ended a seven-year (2000-2007) protest movement against the privatization of its water springs by the French Company Euro Africane des Eaux. Through this resistance the village became an exceptional place for exploring the articulation of capital and affect at multiple scales, and across gendered experiences and sense of place. This paper analyzes silence as the most tangible "effect" (Malmström 2019) of this village encounter with resource grabs. I view silence as a *locus of emotions*, and an *affective container* that crystallizes the tensions, fears, and multifaceted disruptions of life in this village. I build an affective account of the 'ain's privatization through women's narratives about state-embodied violence, restricted mobility, and disruption of social ties in a slipping-away place. Bensmim offers a unique configuration of macro and micro-scale resource grabbing, under the form of large public and private investments (a large dam, golf course, airport, and elite club), small enterprises (cottages, private farms, and resorts), and micro-level bodily extraction, through labor. These developments enable us to understand the penetrating and multiplying effects of one privatization while offering exceptional access points for *sensing* the "intensity" (Massumi 1995) of life in the proximity of multiple enclosures. I narrate this story through the words of the men and the women who first opposed the project, before becoming entangled with it through state governance, violence, and job quests.

RC25-412.1

SALLACH, CARLOTTA* (Central European University, Austria)

Gendering Terrorism in the Courtroom

This article scrutinises the effect of gendered discourses around terrorism on the adjudication of terrorism-related charges. Applying Butler's notion of gender as performative, it investigates how gender-stereotypical notions surrounding political violence are drawn on by different actors in the legal interrogation of (acts of) terrorism and the material consequences thereof. This article thereby contributes to a growing body of literature that problematises the persistence of a masculinised understanding of violence and its socio-political and legal consequences. Current discourses on political violence continue to posit women with reference to the Beautiful Soul, as the ideal of femininity. As the assumed naturally peaceful other to men's aggression, women's violence is, thus, attributed to either feminine qualities such as passivity and submission or a violation of their womanhood. The comprehensive observational analysis of the trial against the German national Carla-Josephine S., reveals that different actors draw on stereotypical notions surrounding female political violence, thereby positioning her at different points on a continuum between the ideal-typical Beautiful and what I call the Broken Soul. In tracing how gendered identity emerged out of a negotiation between these two identities, the article ultimately provides much-needed nuance to our understanding of how gendered discourses of political violence produce material effects.

SALLEH, ARIEL* (University of Sydney, Australia)

An Ecosocialist Labour Form

As the mega-economy brings down the complex of natural systems that sustain planetary life, sociological concepts of labour and value that evolved with industrial capital need to be re-thought. A first step in this political shift is acknowledging labour as the ontological moment that bridges human intention and the material world. This allows us to rethink the relation between productive work and reproductive or regenerative work. It certainly will not do, to accept the rhetoric of progress that runs from industrial manufacture

to post-industrial dematerialisation. Moreover to build future ecosocialist alternatives with the broadest possible democratic base, a generic notion of labour is essential to integrate workers, women, peasant, indigenous, and ecological objectives. A grassroots and global resistance to capital calls for the recognition of these 'othered' labors and the unspoken value that they catalyse. It means theorising non-monetized activities carried on in a space somewhere between economics and ecology. For it is here, that what we might call 'meta-industrial' labour anticipates future models of provisioning in a green and autonomous commons. While marxists have been moving towards an ecological socialism for several decades now, their theoretic focus has remained with 'relations of production'. By contrast, a living ecosystem is about metabolic exchanges between Earth systems - soils, plants, water, atmosphere, and the diversity of species that interact with them. This broad ecocentric perception is essential to the design of 'an ecosocialist labour form'.

Inte-13.4

SALLEH, ARIEL* (University of Sydney, Australia)

Time to Call the Androcene

Whereas Anthropocene scientists emphasise 'deep geological time', social life is infused with another time, the metabolic pulse of materially embodied energies – libidinal and unconscious, intentional and judgmental. The Earth-wide changes classified today under 'deep geological time' actually have their motive source in the repression of 'deep affective time'. If you want a transdisciplinary reading of the planetary polycrisis and a subliminal reading of The Anthropocene Imagination - this is the session for you. It is based on my book *DeColonize EcoModernism!* recently published with Bloomsbury, London. The work is part of a trilogy, which understands the patriarchal-colonial-capitalist system as a single political entity - *The Androcene*. This re-naming opens the way for a shared strategy of resistance among feminist, decolonial, socialist, and ecological movements. The trilogy delves into the deep structure of political ecology by examining how workers, women and indigenous peoples are each manipulated by an ontology of systemic dualisms. *The Androcene* is a vibrant historically evolved complex of patriarchal-colonial-capitalist privilege and rulemaking. Over millennia, it has expanded across the world from local civilizations and religious rites, through tribal invasions and imperial adventures, arriving at its modern capitalist phase some 500 years ago. *DeColonize EcoModernism!* focuses on where the action is right now; that is, the tensions between neoliberal ecological policy and global grassroots initiatives for change.

Participative Storytelling: A Critical Wellness Tool for Teenage Mothers in Mathare Informal Settlement, Nairobi, Kenya

Globally informal settlements are polymorphic in nature, characterized by a myriad of social ills attributed to the low incomes and segregation from the urban development. The youths are usually labelled as villains and marginalized from accessing quality education, thus limiting their life chances. The psychosocial challenges experienced by the girl child within these inner cities are immense given the risk factors attributed to their lack of a sustained social support system. Mathare is one of the larger informal settlements of Nairobi, the Capital City of Kenya. The informal settlement has a history of political violence instigated by politicians, and thus the levels of poverty, crime and under-development are exuberated by ethnic animosity. The fate of the girl-child in Mathare is set in their vulnerability with vivid experiences of a victim and survivor. This paper explores how participative storytelling has been an effective tool for a community engagement at Mathare, targeting teenage mothers aged between 13-17 years. Through a sustained engagement and commitment, a conducive environment emerged, where the young mothers could establish positive emotions in sharing their stories, learning from them and desiring to transform. This paper will aim at highlighting the case stories of these young mothers, their disturbing experiences and how story telling has contributed to their self-transcendence amidst the agonies of their social environment.

SALZANO, GIULIA* (Università Perugia, Italy)

Addressing a Sociology of Empathy: Theoretical Frameworks, Concepts and Perspectives of Investigation

In recent years, the proposal for a sociology of empathy has made its way. Important contributions to this purpose can be found in the sociology of emotions. These pioneering works on the relationship between empathy and social life have mostly seen the cognitive and emotional models of empathy

alternate. However, the recent flowering of interdisciplinary studies on empathy has promoted a more layered model of empathy that brings together perceptual, affective, cognitive and emotional aspects. This aspect leads to renew and systematize the sociological analysis of empathy. This contribution aims to reflect on the most appropriate theoretical frames and conceptual tools to deepen the analysis of the social implications and social conditioning underlying the empathic phenomenon. The paper will develop two concepts that can be useful for this purpose: "empathic work" and "empathic habitus". The first is grounded on the Hochschildian dyad emotional work and emotional labor and can be employed to highlight the factors that solicit or inhibit empathic activation, influencing its modulations and output. The notion of "empathic work" allows us to inquire the social distribution of the empathic load and to investigate the logics that define our empathic maps. While the empathic work is connected to forms of more or less conscious control of one's feelings and affective manifestations, the notion of "empathic habitus" reinforces the identification of pre-reflective social conditioning that characterizes the development of empathic dynamics. This notion will be addressed in order to analyze how relationships of power, social distance and socio-cultural factors are inscribed in our empathic sensitivity. After illustrating the plurality of components related to empathy, having specifically described the concepts of empathic work and empathic habitus, the paper will focus on how these tools can be applied in sociological inquiring reflecting on new research hypotheses concerning the relationship between empathy and society.

Lebanese Power Geographies: How the Political Elite Reinvents Itself through Land and Property

Land has been at the center of political power in Lebanon since the country was part of the Ottoman Empire. Territorial domains – including the people who lived in them – were divided and distributed to middlemen who collected taxes and ensured agricultural productivity. While the nature of office of these middlemen changed throughout the Ottoman reforms of the 19th century (army officers, taxfarmers, private bidders, public agents), their role as land brokers and local leaders strengthened with time. The resulting power-domains, mostly covering state lands, were gradually transformed into elite private domains, de facto or de jure. This emerging class of large landowning families persisted during the French mandate (1920-1943), but also what became the Lebanese state. They occupied the first parliaments and municipal councils.

Such land-embedded power relations are still employed by the political elite in Lebanon to assert their presence and dominance. The two main reasons for that are: 1) the lack of consequential overhaul of the property regime and land structure during the French mandate, and 2) the elite's resilience in preempting any system change, bending it to their interest. The argument will be illustrated by two case studies, one relating to a deputy in North Lebanon, and the other to a mayor in Greater Beirut.

The first case highlights the role of property regimes' historical transformation in allowing such elite to accumulate land not only for wealth, but also to delineate and assert their power geographies over their "constituencies". The second case highlights the contradicting role that mayors play as descendants of large landowners in contrast to their supposed role as "public welfare" custodians.

Such cases contribute to a finer grain analysis of what otherwise would be seen as mere wealth accumulation and elite corruption if understood through macro-structuralist lenses of financialization and weak/absent state.

Transitions and Trajectories in Higher Education: Faculty and Learner Experiences.

Universities within broader knowledge systems are an important point of investigation in the evolving Anthropocene marked by critical structural transitions, encompassing individual, institutional and collective agential trajectories. This interplay of transitions and trajectories brings into focus the 'public' nature of learning spaces, and the paper takes at its starting point this interplay investigating higher education in urban studies and its allied spaces of learning through the lens of Justice, broadly construed. Drawing on fieldwork conducted in India, Tanzania, Sri Lanka and Thailand, on understanding faculty practices and learner experiences, the paper highlights the tension that emerged, particularly in two types of change embedded with their own strategic intents – on the one hand the evolving nature of higher education and allied spaces of learning, and on the other, the pathways imagined and practiced by faculty and learner themselves.

In particular, the paper is set against the backdrop of the nature of 'public', and the inherent rights to quality and democratic education that it promises. It is informed by ongoing conversations around questions of decolonization of higher education, critical representational politics, epistemic justice, and identities and marginalizations, through evidence provided in the narratives of faculty and learners, and touching on issues of pedagogic content, access and educational attainment, campus climate, institutional and non-institutional structures and challenges of technology.

Understanding such negotiations in spaces of higher education and affiliated networks of learning in the context of urban studies allows us to critically examine the just nature of 'public' knowledge and knowledge systems.

The Role of Emotional Intelligence in Enhancing Personal Branding

In today's world, highly connected to the New Technologies of Information and Communication, Personal Branding is more crucial than ever. It involves defining and communicating one's unique value, skills, and personality to create a distinct and memorable image in the minds of others (Peters.1997). Hence, how professors-researchers make themselves known to the world and how well they connect with others is very likely to impact their careers. This is where Emotional Intelligence proves to be efficient and be considered as an important skill to which professors-researchers would better adhere in order to enhance their personal brand. In fact, to have a strong profile rich with high diplomas, experience, published works really matters. Still, the brand professors-researchers forge for themselves matters as well. Hereby, lies the importance of emotional intelligence in enabling professors-researchers construct a bright personal brand and consequently succeed professionally.

Thus, the aim of this contribution is to highlight the most effective emotional intelligence skills such as self-awareness, social connections, empathy, authenticity and effective communication that can be adopted on the part of professors-researchers to enhance their personal branding and promote their professional success.

This study will be based on a theoretical framework. I will conduct a review of the existing literature on emotional intelligence, personal branding, professional success, and the interrelation between them. Also, I will rely on publications which record cases of professors-researchers who have leveraged emotional intelligence skills to forge a strong and brilliant personal brand. The implication of these findings would serve as examples to learn from.

To sum up, this methodology would allow for an exploration of how mastering emotional intelligence skills leads to enhance a positive personal brand and result in professional success.

The Coloniality of LAW: Constitutionalism and Human Rights

Human rights are usually and traditionally understood as an outcome of the political and legal context of modernity, which did not take into account the existence of other subjects besides the abstract and ideal individual, other kinds of knowledge and other forms of structuring power. It is in this perspective that we intend, applying the historical-dialectical method and undertaking bibliographical research, to deepen the knowledge on the critical perspective on human rights and on constitutionalism itself, with the aim to highlight the obscure side to colonialism, which has been obfuscated by modern hegemonic thinking. The decolonial perspective, as it points to the unveiling of the dominion over the non-European other and to the universalism of Eurocentrism as a way of being, of knowing and of exerting power, can demonstrate the inconsistencies of the dominant perspective on law and especially on human rights and their low effectiveness.

Reframing Urban Education: Addressing Informality in Architectural and Urban Design Curricula. Cases of Morocco, Colombia and United States of America

By some estimates, informal settlements (slums) may comprise as much as half of all urban areas by mid-century, making them "the most common form of urbanization on the planet." Despite the rapid growth and prevalence of this form of urbanization, there is a significant gap in architecture and urban design education, particularly regarding urban informality in the Global South. Current curricula often overlook or marginalize this critical aspect of urban development.

This study explores this gap through a comparative analysis of architecture and urban design programs in the United States, Colombia, and Morocco. It investigates the varying degrees of exposure to urban informality concepts among students. The research employs a mixed-methods approach, including curriculum analysis and surveys of students and recent graduates. The paper argues that educational shortfalls in addressing urban informality not only limit students' understanding of global urban challenges but also perpetuate design approaches that may be ill-suited to the complex realities of informal urban spaces.

By comparing these pedagogical approaches, we aim to identify gaps in how these concepts are integrated into architectural, urban design, and planning education. The study emphasizes areas that require further development, highlighting the urgent need for a more inclusive and globally aware approach to urban studies. This research seeks to better prepare future professionals to tackle the diverse challenges of 21st-century cities, particularly in the Global South.

A New Policy or a Return to History? the Historical Roots of Britain's 'Sending' Policy Towards Coloured Migrants: The Uganda Case

The migration policy of Britain has always been one of the core elements for British policymakers. Furthermore, British migration policy has evolved significantly over the last 80 years, shaped and influenced by historical events, economic needs, and societal reflections.

"The United Kingdom's post-war migration policy began to take shape with the arrival of Caribbean migrants in London in 1948, which is considered the starting point for post-imperial migration flows to the British Isles. This date could also be seen as the beginning of the discussion about 'migration' among British political elites and ordinary people, as immigrants began to participate in every aspect of societal life."

The British government's initial reaction to imperial migration flows was very welcoming. This policy (especially from 1948 to 1962) led to a diverse influx of people, particularly from the Caribbean, India, and Pakistan. However, from the 1960s onwards, political and social concerns regarding integration and economic recession led to the emergence of restrictive immigration policies, namely the Commonwealth Immigration Acts.

1971 marked another crisis that British political elites had to handle in post-war British migration history. Uganda decided to send British passport holders back to their original countries after introducing new citizenship criteria. The Uganda crisis made headlines for British political elites, as hundreds of thousands of 'British citizens' were about to be expelled. During the heated discussions on the plight of Ugandan British migrants, a Conservative organization, the 'Money Club,' suggested an unusual solution: sending Ugandan Asian British passport holders to a location in the British Indian Ocean Territory—a move that resonates with a very recent British policy to send irregular migrants to Rwanda. Within the scope of this study, I will be tracking the roots of the British 'sending' policy by examining the Ugandan Asian migration crisis.

Futurs Numériques : Transformer La Gestion Migratoire à Travers L'innovation Digitale

Tout au long de ces dernières décennies, le profil migratoire du Maroc est devenu l'un des plus dynamiques, un pays d'installation et/ou de transit pour des milliers de migrants provenant principalement d'Afrique subsaharienne. Le lancement d'une politique migratoire volontariste a été une réponse aux divers défis liés à la migration, notamment l'intégration. Dans ce contexte, la mise en place d'un système de gestion numérique apparaît comme une nécessité.

Dans la perspective du Maroc Digital 2030, cette étude s'inscrit dans un contexte marqué par l'absence d'outils numériques pour la prise en charge des migrants africains subsahariens, qu'ils soient réfugiés, demandeurs d'asile, sans-papiers ou régularisés. Ainsi, la conception et la mise en place d'une application mobile innovante visent à faciliter leur intégration à l'échelle nationale.

L'application mobile, avant tout un projet de gestion, contribuera à simplifier l'échange d'informations sur les difficultés rencontrées par les migrants, quel que soit leur statut administratif, dans leur accès aux services fondamentaux tels que le logement, la santé, l'éducation et l'emploi. Elle est également destinée aux personnels des associations, des organismes publics et des ONG qui s'intéressent à la question migratoire des Africains subsahariens au Maroc.

Il s'agit d'une application mobile conçue à partir d'un système de gestion de contenu (CMS Joomla) et d'une base de données MySQL. Cet outil numérique deviendra sans doute incontournable pour soutenir la communication, l'échange et la diffusion d'informations relatives aux migrants subsahariens au Maroc.

SANCHEZ, FABIO* (Universidade Federal de São Carlos, Brazil)

The Solidarity Economy As a Reconfiguration of Social Movements in a Context of Dismantling

The aim of the present work is to discuss the constitution of a solidarity economy agenda in conjunction with the Brazilian social movements in the last decades, seeking to perceive its constitution as a political subject and its relationship with the Brazilian democratic process and the social movements after the 1980s.

The literature temporally locates the (re)emergence of the solidarity economy in Brazil - understood as the creation and expansion of associative and self-managerial ways of organizing economic activities - starting from the re-democratization in the early 1980s.

However, the hypothesis of this work is that only in the 1990s - as a response to the advance of neoliberal policies and the consequent configurations of social movements in this scenario - did the solidarity economy acquire meaning and presence in the public sphere and become a political subject. The experiences of the solidarity economy and its political agenda could be considered more as the result of the dynamics of the 1990s and its context, characterized by the advance of neoliberalism and the ebb and flow of democratic experiences of the previous decade, than the opposite.

The central argument of this work is that this process takes place precisely because of the more general reconfiguration of social movements throughout the 1990s, which stemmed from profound transformations in Brazilian society. These transformations led a group of social movements and several of their activists to find in the solidarity economy a new agenda that allowed them to (re)position themselves in a field of conflict in profound mutation.

Considering that, we aim to discuss the reconfiguration of the mobilization processes originally organized around the grammar of the solidarity economy, focusing on the semantic sense of democracy in both cases.

SÁNCHEZ AGUILAR, JESÚS ALEXIS* (El Colegio de México, Mexico)

Implicaciones De La Extorsión Criminal En El Comercio Ambulante Del Centro Histórico De La Ciudad De México. Un Análisis Configuracional De Los Factores Que Inciden En Su Percepción De Riesgo.

La extorsión criminal se ha consolidado como una de las amenazas más significativas para la seguridad en México, comprometiendo tanto la estabilidad económica como el bienestar social. De acuerdo con la ENVIPE 2023, es el tercer delito más frecuente en el país. Este fenómeno delictivo, caracterizado por la obtención coercitiva de recursos mediante amenazas y violencia, afecta de manera particular a sectores comerciales del Centro Histórico de la Ciudad de México (CH-CDMX).

En este contexto, la propuesta de esta ponencia se inscribe en las discusiones teórico-analíticas sobre los mecanismos informales de control social ejercidos por el crimen organizado, como la extracción sistemática de rentas hacia la población. Esta práctica se concibe no solo como una forma depredadora, sino también como un mecanismo de coacción que puede adoptar diversas modalidades. Desde esta perspectiva, la extorsión trasciende el acto delictivo aislado, convirtiéndose en un proceso continuo de interacción coercitiva entre victimario y víctima.

En el caso de los comerciantes del Centro Histórico de la Ciudad de México (CH-CDMX), esta problemática se manifiesta a través de las demandas de "derecho de piso" impuestas por el crimen organizado. Por consiguiente, la presente ponencia tiene como objetivo presentar los resultados de una investigación de maestría que, mediante un enfoque configuracional y comparativo de casos, busca identificar los factores más determinantes en la percepción de riesgo de este delito por parte de los comerciantes, así como analizar las interacciones continuas y coercitivas entre víctimas y actores criminales a través de las tipologías principales. Estas interacciones involucran la negociación de recursos materiales y no materiales y se caracterizan por estrategias de dominación en los ámbitos material, social y político, mediante las cuales las organizaciones criminales ejercen control.

Los Espectadores De Los Discursos De Odio En Las Relaciones Offline. ¿Cómo Se Interviene Desde La Escuela Por Parte Del Alumnado?

Esta comunicación aborda el análisis sobre los datos obtenidos en el marco del proyecto de investigación PID-2021-1271130D-I00 durante el año académico 2023/24 en distintos centros de la provincia de Almería. Dicho proyecto se encuentra focalizado en los discursos de odio y la radicalización violenta tanto dentro de las redes sociales y nuevas tecnologías como fuera de las mismas. A tal efecto, la investigación ha permitido conocer las reacciones de los menores de los centros de secundaria, formación profesional y bachillerato frente a los discursos de odio tanto fuera como dentro de las redes sociales. Durante dicha labor de investigación se contó con una muestra total de 571 menores.

El interés de la muestra seleccionada se halla en su diversidad. Por un lado, está compuesta por personas con edades comprendidas entre los 12 y los 19 años. A su vez, estos individuos tienen rasgos culturales diversos, mostrando de este modo la variabilidad de percepciones y puntos de vista que influyen en la reacción ante los discursos de odio. Asimismo, parte de este alumnado que compone la muestra, posee la característica de ser hijos/as descendientes de personas extranjeras, lo que permite contemplar cómo interseca este factor o incluso si puede ser un factor de riesgo para recibir o emitir discursos de odio.

La metodología elegida ha sido cuantitativa, utilizando como técnica para recabar la información la encuesta. Para el análisis de datos, se ha utilizado el software estadístico SPSS.

Material Phantasmagorias of Modernity. Baroque Dramatization As a Reconfiguration of Freedom and Against the Anthropocene

The Ecuadorian-Mexican Marxist philosopher Bolívar Echeverría was close to critical theory's discussions inherited from Lukács about the possibilities of freedom of subjects within the objective conditions of history. For Lukács was important to criticize reification in the capitalist social dynamics and to understand how empirical class consciousness can rise to the level of attributed consciousness through the experience of struggle and achieve liberation. Freedom is considered here as a rational required moment of subjectivity in order to organize the class struggle.

Instead, Echeverría criticized the modern myth of revolution, a certain Lukács' optimism and developed the concept of baroque ethos as a typical life form in capitalism, transgressing its automated character and refunctionalizing lives. In this sense, freedom is not related to rational and organized subjectivity, but to spontaneous experience. If this is so, to what extent can Echeverría's conceptualization of baroque ethos be understood as a critique of the Anthropocene? How does Echeverría avoid falling into individualism? How does the baroque ethos reconfigure the conceptualization of freedom? What is the theoretical and practical potential of the allegory bringing with it baroque dramatization?

Transnational Repression Against Nicaraguan Opposition Migrants.

Transnational repression refers to governments' efforts to persecute members of their diasporas to control their activities and prevent acts of political dissent abroad. Such actions have been on the rise due to technological advancements in recent decades. While cases involving China, Turkey, and Russia have been extensively analyzed in the literature, this phenomenon is only just beginning to emerge in Latin America. Nicaragua has recently joined this trend, implementing internal policies such as revoking the citizenship of over 300 political opponents abroad and taking direct repressive actions against its nationals living in other countries.

This paper analyzes the types of transnational repression faced by migrant political opponents, their roles as opponents abroad, and the factors explaining the types of repression they suffer. Data were collected from in-depth interviews with Nicaraguan refugee social and political activists based in Costa Rica, the United States, Mexico, and Spain. The data were also contrasted with documentary analysis, mainly from internet news and international reports, to provide a comprehensive understanding of the dynamics of repression and resistance within Nicaraguan diaspora communities.

The results indicate that, despite leaving the country and, in many cases, being granted international protection status, opposition members are still targeted by repressive actions. The persecution faced by these individuals and their families hinders their ability to continue their political work due to fear of the consequences. Data also reveal common repressive practices experienced by all dissidents, with the most severe actions targeted at those with significant media presence and political influence. Finally, socio-demographic characteristics and life situations are important factors in explaining the types of repression experienced.

MIRANDA, DANIEL* (Department of Psychology, Faculty of Social Sciences, Universidad de Chile, Chile)

Gamson's Mistrustful-Efficacious Political Participation Hypothesis in Adolescents from 24 Countries.

Young people have played a prominent role in the global trend towards participation in protests to the detriment of more traditional forms of political involvement. In recent years younger generations have been not only the drivers and protagonists of the protest but often exceeded their more peaceful and "normalized" forms to make their demands heard.

What drives the youngest to get involved in these highly disruptive actions? What differentiates them from those who opt for other moderate avenues of political action? How and to what extent can the interaction between individual characteristics and context radicalize young people?

William Gamson (1968) proposed that low institutional trust and high internal political efficacy are the optimal combination for political mobilization, including participation in protests and demonstrations. According to Gamson, mobilization against the government occurred primarily because of dissatisfaction with its performance but, at the same time, because they believed they could bring about social change through direct action. This paper follows this hypothesis, using the combination of institutional trust and political self-efficacy to generate typologies of "political participants" and assess the extent to which the expected pattern occurs considering different types of participation: conventional, disruptive and digital.

Using the International Civic and Citizenship Education Study 2022 - ICCS, around 80000 students from 24 countries participated, we evaluated Gamson's Mistrustful-Efficacious Political Participation Hypothesis. In line with the expectations, preliminary results showed that efficacious students (trusting and distrustful) are more willing to participate in the different types. In contrast, students with lower levels of self-efficacy and distrust show less willingness to participate in all kinds. Additionally, relevant variations across countries are observed. Latin American students seem to be more radical in their view of participation, while developed countries do not.

SANDAL-WILSON, HAKAN* (London School of Economics and Political Science, United Kingdom)

Radical Democratic Iterations: Gender and Sexuality within Social Movements

How are ideas about democracy and inclusion transformed within social and political movements in light of universal norms? While there is a rich body of scholarship on how democratic meanings and norms within particular polities transform and are subject to contestation and reinterpretation, we understand less well how this process plays out within social movements. Building on Seyla Benhabib's theory of 'democratic iterations', which was focused on liberal democratic polities, I suggest 'radical democratic iterations' as a framework to analyse how understandings of democracy and inclusion, particularly with regards to gender and sexual identities, are transformed within social and political movements.

In this paper I explore two case studies drawn from my ongoing research to illustrate this framework: first, gender inclusion and women's participation in democratic politics, focusing on the transformative redefinition of gender roles within Turkey's Kurdish public sphere; second, Kurdish LGBTI+ organizing and politics, highlighting their significance on multiple levels of political and democratic culture. My reconceptualization treats these cases as interconnected and mutually constitutive, while attending to the broader intersecting exclusionary structures surrounding politics of gender and sexuality, such as racism and class, in modern Turkey.

A key finding of this research is the importance of attending to how social and political movements understand gender and sexual rights. Doing so facilitates our reading of their democratic visions, as well as the current state of democracy within which they operate. Through these examples, I argue that the framework of "radical democratic iterations" offers a valuable lens to understand how democratic visions can transform within and among social, political and ethnic movements, and their ability to influence "strong" publics, such as by pushing for legislative changes even within a nation-state they are critical of.

SANDER, VAN LANEN* (University of Groningen, Netherlands)

Community Spaces Under Austerity Urbanism: The Michi Noeki and the Politics of Social Infrastructure in Groningen, the Netherlands

After years of austerity urbanism, many community spaces disappeared or diminished their services. In response, social workers, municipal employees, and inhabitants increasingly argue for the importance of community spaces, especially in 'vulnerable neighbourhoods' that house concentrations of people with low income, low health, and other indicators of disadvantage. However, the transformation of national and urban governance under austerity impacts the making and remaking of 'social infrastructure'. In this presentation, I explore the values, governance, and practices behind creating a community space in Groningen, the Netherlands.

In 2023, a 'Michi Noeki' opened in the Oosterparkwijk in Groningen, responding to such a professed dearth in community spaces. The Michi Noeki is a quintessential example of social infrastructure; it aims to be a place where people can meet each other with minimal financial, social, and physical barriers. This presentation presents an in-depth case study of the Michi Noeki to assess social infrastructure's nature, impact, and reception under austerity urbanism. Work with developers and municipal employees illustrates how processes of marketisation, directly and indirectly, govern social infrastructure. External competitive funding governs the location and nature of new social infrastructure. Embedded in municipal policy objectives, the Michi Noeki radiates neoliberal subjectivity through work reintegration and personal health responsabilisation. However, interviews with users and volunteers will show whether these groups accept these values or will contest them and appropriate the Michi Noeki for their activities and values.

Through the Michi Noeki cast study, this presentation discusses how (semi-) privatised financing and providing community spaces shape the values and practices these places embody. Furthermore, it shows whether citizens accept or subvert these decisions and regulations of their community spaces. Therefore, this paper contributes to debates about the politics of community spaces under contemporary urban marketisation and financialisation.

Anti-Gender Backlash and Contentious Politics: Polarization and Challenges to Intersectionality within Transnational Feminist Advocacy Networks in Europe

Since 2007, the rise of the third-wave of feminism has coincided with a pronounced anti-gender backlash that poses a threat to democracy both in Europe and beyond. The increasing mainstreaming of radical and populist right-wing ideologies, coupled with anti-gender and anti-feminist actors, has given rise to novel, organised, and transnational forms of mobilisation and alliances. Gender issues serve as a focal point to promote an ultraconservative agenda defending traditional gender roles and the heteronormative family.

In this context, European feminist advocacy networks are also facing challenges. Feminist governance structures established in prior decades have weakened, marked by erosion, fragmentation, and their role witnessed a shift from cooperative relationships with feminist networks and associations to a more sceptical, watchdog stance towards EU policies. Transnational feminist activism encompasses a broad spectrum of positions, where intersectionality plays a pivotal role in shaping collective identity and alliance-building. Nonetheless, contradictions and polarization are present between actors that pursue an intersectional and LGBTQAI+ inclusive feminist approach and others promoting a more "traditional" and binary understanding of gender inequalities and other organizations. The latter adopt a "selective" approach to prioritising intersecting axes of difference and discrimination, often overlooking class, gender identity, and sexual orientation, in certain cases leveraging on arguments that are close to the ones framing anti-gender rhetorics.

This paper, delving into recent CEDAW discussions and debates on the EU Directive on Domestic Violence and Violence against Women, focuses on the actors and frames that have facilitated the "normalisation" or "mainstreaming" of anti-gender positions, also within transnational feminist advocacy contexts,

which used to be drivers of democratic resilience. The paper argues that it has become increasingly difficult to draw a clearcut between the anti-gender and the feminist movement in certain cases.

Living with "Welfare Stigma": Identity and Food Assistance Programme in India

Recent years have seen increased attention and revival of progressive welfare measures in India. Central to this is a more difficult project to analyse how public welfare exacerbate stigma for some more than the others. Based on a thematic review of existing literature, this paper aims to explore if universalistic or particularistic welfare programmes translate into higher stigma for more disadvantaged social groups. In doing so, it examines whether and to what extent historical differences in social identities influence the possibility of gradations of stigma among recipients of food assistance programme under India's Public Distribution System. It attempts to understand caste through the framework of welfare dependency on two fronts. First, to understand the development of and experiments with welfare in India seeking to reconcile previous studies, and second, revive the historically significant idea of welfare stigma which is also distinctively situated within the Indian social structure. Recognizing the persistence of history, especially the inheritance of an unequal social order, is vital to understand why the persistence of caste-based stigma seem so difficult to govern and offers a clue as to why utilitarian policy solutions are unable to amend the concern of society.

Disability Inclusion or Exclusion in Development Efforts: A Critical Review of Learning Disability Amongst School Children in India

Disability is often misconstrued due to its health and economic ramifications. Furthermore, biases against people with disabilities are frequently overlooked. People with disabilities encounter various forms of discrimination, including those based on social class, caste, gender, and the nature of their disability, which is often categorized based on its proximity to or deviation from the societal norm. *Normality* refers to the standard level of physical ability society has adapted to and accepted, enabling individuals to manage their biological conditions. The categorisation of individuals in society and establishing social hierarchy is known as social stratification. Different cultures have varying systems of stratification and beliefs that justify inequality. For example, individuals at the margins in India are often excluded due to their caste, religion, gender and disability. In educational institutions, inequality can be explained through meritocracy, where those who work the hardest and are the most talented are believed to rise to the top, or through birthright, where certain groups are considered to be born into positions of power. These explanations may not always align with reality but are commonly acknowledged. The study of social stratification has traditionally focused on caste, class, and gender, often neglecting individuals with disabilities as a distinct social category. It is apparent that individuals with disabilities encounter barriers to education, are less likely to complete their studies, and often face limited economic opportunities post-graduation. Contemporary theories of social stratification emphasise intersectionality, where multiple forms of oppression intersect. Sociology offers a unique perspective for exploring the construction of disability as a social category, including institutional contributions, societal dynamics, and power inequalities. This study aims to highlight the marginalized status of children with disabilities in India, particularly those with learning disabilities, through a comprehensive literature review.

The Apple of Discord

The application of various forms of intellectual property rights (IP) to agriculture has significantly transformed food production. IP facilitates the concentration of power and control over food systems in the hands of a few corporations, often driving trends toward monoculture and unsustainable agricultural practices.

Club apple is known a system that manages apple supply chains through the application of IP rights. Drawing on ethnographic data from the Tasmanian apple industry, this paper explores the reasons behind the mixed feelings

expressed by interviewees operating within this particular IP regime, ranging from compliance and ambiguity to uncertainty and even anger.

This paper critically engages with governance and intellectual property law to offer insights into how sustainable governance systems can address the challenges of power concentration in food production, while promoting ethical and ecological food futures.

Addressing the Educational Challenge of Unaccompanied Foreign Minors: Sociological Reasons to Deal with It

The following reflections present the path that has guided our theoretical reflections and empirical research experiences since 2017 up to now, on unaccompanied foreign minors in Europe and their access to education. Six reasons, in particular, explain why it makes sense to focus on this specific group of migrant minors transitioning to adulthood, proposing interpretations that not only consider their peculiarities within the framework of migration flows – such as their subalternity, instrumental-acquisitive orientation, racialization and segregation, and the social pressure to quickly achieve autonomy – but also the safeguarding of appropriate spaces and times for formal, non-formal, and informal learning, with reference to a holistic model of educational integration that responds to the cognitive, social, and emotional needs of these young people. Addressing UAMs (Unaccompanied Minors) in their journey toward and within school, in particular, is essential because:

1. They are minors, with a right to education in the contemporary democratic societies, even though they are also irregular migrants with adult projects;
2. It sheds light on important socio-educational dilemmas that permeate international dynamics, in which UAMs experience their mobility;
3. It allows for a deep analysis of the production, reproduction, and amplification of educational inequalities, through the identification of novel mechanisms that operate in contexts of equal opportunities;
4. It makes it possible to classify risks and protective factors that influence the growth of many minors without adult references;
5. They possess typical vulnerabilities and resources, traceable in the paths of many disadvantaged minorities;
6. Finally, it shows how research can shed light on the contextual and institutional conditions that make a statistically improbable phenomenon - UAMs' access to school - possible.

Reclaiming Forgotten Voices: Harriet Martineau's Contribution to the Sociology of Education and Feminist Theory

My proposal invites a critical reflection on what we have been taught about the contributions of male and female sociologists in the field of education. Often, alongside the famous “fathers” of sociology like Durkheim, Weber, and Mead, female figures such as Harriet Martineau, Flora Tristan, Frieda Wunderlich, and Jane Addams have been overlooked, despite offering innovative and relevant contributions to the analysis and interpretation of educational processes.

I would like to briefly reflect on the theoretical and empirical contribution of Harriet Martineau, the first sociologist, who in the first half of the 19th century developed a progressive, inclusive, and universalist vision of education. Her idea of education—addressed to the privileged, the marginalized, the disabled, and women, oriented towards social justice and the development of individual capacities—anticipated concepts that are still debated today.

By addressing the dilemma between “reproductive” education and education that liberates from inequalities and injustices, Martineau's work within the canon of sociology of education could advance feminist theory in legitimizing education as part of the scientific culture of society, a goal inherited from past female sociologists and still not fully achieved (Acker, 1987).

Entrepreneurial Subjectivities and Conflictive Identities within Digital Care and Domestic Platforms

This paper examines the ongoing transformations and tensions underlying the platformization of domestic and care work in Spain, a sector that has historically been feminized, migrant, and racialized. The study uses a qualitative analysis of semi-structured interviews with workers to explore the subjectivities and identities formed through digital platforms. From a critical perspective, it interrogates the contradiction between the corporate narrative of professionalization and the reality of deregulated labor, highlighting how workers, despite facing precarious and adverse conditions, often view aspects like flexibility as positive and present their experiences on these platforms as opportunities. Finally, the article critically engages with the role of these platforms as one of the few accessible pathways to the labor market for workers in vulnerable situations, shaped by factors such as migration, a lack of support networks, and the continued invisibility of care work within a neoliberal framework.

SANTANA MACHADO, GABRIEL* (Getulio Vargas Foundation, Brazil)

The Limits of Tolerance for Territorial Inequalities in Equitable Federalism: Parameters of Distributive Justice in the Brazilian Context

Federative arrangements exhibit diverse relationships with territorial inequalities; however, the existing literature has not thoroughly examined their capacity to promote distributive justice. This empirical article aims to identify the limits of tolerance for territorial inequalities within equitable federalism, a type of federative arrangement normatively conceptualized based on John Rawls's theory of Justice as Fairness. We begin with the premise that while territorial inequalities are tolerated in federal arrangements, there are limits to the acceptability of these inequalities in equitable federalism. Such inequalities should not be excessive and must ensure that subnational entities can provide comparable public policies to their populations. Consequently, this study seeks to establish fair parameters for the acceptability of inequalities within federations. The identification of tolerance limits for territorial inequalities in equitable federalism aims to determine the levels of expropriation of municipal revenues necessary for municipalities to maintain their revenue potential while also addressing the resource needs of less affluent entities through revenue redistribution. Empirical analyses will be conducted using revenue data from Brazilian municipalities. To achieve this objective, quantitative analyses will focus on the budgetary execution of revenues from all Brazilian municipalities between 2013 and 2022. This proposed article is part of a research agenda dedicated to examining the capacity of federative arrangements to promote distributive justice territorially, thereby ensuring that constituent units possess equitable conditions to provide public policies for their respective populations.

Childhood Residential and Neighborhood Trajectories and the Physical and Behavioral Health Outcomes of Low-Income Minoritized Youth

Poor housing quality and residential instability have been found to be consistent predictors of poor physical and behavioral health for low-income children and youth in the United States. Expanding access to quality housing and housing stability are seen as the means for promoting improved health outcomes for disadvantaged children. However, we know surprisingly little about the long-term effects of housing and neighborhood trajectories on the health of vulnerable children. Nor do we know much about children residing in subsidized housing and how such housing might serve as a vehicle for improving children's health.

In this study, we employ longitudinal data from a sample of low-income Latino and African American children (N=850) whose families were quasi randomly assigned to subsidized housing units in neighborhoods with

varying degrees of racial, ethnic and social mix. Using sequence analysis, we assess how variations in housing and neighborhood trajectories of children in subsidized housing affect the health of children over the course of childhood. Further, we examine the comparative health of children assigned to project-based housing and those assigned to tenant-based or other housing types as well as degrees of social mix. Finally, we assess the extent to which these exposures to housing and neighborhoods vary by ethnicity and gender.

We find significant variations in childhood health outcomes by gender, ethnicity, subsidized housing types and social mix as well as the temporality of exposure. Improved physical and behavioral health during childhood was found among children whose housing and neighborhood trajectories were characterized by residential stability and neighborhood safety. Implications for housing policy and practice are discussed.

Feminist Responses to Digital Anti-Feminist Violence: The Case of Spanish Grassroots Collectives

The research presented in this paper, conducted between June and December 2023, seeks to understand the role of digital violence against feminist activists and collectives within the broader context of what has been termed the “patriarchal backlash” (Cabezas and Vega, 2022). A digital ethnography conducted with feminist activists in Spain reveals that the majority of aggressors are aligned with extreme right-wing and explicitly anti-feminist ideologies—whether they are organized in a group or collective or not. This digital violence can therefore be understood as part of a global anti-feminist offensive aimed at undermining the progress and work of the feminist movement, particularly that of grassroots feminist collectives.

In response to the violence identified during the fieldwork—ranging from flaming and trolling on social networks, to the non-consensual dissemination of sexual images, image manipulation, harassment, and death threats—activists have developed a series of strategies. These strategies vary depending on several factors, including the activists’ perceived role of their own social media presence; their level of digital literacy; the importance they attribute to this form of violence; and the centrality of care and activist sustainability within each collective.

This paper will present the specific strategies employed by activists to both prevent and combat digital violence, as well as the challenges encountered in resisting such violence. These challenges include limited digital literacy, a lack of established resistance strategies, and the inaction of digital platforms. In this way, this communication aims to share the insights of grassroots activists confronting anti-feminist digital violence on a daily basis, as well as to highlight the challenges that must be addressed in order to effectively confront and ultimately eradicate anti-feminist violence.

Filling the Gap: Technology-Facilitated Repression of Social Movements in the Spanish Context

The relationship between social movements and new technologies has been widely studied (Earl and Kimport, 2011; Fominaya and Gillan, 2017; Treré, 2018), as has the role of digital technologies in controlling dissent. Extensive research exists on surveillance capitalism (Zuboff, 2020), Big Data and protest (Degli, 2014; Ferguson, 2017), and more recently, the role of artificial intelligence in policing (Polcumpally and Rahar, 2022; Drage and Frabetti, 2024). However, there has been limited integration of studies on social movements and repressive technologies, with most work focusing on autocratic regimes and their suppression of dissent (Topak and Mekouar, 2022; Kuznetsova, 2024). The lack of research in other contexts presents a notable gap in the literature, especially as emerging digital technologies, such as AI, significantly impact how protests and social movements are controlled.

The shortage of empirical studies is particularly pronounced in Spain, where the literature on technology-facilitated repression is largely confined to human rights organization reports (Defender a Quien Defiende, 2024; Scott-Railton et al, 2022; Miralles et al, 2021) and a few academic works (Gonzelmann, 2022; Maroto and Segura, 2018).

This paper offers a literature review on technology-facilitated state repression of social movements, as part of a broader PhD thesis focused on the Spanish context, seeking to identify key findings and gaps in existing research. Additionally, preliminary results from interviews with Spanish human rights defenders, academics, and activists who have experienced technology-facilitated repression will be presented. Therefore, this paper

seeks to expose the main repertoires of technology-facilitated repression, their impacts, the resistance strategies developed by activists, and potential future lines of research on this issue, contributing to the collective reflection on how digital transformation may erode (or strengthen) struggles for social justice.

SANTOS, FABIO* (University of Copenhagen, Denmark)

Fort Allen: Migration, Empire, and Anticolonialism in the Caribbean

This paper engages with anticolonialism through the lens of Fort Allen, a U.S. military base in Puerto Rico that was temporarily repurposed as a detention facility for Haitian asylum seekers from 1981 to 1982. Dismissively labeled “boat people,” some of the tens of thousands of Haitians arriving at the time on overcrowded boats in southern Florida were forcibly transported from Florida to Puerto Rico. Targeting only asylum seekers from Haiti—where the first successful Black self-emancipation and independence movement in the region took place—this deliberate relocation to a remote colonial space symbolizes the intersection of anti-Black racism and the coloniality of migration. Drawing on a range of primary sources, including government documents, legal records, and personal narratives from the refugees themselves, I examine this short-lived experiment in offshoring refugee detention within the broader context of struggles against U.S. and European colonialism in the Caribbean. While often framed as a humanitarian response to a “refugee crisis,” the U.S. detention of Haitians at Fort Allen reveals enduring colonial dynamics that relegated racialized refugees to spaces of containment and exclusion. Deemed unworthy of asylum despite fleeing a violent political regime—one that the U.S. itself supported, in a continuation of its imperialist policies—most Haitians ultimately returned to the U.S., thanks to the solidarity of Puerto Rican lawyers, volunteers, and activists. Together, they mobilized anticolonial thought and practice to challenge U.S. migration and detention policies, linking local struggles for self-determination with broader transnational anticolonial movements, for which the Haitian Revolution provided the radical blueprint. Fort Allen thus serves as a critical site for understanding the intersection of migration, empire, and anticolonialism in the late 20th-century Caribbean.

SANTOS, HERMILIO* (PUCRS, Brazil)

A Brief Appraisal of an International Biographical Encounter from a Biographical Perspective

The establishment of the reconstructive biographical narrative approach in sociology benefits since its beginning from intense and fertile biographical encounters at international level. And it starts long before Fritz Schütze and his colleagues and assistants at the University of Bielefeld started to delineate the scope of such methodological approach. We could traced back this international exchange to the main epistemological foundation of the reconstructive biographical approach: the sociology of Alfred Schutz, who maintained a fruitful exchange with Edmund Husserl, and later with American sociologists. In this sense, Schutz’ sociological contribution cannot be adequately apprehended without referring to the exchange with colleagues from Germany and US. The paper will make an appraisal of the introduction of the reconstructive biographical narrative approach, that started with the encounters between the author with Bettina Völter, and later with Gabriele Rosenthal, Michaela Köttig, and other German colleagues. After this initial exchange the reconstructive biographical narrative approach spread among young scholars, especially, but not exclusively from sociology in Porto Alegre. The paper will also explore some challenges to disseminate this approach in the Brazilian sociological community.

Lifestyles in the “Alpha Generation”: Reading Experiences from a Reconstructive Biographical Narrative Approach

We live in an accelerated society, states Harmut Rosa (2019). Combined with acceleration, contemporary society is also characterized by individualization. According to Ulrich Beck, “individualization means that people’s biographies become independent of pre-established determinations, open, available, and become a task to be performed by each individual” (Beck, 2010, p.199). In the process of individualization, the subject becomes “the center of the biographical process” while family ties and class differences occupy “the background” (Beck, 2010, p.194). Beck also states that the individual “designs

his or her own biography", that is, the "socially predetermined biography is transformed into a biography made and to be made by each individual" (Beck, 2010, p.199). Given this scenario, we observe a precocity in the search for identity within society (Santos, 2015, p.404). The increasingly younger individual seeks his/her identity, his/her lifestyle, his/her self-definition within their social group. In other words, the individual's singularity is gradually and prematurely demanded, which must be confirmed in their daily life. The text addresses the interpretation of the biographical experiences of members of the so-called "Alpha generation" (born after 2010) to understand their lifestyles, especially regarding the practice of reading. The text provides a summary of the main characteristics of the reconstructive biographical method, as adopted in this study, which has a fundamental support, above all, in Schutz's sociology, which is combined with group discussion. At the end, it presents a preliminary result of this research work, the VIR – Visual Interactive Reading, whose objective is to contribute to actions aimed at stimulating reading. It is expected to highlight the potential of interpretative biographical research in developing solutions to identified problems.

SANTOS, JAMES WILLIAM* (Erfurt University, Germany)

A Critical Theory of Social Movements

In recent years, a notable effort has been made to bridge the interests between critical theory and social movement studies. A few approaches have tried to advance this task, reintroducing the first generation of critical theorists and reimagining Habermas's influence in a new world of communications. However, these approaches do not address some of the questions of the social movement field, such as the lack of theoretical interest and practical challenges in reconstructing a comprehensive insight into the movements. This work addresses whether critical theory can contribute theoretically and empirically beyond providing a rearranged or revamped Zeitdiagnose to social movement research and whether there is space in the field for a value-laden approach. Following Rucht's (2023) plea for multiple perspectives and his approach of an interactionist, constructivist, and process-oriented view of social movements, this work utilizes Rosa's resonant theory account of human relations to address the interactionist perspective, Jaeggi's immanent social formation approach to fulfill the constructionist view, and a genealogical approach to address the process-oriented task.

SANTOS, PRISCILLA* (Centre for Research and Studies in Sociology (Cies-Iscte), Portugal)

Small Businesses As an Asset for European Citizenship: A Political Gaze on Street Shops Run By South-Asian Migrants in Lisbon

In this talk, I aim to explore how South Asian migrants in Lisbon, Portugal, are setting up small retail outlets as a means of obtaining residency permits in order to gain European citizenship after five years of residence. I argue that these migrants are using their small businesses to enhance their current citizenship status, revealing the power dynamics inherent in the "European Union and the rest" dichotomy. Within an ethnographic study, I have conducted several interviews with migrants originating from South Asian countries, especially Bangladesh and Nepal. I have observed a pattern, irrespective of country of origin or social class, in the pursuit of a 'red passport'. Migrants aim to take advantage of intra-EU free movement, with some of them planning to move to wealthier EU countries for better income prospects, despite, in some cases, already being middle-class. However, the 'red passport' represents more than just an economic opportunity; it is seen as a means to achieve social mobility, including access to public healthcare, better work-life balance, and higher education for themselves and, especially, for their children to enrich their cultural capital. These migrants are seeking the symbolic power attached to European citizenship to counterbalance their previous condition of multiple marginalities.

Lawyers Dealing with Everyday Life Ethics in Corporate Legal Firms in Cabo Verde and Mozambique: Colonial Continuities, Resistance, and Change

The development of law firms in Cabo Verde and Mozambique dedicated to corporate and international projects aligns with the rapid expansion of globalized financial markets. Portuguese law firms have been using different channels and instruments – legal, economic, political, and cultural cooperation- to enter and shape these markets. One of the forms used is the training of local practitioners and the establishment of partnerships ensuring a strategy of economic and political influence that can be described as postmodern colonialism (Silbey, 1996).

Special attention should be taken at a micro-level focusing on the lawyers' practices and perceptions of ethics and professionalism.

What happens to lawyers who study in the Global North and work in the Global South? Having studied Law in the former colonizer country and acting professionally in their home country impacts their moral reasoning and, if so, how do ethical codes and moral commitment evolve? What is the impact of educational and professional socialization on their activity? How do they think about it? Do they reflect on it?

To answer these questions, we conducted fieldwork in Mozambique and Cabo Verde and interviewed thirteen lawyers selected from a mixed sample of Portuguese lawyers working in another jurisdiction CV and MZ: Mozambican and Cape-Verdean lawyers who studied in Portugal and Europe and practice law in their home country in a firm with a partnership or cooperation agreement; and Mozambican lawyers who studied in their home country and practice law in a firm with a partnership or cooperation agreement with a Portuguese law firm.

Results show that ethical compliance with local populations grows with physical proximity and living locally. Nevertheless, each lawyer is involved, simultaneously, in many projects and transactions making them unaware of the outcome of what can be sustained as a strategy for dealing with professional ethics.

SANYAL, ROMOLA* (London School of Economics, United Kingdom)

Dignity and Displacement: The Politics of Shelter for Houseless and Displaced Communities

Dignity is a foundational human value and the idea of being human is closely intertwined with the idea of human dignity and human 'worth'. Dignity is associated with equality, liberty, autonomy, privacy, decent treatment of individuals and communities by society. It is also subject to cultural interpretations and is intertwined with social and community practices and acceptance thus opening the door to more vernacular and intersectional understandings of the term.

Dignity is an important part of how we live including how we are sheltered and housed. For those inhabiting the margins of society, including the poor and the displaced, the creation and sustenance of a dignified life is central. Practices of aid also often signal a concern with supporting the dignity of those being helped, but it is necessary to consider how people are seen to lack dignity, and what and whose standards of dignity are applied and through what practices. This paper takes a transnational approach, drawing together unhoused and displaced communities in a continuum of precariously sheltered subject. It interrogates how not having a form of mainstream shelter, or being dependent on aid for shelter and life creates experiences of indignities for them. Equally the talk focuses critically on the politics and infrastructures of aid and care that exacerbate these forms of indignities.

Disruptive Dynamics: A Sociological Analysis of Platformization in the on-Demand Transportation Sector in Spain

There are more than 500 digital labour platforms operating in the EU, and even though platform work still only accounts for a small proportion of the workforce in most European countries, scholars, policy makers and social partners are increasingly raising concerns because of the disruptive changes they bring in different dimensions such as the regulatory field, the production system or the power relations (Thelen, 2018; Del Nido, 2021; Riesgo Gómez, 2023).

In the on-demand transportation/taxi sector, the entry of digital platform companies, such as Uber, is disrupting and replacing the shares of traditional taxi companies and is leading to the huge increase of non-standard forms of work. Moreover, the entry of the platform has led to the exponential growth of non-standard forms of work. In this case, the worker power is splintered by either disrupting and forcing existing workers into adopting platform practices or by hiring drivers as "self-employed" individuals (Thelen, 2018). This paper aims to provide a sociological historical analysis of how disruptive changes associated to the platformization of the demand transportation/taxi sector, affect social dynamics and equality at the local level. The analysis focuses on the Spanish cases, and compares recent historical trends in three different cities (Barcelona, Madrid and Zaragoza) through a combination of desk research and key informant semi-structure interviews.

Individual Social Capital and Health: Empirical Cross-National Evidence of the Role of Income Inequality in 30 Societies

Literature has emphasized the association of various dimensions of social networks with health. In parallel, research has highlighted the influence of social structures and socioeconomic inequality on health. Although several explanations were postulated on the mechanisms that link social networks with health, such mechanisms still need to be explored within and across societies. The embeddedness of this linkage in the broader social structures and the influence of national contexts need further examination. Abundant literature has investigated the role of social capital as network resources in relation to health, but limited comparative studies still exist. In this research, we focus on the meso-level hierarchical context in which individuals dwell in their daily lives, or, in other words, the resources accessed through who they know in the status hierarchy. The aim is twofold: first, we assess whether network diversity, extensivity, upper-reachability, and average reachability, as well as a global index of social capital, protect individual health. Secondly, we assess whether this protective effect varies across societies according to income inequality. Based on the data of the 2017 module of the International Social Survey Programme on Social Networks and Social Resources, which includes representative samples of 30 countries, we show that several network indices and relational resources are distinctly associated with self-rated health. We also show how economic inequalities moderate the association between individual social capital and health. We discuss institutional factors and cultural differences that may explain why the association of network measures varied across nations.

Socio-Economic and Lifestyle Determinants of Multi-Morbidity Among Elderly Patients Attending Tertiary Level Hospitals in Bangladesh

Background: Multimorbidity (MM) is the co-existence of two or more chronic diseases and is a significant public health concern for many developing countries, including Bangladesh. Little is known about MM among

Bangladesh's older population. So, this study aims to know the determinants of MM among the older population.

Methods: A cross-sectional study was conducted in randomly selected two public medical college hospitals with a sample of 566 hospitalized elderly patients aged 60 years and above. Respondents' clinical information on chronic conditions was obtained from hospital reports, and socio-demographic data were collected using a semi-structured questionnaire. Bivariate and multivariate analyses were used to assess the associations among the variables and covariates of MM.

Result: MM of the elderly varied substantially by socio-demographic, lifestyle, and economic attributes. Higher age, widowhood, lower education, use of tobacco, and greater economic dependency are conducive to heightened MM likelihood among the elderly. More specifically, females have higher rates of MM than males (64.18% vs. 54.17%). The higher the age, the higher the chances of MM [OR: 1.03; 95% CI 1.04-1.06]. Similarly, economically dependent individuals have higher MM than independent older adults [OR: 3.12; 95% CI 1.88-5.17]. Smoking cigarettes, bidis, tobacco, and other intoxicants (snuff, pan, and pan masala) have a higher likelihood of MM for both males and females. Urban and non-Muslim elderly also have lower odds of MM than their counterparts.

Conclusion: Our study emphasizes the urgent need to explore determinant-specific variations further. This will enable the development of effective preventive measures and specific clinical and public health strategies for targeted prevention and intervention. As revealed by our study, the 'lifestyle factors'-centered systematic treatment strategy should be prioritized in the care of elderly patients with multimorbidity. This study is of utmost importance for healthcare professionals and policymakers in formulating effective healthcare strategies.

SARAVÍ, GONZALO* (CIESAS, Mexico)

Exploring Youth Place-Belonging in Poor Neighborhoods through Participatory and Visual Methodologies

This paper presents preliminary results of a youth participatory research in progress, which is being conducted in poor neighborhoods of the outskirts of Mexico City. I have been working with adolescents aged 15 to 19, on their urban experience using a qualitative and visual methodology. The fieldwork extended for a one year period (from september 2023 to August 2024). During this period, a workshop (14 sessions) of visual-narratives was implemented with a group of 24 adolescents and we produced in collaboration with them 6 short videos (vlogs), about their experiences of the city from the periphery (topics include: urban insecurity, street markets, public spaces for youth, urban mobility, street art). In addition, 18 semi-structured interviews were conducted with other young residents of these same neighborhoods.

Based on this empirical material, I examine in this paper two main topics. First, the construction of place-belonging (Antonsich) among youth from popular sectors. These areas of the city are spaces that are symbolically devalued and stigmatized and are materially precarious and disadvantaged. I explore the emotions and feelings adolescents attach to certain spaces of their everyday urban experiences in this unfavorable context generating some kind of belonging and sense of place. Secondly, I discuss the value of participatory and visual methodologies to work with young people on their own spatial experience -in this case urban experience. This approach and the resulting materials (videos, photographs, etc.) allow us to capture some ethnographic details (the texture) of the everyday life of adolescents (girls and boys) in marginal and subaltern urban area that remain invisible or contempt from the mainstream city. Taking the idea that youth is spatialized (Farrugia), I conclude with some insight on the practices of resistance and integration of youth from disadvantaged urban areas.

Strain, Negative Emotions, Religiosity, and Violence Perpetration in a Sample of Romanian Adolescents

Informed by Agnew's (1992) general strain theory, the present study examines the impact of three types of strenuous circumstances on violent behavior reported by 10th graders (N= 3,245) enrolled in 89 high schools in Bucharest, Romania's capital city. Survey data were collected in 2022 from a stratified random sample, as part of a multi-country study coordinated by Planet Youth Ehf., Iceland. Findings show that more than half (57%) of the study participants acknowledged committing at least one act of violence against another person during the year

preceding the survey. The results of the mediation analysis indicate that in the overall sample, all sources of strain (i.e., perceived failure to achieve valued goals, the loss of something of value, and exposure to toxic stimuli, such as emotional, physical, and/or sexual victimization) are associated with negative emotions (anger), which in turn significantly predicted violent behavior. While those whose parents are strict rule enforcers tend to have a higher level of anger, an authoritarian parenting style and parental supervision have significant direct negative effects on violence perpetration. Conversely, violent behavior is more likely to be reported by male adolescents and by those with stronger religious beliefs. Yet additional comparative analyses indicate that the selected predictors do not always have a gender invariant effect. Although religiosity as a potential stress coping mechanism has a non-significant effect and parental monitoring has a violence deterring effect in subsamples differentiated by gender, for girls and those with non-binary gender identities only one source of strain (violent victimization) is conducive to violent behavior. The study limitations and the implications of the findings will be further discussed.

SARIKAYA EREN, SELEN* (Scuola Normale Superiore, Italy)

Enlighten, Narrate, Illustrate: A More Visual Social Movement Studies

Illustration has been an understudied genre both in art history and social sciences despite its commonness. With the visual turn in social sciences, a range of different disciplines have been increasingly incorporating visuals not only as part of their data but also as part of their methodology, mixing methods from art history and qualitative approaches. However, the general unfamiliarity of social scientists with the art making process, and the lack of rigorous methods and frameworks in the visual arts potentially led to certain gaps in these analyses. This also applies to the forms of illustration, which are used in analyses by social scientists without being acknowledged as "illustration." An example is the recent research in social movement studies, where the graphic protest arts are acknowledged as sources of important information regarding the cultural, cognitive and emotional aspects of the protests without paying much attention to the creation process, differences between forms and artmaking knowledge. My aim with this paper is to review the literature focusing on the methods and frameworks, to understand how Illustration Studies can be bridged with social movement studies. Analyzing images requires an interdisciplinary approach, and most studies innovate their own methodology prioritizing different aspects of images. The nascent illustration research field is promising to make social movement studies more visual both as an art-based research practice and thanks to its unique proclivity for narrative, representation and memory. It is also by nature a research-based visual practice. In this paper I aim to discuss the potential benefits of including illustration studies into social movement research.

SARIKAYA EREN, SELEN* (Scuola Normale Superiore, Italy)

Picturing Contentious Politics: Visual Analysis of 2013 Gezi Protests

One of the results of the amplified visibility of social movements in the last decade has been the increased use of illustrations by protestors. Although understudied both in art history and social sciences, illustration has always been used by social movement actors; and has the potential to reveal various dynamics of contentious politics. The recent literature on social movement visual analyses shows that protest graphics can undercover the protesters' profiles, motivations, emotions and cognitive experiences. With a particularly intense use of visual expressions by protestors, the 2013 Gezi Protests in Turkey was one of the first events in Turkey's history where protestors individually created illustrations and shared them on social media as a way of showing support. Although these illustrations have not been ignored by scholars, they have not been the focus of a systematic analysis either.

This paper will analyze the visual expression of Gezi Protests in the illustrations, focusing on protestor figures and visual narrative. It will employ the innovative three-step visual analysis and contextualization method. While the illustrations will be analyzed through a visual content analysis based on political iconography, the findings will be contextualized through in-depth interviews with illustrators, survey reports, and literature review. The undertheorized category of illustration will be discussed and conceptualized with the introduction of Illustration Studies. By doing so the paper firstly aims to contribute to the recent visual analyses of social movements literature by bringing together sociology, political science and illustration research. Secondly, to further develop the emerging three-step methodology by introducing conceptualization, insights and methods unique to illustration practice as art-based research. Thirdly, by comparing the visual language with previous progressive social movements in Turkey, it aims to contribute to the wider discussion regarding the visual expression of social movements in the context of Turkey.

Artificial Intelligence (AI), Leisure and Social Justice: A Case Study of Use of Technology in Sports at Paris Olympic Games, 2024

Artificial intelligence (AI) revolutionized leisure experiences in sports and also raises significant social justice implications. At Paris Olympic games 2024, athletes, coaches and broadcaster used integrated AI technology to support training, refereeing and broadcasting. In this paper we have used secondary data to analyse the detailed case of how AI is used in sports related to Olympic games Para Olympic games in Paris, 2024.

The intelligent stroboscopic analysis across driving, athletics and artistic gymnastics have helped in better understanding of the game for the viewers. Athlete365 chatbot assists the athletes participating in the Olympic games by providing essential data for easy access. The 'digital twins' helps in the safe conduct of the events by planning the events, the space and scenario. Athletes become able to use technology to optimize their workouts and nutrition. The coaches could analyze players and formulate strategies for winning games. The judges also could use AI for monitoring the athletes.

In case of social justice, the ownership issues are important and it must be ensured that AI is used with transparency and respect for the rights of the participants. Agreements with AI providers which address the liability issues like real-time data and product liability, contractual issues etc. are of utmost importance so that no player is ethically compromised. AI is also responsible for creating digital divide.

Assistive technology used by the International Paralympic Committee in 2024 in Paris, followed the campaign called "Equipped for Equality". AI helped the athletes in training, competition and recovery along with providing help in communication as well as logistics and security.

Leisure and Social Justice Implications: A Case Study of Moran Blind School(Residential), Dibrugarh, Assam, India

Visual impaired people have lot of struggles for their survival and to gain equal access to leisure. They face several challenges. Cultural attitudes also impede opportunities for leisure participation as discriminatory views exist in many societies. This paper will highlight the leisure activities and social justice implications in a residential blind school in Dibrugarh, Assam, India.

Students of residential Moran Blind School, Dibrugarh, Assam, India has also encountered obstacles in their day to day life as well as in conducting leisure activities. But with the concerted advocacy efforts taken by teachers, administrator, Principal and the staff of the school, they are empowered and have improved accessibility. Altogether they have fifty-five (55) blind students studying in classes from 1 to 10; among them thirty-five (35) are boys and twenty (20) are girls mainly from adjacent districts like Dibrugarh, Tinsukia, Charaideo, Sibsagar and so on, fifteen (15) teachers (five are blind), administrator, Principal, hostel wardens, matron and other staff. Majority, that is, ninety-nine (99) per cent of the students are sons and daughters of tea garden labourers who are from poor socio-economic background.

Their major leisure activities are listening to songs, playing the flute, tabla, guitar, harmonium and other musical instruments. Singing, listening to radio and TV, gossiping, reading and writing by Braille, using Internet, playing Ludo and Chess suitable for blind players, playing football and cricket with auditory balls, playing Kabaddi, Hide and Seek game, skipping, making crafts with bamboo items, pottery, weaving etc. during their free time. Reading and writing by Braille, Internet. All these have helped them for their psychomotor, socio-emotional development and psychological wellbeing.

SARRIS, NIKOS* (Institute of Political Research, National Centre for Social Research, Greece)

Perspectives of Deprivation in Europe: Is the South Left behind?

The European Pillar of Social Rights sets poverty and social exclusion as one of the three EU-level targets that must be achieved by 2030 in the areas of employment, skills and social protection. The number of people at risk of poverty or social exclusion (AROE) should be reduced by at least 15 million by 2030, and out of them, at least 5 million should be children. The 2030 targets are consistent with the UN Sustainable Development Goals. They set out the common ambition for a strong social Europe and will allow the Commission to monitor Member States' progress in the context of the European Semester.

The presentation aims to compare country rankings based on severe material and social deprivation rates (SMSD) describing also its evolution during 2015-2022 across the EU countries. Our main premise is that certain group of countries (e.g. Greece, Bulgaria, Romania, Spain) fall behind the rest of EU countries. This is also an empirical finding which is more indicative if examined in association with the other two sub-indicators (at risk of poverty and very low work intensity) composing the AROPE rate. Generally, the majority of the countries with the lowest income poverty rates, e.g. Czechia, Finland or Denmark, also have low material and social deprivation rates. Symmetrically, most of the countries with the highest rates of material and social deprivation (such as Romania, Bulgaria or Greece) have very high or very high poverty rates.

The empirical findings indeed show a clear divide across Europe. Although the number of people experiencing at least one of the three poverty and social exclusion risks (risk of poverty, severe material and social deprivation and/or living in a household with very low work intensity) has dropped since 2015, the figure underlines the challenge facing the EU.

Identifying Potential: Exploring Opportunities for Excellence in Rural Schools

This study addresses the global issue of educational inequality among rural schoolchildren, a phenomenon influenced by a myriad of factors ranging from geographical inaccessibility to the quality of teaching. Recognizing the unique challenges faced in different countries, this research focuses on Kazakhstan's approach, particularly the annual "Myn Bala" Olympiad. This event is instrumental in identifying gifted students from rural schools, engaging over 80,000 6th graders across the nation.

Our project utilizes data from the Olympiad and the infrastructure of rural schools to analyze educational successes at both individual and institutional levels. A key objective is to determine which schools provide students with greater opportunities to exhibit outstanding abilities. This involves an in-depth examination of the factors contributing to educational inequality, considering both individual and institutional perspectives.

Methodologically, the study employs statistical modeling techniques, including regression analysis, supplemented with elements of spatial analysis. This approach is aimed at uncovering the underlying mechanisms that perpetuate educational inequality. Our findings are intended to make a significant contribution to the ongoing academic and practical discourse on educational disparities, particularly the challenges and nuances of teaching in rural schools. The research not only sheds light on the situation in Kazakhstan but also offers insights that could be applicable to similar contexts globally.

The Role of Teachers and School Infrastructure in Overcoming Educational Inequality: Evidence from the Kazakhstani Olympiad

This study presents the results of the All-Kazakhstan Rural Schoolchildren Olympiad, conducted among 80,000 sixth-grade students in 2024, including an analysis of schools' and teachers' effect on academic achievements of participants. The Olympiad has been held annually by the non-governmental organization El Umiti since 2020. The Olympiad provides an opportunity for gifted students to gain places in prestigious schools – thus achieving social mobility and receiving better educational opportunities. An innovative approach to the implementation of the Olympiad is also not only measurements in academic subjects (mathematics, science, languages, etc.), but also measurements in functional and spatial thinking, closely related to non-cognitive skills. The study uses open data on school infrastructure, participants and results of the Olympiad, as well as support for teachers in preparing for the Olympiad. We study the structure of the data, first using classical statistical methods (regression analysis) with elements of spatial analysis to find mechanisms for the reproduction of inequality, and then more modern methods of network analysis, assessing the contribution of teachers. The study contributes to the existing academic and practical discussion on

educational inequality and the specifics of teaching in rural schools. At the same time, the data used allow us to draw conclusions that are relevant specifically in the context of educational innovations based on NGO, which is important due to the recognized lack of such works on local material by the expert community. From the methodological side, we emphasize how the network approach enriches the understanding of the data compared to classical statistics.

TERRANE, MARCO (Università degli Studi di Milano-Bicocca, Italy)

CONSOLAZIO, DAVID (University of Milan, Italy)

A Network-Grounded Approach: Reconstructing the Complete Network of Healthy Lifestyles in an Italian Community

This paper presents the initial findings of the Italian PRIN HEALING Project, which investigates the role of social networks in shaping health-risk behaviours and lifestyles within a small municipality in the Lombardy Region of Northern Italy (about 1500 inhabitants). While existing literature highlights both structural factors (such as education and occupation) and relational factors (family and peer networks) as determinants of health, this study seeks to deepen understanding of how these factors interact and collectively influence health-risk behaviours. Structural factors are relatively static over an individual's life course, whereas social networks are more dynamic, with relationships such as friendships and acquaintanceships shifting across occupational and educational boundaries.

Key research questions include the clustering of health-risk behaviours among interconnected individuals, the comparative impact of structural and social networks on unhealthy lifestyles, and the dynamics of habit transmission within these networks. A clearer understanding of the relationship between stable structural factors and fluid relational dynamics can help enhance public health interventions by identifying influential individuals or communities that spread unhealthy practices.

This research is innovative in its approach to mapping **the complete social network** (not only egocentric) within a local community to examine health-risk behaviours—an unprecedented method in Italy. Internationally, the Framingham Heart Study offers a similar socio-epidemiological model (Christakis & Fowler, 2013).

"Using a mixed-methods approach, the study combined a quantitative survey of approximately 900 inhabitants, gathering data on socio-demographic characteristics, health behaviours, and social ties, by means of face-to-face standard interviews, and, additionally, 48 qualitative interviews to refine the emerging social profiles. These in-depth interviews explored the dynamics behind healthy and unhealthy behaviours, focusing on specific cases such as individuals with high socioeconomic status who engage in unhealthy lifestyles, lower-status individuals displaying healthy behaviours, as well as those occupying central, bridging, or isolated positions within the network.

Amazonian Matorios: Multiscalar Conflicts, Climate Emergencies, and Alternative Practices in the Fishing Community of Jubim, Marajó

In the Anthropocene context, the intensity of extreme events (floods, landslides, cyclones, heat waves, etc.) and the broader effects of climate change, such as food insecurity, health impacts, economic losses, and climate-induced displacements, highlight the urgent global nature of this phenomenon and the need for effective responses. While not a recent issue, the consequences of climate change have become increasingly evident since the early 21st century, especially in the Global South. Countries in this region face greater vulnerability and less adaptive capacity due to factors such as development models, poverty, inequality, resource scarcity, institutional fragility, and reliance on agriculture.

The Marajó Archipelago in Pará, Brazil, located at the mouth of the Amazon River, is a region rich in biodiversity and culture, yet its population of nearly 500,000 inhabitants—comprising Indigenous peoples, Quilombolas, riverine communities, fishers, and other traditional groups—is threatened by the development model imposed along Pará's coastal zone. Intensive logging, agribusiness activities like cattle ranching, açai appropriation, industrial fishing, and monoculture have severely impacted natural resources, leading to socio-environmental conflicts and increased violence against Indigenous and traditional communities.

This study focuses on the fishing community of Jubim, in Salvaterra, exploring the socio-territorial conflicts affecting their maretorio (marine territory). Using ethnography, it investigates the impacts of climate change on Jubim's socio-biodiversity, based on local fishers' perceptions. It also seeks to highlight the community's responses to these challenges, including non-Westernized organizational practices. In Jubim, responses to climate change are intertwined with enchantments and legends, restoring non-human beings to a position of horizontality, rather than duality, with humans, offering an alternative view of collective action and climate adaptation.

Trace Yourself: Layers of Interpretation in Autobiographical Photo Tracings

Visual elicitation, well established in social research, if always somewhat niche, is diversifying. Photoelicitation is prevalent, while drawing or mark-making in general remains uncommon, largely because of people's perceived or actual aversion to drawing as a slow and difficult activity. Forms of combining photography and drawing are even rarer, but potentially offer greater flexibility and a wider range of stimuli for interpretation. Phototracing combines the rapidity and descriptive richness of photography with the ability to allow for individual reflexivity and interpretation. To stimulate discussion of these issues and to present some applications, I will show how I have explored the potential of line drawing by tracing over photographs. In a research setting, it is possible to take or elicit photographs (in a variety of ways, depending on the focus of the project) and then, as part of the analytical phase, trace them to peel back layers and boundaries to get closer to what - one discovers - matters, focusing on objects/subjects but also on their relationships and narratives. I experimented with this method in a student project, *Trace Yourself*, where we examined how identity is expressed and performed through the material and social world, starting with the clothes and other objects that surround us. Students selected and traced photographs of themselves that they felt defined them. They were asked to focus on the details that they felt were important, but were free to intervene by selecting and pasting elements onto old or new photographs, reflecting on the practice and arranging the images in a sequence that was meaningful to them. I then traced and combined the resulting tracings as part of my own reflections, which I shared as inspiration in a feedback discussion. If time and conditions allow, a short tracing experiment could be attempted with the roundtable participants.

SASSATELLI, ROBERTA* (University of Bologna, Italy)

A Pleasure Greater Than Myself. Consumption, Pleasure and Sustainability.

In recent years, sustainable consumption has often been studied through the lenses of practice theories which have largely moved beyond a concern with subjectivity and pleasure. This paper considers the discourse around sustainable consumption as a fundamental territory where visions of subjectivity are produced and reproduced, and new definitions and experiences of pleasure are possible. Different dimensions of sustainable consumption - practical, symbolic and moral - are explored by looking at empirical research on alternative food networks and the way they involve new visions of consumer sovereignty. These visions articulate both a notion of authenticity which is contextual and relational and a vision of wellbeing which stretches beyond the present into projects wider than the self. It also comes with a reappraisal of the notion of quality of goods - including fairness as well as aesthetic qualities. Potentially alternative to neo-classical and neoliberal views, such a vision of consumer sovereignty adumbrates pleasure as a form of responsibility for personal, creative well-being and fulfilment which is meant to be opposed to mere acquisition and spending power. Consumers' capacity to develop and elaborate new pleasures in sustainable consumption is thereby to be taken seriously. Pleasure is not only an important element of the experience of sustainable consumers, but it is also a crucial element in the promotion of sustainability in consumption. The paper concludes by exploring how pleasure is re-defined and re-organized in the promotion of alternative food networks, stressing longer temporalities, thicker relationships and more reflexive relation with materiality.

SASSATELLI, ROBERTA* (University of Bologna, Italy)

ARFINI, ELIA A.G. (University of Milan, Italy)

Morality and Consumption: Subjectivity, Collectivity and Value

This paper engages with the relationship between morality and consumption, starting from the fundamental notion of consumer choice, linked to a hegemonic vision of the consumer as an autonomous and rational actor. In consumer culture, this notion plays the role of a normative claim around which subjects can organize their own moral justifications, assuming a central role in the legitimization of consumption. Rival notions help define forms of tamed hedonism and authenticity which adumbrate the boundary between normality and deviance within consumer culture. Consumption is revealed to be fundamentally related to value and value judgement: not merely a practical and symbolic activity but also, and fundamentally, a moral activity through which subjectivity and collectivity are mutually shaped. Consumer cultures increasingly depend on the development of complex mechanisms of coding and decoding of value and quality. This dynamic involves not only economic, but also moral assessments, reflecting contemporary societal changes and challenges to conventional moral orders. The paper therefore concludes by exploring the theory of conventions that was developed precisely to focus on the valorization processes that take place within consumer culture. By critically analyzing the theory of conventions the paper explores how it may offer a pragmatic framework that puts the action of actors at the center while assigning importance to the moral justifications that actors provide in support of their actions. This exploration contributes to current sociological theory on the moral dimensions of social life, addressing the issue of how collective moralities shape and are shaped by individual and group practices within consumption. In this way, the theory of conventions aims to overcome the limits of economic reductionism in which the actor is postulated as rational and sovereign and grafts an affective and moral component to the heart of economic activity.

Predictive Policing in India: An Appraisal

Predictive policing has emerged as a revolutionary tool for law enforcement agencies worldwide to forecast and prevent crime using data analytics and artificial intelligence (AI). In India, with its vast population and complex socio-economic landscape, the adoption of such technologies offers potential benefits in terms of crime prevention, resource optimization, and policing efficiency. However, implementing predictive policing in India also raises several complex issues regarding technological limitations and ethical challenges. This appraisal will evaluate the Indian cities concerning the implementation of predictive policing, highlighting both the successes in predictive accuracy and crime reduction, as well as challenges in data collection, algorithmic transparency, and public accountability. This paper aims to contribute to the global discourse on predictive policing by offering a comprehensive evaluation of its practice in India, balancing technological promises with social realities. From a legal perspective, predictive policing raises important questions about data privacy and civil liberties. The legal and ethical framework governing predictive policing in India is still nascent. While the country is progressing towards a comprehensive data protection law, concerns remain over how people's data is collected, stored, and utilized by law enforcement agencies. The lack of transparency in AI decision-making processes also poses a threat to accountability, transparency, and public trust. The findings underscore the need for a cautious, ethically grounded approach to predictive policing, ensuring that its deployment aligns with India's democratic values and safeguards against undue harm.

Transnational Wildlife Trafficking: Combating Challenges in India

The illegal trade of wildlife animals and their products has emerged as a critical transnational crime, undermining biodiversity, ecosystems, and conservation efforts globally. India, with its unique and diverse wildlife, plays a significant role in this illicit trade, acting as a source, transit, and destination country for trafficked species. From tigers and elephants to lesser-known species like pangolins, India faces immense challenges in combating this highly organized crime syndicate. The poaching and trafficking of wild species in the lure of money as well as fashion has wiped out a range of wildlife species that call for critical attention to tackle this menace. This paper aims to explore the

transnational dimensions of wildlife trafficking in India, analyzing the intricate networks of poachers, intermediaries, and international markets that fuel this illegal activity. It highlights key drivers, such as demand from foreign markets for exotic pets, animal parts, and traditional medicines, and the use of technology and organized crime syndicates in smuggling operations. Despite India's robust legal framework, including the Wildlife Protection Act of 1972 and its active participation in international conventions like CITES, enforcement gaps, border security vulnerabilities, and the growing sophistication of criminal networks continue to fuel the illegal trade. This paper explores India's ongoing efforts, including the role of the Wildlife Crime Control Bureau (WCCB), advancements in technology, and community-based initiatives, while recommending enhanced international cooperation and stricter enforcement protocols to disrupt trafficking networks. By collaborating on a global level, India can strengthen its internal capabilities, disrupt trafficking networks, and contribute to broader conservation efforts. Addressing these challenges is crucial for the protection of India's wildlife heritage and global biodiversity conservation.

Victim's Talk: Doing "Being a Victim" and Managing Its Dilemma

There has been a lot spoken by all sorts of victims in this disastrous world. In order to become a victim, people are asked to talk about what they have experienced and how they have been suffering from such experiences. In other words, becoming a victim is an interactional and discursive practice. Drug-induced Suffering (DIS) is one such difficulty. DIS stems from problems caused by pharmaceuticals, including the Thalidomide incident, the HIV contaminated blood-products incident, the MMR vaccine-induced suffering, etc. DIS is not just limited to adverse reactions to pharmaceuticals. Further difficulties include relational, economic and social damages caused by those pharmaceuticals. DIS has been a well-known concept of such social problems in Japan. I have been researching on DIS in Japan for over 10 years with both my colleagues and the victims of DIS. I have analysed what and how some victims of DIS talk about their difficulties, using Discourse Analysis and have found that their talk about difficulties involves an interactional job in managing the dilemma that accompanies "being a victim". In other words, doing "being a victim" can be considered not as a simple and straightforward job like a job of doing "being ordinary" (Sacks 1970) but as an exquisite job that such sequences in a victim's talk should manage the dilemma that has emerged by the talk itself. That is because the DIS victims not only do "being victims" in order to accuse the pharmaceutical companies and even the government of inflicting damages, but also live their own lives. Their own lives are much more than what the victims' lives are generally expected to be. I will show how we can analyse victim's talk and the dilemma with Discourse Analysis and will discuss the implication of the analysis and the result.

Exploring the Emergence of Social Order through Computational Social Science and SNS Data

The emergence of social order has long been a central issue in social science, tackled by thinkers like Thomas Hobbes, Adam Smith, and Talcott Parsons. In this presentation, we focus on Parsons' theory, which describes the emergence of social order through the interaction between factual and normative behaviors.

1) Factual order: Regular behaviors emerge in society. For example, during the COVID-19 pandemic, many people regularly wore masks.

2) Normative order: People begin to believe that these regular behaviors are desirable and expect others to hold the same belief. For instance, seeing others wear masks, individuals may come to think that mask-wearing is socially desirable and that others agree.

3) Social order: A process of mutual reinforcement between factual and normative orders leads to the emergence of social order.

While Parsons' theory provides a clear conceptual framework, testing it empirically poses challenges. Cross-sectional surveys fail to capture dynamic processes, and even longitudinal surveys struggle to detail the emergence of social order. Case studies offer insight into the process but may lack generalizability.

By contrast, digital trace data offers a solution. This type of data is "always-on" (Salganik 2019), allowing us to track the emergence of social order over

time. We propose using X (formerly Twitter) data in two steps: (1) identifying clusters of users who interact around specific topics, and (2) analyzing their posts and replies. If these interactions align with the three stages outlined above, we conclude that social order has emerged.

We will present detailed findings at the session.

Doing Nothing, Redefining Care: Youth Non-Reproductive Choices and Agency

The gap between the average number of desired children (around 2) and the total fertility rate (1.24) in Italy is mainly interpreted as the result of structural dimensions (inefficiency of the labour market, lack of family policies, scarcity of housing and youth policies) and contingent ones (e.g. the Great Recession, the economic crisis, the Covid-19 pandemic). At the same time, it is apparent that an increasing proportion of young people do not wish to have children and/or see the parental experience as irrelevant to their self-fulfilment.

Youth non-reproductive choices – or their "doing nothing" in the reproductive sphere – often become a focal point for blame and intergenerational conflict. From an adultist and adult-centred perspective, these choices are seen as a sign of selfishness, hedonism and immaturity. This viewpoint particularly influences the public discourse, which tends to blame young people – especially young women – for the declining birth rate, now at an historic low. However, from a youth-centred perspective these choices can be read as a different way of caring for oneself, the others, and the planet. The non-reproductive discourse is linked to emerging new definitions of caring that transcends biological and family boundaries, emphasizing the social responsibility to care for others within the community, as well as to the environmental discourse.

Understanding youth choices not just as individual decisions, but as expressions of agency that opens new perspectives on both their personal futures and the collective future, the paper explores childless young people's position within the current generational and gendered order. Drawing on two ongoing studies on the reproductive and intimacy ideas, expectations, desires, fears of childless young people aged 25-34, it asks how the blaming discourse affects both young women and men, and how they, in turn, resignify their non-reproductive choices.

Street Art As the Emotional Infrastructure of Social Movement: The Case of Bangladesh

Bangladesh has undergone a series of anti-government and pro-democratic protests through July and early August of 2024 primarily led by the university students which eventually successfully resulted in the fall of a fascist, corrupted and an authoritative government in August 5, 2024. Although it started as the restructuring of the quota system of the government job recruitment, later the oppressive and derogatory activities of the then government instigated the emotions of the youth. At one level of the movement, street art was used as a medium to express their emotions. The research question of this study is to demonstrate how the emotions of the youth and the people were accentuated through street art and assisted to the fall of an authoritarian regime in Bangladesh. The objectives of the study are to explore the chronological history of July-August, 2024 uprising in Bangladesh and the associated emotions; and to examine the role of street art as a key medium of expression that mobilizes the collective actions and resistance. The research was conducted in August and September, 2024 employing reconnaissance survey, observation and interview of street artists and common people. The study findings revealed that anger and hate against the then government and the love and passion for the oppressed activists and the fellow countrymen were expressed through street art and people of all classes came forward protesting against the huge bloodshed of the then government under the banner of anti-discriminatory movement and became a successful social movement. The emotions of the public urged to raise their voices and street art was used as a form of expression to uphold the emotions by portraying nationalism, communal harmony, inclusiveness, solidarity, public engagement and awareness. This medium was employed to create memory and pay homage to the martyrs and the injured of this movement.

Is the Military Still 'just a Job'? Examining the Transformation of the Institutional/Occupational Recruitment and Retention Approach in East Central Europe: The Case of Romania and Poland.

In the past decades, countries in East Central Europe have had to adjust their recruitment and retention policies to address new challenges. Alongside a culture of no conscription and a growing interest among young people in higher-paying civilian jobs, they have successfully transitioned to an all-volunteer force. The military is 'just a job'. Recently, there has been pressure from allies to increase defence spending and from the neighbours the size of the armed forces. Various occupational incentives have been offered to attract and retain supplementary personnel for a certain period. This presentation proposes making policy adjustments to address Moskos's institutional versus occupational dilemma to meet long-term requirements. The case studies I have selected suggest a similar approach for Romania and Poland, with Poland showing some advancement. However, the results of these changes will be evident in the medium and long term.

Mixed Methods As a Complementary Approach to Social Network Analysis in Comparative Transnational Settings. Case Study of Migrant Groups in Spain.

Social network analysis (SNA) has been recently applied to assess migrants' assimilation and transnationality. Various research has been revealed that, sometimes, networks are insubstantial as all nominated nodes and bridges are part of the network graph except they are not part of the social grouping. This presentation looks beyond the metaphor of social networks as it reviews critical group size theory and complements social network analysis with mixed methods of network survey and ethnographic interpretation. It questions the structural approach and argues that interactions among alters may not be accurately recorded by this method. Empirical data collected from 55 migrant networks in Spain support main theoretical hypotheses.

RC53-JS-96.1SAVIC, KRISTINA* (Universität Innsbruck, Austria)
WECKENMANN, REBECCA (Universität Innsbruck, Germany)*Observing Linguistic Practices in Multilingual Preschools. Insights from a Participative Research Project*

This paper focuses on the role of language(s) and multilingualism in preschools in the multilingual region Carinthia, Austria. It is situated in the wider framework of a participative research project in which students of a vocational school for elementary education (aged 16-17) receive an introduction to ethnography and do fieldwork during their internships at preschools. Theoretically, we combine critical sociolinguistic and educational theories on language and power (Blackledge/Creese 2010; Tusting 2020). In these theories, language is understood as "ideology and practice" (Heller 2007), and as a socially and institutionally situated practice which can (re)produce, negotiate, shift or irritate powerful relations between speakers. Empirically, we draw on our, the researchers', ethnographic fieldnotes at school, and on the fieldnotes, photos and audios the students, our co-researchers, made in the preschools.

In our presentation, we will answer the following questions:

- Which forms of linguistic interactions do the students choose for their descriptions and which linguistic and pedagogical norms become visible in their texts?
- Which practices of natio-ethno-religio-gender-lingual differentiation and which social hierarchizations at preschools are visible in the students' protocols?
- What conclusions can be drawn for observing learning in the context of pedagogical professionalisation and what role do language(s) and multilingualism play in this?

Blackledge, Adrian; Creese, Angela (2010): Multilingualism: a critical perspective. London: Continuum.

RC04-53.4SAVINSKAYA, OLGA* (HSE University, Russian Federation)
MKHITARYAN, TAMARA (HSE University, Russian Federation)*Conceptualizing the Female Coping-Practices Against Gender Stigma: The Case of STEM Major in Russian Higher Education*

The paper examines coping practices developed by female students in order to overcome the stigmatization of women in the IT field and reduce the psychological discomfort that arises in response to discriminatory situations that are traumatic for their identity. Stigma is defined as a configuration of attributes inherent in female students that are deeply discreditable in certain situations (Goffman 1963). In the IT institutional space with a dominant male culture, the main discrediting attribute is the gender of females. The identified coping practices are systematized for scale elaboration. A body of work focused on the study of adaptation strategies to the stress encountered in the higher education environment from one side, and gender stigmatization in a patriarchal society from the other are discussed in the theoretical framework. Mixed methods research with an exploratory sequential design (Creswell and Plano Clark 2018) is used. At the first qualitative stage, 23 semi-structured interviews were conducted with female students studying at the Faculty of Computer Science at a top-rated Moscow university, in the spring of 2023. The following practices identified on the qualitative stage - rationalization, avoidance, resistance, professionalism, apply an anti-female approach, and transferring to another program or working with a psychologist. A survey was conducted at the second stage of the research. 312 out of a total of 555 female students take part in the survey (RR=0.41). The identified coping practices were tested by factor analysis and ordered according to the level of their acceptance of the traditional social order of a patriarchal society. The supposed poles of the coping practices continuum are decomposed into 2 independent scales - the scale of acceptance and adaptation of sexist stigma (the coefficient alpha 0.864) and the scale of resistance to stigma (0.825).

SAVINSKAYA, OLGA* (HSE University, Russian Federation)

The Methodological Inclusion: How Can We Get the Rapport with a Child and Gain Rich Data

The paper examines the modern project of childhood developed within the framework of the new sociology of childhood, forms a methodological framework for rules, techniques, and ethics in the empirical research methods of interviewing children. Recognition of the plurality of childhood in the global world, on the one hand, gives rise to many unique practices in field work, on the other hand, creating the ground for the development of common ethical and methodological approaches and principles. Approaches to the understanding of childhood described in theoretical works influenced the development of the method. The analysis of the method is based on the principles of the new sociology of childhood: equal communication, agency of children, involvement in decision-making concerning the lives of children. A definition of methodological inclusion is given as a mechanism for adapting a method to the characteristics of a social group. The following aspects of the children's interviewing are identified and described: in-depth study of the interview script, taking into account the characteristics of age and the inclusion of elements of gamification and projective techniques as stimulus in the interview script, selection of the best interview venue, selection of interviewers and more thorough briefing due to their age, dynamic interviewing with switching activities, flexibility in conducting interviews in accordance with the individual characteristics and development of the child, contact with a parent or other responsible person before, (during) and after the interview, post-field relations, data analysis and the world of childhood representation in scientific articles and political documents. The examples are coming from author's different research with children 7-9 years old.

RC04-62.4SAVA, MARIA* (European University Cyprus, Cyprus)
SYMEOU, LOIZOS (European University Cyprus, Cyprus)*Parent and Guardians Associations and Their Role in the Landscape of School-Family Relationships*

Parent and Guardians Associations (PGA) serve as a crucial link between schools and families, fostering collaboration that benefits both students and the broader school community. Research has shown that effective cooperation between schools and PGAs creates an environment that enhances students' academic achievement and social development. PGAs provide a platform for parents to engage in school decision-making, advocate for resources, and support educational initiatives. They also help strengthen the relationships between teachers, administrators, and families. This collaboration enhances school programs, encourages parental involvement, and promotes a more

inclusive school culture. By facilitating open communication and shared responsibility, PGAs positively impact student outcomes.

This paper reports on the findings of a mixed-methods study that examines the role of PGAs in relation to school effectiveness, conducted in primary schools in Cyprus. The study employed an initial qualitative phase, which included semi-structured interviews, observations, and document analysis, to develop a comprehensive understanding of school-PGA dynamics. These insights informed the construction of a mail quantitative questionnaire, which was subsequently completed by a representative sample of primary schools of 1,118 teachers and parents.

The paper presents the perceptions of teachers and parents/guardians regarding the role of PGAs in schools. Findings indicate that PGAs play a pivotal role in facilitating communication between schools and families, supporting school activities, and influencing decision-making processes. Following exploratory factor analysis, 18 variables related to the role of PGAs were consolidated into three main categories depicting the PGA's role: contribution to the school environment, provision of economic support, and involvement in volunteering and school interventions. The statistical analysis also revealed significant differences in perceptions between teachers and parents, as well as between PGA board members and non-members.

The findings of the study offer valuable insights for school administrators and policymakers aiming to foster effective family-school partnerships and promote meaningful parental engagement.

SAXONBERG, STEVEN* (Södertörn University, Sweden)

How the Settler Colonialist Paradigm Prevents Peace in the Middle East

My paper will question the notion that colonialism in general and settler colonialism in particular is something "Western" and will show that power nations throughout history and throughout the world have carried out colonial and settler-colonial policies. Then it will question the common claim that Israel is a settler-colonial state and show that the belief in this false paradigm has made it nearly impossible to reach a peaceful solution between Israel and the Palestinians living in the West Bank and Gaza. This paper will go one step further by taking up other examples, such as the war in Ukraine to show why the shift from Marxism (or neo-Marxism) to post-colonial theory is leading to the decline of the democratic left and will plea for a return to a more pragmatic, non-dogmatic form of Marxism.

SAYAPIN, LUCIA* (Universidad de Buenos Aires. Facultad de Ciencias Sociales. Instituto de Investigaciones Gino Germani, Argentina)

La Escuela De Cine Del Arroyo. Analysis of a Community Cinema Experience in the Anthropocene.

The expansion of high environmental impact activities in Latin America has prompted numerous organizations to adopt community film production tools to share their demands in the public sphere. This situation is being re-actualized in a scenario of climate and social crisis intensification, where living conditions are improving and the demand for care and reproduction of life tasks is increasing, mostly falling on women's groups, in a context in which popular neighborhoods emerge as territories where these processes assume bigger dimensions.

This paper analyzes the case of the Escuela de Cine Comunitario del Arroyo, a community film school located in the Sayonara I settlement, in Quilmes, Buenos Aires, Argentina. In this space, multiple recreational activities for children and adolescents are carried out, with a community dining room run by a group of women. The film school is built as a neighborhood community space that enables new territorial practices as well as the recognition of territorial ecofeminist praxis in this precarious territory.

The analysis combines community cinema perspectives, the contributions of critical ecofeminisms to understand the praxis of women's collectives, and the approach of political geography to comprehend the deployment of spatialities of resistance. The methodological strategy adopted is based on audiovisual qualitative sociology, specifically on the viewing of documentaries with the analysis of material posted on social networks, and the analysis of key informant interviews and the recording of participant observations are included.

The main findings of the work include thinking of the film school as a collective process, where from the practice of filmmaking, the community build new community identities in the face of the problems generated by living in a neighborhood where the consequences of living in the Anthropocene era are deepening and where a set of territorial ecofeminist praxis emerge for reasons of survival.

Navigating Gentrification and Governance: The Case of Nbgg Cultural Community Space in Malmö

This paper examines the transformation of the NGBG community space in Malmö, Sweden, originally founded as a grassroots music festival eight years ago. Over time, NGBG has evolved into an inclusive cultural hub that fosters creativity and civic engagement, while continuing to host its annual festival. However, the SofieLund neighborhood where NGBG is located is undergoing rapid gentrification, with the city recently designating the area as a sound-free zone and unveiling a master urban plan for 2040, which includes an increase in commercial spaces.

This research employs a mixed-methods approach, combining ethnographic fieldwork, semi-structured interviews with community members, city officials, and private stakeholders, and document analysis of local policy papers to understand how governance, music, and urban development intersect. By exploring the role of music and creativity in fostering community and civic engagement, the study investigates how NGBG navigates the pressures of gentrification and marketization. Key questions include: How does NGBG balance its role as a cultural space for music and creativity amid increasing commercialization? What do new governance models mean for the inclusivity and accessibility of NGBG as a public space?

By framing NGBG within larger debates on culture-led urban regeneration, gentrification, and governance, this paper offers insights into how creative communities adapt to urban transformation. It contributes to discussions on the future of cultural spaces in cities where the intersection of music, creativity, and urban policy shapes the dynamics of public life.

The Measure of Merit. Learning Outcomes and the Neoliberal Education Paradigm in Italy through the Lives of People in Education

In recent decades, the relevance of learning outcomes (LOs) – particularly in their quantitative form – has increased across the EU, shaping education policies in several countries, Italy included (Landri 2014; Giancola, Salmieri 2022). This trend developed in parallel with the rise of a neoliberal paradigm in education (Grimaldi 2013). This shift is particularly evident in two interconnected dynamics: the emphasis on a "meritocratic" discourse and the push to categorise learners by achievement levels – two key components of the neoliberal education paradigm (Mijs 2016; Robertson, Nestore 2022). Quantitatively assessed LOs thus become an ostensibly objective "measure of merit," applied to learners as well as teachers and schools more broadly. Yet, despite this approach becoming increasingly hegemonic, it also stands in opposition to earlier, more inclusive paradigms, potentially creating tensions and ambiguities within the education system.

Building on this premise, this paper draws on research conducted as part of the Horizon 2020 CLEAR project, focusing on the social construction of LOs in Europe and their impact on learners' trajectories. With specific reference to the Italian context, the paper addresses two key questions: a) how LOs are constructed and interpreted amidst the contested rise of the neoliberal education paradigm; and b) how young people navigate this stratifying yet ambiguous education landscape. To this end, the paper first uses document analysis of policy documents and programme descriptions, and an expert survey involving around 100 national education stakeholders (comparing them with respondents from other EU countries), centred on the construction of LOs and broader trends in education. It then examines learners' direct experiences through semi-structured interviews with youth and key education and training professionals in an area in central Italy, characterized by differentiated urban and labour market conditions. Interviews adopt a Life Course perspective, examining significant transitions in learners' lives.

SCARFÒ, GRAZIA MARIA* (Ecole Hassania des Travaux Publics, Morocco)

Être Femme Ingénieure Au Maroc : Évoluer Dans Un Monde Professionnel Peuplé d'Hommes.

La question qui structure ma communication est la suivante : en partant d'un travail de terrain basé sur plus d'une centaine d'entretiens biographiques,

collectés auprès d'ingénieurs marocains diplômés d'écoles françaises, marocaines et soviétiques, nés entre 1930 et 1980, il est clairement apparu que le diplôme d'ingénieur est un moteur de mobilité socio-professionnelle pour la grande majorité des hommes ingénieurs interviewés ou, au minimum, un facteur qui a contribué au maintien du statut social pour ceux issus des milieux privilégiés : qu'est-ce qu'il en est pour les femmes ingénieures ? En d'autres termes, la variable « genre » a-t-elle une place, et si oui laquelle, dans l'analyse de la mobilité socio-professionnelle des ingénieurs marocains et plus particulièrement de celle qui mène au pôle du pouvoir ? Ma communication portera sur 20 femmes ingénieures, nées entre 1950 et 1980, diplômées elles aussi d'écoles françaises, marocaines et soviétiques. Selon le schéma suivi pour les hommes, il s'agit de saisir comment leurs carrières socio-professionnelles se sont mises en route et ont évoluées à partir de l'analyse de leurs récits biographiques qui retracent leurs vies de la plus tendre enfance à l'accomplissement de leur carrière professionnelle. L'analyse des trajectoires personnelles, scolaire et professionnelles des femmes ingénieures s'est révélée fondamentale non seulement pour comprendre la place que la variable « genre » occupe au sein d'une problématique telle que la relation qui existe entre mobilité scolaire et mobilité socio-professionnelle. Elle a en effet permis de mieux saisir les caractéristiques que le groupe socio-professionnel des ingénieurs marocains a acquises dans le temps, et les mécanismes sociaux qui l'animent. Le « genre », ainsi que l'origine sociale, regardée dans tout son dédale d'imbrications, le cursus scolaire accompli, le contexte historique se sont imposés comme des variables essentielles pour mieux appréhender le phénomène étudié.

Neighborliness As a Social Relation of Our Time

Neighborliness is probably the most contingent relation in the triad kinship-friendship-neighborship. Neighbors are close because they live close, not because we feel close to them as in friendships or are related to them through bonds of kinship. The neighbor-relation is the only one which is based on proximity, closeness of space, which makes it both a vital and a precarious relation. For Max Weber, interested in rational social action, neighborliness was an unsentimental, economically inspired brotherliness, "that sombre economic brotherhood practiced in case of need". In the last decades, sociology has rethought and widened this understanding of neighborliness considerably.

Historically, it was the neighbor who inspired theologies of world religions. The neighbor, 'Nachbar', 'voisin' is 'der Nächste' or 'le prochain' in the Old Testament. "...thou shalt love thy neighbour as thyself" refers originally, as has been argued, to the one living close. Islam also has a strong and well-thought out ethic of neighborliness.

The question of neighborliness thus is also a theological, ethical and political-philosophical one. This makes it a concept apt to reflect on the human capacity of co-existence throughout history and our time. Being both deep and concrete and expressing both social realities and aspirations, it challenges and complements other concepts currently en vogue.

The presentation will explore neighborliness along these lines as a form of social love.

SCHAEFER, KRISTINA* (Johannes Kepler University Linz, Austria)

Negotiating Diversity: Discrimination Experience of Queer Police Officers and Their Struggle for Justice in the Police Force

Following a global trend, Austrian and German police forces have implemented policies aimed at fostering gender equality and diversity. However, tensions remain between official commitments to diversity and persistent internal discrimination, particularly towards queer police officers.

Against this background, this study not only analyzes the formal institutional efforts to promote gender equality and diversity, but also the subjective experiences of discrimination within the police, revealing how these experiences contrast with well-sounding organizational mission statements.

Methodologically, guided and narrative interviews are used which are analyzed with the Grounded Theory Methodology. Theoretically, this study draws on Pierre Bourdieu's praxeological theoretical framework to analyze inequality and discrimination against the background of power struggles within a given social field as well as in relation to other social fields, e.g. the government, law and media. Neo-institutional concepts are used to enrich this theoretical embedding.

Preliminary findings indicate that discrimination persists in more covert, less visible forms. However, this development challenges both the identification of

such discrimination by affected individuals and efforts to sensitize colleagues, thereby complicating attempts to foster a truly inclusive, diverse police force.

Queer police officers, in particular, navigate unique tensions between their identity within the LGBTQ+ community—historically in conflict with law enforcement bodies—and their professional loyalty. This tension is exacerbated by the police's framing of internal criticism and activism as threats to the institution, limiting queer officers' ability to advocate for meaningful change.

This research contributes to a critical understanding of justice by interrogating whose knowledge and experiences are prioritized within state institutions. In the context of the Anthropocene, where social, environmental, and institutional sustainability are intertwined, examining these power dynamics offers insights into the barriers to achieving justice in both human and institutional relations.

POHN-LAUGGAS, MARIA* (University of Bochum, Germany)

Life Stories and Self-Thematizations of Jehovah's Witnesses in the Context of Familial and Collective Persecution Under National Socialism

In the context of a multi-generational biographical study on stigmatized Nazi victim groupings in Germany and Austria, we conducted interviews in families in which family members were persecuted because they were members of the religious group of Jehovah's Witnesses. The sample includes cases where (almost) all family members have been part of this religious group for generations, families where only the persecuted persons were Jehovah's Witnesses, and families of persons who have left the community. One challenge presented by our study – and of biographical research on closed religious groups in general – is the reconstruction of experience structures. We see one reason for this in the shift in the "we-I" balance (Elias): in the interviews in families that have been integrated in the religious group for several generations, we clearly see that as their separation from the "outside" world increases, the we-I balance shifts in favor of the we. When talking about themselves and their family history, people then refer almost everything to the we-group. Only those biographical experiences are presented that can be linked to one's own religiosity or the religious community. Our hypothesis is that this phenomenon occurs when the we-group is the relevant instance of socialization across generations. The socialization framework is largely structured by the religiously based world view, and the strict group rules and assigned group roles based on it. Using an empirical case – a family – we will show what kind of biographical experiences lead to this form of self-thematization. However, we will also show how certain biographical and generational experiences make it possible to present other affiliations or 'problematic' topics. In the cases we have studied, this is related to the experience of persecution by the Nazis, and transmission of the fear of persecution within families and within the religious community.

Farmer Climate Adaptation Strategies in Rice-Growing Areas of the Southern United States

The long and still evolving adoption of innovation literature has deepened our understanding of various factors shaping farmer climate adaptation strategies, or the extent to which farmers adopt more sustainable varieties and practices. Qualitative and focused quantitative studies point to a broader range of factors potentially influencing climate adaptation strategies within more specific or local contexts. Our study attempts to combine insights from the extant literature with those of key informants, to develop a multi-module survey instrument designed to assess factors shaping rice growers' adoption of more sustainable varieties and farming practices. Our instrument is grounded in a sociological perspective, and was developed in connection with an extensive review of the evolving literature in various domains of sustainable agricultural production. Our survey considers broader relational and structural factors, often absent in existing technology adoption studies, along with individual grower and farm characteristics and attributes of innovations. The modules include questions capturing growers' farming history; land ownership; personal and organizational networks; future orientation; knowledge of and attitudes toward climate change and sustainable agricultural practices; perceptions of science, technology, and research; views on what constitutes

a 'good farmer'; and grower socio-demographic and farm characteristics. Combined, the data from these modules will enable us to develop and test more comprehensive models of factors shaping farmer climate adaptation strategies. The instrument will be administered in the first quarter of 2025 to a representative sample of rice growers in the Southern United States. Our paper presentation will discuss the lessons learned from our review of the literature and key informant interviews, the development and finalization of the survey instrument, along with initial findings supporting or questioning the role of diverse factors considered critical in shaping adoption decisions. We conclude with a discussion of the implications of research and policies related to sustainable agricultural production.

Research during Covid-19: A Five Country Comparative Analysis

In 2020 and 2021, the Covid-19 pandemic disrupted research activities globally. The response to the pandemic varied widely across nations and institutions. Scientists' experience, access to technologies, designation as "essential", gender, extent of teaching responsibilities, health, and perceptions of the pandemic and the response to the pandemic may have also shaped the extent to which research progress was made during the pandemic.

Drawing on data collected in 2022 and 2023 with about scientists at agriculturally-oriented universities and research centers in each of five countries—nearly 1500 total surveys, about 300 each in Ghana, India (Kerala), Kenya, Mexico, and the United States (Louisiana)—our paper explores variations in the degree to which the pandemic led to changes in the amount of (a) time scientists in these locations devoted to research, (b) progress made on their primary and secondary research projects, (c) funding that was available for research, and (d) other indicators of research productivity. Our study considers the national and institutional (university versus research center) variations in response to the pandemic and scientists' perceptions of the Covid-19 pandemic. We underscore certain factors that facilitated and hindered research progress and discuss implications for future research.

SCHÄFER, SARAH HELENA* (University of Vienna, Austria)

Decentering Deliberation: Political Emotions in the Climate Discourse of Spiritual Communities

This paper explores the significance of emotions in global climate politics and challenges the dominant technocratic paradigm which mainly relies on scientific expertise and economic concerns. I start with the assumption that the current climate discourse is heavily influenced by Eurocentric approaches to knowledge rooted in modernity and rationalism. Although science-based arguments for urgent climate action outweigh climate change denial in public debates, policy makers still fail to implement effective large-scale climate policies. This is underlined by a public lack of commitment to change, especially in Western democracies. Therefore, I suggest that science alone might not be sufficient to motivate a profound environmental transformation in modern societies.

I argue that emotions need to be taken seriously as a form of knowledge and am especially interested in how they influence political deliberation beyond the technocratic paradigm. In a decentred approach, I focus on spiritual communities to demonstrate how multiple understandings can confront the climate crisis from different angles. Rather than necessarily rejecting climate science, such discourses often highlight different values in relation to the environment. Applying the interpretative approach, emotions serve me as a critical lens to analyse how spiritual narratives on climate change frame political priorities in this regard. Taking Tibetan Buddhism as a case study, I conduct an Emotional Discourse Analysis of texts on climate change by Tibetan Buddhist leaders such as the Dalai Lama or the Karmapa.

My research contributes to the sociology of emotions which understands emotions as structurally embedded and rejects the dichotomy of rationality and emotions. By challenging the hegemony of technocratic reasoning in modern politics, I aim to make a case for broadening the discussion about climate change. I propose that including a diversity of narratives in policy deliberation can foster depolarisation among democratic publics and thus increase the acceptance of climate policies.

SCHEIRING, GABOR* (Georgetown University Qatar, Qatar)

Left behind By the Left, Voting for the Populist Right

The populist right continues to thrive, largely due to its ability to attract former core working-class voters from left-of-center parties. East-Central Europe is a populist right hotspot, providing key insights into how these parties construct a durable social base. This study contributes to the global debate on the social foundations of right-wing populism by analyzing Hungary as a strategic case. It offers unique mixed-method evidence demonstrating the interplay of demand and supply, showing how the mainstream center-left's strategic errors enabled the rise of radical-right populism. First, it conducts a novel quantitative content analysis of the Hungarian Socialist Party's programmatic documents (party manifestos and parliamentary speeches). The analysis reveals an increasing neglect of workers and a shift toward the right in social and economic policy. Second, the paper analyzes a unique town-level dataset on long-term economic and demographic trends, alongside data on vote share shifts before the watershed 2010 election when the Hungarian Socialist Party collapsed and the radical populist right Jobbik party burst onto the scene. The analysis shows that voters in towns hit hardest by deindustrialization and rising mortality in the 1990s felt abandoned by the Socialist Party and turned toward Jobbik. The study also shows that Jobbik was able to mobilize voters against the Roma minority in towns experiencing bigger shocks in the 1990s but the Roma population share itself is not a robust predictor of Jobbik's success. The findings are robust against a host of demographic, economic, and cultural controls. Overall, the study shows that radical-right populism's success hinges on the mainstream left's failure to retain support in areas facing long-term socioeconomic decline.

Violence and Victimization of People with Severe Mental Illness: Socio-Psychiatric Perspectives on Vulnerability and Structural Challenges

Little is known about people with severe mental illness (SMI) and their experiences of violence. People with SMI have a significantly higher risk of experiencing physical and/or sexualized violence in their social environment during the course of their lives. Experiences of violence (e.g. domestic violence) can have serious consequences for the mental health and the individual recovery process of those affected. Victimization is one of the most pressing problems in the care of people with mental health issues worldwide. However, the topic has hardly been addressed in German-speaking countries. This is at odds with a socio-psychiatric perspective on mental illness, which emphasizes the importance of social environmental factors for the treatment, care and support of people with SMI.

The ongoing research-project EVIO (Experience of Violence), based in Germany, is investigating the prevalence of experiences of violence (last 12 months) of people with SMI. Using a mixed-methods approach, the study collects both quantitative and qualitative data. Surveys are used to measure the prevalence of physical and sexual violence, and in-depth interviews provide personal narratives to contextualize these experiences of service users and mental health professionals.

This presentation gives insights in the ongoing analysis of the data, e.g. the challenges people with SMI face regarding experience of violence and (re-) victimization as well as the dimensions of disclosure inside and outside of mental health structures.

Feminisation of Islamic Religious Leadership in a Muslim-Minority Country: An Exploration through Biographical Interviews

The Islamic religious field in Italy, a Muslim minority country, is progressively going through a process of feminisation of religious leadership, which concerns both the so-called "first" generations, the "second" and "third" generations of migration, and finally women who are converted to Islam. The Italian case can be described as an interesting "laboratory" in which women are conquering a significant role for their religious communities, within a limited space that is not fostered by the local political-institutional framework. We are thus facing a significant but scarcely visible transformation in the public space and in the collective imaginary.

In this framework, therefore, biographical interviewing allows dynamics to emerge that are difficult to represent through other social research methods. In fact, it allows the life trajectories of Muslim religious leaders to be traced, who have come to occupy their roles through different personal paths, passing through political "militancy", involvement in associations, or in the professional practice of cultural mediation. Again, in the personal life stories, the reference to their culture of origin and the role of women in the social and religious spheres appears, as well as the encounter with the various dimensions of life in migration.

The paper therefore presents an analysis of some biographical interviews conducted with women who occupy a position of leadership in the Islamic religious field in Italy. The interviews are carried out as part of a broader research in progress that aims to provide an up-to-date portrait of the Muslim presence in Italy, by studying both the religiosity profile of the Muslim population and the perspective of Islamic organisations and their relations with State policies.

SCHIAVO, LUIGI* (Scuola Normale Superiore, Italy)

Resistance Strategies: Exploring Hybrid Networks in the Shadow of Repression.

In recent years, there has been a growing interest in the study of repression within social movement research. The literature has significantly focused on how repression influences processes of civil society mobilization and, consequently, the ability of collective actors to respond strategically. However, in analyzing the dynamics of contentious politics, scholars have discussed the biunivocal relationship between repression and movements. On the one hand, these studies emphasized the centrality of context in limiting their scope of action (Tilly & Tarrow 2015), while on the other hand, underlining their strategic capacity to address challenges and resolve their own dilemmas (Jasper 2004). Besides, with respect to the latter agency-based approach, the strategic use of digital media has been rather framed with reference to the analytical categories of repertoire of action and tactics.

This article is an attempt to reconcile both perspectives under the lens of the processual-relationship approach. Considering digital media as intrinsic elements of the organizing (Diani 2015), rather than mere digital tools, it proposes to rethink their use as potential actors that can enhance social capital and chart new pathways for the expansion of the interorganizational social structure in support of collective efforts. By doing so, the dynamics of interactions between different actors, operating within the same field of action, can determine different turning points in the political process, which emerge as a result of the choices adopted by civil society organizations taking into account variations both the degree of repression adopted by the state and the availability of their resources. In this vein, adopting a processual perspective (Bosi & Malthaner 2023) can allow us to classify the different hybrid trajectories of mobilization in this new historical phase, pervaded by the massive use of digital platforms.

SCHILK, FELIX* (Universität Tübingen, Germany)

From Epistemic Work to Resilience Training: Problematisations and Approaches in the Counter-Conspiracy Ecosystem

Politics and the media often discuss the knowledge conflicts we face today under the umbrella term of conspiracy theories. Thus, conspiracy theories are not always used to conceptualise a distinctive incident but also serve as a common signifier for a bunch of political, informational and epistemological phenomena. In recent years, however, various approaches that aim to tackle conspiracy theories have been funded and implemented by authorities at the European, national, and regional levels as well as by the media, NGOs, and social networking platforms. It comes as no surprise that all of those stakeholders are embedded in their respective fields and use different concepts and semantics.

In the cross-European research project "REDACT: Researching Europe, Digitalisation and Conspiracy Theories" we examine these different approaches. We aim at figuring out how the people who conduct them understand the phenomena of conspiracy theories and disinformation and how hegemonic perspectives in social science on a national level translate into different approaches across regions. For this purpose, we conducted about 80 semi-structured expert interviews with individuals working in institutions, the media, and NGOs.

In my paper, I will first provide a typology of our interlocutors, their understandings, and the approaches they apply and second show how institutional settings and funding shape the implementation and continuation of projects. Drawing on a Sociology of Knowledge and Grounded Theory approach, I will further show that conspiracy theories serve as five different

problematisations in what I call the Counter-Conspiracy Ecosystem: They are perceived (and tackled) as hate speech, as a political current, as a rhetorical tool, as a social identity and as a belief system. My research contributes to understanding why limited models of how conspiracy theories work necessarily persist in certain fields.

SCHILLINGS, TOBIAS* (University of Oxford, Germany)

Progressive Versus Competitive Democracy: Examining the Political Determinants of Universal Healthcare Reform in the Global South

The achievement of universal health coverage (UHC) for all stands at the centre of the international development agenda, championed by both national governments and transnational organisations. Despite this global consensus, national implementation varies widely across the world, emphasising that processes of healthcare reform remain inherently political rather than technocratic. While the literature has consistently highlighted the central role of regime type and especially democratisation, it remains poorly understood which specific attributes of democracy are conducive to achieving truly universal healthcare systems.

This paper examines the political determinants of universal healthcare reform by contrasting two prominent theories for explaining social policy reform in the Global South: party ideology and electoral competition. Informed by diverse country case studies and the regional literature on social policy reform, the analysis further explores the role of two potential mediating variables: insider-outsider politics and international development assistance. To do so, the paper codes the timing of major healthcare reforms across a sample of 95 countries in the Global South between 1995 and 2023, classifying them as either universal or residual. Drawing further on data from the Varieties of Democracy (V-Dem) and Development Assistance for Health databases, the analysis employs an event study to investigate the factors associated with each type of reform.

The findings demonstrate that politics plays a critical role in healthcare reform, even outweighing socio-economic factors. However, neither of the main explanatory factors – party ideology or electoral competition – is systematically associated with policy reform in the Global South. Instead, the study provides a more nuanced perspective on the complexities of political processes, showing that it is the combination of several factors – such as left-wing governments facing weak trade unions, right-wing governments receiving development assistance, or high electoral pressures supported by organised labour – that significantly increases the likelihood of universal reform.

SCHILLINGS, TOBIAS* (University of Oxford, Germany)

SANCHEZ-ANCOCHEA, DIEGO (University of Oxford, United Kingdom)

The Healthcare Universalism Index: Measuring Coverage, Generosity and Equity of Healthcare across the World

Exemplified in the "Leaving No One Behind" promise of the United Nations 2030 Agenda for Sustainable Development and tragically highlighted by the Covid-19 pandemic, a growing international consensus recognises that states should provide comprehensive access to high-quality social services and benefits for the entire population. While traditionally, such universalism in social policies has been associated with specific welfare regimes in the Global North, recent research has expanded the concept to the Global South – with a particular focus on healthcare.

Despite the growing emphasis on universalism, there have been few systematic efforts to measure its performance across different regions globally. This paper addresses this gap by introducing the Healthcare Universalism Index (HUI), a novel composite indicator to measure universal healthcare for 195 countries from 1995 to 2020. In accounting for 'varieties of universalisms' across the globe, the HUI comprises three dimensions of policy outputs: Coverage (measured by effective universal health coverage), Generosity (public health spending), and Equity (the level of healthcare privatisation).

Our findings reveal notable improvements in universalism across most regions from 1995 to 2020, driven by significant expansions in Coverage and Equity – especially in low-income countries in South Asia and Sub-Saharan Africa. In contrast, growth in high-income countries has been primarily driven by increased public investment in healthcare. Despite these positive trends, substantial inequalities persist between countries of the Global North and South, largely due to disparities in healthcare spending capacity.

Building on these findings, we propose a new global typology of healthcare regimes that categorises countries based on their performance across the three dimensions of the HUI. This typology highlights diverse pathways to achieving healthcare universalism, revealing both unexpected convergence among different regions and persistent structural disparities. The paper aims to stimulate further research on global healthcare regimes and inform debates on achieving equitable healthcare worldwide.

SCHLEICHER, NORA* (Eötvös Loránd University, Hungary)

The Numbers Game. the Discursive Construction of Ukrainian Migrants in Hungarian Media

Since 2015, the issue of migration has become one of the most important cornerstones of the populist discourse of the Hungarian right-wing government. Originally framed as a securitization problem, this moral panic initiated from above (Gerő-Sik, 2020) has undergone changes after the breakout of Russia's war against Ukraine resulting in the arrival of Ukrainian displaced people to neighboring Hungary.

Using critical discourse analysis as a general methodological framework, I analyzed the representation and construction of Ukrainian refugees, in Hungarian media.[1] The corpus consists of a purposive sampling of articles appearing between February 2022 and February 2024 on two of the most visited online news portals, pro-government *Origo* and non-pro-government *24.hu*. Here I shall focus on the use of numbers in the corpus. Numbers are a typical rhetoric tool often used in migration discourse to emphasize the size of the threat. (Van Dijk 1991) Their connotation of factuality, scientific truth, objectivity, etc. renders them especially useful for this purpose. They can signify the size of the threat migration poses but also the size of a claimed humanitarian effort. My analysis shows how the figure of the migrant can be flexibly used for various strategic purposes depending on the context. I argue that it works as a floating signifier (Laclau 2018) open to various interpretations. As such it is useful for constructing alternative realities but remains open for contestation as I shall also show.

SCHLEICHER, NORA* (Eötvös Loránd University, Hungary)

"Migrant" and "Pedophile" As Empty Signifiers in Populist Discourse. When Reality Strikes Back.

Discourses around migration and gender are important building blocks of the populist ideology of Hungary's right-wing government that have contributed to its success in the past decade. The presentation would analyze the discursive struggle over the terms "migrant" and "pedophile" in light of recent events. The arrival of a large number of guest workers facilitated by new legislation, on the one hand, and scandals connecting the government to pedophile crimes, on the other hand, have led to questioning and contesting the dominant discourses around both migration and gender.

Within the general framework of critical discourse analysis, a semiotic approach will be applied to study the signification process around the terms "migrant" and "pedophile" in contemporary Hungarian media discourse. I shall analyze the intertextual history and connotative meaning of the terms, and look closely at the current meaning-making process around them. Building on Laclau's (2018) concept of empty signifiers I aim to show that while the terms can be used with great flexibility to serve various strategic purposes the alternative realities they construct can unexpectedly come under attack when certain aspects of reality suddenly achieve greater visibility.

CURTIS, KATHERINE (University of Wisconsin-Madison, USA)

To Lose One's Place: Confronting Environmental and Community Change on the Northern Great Plains

A task of accelerating importance for sociologists is grappling with the social implications of environmental change. Though a global phenomenon, environmental change also has local impact and, central to our study, alters how places are known. Scholars are granting more attention to conceptualizing how local environmental change is experienced as *loss*. Thus, arising from a premise that loss plays a role in the remaking of place, in this paper we ask: What does it mean to lose one's "place"? To explore the intersection of the sociology of loss and placemaking, we turn to a case from the prairie of northeastern Montana to explore the sociology of loss, where local cattle ranchers are confronting a moment of profound environmental change affecting both their homeplace and their place in society. Driven by complex demographic and socioeconomic phenomena, ranchers long embedded in the community and deeply attached to place are grasping to maintain an emplaced identity some feel is being erased by a host of ambitious public and private land initiatives. In this study, we draw on oral histories collected from ride-alongs and archival interviews to interrogate the spatio-temporal fluidity of place. We find that despite individuals' epistemological differences shaping their unique senses of place, a history of public-private land controversies create common ideas around what it means to be a "good" neighbor and land steward. Interwoven through these narratives of place construction, however, are expressions of loss as a place known through these shared ideas change in ways that erase its identity. Thus, we situate loss as integral, yet often hidden, in the process of placemaking (and remaking). Centering loss in the face of environmental change furthers rural and environmental sociological work in understanding the conjoined relationships between people and their place(s).

SCHMIDT, ELISABETH* (Bielefeld University, Germany)

Circus Scapes: An Inquiry into Global Arts and Local Performances

With this paper, I will examine the role of global knowledge flows and labor mobility in establishing and advancing a creative career. The focus is on the contemporary circus industry, characterized by human-only performances with a focus on acrobatic skill, incorporating theatrical elements and dance, and generally consisting of solo, duo, or trio acts (Trapp 2020).

Applying the approach of Larissa Buchholz (2022), I describe circus performance both as a form of art and in terms of economic interaction, thereby showing that the labor market for circus performers includes not only the renting of labor power, which takes place in a specific locality, but also artistic compositions that can be marketed globally.

Based on interviews with circus arts scholars and performers currently active in South Africa and the EU, this paper will investigate the role that globalization, technological advances, and mobility have played in the development of contemporary circus performances around the globe.

I use the interaction forms of competition, cooperation, collaboration, and emulation as a framework to describe the networks and information flows that define contemporary circus performance. With these categories, I explore the possibility of describing the labor market of circus performers as a circus scape, in which ideas and inspiration for artistic acts flow freely across borders (Appadurai 1990), where, however, the physical presence of the circus performer is necessary to express the artistic act, which also serves as their means of income.

Customization and Choice Options in Online Surveys: Can They Influence the Willingness to Participate?

The use of online access panels, which is now common practice in a scientific context, is accompanied by several challenges, such as achieving a sample composition that corresponds to the composition of the population. One reason for this is that fewer low-educated, younger, and elderly people are registered in online-access panels, making it difficult to reach these groups to a sufficient extent. Market research companies then often use several online access panels, which can differ in various aspects (e.g., monetary rewards). To avoid this potential source of error, it is important to increase the participation and completion rate per online access panel.

One lever for this could be to recognize that different groups of participants, including the less educated, younger, and elderly participants mentioned above, have specific needs in terms of survey participation. This represents a challenge that standardized surveys generally have to face (e.g., Dillman et al. 2014). Online surveys have a decisive advantage in this regard: they offer technical possibilities to take into account the individual needs of the participants and the specific requirements of the survey situation.

This study addresses the research question of whether customization and choice options in online surveys conducted via commercial online access panels have a positive influence on the willingness to participate and, in addition, on the willingness to complete the survey.

In an online survey conducted in 2024, the survey participants of a commercial online access panel were offered several options for adapting the survey to their personal needs (e.g., additional explanations of terms) and the specific survey situation (e.g., alternative question presentations for device-specific display problems). To investigate the above-mentioned research question, the survey participants were randomly assigned to three different groups, which differed in terms of the announcement and offer of customization and choice options.

Justice, Power, and Authority: How the IAPD Framework Clarifies the Roles of Social Actors

If we are to address today's power imbalances and to know justice in the Anthropocene, social actors will need to know what power is. This paper presents a new conceptual analysis that distinguishes between four idealized types of social relationships: Influence, Authority, Power, and Domination ("the IAPD framework"). By focusing on only one type of social relationship, the so-called 'power debates' between Mills, Dahl, Bachrach & Baratz, Lukes, Foucault, Gaventa, and others, were too limited. By contrast, the IAPD framework takes social relationships as its starting point, allowing conceptual space for the full range of actual social interactions. Part 1 of the paper identifies the six properties inherent in social relationships: (1) identity, or the in-group/out-group membership (Plato's *The Republic*, Popper (1945, 1947), Habermas, Cronin, & De Greiff, 1998); (2) scope, the where, when, and what of the relationship (Dahl 1987); (3) intensity, the depth of feeling (Mann 1986); (4) possibility, meaning rights, options, and choice (Hirschman 1970, Frankl 1984); (5) sanction, the extent to which punishment, clemency, deprivation, and reward are normalized in the relationship (Machiavelli 2014 [1532], Lasswell & Kaplan 1950); and (6) well-being, the objective interests and subjective values of the members in the relationship (Gaventa 1986, Nyman & Nilsén 2016, Wilkinson & Pickett 2019, Sen 2000). Part 2 briefly shows how the IAPD framework can be applied to clearly and reliably distinguish power relationships from relationships of influence, authority, and domination. Part 3, argues that there is an inherent tension between justice, power, and authority. From a normative perspective, moral authority relationships, with their basis in membership well-being, minimize sanction; yet enforcement mechanisms, in particular punishment, are a defining characteristic of power relationships. It will be shown that, in practice, social actors pursuing justice carefully balance these two competing demands.

Humanimal Care Chains in Contemporary Mobilities

This paper seeks to contribute to research on transnational care circulation by proposing a "more-than-human" approach to care circuits. The more-than-human is present at all levels in international migration: in what people on the move carry with them, in the places and situations they pass through, in bordering practices and policies, and in how people maintain connections

with those left behind. Paying attention to the "more-than-human" within care circulations implies a renewed focus on affects and attachments in relation to objects, nature, and animals. My paper will draw on a recent research on humanimal care chains, undertaken in the context of Ukrainian exile following Russian invasion of February 2022.

Wheels of Change: Digitalization in the German Trucking Industry and Its Impact on Workers' Structural Power

The digitalization of the trucking industry in Germany offers a compelling case study for understanding how technology can undermine workers' structural power, even in the face of a severe labor shortage. Despite an estimated shortfall of 100,000 truck drivers in Germany, their bargaining power is paradoxically weakening. This raises important questions about how digital technologies are reshaping labor relations.

Historically, truck drivers have held a crucial role in supply chains. Positioned at critical choke points, their practical and tacit skills have given them high degrees of autonomy as well as marketplace and workplace bargaining power. In this presentation, we argue that digitalization—through tools like telematics, wearables, and driver-assistance systems—is eroding the need for skilled labor in the trucking industry. Tasks that once required years of experience, such as intuitive driving, route navigation, and mechanical troubleshooting, are increasingly standardized or automated. As a result, logistics companies are now able to recruit semi-skilled and unskilled workers from a global reserve army.

Drawing on over 60 interviews with truck drivers, management, and logistics experts, as well as ethnographic workplace observations, we provide concrete empirical evidence of how the implementation of digital technologies is reshaping skill requirements in the trucking industry. By lowering the bar for entry into the job, digitalization weakens the structural power that truck drivers once held.

Our analysis sheds light on the broader implications of technological deskilling in industries where workers have historically enjoyed strong bargaining positions. As digitalization continues to disrupt traditional labor relations, the trucking industry serves as a key example of how worker autonomy and structural power can be undermined, even in the face of labor shortages.
