The article presents the concept of nested markets and discusses its potentiality and utility as an heuristic device that might be useful in the study of markets. The article introduces the trajectory of the concept and the main discussions on nested markets and situates the approach among key theoretical traditions. The main goal of the article is to present a methodological tool that allows to identify and make classifications on nested markets, which is based on farmers' perception of the different dimensions that make up these markets. The typology on nested markets presented in the article has an heuristic utility but it also allows the identification of concrete situations and variables on nested markets which potentially will allow comparative studies to be carried out between different regions and countries, adding a historical, social and contextual component that still was missing. By doing so, the article also provides a contribution for the design of public policies that may foster and strengthen nested markets.

Beliefs in Equality of Educational Opportunities: A Comparative Study of 20 European Countries

The belief in the **equality of educational opportunities** forms the ideological fundament of meritocratic societies by providing a theoretically convincing and commonly accepted **narrative** for the justification and perpetuation of socio-economic inequalities in society. This study explores whether Europeans blindly follow an ideologically informed narrative when

assessing the fairness of their own educational opportunities and those of others in society – or whether individuals are reasonable when forming their judgements accounting for socio-structural factors that thwart equal educational opportunities. The empirical analysis is based on data from the **European Social Survey** and applies **multi-level modelling techniques** to study the impact of institutional barriers – most famously the level of educational tracking enshrined in European school systems – and personal factors affecting the chances for educational success on respondents' assessments of educational opportunities across 20 European countries. **Results show that fairness assessments of educational opportunities vary systematically between societies and social groups within society.** (1) Respondents seem well aware of their personal advantages and disadvantages and assess their own experienced educational opportunities accordingly. Educational opportunities are also assessed as less fair when respondents grew up in educational systems with strong tracking. (2) Assessments of personal opportunities are strongly interconnected with and reflected in societal judgments and the perceived educational opportunities of others in society. In fact, assessments of personal experiences function as an important mediator between socio-structural forces and assessments of societal conditions more generally – next to informational and ideological cues. **Overall, our findings suggest that individuals do not follow ideological narratives blindly. Instead, public assessments of educational opportunities align with sociological findings on structural inequalities observed in education - based on experienced and informational knowledge.** This sparks confidence that educational reforms that aim for equal opportunities can be considered reasonable and find support also amongst socially advantaged groups.

SCHNEIDER, SIMONE* (Universitat Pompeu Fabra, Spain)

"Institutional Imprints of Social Disparity": Introducing a Novel Conceptual Framework for the Development of New Institutional Indicators on Social Inequality

Welfare states are complex and provide different, even conflicting, answers to the questions of 'who gets what and why?' and 'who should get what and why?' This study will go beyond classical distinctions proposed by welfare state typologies and study differences in the various spheres of welfare, most importantly, old age security, healthcare, unemployment, and minimum protection. It proposes that ideas about inequality and the distribution of resources are imprinted in the institutional setting of social security systems. A starting point are current debates on path-dependency and policy feedback, as these suggest the institutional settings of welfare systems may structure and legitimate inequality through their impact on **access to services** and the ways they support or disrupt **attribution of responsibility** for personal outcomes. Less recognized but central for the study of inequality are the welfare privileges institutions grant to specific groups, as these manifest **societal divisions**. I propose these distinctions are evident in the legal foundations of the institutional setting of social security systems. Building on these assumptions, this study will introduce a novel conceptual framework for the measurement for "institutional imprints of social inequality" across policy fields, countries and time. First empirical examples of quantitative indicators based on legal information will be provided.

SCHNIEDERMANN, ALEXANDER* (German Centre for Higher Education Research and Science Studies, Germany)

Histories and Futures of Science Reform - from Reporting Guidelines to Metascience

In 1976 Gene Glass conducted the first modern meta-analysis of the effectiveness of psychotherapy. As he read and synthesised hundreds of papers, he "developed a very jaundiced view of the state of research reporting" (Hunt 1997, p. 28). In 1994, less than 20 years later, an international team of editors and publishing professionals developed CONSORT, the first reporting guideline for randomised controlled trials. Today, this checklist is a necessary requirement for publication in most major clinical journals. But what does the development of reporting guidelines for biomedical research tell us about metascience and science reform as we experience it today?

In this talk, I will trace the historical development of reporting guidelines from the 1980s onwards. I will highlight the role of crisis narratives, systematic inquiry and the development of concrete solutions. The findings are based on my doctoral research, which included document analysis, bibliometric analysis and qualitative interviews with guideline developers, editors and users. Based on the findings, I would like to propose and discuss two arguments.

First, science reform and metascience-based interventions, as we are witnessing them today, are not a new phenomenon that has only emerged with increased attention to misconduct or the publication crisis. Second,

some of the intellectual and practical roots of the metasciences lie in the emergence of meta-analysis and systematic review as scientific practices in the life sciences.

In contrast to many recent reform proposals and implementations, reporting guidelines have had an impact on biomedical writing for 30 years. By drawing on the experiences of their users, I will conclude with some ideas about how the professionalisation of the metasciences and the proliferation of metascientific knowledge might affect the intellectual (re)organisation of the future science system.

Families in Migration: The Significance of Educational Institutions for Transnational Family Biographies

Families who arrive in Europe after fleeing their home country do not only have to deal with the processes that the individual family members go through, but also to find a balance as a family between continuity and change that allows them to be able to act in the new context and at the same time maintain their self-image as a family. The planned contribution centres on the question of the significance of educational institutions in the narrated family biographies in the context of the challenges in the field of tension between continuity and change. This question is particularly important against the background of power and inequality relations in migration society and the role of educational institutions in the context of Multilingualism and the reproduction of social inequalities for research interested in inequality theory.

The project on which this contribution is based involves participant observation of family practices of storytelling and remembering. In addition, family biographies are collected in family interviews in which family members from different generations are present. Methodologically, the project adopts a reconstructive perspective that focuses on situational logics as well as the biographical processing of situational experiences and analyses negotiations of meanings in the context of a multilingual migration society in a differentiated manner.

The following questions are raised: How is the significance of educational institutions negotiated in narrated family biographies? What everyday challenges can be reconstructed for families with regard to educational institutions and multilingualism in the 'arrival context'? How do families deal with these challenges? And to what extent are these challenges an expression of inequalities in migration society?

Telling Family Stories in Migration: Transgenerational Remembrance Practices in Transnational Families

This paper focuses on families with a migration history and the negotiation of their family story (Schnitzer 2023) around the experience of (flight) migration: Memory and remembrance are playing a significant role in constituting communality and as biographical capital in families (Delcroix, 2013). They find different ways to tell their story and thereby claim their place in a new society as well as construct themselves as a family. This paper draws on a study conducted in the German speaking part of Switzerland that accompanied families migrated from different parts of the world from one to three years doing participant observation as well as conducting family interviews. The paper explores transgenerational remembrance practices in the families and how a family story can be told on the basis of negotiations within the family as well as within a society that shapes their lives in a significant way, especially by regulations of legal status and access to the labour market. The analysis based on fieldnotes and transcripts of family interviews (Phoenix et al. 2021) will focus on one family and their transgenerational transmission of family memories in the context of migration. Thereby also an autobiographic book of the family telling their story comes into play, published and written with the aid of a journalist.

SCHOBER, ANNA* (Klagenfurt, Austria)

I-Figure in a Concrete Scene: A Pattern of Addressing an Audience and Its Realisation in the Visual Arts

Images that are generated by machine learning tools are synthesised from the image archives that the programs can access. The images created are therefore close to the 'previous' ones. They no longer refer to factuality or truth, but to probability. In this paper, I am interested in a certain pattern of addressing the audience which consists of using image personnel who appear in the form of the 'all-seeing' frontal figure or the frontal portrait, as a back figure or as a small group portrait of two to three people, in order to attract the viewer's gaze and direct it to the background of the image (or to an accompanying text). In most cases, we are dealing with one or more figures that are clearly visible in the foreground, leading the eye into the centre and background of the picture, in which a certain 'scene' is concretised. Millions of such images find their way into media channels such as magazines, blogs and Instagram via stock images.

These patterns become very clear when diffusion models of AI programs that generate images, such as *dalle-e*, *midjourney* or *stable diffusion*, are used. This is because the generation of images and the perception of images, i.e. the activity of creating art and viewing it, are intertwined in these programs. These AI-generated image media therefore also reveal the structures and patterns of our visual culture and its prevailing traditions, including stereotypes, prejudices and biases. This paper asks the following questions:

- What historical image traditions can be identified in relation to these patterns?
- How do they manifest themselves in the present and in particular in connection with AI-generated images?
- What makes these image patterns so attractive for contemporary acts of visual communication?
- How do artists adopt these patterns using repetition, exaggeration and alienation?

SCHOBER, ANNA* (Klagenfurt, Austria)

Theatricality, Research and Humour: Visual 'Other' Narratives As a Means to Popularise Environmental Issues

The physical and aesthetic dimensions of visual culture are part of how we organise ourselves – but they can also change and reorganise us. Art in particular has this capacity to transform us and our world by exhibiting the making of images and the use of images. (cf. Alva Noë). Aesthetic modes and ways of addressing can therefore challenge us to reorient the relationships we inhabit and the orientations that arise from them. Within scenes of address, styles, patterns and scripts of address can be changed, challenged, humorously or ironically turned or mocked through modes of addressing an audience (cf. Monique Roelofs). How this can happen is shown in this paper using the example of the artistic works of Jana Kerima Stölzer and Lex Rütten.

Their work for publicly funded institutions, for example museums and cultural organisations, is based on research into climate change, i.e. they are concerned with making soil, rock or plants speak in the context of the Anthropocene in precisely researched, site-specific stories. They work with a variety of media and create interactive formats in the form of VR worlds, which they also refer to as 'platforms of 3D objects'. In their productions, they do not place humanity at the centre, but rather associations between human, non-human, virtual, material, conceptual and other actors. They use various digital programs, but also artistic tactics of wit, humour and absurdity.

The main questions I will explore are:

- how are designs of the human body and portraits aesthetically 'calculated' in their work in order to make response events (resonance) likely on the part of the audience?
- To which 'long' artistic tradition of addressing the audience, based on the use of anthropomorphic figures and an aesthetic of corporeality, can the specific 'relational' aesthetic of these works be connected?

Eurocentrism in Theories of Migrants' Labor Market Outcomes and the Deviant Case of Southward Migration – the Theoretical Blindness to the Coloniality of Power

The literature on migrants' labor market outcomes makes a false generalization: The literature almost exclusively examines and theorizes based on cases of what I call 'Northward migration.' Drawing mostly on data from the Global North, the literature finds that migrants experience lower labor market outcomes than receiving society members, and generalizes this as an outcome of migration 'as such.' I argue that 'Northward migration' is just one possible case of moving through global power relations, and the attempt to develop general migration theories from this single case has caused migration scholars to overlook the impact of global power relations on migrants' labor market outcomes. The opposite case, which I call 'Southward migration,' is theoretically highly informative, because Southward migrants have been documented to experience labor market privilege vis-à-vis receiving society members, receiving higher earnings and better job statuses for equal human capital. Drawing on a case study in Hong Kong that systematically compares the accounts of 64 Southward and Northward migrants, receiving society members, managers, entrepreneurs, and headhunters, I explain the mechanisms of how various axes of the coloniality of power impact the labor market outcomes of Southward migrants, constituting glass escalators for them, while creating barriers and obstacles for Northward migrants. I end with an urgent call that migration studies need to take into account the overlooked effects of Global Power relations.

The Importance of Autonomous Social Science Traditions in the Global South for Decolonization of Knowledge Production – a Manifesto

While in recent years, calls for decolonization of knowledge production have intensified, we argue that such calls have largely overlooked the vital importance of Autonomous Social Science Traditions (ASSTs) for decolonization and global epistemic justice. This essay is in the form of a manifesto on the steps scholars from the Global North can take in order to support the project of developing Autonomous Social Science Traditions in universities in the Global South. It begins with a short account of the ASST as an important approach in decolonizing academic practices. The world university rankings and academic performance metrics are then discussed as the contemporary context which affects the nature and operations of universities on a global scale. Finally, we outline possible steps to decolonize global academic practices and foster ASSTs in the Global South: (1) Dismantling University rankings and metrification, (2) Reading and citing Global South literature broadly, (3) Decolonizing teaching, (4) Decolonizing graduate student training, (5) Fostering hierarchy-free North-South collaborations, (6) Making co-produced knowledges accessible to communities in the Global South (6) Striving for Reparations and Redistributive Justice.

Socioemotional Skills, Secondary School Completion, and the Intersection of Social Background, Ethnicity, and Sex

Previous research has established the significant role of socioemotional skills in educational attainment. There is little agreement, however, about which socioemotional skills are relevant for promoting academic attainment among socioeconomically disadvantaged youth, especially when accounting for the intersection of social background with other social indicators, such as sex and ethnicity. Additionally, whereas most research has focused on higher education participation, evidence is scarce on the competencies that can support youth in gaining the key secondary education qualifications needed for entering further training and skilled occupations. Estimating linear probability models based on the nationally representative Longitudinal Study of Young People in England ($N=15,770$, female=49%, ethnic minority groups=33%), this

study assesses the role of education-related socioemotional skills (captured by educational expectations, academic self-concept, school engagement) in enabling socioeconomically disadvantaged youth (measured by parental education and social class) of different sex and ethnicity to complete secondary education, crucial for occupational progression in England. Results first show that being female, from a minority group, coming from a more privileged social background, having higher educational expectations, and greater school engagement, significantly and positively predicted individuals' probabilities of completing secondary education. However, among ethnic minority youth, students from less-educated families benefitted more from ambitious expectations than their peers from higher-educated families, regardless of sex. Among white youth, males from less-educated families benefitted more from positive self-concept than those from higher-educated families, while females from less-educated and lower-class families benefitted more than their more advantaged peers from both a more positive self-concept and higher expectations. These findings suggest that education-related socioemotional skills may serve as compensatory resources for less socioeconomically privileged students. However, distinct socioemotional skills might be especially important to support different subgroups of socioeconomically disadvantaged youth by sex and ethnicity in acquiring the crucial qualifications of secondary education.

SCHOONMAKER, SARA* (University of Redlands, USA)

Pandemic Neoliberalism and Struggles for Vaccine Equity

I analyze the development of what I call "pandemic neoliberalism," where neoliberals strive to regulate global public health through neoliberal institutions, particularly intellectual property law and the Trade-Related Aspects of Intellectual Property Rights Agreement (TRIPS) within the World Trade Organization (WTO). During the COVID-19 pandemic, pandemic neoliberals used the TRIPS Agreement to define vaccines and therapeutics as intellectual property. They employed the dominant form of intellectual property law involving patents on vaccines and therapeutics, which included a wide range of trade secrets and tacit knowledge owned and controlled by major pharmaceutical firms, states and other institutions in the global North. In order to challenge this regime, states in the global South advocated vaccine equity, seeking to develop local capacities to manufacture and distribute vaccines.

Pandemic neoliberalism developed through interconnected conflicts between the global North and South over intellectual property law. They arose in October 2020, when the Indian and South African WTO delegations requested the WTO to temporarily waive TRIPS restrictions on COVID-19 vaccines and therapeutics. WTO delegates from the global North opposed this request as an infringement on intellectual property. They delayed and ultimately restricted access to lifesaving vaccines and therapeutics.

Simultaneously, related struggles emerged over vaccine technology, production and distribution. Vaccine equity advocates at the World Health Organization (WHO) established an mRNA Technology Transfer Hub in South Africa to expand vaccine production in the global South, particularly Africa. The Hub posed an alternative to the dominant model of drug development under intellectual property law that relied on patents, exclusive licensing, and the profit motive.

I explore these two interconnected conflicts between pandemic neoliberals and vaccine equity advocates between 2020 and 2024. I evaluate prospects for "technological sovereignty" over vaccines, diagnostics and therapeutics. Such sovereignty involves local ownership or control over these technologies to prepare for future pandemics.

WG11-946.6

SCHUBERT, TINKA* (Universität der Bundeswehr München, Germany)

The Inexistent Collective Memory about the Soviet Mass Rapes and the Potential Intergenerational Consequences

At the end of WWII during the advance of the Red Army through the Eastern territories to Berlin and the occupation between 1945 and 1947 approx. 1.9 million women and girls have been raped in Germany and Eastern territories. The estimations do not include victims in the territories of today's Czech Republic, Slovakia, Hungary and Austria. Among the victims were not only German women, but Polish, Yugoslavian, Hungarian, Austrian Jewish women, and even Soviet women. Thus, the Soviet mass rapes is likely the largest attack against women that we so far know of in history and it is largely unknown by the general public and has not been claimed by feminist movements to be condemned or received justice. Moreover, speaking up about these mass rapes or denouncing them sparks controversy, especially among feminist scholars. While diverse feminist perspectives are crucial to improve the lives of all women, some of the considerations of the Soviet mass rapes use

arguments, perspectives and strategies that align with those who consider their privileges at stake. If we want to advance toward the common goal of ending VAW, we need to understand how the debates are played out and be aware of the effects they have. The paper analyzes the public debate about the Soviet mass rapes for the arguments, perspectives and strategies used by feminist scholars and society at large to provide insight on distinguishing a "feminist" critique that prevents us from advancing towards the goal of ending VAW from a constructive critique that helps feminist movements to progress. This is not only crucial to feminism but to society at large, as research on the intergenerational consequences of these mass rapes have evidenced that the silencing contributed to negative outcomes for victims as well as their children.

SCHUBERT, TINKA* (Universität der Bundeswehr München, Germany)

The Role of a Religious Coercive Discourse in Sexual Violence in the Protestant Church in Germany

Sexual violence is a longstanding scourge of society present in all social spheres. After a first study on the prevalence of sexual violence in the Catholic Church in Germany released in 2018, the pressure on a similar study of the Protestant Church has been strong. The Protestant Church in Germany, however, has a self-perception of a progressive institution in which sexuality is openly discussed and thus sexual violence is not as much of a problem as in the Catholic Church. The recent ForuM project on the reappraisal of sexual violence in the Protestant Church has shown however, that the problem of sexual violence in the Protestant Church in Germany is comparable to the Catholic Church. In this paper results of this ForuM project will be presented. Particularly, data from the subproject C "The perspective of survivors" has been analyzed drawing on 48 in-depth interviews with victims of sexual violence. Using the theoretical framework of the preventive socialization (Gomez, 2015) results show that while previous research on sexual violence has pointed to the existence of a coercive discourse that forces victims into sexual violence, the data presented here evidences the existence of a religious coercive discourse present in the Protestant Church in Germany. Data suggests that the religious coercive discourse reinforces a coercion into sexual violence leaving victims with feelings of guilt and blame for the violence they suffered. Potential opportunities to challenge this religious coercive discourse and provide support for survivors as well as potential prevention strategies are discussed.

SCHUENEMANN SCHUENEMANN, TYLER* (Keene State College, USA)

The Halting Movements for Disaster Socialism from Above and below: US Disaster Politics in the Twentieth and Twenty-First Centuries.

In spite of the considerable public attention and resources that recent natural disasters generate in the United States, these events rarely trigger the kinds of broader social, economic, or political change hoped for on the left. Instead, discussions of humanitarian relief, blame games, and culture wars dominate the public sphere until attention and concern moves elsewhere. When we do see grass-roots experiments to build alternative economic, cultural, and political institutions in the aftermath of disaster, they are often ignored. Moreover, these organizers find themselves in a dilemma: are their efforts to generate alternatives on the ground effectively building political power in support of a more democratic, ecologically sound responses to disaster? Or are they falling into a neoliberal trap of self-help, surrendering what claim to government support that they had under the administrative state? In this paper, I argue that this political inertia and the movements to overcome it are responses to an unfulfilled promise of America's administrative state. I provide an analysis of the evolving thinking and experimentation on display in response to major disasters in the twentieth and twenty-first centuries, starting with the Great Galveston Hurricane (1900) and ending with Hurricane Maria (2017). This record demonstrates how disasters have been sites of political reform in the past, generating an emerging social contract of environmental security from above. Today's political inertia is shaped by the perceived failure of that social contract. Any progress made toward a fairer, ecologically sound response to disasters in America will have to contend with that legacy and the public's waning trust in administrative authority.

Entreprises Et Développement Durable En Afrique

Cette présentation offre de nouvelles perspectives critiques sur les relations entre la responsabilité sociale des entreprises et le développement durable en Afrique. La mesure dans laquelle les initiatives de RSE contribuent au développement durable en Afrique reste un sujet très discuté. Cette présentation examine comment, quand et si les initiatives de RSE peuvent contribuer à la réalisation des objectifs de développement durable, à la paix et à la durabilité environnementale au niveau microéconomique de la société. Avec des sujets alignés sur les objectifs de développement durable (ODD) des Nations unies, la présentation fournit des conseils utiles aux décideurs politiques et aux chefs d'entreprise qui cherchent à mieux comprendre les forces et les limites de la RSE en tant que moyen de faire progresser le développement durable en Afrique.

Femmes Entrepreneures En Afrique De L'ouest: Présentation Du Livre: Women Entrepreneurs in West Africa in a Glocal World, Routledge 2025

This publication can be seen as one that focuses on women entrepreneurs in West Africa and their multiple and widely diversified roles that permit us to overcome the discourse on the poor African women working in the informal sector that characterised the academic literature for the last decades. Africa has changed and there are now female leaders emerging that realise important tasks described in the different countries of the empirical studies of this book. This book also shows that women play important roles in philanthropy and sustainability, fields that they are interested in and this more than men. Let us hope that this publication can be considered as useful for women entrepreneurs in West Africa and beyond, and for universities and business schools that educate the next generation of women entrepreneurs and their male counterparts who must accept the important role of women entrepreneurs on the African continent.

Constructing Masculinities in the Manosphere's Discourse on Prostitution

The changes in masculine subjectivation in late modernity and the crisis of neoliberal subject cultures can trigger authoritarian reactions. From a gender sociological perspective, the reference to traditional ideals of masculinity is particularly relevant in this context. The emergence of the so-called *Manosphere* can be considered as a manifestation of these developments. With reference to Connell's work on Hegemonic Masculinity we understand this as a defence of a masculine self-perception whose hegemony is perceived as being threatened.

Especially the engagement of the *Manosphere* with the topic of prostitution offers an often-unrealised potential to elaborate implicit masculine self-perceptions in digital communication. Therefore, we focus on how the interpretation of prostitution by actors in the *Manosphere* is accompanied by discourses of subjectivation. Our presentation addresses the gender images within the framework of a sociological discourse analysis of postings from a sex buyer online forum (*USA Sex Guide*) and a key forum of the so-called *Incel*s (*incel.is*). We identify central themes of gender-related understandings of subjects and further interpret them through a fine-grained sequential analysis.

In sex buyer forums, the entitlement to sex manifests especially through the commodification and objectification of women and demands for specific sexual practices, while in Incel forums, prostitution is portrayed as both a desperate last resort and a symbol of masculine failure, reflecting a broader frustration with unmet expectations of male entitlement. Despite surface-level differences, the underlying discourse of male entitlement connects incels and sex buyer forums, manifesting in different yet related ways. Our findings reveal how these online spaces contribute to a shared discourse around male entitlement, positioning sex as an assumed fundamental male right that reflects broader tensions surrounding masculinity in contemporary society.

SCHULZ, MARKUS S.* (FLACSO, Sede Académica de México, Mexico)

Between Extractivism and Green Transformation: Scenarios of Mexico's New Sexennium

What can be learned from a major oil-producing country's balancing the desires for the material wealth and lifestyles of the Global North with the goals of ecological sustainability and social justice? The recent election of a climate scientist to become Mexico's first female President was accompanied by high expectations that are now facing turbulent geopolitical dynamics. This study examines competing scenarios of the new sexennium and the drivers behind them in order to address broader questions about the political leverage for transitioning from extractivism to sustainability. Critical observers ask to what extent the new administration is bound to continue the deeply entrenched support for a carbon economy and prioritization of military collaboration over human rights. Other policy analysts point to a congressional supermajority that allows more progressive politics and a green transformation. What alternative visions do political parties, corporate lobbies, and civil society actors articulate? What specific roles do social movements, including indigenous communities, environmental activists, and academic researchers take? How do different social forces contest the future pathways, and what factors shape their efficacy? How are solidarities conceptualized, enacted, and mobilized to advance social justice within the political, economic, and cultural transformations? What lessons can be drawn from the Mexican case that is relevant for other countries and regions and the broader struggle for socially and ecologically sustainable futures?

RC22-339.2

SCHULZ MEINEN, HAIMO* (Leibniz University of Hannover, Germany)

Finally Drop the Term 'religion'!

In an attempt to enhance the critical sociologies of religion this is another call to drop the keyword 'religion' in academic procedures. We, as scholars of the (critical) sociology of religion, can and should proceed without using this outworn and misleading term. Firstly, for forty years authors have contributed to a growing body of scholarly literature that has questioned the use of the term "religion". Secondly, talking without considering consequences contributes to the ongoing wrongdoing, year after year irresponsibly producing damages and victims. Third, as the newly exploded war zone in the Near East has shown, religion still serves particularly right wing extremists on all sides to camouflage their nude territorialist claims, and sometimes, their genocidal agenda. In the traditional and as well actual form the term religion serves them to mobilize supporters for their false claims.

Mitsutoshi Horii (2015): „The notion of 'religion' is utilized, with norms and imperatives, within particular historical, ideological, and cultural settings. In other words, any form of boundary making between religion and the non-religion secular serves specific norms and imperatives. The religious-secular dichotomy is not ideologically neutral. Thus, this dichotomy itself should be a subject of critical investigation.“ (Horii 2015:32) Dubuisson hints (Dubuisson 2016: 27) for representative works of authors arguing, „that [religion] doesn't exist ...“, to „Asad 1993; King 1999, Fitzgerald 2000; McCutcheon 1997; 2001; 2003; Arnal and McCutcheon 2013; Masuzawa 2005; Smith 1982; 1987; 1993; 2004; Chidester 1996; Lincoln 2012; Balagangadhara 1994; Wiebe 1991; Bloch 2005; Hughes 2012; Dubuisson 2004 [1998]“.

Beyond the term 'religion', Richard King has reminded: „Increasingly contemporary scholars of religion, influenced by feminist, poststructuralist, postcolonial and queer theories, have sought to denaturalize the established categories of scholarly analysis – those terms and approaches that have been mostly taken for granted by an earlier generation.“ (King 2013:139)

RC24-JS-161.1

SCHUMACHER, JULIANE* (Humboldt-Universität zu Berlin, Germany)

Imaginaries and Politics of Green New Deals

In 2019 the idea of a Green New Deal (GND) emerged as a framework aiming at combatting both the climate crisis and the crisis of social justice (Aronoff, Battistoni, & Cohen, 2019; Klein, 2019; Pettifor, 2019). The GND became prominent when the initial campaign by youth social movements became a prominent topic in the US electoral campaign. While some critics have argued that the GNDs follow technocratic, (post)colonial and extractivist schemes (Ajl, 2018; Kolinjivadi & Kothari, 2020), proposals for similar programs were brought forward by a wide range of actors in many countries worldwide, on different scales (The Pact for a Green New Deal 2019; GNDE

2019), and addressing, among others, racial, Indigenous, and gender injustices (Coleman, 2019; Feminist Green New Deal, 2019; Red Nation, 2019). They were supported by "arts of the Green New Deal" inspired by this 'positive' vision of the future, in design, film, poetry, and fiction.

In this contribution I am tracing the emergence of and the debates around the GND, asking if and how the imaginaries and narratives of a Green New Deal supported political practices and actions. How did the idea of a GND travel through different political and societal arenas, which questions did the different proposals address, how and by which actors were they taken up, negotiated and appropriated? How did different groups of actors – p.e. movements, politicians, scientists or artists – cooperate and negotiate the different versions of a GND? And finally: What were the trajectories and outcomes of the proposal in different places like the US, the EU, South Korea and South Africa, which concrete effects did the vision of a GND have (or have not)?

The Revival of Voluntary Carbon Markets in the Anthropocene

Voluntary carbon markets, such as frameworks like REDD+, have played a central and controversial role in global climate policy since the 1990s. Within the framework of neoclassical environmental economics, such approaches are viewed as efficient tools for internalizing external environmental costs. Critics, however, argue that they fail to provide genuine incentives for emissions reduction, overlook issues of justice and often serve as vehicles for greenwashing. Studies have shown that especially offset schemes are prone to fraud and often do not reduce emissions as planned, calling into question the validity and credibility of such programs. Despite this long-standing criticism, the concept of carbon markets remains pervasive as evidenced by recent development such as the introduction of the EU's Carbon Removal and Carbon Farming Framework which aims to establish soil carbon markets within the EU.

This paper seeks to examine the politics of behind voluntary carbon markets in forestry and agriculture. Drawing on recent academic debates and empirical research on soil carbon markets and forest-based offsetting schemes, we analyze the changing landscape of voluntary carbon markets. What makes the idea of voluntary carbon markets so compelling and enduring? How have they evolved over time, how have they been adapted in response to criticism? And how do they relate to shifting form of the governance and commodification of nature?

Drawing on critical theories of the capitalist valorization of nature, we argue that the compelling nature of these markets arises from the ideology of ecological modernization, in which green growth and ecological sustainability are seen as compatible and easily measurable. We further argue that the potential flaws and failures of these markets are legitimized by invoking new digital precision technologies as solutions to the challenges of carbon markets, with the promise to ultimately making them an effective solution to the climate crisis.

SHERMAN, JENNIFER (Washington State University, USA)

The Bare Minimum: Effects of Legal Deserts on Pretrial Jail Detention

Legal deserts literature, often applied to the civil realm, is also important to understanding inequalities in criminal legal system outcomes. One issue garnering recent attention is the lack of lawyers, especially criminal defense lawyers and other legal resources, particularly in rural jurisdictions. This place-based gap in access to justice intersects with broader concerns among criminologists and rural legal scholars about increasing rural jail populations, which contrast with declining urban jail and overall prison populations. Most of those detained in local jails in the US are pretrial. Our previous research in rural Washington State found that many were jailed for court nonappearance and other minor offenses, which greater access to legal, pretrial, and social services could help mitigate.

We take a mixed methods approach to study whether and how limited legal resources contribute to frequent jail admissions and lengthy pretrial jail stays. First, we examine the quantitative relationship between availability of criminal-legal resources and jail admissions, as well as length of pretrial detainment,

across rural and urban counties in Washington State. Specifically, we assess whether fewer lawyers per capita, lesser spending on public defense, lack of an office of public defense, and criminal court backlogs are related to county jail admissions and lengthier pretrial jail stays, net controls. Next, we draw on qualitative interviews with 71 individuals who spent time in one or more of the six rural jails in our study. Their experiences further illustrate the ways in which the lack of legal resources worsened and prolonged jail stays and undermined individuals' abilities to recover quickly from arrests. Our findings suggest that broadening access to legal resources in rural areas might reduce incarceration, yet legal resources alone would be insufficient. Our results highlight the need for additional social services that are responsive to the rural context.

Living through the 'Pact of Silence': Political Violence in Biographies of Iaioflautas Activists in Spain

In the social sciences, Spain's *transición* had for decades been considered an ideal and relatively non-violent transition from a dictatorship to a democracy. However, this assessment has rarely taken into account that democratization and socio-economic mobility came in exchange for the *pacto del silencio* (pact of silence), i.e., the taboo to address the violence of the civil war and the dictatorship in the political arena. In 2011, the *transición* narrative was put into question by the *indignados* movement, started by younger activists who, under the slogan *¡Democracia real ya!* (Real democracy now!), protested against the continuous precarization of the young generation and the austerity politics in the wake of the financial crisis. Some months into their protests, they received support from a 'grandparents' movement': The *iaioflautas*, older *indignados* activists, who define themselves as 'the generation that fought and achieved a better future for our sons and daughters'. The movement brings together very experienced leftists, some of whom had already organized clandestine resistance under Franco, with newcomers who had never been politically active before. In recent years, *iaioflautas* have regularly been at the frontline of protests and civic disobedience, marked by their characteristic yellow vests. Their biographical experience is an important resource that endows them with a certain authority as historical witnesses, when they testify to the rescinding of *transición*'s underlying social pact, as well as when they point to post-franquist continuities in Spain's democracy.

Based on campaign material and participant observation, this paper first contextualizes the movement and discusses the strategic advantages of a framing strategy based on seniority in the post-Franquist public sphere. On this basis, it looks at life stories with *iaioflautas* activists and reconstructs the effects of political violence on their biographies and their biographical work.

SCHWARZ, CHRISTOPH* (University of Innsbruck, Austria)

Political Socialization in South West Asia and North Africa. Observations through a Research Gap.

Before the 'Arab Spring', young people in Southwest Asia – North Africa (SWANA) were hardly taken into account as political subjects by the international public. Either they were assumed to be politically disinterested or they were discussed as a jihadist security risk. With the revolutions, uprisings and protests of 2011, the political agency of an 'awakening youth' suddenly seemed obvious, and even inspired other protest movements around the world. However, despite a plethora of publications on the 'Arab Spring' since 2011, as well as on the ongoing authoritarian backlash and civil wars, there has hardly been a discussion on the political socialization of the young in SWANA (Schwarz 2024). One reason might be that the research field itself has been in a crisis for decades (Haegel 2021); what is more, most of political socialization research has focused on the Global North and the key theoretical tenets and discussion seem to offer little for research on other regions of the world.

Against this backdrop, this paper recapitulates key discourses on youth, politics and citizenship in the region since the turn of the millennium and discusses their relevancy for political socialization in SWANA. Subsequently, based on the data set of the MENA Youth Study by the Friedrich-Ebert-Stiftung, biographical-narrative interviews with activists in Morocco, and working hypotheses developed within the ERC project LIVE-AR, current agents, spaces, and temporal dynamics of political socialization of young people under authoritarian rule are discussed and put in relation to results of youth research in countries of the Global North. One focus is on young people's understanding of 'politics' in SWANA, in particular on supposedly apolitical everyday practices that can be understood as struggles for participation under conditions of an ongoing crisis of citizenship (Meijer/Butenschön 2017), the outcome of which is anything but predetermined.

SCHWEITZER, REINHARD* (Universitat Abat Oliba CEU, Spain)

Ancestral Citizenship As Restitution, or Selective Immigration Policy?

Like several other EU Member States, Austria and Spain have recently extended privileged pathways to external citizenship for descendants of the many people who had fled persecution under previous totalitarian regimes. Ancestral citizenship not only offers mobility and other key rights and opportunities for individual beneficiaries (as well as their children) but also fulfils a range of purposes for the nation-state that grants it, including intergenerational continuity and territorial or at least symbolic inclusion of people with familial ties to that particular state. This can be part of a necessarily complex and long-term process through which modern nation-states (and their populations) are trying to come to terms with their uncomfortable past. But it can also be seen as a tool for managing the future composition of a country's population and thus function as an ethnically selective complement or even substitute for immigration policy. Based on a comparative analysis of legal documents, media coverage, and political debates around these two reforms and their ongoing implementation, this paper highlights the similarities and key differences between the Austrian and Spanish cases, questions some of the underlying interests, intentions, and official justifications, and thereby helps to explain how and why these reforms have come about. This analysis constitutes the first step of a multi-annual research project funded by the Spanish Ministry of Science that aims to contribute to a better understanding of, and more informed public and political debates about, the role of ancestral citizenship in and for contemporary Europe.

SCHWITTEK, JESSICA* (University of Duisburg-Essen, Germany)

Young People As Addressees of Vietnamese Migrant Organisations in Germany

Migrant self-organisations (MSOs) are highly relevant players in the education and training system and are increasingly recognized as such. While they were viewed rather critically in the past and their role in the social integration process was questioned (Hunger/Metzger 2011), they are now increasingly being supported, particularly regarding their activities offered to children and young people from migrant families, for example in the areas of cultural, linguistic or religious education (SVR 2020). The activities have a broad spectrum of local, national and transnational focuses. Nevertheless, there has been little research to date on how MSOs address young people, to what extent MSOs can also be understood as socialization spaces for children and youths, and how they differ from "classic" socialization instances (such as family, school and peer-groups). The presented study addresses this research gap and turns to the example of Vietnamese MSOs in Germany, as a community that is considered community-oriented (Nauck et al., 2017) and is characterized by a high degree of formalization (e.g. in the form of registered associations) (Schaland/Schmiz, 2016). On the basis of natural data (websites, brochures, flyers or event documentation published by associations), it is worked out how and with which offers Vietnamese MSOs address children and young people, and to what extent they present themselves as relevant spaces for the (trans-/national) socialization of young people.

SCHWITTER, NICOLE* (University of Mannheim, Germany)

Assessing Ambiguous Crime Scenarios

Discrimination and prejudice on the basis of ethnic background is a persistent phenomenon in Western societies across different domains and devaluations of ethnic minorities have particular consequences within the legal justice system (e.g. police brutality against black men in the US). Real-life criminal situations often exhibit some ambiguity and decisions in these situations need to be made rapidly; following dual process theory, it could be expected that these decisions are thus more racially biased than if actors were able to take their time.

This presentation will present an empirical application in the form of an experimental visual vignette study (for which data will be collected in March 2025 through the German Internet Panel). Participants in this study will be shown an AI-generated image that depicts an ambiguous situation that could potentially involve criminal activity. The ethnicity and age of the person shown will be systematically varied and participants will be encouraged to respond to the image and rate the offender's level of suspiciousness and deviance either spontaneously, while being pressured with a countdown, or thoughtfully, after having written a description of the image. The experimental setup will

allow to test whether participants' responses to the images are more racially biased and stereotype-driven when respondents are encouraged to answer spontaneously (and taking into account potential non-compliance). The study thus aims to shed light on how cognitive processes involved in decision-making under time pressure might contribute to racial biases and to highlight how AI technologies can be used to provide respondents with a controlled but engaging stimulus.

SCHWOERER, LILI* (Oxford Brookes University, United Kingdom)

Positioning Fugitive Feminist Knowledge Production As Resistance in English Universities

Gender and feminist studies in England experiences unprecedentedly strong regulation and interference by state actors. Humanities and social sciences are increasingly required to prove their 'value for money', while debates about gender and feminist studies' relationship to free speech animate emotive responses across policymaking, public life and university governance. Feminist factions join right-wing political actors in challenging the field's central categories. It thus might seem straightforward to defend the field from perceived attacks by highlighting its inclusivity and pedagogical value.

However, such responses can preclude an engagement with the complex ways in which feminist and gender studies is entangled with the ideologies and narratives that motivate this current contestation. Drawing on interviews with 34 academics interested in feminist and gender scholarship at four case study universities in England conducted in 2018-19, my paper begins to explore these entanglements. I draw on scholarship on academic racial capitalism (Gerrard, 2022) and on the epistemic and material violences of a neoliberal politics of recognition (Fergusson, 2012; Hong, 2015; Melamed, 2011) to conceptualise the 'paradoxical' (Pereira, 2017) relationship between English universities and feminist academics. I argue that marketised universities are governed by a logic which combines a selective inclusion of difference with the disavowal of ongoing racialised and gendered violences. Thinking through the lens of fugitivity (Harney and Moten, 2013) allows us to recognise the resistant potential of feminist knowledge that does not seek to defend its existence within universities but aims instead to escape them.

Racializing the Urban-Rural Divide: A Critical Examination of Whiteness, Migration, and Spatial Imaginaries in Belgium.

Several studies in Whiteness literature have showed how the rural-urban divide becomes racialized in Western European countries. In countries like France, Germany, and the UK, rural areas are often racialized as spaces of White populations, while cities are seen as spaces of racial diversity due to migration. However, in Belgium, urbanization has blurred the traditional rural-urban divide, particularly as suburbanization expands the reach of major cities like Antwerp, Ghent and Brussels. Yet, narratives in public discourses about a growing divide between 'cosmopolitan cities' and 'nationalist countryside' reproduce this imagined rural-urban divide, where residents of urban areas are portrayed as holding more progressive views on migration and multiculturalism than in rural areas. This raises questions about what racialized spatial imaginaries residents of Belgian urban and suburban areas hold of the rural-urban divide as well as to what extent these spatial imaginaries are linked to narratives of the 'cosmopolitan city' and the 'nationalist countryside'. Drawing on 80 in-depth interviews with residents of (what are considered) urban and rural areas, our research extends literatures on the racialization of the urban-rural divide by centering spatial imaginaries that highlight the complex intersection of race, space and narratives in public discourse. We find that the rural is often imagined as a nationalistic and racially homogeneous, predominantly White space, that is historically insulated from exogenous changes like migration – whilst demographically these areas are becoming increasingly diverse. In contrast, cities are frequently perceived as cosmopolitan, multicultural and non-White spaces, despite the presence of White communities. We argue that, by (re)producing the narrative of the 'cosmopolitan' and 'nationalist' divide, residents in both cities and rural areas racialize the urban as an imagined multicultural space—and therefore as non-White—and the rural as homogeneously White.

Emotions and Transglobalization

This paper attempts to systematise the prevalent emotions whose recurrence is associated with the Anthropocene in the context of trans-globalization. To achieve this objective, the following line of argument is elaborated: a) what is meant by emotions, emotional ecologies and politics of sensibilities is defined, b) the theoretical tensions between the Anthropocene, Capitalocene and trans-globalization are synthesised, c) the emotional ecologies that appear associated with the ecological crisis are identified from empirical research, d) some politics of sensibilities are systematised and e) an agenda for the Humanities is discussed as life sciences that can make the process described from the critical sociology of bodies/emotions. It concludes by advocating the construction of a sociology of bodies/emotions that makes analysis the states of environmental scarcity and the sensations of dispossession associated with them critical within the framework of catastrophic capitalism.

Different Modes of Risk-Taking? – How Unemployment Benefit Recipients Claim Agency in Conflict

Unemployment benefit recipients are in a difficult social position navigating stigmatization (e.g. Jürss 2024) and trying to exercise agency thus act autonomously. Living with benefits comes with several restriction to their action as the framework of activation characterizes certain action as desirable and sanctions others (Löwe & Unger 2022: 2). This framework is applied by street level bureaucrats, who need to interpret sometimes abstract rules. Here, social conflict arises and concerning the recipients the role of risk-taking (Zinn 2024) comes into play when interacting with institutional counterparts as there is a overall well-known imbalance of power in place. Drawing upon interview data from a research project around unemployment benefit recipients [1], my presentation will focus on reconstructing how the interviewees try to maintain or exercise agency (e.g. Lister 2023) in situations of conflict (thus taking risks) with welfare institutions especially street level bureaucrats. The goal is to explore different paths of action and reconstruct how the recipients risk-taking is rooted in their biographical experiences. They tend to either engage in confrontation (1), withdraw themselves out of the welfare relationship (2) or try to adapt thus maintaining agency (3). With Zinn's distinction of dimension of risk taking, in most cases these pathways fall under *risk-taking as a means to an end* (Zinn 2024: 371f) and are used to claim or at least maintain agency as other choices to act are rather limited. Finally, taking this theoretical lens might help understand how unemployment benefits limit personal agency and to what degree welfare subjects (Wright 2016) tend to take risks to counter their perceived powerlessness.

Financial Strategies And Growth Of Meta Religious Organizations; Case Of The Roman Catholic Church In Cameroon

Our research focuses on the diversity and dynamism of the Catholic religious Meta organization in a sub-Saharan African country: Cameroon. The article focuses in particular on the specificities of the financial and growth strategies of religious meta-organizations. The Catholic Church can be conceived as a Meta Meta organization, in that the organizations composing it, which are the national episcopal conferences, are themselves members of the regional episcopal conferences which are Meta organizations, which are also members of continental episcopal conferences which are still Meta organizations, which are finally members of the Roman Curia which is the institution governing the Meta Meta organization. This meta-meta-organization has a theocratic character. The Roman Curia influences the management of the national Meta organizations and there are internal sanction mechanisms for individuals administering the regional or local national Meta organizations. The Catholic Meta Meta organization is certainly externally legally responsible but only individually (by the individuals who compose it) reprehensible. The growth dynamic is both internal through the creation of new religious institutes and external through the creation of new dioceses. The main indicator of growth of the Catholic Church is not financial or economic performance, but the number of converts and new establishments. The financial strategy is an

associative financial strategy aiming at financial balance based essentially on collection and hoarding for operation. Financing is done essentially by self-financing, which corresponds to the growth phase of creation; either by a local collection from the faithful, or by internal financing specific to the Church, through ecclesiastical financing channels. This work promises contributions to the analysis of meta-organizations on the one hand but also to the managerialization of the Church on the other hand.

An Ecocritical Exploration of Ecological Myths in Animation: Unveiling Imaginaries of Modernity and Climate Change through Suzume, Princess Mononoke, Nausicaä, and Weathering with You

As we navigate the intricate landscape of shifting perspectives on climate and ecological concerns, the narratives woven around climate change and its repercussions form an integral part of contemporary imaginaries of the future. Particularly, Japanese animation, or anime, with its diverse cultural narratives, offers a distinctive lens through which viewers can delve into various depictions of climate change and its societal consequences can inspire radical imaginaries. This presentation delves into specific anime works—Suzume, Princess Mononoke, Nausicaä, and Weathering With You—with the aim of unravelling the intricate tapestry of themes, characters, and visuals embedded within these narratives and focusses on them as part of a 'war machine'. Our presentation interprets animation as a mode of contemporary storytelling that explores potential future scenarios. By analysing these animated works, we intend to delve into the global challenges posed by climate change and establish connections between the dystopian worlds portrayed in the selected anime and real-world climate-related issues. This approach fosters a profound comprehension of the urgency for sustainable practices. Utilising qualitative analysis, we will focus on narrative elements and symbolic representations of climate change.

Clinical Sociology in Practice

Clinical sociology, a dynamic subfield within sociology, offers practitioners a unique lens through which to apply sociological theories and methodologies to real-world problems. This paper explores the dual role of clinical sociologists both within academic settings and in broader societal contexts. Inside the academy, clinical sociologists contribute to the development of applied sociological knowledge, teaching, and research, while also engaging in the critical analysis of social structures and their impacts on individual and group behaviour. Beyond the academic realm, clinical sociologists are actively involved in addressing social issues, working with communities, organizations, and institutions to diagnose and solve social problems. The paper highlights the interdisciplinary nature of clinical sociology, examining how practitioners integrate insights from psychology, social work, and public health to create holistic approaches to societal challenges. Through case studies and interviews, the paper illustrates the diverse roles that clinical sociologists play as consultants, therapists, policy advisors, and community activists. Furthermore, it addresses the challenges faced by clinical sociologists in maintaining a balance between their academic responsibilities and their commitment to social change. The paper concludes with a discussion on the future of clinical sociology, emphasizing the need for continued collaboration between academia and practice to enhance the field's impact on society.

SEEDAT-KHAN, MARIAM* (University of KwaZulu Natal, South Africa)

Post Pandemic Gendered Burnout

The COVID-19 pandemic has exacerbated existing gender inequalities, leading to a significant increase in burnout among women. This paper explores the concept of "gendered burnout" in the post-pandemic context, analysing how the pandemic's unique challenges have disproportionately impacted women across various sectors. The paper investigates the intersection of work, caregiving responsibilities, and social expectations, highlighting how the convergence of these roles during the pandemic has intensified emotional, physical, and mental exhaustion for women. Drawing on recent studies and gender-focused surveys, the paper examines the heightened burnout experienced by women in essential roles, such as healthcare workers, educators, and caregivers, as well as those in precarious employment situations. It also explores the increased burden of unpaid domestic labour and childcare that has fallen largely on women during lockdowns and remote work scenarios, contributing to their burnout. The paper delves into the psychological impacts of gendered burnout, including higher rates of anxiety, depression, and stress-related health issues among women. In addition, this study evaluates coping mechanisms and support systems that have been effective in mitigating gendered burnout, including organizational policies, community support networks, and mental health resources tailored specifically for women. The paper advocates for a gender-sensitive approach to workplace policies and mental health interventions to address the root causes of burnout and promote recovery for women in the post-pandemic era. It concludes with recommendations for future research and policy development, emphasizing the need for systemic change to prevent the persistence of gendered burnout in a post-pandemic world.

SEEGERS, MARCO* (Federal Institute for Vocational Education and Training (BIBB), Germany)
EHLERT, MARTIN (Berlin Social Science Center (WZB), Germany)

Can Continuing Vocational Training Help to Close the Gender Pay Gap?

The question of whether men and women receive unequal financial returns from continuing vocational training (CVT) has the potential to provide an impetus for tackling the gender pay gap. Since the 2020s, women in Germany have tended to participate more than men in non-formal CVT, i.e. flexible and often course-based learning activities. This raises hopes that the gender pay gap can be tackled by increasing women's participation. However, the value of CVT is measured less by quantity than by the opportunities it offers for career development. Whether participation in CVT can reduce the gender pay gap depends first and foremost on whether there is a corresponding financial return. Looking at the current state of research, there are few (international) studies on the gendered returns to CVT, both internationally and in Germany. Theoretically, based on the Relational Inequality Theory (Tomaskovic-Devey & Avent-Holt 2019), participation in CVT can be seen as an impetus for the (re)allocation of financial resources in the company. We argue that women are less likely to successfully claim these resources (Lükemann/Abendroth 2024) and that this is mainly due to the gender-typing of CVT programmes, as women are less likely to experience career progression due to the type of training (Evertsson 2004). We use German longitudinal data from the adult cohort of the National Educational Panel Study (NEPS Network 2022) to estimate fixed effects regression models. Our analyses address the question of whether men and women receive different financial returns to participation, differentiated by the varying forms and contents of non-formal CVT (e.g. on-the-job vs. off-the-job). The results can shed light on whether unequal returns to CVT reproduce the gender pay gap in Germany, and under what conditions CVT can be a countermeasure against the gender pay gap.

Building Flood Resilience through a Citizen-Centered Risk Communication: Flood and Climate Change Perception in Italy

We are currently facing a climate change-induced increase in extreme rainfall events, which amplify the intensity and probability of floods across Europe (IPCC, 2022). An example of such events took place in the Emilia Romagna region, in Northeast Italy. Just after 2022's Po River drought, the worst in two

centuries (Montanari, 2022), since 2023 the region faced two large-scale floods (2-17 May 2023, 18-19 September 2024), resulting in significant economic damage, thousands of displaced residents, and 17 deaths.

As shown in the aftermath of these events, community vulnerability stems not only from a disaster's unpredictability but also from how people and institutions respond, often intensifying social and political impacts (Burns & Slovick, 2012). This makes risk communication crucial for building resilience, requiring a deeper understanding of citizens' perceptions of flood risk and climate change to address information gaps and strengthen response capacity (Rollason et al., 2018; Jongman, 2018).

Our paper will present findings from a survey conducted within the "Risk Communication and Engagement for Societal Resilience" project, funded by the Italian Ministry of University and Research through PNRR resources. The survey explores Italians' perception of flood risk under different dimensions, including climate change awareness. It employs both CATI (Computer-Assisted Telephone Interviewing) and CAWI (Computer-Assisted Web Interviewing) techniques, sampling 2,500 respondents representative of the Italian population aged 15 and older, based on gender, age group, educational level, and province of residence. The survey will be conducted in two waves, the first is currently underway (October 2024), and the second will be carried out in April 2025.

The survey results will inform a public consultation with 100 Italian citizens, focus groups and interviews with stakeholders to further explore flood risk perceptions and develop new risk communication guidelines tailored to citizens' needs.

Questioning Participation: Reflexivity, Silence, and the Limits of Knowledge Production in Research with Children

Participation is often heralded as a key tenet in the 'New Sociology of Childhood'. Increasing recognition of children's right to participate has been welcomed by childhood studies (Powell & Smith, 2009). Article 12 of the UN Convention on the Rights of the Child provides the legal backing for this right. However, there are authors like Spyros Spyrou or Nick Lee, who question the limits of participation to "problematize the scientific production of knowledge" (Spyrou, 2018, p. 178).

This paper critically examines ethical challenges in qualitative research with children, focusing on the limits of participation and complexities of knowledge production. It discusses the risks of coercion in human and non-human interactions and the implicit power dynamics within the research process. This raises key questions: *What if children choose silence or disengagement? Are researchers unintentionally compelling children to fit adult-centric research paradigms?*

This leads us to interrogate the role of adult researchers in shaping knowledge production. We explore how adult frameworks and methods shape—and may distort—children's insights. Drawing from poststructuralist and postmodern critiques, we refer to authors like Donna Haraway and Veronica Pacini-Ketchabaw who push for more reflexive approaches that address these asymmetries. Also, we introduce Karen Barad's theory of diffraction to explore limits in relying solely on reflexivity. Reflexivity allows us to critically examine our positionality, but diffraction encourages engaging with contradictions and tensions in research. *How do these "diffracted" perspectives reveal the ways adult methods influence children's participation?*

This paper opens a space for dialogue. Rather than offering definitive answers, we invite researchers to rethink participation and knowledge production, acknowledging power asymmetries while embracing the uncertainties of qualitative research with children.

Policy Ideas, Capacity, and Inequalities during Crisis: Flood-Risk Management in Brazil' Subnational Context

Recent studies have focused on understanding the factors that shape governmental responses to crises, including actors' ideas and framing strategies for avoiding blame and obtaining credit and political support, the robustness in policy design and capacities, and governance capacity and legitimacy. We analyzed how the understanding and definition of crises evolve over time and changes related to the production, circulation, and usage of data, decision-making, and governance and policy capacity through a historical and multilevel analysis.

We explored flood-related crises, a growing relevant topic for Brazil. The combination of rapid and unplanned urban growth of Brazilian cities in the last decades and climate change has affected the dynamics of water flows in the country, and flood-related disasters are becoming more frequent and intense. We analyzed the case of the states of Acre, São Paulo, and Rio Grande do Sul, which experienced multiple crises connected to recurrent and intense fluvial floods in the last decades that disproportionately affect the most vulnerable population. This is an exploratory, qualitative, and historical study of previously conducted research, official documents, and the content of semi-structured interviews with state and municipal managers.

The analysis shows that the three states varied greatly. In Acre, the strengthening of national coordination in a different policy (water resources) triggered the development of administrative and infrastructural capacities at the state level in the environment policy, reshaping the understanding of flood-related crises among policymakers and allowing the development of policy capacities. In the other two states, the state did not develop a coordinator role, and fragmented and uncoordinated actions prevailed. The analysis of the three states show that they varied in how power is distributed among different actors at the state level.

"the Bigger Picture Beyond the Pump": Engaging Farmer's in Collaborative Groundwater Management in California

In response to the limitations of the "open-access" groundwater management regime, exacerbated by climate change, many countries are shifting towards a regulated access paradigm (Rouillard et al., 2021). This new governance approach ranges from "state-centered" to "collaborative management" or "comanagement" (Molle, Closas, 2020), where farmers must now cooperate with stakeholders representing diverse interests (drinking water supply, protection of groundwater-dependent ecosystems, etc.). In California, the *Sustainable Groundwater Management Act* of 2014 embodies this shift, with the creation of *Groundwater Sustainability Agencies*, responsible for developing sustainable management plans that engage a wide variety of stakeholders.

Based on a qualitative survey (~50 interviews) conducted in two groundwater basins in California, we examine how this new governance effectively involves farmers in the development of communities of interest and collective action for sustainable groundwater management. Our analysis focuses on two key aspects:

- First, we evaluate the social learning outcomes of the participatory process, examining how this experience contributes to foster a shared understanding of an invisible and complex resource, deeply intertwined with socio-economic and political dimensions. Specifically, we investigate how the process facilitated the co-construction of a common vision regarding groundwater dynamics, the interdependencies between groundwater and surface water, and the relationships among various water users - capturing the "bigger picture beyond the pump". Additionally, we examine how this collaborative effort was able to build new forms of cooperation, grounded in mutual recognition of legitimacy, and the creation of shared values.
- Second, we explore how this process challenges collectives and communities of interest within the farming community itself. Participation reshapes relationships among farmers - between large and small farms, and farmers with different practices and environmental sensitivities. It redefines collective action, reinforcing or creating coalitions of interests, and elaborating new strategies to protect farmer's "water rights", in the face of evolving political dynamics.

Estudio Exploratorio Sobre Las Emociones Generadas Por Instagram En Adolescentes

Esta comunicación explora las reacciones emocionales de adaptación en una muestra de población universitaria adolescente (máximo 19) ante las emociones que desarrollan ante la red social de Instagram, el presente estudio explora en 105 alumnos universitarios, sus emociones ante esta red social, sus respuestas emocionales habituales. Se utilizan los estudios de emoción positiva y negativa expuestos por Averil (1980) y Fredrickson (1998,2000) y se plasman en un cuestionario.

Se pretendió explorar estas emociones para determinar las consecuencias, que esta red social, podría suponer en fenómenos posteriores relacionados con su desarrollo vital. Los resultados exploratorios indicaron algunas emociones positivas útiles y sirvió para identificar sobre todo aquellas emociones negativas que pueden representar más adelante una amenaza, creando una imagen de los estados emocionales presentes en esta transición de la adolescencia a la adultez.

Estrategias y Desafíos En La Movilidad Social: Un Estudio Comparativo De Andalucía y Cataluña

El texto aborda un análisis sobre la movilidad social y estratificación en base a los antecedentes sociales, la educación y los destinos socioeconómicos. Estudia cómo diversos factores, como clase social, género, origen inmigrante, raza y edad, influyen en el mercado laboral.

El estudio usa una metodología mixta, con una fase cuantitativa basada en la Encuesta de Condiciones de Vida de 2019. Se identifican cinco estratos sociales y una fase cualitativa con entrevistas biográficas a 50 personas de Andalucía y Cataluña, destacando factores que favorecen o limitan la movilidad inter e intrageneracional.

Como principales resultados, encontramos que los factores positivos para la movilidad ascendente se encuentra el logro educativo universitario, la conciliación trabajo-familia y el apoyo de la familia extendida. Además, las experiencias universitarias y el capital social también son determinantes clave.

En cambio, la movilidad descendente se asocia con ocupaciones manuales y trayectorias laborales inestables, además de barreras como la falta de educación, los roles tradicionales de género, el cuidado de dependientes y enfermedades. Las mujeres, en particular, enfrentan desigualdades de género que limitan sus oportunidades laborales y educativas, mientras que las expectativas familiares influyen en sus decisiones de vida. Los eventos vitales como enfermedades, fracasos escolares o rupturas familiares generan puntos de inflexión que pueden cambiar el curso de las trayectorias personales, impactando tanto positivamente como negativamente en la movilidad.

SEGURA-CARRILLO, CRISTIAN* (Universidad Autónoma de Barcelona, Spain)

La Influencia De La Movilidad Intrageneracional y La Educación En La Movilidad Intergeneracional: Un Enfoque Territorial y De Género

El texto explora la movilidad social en España, destacando la importancia del origen social, la educación y la movilidad intrageneracional en la configuración de la movilidad intergeneracional. La movilidad social es un tema clave en sociología, ya que permite comprender las desigualdades y cómo se distribuyen entre generaciones. La educación es presentada como un factor crucial que actúa como puente entre el origen y el destino social. A su vez, el género influye de manera significativa en la configuración de las oportunidades de movilidad, con las mujeres mostrando patrones distintos a los hombres en cuanto a su progreso social.

El análisis se basa en los datos de la Encuesta Social General de España (ESGE) y utiliza la categoría ocupacional en tres momentos clave: origen social,

primer empleo y empleo actual. Además, incluye una perspectiva de género y un análisis territorial que diferencia entre Andalucía, Cataluña y el resto de España. Se encuentra que los hombres tienen mayor movilidad ocupacional ascendente, especialmente en Cataluña, mientras que las mujeres muestran una mayor movilidad educativa, especialmente en Andalucía.

Los resultados muestran que la edad de ingreso al mercado laboral tiene efectos diferentes según el género. Los hombres que entran jóvenes al mercado laboral tienden a mantener su nivel educativo, mientras que las mujeres siguen estudiando incluso después de ingresar al trabajo. Además, la educación terciaria mejora significativamente las probabilidades de movilidad ascendente, tanto para hombres como para mujeres. En general, las mujeres muestran una mayor movilidad intergeneracional ascendente, mientras que los hombres tienen una mayor movilidad intrageneracional.

Finalmente, se destaca que la movilidad intrageneracional impacta de forma considerable en la movilidad intergeneracional, siendo este efecto más pronunciado en Cataluña, donde las probabilidades de ascenso son mucho mayores.

Structural Inequalities and Realization of the 'Language As Pure Potential' Ideal

The 'language as pure potential' ideology views language as a tool that will unlock speakers' potential, allowing them to achieve their goals. Through unquestioning acceptance of this ideology as a commonsensical notion, neoliberal subjects feel compelled to constantly upgrade their language skills as part of the continuous self-improvement project necessary for success (or even survival) amid the precarious lack of stability that characterizes today's neoliberal workplaces. This idealized view of language as a neutral key that will open doors for unproblematic communication across cultural borders obscures structural inequalities and other language ideologies that, in reality, serve to constrain realization of the 'language as pure potential' ideal. In 2009, I conducted in-depth semi-structured interviews with six female Taiwanese research participants – interviews in which they provided me with recollections of their original language learning motivations, as well as predictions of their personal and professional lives in ten years' time. Over the course of the subsequent ten years, I conducted periodic interviews with these participants, allowing me to address the question of how their early aspirations and visions of the future aligned with the realities they ended up experiencing. In this talk, I will focus on the trajectories of two of these participants – Rachel and Gigi. Rachel subscribed vehemently to the 'language as pure potential' ideology – Gigi less so. While both Rachel and Gigi experienced periodic frustrations in their trajectories, largely attributed to their gender, Gigi ultimately achieved a great deal of success, and her linguistic abilities did play a key role in that success. Rachel, in contrast, faced obstacles that she attributed to structural socioeconomic advantages of others (such as the means to study overseas). Interlocutors did not always regard her words (however fluent) as legitimate, and her belief in the 'language as pure potential' ideology was shaken.

Standardizing or Normalizing Social Farming? National Regulation and Consumers' Cooperatives Frontiers in Japan

Currently, social farming, which mobilizes agricultural resources to generate social services and care (e.g., therapy, rehabilitation, social inclusion, and education), is being promoted and has gained popularity in many countries and regions. Among them, Japan serves as a pertinent case, as the government released its official standard, "Japan Agricultural Standards for Agriculture and Wellbeing" (Nou-Fuku JAS), in 2019, for a third-party certification to promote cooperation between the farming sector, which requires labor, and the welfare sector, which requires earning opportunities, especially for persons with disabilities. While this new standard is based on the growing awareness of the intangible social values of agri-food products among consumers, the market-based solution that distinguishes and brands these labeled products has been criticized because of its neoliberal tenets. However, even before the creation of Nou-Fuku JAS, several Japanese consumers' cooperatives established farming activities with persons with disabilities in their respective regions, based on solidarity and participative guarantee systems. Employing the theory of the sociology of agriculture, food, and political economy, the author conducted a literature review, statistical analyses, and semi-structured interviews with several consumer cooperatives and their farms between 2022 and 2024. The findings suggest that (a) a limited but growing number of entities, social welfare corporations, NGOs, and private corporations are engaging in social farming with varying objectives and outcomes; (b) the National Standard, Nou-Fuku JAS, on the one hand, contributes to increasing

awareness and ensuring the national minimum of social farming, and on the other hand, promotes its commercial value; (c) without relying on the national standard, consumers' cooperatives are successfully providing opportunities for persons with disabilities to receive relatively higher earnings and collaborate with local residents, and are contributing to preserving farmland as a productive asset, realizing a circular economy, and even increasing their membership.

Intersecting Identities and Negotiating Boundaries: Relational Dynamics in Care for Older Adults By Migrant Care Workers in Turkey

Turkey has traditionally relied on family-based care for older adults, but with a growing shift towards employing migrant care workers (MCWs), a new caregiving relationship is emerging. This shift brings together two women—often strangers—within the private space of the home, where their relationship is marked by significant emotional and social inequalities. Drawing on intersectional feminist theory, this study examines how the intersection of gender, ethnicity, religion, age, and social class informs the complex dynamics of this care relationship. Older women in Turkey face particular gendered challenges in ageing, and their dependence on a care worker introduces new forms of social interaction and identity negotiation. At the same time, MCWs, often marginalised by their own gender and migrant status, enter these relationships with limited power. This study focuses on the relationship between these two women—who come from different social backgrounds—and how the shifting balance of power and emotional needs shapes their daily interactions. Through in-depth interviews with care receivers, family employers, and MCWs, the study explores how both parties, despite being in close proximity, experience distinct and, at times, conflicting emotional and social realities. Additionally, it also examines how they interpret the norms, values and ideas practised in this dynamic, adding to our knowledge of how various social identities and positions intersect and affect the real-life experiences of both care recipients and MCWs in this unique employer-employee relationship. Central to the analysis are the socio-cultural and emotional boundaries that emerge within these relationships and the inequalities they reinforce. When these boundaries cannot be redrawn, both MCWs and care receivers share 'silence' and 'loneliness' round the clock in the 'home' space. The research highlights the importance of understanding that care relationships are not only transactional but also significantly influenced by the intersecting social realities of those involved.

RC02-36.4

SEL, GIZEM IRMAK* (Bremen International Graduate School
of Social Sciences (University of Bremen), Germany)

Negotiating Care: Power, Boundaries, and Relationships in Paid Home-Based Elderly Care in Turkey

In light of global shifts in caregiving practices, this study explores the increasing reliance on paid home-based elderly care in Turkey, where traditional, family-centric caregiving models are being reshaped by socio-demographic changes. As part of the global trend of employing migrant care workers (MCWs), Turkey offers a critical lens to examine the intersection of care work, gender, class, and cultural boundaries. Through 39 in-depth interviews with family-employers, care receivers, and MCWs, this study reveals how daily practices and personal relationships within care labor are negotiated amidst emerging struggles and incompatibilities. Focusing on gender, social class, and socio-cultural boundaries, I analyse how these dimensions shape the dynamics of paid home-based elderly care in Turkey. Despite its largely unregulated nature, this care arrangement is not chaotic but governed by evolving boundaries—often exploitative yet intricately connected to personal relationships, culture, and class. These dynamics reflect broader power structures within both the local care sector and the global organisation of care work. Turkey's immature welfare regime and fragile economic context exacerbate these tensions, creating significant challenges for both MCWs and employers. Negotiation practices within these care relationships are fluid, with actors continuously adapting strategies based on the specific issues and moments at hand. The boundaries and bargaining power within the relationships are not fixed; hierarchical roles shift over time and between individuals. This dynamic nature resembles a kaleidoscope, reflecting the hybrid and permeable qualities of these care relationships. There is no perfect relationship; actors constantly navigate the unstable and delicate nature of the arrangement. I conclude by linking these diverse negotiation strategies to broader patterns of power, culture, and socio-economic boundaries.

Counter-Discourses Towards Digital Feminist Activism in South Africa: A Case of #Menaretrash

The #MenAreTrash digital feminist activism (DFA) emerged in South Africa (SA) as a response to the prevalence of violence against women (VAW), including issues of rape, and femicide. However, the #MenAreTrash DFA was met with resistance in the form of counter-discourses, most notably through the #NotAllMen social media hashtag. While prior research has viewed these counter-discourses as fundamentally anti-feminist and misogynist, this study adopted a more nuanced approach to understand the alternative perspectives of resistance towards the #MenAreTrash discourse. The study employed qualitative methods that include in-depth interviews and secondary multimedia sources and drew on counter-discourse theory as an analytical tool to examine the narratives of those who challenged the #MenAreTrash DFA. The findings highlight that the counter-discourses against #MenAreTrash were driven by the perception that the discourse unfairly generalises all men as inherently violent, abusive, rapists and murderers. Critics argue that the slogan disregard the existence of non-violent, pro-feminist men who are committed to addressing VAW while in the process alienating potential allies who could actively contribute to the cause. The study emphasizes that resistance towards #MenAreTrash DFA was not entirely rooted in anti-feminism, rather, it operated as a counter-discourse that towards a seemingly hegemonic discourse of #MenAreTrash. The study concludes by recommending that future DFA should consider more constructive engagement strategies to include men as allies rather than adversaries. By acknowledging the presence of supportive men, feminist movements can potentially strengthen their impact and achieve broader social change in combating issues of VAW, rape and femicide in SA and beyond.

Framing Dissent through Art: The Role of Ahmed Fouad Negm and Sheikh Imam in Shaping Political Consciousness in Egypt and Beyond

This paper examines the political and cultural impact of Ahmed Fouad Negm and Sheikh Imam, two influential figures in Egyptian popular culture and political activism from the 1960s onward. Despite their significant role in shaping political discourse and mobilising dissent, their work has received limited systematic scholarly attention. Drawing inspiration from Cornelius Castoriadis' concept of the "social imaginary," this study offers a comprehensive analysis of Negm and Imam's collaborative output and its enduring influence on political movements in Egypt and the broader Arab world. Using framing theory and historical analysis, the research examines how Negm and Imam interpreted and created mobilising songs around key historical events, challenging official narratives and constructing a counter-narrative that resonated across generations. The paper focuses on their engagement with pivotal moments such as the 1967 war, economic policies of the 1970s, the student-worker movement, and international political developments.

The paper is divided into two main parts. The first analyses Negm and Imam's songs in their historical context, exploring themes of pan-Arabism, anti-colonialism, class struggle, and revolution. The second part investigates their extended impact, exploring the resonance of their work with new generations in the context of the Arab Spring. By examining the duo's role in framing dissent and their influence on political imagination across time and national boundaries, this paper aims to provide new insights into the formation of political culture and the power of artistic expression in mobilising social movements. The paper findings will contribute to our understanding of the interplay between popular culture, political activism, and social change in the Arab world, with potential implications for broader studies of cultural resistance and political mobilisation.

Navigating the Ethical Maze: Dynamic Risk Management and Adaptive Ethics in High-Stakes Field Research in Egypt

This article examines the ethical challenges and risk management strategies employed during qualitative fieldwork conducted in Egypt in 2019, amidst an increasingly oppressive political environment hostile to academic research. It presents a framework for implementing dynamic risk assessment and adaptive ethical practices in high-stakes field research settings. The study introduces the concept of the Field Research Risk Escalation Curve, illustrating how risks can increase over time due to expanding sample size, growing sense of security, and increasing data collection temptation. To mitigate these escalating risks,

the article emphasises the importance of continuous situational awareness, periodic risk reassessment, and flexible adaptation of research strategies. Key ethical considerations addressed include obtaining informed consent without written documentation, protecting participant anonymity, and managing data securely in a volatile political context. The article argues for a comprehensive approach to risk assessment that considers potential harm not only to the researcher and participants, but also to their extended social networks. The article advocates for institutional support in the form of specialised training for researchers working in oppressive contexts, separate from formal ethics approval processes. This would allow for candid discussion of identified risks and mitigation strategies without jeopardising research access. By sharing strategies for navigating the complex ethical landscape of conducting research in oppressive environments, this article contributes to the ongoing dialogue on balancing academic rigour with participant safety in cross-cultural qualitative research. It underscores the need for continuous ethical reflection and adaptation throughout the research process, from pre-fieldwork planning to post-fieldwork data management and dissemination.

Relevance of Public Policy in Achieving Sustainable Development Goals: The Indian Reality

Public policy is the framework of laws, regulations and actions governments implement to achieve social and economic goals. Public policy in India is influenced by the country's Constitution based on the principles of democracy, equality and social justice. It is marked by profound impact on the lives of citizens, promoting economic development and social justice. Sustainability addresses the needs of the present without compromising the ability of future generations to meet their needs. Since 2018, India has realized notable development in goals, 3 (Good Health and Well-being), 6 (Clean Water and Sanitation), 7 (Affordable and Clean Energy), 9 (Industry Innovation and Infrastructure) and 11 (Sustainable Cities and Communities). India's significant progress is also seen in other SDGs including 1) Poverty eradication: India has been working to eradicate poverty since its independence 2) Education: India has attained universal primary and secondary education. 3) Gender equality: Indian Constitution recognized gender equality in its Preamble, Fundamental Rights and Directive Principles of State Policy. Clean Water and Sanitation: India has achieved significant progress in provision of water and sanitation for all. Infrastructure: India has achieved significant progress in construction of infrastructure for its economic growth. Sustainable Industries: India has achieved significant progress in industrial development and innovation. The goals dealing with poverty elimination, providing descent work, economic growth, climate action registered growth at higher levels.

Consequently, India's national score on SDG index increased from 60 in 2019-20 to 66 in 2020-21 and 71 in 2023-24. India has set the goal of realizing all SDGs by 2030 in conformity with UN's goal of achieving the same. In addition, India has also fixed the target of achieving a fully developed country in 2047. The target of achieving the goal of all SDGs is also intensified through the time bound and target-based approach of achieving India as a developed country in 2047.

SEMBA, RIEKO* (Yokohama City University, Japan)

How Can We Practice Sociological Arts-Based Research with Eastern Thought?

Historically and in general, Western and Eastern art greatly differ in the background of their establishment. For example, the history of Western art cannot be discussed without a tense relationship with Christianity. On the other hand, in Eastern art, there is no such tension with Buddhism. Then, what is the relationship between art and religion? In the Eastern world, people believe art and religion are fundamentally connected. Ryosuke Ohashi (1996), for example, positions the early modern Japanese art form of 「芸道」 "geidō" as a realization of becoming aware of religious traditions. Also, Yanagi Muneyoshi's (1998-1961) famous concept of 〈用即美〉 "Function in Beauty and Beauty in Function" is simultaneously found usefulness and beauty in an extension of everyday life.

Now, in what ways can my artistic practice as a sociological researcher who was born and educated in Japan be examined? I produce ethnographies with drawings as part of Western social science research such as fieldwork and interviews. For example, at some stage in my analysis, I create portrait paintings of my research collaborators to visually share my interpretation of them. This is part of an effort to enhance the validity of the researcher's interpretation and the ethics of the investigation. Then, in terms of art, how can these portrait paintings be viewed? What depictions of the world might be possible through the use of Eastern perspective?

In this presentation, I will focus on Kitaro Nishida, one of Japan's leading philosophers, made his poetry and calligraphy based on religious ideas, while using many examples of Western art in his philosophical contemplation process. I will consider the relationship between Nishida's "intuition" and the actualization of the space he lived and my own experience.

Floods, Blame, and Community Resilience: Regional and Local Responses to Natural Disasters in Qazaqstan

In Spring 2024, Qazaqstan was hit with unprecedented floods leaving hundreds dead and thousands evacuated. In some communities, the locals took the initiative to develop the necessary infrastructure, while in others they mostly relied on governmental help to arrive. Responses on the regional level also varied: some *akims* (local executives) took some measures, while others attempted to diffuse the responsibility. Local communities across the country before the floods struggled with the deficits of human, social, institutional, economic, physical, and environmental capital. Blame-shifting is a natural response to these developments, but it also might undermine interpersonal and institutional trust, which is important for resilience and capacity-building.

We test the implications of this theory by leveraging the variation in the level of exposure to floods and local responses to floods in Qazaqstan. Specifically, we are interested in the following questions: How do local communities respond to flood crises and what explains the variation across regions and communities? How do the local communities mobilize resources and what underpins successful mobilization? And how do the residents of the affected areas assign responsibility for handling the crisis? We use a combination of computational linguistics, public opinion surveys, and fieldwork to document the variation in individual- and community-level responses to floods.

Mapping Environmental Protests in Russia, 2007-2021

Environmental protests have been a major strand of contention in Russia, yet the cross-regional variation in ecoprotests has not been systematically studied. In this paper, combining several protest event datasets we analyze the patterns of environmental activism across time and regions. The data cover more than 1000 protest events with an environmental agenda in the period 2007–2021. Based on these data, we develop a typology of Russian regions with the intensity and consistency of environmental mobilization as key dimensions. In the next step, we explore the covariates of ecoprotests in Russian regions and show that the overall level of mobilization, inequality, and governors' tenure and links to the coercive apparatus are consistent predictors of ecoactivism. We also document the interaction between inequality and the strength of governor-siloviki ties indicating that in regions with high inequality, the negative effect of the latter is more pronounced. This paper contributes to the studies of environmental and subnational politics in Russia and demonstrates the need to account for spatial heterogeneity even against the backdrop of the consolidated autocratic regime.

"for the Forest, for the Water, for Our Nature": Scenarios of (De) Politization of the Environmental Agenda in Russian Regions

Environmental activism in Russia has traditionally been seen as a sphere separate from politics. However, environmental issues often require political solutions that can lead to ordinary people becoming more interested in political action. The opposite process, depoliticization, involves distancing from political participation and stigmatization of political action. The politicization of the environmental agenda in Russian society has several paradoxical phenomena. It promotes citizen involvement in politics, while in others, it is seen as a way to protect citizens from getting involved in politics. The degree of politicization seems to depend on factors such as the level of pollution and threats to public health, but research shows that this isn't always the case.

Citizens' discussions and challenges to authorities' actions are not always related to the severity of environmental problems. The conditions for politicization can vary, and regions with similar levels of pollution can have different intensities of environmental protests (Sementov et al., 2024). Many environmental protests often turn out to be framed through pro-government rhetoric and an appeal to traditionalist values (Kuzmina, 2023; Turovets, 2015). Environmental activists, who claim to be apolitical, often take political actions. The government itself tries to use environmental issues to co-opt activists (Martus, 2021). This study aims to answer the following questions: Why does the politicization of environmental issues occur in Russian regions? What scenarios exist for grassroots politicalization of the environment?

The study is based on an analysis of grassroots environmental movements in three regions: the Krasnoyarsk Territory, the Trans-Baikal Territory, the Sverdlovsk Region. The research methods used include semi-structured interviews with members of environmental organizations, focus groups, an analysis of regional media.

Based on the politicization of the environmental agenda in these regions, we identified several types of grassroots activism: patriotic ecological movement, pragmatic ecological movement, civic ecological movement, and environmental volunteering.

Kinship and Transformations in Law: An Assessment of Ten Years of Indian Jurisprudence

In the transforming social and political times, kinship is also an ever-changing relation and institution. This paper, intends to look at judgements from Indian courts over the last 10 years to assess what patterns are being witnessed in interrogating heterosexual kinship. Judgments engaging with queer kinships, where there is a reimagined legitimization of a domestic arrangement in the nature of family, or non humans are understood as children or family. By engaging with these changing meanings of kinship, this paper intends to argue that kinship jurisprudence is transformative and sometimes defying the dominant societal patterns related to heterosexual, usually arranged marriages.

SEN, RUKMINI* (Dr B R Ambedkar University Delhi, India)

Trends in Gender Justice in Last Decade in Indian Judiciary

The last decade has seen a proliferation of 'right to choose' jurisprudence through Indian judiciary. There have been court verdicts around right to abortion, right to choose one's adult intimate partner, right to access public spaces (like temples) for women. It is interesting to note that most of these judgements are couched in the personal liberty framework.

This paper intends to argue how personal liberty conflicts with societal practices and norms in India. As the 2030 UN agenda approaches, does the right to choose jurisprudence pave a new path for gender justice in India

or does it create unjustified expectations on women. Questions of choice and culture how do they co-exist and are interrogated at the same time in decisions related to intimate relations? This paper intends to explore this paradox through court judgments in India

RC24-JS-241.2

SEN, SERTAC* (Independent Researcher, Turkey)

Defending the Sacrificial Frontier: The Military's Conception As an Environmental Steward in Turkey

'As you know, there are two things that come to mind when one thinks of greenspace: military posts and graveyards,' announced Turkish President Erdogan in a speech delivered after the failed coup of July 15, 2016. Erdogan's words were intended to assuage public concerns that a post-coup governmental plan to relocate major military units away from metropolitan areas was a mere fig leaf to open vacated military zones to development. Still, the association of the military with ecological conservation runs deep not only within the military community and political establishment but also across broad segments of the Turkish society. This paper grapples with the puzzle of how the military is cast as an environmental steward despite the evidence that militaries, both in Turkey and globally, are tremendous drains on national resources and polluters of the environment in the era of Anthropocene?

Based on three years of archival research and ethnographic fieldwork in a garrison town in Thrace, Turkey's northwestern borderlands, this paper explores militarist ecological discourses and environmental movements in Turkey. Using archival sources, it first situates the military's activities on the environmental front from a historical standpoint, ranging from forestation efforts driven by forced conscript labor to mass campaigns for raising ecological awareness. It then recounts the recent history of Thrace's rapid transformation from a heavily militarized Cold War borderland into a sacrificial frontier for capitalist extraction and expansion. Next, it focuses on environmental activism in the borderland, particularly regarding the crisis in Thrace's interconnected water systems. Finally, it identifies ecology as the central point of articulation between local perceptions of capitalist expansion, globalization, defense restructuring, and a growing nostalgia for the military.

RC01-25.4

SEN, SERTAC* (Independent Researcher, Turkey)

Marching on the Army's Stomach: Military Procurement and Urban Development in Turkey

As an institution that diverts crucial human and material resources from productive sectors to destructive ends, the military is not typically seen as a developmental actor. In contrast to this predominant public and scholarly view, "soldiers bring development wherever they go" and "the military breathes life into our lives" were common refrains that I heard from my interlocutors during my dissertation fieldwork in Thrace, Turkey's northwestern borderlands. How can we understand the paradoxical coupling of vitality and development with an institution mastering the art of warfare, organized violence, and destruction?

Based on three years of archival research and ethnographic fieldwork in Çorlu, a garrison city in Thrace, this paper offers an account of urban military dependence that shifts the literature's focus on Western countries that mobilize sophisticated military-industrial complexes with high levels of arms exports, professional militaries, and privatized defense functions. It lays bare the mechanisms through which militarist conceptions of development find purchase in a country that relies on a nascent defense industry with large-scale arms imports and mass male conscription. Drawing on an original dataset on local military expenditure compiled from archival sources, the paper documents the centrality of military spending to the local economies in Thrace during the Cold War. Building on interviews with civilians, military contractors, and veterans, it demonstrates how a predominantly male coalition of local notables, businesses, and workers allied with the Army Corps stationed in their city to capture resources that would not have been typically available to a city the size of Çorlu. Ultimately, the paper illustrates how Turkey's historical role in the international division of labor under NATO, supplying cheap and abundant manpower to Western industrial warfare, rendered military procurement for basic provisions, such as foodstuff, forage, and shelter, a critical domain of capital accumulation and urban military dependence in Turkey.

Socio-Technical Challenges in the Implementation of Telemedicine Regulatory Frameworks. the Italian Case between Health Policies and Practices.

The spread of telemedicine (i.e. ICT-mediated care services) needs to be enabled by the introduction of new health policy regulations, as any innovation must be regulated for efficacy and safety (Kruse et al., 2021). However, the intermingling of knowledge, practices and institutions involved in the relationship between policy and health technologies is always culturally and value-laden, entangled in different power relations, and only seemingly politically neutral (Ashworth & Cloatre, 2022).

This paper aims to analyse how the policy-driven introduction of telemedicine in Italy is challenged by the existence of a 'grey area' where telemedicine may merge with other well-being oriented (albeit non-medical) ICT-mediated services, but also by a number of organisational difficulties, such as the lack of interoperability between different systems and technologies, the weight of territorial and regional mechanisms of path-dependency, and the necessary changes in professional practices to integrate telemedicine into established workflows. These critical issues will be discussed by reviewing the political-institutional approach to telemedicine defined over the last decade in the Italian context, through a documentary analysis of legislation at national and regional levels. The paper will also analyse the most controversial issues related to the obstacles that certain social, economic, technological, cultural and structural factors of the Italian health system represent for the regulatory implementation of ICT innovations. To empirically support this thesis, some case studies of telemedicine services in emblematic Italian healthcare contexts will be presented. They will show how the regulatory and institutional framework can be interpreted, readjusted or overcome by health care providers and health care organisations, producing different socio-technical outcomes.

The aim is to explore the complex relationship between institutional regulation and technological innovation in the health sector, focusing on the socio-technical reasons that often make this relationship problematic and the expected outcomes unfulfilled.

Chapbooks Against the Machine: (re)Developing Local Community-Based Publishing in the Age of Generative AI

Following the hypothesis of a revival of analog creativity modes, channels and techniques, the pliegOS.net project promotes paper content co-creation on the spot as a form of resistance against the pervasiveness of generative AI. Originating from the discovery of early 1900s Catalan chapbooks, this ethnographic action research and coop-driven initiative develops open tools for rapid community-based writing and publishing. The project's activities include chapbook editing and distribution at local fairs and academic congresses, or a mobile printing van at cultural festivals, engaging participants in creating zines using typewriters and collages –about ad hoc and co-decided topics and issues. By emphasizing hands-on, local production methods, this approach highlights the authenticity and immersive qualities of print media against cloud-based AI. Recent experiments with the project tools, such as postal mail-chapbooks for artist residencies and youth mental health projects, further orient our dedication to digital obfuscation techniques and anti-extractive, low-tech creative processes.

Prácticas Innovadoras De Los Sindicatos En Argentina Ante Los Desafíos Tecnológicos y Climáticos

La pandemia por Covid-19 aceleró la adopción de tecnología, tanto en los ámbitos de trabajo como de consumo, cultural y de representación política, sobrepasando el mero hecho de estar comunicados/as (Benitez Larghi y Duek, 2017). En paralelo, los efectos del cambio climático se hicieron evidentes en eventos extremos como inundaciones y olas de calor, movilizando a los actores colectivos preocupados por el cambio a largo plazo, entre ellos, las movilizaciones juveniles adquieren una gran relevancia (Pochet, 2022)

Frente a la agenda urgente que imponen los desafíos descriptos, los sindicatos argentinos han desarrollado prácticas innovadoras que representan nuevas formas de compromisos en el contexto en el que operan, o compromisos que trascienden las comunidades sindicales tradicionales (Working Lives Research Institute, 2010).

Para explorar la *transición ambiental*, analizaremos la emergencia del Frente Sindical de Acción Climática en Argentina, creado en 2019, los sectores que lo componen, las acciones que llevan a cabo, sus articulaciones con otros movimientos sociales de acción por el clima y para explorar las prácticas innovadoras en el contexto de *transición tecnológica*, nos enfocaremos en mapear el uso, diseño o adaptación de tecnologías por parte de algunos sectores que conforman dicho Frente. El estudio se inicia en el año 2019 y se extiende hasta la actualidad, período marcado desde diciembre de 2023 por el ascenso del gobierno de derecha de Javier Milei que da inicio a un nuevo escenario económico y político regresivo para los trabajadores a la vez que niega el cambio climático. Se utiliza una metodología cualitativa que incluyó entrevistas en profundidad con líderes sindicales, el análisis de documentos técnicos, páginas web y convenios colectivos de trabajo.

Gender Equality and Sustainable Development: Narrativizing the Changing Dynamics of the Development Paradigm of Transgender Women in Urban Kolkata, India

Gender Equality occupies an uneasy relationship as far as the relationship between the State and society in India is concerned. The Constitution of India declares lofty ideals of equality while the society is deeply embedded in structural inequalities. This has placed the marginalized transgender community in a state of dysfunction. In 2014, the NALSA Judgement in India categorized transgender persons as 'Third Gender', and conferred entitlements and benefits regarding access to education, jobs, and other beneficial institutions. However, it has been almost a decade, and no significant development in the community has been noticed. This paper attempts to reveal the gaps that exist between the laws and policies on one hand and the socio-cultural challenges that prevail in society. The author focuses on 'real politics', that lies behind the policy of actualization. The present paper highlights the role of various agencies in promoting the upliftment and growth of transwomen in strengthening their capacity building and in advancing their freedom towards a sustainable future. The methodology of this paper is based on narratives and case studies of transwomen in urban Kolkata and tries to depict their struggles in everyday life. This work attempts to find out the road that can ensure economic, social, legal, and bureaucratic inclusion that will create a safe environment for the transpersons to live and work with dignity.

Sacred Space, Religious Practices, and Cultural Identity: Narrating the Role of Widows and Vulnerable Women in 'sindur Khela', during the Durga Puja in India

In India women's right to equality in society has been controlled by patriarchy and religious fundamentalists. This controlling of women's bodies and minds takes place gradually from families and extends to State and even public spaces. *Durga Puja* is one of the most celebrated ceremonies in West Bengal, India, and invokes the power of Devi Durga, in killing *Asura*, the demon thereby symbolizing ultimate power in the hands of a woman against all oppressions. "*Sindur Khela*"—literally meaning 'vermillion game', is a popular Bengali Hindu tradition where married women smear each other with sindur and seek blessings for their husbands and families. However, the public domain has been severely restricted for widows, unmarried women, divorcees, or other vulnerable women like transgender women and prostitutes. These practices have been severely criticized not only by feminist groups who refer to the curtailment of women's rights but also by human rights defenders who point out that religious traditions and culture can never be accepted as an excuse for violating human dignity and freedom. This paper draws attention to the plight of vulnerable women who have been debarred from enjoying social recognition for ages and focuses on the changes that are taking place in today's contemporary global world. This work identifies the impact of social marginalization on these women and seeks to focus on the major agencies that are increasingly responsible for reclaiming the lost voices. By drawing examples from popular culture, like films and literature, and narrating individual case studies the paper identifies the major gaps that are linked to structural inequalities and cultural traditions and practices.

Housing Precarity, Politics and Justice: Lessons from Slum Relocation Projects in Kathmandu, Nepal

Over the past four decades, the Global South has experienced rapid urbanisation, a rise in informal settlements, and pressures to eradicate them. In 2020, about one in four urban dwellers lived in slums or informal settlements. This translates into more than 1 billion slum dwellers who must be given the support they need to lift themselves out of poverty and to live free from exclusion and inequality (UN, 2022). The global efforts to resettle slum and squatter dwellers have been fraught with problems. In theory, resettlement benefits households through ownership and integration to ensure a stable and enduring future free from any risk of eviction or displacement. However, evidence shows the process is fiercely contested raising questions about agency, governance and participation models. The question is what innovations can be brought in policy frameworks and institutional approaches which would aid the process. Based on the experience from fieldwork conducted in Kathmandu's two squatter resettlement projects - Kirtipur housing settlement and Ichangu housing project, we examine the approaches and assumptions underpinning the two projects and the manner they were delivered to conclude the factors that contributed to the success of one and a failure of another. We make a comparison of four key attributes - location, design and infrastructure, finance mechanism and inclusivity and participation. It is also observed that the resettlement process has been increasingly authoritarian owing to the wider political turnover in the nation and marked by legislative and regulatory changes that work towards reducing empowerment and agencies. I argue that resettlement is fundamentally both physically and socially disruptive and the odds of success for the project how nuances of those disruptions are handled, the levels of institutional support provided and how resilient is to the external conditions that are constantly mutating.

Long Distance Fatherhood: Filipino & Vietnamese Guest-Worker Fathers in South Korea

There are two kinds of separated families, living apart for the sake of work or education. Guest-worker fathers from Asian countries, including China, Vietnam, Indonesia, the Philippines, Thailand, Sri Lanka, Uzbekistan, and Bangladesh, are working in Korea without their families. Additionally, "wild goose" fathers or *kirugi appa* are also working in Korea to finance their wives' and children's stay and education in overseas countries, including United States, Canada, Australia, New Zealand, China, and others. For these families, both types of separation represent life-changing decisions and commitments that can have positive as well as negative aspects. In this paper, we will explain the relations between father and children, Korean citizens' attitudes towards them, and Korea's government's policy responses of the Korean government.

Ethnic Ceiling: An Intersectional Exploration of Access Privilege Positions of Upwardly Mobile Indigenous in Chile

This article delves into the lived experiences of indigenous people in Chile who have achieved upward social mobility, yet still encounter significant obstacles in their pursuit of elite status. By identifying and analysing the various barriers, obstacles, and challenges that indigenous people face when attempting to gain access to privileged positions, this article aims to illuminate the persistence of inequality even in the face of apparent progress. Drawing on 50 interviews with indigenous professionals, the analysis reveals complex and varied responses to social mobility. These narratives expose the nuanced realities of navigating a social landscape that continues to be shaped by colonial legacies and entrenched power structures.

In the context of Chilean society, reaching elite status has historically been a formidable challenge for indigenous individuals. Through an intersectional and social reproduction lens, it seeks to uncover the enduring inequalities

and the subtle yet pervasive forms of exclusion that persist. This exploration sheds light on the multifaceted nature of privilege and the ongoing struggle for equity and representation within Chile's elite circles. The contribution of this article lies in its examination of the consequences, barriers, and challenges faced by indigenous people in their upward mobility, proposing the concept of the 'ethnic ceiling' to encapsulate these dynamics. This concept serves as a critical tool for understanding the specific limitations imposed by ethnic identity within the broader discourse on social mobility.

Tejiendo Trayectorias De Movilidad Social De Personas Indígenas En Chile, Desde Una Perspectiva De Género.

El artículo examina cómo se construyen las distintas trayectorias de movilidad social de personas indígenas, evidenciando desigualdades en dimensiones interseccionales, y decolonial. Así, el artículo busca contribuir a los estudios de género y movilidad social, evidenciando los desafíos que afrontan personas indígenas en Chile. El estudio se concentró en 34 entrevistas a hombres y mujeres de primera y segunda generación profesional Quechua, Aymara y Mapuche, realizadas en Arica y Paríacota, Metropolitana y Araucanía. Concluimos que las trayectorias se tensionan por la introducción a nuevos contextos (blancos y de clase social media/alta), que afectan el posicionamiento/negociación identitaria. Se sugiere que existen barreras que operan simultáneamente (género/clase/etnicidad) en el acceso a posiciones más privilegiadas (techo de concreto), y que la violencia de género (familiar/comunitaria/social), es un obstáculo para la movilidad de mujeres indígenas, no obstante, la entrada al mundo universitario y laboral se convierte en una posibilidad de ruptura con dicha barrera.

Social Innovations and Fourth-Generation Science and Technology Parks: An Analysis from the Global South

Over the past decade, Latin American academics and policymakers have promoted initiatives that critically foster relationships between universities, research institutes, and their surroundings, challenging the traditional linear, supply-driven knowledge model. These initiatives aim to develop fourth-generation science and technology parks, characterized by their emphasis on environmental concerns and social inclusion in governance and the design of socio-technical adaptations (Djonić Alibegović et al., 2022; Noronha et al., 2023). This paper explores the involvement of social groups and popular movements in technology co-production within two case studies. Despite rhetoric supporting social participation, the paper hypothesizes that such involvement is minimal. Methodologically, this exploratory study uses a multiple case study approach, combining field visits, document analysis, and secondary data. The parks were identified through databases such as National Association of Entities Promoting Innovative Enterprises (Anprotec); The Global Institute on Innovation Districts (GIID); International Association of science parks & areas of innovation (IASP); Inova data BR - a platform for integrating, monitoring and developing Brazil's Technology Parks and their resident companies and organizations. Selection criteria included location in Latin America, a democratic political regime, and university involvement in governance. The analysis of 34 characteristics of fourth-generation parks, based on official documents and websites, narrowed the focus to 88 parks (of 183 existing parks), with 7 aligned with social participation and sustainability goals. From these, two parks were selected: Distritotec (Monterrey, Mexico) and Parque Patricios (Buenos Aires, Argentina). Our initial findings showed societal participation in some instances, such as cultural and artistic initiatives, services like a hub for local producers, and guidance for independent workers. However, there was little social participation in the co-production of socio-technological development.

Impact of Covid-19 Pandemic on Health Inequality in the Southern European Countries

The number of studies produced and disseminated on the various aspects of the recent pandemic has been abundant. Above all, what has been missing is a comparative reflection on the effects of the pandemic on health systems (HS) and health inequalities (HI) and on the two-way relationships between the pandemic and inequalities. Thus, the central theme is to explore how the Covid-19 pandemic has transformed or is transforming the HS of Southern Europe. This paper, based on the international literature, aims to analyse the impact of Covid-19 pandemic on HS and HI in four Southern European countries – Spain, Greece, Italy and Portugal. In particular, it focuses on how the pandemic disproportionately has hit the most disadvantaged communities and created new inequalities among population groups made more vulnerable by the difficulty of following the containment measures imposed by health authorities. In summary, here are some of the results of the study: the immediate effects of Covid-19 were reflected in an excessive mortality rate; the level of unmet health needs has increased, in particular: cancer patients were diagnosed late, a drastic reduction in cancer-related surgeries, elective surgeries were suspended, inpatient and outpatient mental health services were also suspended during the pandemic; elderly residents of nursing homes have suffered the effects of Covid-19 most severely, and it is precisely there that the highest number of deaths was recorded in the first wave. Among the categories most affected, in all four countries, there are refugees, asylum seekers and international emigrants, with disadvantaged socioeconomic conditions and high levels of job insecurity, housing precariousness, and social marginalization: all risk factors associated with poor health. The incidence of Covid-19 on these vulnerable social groups are a good example of the intersectionality of different dimensions of social inequalities that intersect, accumulate and worsen.

BISPO JÚNIOR, JOSÉ PATRÍCIO (Federal University of Bahia - Multidisciplinary Institute of Health (IMS-UFBA), Brazil)

Public Participation, Vulnerable Population and Health Inequality

The benefits of public participation (PP) in health systems (HS) have been extensively discussed in the literature. There are many arguments that legitimize the PP, such as increasing accountability and transparency, improves the quality of the decisions, strengthening health promotion activities, and improving the representation of underrepresented groups, thus reducing health inequalities. However, central investigation has highlighted some critical points affecting the quality and the effectiveness of PP in the HS. One of the most noteworthy is the deficit of representativeness in participatory forums and the failure to prioritize the involvement of socially disadvantaged groups, such as migrants, homeless people, mental health patients, etc. In this context, it is important to point out that there are still few articles reporting the participation of vulnerable groups and indicating which groups are involved in participatory spaces. In fact, health institutions still are criticized for not providing appropriate opportunities and mechanisms to citizens who lack the economic and social resources to participate in decision-making processes. The World Health Organization has repeatedly supported and promoted PP as a strategy to reduce health inequalities. The post-pandemic scenario has certainly contributed to further deepen the dynamics of social and health inequality, especially of vulnerable groups, making PP (and not only the participation of experts) in HS even more relevant. This article discusses some important PP experiences carried out in the HS of Brazil and Southern European countries (Italy, Spain and Portugal) in recent years, with the aim of identifying the strengths and weaknesses of the participatory mechanisms adopted, as well as the main barriers that determine the underrepresentation of socially disadvantaged groups. The result of the study points to the following barriers: lack of health literacy, communication difficulties, financial constraints, few channels for expressing the interests of vulnerable groups, among others.

SERBEDZIJA, VOJIN* (Humboldt Universität zu Berlin, Germany)

Growing up in the Closed City. Patterns of (Durable) Social Segregation Among Migrant Youth from Berlin

Following the assumption that for some social groups the city is more closed than for others, this paper examines perspectives and paths of young residents who grew up in a stigmatized housing estate surrounded by gentrified areas in Berlin's inner city. The fact that privileged members of a predominantly white middle class and socially disadvantaged, mostly migrant groups live close to each other does not necessarily mean that social mixing develops. Hence, recent studies suggest taking a closer look at segregated social uses of the city.

The analysis is based on data from two related research projects in the same neighbourhood, conducted in 2017/18 and 2023/24 with a qualitative research design, including individual and group interviews (with focus on youth), expert interviews (with street-level-bureaucrats) and participant observation (at relevant local sites). Some key findings concerning the everyday challenges of mostly male youngsters from ca. six years ago revealed that they had similar routines back then: they spent a lot of time in the local streets and youth clubs (when not banned from them); they had a strong sense of local belonging, despite conflicts with neighbours or the police; they experienced uncertainties connected to poverty, racism and lack of perspective but also had plans for a better future. How are these adolescents doing today? Through follow-up interviews and vignettes the partially very different paths - ranging from college to imprisonment - will be contrasted and analyzed by asking: which circumstances increased the youth's marginalization and criminalization, and which possibly empowered them to develop towards a more inclusive, stable future? The additional findings emphasize that such longitudinal data that is rarely collected in sociology is highly relevant for a deeper understanding of social processes and mechanisms that influence the (re-)production of urban inequalities for vulnerable youth.

SERCOMBE, HOWARD* (Western Sydney University, Australia)

Schrödinger's Cat, Charlie, and the Youth Worker: Superpositionality and the State of Being Young.

The concept of superpositionality was developed in the first half of last century in quantum physics. Superpositionality describes a condition in which an object can be in two (or more) different and apparently inconsistent states at the same time. According to quantum theory, the state of superposition holds until observation and measurement establishes one state or the other, and the superposition 'collapses'. The process of observation, description or representation and the instruments used to do these things are implicated in the final state of the object. The theory was famously illustrated through a parable posed by physicist Erwin Schrödinger in 1935 and now known as Schrödinger's cat.

The concept offers a perspective on the state of being a young person: young people occupy adult and non-adult, child and non-child, worker and non-worker, citizen and non-citizen, independent and non-independent positions at the same time. The paper explores the implications of the concept of superpositionality in our understanding of young people, the exercise of observation, assessment and measurement that engagement with young people involves, and the impact of collapsing superpositions on both the young person and the practitioner. It may also help in framing the persistent tension between structure and agency in the sociology of youth.

Fractured Solidarity: Polarized Pro-Palestine Mobilizations and State Legitimacy in Turkey

In the pro-Palestinian solidarity protests in Turkey, images of large crowds gathered in Istanbul's central squares were widely shared by international media. These squares and bridges, typically unused for other protests, were opened to those wishing to express solidarity with Palestine, often in the presence of state officials and political leaders. However, these rallies did not represent the entirety of the pro-Palestinian movement. Due to Turkey's polarized political and social landscape, various pro-Palestinian groups held separate protests.

While the Turkish left has shown solidarity with the Palestinian liberation movement since the late 1960s, the Islamic movement, which gained

prominence in the 1980s, has increasingly dominated the discourse surrounding the Palestinian cause. Following Israel's genocidal response to the October 7 attacks, two distinct forms of protest emerged: one comprising large-scale, government-sanctioned pro-Palestinian rallies, characterized as legitimate and protected; the other featuring repressed protests by independent Muslim and socialist students, who accused the current government of complicity through direct and indirect trade with Israel, often resulting in detentions.

In Turkey's public spaces and universities, pro-Palestinian protests have evolved into activities that are officially recognized and sanctioned for some, while others face violent repression. This study will explore the polarization and fragmentation of Palestinian solidarity within a national context, focusing on the divide between pro-government and opposition groups through the lenses of social movement theory and political opportunity structures. Additionally, it will examine the evolution of Palestinian solidarity, tracing its roots in the Turkish youth and student movements and highlighting the sharp divisions that have emerged between those aligned with the government and those opposed to it.

Post-Earthquake Politics Under Neoliberal Populism: A Polanyian Analysis of Commodification and De-Commodification

This paper examines the interplay between populism and neoliberalism in Turkey's post-disaster context following the 2023 earthquakes. The neoliberal populist state-capital nexus shaped disaster recovery and rebuilding, emphasizing the commodification and marketization of emergency response, relief efforts, and properties such as housing, land, and nature. Drawing on Polanyi's theoretical framework, the paper explores how disaster capitalism acts as a catalyst for neoliberal accumulation and the marketization of state-civil society relations, while also considering the potential for a societal counter-movement that challenges the binaries of the populist imaginary. The displacement caused by the disaster intersected with existing class and identity-based inequalities, accelerating the neoliberalization of the social fabric. However, the solidarity and lived experiences of survivors and volunteers demonstrate the potential for a "double movement," as Polanyi proposed, signaling resistance to these forces. Based on an extensive analysis of media reports and empirical research conducted in the Samandıĝ district of Hatay province, the paper grounds its analysis in the post-earthquake realities and situates it within a critical examination of neoliberal populism.

Deconstructing Legal Professional Identity: An Analysis on the Meanings of Hukukcu (Jurist) in Everyday Legal Practice in Turkey

The term *hukukcu* (jurist) is commonly used to refer to someone who has legal expertise. It is also exclusively used among legal professionals to refer to a legal professional who has distinct legal knowledge, qualities, skills, and orientations. The double meaning of *hukukcu* naturalizes under the premise of standardized legal education/training and professional competition as a routine part of everyday legal practice while obscuring the ambiguities that it generates in both constituting a common place for legal community and distinguishing from one legal professional from another. In providing an understanding of these ambiguities, this paper interrogates the meanings that lawyers attribute to the term *hukukcu*. It examines how lawyers articulate the distinctions between the term *hukukcu* and *avukat* (lawyer). It argues that *hukukcu* constitutes a playful centre in informing legal professional orientations as part of everyday practice. Through analysing the narratives of twelve lawyers living in Turkey, it provides a map of the themes through which lawyers express the distinct knowledge, qualities, skills, and orientations of *hukukcu* as opposed to those of *avukat*. It also demonstrates two modes in which lawyers position the professional practice of *avukat* in relation to that of *hukukcu*. This paper challenges the monolithic conception of contemporary legal professional construction through discussing the function and elements of *hukukcu* in concurrently opening possibilities of and imposing limitations on legal change.

 MUÑOZ GONZÁLEZ, BEATRIZ (Universidad de Extremadura, Spain)

Addressing Isolating Gender Violence (IGV) As a Preventive Mechanism to Face Gender Violence: Lessons from Qualitative Research Among Professionals Attending Victims of Gender Violence in Extremadura (Spain).

Scientific literature defines isolating gender violence (IGV) as that suffered by people who support victims of gender violence. Thus, its identification is a key element as a preventive mechanism, both for victims as for defenders. However, although progress has been made in the delimitation of the concept, in its legal regulation and in its manifestation in areas such as sexual harassment in universities, it is still unknown whether IGV is suffered by professionals attending women victims of gender violence. To this end, in-depth interviews with a communicative approach to professionals of the Extremaduran system of attention to victims of gender violence (Spain) has been conducted.

Four are the lessons that can be derived from the results of this research. Firstly, there is sufficient evidence to place these professionals as preferred victims of IGV. Secondly, a clear isomorphism has also been found between the processes of victimisation of gender violence victims and IGV victims. In particular: difficulty identifying and acknowledging the situation of violence experienced, denial, difficulty asking for help, self-blame and secondary victimisation and normalization of IGV. Furthermore, the research has made it possible to identify the victimization mechanisms that professionals suffer, allowing us to establish two different categories named as "subtle" and "explicit" and that differ in the degree of violence. Finally, the consequences of IGV have been analysed both on their reputation as professionals as well as the effects it has on victims of gender violence and on their own families.

A deep understanding of such processes of victimization is essential, on the one hand, to face an occupational risk which has been ignored to date. Such risk is affecting not only the health of these professionals but also the quality of their service provision which, on the other side, contributes to fuelling denialist discourses of gender violence.

A Systematic Review of Qualitative Studies in Health Inequity with an Intercategorical Intersectional Perspective

Introduction: Intersectionality has been gaining prominence both as a concept and as a theoretical and analytical framework in health research in the past decades. To the point that "Intersectional Framework" was introduced as a MeSH term in PubMed in 2022. Leslie McCall explained that intracategorical studies inaugurated the study of intersectionality (research focusing on a particular social group defined by a specific combination of gender, race and social class, for instance, black women in deprived neighbourhoods), and this is the most frequent way in which intersectionality have been analysed in health qualitative research. Nevertheless, the concept of health inequity implies comparison between social groups (or intersectional strata). For this reason, we are interested in intercategorical research (e.g. research comparing two or more social groups defined by different combinations of gender, race, social class or other social categories related with social stratification).

The aim of this research is to identify and analyse qualitative research studies on health inequity applying an intercategorical intersectional approach. By this, we understand, research that compares two or more groups defined by intersectional criteria. The goal is to identify how health inequity understanding can be enriched when intersectionality is considered (in terms of diversity, specificity, accumulation of effects, interactions, and other key concepts in the literature on intersectionality).

To do so we have started to carry out a systematic review of qualitative studies following the 2020 PRISMA guidelines for this kind of research.

Data sources: The following databases are being consulted: Pubmed, Web of Science and Scopus.

Study selection: The selected works had to be studies comparing at least two groups of people (intercategorical and intersectional perspective) using qualitative methodology or at least mixed designs. They should be explicitly or implicitly studies on health inequity, inequality or disparities, and written in English or Spanish.

Is Social Innovation Possible in Spanish Social Services? Reflections from the Professionals' Point of View

Between 2021-2022 we carried out a study on the perception of public innovation, which took into account the assessments of the people responsible for the seventeen social services of the autonomous communities of Spain. At a later stage, we conducted a second survey aimed at social service professionals. As a result of this previous investigations, arose the need to research the role of social innovation in social services from the point of view of the professionals who make up the work teams. To this end, throughout the summer of 2024, we carried out an exploratory phase, through semi-structured interviews with top-level experts in social services, whose profiles ranged from social workers to centre directors and municipal advisors.

The approach used was qualitative, and reflections focused on the weaknesses, threats, opportunities and strengths existing in the sector in relation to social innovation and the promotion of creativity in the sector. Likewise, a series of recurrent resistances and elements that hinder the innovation of professionals were detected, such as: lack of time and personnel, and the lack of support from political managers. Among the discourses, the impact that COVID-19 has had on the internal functioning of the teams appeared, both in terms of organisation, communication and professional practice itself. In short, by actively listening to experts in social services, it has been possible to obtain a preliminary diagnosis of the situation. This information, in addition to advancing in the knowledge of good practices and keys to promote social innovation in social services, has allowed us to have accurate and focused criteria to design a Research and Development project at national level. The main objectives of this project will be to detect, validate and transfer good practices of social innovations carried out in first level social services in Spain.

To Plan or Not to Plan? Anticipating Agency in Academic Competitions

Postdocs are caught in the limbo of temporary work contracts and high-performance expectations of academic organizations. Our paper investigates how they make sense of this particular career stage. Specifically, our study examines how postdocs plan future activities and career steps in the absence of tangible prospects. We therefore draw on a full qualitative interview panel of 45 postdoctoral researchers in particle physics and modern history employed in German research institutions. By focusing on the temporal orientations engrained in the decision-making process of postdocs, we contribute a novel and processual perspective on the precarity and meaningfulness of academic work. We find that postdocs' career narratives are structured by the temporalities of different forms of organized academic competition: On the one hand, the temporal horizon against which postdocs make sense of their career is adapted to both the average length of employment contracts at the postdoc stage and to the funding cycles of the grants that are crucial to secure postdocs' employment. On the other hand, narratives about the agency that postdocs claim to have for their career are not related to any academic activities *per se*, but geared toward competitions for publications, funding, and jobs.

The Body As Cultural Practice: Brazilian Indigenous Narratives and Body Painting in Ritual Expression

In this discussion, we aim to present the body paintings of indigenous peoples in Brazil as dynamic narratives of their cultural practices. These paintings, understood as living manifestations that transcend forms, colors, and patterns, are created for specific rituals, symbolizing life stages and the identities of community members, and reflecting the diverse cosmologies of these peoples. These artworks carry narratives and cultural discourses that can only be fully understood within the context in which they are produced, where the relationship between the painter and the painted, as well as the dialogue that unfolds during the process, constitute a ritualistic and ancestral practice. Unlike permanent tattoos in non-indigenous cultures, indigenous body paintings are ephemeral, as their significance also lies in the act of inscribing them on the body. The process of painting and composing the designs on another person is an intrinsic part of the cultural practice itself. Each stroke imprints a story on the body, which is expressed through rituals, dance, song, and the collective sharing of this cultural expression. The body paintings of the Apyãwa and A'uwẽ peoples, for instance, are part of practices that integrate the individual with the community and nature. Inspired by the reflections of Ailton Krenak (2019), we understand these practices as a form of resistance to a way of life that separates human beings from nature, reaffirming the interdependence between body, culture, and environment. The painted body narrates and dances, connected to its ancestry and the wisdom of natural cycles, and the sacredness lies both in the creation and at the moment these cultural narratives are expressed. Thus, the various indigenous body paintings in Brazil are cultural practices that celebrate the interconnectedness of body, art, and the environment.

Disconnection : A New Trend in Sociology of Resistance

Based on a multi-sited ethnography conducted in Alaska, the Pyrenees and the French Alps, this contribution aims to lay the groundwork for a sociology of digital disconnection, viewed as a system of social control or domination. It will demonstrate how voluntary disconnection emerges as a new form of social struggle. Additionally, it will examine how the advent of satellite-based connectivity (e.g., Starlink) disrupts these efforts. After outlining 3 ethnographic cases, the presentation will examine the perspective of digital power and avoidance strategies as a means of rebalancing relations of domination at a local level. It will also look at how these struggles take shape in communities between supporters of hyper-connection and those defending the right to total disconnection. Ultimately, the work will draw on David Graeber's theories to explore the rearticulation of local resistance in the digital age.

El Feminismo Purepecha Como Praxis Interseccional y Decolonial

Esta propuesta busca explorar la existencia y surgimiento de un feminismo purépecha que se construye desde una praxis interseccional y decolonial, basándose en las experiencias de las mujeres purépecha en la región de la Meseta Purépecha, Michoacán, México. Las mujeres indígenas han enfrentado históricamente múltiples formas de opresión, incluyendo la discriminación por su género, la exclusión étnica y el racismo estructural, entre otras intersecciones. En este análisis, se parte de la idea de que el feminismo purépecha no se puede enmarcar fácilmente en los paradigmas feministas dominantes. Más bien, se articula a través de una lucha por la autonomía de sus comunidades y una defensa activa de sus territorios, lengua y cultura. Este feminismo combina las demandas de justicia de género con las exigencias de autonomía cultural y política, lo que le otorga una naturaleza interseccional, ya que abarca tanto las opresiones de género como

las étnicas. A través de entrevistas a profundidad con mujeres purépecha pertenecientes a organizaciones comunitarias, este trabajo examina cómo las mujeres purépechas siguen construyendo una praxis feminista propia, que responde a sus necesidades particulares y las coloca en el centro de la lucha por la equidad. También se analiza las formas en que este feminismo desafía tanto las estructuras patriarcales tradicionales dentro de sus comunidades como las narrativas hegemónicas impuestas desde el exterior, contribuyendo así al debate sobre la decolonización del feminismo en América Latina.

An Evaluation on the Possibilities of Human Mobility and Immobility Regarding the Climate Crisis in Turkey

This paper focuses on the possibilities of migratory movements including human mobility and immobility in Turkey directly or indirectly related to the effects of the global climate crisis. Based on a literature review and grey literature with various sources and news on the subject, the paper examines current events and possibilities within the context of the climate crisis and climate justice in the light of the literature, and discusses various dimensions of possible human mobility and immobility in Turkey, including vulnerabilities stemming from existing hierarchies and injustices. It is argued that the issue of human mobility or immobility in the context of migration studies and climate crisis could be analyzed from a social transformation perspective for a better understanding of socioecological and holistic evaluation. In addition to this central argument, within the framework of existing reports and literature, it is anticipated that potential human mobility and immobility based on the climate crisis in Turkey will come into the spotlight more in the near future.

Migratory Movements As a Multifaceted Process Under the Impacts of Climate Crisis: The Case of Central Anatolian Agricultural Basin, Cihanbeyli/Konya/Turkey

This study aims to examine the actual and potential role of the current climate crisis on human mobility and immobility in the context of migratory movements. Another aim of the study is to understand how this role is manifested in agricultural inequalities and injustices in rural areas where income equilibrium has been disrupted. Since 1980, the general trend in Turkey's rural areas shows that young peasants have been leaving agricultural production and agrarian life by heading towards district and urban centers. Between 2010 and 2020, one-fifth of the rural population engaged in agriculture followed a similar path. In this context, the research focuses on the Cihanbeyli district in the Central Anatolian Agricultural Basin in the Konya province of Turkey. The main question of the research is as follows: How do socio-economic injustices and inequalities emerging under the impact of neoliberal policies and the climate crisis affect migratory movements in the Central Anatolian Agricultural Basin in Konya, Turkey? To be able to give answers to this question, the research focus was directed to Cihanbeyli district and the villages of Böğürdelik, Gölyazı, Günyazı, Kuşça, Taşpınar and Yeniceoba. While in-depth interviews were conducted with local people and families in six villages and the district center, expert opinions from different institutions were also included in the research. Methodologically, the study also benefits from an extensive literature review. The results of the research show that the background of the migratory movements from Cihanbeyli district and villages in the Central Anatolian Agricultural Basin, which have been continuing since the end of the 60s, has become more layered and complex within the framework of climate change and neoliberal policies that have increased their impacts since 2000. Along with this layered and complex background, a significant acceleration and intensification in migratory movements in the region is identified.

SEVGUR, SERPERI* (Medicine Hat College, Canada)

Disrupted Livelihoods, Debt, and Border Crossings: The Role of State(s) in Georgian Women's Migration and Its Implications

My presentation focuses on the role of state(s) in the economic, social, and political oppression of Georgian Migrant Domestic Workers (MDWs). For several decades, the Georgian state has encouraged women to migrate to wealthier states in order to maintain its financial viability, while receiving countries have exploited and controlled Georgian MDWs to fill the social reproductive void in their own nation states. I first trace the multiple dispossessions that

Georgian families experienced during the country's transition to a neoliberal capitalist political economy following its independence from the USSR, and the subsequent civil war and Russian invasion. I then follow Georgian MDWs who, forced by the state to sustain their families by borrowing loans and by migrating, navigate border crossings. Migrant women who arrive in the receiving country experience extreme precariousness due to their position in the labour market and in relation to employer families based on their (non)migrant status. Migrant narratives convey feelings of hope shadowed by anxiety, sorrow, and 'being in suspension', in the face of possible (and sometimes real) danger of deportation, as well as in relation to their individual and family well-being. Drawing from my fieldwork with Georgian MDWs who work in Turkey, and through a feminist political economy perspective, I outline how state(s), in conjunction with intermediaries such as official and unofficial lenders and migrant smugglers, discipline migrant women by instituting neoliberal social reproductive relations, visa regulations, and debt repayment schemes. In the process, a neoliberal subjectivity is being instilled into post-Soviet Georgian citizens and emigrants.

De l'Acceptabilité Et l'Appropriation De l'Ajout d'Un Kit d'Hygiène Dans Le Protocole De Prise En Charge De La Malnutrition Aiguë Sévère (MAS) Chez Les Enfants De 6 à 59 Mois Dans La Zone Nord Du Sénégal

La réduction de la prévalence de la malnutrition par le renforcement de l'hygiène peut être un moyen non négligeable de réduction de certaines pathologies chez les enfants. Toutefois, l'acceptabilité et l'appropriation d'une innovation (kit d'hygiène) promu dans le cadre d'une intervention/sensibilisation peuvent être les facteurs déterminants au changement. Cette étude aborde l'analyse des déterminants de l'acceptabilité et de l'appropriation de l'ajout d'un kit d'hygiène (savon, aquatabs, seau avec couvercle et robinet, message de sensibilisation) dans le protocole de prise en charge de la MAS chez les enfants de 6 à 59 mois. L'étude a été réalisée auprès d'un sous échantillon de 199 personnes constituées des mères ou gardiennes d'enfants, des maris et belles-mères des femmes, du personnel de santé et des acteurs communautaires. Sur les 86 poste de santé de l'échantillon du projet, 24 ont été choisis pour cette étude dont 16 du groupe d'intervention et 8 du groupe contrôle. L'approche est essentiellement qualitative et la collecte s'est faite avec des entretiens, des *focus group* et de l'observation. Les résultats montrent une bonne acceptabilité du kit d'hygiène qui est perçu comme un intrant pour le renforcement de la qualité de la prise en charge à domicile des enfants MAS. Toutefois, l'appropriation de l'intervention s'est heurtée aux facteurs socioculturels (difficultés dans l'utilisation exclusive du kit pour l'enfant MAS, croyance et recours à des connaissances traditionnelles pas en phase avec les prescriptions de l'intervention, influence des belles-mères, etc.), financiers (pauvreté, manque de moyens de transport pour respecter les visites au poste, etc.) ; et géographiques (longues distances entre le poste de santé et les lieux d'habitation des femmes, mauvais état des routes ou pistes, transhumance, etc.). Le paradigme de l'appropriation est mis en avant notamment la manière dont une innovation est comprise et adoptée dans un domaine particulier et une période donnée.

Valued Exchanges: Supporting Health, Nutrition and Cultural Foodways in Agroecological Food Markets in Dakar, Senegal

While there is evidence that agroecological practices can improve food security and nutrition for smallholder farming households, there is less evidence in urban areas, particularly for low-income households. This study

asks: what agroecological food system interventions could be implemented to address multiple forms of malnutrition? Dakar, Senegal, was chosen as a case study due to the prevalence of malnutrition, and the presence of a dynamic network of local civil society-led projects in support of agroecology, including support to domestic market outlets. Three market sites were selected based on : urban or peri-urban, agroecological food products sold, including fruits and vegetables, low-income consumers purchase food at this market. The methodology is a combination of qualitative and quantitative data collection tools. Semi-structured interviews (n=40) were carried out with actors involved in agroecological food markets, including consumers, producers, traders, market vendors and development partners (bilateral cooperation agencies, international organizations). Three focus groups with consumers in the sites were held with women. A structured survey was carried out with 120 consumers. Preliminary findings show that health, food safety and quality are major motivations for involvement in agroecological food markets, whether they are consumers, vendors or producers. Urban markets rely on direct sales and/or short chains, often with development organizations supporting the initiatives, giving them considerable power within these markets. Trust and reputation are at the core of the relationship, which depends on vendors' capacity to effectively respond to consumers' concerns. Although agroecological products are priced competitively, there is a perception that agroecological products are more expensive than conventional products and inaccessible to low-income consumers. We explore several key concepts to understand the dynamics operating in Senegal, including structural inequalities, cultural foodways, social embeddedness, and dominant narratives about agroecology, local food and safety that help build connections between low income households and urban agroecological markets.

Designing for New Publicness: Learning from Tokyo and St. Petersburg.

Our paper explores how transdisciplinary approaches to urban design can result in a renewed interest in urban public space and foster a sense of "togetherness". The design of public spaces plays a crucial role in shaping how individuals experience and interact with the urban environment — through the movement of bodies, the texture of surfaces, and aesthetic senses that infuse them. Such design ought to combine insights from sociology, politics, architecture, and decision-making processes. Specifically, our paper builds on the experiences and results of two interdisciplinary practical workshops in participatory urban design, one conducted in Tokyo and the other in St. Petersburg. In Tokyo, a city traditionally characterized by small-scale urban fabric, recent developments reflect competing trends: large, monolithic private projects alongside an emerging collective understanding of the sociopolitical significance of public spaces. In contrast, St. Petersburg's public spaces also undergo a renaissance, which is nevertheless associated with a very different political agenda away from democratic, participatory publicness. Both non-European cases can provide an insight into what is public about the public space, as well as the potential of social urban design to redress segregation.

From 'trophy' to 'patrimony'

This presentation is based on a decade-long ethnographic study and camera-led interviews conducted in Kaliningrad, Russia. Formerly German East Prussia, the region experienced unprecedented levels of violence during and immediately after World War II. Its German-speaking population was drastically reduced, and the survivors were later deported. New Russian-speaking settlers were brought in. As with other instances of occupation and population displacement, new historical narratives emerged to support claims of ownership. However, subaltern practices of reconstruction, claiming, and appropriation of historical memory persisted. They formed around the traces of German-period architecture, blueprints of urban spaces, photographs, and small objects. How do these entities 'act,' and what effects do they have on their owners, users, and keepers? What are the dynamics and differences in their performativity? Drawing on examples from the fieldwork, I demonstrate that collecting in Kaliningrad serves as a form of evidencing. I explore the ways in which such evidencing occurs: through imagination, guessing, staying with the unknown, and delegating agency. The presentation concludes with an analysis of the politics of heritization, and its problematic status -- between forgetting and historical recovery, commemoralization and cultural appropriation.

"Somewhere between Comfort and Crisis": An Analysis of Humour As a Means to Deal with Challenging Times in South Africa

"Kuhlekwa noma kufiwe", a Zulu phrase translated to "laughing in the face of adversity"; describes how humour is a means of creating dialogue, addressing important issues and forming social bonds in South African families and in the wider society. Growing up in a large and multifaceted family, humour has always been a way to start difficult conversations, react to difficult situations, create and re-create memories. Even though it may be seen as a diversion from facing difficult issues head-on; it somehow has cemented the social bonds in my family. Similarly, the SA social media space which I observe as a macro level virtual family, emulates the way in which my family utilises humour. The emergence of social media initially for the purpose of communication and forming network communities, has grown into a space whereon various social issues are discussed and reacted to. It has evolved from a means of information dissemination into a daily virtual reality for many South Africans. During the Covid-19 pandemic hard lock down; South Africans were riddled with fear, confusion and uncertainty about this new illness and its implications. However, through humour expressed and shared on social media, South African families and society found a way to cope with challenges and uncertainty during that time. This did not remove the seriousness of the situation; instead, humour created a means for South Africans to cope with the challenging times ahead and create virtual social bonds. Since then, platforms such as TikTok have become instrumental for both content creators and consumers to analyse and re-create social issues. This paper analyses how humour is instrumental in dealing with crises at a micro and macro level, through examining how diverse families and individuals use it to navigate their challenging lives on social media platforms in the South African context.

Single Parenting in Kazakhstan

This study presents a sociological analysis of different aspects of everyday life of single-parent families in a large city of Kazakhstan. The article focuses mainly on the formation of a model of social and economic adaptation of a Kazakhstani single-parent family, explaining how a single parent organizes and combines family life and child raising with his/her work and provision of economic independence of his/her family. In Kazakhstan, as in many other countries, one can observe increase in the number of single parents, which actualizes research interest in this family type. This paper presents findings of a study aimed at exploring life within single-parent families, strategies for their survival, and related problems, which was carried out using qualitative methodology advantages. In addition to a number of typical reasons for the emergence of single-parent families, which largely include divorces, unwillingness of partners to create a family, and the planned pregnancy for the purpose of giving birth to children outside of marriage, the phenomenon of unofficial marriage, concluded only as a result of religious ritual, is typical for Kazakhstan.

Studies consistently demonstrate that single mothers are in a rather unfavorable economic situation, which is aggravated by the economic crisis in the present-day Kazakh society. Extended families and informal social ties are the most important source of economic, emotional and psychological support for this type of family in Kazakhstan.

MAGNUSSON, CHARLOTTA (Swedish institute for social research (SOFI), Stockholm university, Sweden)

Navigating the Path to Healthcare: School Rank and Its Impact on Care Occupation Choices across Gender and Social Class

Our paper examines how the intersection of gender and social class within educational institution shape career trajectories in healthcare occupations, a sector traditionally dominated by women. We explore how students' relative academic performance within their school (measured as ordinal

rank within the school's grade distribution) influences their occupational choices, considering both gender and social class differences. Using Swedish administrative data on students who completed ninth grade between 1990 and 1997, we assess how relative school rank, alongside individual ability, affects access to prestigious healthcare professions.

Preliminary findings indicate that school rank strongly predicts entry into the medical profession, with higher-ranked students significantly more likely to become doctors. However, gender differences are pronounced: women's healthcare career outcomes, especially in female-dominated roles like nurses and nursing assistants, are more sensitive to school rank than men's. Additionally, social class plays a pivotal role, as students from higher social class backgrounds are more likely to become doctors, particularly when they occupy top positions in their school's grade distribution. In contrast, students from lower social class backgrounds with lower school ranks tend to pursue nursing assistant roles.

By addressing the intersection of gender and social class, our study contributes to the theoretical frameworks of cumulative and compensatory social characteristics in educational attainment. Our findings highlight how educational systems reinforce both gender and social class inequalities in access to higher education and prestigious careers, particularly in the healthcare sector. By linking students' school experiences to occupational sorting, we shed light on how educational systems perpetuate both gender and social class inequalities in access to prestigious careers.

Navigating Ethics and Positionality in Community Research: Reflections from Fieldwork with Migrant Communities

This presentation compiles the reflections from fieldwork and theoretical study of the methodology, ethical considerations and findings of the author's ongoing doctoral project, examining the interconnections of housing, migration and informality. The fieldwork is conducted using ethnographic qualitative methods of in-depth interviews and passive observation, with Pakistani Migrants and Refugees in North Italy, who may be perceived as vulnerable groups.

The study investigates the integration and inclusion experiences of migrants, focusing on their housing access and entanglements with arrival infrastructures over their migration and settlement trajectory. The presentation emphasizes the complexities of applying ethical protocols in qualitative research, highlighting the subjective nature of data collection and analysis. This calls for the researcher to engage in interpretation, observation and reflective inquiry. The author explains the importance of social constructivist and interpretative frameworks as a guiding methodology for this project, and the chosen approach of on-ground community research to inquire into lived experiences.

The author argues that while research ethics provide essential frameworks and guidelines for making informed decisions throughout various research stages, including design, analysis, storage, and dissemination, they can also be restrictive and insensitive to innovative and nuanced studies. In this context, positionality and ethics are critical for the author in understanding their relationship with the migrant community which they observe in a foreign land, but share a homeland and mother tongue with.

The discussion emphasizes the importance of researchers conducting participatory and community-engaged research to be knowledgeable about the community's social and spatial dynamics, fostering sensitivity and respect. The author advocates for greater inclusion of qualitative research perspectives in ethical committee deliberations, aiming for more context-sensitive guidelines. In conclusion, the reflections highlight the responsibility of researchers to represent knowledge and narratives without prejudices, respecting the socio-cultural practices and spatial logics of the communities involved.

Feminism in the MENA: Unraveling Local and Global Dimensions

This talk explores the diverse and dynamic landscape of feminism and women's movements in the Middle East and North Africa (MENA), with a particular focus on over two decades of research in and on Iran. While grounded in my work on Iran, I will zoom out to examine both the commonalities and differences in women's movements across the region. These movements have emerged and evolved at the intersection of several forces: state authoritarianism, global entanglements—including wars, sanctions, and international interventions—domestic and regional rivalries,

and the influence of Islam. I will discuss the convergences where feminists across the region find common ground, as well as the divergences that reflect the unique socio-political landscapes of each country. By exploring these variations, I aim to illustrate the ways in which women's movements in the MENA region are not monolithic but are deeply shaped by local, national, and global forces, demonstrating their resilience, adaptability, and strategic responses to the multiple layers of power they confront.

SHAKIR, SYRA* (Leeds Trinity University, United Kingdom)

Anti- Racist Activism in Higher Education, Let's Disrupt, Deconstruct and Decolonize.

ANTI RACIST

Accept racism exists Not being racist is not enough Time to listen and learn from people's experiences Information, understand the terms, data, research Racism harms everyone, know the reality Accountability and responsibility Care, compassion and empathy I can make a change Support, report, challenge Time to take action and make changes This acrostic defines anti-racism and invites everyone in the call to action to become anti racist. Anti-racism embodies the principle that all races and ethnic groups should be treated equally and have access to the same opportunities (Kendi, 2019). However, the essence of anti-racism extends beyond this belief, it involves taking active measures to address current inequalities. This includes the deliberate deconstruction of systems, privileges, and routine behaviours that uphold and standardize present-day forms of white supremacy (Delgado and Stefancic, 2023). In relation to higher education, anti-racist practice helps to create a more equitable and inclusive environment by actively addressing and dismantling systemic racism within the institution (Salisbury & Connelly, 2021). There is a notable link between students' sense of belonging and their academic success (Thomas, 2012). Anti-racist practices have been shown to reduce racial disparities in educational outcomes by providing support systems tailored to the needs of racially marginalised students, such as mentoring programs, academic support, and mental health services (Jankowski, 2022). This presentation will detail the ways in which my activism has affected policy change at the university to build an anti -racist institution. I will provide practical take aways and lessons learned to embedding such an approach, within a critical race theory framework using both teaching practice and research scholarship whilst engendering hope and solidarity to those working in higher education.

SHAKYA, MALLIKA* (South Asian University (SAU) / Friedrich Alexander Universitat (FAU), India)

(AUTO)Biographical Nationalism: The Legacies of Twentieth Century Radical Elites in the Himalayas

This paper explores the contributions of two early 20th-century radical figures from the Himalayas: Chittadhar Hridaya from Nepal and Rahul Sankrityayan from India. Their intertwined lives and works traversed the Himalayan region, forging connections between Lhasa (Tibet), the Kathmandu Valley, and the Indo-Gangetic plains of northern India. By juxtaposing their autobiographies with their diverse roles as travelers, fiction writers, poets, traders, and radical dissenters, the paper highlights how they shaped early discourses on anti-colonialism and opposition to dictatorship in northern South Asia.

Through a sociological lens, their experiences are examined alongside contemporary ethnographies of ongoing social movements, particularly those centered on indigenous and Marxist activism in the Nepal-India border region, which regard these two dynamic individuals as symbolic figures. The paper raises critical questions about the relevance of early 20th-century social and literary history for today's young activists resisting the rising tides of religious and market fundamentalism in South Asia. It also investigates the paradoxes inherent in the ways ideas from a century ago are leveraged by those seeking to undermine progressive subversion. Ultimately, this study situates their literary works and ethnographic narratives within broader sociological debates concerning the epistemologies of cultural writing.

Navigating the Global Landscape: The Role of Social MEDIA in Career Choices for Young Indian Women

In an increasingly interconnected world, social media has become a vital tool for career development, especially for young women seeking to navigate global opportunities. For young Indian women, the interplay of cultural expectations and digital platforms presents unique challenges and possibilities. In the context of a rapidly evolving job market, social media has emerged as a critical tool for professional networking and personal branding. Platforms like LinkedIn, Instagram, and Twitter offer young women access to global job markets, industry insights, and success stories that inspire ambition. However, while social media provides significant advantages, it also presents challenges such as information overload, unrealistic portrayals of success, and cyber bullying.

This paper explores the role of social media in shaping the career aspirations and choices of young Indian women seeking international opportunities and how they navigate these digital landscapes to leverage social media for career development, emphasising the importance of strategic usage and digital literacy in an increasingly globalised world.

This study employs a mixed-method approach, integrating quantitative surveys and qualitative interviews with 120 young Indian women (ages 21–30) across various educational institutions and professional settings to gather data on social media usage and career aspirations. An in-depth interview was done with five respondents to obtain qualitative insights into their experiences with social media in connection to their careers.

SHANKARAYYA HIREMATH, SUMANTH* (Rani Channamma University, Belagavi., India)

Towards Sustainable Sanitation in Urban Areas: A Pragmatic Study

One of the most pressing issues facing the world today is meeting the sanitation needs of rapidly growing urban populations, which is a major obstacle to a healthy and productive urban lifestyle. About 80 million people around the world still use open defecation methods, and 700 million more do not have access to proper sanitation. The problem of unstable or nonexistent sewerage systems is becoming more acute in urban settings, particularly in dense, low-income, and informal neighbourhoods. Contributing factors include issues with toilet space, the management of septic tanks and pits that pollute open sewers and groundwater, and the absence or inability to purchase faecal sludge disposal services. Polluting lower-income urban neighbourhoods with sewage that flows into storm drains and rivers exacerbates existing inequalities. Climate change, floods, water scarcity, droughts, and rising sea levels, all of which threaten the resilience of current services, impede the progress of billions of people without access to safely managed services.

Urban sanitation has reached a turning point. Both the global community and national governments are becoming increasingly aware that traditional sewer-based sanitation systems are insufficient for certain metropolitan regions. In areas where sanitation is essential for disease prevention and risk reduction, such as neglected tropical diseases, cholera, polio, antibiotic resistance, and environmental surveillance of pathogens, the World Health Organisation (WHO) endorses partnerships between WASH and health programs. There are system failures and missed opportunities to address interconnected urban problems, such as a lack of political will, insufficient technical, financial, and institutional resources, and an unwillingness to integrate safe sanitation systems into broader urban development. This paper looks at the difficulties of establishing sanitation systems in cities and discusses strategies for making those systems more sustainable.

Globalisation, Modernity and the Changing Cultural Landscape: A Critical Review

The transformative globalization processes are the driving force behind changes that are re-shaping the social, cultural and economic world order. It is transformatory in nature because it has the potential to change people's life's experiences allowing them to reflexively respond to the dynamic predicament of the uncertain world. The notional term VUCA (Volatile, Uncertain, Complex, Ambiguous) used widely to explain the changes in the society and people's

difficulties to grasp the changes is now being replaced by the term BANI (Brittle, Anxious, Non-Linear, Incomprehensible) suggesting the fragility and shattering of the many illusions of humanity's perception of the world. With the rapid changes in the contemporary societies through globalisation processes, the potential impact of the changes is multi-folded and multi-faceted with far-reaching affects across cultural and geographic boundaries. The paper is an attempt to critically map the changing landscape of the relationship between globalisation, modernity and its socio-cultural impact from varied viewpoints – homogeneity, heterogeneity, hybridity perspective etc., with the explorations in the Anthropogenic era and conditions.

SHANKER, DEEPTHI* (Central University of Odisha, India)

The Practice of Yoga and the Theory of Triguna of Ancient India As an Indicator of Well-Being

Ancient India's theory of Tri-Guna presents itself as a potential hope for exploring new dimensions of understanding human well-being and its measurement. The concept of Tri-Guna consists of three energies or gunas namely 'Sattva', 'Rajas' and 'Tamas'. India's ancient scripts portray that these three elements are present in all human beings in different degrees and combinations. It is manifested in individual's differential behaviour and also gets exhibited in their 'well-being' quotient. The tri-dimensional classification of Gunas (*Sattva*, *Rajas*, *Tamas*) entails holistic well-being of the individuals that includes the physical, mental, spiritual elements of personality. This paper is an attempt to examine the relationship between the practice of Yoga, Gunas and the Well-being indicators. While the paper presents the theoretical review of the indicators of these Gunas from the available literature, it also draws attentions to the practice of yoga, the age-old ancient Indian wisdom popularly believed to be a key indicator of experiencing well-being. While there is no agreed definition of well-being, there is also no universally agreed method of measuring well-being either. Recent literature on the subject indicate that well-being is a combination of 'feeling good' (hedonic view) and 'functioning well' (the eudaimonic view). Literature state the need for multidimensional approach to the definitions and measurement of well-being for the advancement of well-being studies. The paper serves as an initial foundation for more systematic and methodical examination of the larger empirical data from across cultures using ancient Indian 'well-being' concepts. This study shall be a contribution towards the development of the multidimensional approach that includes a diverse well-being construct from across cultures and societies. The Vedic Personality Inventory, Psychological Capital Questionnaire, Mental Health Continuum, Big-Five Personality inventory etc., shall be used to collect and analyse data.

In the Frame, Involuntarily: An Enquiry into the Concerns of THOSE in Background

The representation of any individual on motion picture can be a complicated task to undertake if one considers consent and future implications to the individual being represented. That's why several platforms screening the professionally produced audio-visual material, deem it important to have consent letters from all those who appear on screen. However the situation has changed to a large extent in last decade. With the twin forces of mobile phone cameras and free video-sharing platforms, the superpower to represent others on screen has now been democratised. Locations earlier known for shopping, tourism, religion, culture, mass transit etc have now also become sites for production of amateur videos.

This new paradigm of audio visual production has also led to several citizens ending up involuntarily in the backgrounds of publicly shared videos. Most of the creators do not care to blur the identities of people coming into their videos. How does this affect an individual stepping out of home into spaces where he/she can end up in a publicly shared video without his/her knowledge and consent.

The case of Delhi Metro, in this context is a significant one. It has been in discussion for last few years for the amateur videos being produced here. This research attempts to understand the situation of commuters of this mass transit system, who now suffer the risk of being represented in unexpected ways in these videos. How does this affect these commuters? The research will use interviews with some commuters of Delhi Metro to understand the impact of the phenomenon of recording amateur videos in public spaces on those who end up being featured in the background of the main action in these videos. This research will be an attempt to unravel the nuances of the impact left by an emerging practice in audio visual production.

Voices from the Grassroots: A Study of Youtube Channels Raising Citizens' Issues in Haryana

This study explores the eclectic range of issues, civic matters and political discourse articulated by grassroots media professionals. The research project delves into the content and working of certain small YouTube News Channels in Haryana, which have been working to bring to the fore the civic and political issues as seen from the perspective of those who are at the margins and who do not find a voice in mainstream media. The civic issues they face remain away from the news spotlight, not just due to their limited relevance to the broader audience but also due to the general apathy of mainstream media towards such issues. The role of grassroots-level media outlets becomes crucial when the well-funded mainstream media completely ignores civic matters in favour of political topics. The outlets under study stand out for presenting views and stories often overlooked by the mainstream media and for their work for strengthening grassroots level democracy. As these platforms voice the civic concerns faced by ordinary people, they also shape an alternative political discourse by drawing attention to issues generally pushed outside of the public consciousness.

This study is based on the growing significance of new and emerging mass media in shaping alternative narratives and democratizing the flow of information. The study will conduct a thematic analysis of the stories published by these news channels and will also conduct in-depth interviews with the people behind the channels. The paper aims to underscore the vital role of small scale independent media outlets in voicing the issues that are relevant to local communities and often ignored due to a lack of wider relevance and appeal. These outlets, by focusing on local issues, play a crucial role in the media landscape, ensuring that these issues are not overlooked.

Preventing Colorectal Cancer Among Immigrants

Beyond genetic and biological factors, social and cultural factors can also play an important role in reducing the screening for and thereby incidence of colorectal cancer (CRC). The influence of ethnicity and migration on CRC screening is not a new idea but a growing number of recent studies have found racial and ethnic inequities in CRC screening, with foreign-born populations often less likely to be screened. However, the topic has been understudied, especially in Israel where there is a diversity of immigrant groups, making up about a third of the population.

This study sought to understand colorectal cancer screening rates among immigrants to Israel as well as to analyze how CRC screening varies by key demographic groups, including immigrant characteristics, as well as variations by screening type.

The medical records of 300,000 patients aged 40-75 of a leading Israeli HMO were analyzed, of which 100,000 were born in another country, using data from 2011-2021. Descriptive and multivariate analyses were performed. We analyzed screening according to three dimensions of immigration which, according to the literature, can be related to screening: country or region of birth, years since migration, and age of migration.

We found differences according to country/region of birth, migration year, age at migration and type of screening. Immigrants from the Former Soviet Union, Europe and North America in particular performed fewer screening tests. The reasons for the lack of testing found in this study include both personal factors (eg health behaviors and lifestyle) and systemic factors (eg health system utilization and provider behaviors).

We conclude that it is necessary to increase screening rates for CRC among certain immigrant groups in Israel. Barriers can potentially be addressed through interventions such as increased education, facilitation of health system utilization, innovative solutions such as community health workers, and general prevention initiatives.

The Complex Relationship between Observing the Sabbath and Health

Background: The sabbath is a key element of many religions and has a variety of social, psychological, and spiritual aspects that can affect health and well-being. The Jewish sabbath has distinctive features, including many

proscriptions and prescriptions. However, there has been surprisingly little research about this issue despite its potential implications for both individuals and organizations.

Aims: This study examined the nature of the relationship between observing the Sabbath and both physical and mental health, while considering the social context and analyzing how findings varied by sociocultural and other demographic variables as well as by aspects of religiosity and spirituality.

Methods: An anonymous survey was distributed online in September-October 2024, using a variety of platforms to increase representativeness. The sample included 331 adult Jews in the U.S, Europe and Israel. The survey consisted of 68 questions related to several dimensions of religion, spirituality, physical health, mental health, health behaviors, social environment and sabbath observance as well as demographic information. Descriptive and multivariate analyses were performed.

Results: The sample represented a diversity of levels of religiosity, spirituality and Sabbath observance. In general, a positive albeit complex relationship was found between sabbath observance and health, with a stronger relationship for mental than physical health. Sabbath observance was associated with improved coping as well as better overall well-being. Outcomes varied by some contextual and demographic variables. For example, those who observed the sabbath with others had greater well-being.

Conclusions: The Sabbath can be an important source of social and religious capital and can counterbalance modern life's stresses and ever present distractions, and sabbath observance can have health benefits. Steps should be taken to raise awareness of these benefits as well as facilitate Sabbath observance. The study's findings also have implications for organizations by promoting employee well-being and effectiveness.

Immigrant Self-Advocacy and Local Politics across Three European Cities: Case Studies from Girona, Sofia, and Athens

This article explores the intrinsic factors influencing immigrant participation in local policymaking in four European cities: Girona (Spain), Sofia (Bulgaria), and Athens (Greece). While national policies, legal frameworks, and societal attitudes play significant roles in shaping political opportunities for immigrants, urban centers are increasingly adopting proactive approaches to integration and diversity. In these cities, immigrant populations, concentrated in urban areas and close to local decision-making processes, can engage through various channels such as voting, neighborhood councils, and advocacy organizations. This study addresses key questions about how immigrants are involved in local policymaking, the conditions under which they organize, and the internal dynamics within immigrant communities that influence their participation.

Based on political process theory, the study argues that immigrant political engagement is a dynamic and interactive process shaped by multiple actors and collective negotiations. The research utilizes a mixed-method approach, including six focus groups, fifteen qualitative interviews, and a three-wave online survey with immigrants involved in Self-Advocacy Teams (SAT). The findings highlight concerns about under-representation and limited political engagement among immigrants. While national and local dynamics play crucial roles, internal factors within immigrant communities significantly affect their success in political participation. Three key internal factors are identified: the strength of relational networks, which either facilitate or hinder engagement; framing processes, which shape how immigrants articulate and mobilize around collective concerns; and leadership patterns, which influence the effectiveness and representativeness of advocacy groups. These insights emphasize the need to understand the internal dynamics within immigrant communities to facilitate their political participation at the local level.

SHARMA, RUKMANI* (Ghoshpukur College Siliguri, India)

Navigating Choice, Agency and Social Class: Maternal Health Care in Siliguri Town, India

This paper aims to discuss and analyze the culture of service in health care institutions in Indian context. Based on ethnographic observations and in-depth interviews, it argues that culture of service in medical institutions shapes the choices and agency of pregnant women regarding their preferences for

place for health care. Culture of service in this context refers to the sum total of the whole material and non-material culture of a healthcare institution. The paper examines the differential services in maternity care institution that lead to women belonging to specific classes choosing the health institution accordingly. In addition to the medical care institutions' resource structure, social class also shapes the decision making of pregnant women. In this research one private and one public medical institution have been studied. And a total of 60 women had been interviewed, 30 from each institution.

Drawing on the social constructionist approach, this study shows how birth knowledge, which includes biological and social aspects of pregnancy and labor, differs between middle-class women receiving care at Private Hospital and disadvantaged women using public healthcare. It provides a comparative account of middle class women and poor class women's agency while they navigate the medical system. Middle class women prioritize continuity of treatment and prefer obstetricians who communicate well and build trust. Access to information and perceived technology advances in healthcare empower them to make birth choices, whether they prefer technological or traditional approaches. Although institutional issues hinder natural deliveries in privatized settings. Conversely, poorer women have fewer choices and control. They typically have to use impersonal public healthcare due to economic and educational constraints. Lack of continuity and contact with healthcare providers causes dissatisfaction and helplessness.

From Employers' Homes to Political Rallies: How South African Domestic Workers Mainstream Their Rights

How do marginalized workers position themselves in the context of mainstream politics? This paper examines the case of the domestic workers' movement in South Africa to show that often marginalized section of workers, particularly those lacking disruptive power, position themselves such that their issues resonate with the prevalent hegemony in a specific historical context. This resonance of specific issues with the hegemony allows workers to strike up a conversation with the 'public' and mainstream their issues. To establish this argument, the paper draws on the ethnography of the domestic workers' movement in South Africa. The paper shows that the South African domestic workers' movement positions domestic workers in three crucial ways: 1) as *caregivers for South African society*, who contribute to the growth and prosperity of the capitalist economy; 2) as *urban poor Black women* whose plight as workers is a remnant of apartheid and therefore a disgrace for the democratic nation, and; 3) as *disenfranchised African population*, who irrespective of their national origin, do not find dignity in the rainbow nation. Through these framings, domestic workers amplify the significance of their rights and transform them into mainstream political issues that merit political parties' attention. The findings contribute to scholarship on labor and social movements by examining how marginalized groups craft leverage when they lack conventional sources of power.

RC02-37.1

SHARMA, SONAL* (Tufts University, USA)

Urban Space and Domestic Workers' Organizing Practices in India and South Africa

This paper discusses the differences in mobilization strategies of domestic workers across various national contexts. Historically, domestic workers have faced challenges in organizing due to the fact that their workplaces are their employers' private homes. However, in recent decades, domestic workers have managed to overcome this obstacle and build collective organizations. Drawing on comparative ethnographic fieldwork from India and South Africa, the article demonstrates that while the privacy of employers' homes has posed a hindrance to organizing efforts, domestic workers have innovatively focused on multiple and unique sites for mobilization. For instance, domestic workers' organizations in India and South Africa strategically utilize locations such as shopping malls, bus stands, promenades, and low-income residential areas to mobilize workers. Despite the similarity in the innovative use of non-workplace sites for mobilization, there are significant differences between the organizations in the two national contexts, which reflects how domestic workers have navigated the intersecting structures of race, caste, gender, and class in their respective national contexts. Building on scholarship highlighting the dialectical relationship between geography and social structures, the paper argues that while urban space shows historically specific structures of power, domestic workers' organizing practices reveal how marginalized groups transform and/or reconfigure those structures through their use of spaces.

Negotiating Life before Birth and Scavenging for Survival: Unveiling the Hidden Consequences of Child Malnutrition in Rural South Africa

A qualitative study using ethnographic research tools such as life histories, observations and interviews, captured the lives of 300 women and their children in the Eastern Cape province of South Africa, who face hunger and malnutrition. The research noticed how the problem of child malnutrition has been a continued issues since 2018, when the department of health in the province, first published its data on acute child malnutrition in some of the Eastern Cape districts. Today, on the after mouth of the COVID-19 pandemic, the entire province has been labeled by the human rights commission as a child unfriendly province, advocating for real efforts by the government to address acute child malnutrition. The research noted data from organizations like Operation Hunger, Statistics South Africa and UNICEF on the current state of child malnutrition, like 4.6% in severe malnutrition, 5.4% in low births weights, 21% overweight and 24.8% in stunting. Even though a lot has been spoken and written on the physical indicators of malnutrition to children, less has been addressed on hidden consequences of child manutention and this paper addresses such long-term hidden consequences of child malnutrition, such as physical growth, cognitive development and emotional and social development. The research presented here has used the mastery of sociological imagination to connect the drivers of child malnutrition in the province with current interventions on ground, while addressing the hidden long-term consequences of child malnutrition as a growing disaster in rural South Africa

"Green Carrots?" Distribution of Presidential Grants for Environmental Initiatives in 2017-23 As an Element of Regional Environmental Politics in Russia

This article aims to identify factors associated with distribution of Presidential grants for environmental initiatives in 2017-23 in Russia. The main argument is a presence of specific political logic in supporting regional eco-initiatives in the authoritarian context. While previous studies considered environmental conflicts, as a rule, on the part of eco-activists, in this paper we focus on studying the strategy of the authorities. For this purpose, we propose using the concept of 'regional environmental politics'. Assuming that the key point for the authorities is an attempt to reduce eco-protest activity, we argue that the authorities seek to use not only the "stick", meaning forceful strategies for combating protests, but also the "carrot", or strategies for co-opting eco-activists. In this model, the distribution of grants to support environmental initiatives is considered as a reaction to environmental conflicts. We test two main hypotheses about the logic of project support: a reaction to the frequency of eco-protests, and a reaction to inequality, which contributes to protest sentiments in general. We rely on several sources of empirical data. First, we use data on the distribution of Presidential grants to eco-NGOs. Second, we use a large-scale database on eco-protests. Fixed-effects models show that the distribution of presidential grants follows eco-protests logic. In addition, the distribution of grants is affected by low inequality, which in Russia is typically characteristic of poor regions. We also illustrate our arguments on the example of the Sverdlovsk region, revealing non-coincidence of regional environmental agenda and profiles of supported projects. One may interpret it as a government's attempt to affect environmental agenda by shifting attention to other problems. It shows how cooptation strategies are used in the non-democratic context.

Mitigating Cyber Risks: Individual Cybersecurity Practices

In recent decades, the widespread accessibility of the internet and digital devices has reached diverse social groups globally. However, the integration of digital technologies into everyday life also introduces cybersecurity risks for individuals (Lupton, 2016), ranging from data breaches to financial loss caused by malicious activities or vulnerabilities in digital infrastructure (Kim et al., 2011).

To mitigate these threats, individuals adopt various cybersecurity practices, which can be categorized using an information skills framework. Based on Steyaert's (2002) classification of information skills, these practices can be divided into instrumental and strategic. Instrumental practices involve basic security features, such as Face ID or password protection, while strategic practices require more deliberate actions, such as regularly updating passwords and managing cookie settings.

While cognitive studies have investigated internet users' cybersecurity behaviors (Moustafa et al., 2021), there remains a lack of sociological understanding of how individuals respond to cyber threats. Despite the increasing prevalence of cybersecurity risks, there is limited insight into the factors driving the adoption of protective measures. This research seeks to fill that gap by examining how exposure to cybersecurity threats and the use of mitigation practices are distributed across different population groups.

Using nationally representative survey data (N = 10038) collected in April-May 2024, preliminary findings reveal that 33% of internet users experienced a cyber threat in 2024. The most common incidents involved attempts to steal personal information, with 21% of respondents reporting fraudulent emails and 7% encountering fake websites. Instrumental practices were more widely adopted (70%) than strategic practices (49.6%) among internet users aged 14 and older.

This study will further investigate how socio-economic factors such as age, education, and digital literacy shape the adoption of cybersecurity practices.

Negotiating Membership: A Comparative Study of Echr Accessions in Hungary, Poland, Romania, Russia, and Ukraine

This paper presents an in-depth exploration of the complex process of accession to the Council of Europe (CoE) and compliance with the European Convention on Human Rights (ECHR) by five Eastern European countries—Hungary, Poland, Romania, Russia, and Ukraine. Based on a chapter from the book "Who Are the Humans Behind Human Rights? Historical and Comparative Perspectives from Eastern Europe and Russia," produced as part of the HuRiEE (Human Rights in Eastern Europe and Russia) research project, this paper provides a detailed examination of the journey these nations undertook in aligning themselves with CoE principles.

The discussion aims to provide valuable context for attendees who may be less familiar with the CoE and the European Court of Human Rights. By tracing strategic negotiations by national governments and documenting the debates within parliaments and among political elites, this paper captures the various perspectives, priorities, and challenges that shaped each country's path toward CoE membership.

Further, the analysis delves into how these accession processes were represented in the media, highlighting the narratives and messages communicated to the broader public. This examination sheds light on political, societal, and media responses during this critical transitional period. Ultimately, the paper seeks to provide a nuanced understanding of the political dynamics, public perceptions, and broader implications of these nations' accession to the CoE and their adoption of ECHR standards.

Centering Young People's Voices and Agency: Re-Thinking Sexuality Education

In South African contexts as elsewhere, children continue to be considered 'sexually innocent' and assumed asexual. In this respect, sexuality education, now part of the core curriculum, remains a 'queer proposition' for schools, and it is intensely contested in South Africa and other global contexts. Discourse around the challenges of teaching and learning sexuality abound, and closely linked to these are critiques and suggestions from scholars on how best to approach sexuality education. Some even question whether it should be taught at all at schools and by adults within the recalcitrant idea that young people are and should remain 'innocent'. In this paper, we apply a decolonial feminist lens to rethink possibilities of sexuality education in South African contexts, with relevance globally. We specifically foreground the sexuality education classroom as a potential productive space for promoting gender and sexual justice, but also for thinking about how gender intersects with other inequalities, power and privilege. We review current critiques of sexuality education, in South Africa and elsewhere, which flag the negative and regulatory role that it often plays. The chapter raises a number of key propositions to ignite alternative imaginaries of sexuality education, including: the importance of acknowledging young people as knowledgeable agents; challenging adult authority and centredness; promote sexual literacy and agency in relation to online sexual material; and advocating embodiment and affect in teaching and learning, through, for example, creative, participatory and arts-based engagements.

Thinking with South African Oceans for Social and Environmental Justice

There has been a welcomed focus on oceans and bodies of water globally and in South Africa as part of a larger project on social and environmental challenges. This includes acknowledgement of the entangled histories of colonisation through oceans, what Isabel Hofmeyr (2019) has termed hydrocolonialism and how this is implicated in contemporary global extractivist capitalism and its impact in the (m)anthropocene. This paper speaks to a growing body of hydrofeminist scholarship in South African contexts, drawing on the work of Astrida Neimanis who coined the term, and with reference to a recently published volume entitled *Hydrofeminist Thinking With Oceans: Political and Scholarly Possibilities* that includes the work of scholars and activists located in South Africa that are thinking with ocean/s in addressing social and environmental challenges. In this paper I unpack the key philosophical and methodological framings that are emergent in this context, within the larger framework of posthumanist, new materialist, decolonial and indigenous feminist thought and praxis. Much of this scholarship is also transdisciplinary and transmodal, and engages participatory active collaborations of art and activism, also blurring the boundaries of what counts as knowledge. It includes a range of embodied, affective and relational engagements including: walking and swimming methodologies; research-creation; hauntological approaches; and artistic practices such as poetry, photo-essays and theatre. We explore here the multiple and rich ways in which contemporary South African engagements with oceans may contribute to local and global social and environmental justice by drawing together our shared responsibilities for each other as humans, other species and the planet.

Children's Digital Capital in the Digital Era: Forms & Functions

Today's adolescents have grown in a world where technology and social networks are integral parts of their life. While some of the promises of technology in helping children are obvious, the continued proliferation of digital technology also poses risks to children's safety, privacy, and well-being.

In addition to concerns for safe and secure digital engagement, there are also concerns related to the digital potential of aggravating the existing disparities in social life. The technology does not make us all equal to enter the "flat world." The new modes of digital communication may widen the gap between different social groups, favoring the groups with better socio-economic status while lagging their disadvantaged peers in fulfilling their potentials. Following sociologist Pierre Bourdieu's theory of 'habitus' and social practice (Bourdieu, 1989), this study argues that the diffusion of digital technology has created new 'habitus' to produce different forms of digital capital, which will throw individuals into new domains and new interrelations between economic resources, internalized aptitudes, and social positioning through productions and reproduction. Internet and digital technology may even compound the deprivation for children who are already in a disadvantaged situation with limited resources and less preparedness. Adopting an interdisciplinary perspective intersecting social and behavioral study with cybersecurity, this study proposes to conceptualize the digital capital with the following three domains to encompass the multidimensionality of this concept: external capital, bridging capital, and internal capital. Empirical evidence from surveys will also be integrated to illuminate the effective factors to cultivate children's digital capital and to promote children's meaningful digital engagement. This study will contribute to the discussions of building equitable societies to enhance the individual flourishing in an increasingly digital mediated world.

Unequal Advantage: Fatherhood Premiums and Penalties across Income Distribution in China

Objective: This study investigates how fatherhood is associated with men's income in China and variations of the effect across income distribution.

Background: Prior research on the fatherhood effect has predominantly focused on Western developed countries, in which most studies found wage premiums, particularly among higher-income fathers. The unique institutional and cultural context in China provides avenues for extending this body of scholarship.

Method: We conducted unconditional quantile regression analyses with fixed effects using data from ten waves of the China Health and Nutrition Survey.

Results: Although the association between the number of children and men's income was non-significant in the total sample, the effect of fatherhood turned out to be masked by heterogeneity across income strata. Specifically, fathers' higher income at the bottom of the income distribution was mainly accounted for by selection. In contrast, fatherhood premiums were found among middle-income men and fatherhood penalties were observed among high-income men.

Conclusions: Our results revealed different patterns of fatherhood effect across income distribution than those found in Western developed countries. We interpret our findings based on the unique work-family context and different perceptions of fatherhood roles across income strata in China. Our study underscores the interplay of socio-cultural context and income stratification in shaping the effect of fatherhood and extends the understanding of labor-market inequalities from the views of status intersectionality. Policy interventions to raise fertility rates in China should target men as well as women and take the differential effect of fatherhood across social strata into consideration.

Foresight Study on Digital Trust in Taiwan for 2040

People's daily lives are more and more embedded to the digital environment, including the use of digital technology in everyday lives and exchange messages through various social medias and other online platforms. However, the "trust" in the digital world is always a central issue. There could be at least two dimensions of digital trust, the mechanical digital trust and relational digital trust. The "mechanical digital trust" is related to the issues like cybersecurity, transparency, fair and other issues on technology mechanism. Instead, the "relational digital trust" is concerned more about how the people's attitude toward to the technology, the experience of using

technology and how to make people feel that digital technology is trustworthy. Different generations and social economic classes maybe have different way of trust building process with the new technology. Practically, in the coming years and decades we may expect to see the artificial intelligence and robot will more involve in our daily lives. Are we well prepared to live with the robot at home? Are we expected the robot become a caregiver to take care the elders? This session welcomes papers to discuss the issue of digital trust and foresight with empirical studies, scenarios and other innovative ways of thinking.

SHIH JHANG, HUANG* (University of Tokyo, Japan)

The Transformation of Public Discourse on Sexual Minorities in Japan

In the past 30 years, sexual minorities, especially LGBTQ individuals, have increasingly garnered attention in Japan's public sphere, and debates on social issues related to sexual minorities have gradually taken shape, aligning with localized contexts. Within this backdrop, the field of Japanese sociology has conducted more detailed and comprehensive studies on sexual minorities, particularly the LGBTQ community, yielding significant results. On the other hand, numerous pieces of evidence suggest that the formation of such public discourse does not directly correspond to the narratives of sexual minority communities and activists. Many scholars have pointed out the political and economic intentions behind the attention to sexual minority issues and the problems that arise from these.

However, as research on sexual minorities, especially LGBTQ individuals, tends to focus on the lived realities of oppressed groups, it has overlooked the process of problematizing these realities. The counter-discourses initiated by specific sexual minority communities and activist organizations since the 1990s have gradually been absorbed into various social systems, with a trend toward mainstreaming through the implementation of SDGs policies and related legal frameworks.

Therefore, this study focuses on the formation of public discourse on sexual minorities, particularly LGBTQ individuals, in Japan. It conducts discourse analysis using news reports from the Yomiuri Shimbun and the Asahi Shimbun over the past 30 years since 1990. The study finds that Japan's public discourse on sexual minorities operates within two paradigms: a "discourse of othering" and a "discourse of diversity." In the former, sexual minorities are imagined as the 'other' of mainstream society, while in the latter, they are seen as offering diverse social values. Furthermore, in the overall shift of Japan's public discourse on sexual minorities from othering to diversity, the testimony of "concerned individuals" as a means of problematizing social issues has become the most common strategy.

SHILAJIT SENGUPTA, SHILAJIT SENGUPTA* (TISS Mumbai and National Institute of Advanced Studies, India)

Caste Dynamics of Internal Migration in India – Studies from West Bengal

Internal migration in India is rooted in the agricultural transformation and has an inherent caste-based stratification. While upper-caste skilled migrants comprise the affluent urban middle class, lower-caste unskilled informal labourers come to the city, often permanently or seasonally, as daily-wage-based non-farm workers, primarily catering to the development needs of the former groups. Additionally, the decline of employment opportunities in agricultural work resulted in rural distress and caused large-scale rural-to-urban migration.

Against this political-economic backdrop, declining farm-based employment in West Bengal has jeopardized the livelihood of the daily wage-based agricultural workers belonging to mainly lower caste groups. Calcutta, the capital city of British India, attracted migrants to its industrial suburbs and absorbed the seasonal agricultural workers who were finding non-farm jobs. However, during the post-independence era, industrial stagnation in the state dovetailed with agricultural decline, and political unrest resulted in unemployment problems. Consequently, the first wave of out-migration started when socio-economically dominant upper-caste Bengalis began to leave the state to find better work opportunities. Later, the lack of opportunities in agriculture pushed the former agricultural workers to migrate to informal non-farm sectors that were developing in more industrialized states. This has transformed West Bengal from a migrants' 'destination' to a migrant-sending state. Literature shows that since the 2000s, out-migration in the state has surpassed in-migration. In 2023, approximately 21 lakh labourers migrated, making it India's fourth-largest migrant-sending state.

Following the MDR framework, this paper attempts to explain how historically embedded and hierarchically structured caste dynamics in the context of changing economic and social activities have shaped the

inequalities in the new migration regime of the state. Through qualitative interviews with precarious lower-caste migrants and their families from the three backward districts, it shows the development of a resilient arrangement of governmentality amidst the development of a 'migrant-sending' state.

SHILOVA, VALENTINA* (National Research University Higher School of Economics, Russian Federation)

BIKOV, KIRILL* (Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation)

"New" Villagers: Typical Scenarios of Moving to the Countryside and Strategies of Interaction with Local Residents

The theoretical foundation of this study is based on the conceptual work of Russian scholars involved in the "Ugor Project" (from 1996 to the present), which focuses on the development of rural areas in the Near North of the Russian Federation during the post-Soviet period. This includes the work of sociologist N.E. Pokrovsky and social geographers T.G. Nefedova and A.I. Treivish.

The report focuses on the strategies of adaptation adopted by former urban residents ("new" villagers) who have moved to rural areas. Depending on their motives for relocation, material and professional resources, types of activities, and cultural capital, these individuals choose different strategies for interacting with local communities, territorial authorities, and their immediate neighbors.

The authors provide three case examples: (1) the story of a 60-year-old man who moved from a regional center to a depopulated village to revive it; (2) a 45-year-old agronomist who relocated from a city in the Moscow region to a rural province for a high-ranking position with the aim of developing an agricultural nursery; and (3) a 38-year-old journalist who prefers combining life in the countryside with remote work. These cases allow the authors to identify and describe three typical scenarios—return migration, professional mobility, and downshifting—while not overlooking the unique characteristics of each life situation.

In the report, the authors conduct a comparative analysis of the chosen strategies for interacting with local residents in relation to the life trajectories of the "new" villagers.

The results presented in the report were obtained with the support of the Russian Science Foundation Project 24-68-00055 "From the past to the future: rural communities in a post-agrarian transformation vector."

Post-Agrarian Communities in Rural Areas of the Russian Federation: Features of Self-Organization and Promotion of Creative Practices

In their report, the authors rely on empirical materials collected during an expedition 09/2024 to the central regions of Russia. The collapse of agriculture, the gradual reduction and closure of schools, technical colleges, and medical points from 1991 to the mid-2010s, led to the outflow of the working-age population.

At present, the situation is such that a return to previous conditions is impossible on the one hand, while on the other, modern challenges require new development vectors for rural areas.

In their report, the authors present a case that demonstrates the formation of new types of communities in rural areas that not only encompass rural localities but also extend into urban environments. By establishing a direct, mutually beneficial dialogue with municipal authorities and large and medium-sized farms, they are gradually starting to defend their own interests. In our case, these are beekeepers from Gorodets (a city in the Nizhny Novgorod region), who have united and gained the opportunity to influence crop rotation practices not only in the interests of farmers but also in the interests of beekeepers, lobbying for the planting of crops that contribute to the collection of quality honey harvests.

The local beekeepers developed a unique design and form of the Gorodets hive, patented it, and are promoting their brand within the Russian Beekeepers

Union. By maintaining connections with the unique “Beekeeping” Research Institute, the initiative group of Gorodets beekeepers has the opportunity to learn about new technologies and demands, which allows them to establish the production of dietary supplements, cosmetic products, and items for apitherapy. A domestic tourism program is being developed with a new offer — comprehensive human health improvement through proximity to a beehive in specially constructed “api-houses.”

The results presented in the report were obtained with the support of the Russian Science Foundation 24-68-00055

Lived Religion through a Japanese Lens: New Survey Approaches to Functional Equivalence

Japan's unique religious landscape, characterized by non-institutional religion, challenges conventional measures of religiosity developed in Western contexts. Despite this, many people in Japan engage in traditional religious rituals and express belief in spiritual beings, suggesting that alternative measures are needed to fully understand Japanese religiosity. Terms like “folk religion” or “diffused religion,” used to describe non-institutional practices, have explained this unique religious landscape. A long-standing challenge for Japanese scholars has been whether such practices qualify as “religion” and if Western-developed theories can explain them. Critics often argue that theories like secularization and privatization oversimplify Japan's religious context.

Despite these differences, parallels have been drawn between Japanese and Western religious practices. Japanese cultural practices are often tied to beliefs in deities or the afterlife, and like in the West, these beliefs have shown a steady decline across generations. Such religious sentiment enhances subjective well-being and is linked to nationalism, suggesting functional equivalence with Western religiosity despite different historical contexts. This concept of functional equivalence—where Japanese religiosity serves similar social roles as Western religiosity—broadens our understanding of Japanese religiosity.

To better understand these dynamics, Japanese scholars have developed alternative survey questions that reflect Japan's unique religious landscape, replacing traditional Western measures of religious belonging, worship attendance, and frequency of prayer. This functional equivalence justifies viewing Japanese religiosity as a legitimate object of study within religious studies, rather than merely a cultural phenomenon, even if it does not align with the strictest definitions of “religion.”

Moreover, it offers valuable insights for the study of “lived religion” in broader sociological contexts. In this presentation, I will share findings from several national representative surveys conducted in Japan, and demonstrate how this approach to examining functional equivalence can be applied to the emerging focus on “lived religion” in contemporary Western religious studies.

The Marketization of Work Relations By Online Labor Platforms in Japan – the Case of the Expansion of Company a –

The expansion of online labor platforms (OLPs), which profit by matching labor supply and demand, has been gaining momentum in Japan. OLPs were said to be established as a way to liberate labor from organizational control, promising better work-life balance than organizational employment. This paper argues, from an institutional perspective, that the growth of the OLPs is accelerating the further marketization of work relations. The study illustrates a facet of this marketization process using data from Company A, one such OLP.

Company A, a rapidly expanding OLP over the past few years, differs from many other platforms in that it views itself as a labor market actor (a licensed employment agency), with most of its transactions involving formal employment rather than contracting. For this study, data was collected from 500 randomly selected registered users who completed transactions on the platform between 2018 and 2024. The data includes more than 10,000 transactions conducted by these users during the same period. The analysis focuses on four key aspects of the marketization of work relations: the range of options available to sellers and buyers, the flexibility of procurement from the perspective of employers, job stability from the perspective of workers, and wage levels.

The findings show that sellers and buyers have unbiased options on the platform, with no strong algorithmic restrictions. Employers enjoy high flexibility in sourcing labor when needed. Workers, however, often engage in

same-day applications and shifts, indicating that while flexibility is high, job stability may be at risk. Wages tend to cluster slightly above the minimum wage, suggesting downward pressure, though minimum wage regulations are still effective.

In conclusion, although this case study is limited to Company A, it shows clear signs of labor marketization regarding flexibility, with wage regulations still providing some stability.

Examination of the Factor Structure of the NEP Scale : Analysis of Survey Data in Japan

This study explores the factor structure of the New Ecological Paradigm (NEP) scale, a widely used measure of environmental awareness, by analyzing data from web surveys that we conducted in Japan in 2015 and 2023. Both surveys involved 2,500 respondents, selected to reflect the population distribution by prefecture, gender, and age. This research provides insight into evolving environmental perceptions in Japan over time.

The NEP scale typically identifies a two- or three-factor structure. The 2015 survey revealed a three-factor structure: recognition of environmental limits, belief in human control over nature, and thought in human ingenuity to manage resources sustainably.

In contrast, the 2023 survey found a two-factor structure, which aligns with previous research in Japan. The two-factor model resulted from the redistribution of the items from factor 3 in 2015 survey. For example, the belief that “Human ingenuity will insure that we do NOT make the earth unlivable” contributed to the first factor, while the idea that “The earth has plenty of natural resources if we just learn how to develop them” contributed to the second factor.

Further analysis examined the impact of age, education, and the richness in nature that respondents live on factor structures. In 2015, younger participants (under 50) exhibited a two-factor structure, whereas the overall sample retained the three-factor model. By 2023, the two-factor structure was consistent across all groups, except for older individuals (over 50) in rich nature, who still reflected the three-factor model similar to the one observed in 2015.

These findings suggest that environmental perceptions may evolve over time, influenced by global trends and generational shifts. The two-factor structure appears to be becoming the dominant perspective among younger people in Japan, while older populations in environmentally rich areas maintain a more nuanced, three-factor view.

Revisiting the Ginza Fashion Survey after 100 Years

In the 1920s, the Japanese architect and designer Wajiro Kon developed the methodology of Modernologio and conducted a survey of Ginza, Tokyo, Japan, to record urban and “tasteful” street customs. Distinguished by its thorough counting and illustrations, Modernologio is an original method for observing changing customs in contemporary Japan. Walking at a fixed speed over a defined section of pavement, Kon and his researchers tallied up certain features of Ginza City passersby in early-summer 1925, including their hats, hairstyles, beards, ties, combs, clothing, accessories, and shoes. Kon's survey empirically measured the impact of modernisation and Europeanisation on Japan, primarily through the ratio of Japanese to European clothing styles. This basic and informative method was a way of exploring social changes through urban customs. The illustrations from the survey also serve as a historical representation of the time. For the present study, I will adopt Kon's methodology and reproduce the survey. I plan to conduct a Ginza fashion survey during early-summer 2025 to see how Ginza City pedestrians have changed in appearance over 100 years. This presentation provides a brief report on this topic. Whereas this survey will follow the model set by Kon in 1925, it will also use modern recording tools to ensure careful counting. The accumulation of such surveys allows for diachronic comparisons and contributes to historical sociology. To be sensitive to changes in contemporary society, Kon's method enables the researcher to develop analytical categories on the ground. Using a phenomenological method that operates through the eyes of researchers, this method has the potential to capture changing customs in a flexible way, even today.

SHIRAHASE, SAWAKO* (University of Tokyo, Japan)

Wealth and Trust in General in the Most Aged Society, Japan

Japan used to be characterized by high saving rates in the 1960s and 70s mainly to prepare for the uncertain future under the immature social security system (Tachibanaki 1997). Horioka (1989; 2007; 2010) claimed the life cycle hypothesis to explain relatively higher saving rates in Japan compared with the US or other nations, and once the population ages, the overall saving rates could decline because the proportion of older people who have relatively low rates of saving increases. However, according to Unayama and Ohno (2017), the percentage of older people with low savings rates increased.

Our main research question is how the savings changed during the life course since 2010 among older people aged 60 and over, and how such a change is associated with their trust in general. We want to see how people construct trust in general beyond self-interests because trust in general could lead to the development of generational justice for the future.

The data that I will analyze is waves 1 through 7 of the Panel Study for Senior People in Japan (JPSSP), which has been conducted every 2 years since 2010. JPSSP respondents included men and women between the ages of 50 and 84 years in 2010. The number of respondents analyzed for this study was 1,152 (50.4% men, 49.6% women, aged 60 to 96 years old). We run the fixed model analysis on personal savings. The age, marital status (married or not), personal income (log), the number of children, and having bequests from their parents are included in our analysis. We confirmed a positive age effect on the change in savings, and such a saving behavior of older people to continue after the later stage of life might lead to negative effects on their trust in general.

Building a New Economic Sociology of Migration

This paper reflects on the economic sociology of migration in global capitalism from three perspectives: (1) from the perspective of the new sociology of markets and its mobilisation for theorising a social order of cross-border labor markets, (2) in studying intermediaries as market actors in the constitution of cross-market labor markets, and (3) in mapping the multiple-levels of public governance of transnational labor standards and social protections that might protect migrant labor from the extreme exploitation they typically face. The case is made for a theory of a sociology of cross-border labor markets that incorporates the risks, ambiguities and possibilities for the regulation of labor standards and social protections for the exchange of labor across territorial jurisdictions.

Displacement Beyond Relocation: Exploring the Loss and Legacy of Arab Al-Yasar in Cairo

This presentation investigates the multi-layered displacement of Arab al-Yasar, a historic neighborhood in Cairo that was recently demolished to make way for urban redevelopment projects. This displacement is complex and multifaceted, encompassing not only the physical relocation of residents to new public housing but also the irreversible loss of the area's heritage buildings and rich urban fabric. The radical changes created by this redevelopment raise critical questions about how the neighborhood's living memory can be restored and reassembled. Moreover, it compels us to consider the broader implications of such displacements on the city's history, identity, and living heritage.

Through an ethnographic approach that includes interviews with former residents, participatory observation, and behavioral mapping, this study delves into how various forms of social, cultural, and material displacements reshape both the physical spaces and the narratives that define the community. My prior involvement in a revitalization proposal for Arab al-Yasar, conducted before its demolition, and its selection as a study area in my university design studio provide additional insights into the site's intricate spatial and cultural dynamics.

This presentation critically examines the tensions that arise between speculative development and the preservation of cultural heritage. It reflects on the ways in which displaced communities and their heritage can reassemble and adapt in new contexts, highlighting the potential for resilience amidst loss. By situating the case of Arab al-Yasar within broader patterns of urban transformation in Cairo, this research contributes to ongoing discussions

surrounding planning, displacement, and justice in the Arab world. Ultimately, it advocates for a more nuanced understanding of urban development that acknowledges the voices and experiences of displaced communities, aiming to foster a dialogue about the ethical responsibilities of urban planners and policymakers.

Understanding Marital Sexual Violence Among Egyptian Women: A Qualitative Study

Purpose: The current presentation aims to highlight Egyptian women's perceptions, feelings, and coping with marital sexual violence. Throughout culture and history, women are expected to fulfill men's desires and needs, which leads to the societal normalization of many sexual gender-based violence (SGBV) practices. In Egypt one of the Muslim-majority countries, the legal system does not criminalize such form of violence or fully protect women who their husbands victimize. The Egyptian laws are limited to physical abuse under certain conditions. **Methods:** A semi-structured interviews with 15 well-educated Egyptian women who self-identified as being in a sexually abusive marital relationship for at least one year and aged between 24 and 47 years.

The Findings: Four themes were identified from the interviews: reframing marital sexual violence, women's perceptions and implications, women's coping during and after being sexually by husbands; and societal and religious interpretation of normalization of Marital sexual violence.

Decolonial Political Reclamation: Claiming Ownership of the Land and Its Constitution

In the 20th century, anti-colonial struggles created new foundational documents to start an optimistic journey for democracy in a decolonized world. The Indian constitution created in this process, has re-emerged as a symbol and the political normative framework of different people's movements in India in the last decade. The people's movements are using the Constitution as a framework to argue for rights and attempting decolonial reinterpretations of 'modern', 'democratic' values by excavating regional history for claiming cultural ownership and decolonial legitimacy for the Constitution.

In the Pathalgadi movement in Jharkhand, India villagers erected megaliths carved with the Preamble of the Constitution in 2017-18. The 'Pathals' (megaliths) also had several laws carved that protect the land rights and sovereignty of tribals in matters of governance and collective resources. These Pathals also present a creative way of finding epistemic tools in regional historiography for asserting identity and autonomy.

Birsa Munda, a leader of the anti-British movement who went on to become almost a mythical figure in Jharkhand, also mobilized people against 'Dikus', the non-tribal outsiders including traders, moneylenders, Christian missionaries and Hindu landlords who exploited the Adivasis of the region. The Pathalgadi movement, by claiming 'our village, our government' brought Birsa Munda's political legacy to claim legitimacy from the modern State apparatus by invoking folk history.

Jaipal Singh Munda, an Adivasi leader from Jharkhand representing the tribals in the Constituent Assembly claimed that the modern democratic values that the Constitution proclaims as 'new'; are already present in the life world of the tribal communities in India: 'There is nothing that the Constitution has to teach the Adivasis, but Adivasis have a lot to teach to the others'.

This paper argues that Pathalgadi presents a way of decolonial reclaiming of the 'modern', 'democratic' Constitution for Indigenous people's identity, autonomy and rights.

Bridging Crisis and Disaster Sociology in the United States and Sub-Saharan Africa

While sociological approaches to climate-related crisis and disaster have advanced in the U.S and sub-Saharan Africa over the past several decades, they have often developed along different pathways. For example, several major U.S. disasters have encouraged ethical and empathetic methods in marginalized communities, have challenged popular cultural disaster myths, and have emphasized the political economic roots of uneven development, land use exploitation, and complex migration. In LDCs and MDCs in Africa and elsewhere, others have similarly explored potential political economic hazards arising from complex climate governance and green planning in marginalized communities. Despite these similarities, due to contextual differences ranging from administrative structures to resource access to cultural precepts, efforts to understand complex disaster planning, response, and other governance strategies have often developed in isolation. Maximizing environmental sociology's capacity to support applied research into equitable climate and disaster governance across contexts requires better synthesis of these disparate traditions. Yet exactly how to do so remains elusive due to justified concerns over recreation of colonial or neocolonial hierarchies, as well as contextual differences. Based in our experience in U.S. disaster sociology and sub-Saharan African climate governance, we employ a critical, anti-colonial analysis of complex crisis governance under the logics suggested by international principles like SDGs and DRR frameworks that are commonly used in sub-Saharan African contexts, as well as similar assessments of U.S. disaster and climate sociology principles. This comparative prism supports the development of best practices for translation of disaster sociology tools across structural and cultural contexts, reducing risks of material, social, and ecological harm. Beyond supporting mutually beneficial cross-pollination across sociology's subdisciplines, this emphasizes the importance of nuanced, ethical, and empathetic research foregrounding the complexities, capacities, and diversity of sub-Saharan African communities, challenging colonial (and neocolonial) assumptions of simplicity and homogeneity sometimes encountered in socio-environmental research and aid initiatives.

SHUKER, ZEINAB* (Sam Houston State University, USA)

The Weaponization of the Environment in Warfare: The Changing Landscape of Iraq and Gaza

The environment-conflict nexus is a topic of much debate in scholarly literature. Many studies suggest that competition for scarce resources, often linked to climate change, can increase the likelihood of conflict and pose a security threat. However, some argue that other factors, such as economic and political conditions, are equally important but often overlooked. Others focus on the environmental damage caused by conflict, viewing the environment as a passive backdrop to war. While these are important considerations, I contend that during armed conflict, the environment is often used as a powerful weapon by warring factions to weaken their opponents and make areas unlivable. The environment is not just a passive bystander or collateral damage but rather one of the most deadly weapons of warfare. In this paper, I will examine the weaponization of the environment in Iraq during two distinct time periods. The first period covers the early 1990s, specifically Saddam Hussein's invasion of Kuwait and the subsequent Kurdish and Shia uprisings. The second period explores the defeat of ISIS and their use of the environment as a means of punishment during their retreat. In both cases, the defeated powers adopted a scorched-earth approach to maximize damage and minimize livability. In addition, I will analyze the state of Israel's use of the environment and resources as a form of continuous warfare against the people of Gaza before and during the events of October 7th, in a much more surgical and strategic manner. By examining these cases, we can gain a better understanding of the nuanced ways in which the environment can be weaponized during warfare and the significant impact it has on both people and the environment itself.

SHUTES, ISABEL* (London School of Economics and Political Science, United Kingdom)

Global Care Labour Markets and Ethical Recruitment

The health and care systems of high-income countries have become increasingly reliant on international migration and recruitment to sustain their workforce. This includes the long-standing international recruitment

of doctors and nurses, and more recently, of care workers, through their integration in labour migration systems. While the role of migrant care labour has been well documented in the literature, there has been more limited attention to the 'brokers' of these workers, including private recruitment agencies. At the same time, the governance of international recruitment in health and care systems has been underexplored (Yeates & Pillinger 2019). At the international level, this includes the WHO Global Code of Practice for the Recruitment of Health Personnel, which sets out the principles to which states should adhere to promote 'ethical recruitment', alongside codes at the national level that position recruiters as responsible for upholding ethical recruitment standards. This paper develops understanding of ethical recruitment in global care labour markets in practice. It draws on the findings of research on the integration of care workers in labour migration systems, and specifically the international recruitment of care workers to the UK since 2022, involving qualitative interviews with recruiters and other actors directly involved in care worker recruitment between the UK and some of the principal countries of origin of care workers in South and South East Asia, West Africa and Southern Africa. I consider how (un)ethical recruitment is understood, navigated, enforced or resisted in practice by these actors, and the implications for the regulation of international recruitment in care labour markets.

Is Escape from the City Justified: Urri & Chayanov?

My report is devoted to the socio-cultural aspects of migration of urban residents to rural spaces, the prospects and risks of this process. The suburbanization migration in question gives rise to "anti-urbanites" who have left the city in search of new meanings, and it is important to understand their motives and internal conflicts. Do these people become villagers?

J. Urry in his work "What is the Future?" (2016) presented models of cities of the future – Urry associated the future with the life of cities. But 100 years before that, the Russian writer A. Chayanov, in his social utopia, which is called peasant, presented a model of the future as a return to life outside the city, life in the countryside with a rural way of life.

Chayanov's novel today looks more like a negative utopia, since the writer debunks dreams of rural communism. In the author's imagination, the world has turned upside down: before the reader is a village estate, a villager is an aristocrat, the new estate is a park, a sports field, a city cottage, technological advances allow the villagers to free up their time, who spend their leisure time talking about science, art, economics, and walking. Isn't this the dream of today's migrants fleeing from smoke-filled, from loneliness in the crowd? But just as Thomas More's works did not help build communism in one particular country, Chayanov is not deceived by the prospect of deurbanization – in the project of the new village, he sees the foundations of a surveillance state. Will escape from the city save humanity? How to preserve the socio-cultural world?

SIECZKA, EMILIA* (Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland)

Polish Cleft National Habitus and Its Politico-Legal Accommodation in 1989 and 2015. Polishness As a Reproduction of Hysteresis Effect.

The paper proposes to inscribe the post-transition Polish state building process from 1989 and the attempt of its reversal by the Law and Justice government in 2015 in the context of accommodation of Polish cleft national habitus. Drawing from theories of Norbert Elias and Pierre Bourdieu, the author argues that the national habitus as such is, in fact, always plural and to some extent, characterized by a lag, a hysteresis between the state norms (the field) and social norms (habitus). However, inherently plural character of national habitus postulated in this presentation does not presuppose that plural dispositions are incorporated in the we-image of the nationals. On the contrary, the case of inner normative antagonism in national dispositions will be exemplified by cleft national habitus – modelled on cleft habitus described by Bourdieu in a class context, where a quest toward purification of plural habitus becomes ideologically crucial in national identity-building. The latter occurs in response to strong hysteresis in national figuration and is reproduced through Don Quixote effect dislocating the national experience of social time.

It is therefore not so much the lack of containment between new state norms and national norms that is bound to backfire into particularly strong anti-state national radicalization, but such a cleft social disposition in which the attempts in isolating 'Polishness' from any influences of former state-

building is especially legitimate. The author presents a sociogenesis of the Polish cleft national habitus and the analysis of the recent mass national mobilizations – the one in 1989 and in 2015 that were both characterized by negating the previous state building as not truly national and not sovereign enough. The nationalist state project of 2015-2023 will serve here as a case study through which a paradoxical institutionalization of the hysteresis effect on the state level will be illustrated.

SIENKIEWICZ, MARTA* (Leiden University, Netherlands)

Narrative CVs in Grant Peer Review: Implications for the Review Process

Narrative-style CVs are a new instrument conceived within research assessment reforms. They are meant to capture diverse forms of scholarly activities and decrease the overreliance on quantitative metrics in funding decision-making (Bordignon et al. 2023). In this paper, I explore the effects that the introduction of a new CV format by one of the Dutch funders has had on the peer review process.

Grant peer review includes a comparative and contextualised interpretation of CVs which relies on judgement devices as well as interpretive flexibility of the reviewers (Kaltenbrunner and de Rijcke 2019). Standardised CVs have long predisposed some routine assessment practices which are now being disrupted by the introduction of narrative-style CVs.

The case study revolves around the effects of two major changes in evaluative procedures introduced by a Dutch research funder in selected competitions. Firstly, the CV format has been changed to a narrative one supported by a drop-down menu of diverse evidence (quantitative and qualitative) to be chosen to support the text. Moreover, the CV is now separated from the proposal and accompanied by a minimal description of a research idea. Only successful candidates have their full proposal reviewed which is done without a CV. Therefore, the reviewers are now presented with a radically different type of information and context in which they need to interpret it.

This intervention poses several questions about the ways in which interpretation of CVs and evaluative decision-making occur in these new circumstances. How do reviewers score applicants and justify their judgements? How do they establish comparability in light of diverse information? How do they maintain a sense of legitimacy and trust in a new peer review practice? I explore these questions using written evaluation reports and interviews with reviewers, focused on recreating their assessments of CVs submitted in the new format.

Reintroducing the Vulnerability of Asylum Seekers into the Examination of Their Asylum Application. an Ethnography of the Legal Work Carried out By Volunteers in an Association Involved in the Reception and Legal Assistance of Migrants

This paper examines the role of associative actors in investigating access to migrants' rights through an ethnography of a legal office set up to guarantee access to rights for asylum-seekers in France since 2016. In the face of a more and more restrictive French and European policy on migrants, especially in the context of the Dublin III directive, the volunteers of a legal assistance service are trying to resist, not to say to fight, the reintroduction of physical and mental vulnerability into the examination of their asylum claims. According to the European Dublin Regulation, the administrative authority to which an application for international protection is referred must send the foreign national back to the first member state through which they passed after leaving their country of origin. They become the object of a game of Ping-Pong between European countries, to the extent that they define themselves by the name of the legal procedure to which they are submitted: I'm Dublin. We will show how the volunteers took advantage of an article of the regulation, which allows a State to 'depart from the criteria of responsibility, in particular for humanitarian reasons', to use and turn the regulation against the administration. The aim is to examine how the legal work carried out by volunteers contributes to access to and the examination of asylum applications and to reintroduce the consideration of their vulnerability. The results show how a double struggle is being waged: the guarantee of access to asylum rights and access to health care, through support work that is aimed at the reintroduction of the bodies of exiles and their vulnerability to the authorities, and at the exiles themselves.

SIGUERO LIZANO, ALBA* (Universidad Complutense de Madrid, Spain)

Ecological Spiritualities: An Ethnographic Approach from the Spanish Case

Although not in all cases with a political intention, in recent decades a series of practices and discourses have emerged in different parts of the world that point to different forms of spirituality as a way to have a different relationship with nature. The objectives are diverse, ranging from the improvement of individual physical and emotional health to the transition towards more environmentally friendly societies.

In this presentation, we will focus on practices and discourses that incorporate spirituality as a fundamental part of environmental activism. From this point of view, the transition towards more sustainable societies is not reduced to changing external elements such as the incorporation of renewable energy sources, but also includes changes on a smaller scale, such as the relationship of each individual and of human groups with nature. Through collective rituals, which do not have a spiritual dimension for all members, a personal and collective transformation is carried out, which they call "reconnection with nature". Thus, the study of these practices constitutes an opportunity to continue reflecting on some assumptions that have been established in the scientific literature, such as the exclusively individual and neither collective nor political character of these new spiritualities.

For this purpose, data obtained from an ongoing research carried out in Spain will be analyzed, in which both in-depth interviews with participants in this type of activities and analysis of audiovisual content circulating on various websites and social networks have been conducted.

The University As a Scenario of Religious Change: A Sociological-Biographical Approach to the Case of the Complutense University of Madrid

Among the several decisive moments in the personal trajectory of many people, the university experience is one of them. In fact, university studies mark a turning point in the life trajectory of many people that also affects the relationship with religiosity, whether it be from belonging to a religious institution, the individual practice of activities with a spiritual dimension, indifference towards any type of religiosity or any other. In the university stage, one comes into contact with a greater number of people who are different with respect to religion than in previous stages, which makes the university one of the first interreligious contexts, to which many people have access. At the same time, the university years often coincide with profound changes at the personal level, which in terms of individual religiosity can manifest itself in multiple ways. Thus, university life, understood not only as an area for acquiring regulated knowledge but also as a space for intense social interaction, constitutes a relevant context to be taken into account in the study of religious change in today's societies.

In order to analyze these questions, it is essential to adopt a biographical perspective in which the relevance of the university experience in the religious change of individuals is highlighted. For this reason, this paper will analyze the different trajectories of religious change during the university stage. For this purpose, we will show the data obtained in a research carried out in the framework of the project DIVERESU: Religious and Spiritual Diversity of the University Students of the UCM (Complutense University of Madrid) of the Student Observatory of the same university in the year 2024.

SIGURU WAHUTU, J.* (New York University, USA)

"African Journalism Fields: What's Bourdieu Got to Do with Them?"

Is there such a thing as a Transnational African Journalism Field? This chapter argues that there is indeed such a field. It shows how scholars can theorize such a field and the benefits of taking a transnational approach when theorizing journalism on the continent. Relying on a sociology of knowledge approach, this chapter takes a postcolonial field theory approach to articulate the boundaries of such a field while paying particular attention to the enduring logic of coloniality in how journalism and journalists operate in the continent. It argues that journalism in Africa has often been transnational in scope,

beginning with missionary newspapers that sought to indoctrinate, followed by colonial and indigenous fields, and to this post-colonial moment. Studying journalism as uniquely bounded by national geographies, therefore, not only shortchanges this rich and nuanced history but also creates a bifurcated world in which journalism on the continent is forever stuck in spaces of absence, ensconced in what Mbembe (2015) calls a negative moment. A transnational approach not only centers African journalists and the fields they are immersed in but also works to theorize how or even if journalistic doxa can be aligned with an African habitus. It is an approach keen on conviviality rather than the antagonisms likely to persist through a preference for nation-states as the defining unit of analysis

Class, Gender, and STEM Career Expectations: A Cross-National Trend Analysis of Teenage Plans

Cross-national comparisons typically explore how gender or class independently influence STEM career expectations of teenagers. However, less attention has been given to how these factors intersect. Most studies contrast broad science vs. non-science categories, but this analysis examines horizontal gender segregation of STEM occupational plans grouped into two categories. We distinguish between biology, environmental, and health sciences—fields construed as suitable for and preferred by females—and compare them with computing, engineering, and mathematics—fields more often associated with male preferences and aptitudes.

This paper focuses primarily on WEIRD (Western, Educated, Industrialized, Rich, and Democratic) societies, and the goal is to highlight the intersection of class and gender within them. Using data from the OECD's Program for International Student Assessment (PISA), collected between 2000 and 2022, we analyse overtime trends in how class and gender jointly influence adolescents' expectations for careers in these distinct science field groups. Specifically, we consider whether youth from higher socioeconomic backgrounds form significantly less gender-segregated career expectations within STEM fields and whether this convergence has grown with time.

Beginning by comparing comprehensive systems like Australia and the USA with early stratifying systems like Austria and Germany and late stratifying systems like Finland and Norway, we end by examining patterns in 30 OECD countries that collected data on teenage career expectations between 2000 and 2022. Our findings support the conjecture that gender-liberal ideologies counter gender essentialist ideologies among socio-economically privileged youth while holding a firmer grip on upward mobility plans of lower SES youth. We demonstrate that STEM plans for higher-class youth exhibit less gender segregation over time. However, the rate of this convergence varies by science field.

Teenagers' Plans to Pursue Careers in Care Work in 30 OECD Countries, 2000-2022

Care work's social and economic importance has garnered increasing attention, especially since the outbreak of COVID-19. While understanding teenagers' interests is critical for addressing staffing shortages in these gender-segregated and under-valued fields, research on career plans has yet to focus on careers in care work occupations. The study we have conducted is original in several respects: it is the first research on plans to pursue careers in care work; it is the first comparative international paper in this area, and it is the first to examine trends over time.

This paper explores teenagers' career plans in professional care work through overtime and cross-country comparisons of 30 OECD countries. Following England, Budig, and Folbre, we define care work as occupations where workers provide face-to-face services that enhance the recipient's health, skills, or emotional capabilities

Our analysis draws on data from the OECD's Program for International Student Assessment (PISA), collected from over 1 million teenagers between 2000 and 2022. We find that there is considerable interest in care work, with about one-third of PISA respondents expressing interest in these careers. Across OECD nations, we observe a significant rise in interest in health-related care work, while interest in education-focused careers has steadily declined. Gender dynamics are pronounced—female teenagers are more likely to want to pursue care careers, with minimal change in male interest over the two decades.

Interestingly, neither salary differences nor employment opportunities explain the cross-country variation in how much care work appeals to teenagers. Moreover, while shortages reported are in less skilled areas of care work, youth focus their ambitions exclusively on highly skilled care work. In our discussion section we consider the implications of these findings for the future supply and valuation of care work.

SILLAT, PAULA JOANNA* (Tallinn University, Estonia)

The Impact of Changes on Twitter on Transnational Political Participation

Digital technologies and social media have expanded opportunities for youth engagement in political participation. Due to its sociopolitical context as a former socialist country, Estonian youth are even more disengaged from electoral and party politics than their counterparts in other countries. However, they remain well-informed and actively involved with global political issues such as climate activism, LGBTQ+ rights, BLM, and other social movements. Social media plays a crucial role in shaping their political views.

This paper focuses on young people who have primarily been politically active on Twitter (now known as X). The empirical section is based on an ethnographic study conducted on Twitter during the spring of 2022 and the autumn of 2024, complemented by open-ended interviews with the same participants during both periods. The analysis examines the impact of changes within Twitter on their political engagement. Formerly, Twitter facilitated global mobilisation; however, recent transformations have raised concerns about disinformation and the challenges posed by artificial intelligence (AI).

The analysis indicates that participants recognise the rise in misleading information and express concerns about their ability to identify false content and the increasing use of AI. Previously active Twitter users now hesitate to rely on the platform for news consumption and political organising, especially during times of global crises. With the proliferation of bots, participants no longer view Twitter as a platform conducive to meaningful political discussions. Some former users have partially migrated to Instagram and other platforms. Additionally, they now turn to established media outlets for international news, which they had previously accessed on Twitter, and offline discussions around global movements have intensified.

From Perceived Threats to Active Defense: How the Russo-Ukrainian Conflict Shapes Civil Defense Engagement in Estonia

The geopolitical situation of the 2020s and the threat of a broader military conflict involving the West have increased the need to rethink society's willingness and capability for defense. One way to measure the society's and individual willingness to contribute to national defense tasks is by using the concept of will to defend and, more precisely, by examining those whose contribution to national defense is most significant - who have voluntarily joined the Defence League.

From 2018 to 2022, the number of members of the Estonian Defense League was on a downward trend. In 2018, the Defense League had 26,069 members, which decreased to 25,355 by 2021; the aftermath of the war that started on February 24, 2022, in Ukraine, increased the number of volunteers by 1,428 within a month[1]. In the last two years, i.e., after Russia attacked Ukraine, more than four thousand people have joined the Estonian Defense League, reaching 30,175 as of the end of May 2024[2]. Also, the public opinion surveys conducted annually by the Ministry of Defense show that after the Russian attack on Ukraine, the will to defend the nation increased from 64% by leaps and bounds to 76% in 2022[3]. So, as the population's risk of security threats grew, the will to defend also increased.

This presentation aims to shed light on this phenomenon, discover why people join voluntary-based defense forces (including women's home defense), and understand what values and beliefs form the basis of their will. The research offers better prerequisites for determining national defense capability and improving the ability to develop national defense strategies. The research uses individual interviews and the narrative interview method.

Calculated Journeys: Exploring the Migrants' Risk Perceptions

Migrants are often perceived as impulsive risk-takers due to their decision to relocate and face uncertainties in new environments. While some studies do indicate higher risk-taking behaviors among migrant populations, such a generalized perception can obscure the complexity of the risk management strategies they employ in everyday life. This study challenges the stereotype of migrants as inherently risk-seeking and highlights the careful planning they often undertake, particularly in education and career advancement. Through a mixed-methods approach, we combine qualitative insights from focus groups with quantitative data from a survey conducted among migrants in Belgium to explore their nuanced risk management behaviors.

The focus groups, conducted with migrants from various nationalities, including Persian, Ukrainian, Arabic, Turkish, and Spanish-speaking individuals, reveal that many approach significant life decisions with strategic caution. Rather than acting impulsively, participants frequently develop alternative plans, reflecting a thoughtful consideration of potential outcomes. They rely on social networks and online platforms to gather information, demonstrating efforts to reduce uncertainty and make informed decisions.

The quantitative component, a multilingual survey distributed using Respondent Driven Sampling (RDS), investigates risk-taking behaviors across both monetary and non-monetary domains. We also examine migrants' attitudes toward patience in relation to education and career decisions, using tools like the General Risk Propensity Scale (GRIPS). This data further reinforces the view that many migrants employ risk-averse, strategic approaches when planning for their futures.

Our findings challenge the one-size-fits-all perception of migrants as uniformly risk-seeking, emphasizing the diversity within migrant groups. By providing a more comprehensive understanding of their decision-making processes, this study advocates for more nuanced policymaking that recognizes migrants' cautious risk management strategies, ensuring policies align with their specific needs and aspirations.

Transient Lives, Lasting Impact: The Role of on-the-Go Populations in Shaping Marseille's Neighbourhoods

This research explores the contribution of "on-the-go" individuals, those who do not consider themselves permanent residents, such as tourists, visiting researchers, refugees, and transient workers, to the life of ordinary neighbourhoods. Research on urban spaces has often focused on the influence of long-term residents. In this study, we focus instead on how these transient populations may impact micro-segregation patterns in Marseille, a Mediterranean city with rich social and urban complexities. By concentrating on two neighbourhoods in Marseille (IV and V arrondissements), this paper seeks to answer two central questions. First, where can we draw the line between spatial "permanence" and "on-the-goness"? A priori, we define as on-the-go people all those individuals who do not define themselves as permanent residents, ranging, for example, from tourists, to visiting scholars, to refugees, to non-tenured priests. However, is residency the primary factor that defines one's contribution to a neighbourhood, or how do transient individuals, despite their temporary presence, play an integral role in shaping the community? Second, what specific contributions do on-the-go individuals make to the neighbourhood's social fabric, economic activities, and cultural heritage? Rather than viewing these populations as peripheral to neighbourhood life, this research argues that their presence, even if short-term, leaves lasting impressions on urban dynamics. Using a mixed-methods approach, the research combines field observation, interviews, and ethnographic walks to examine the everyday presence, lives, and contribution of transient populations. The analysis focuses on how these on-the-go individuals might subtly but significantly shape processes of urban inequality and segregation, challenging conventional assumptions about the stability and permanence of urban contributors. By questioning the intersection of mobility and community-building, this study broadens the scope of how we understand the forces shaping contemporary urban spaces, offering fresh insights into the ways transient populations may influence the long-term evolution of neighbourhoods.

Play As Activism: Fostering Social Change in Vulnerable Brazilian Communities

This paper investigates the role of play as a form of activism in Brazilian initiatives that engage schools and communities confronting vulnerabilities in varied educational, social, and economic contexts. Grounded in a decade of research with the Language in Activity in the School Context (LACE) group at the Pontifical Catholic University of São Paulo (PUC-SP), this study draws upon the Socio-Historical-Cultural Theory (Vygotsky, 1994) and Critical Collaboration Research (PCCol) (Magalhães, 2011). LACE aims to foster critical reflection and catalyze social transformation by addressing issues of injustice and inequality while honoring diversity and multiculturalism. Utilizing Vygotsky's (1933) concept of play, this study elucidates its role as a developmental mechanism for the participants to creatively and imaginatively explore solutions to facing social issues. Play not only nurtures individual growth but also promotes collective action against contemporary injustices. The project "Brincadas" is examined as a salient example, demonstrating how play as activism actively engages marginalized communities, allowing them to reevaluate curricula, resist racism, and effectively navigate social crises. Through collaborative methodologies, the LACE research group reveals how play can cultivate diverse epistemologies and practices, thereby enriching participants' multimodal repertoires while advancing social justice. The implications of this research transcend academic boundaries, advocating for a more equitable and just society through the multifaceted experiences of individuals within these communities. Ultimately, this work underscores the necessity for critical engagement in a rapidly changing global landscape, positioning "activist play" as an instrument for the social change.

Public Policies and Inclusive Practices for Visual Functional Diversity in Higher Education

This paper, framed within a doctoral thesis conducted at Pablo de Olavide University. Investigates the role of public policies and inclusive practices in promoting the integration of individuals with visual functional diversity in higher education. The study outlines a theoretical framework established by the United Nations Convention on the Rights of Persons with Disabilities (CRPD) and the principles of Universal Design for Instruction (UDI), Emphasizing their significance in creating equitable educational environments.

Through case studies from South Africa, Israel, Ethiopia, Italy and Brazil, the paper illustrates the impact of inclusive policies and practices. Findings indicate that while UDI improves academic performance, compliance is often insufficient, necessitating stronger policy reinforcement. In Israel, significant barriers hinder students with visual impairments, underscoring the need for more effective support systems. In Ethiopia, limited access to educational resources restricts student participation, highlighting the importance of incorporating assistive technology into education policies.

The research also emphasizes the necessity of inter-institutional collaboration, with Brazil's REBECA network serving as a model for resource sharing and accessibility promotion. The study concludes with recommendations for enhancing public policies, implementing UDI in educational practices, increasing access to assistive technology and providing ongoing training for academic staff to foster an inclusive environment for all students.

SILVA SILVA, RENATO* (FE-UNICAMP, Brazil)

Social Culture Center and the Libertarian Athenaeums - a Tool of Fight and Learnings for Anticolonial and Eurodiscidence in Brazil

The Social Culture Center (Centro de Cultura Social-CCS), in São Paulo, is a self and collective education space linked to the anarchist social movement in Brazil, within the context of the creation of Libertarian Athenaeums. Founded in 1933, it was closed during the two dictatorships faced in the territory occupied by the National State (1939-1945 and 1964-1985), but continued its activities clandestinely, becoming a catalyst for the collective strength of anarchist activists in the education, protection, and organization of key figures in social

struggle and intellectual movements. Understanding anarchism as one of the social forces that emerged in the context of the globalization of the European model, which arrived not as a tool of domination but as a means of organizing and supporting local struggles against the Eurocentric and colonialist model, this work aims to reflect on the international campaigns, social mobilizations, and distinct phases of the multiple realities of social struggle that the Centro de Cultura Social has experienced. Thus, the CCS is understood as a socio-political actor itself, capable of generating deep intersubjective constructions, always in dialogue with the reality of the anti-state struggle, from the Brazilian First Republic to the present day.

RC42-672.1

SILVA SILVA, RENATO* (FE-UNICAMP, Brazil)

The "Formation of a New Man" at the Lens of the Social Theater

The Social Theater was another integrated force within the body of anarchist practices linked to unions and the popular self-education known as Libertarian Pedagogy, which was experimented with in Brazil in the early decades of the 20th century. The concept of the "formation of a new man," common in the political literature strongly marked by the positivism emerging in the dissident movements of the time, arises from the idea of the integral formation of the individual—that is, their physical health, intellectual abilities, and ethical practices in collectives, understood as moral. It involved breaking with hierarchical models and proposing an education that values autonomy, creativity, and the collective construction of knowledge. Through the exercise of theater, participants are encouraged to imagine new realities and to experiment, on stage, with other possibilities of being and acting in the world. Based on the writings of the French syndicalist magazine *L'Art Social*, in Brazil, political-social actors such as the cartoonist Miguel Caplonch and the actor Romualdo Figueiredo developed new local forms of social art, propagated, among others, by the Social Theater group, directed by the seamstress and revolutionary Maria Angelina Soares, in São Paulo. Thus, the Social Theater not only stages social issues but also lives and reinvents them with its participants, suggesting that the transformation of social structures is closely connected to the transformation of the individuals who comprise them. This formative approach seeks a new subjectivity that, by breaking free from the chains of passivity and oppression, enables the construction of a more just and free society, in which the "new man" is both a subject and an author of social change.

Land Dispossession As Climate Injustice: Lessons from Secwepemc and the British Columbia Fires

Research incorporating perspectives from racial capitalism, Indigenous studies, critical development studies, and others have importantly illustrated how what is often thought of as climate vulnerability or 'maladaptation' is rather a result of larger power structures, including colonialism and global capitalism. In Indigenous contexts, this has included how settler colonial processes, such as land dispossession, extractivism, and the curtailing of Indigenous mobilities, have created maladaptation to climate changes in Indigenous communities. Such insights have importantly highlighted how Indigenous peoples face climate risks largely because of how colonialism, along with capitalism, shape the geographic spaces they live in and their socio-economic conditions. This presentation aims to investigate the role played by settler colonial dispossession, or settler enclosures, in creating and maintaining climate risk, including climate-related displacement, experienced by Indigenous communities in a settler colonial context, particularly focusing on Secwepemc communities in western Canada. Recognizing that vulnerability in the context of climate change and ecological precarity is largely a consequence of ongoing histories of colonialism and racial capitalism, this paper examines how settler enclosures both exacerbate ecological instability and limit the possibility for climate adaptation and emergency responses to climate-related events. The British Columbia wildfires, which have particularly affected numerous Secwepemc communities, will be used as a case through which to explore how settler enclosures and settler colonial infrastructures enhance climate-related precarity for Indigenous communities.

"Deaf: Politics of Listening" - a Sonic Exhibition on Gender Violence in Higher Education

The gap between the promises of universities to resolve complaints and the reality has been the subject of Sara Ahmed's research on complaints within universities in the U.K. (2021). This paper examines how Chilean

universities process gender violence complaints and to what extent their protocols are able to resonate the voices of victims, thereby practising a "politics of listening" (Bassel, 2017) in the university. Despite the success of the Chilean feminist student movement and the subsequent implementation of equal opportunities offices and sexual harassment protocols (Dinamarca and Trujillo, 2021), universities face challenges in institutionally channeling complaints with regard to gender violence (Barra and Montes, 2022). The paper discusses the experience of having curated the sonic research exhibition "Deaf: the politics of listening"—based on qualitative interviews with equal opportunities officers and officers—and aims to demonstrate the sonic dimensions of resonance and listening on a political level and the necessity to work with arts-based methods.

SIMBÜRGER, ELISABETH* (Universidad de Valparaíso, Chile)

Rooms with a View: Images of Academic Writing

Higher education studies has left aside a visual approach to the study of higher education even though visual studies have almost reached mainstream status in the social sciences (Kortegast et al., 2019; Metcalfe (2015; 2012). Photo-elicited interviews in higher education research and particularly participant-generated visual methods enhance other ways of knowing (Kortegast et al., 2019; providing new perspectives on academic work that would have remained invisible otherwise (Mora, Undurraga & Simbürger, 2023). Academic writing in higher education is one of the topics that has hardly ever been researched from a visual perspective. In the current paper I will present photo-elicited interviews with 20 academics from the social sciences, humanities and arts in Chile on their experience and associations with academic writing. For the panel discussion I would like to focus on images that show the still view outside the office window of academics and that accompany academics like a basso continuo in their writing process.

SIMOE, SOLANGE* (Eastern Michigan University, USA)

The Right-Wing Assault on Women's Rights in the United States and Women's Voting Responses

This paper starts by addressing the last decades of war on gender in the US and its high point in the overturning of Roe v. Wade and women's constitutional right to abortion in 2022. The focus of the paper is then set on the women's, feminist and LGBTQ+ responses through voting and political representation. We look at the gender gap in electoral behavior, which has been evolving since the 1980's, analyzing: 1) an increased gender gap in voting turnout (more women voting than men), 2) an increased gender gap in voting (more women voting for the Democratic party) and supporting progressive policies), and 3) the intersections of gender with race, ethnicity, age and education in voting (for example, the large voting gaps between young women and young men, the persistence of a race and ethnicity gap among women's voters, and the gender differences among non-college educated white voters). We also look at how the United States moved from notoriously holding one of the world's lowest percentages of women's political representation - the number of women elected to political office - to reaching the world average two years after Trump's election in 2016, although still underperforming in relation to so many Global North as well as Global South countries. The final question raised is: how can the gender gap in voting, and especially the growing gap between young women and young men, be understood and explained in the context of the ongoing assault on women's and LGBTQ+ rights?

SIMOE LOUREIRO, KEVIN* (University of Fribourg, Luxembourg)

Biographical Mappings on Subjective Well-Being (SWB): Enhancing Narratives of Young People with Disabilities during Their School-to-Work Transition.

Young people with disabilities face significant challenges during their transition from school-to-work, with employment rates remaining low (OECD, 2022). As failure to first enter the labor market can lead to limited participation, social isolation, lower wages, poorer health, and recurrent unemployment, they may experience lower SWB during and after the school-to-work transition phase (Hadjar & Backes, 2013; Hadjar & Kotitschke, 2021). Focusing on SWB as an important indicator in understanding successful school-to-work transitions of young people with disabilities, this study conducts biographical interview techniques to explore drivers and barriers during their transitions (Traue & Pfahl, 2022). To better capture variations of SWB during their life-course and identifying enabling and disabling factors that affect their SWB, we integrated a biographical mapping approach – a graphic

elicitation strategy. This method incorporates both "researcher-created and respondent-generated visual data" (Schubring et al., 2019: 2), with the latter dominating the data production. By visualizing different strands of development, these drawings reveal the nonlinearity and multidimensionality of SWB in biographical trajectories (Schubring et al., 2019; Thiel et al., 2011). Preliminary findings highlight the methodological benefits of biographical mappings as a supportive tool for facilitating the narration of young people with disabilities during biographical interviews. In the context of researching SWB, this approach provides new opportunities for collecting, processing, analyzing, understanding and reporting SWB across life course trajectories. Our empirical results indicate that SWB tends to improve following the transition out of compulsory school. During the educational trajectory, SWB is influenced by various interconnected dimensions, with each carrying different levels of importance for individuals. In particular, positive relationships and strong social support seem to play a key role in enhancing SWB across these dimensions, while negative experiences impacting social well-being and mental health present ongoing challenges to overall SWB.

Conflicting Crosscurrents: Sense of Connection and Responses to Aging Parents' Care Needs across Distance

This paper analyses the experiences, reflections and imaginings of intra-European migrants about the present and future care of their ageing parents living in their country of origin. Conceptually, we draw on Mason's (2018) work on personal life connections that have potency, experienced not only with other people but also, for example, with particular places and environments. The notion of potent connections provides a multidimensional view that does not presuppose relational warmth and closeness, but highlights that such connective forces can be powerful even when charged with negativity. Empirically, we build on a study that explores potent connections through in-depth interviews (N=33) with working-age Spaniards and Finns living in Belgium. We analyse how they describe their ageing parents and their care needs. How do the potent connections they feel with their parents and the environments in which they live shape the way these adult children experience and respond to the care needs across distance? Our analysis reveals conflicting crosscurrents in people's lives, for example when return migration to care for a beloved ageing parent also means returning to a village where the social environment is perceived as suffocating, or when the shared history with the parent is marked by silence or abuse. We further analyse how the charges connecting people evolve when an ageing parent suffers from cognitive decline.

SIMOLA, ANNA* (Université catholique de Louvain (UCLouvain), Belgium)

Experiencing Effects of the Climate Crisis from Afar: How Does Changing Weather Mark People's Ecological Connections in a Privileged Mobility Context?

How do people experience the weather in places that matter to them from a distance? This paper addresses this question and the complexity that rapidly advancing climate change adds to such experiences. The paper is based on a study set in the privileged context of non-forced migration within the area of free movement in the EU. Drawing on in-depth interviews with Spaniards and Finns living in Belgium, this study explores the potent connections (Mason, 2018) that people feel with other people and environments that matter most to them. This paper reports findings from an analysis that reveals the centrality of weather in people's mobilities: On the one hand, the experience of weather shapes people's relationships with the places they come from, and their desire or reluctance to return to those places for visits or more permanently. Weather also plays a central role in people's desire to pass on their personal ecological connections with these places to their children. At this level, the paper demonstrates the highly relational ways in which people experience ongoing or anticipated changes in local weather conditions in the context of the climate crisis, and the implications of such changes for local ecologies in the present and future. On the other hand, many people with privileged mobility rights, aware of the role of air travel in accelerating climate change, are also questioning the frequent travel that underpins their mobile lifestyles. The paper also explores how people are engaging with the impacts of the climate crisis through digital means, and the extent to which people are able to relate to the weather in places that are not part of their personal spheres of life.

SIMON, MARK* (Bielefeld University, Germany)

(In)Visible Inequalities: War-Induced Migration from Russia to Neighboring Countries and Access to Resources through Mutual Support Infrastructures

In his book on transnational social spaces, Thomas Faist (2000) rightly pointed out that network theory as applied to migration says little about the content of resources inherent in migrants' social ties. The content of the resources that make up the webs of migrants' transactions is the accumulation of economic and social capital, as well as access to information necessary for employment. According to Faist, if migration scholars strive to go further than network theory allows, they need to pay more attention to how the (un)equal access to designated resources generates *obligations, reciprocity and solidarity*. Since the publication of Faist's book, migration studies have undergone an infrastructural turn. This turn consisting of a focus on cross-border assemblages that facilitate mobility, has clearly enabled a step beyond network theory. Within the infrastructural turn, however, the issue of social inequality and power dynamics seems to be somewhat overshadowed by the material and technical dimensions of transnational social spaces.

This paper aims to draw attention to how inequalities in access to resources are arranged in relation to migrant infrastructures, and how relationships of obligation, reciprocity and solidarity operate accordingly. Drawing on the existing literature on privilege and precarity within the war-induced migration of Russian citizens to neighboring countries, as well as the author's own ethnographic research conducted in Kazakhstan, the paper will focus on the following question. What can the study of Russian migrant infrastructures reveal about configurations of privilege/precarity at different levels: a) within migrant communities; b) between migrants and those in Russia with whom they maintain ties; c) between migrants and citizens of the countries they are in; d) in the contrast between migration from Russia and expatriate mobility along the global North / global South axis?

Citizen Science and Social Innovation Policies: Creating a Pathway to Inclusive Development

Citizen science projects aim to actively involve public in scientific research, while transforming the scientific research approach, engaging communities in the co-production knowledge and encourage inclusive development. This research explores the critical role of citizen science in promoting social innovation policies that address inequalities and enhance community empowerment. By actively involving diverse populations, citizen science projects and researches enhance a sense of belonging, ensuring that different voices are heard in decision-making processes.

This research emphasizes the importance of citizen science that influence local policies towards beneficial changes. Such initiatives create successful pathways to collaboration of citizens and researchers, integrating citizen gathered data into decision-making process. This research aims to discuss the importance of citizen science initiatives that have an impact on both scientific outcomes and social benefits, such as social equality and community development. Citizen science initiatives are popular worldwide, few examples of citizen science initiatives are: the EU's Citizen.science platform, Australia's National Environmental Science Program, and Costa Rica's biodiversity policies.

This research addresses the challenges of ensuring equitable participation and the sustainability of citizen science initiatives, discussing strategies for long-term success that are offered by the scientists who have participated in citizen science projects. Additionally, the research aims to emphasize how citizen science, supported by innovative policies, can contribute to building resilient and equitable societies.

Social Solidarity and Inequality during the War: Callenges and Prospects

According to the author's concept of the influence of wars on the social structure of defending societies, the strengthening of civil solidarity and the mitigation of social inequality are the necessary conditions for successful resistance to aggression and post-war reconstruction. According to the data of the 2022, in the first year of the war, the situation in Ukrainian society met theoretical expectations: more than half of Ukrainians noted an increase in

manifestations of interclass solidarity and a reduction of inequality. However, in the context of a protracted war, changes of these phenomena should be expected, as well as the emergence of new types of inequality and conflicts. The goal of the state is to maintain social inequality within limits that do not provoke disintegration and ensure stability.

Our research is based on the following key questions: Do people from different social classes and groups suffer from war and participate in the defense of the country to the same extent? What new types of inequality are emerging and have the potential to create social divisions in society? How has Ukrainians' perception of social inequality changed during the war and compared to the pre-war period?

To obtain empirically based answers, we will use data from two projects of the Institute of Sociology of the NAS of Ukraine: the *Ukrainian society: monitoring social changes* (2021 and 2024), and five waves of the survey *Social inequality: monitoring times of war*, which since September 2022 is held every six months. The indicators are: assessments of Ukrainians regarding the level of income inequality, emotional reactions to differences in well-being between the rich and the poor, a sense of justice in society, perceptions of the social structure of Ukraine and one's place in it, as well as views on current manifestations of inequality and injustice.

Waiting for Godot: 'Situated Waiting' and Expectations in the Construction Sites of a Cross-Border Company

Our article focuses on the experience of people working at the construction sites of the French-Italian company in charge of the construction of the Lyon-Turin railway, and how this experience takes shape according to the different speeds and spaces within the organization. We focus on how the present time is experienced and how any waiting is endured. We analyze the employees' experience of 'waiting' in the construction sites of this binational organization by combining Taylor and Spicer's (2007) notions of space, conceptualized as distance, power and experience, with Bayles' (2019; 2023) notion of 'situated waiting,' which uncovers the complexity of the lived experience of waiting from the employee's perspective. Since the construction sites of this company, located on the border between Italy and France, operate at different speeds for technical, geographical and socio-political reasons, the employees' experience of time varies and is influenced by the context in which these sites are situated. This aligns with Schoenberg's (1997) idea that the issue of time is often an issue of space. Our analysis focuses on one of the construction sites (the Italian one), which started at a later stage than the others (the French ones). People working at the Italian site have therefore experienced a prolonged wait and a dilation of time, leading to a different sensemaking of their work and the development of various strategies and micro-daily practices to manage this waiting in a context of high uncertainty and risk. By adopting a case-study approach and using data from ethnography and interviews conducted at the construction sites in 2024, we will outline the Italian employees' experience of temporality, their sensemaking of the 'situated waiting,' and their ability to enact agency, comparing it with the employees' experiences at the other construction sites.

Alienating Emotional Labor in Non-Western Societies: Problem or Norm?

The study of emotional labor has become a significant area of inquiry within the sociology of occupations and professions. This is particularly evident in instances where the management of emotions becomes an inherent aspect of the labor process, as evidenced by its incorporation into formal rules and representations of workers. Although the concept of emotional labor reflects the universal characteristics of the commodification of emotions in modern societies, a significant portion of the existing knowledge about emotional labor has been derived from studies conducted in Western societies. In particular, the theory of "alienation" in the process of performing emotional labor and the term "alienating emotional labor" have gained considerable currency. However, the process of performing emotional labor and its consequences may vary across different societies, taking into account the diverse cultural ideas and varying approaches to emotion regulation. Therefore, the experience of performing emotional labor may be contradictory, with differing benefits and costs. This paper aims to assess the applicability of the concept of "alienation" and "alienating emotional labor" to the study of emotion management in the workplace in non-Western contexts. One significant issue is the problem of

burnout and workplace stress as a psychological component of alienating emotional labor, which will also be discussed. The author concludes that the concept of alienating emotional labor requires further clarification or at least careful application in research, as it does not always reflect the reality of labor relations in non-Western societies. This paper will demonstrate the necessity of including cultural variables in the conceptualization and research protocol of emotional labor. It will also illustrate the importance of critically evaluating the notion of alienating emotional labor and taking into account the uneven spread of neoliberal ideology and practice and therapeutic discourse. To achieve this, the latest research on emotional labor will be analyzed.

The Empathy Imperative in Contemporary Emotional Culture: An Examination of the Rhetoric of an Inclusive Agenda and Therapeutic Culture for Work and Personal Relationships

The empathy imperative in contemporary emotional culture denotes the necessity to express empathy in order to establish a climate of loyalty and effective interaction within work teams and organizations, as well as to achieve well-being in personal relationships. Empathy is becoming an increasingly important emotional ideal in a variety of social contexts, with the largest agents of empathy being the therapeutic culture and an inclusive socio-political and cultural agenda. The paper will examine this situation from the perspective of social analysis of empathy as a sociological concept. Unlike public discourse, empathy is considered as universal foundation for human relations. However, the challenge lies in navigating the expression of sympathy in public discourse and politics, which is often shaped by social relations, inequality, cultural politics, and other factors. The author posits that the emotional imperative of empathy in modern culture is inherently contradictory. However, it aligns with the characteristics of modern society, which are shaped by the proliferation of therapeutic culture, the prevalence of loneliness, and the mobilization and solidarity-building potential of empathy in politics and economics. The demand for empathy indicates a particular kind of tension between the self and others, which can be conceptualized as a dialectic between the individual and the collective. Moreover, unrelenting commitment to the empathy imperative may result in compassion fatigue and a sense of self-neglect. This moral dilemma affects not only personal relationships but also institutional spheres such as social policy, where the objective is to target state and community care for those in need. Consequently, the author, based on research on empathy in the public and private spheres, concludes that the empathy imperative manifested in contemporary public sphere rhetoric may be a compensatory mechanism for the weakening of social ties in late modern societies.

Breaking the Cycle: An Agent-Based Model on the Efficacy of Inclusivity Norm Interventions to Reduce Affective Polarization within an Ethnic Majority Group.

This study examines whether and how a social network norm intervention that promotes inclusive attitudes towards ethnic minority groups can induce lower levels of steady-state affective polarization across generations of an ethnic majority group in a society with high initial levels of affective polarization. We investigate the efficacy of such an intervention if it is targeted at four types of socializing agents in the ethnic majority group (parents, peers, teachers, and the media) in empirically calibrated social networks with different types of structures (i.e., the relationships between all actors and agents in the network) and compositions (i.e., the initial distribution of attitudes across agents and actors). Based on empirical work, we specify a range of likelihoods for the intervention to enact a change of a particular magnitude in the attitudes of a socializing agent. Based on social learning theory, we assume that actors observe and learn the attitudes of socializing agents in their social environment, represented as a social network. Again, based on empirical work, we assume a particular magnitude of transmission between each agent and actor in various life course stages. From a social identity perspective, we argue that the likelihood for actors to adopt more positive attitudes towards ethnic out-groups from an agent first depends on how representative the agent is of the collective in-group identity. From a complex contagion perspective, we further argue that this likelihood depends on how many, to what degree, and how consistently the socializing agents in the actors' social network adopt inclusivity norms. Based on this theoretical framework, we generate hypotheses that are evaluated with a stochastic actor-oriented model, which simulates the evolution of ethnic majority group attitudes towards ethnic minorities across generations for each of the conditions in our design.

Made in Barnsley: A Hauntological Approach to Understanding Youth Belonging in the Former Coalfields

Whilst most visible landscapes and toxic effects of deindustrialisation have waned over time (Linkon, 2018), the affective legacies are complex and far-reaching, perhaps especially for future generations of youth growing up in 'disconnected' and/or 'unknown' past-present temporalities. In partnership with the Yorkshire and Humber Youth Work Unit, this paper draws on initial data from a three-year project that aims to understand working-class lads' experiences of identity and belonging within three spheres: education, community, and opportunity. Working with over 100 lads (11-25-years-old) from the former coalfields of Barnsley, the research aims to co-produce knowledge on their lived experiences in order to transform youth conditions, experiences, and policy. This paper focuses on data from Phase 1 and utilises the notion of social haunting to examine how modes of 'being, doing and belonging', traditionally associated with coalmining communities, continues to shape the lads' experiences of, and attitudes towards, the three spheres. For these lads, their present is not disembodied from the past but is often an 'unknown' history and understanding these experiences, we argue, requires a socio-historically informed lens to see and know the historical dimensions. Drawing on youth narratives, data shows that rather than dissipating over time, the effects of deindustrialisation remain, opening up cracks in the everyday for ghosts to emerge with murmurs of goodness, and tensions and 'discomforts' (Doherty & de St Croix, 2024). We suggest that spectres of policy and practice of the yet-to-come must engage with spectralities and linkages of the past, present and futurity of youth – those at the the 'chalkface' – and that understanding ghosts has important implications for community funding and spaces, youth education, training and employment, and youthwork and policy.

SIMSEK, DOGUS* (Kingston University London, United Kingdom)

Race, Waiting and Bordering Practices of Young African Migrants

This study is about race, waiting and bordering practices of young African migrants in Turkey that receive little attention within the global South scholarship. The vast majority of the literature on migration from Africa has focused on Europe and overlooked African migration towards the global South. However, most African migrations are not directed towards Europe, but towards Africa, the Gulf and Turkey. Founded on seven years of ethnographic research from 2016 to 2023 with young African migrants in Istanbul and Izmir, where I documented their everyday lives, settlement practices, and responses and resistance to racism, waiting and criminalisation, the study answers the questions of how the intersections of migrant status, race, class, gender and religion shape the experiences of young African migrants in Turkey; how young African migrants position themselves within a range of locations where they face racial and class hierarchy, racism and discrimination and how solidarity among young African migrants is maintained to overcome racism, deportation and police violence. I argue that waiting is a racialised phenomenon and concomitantly when it intersects with migrant status, class, gender and religion, it makes some young Africans exploited more. It aims to provide a conceptual tool highlighting a need to focus on the intersection of race and migration in exploring the experiences of migrants in mobility. It also reflects on the intersection of race, class, and gender by examining how the complexities of their intersection impact young Africans' mobility and immobility. It aims to contribute to the construction of 'non-Western' forms of knowledge in migration scholarship by showing that there is a need to focus on racialised forms of everyday experiences such as waiting, exploitation, oppression, racism, and inequalities in exploring young Africans' experiences, and most importantly hierarchies among them that have emerged from different class backgrounds, gender and religious beliefs.

Remaking Home in the Face of Racism: Young Migrants Everyday Experiences in London and Istanbul

This paper aims to answer the question of how young migrants make a home in a postcolonial city like London and a 'superdiverse' city like Istanbul. Both London and Istanbul are cities of migration. An established research area on conviviality and diversity is western-oriented, but many diverse cities in non-Western parts of the world have not been included in the literature.

Migrant receiving cities in the Global South have become 'superdiverse' and how can we understand conviviality in these non-Western superdiverse cities is crucial. By comparing the potentials of conviviality in the case of London and Istanbul, this research will contribute to the literature on diversity and multiculturalism in exploring how we can live together with and in difference. Moving beyond the methodological nationalism and the ethnic lens, I focus on the everyday experiences of young migrants in London and Istanbul. I develop the theorisation of multi-ethnic solidarity using the term conviviality and show how positive forms of social solidarity are maintained through building cultures of coexistence in the face of racism among young migrants in London and Istanbul. Drawing on in-depth interviews with young migrants in London and Istanbul, I explore how young migrants develop emancipatory practices despite the racism and discrimination they experience, and how they establish a culture of conviviality that is of central importance for living together in society. I argue that everyday conviviality in multicultural neighbourhoods of London and Istanbul has been strongly developed among young migrants who are working-class even in the face of exclusion and racism.

Sikhism and Environmental Activism: A Comprehensive Analysis of Ecosikh and Khalsa Aid Fostering Sustainability and Justice

Sikhism, grounded in the teachings of the Gurbani, promotes a deep connection with nature, viewing it as a sacred, interconnected entity, rather than as a mere resource. Central to this belief is the responsibility of humans to act as stewards of the environment, making environmental care a core aspect of Sikh spirituality and intentionality. Sikh organisations today, inspired by the Sikh concept of *Seva* (selfless service), are highly active in environmental initiatives. The proposed paper explores the intersections of Sikhism and environmentalism, focusing on how two contemporary faith based organizations rooted in Sikhism, the EcoSikh and the Khalsa Aid, incorporate religious principles to address the growing environmental crisis.

EcoSikh is primarily dedicated to reforestation and climate advocacy, while Khalsa Aid addresses broader humanitarian needs but also engages in environmental justice efforts. Both organisations draw on the Sikh practice of *Dasvand* (donating a tenth of one's income), to encourage communal participation in their projects, weaving together spiritual duty and sustainability. Through an ethnographic analysis of the approaches employed by the EcoSikh and the Khalsa Aid, this paper highlights how Sikh environmentalism adapts to diverse socio-cultural contexts, while remaining rooted in its spiritual ethos. It thereby attempts to understand how spirituality can drive positive environmental change and inspire collective responsibility for sustainability in the Anthropocene, both within and beyond the Sikh community.

A Critical Analysis of India's Human Rights Performance Concerning SDG

Sustainable development, as defined by the Brundtland Commission, aims to meet current needs without compromising future generations. In 2015, all United Nations Member States adopted the 2030 Agenda for Sustainable Development, outlining 17 SDGs that focus on people, the planet, prosperity, peace, and partnerships. Human rights are essential for achieving these goals, as most of the 169 targets are linked to international human rights and labor standards. The agenda emphasizes "leaving no one behind" and promotes universal respect for human rights, dignity, justice, and equality while recognizing diversity. It seeks to provide equal opportunities to realize human potential and foster a just, inclusive world that addresses the needs of the most vulnerable. As the world's most populous and fastest-growing large economy, India plays a disproportionately important role in achieving the SDGs. The SDG India Index has emerged as a powerful tool for assessing the country's progress, offering a comparative analysis across states and Union Territories. The first SDG Index and Dashboard was released in 2018, prepared by NITI Aayog, and is considered an important instrument for evaluating progress and instilling a spirit of competition among states and UTs. The Government of India has been designing and implementing key interventions, programs, and schemes to accelerate progress on the SDGs. With just six years remaining until the 2030 deadline, it is essential to evaluate the progress made so far, as current achievements fall far short of what is required to meet the SDG targets by 2030.

Bridging the Gender GAP: Political Empowerment and Women Leadership in India

The political empowerment of women is essential for women-led development, as their participation in politics not only signifies equality and freedom but also the ability to exercise power and make decisions. The Indian Constitution guarantees several rights for women, including Articles 14, 15(1), 15(3), and 16, while India also ratified the Convention on the Political Rights of Women (1953), affirming their right to hold public office on equal terms with men. Women's leadership is crucial for achieving the Sustainable Development Goals (SDGs) by 2030. India is committed to gender equality through international frameworks like the Beijing Declaration and Platform for Action. Despite notable progress—such as the election of a woman Prime Minister, two women Presidents, and 16 women Chief Ministers—India ranks 143rd out of 185 countries in women's representation in the lower house of Parliament. In contrast, Sweden, South Africa, the UK, and the US have much higher representation. In the 2019 Lok Sabha, India saw a record 78 women MPs, though this number declined to 74 in 2024. These women MPs represent 14 political parties, with the BJP having 31, Congress 13, and AITC 11. However, only 43 are first-time MPs, including figures like Misa Bharti (BJD) and Kangana Ranaut (BJP). Likewise, Women's representation in state legislative assemblies remains below 10% as a reflection of deep-rooted socio-cultural barriers. Socio-cultural barriers such as patriarchal norms, gender stereotypes, male-dominated political parties, high election costs, and muscle power continue to impede women's political participation. Comprehensive research using data from government sources and political manifestos is essential for addressing these challenges and improving women's representation in Indian politics.

Right to Have Clean Air :Issues and Challenges

Human body is an amalgamation of all the 5 elements of nature soil, fire, water, space and most importantly air. Not only humans but all living beings thrive on air which is essential for their physiology. However, having a clean, quality air is still a huge challenge for so many Indians especially the ones living in the NCR (National Capital Region). Clean air is one of the substantial element of right to safe, clean and sustainable environment but the figures of AQI says otherwise, the current AQI (Air Quality Index) of India is 109 (poor) level. The current PPM 2.5 concentration in India is 2.7 times above the recommended limit given by WHO, with Delhi having the poorest AQI even worse than the national average at 160 followed closely by Haryana at 153. India ranks 3rd among the world's most polluted countries based on Annual PM2.5 concentration, with Two Indian Cities namely Delhi and Kolkata being among the top ten most polluted cities in the world. The living state of NCR is progressively progressively becoming hostile although The Air Prevention And Control Of Pollution Act was enacted in 1981, later amended in 1987 as in MC Mehta Versus Union Of India (AIR19807SC1080) Supreme Court treated Right To Live In A Pollution Free Environment as a part of Fundamental Right To Life under Article 21 of the constitution. This however even after almost 4 decades of implementation is still a challenge in the major metropolitan cities of the country including New Delhi, NCR. This paper advocates for this Right necessary for better human life and will use Secondary data ie various Govt reports, report of NGOs, various judgments for analysis

Anthropocentric Environmental Degradation in the Era of Globalization: Catastrophe in the Making

The ecological critique of modernity put forward the *anthropogenic thesis* as a critique of the modernization theory of development in the 1970s and pointed out the negative impact of industrial development in the Western as well as in the developing worlds. This has given rise to several environmental and social movements throughout the world in the last five decades. The notion of sustainable development was coined to address these problems and various measures were taken at the global and local levels to deal with the problems of global warming and climate change at various fora and several debates are still on. These issues can be addressed at different levels. 'Not all environmental problems can be described as global, nor all responses to environmental threats global'. Many threats are highly localized in both their

origins and consequences with little or no stretching of social relationships or movements of pollutants through space and time. It is not possible to reduce an account of ecosystems, environments, and environmental change purely to the language of social sciences or to describe a distinct environmental action in different spheres of social life. Thus, our central concern must not be on the environment in general but on *environmental degradation* in particular and social action or processes that either cause environmental degradation or respond to it. However, it is also not altogether clear what is meant by environmental degradation as some of these like, radioactive emissions, are invisible and can be identified through the use of sophisticated technologies and are only conceivable in terms of complex scientific models and languages. Thus, our focus must be on anthropocentric environmental degradation, on how the interaction of natural and social worlds generates constraints, opportunities, and problems for other forms of social action- political, military, ethical, or economic.

The Future of Nation-States in the Changing World Order

The notion of nation-states is closely related to the project of modernity that began in the 14th and 15th centuries in Europe and spilled over to Asia, Africa, and Latin America in the post-colonial period. The developing societies adopted the process of modernization (convergence thesis) for their development based on the experiences of the European societies. However, they could not get much success in achieving the goals of modernity. Two dominant paradigms, socialistic and capitalistic models, of development advocate for a centrally administered nation-state and a federal structure of states within this. In the last few decades, the project of modernity has faced a crisis, particularly after the dissolution of the Soviet Union into 15 new nation-states. The capitalist countries of Europe and the American continent have also faced an economic crisis in the form of recession and initiated a new economic policy of liberalization, privatization, and globalization and a new global economy came into existence in the first decade of the 21st century with the rise of internet-based new communication technologies which intensified the globalization, beyond the economy and added cultural, social, political and environmental dimensions. A set of globalization theorists, particularly hyperglobalists, argue that nation-states have become weak and a new epoch of human history has begun with globalization. They also claimed the end of the modernity project. However, neo-Marxists and Sceptics denied their claims and argued that nation-states are as strong as earlier and globalization is just confined to trading that is also at the regional level and rejects the notion of globalization. The present paper aims to analyze the future of nation-states in the era of globalization in which world order is transforming from a unipolar world to a multi-polar world.

The New Colombian Migration in Spain after the Great Recession: Integration and Emerging Profiles

Colombian immigration was one of the protagonists of the first international migratory wave from 2000 to 2007, with a clear pre-eminence of women, related both to the global chain of care and to the attraction factor exerted by the labour and marriage markets in Spain. After the Great Recession, Spain once again experienced a second migratory boom, only temporarily interrupted by the COVID-19 pandemic. However, in this second flow of Colombian immigrants to Spain, the economic factors of expulsion and the existence of migratory chains supported by an extensive Colombian population already settled in Spain, explain a unique and differential character of the flows and the immigrant population between 2014 and 2022. The immigration and integration policies in Spain, which favours Latin American immigrants, helped Colombian immigrants to settle permanently in the country and grow socio-economically. With the help of national registers, data from the migration observatory, and the UN global migration database, this paper: 1) explores Spain's position in the Colombian diaspora; 2) examines the flow (size, structure and composition) of the Colombian population to Spain, comparing the two growth periods 2000-2007 and 2014-2021, and the impact of migration and integration policies on it; 3) studies the changes in the sociodemographic characteristics and territorial distribution of Colombians in Spain; and, 4) determines the demographic and legislative factors that affect the integration process of Colombians in Spain. The preliminary results show that the Colombians are well integrated into the Spanish society and economy, where they are contributing to different sectors.

SINGH PARIHAR, VANCHNA* (ISA TG03, India)

A Sociological Study of the Characteristics and Challenges of Rural and Urban Motherhood in India

India is a fast developing economy with predominantly rural population. On one side 68.8 pc of its population is rural in nature while rapid modernisation and industrialisation lead to its urbanisation. The efforts for women-empowerment and equality of sex has increased the number of working women. They have proved their professional skills and expertise in various fields. Apart from professional acumen, motherhood is the natural quality of a woman. The responsibility of motherhood and nurturing children is defined differently in rural and environment.

Rural area women witness the nurturing of a child as their primary responsibility along with household jobs, while a different status is observed in urban areas where women face the challenge of creating balance between their profession and motherhood. The birth and responsibility of nurturing a child has emerged as a barrier in successful persuasion of career. The problem may vary with field and status but problem relating to maintenance of balance and paying attention to child is same. There are several factors as barriers and assisting the motherhood in different areas. The correct parenting involving the education and development of a child is affecting the decision making process and future of a woman.

The government has also realised the problem and taken measures to improve the share of rural parenting women in different fields and at the same time facilitating urban mothers for carrying out their responsibility towards their children.

This research paper is a sociological study aimed at pointing out the difference in rural and urban pattern of motherhood, its execution as a right, responsibility or burden and its affect on the professional life of a woman.

NADKARNI, DR. VISHAL (Women and Child Development Department Govt of MP, India)

Sociological Study about Public Behaviour Towards Women in Uniform in Indian Context

India is the country a witnessing rapid growth in economic, military, technology, social etc. Availability of better medical facilities has catalyzed rapid growth of population. At the same time the education and social renaissance has improved the female sex ratio and girls education. The half population is demanding its fair share in this competitive world. Their claim is rightly supported by various government policies and acts.

The Indian society to some extent accepted a woman role in in-office desk job. But their employment in a uniform service has presented mixed response devoid of uniformity. The Indian women starting from mythological warrior queen Kaikeyi in Ramayana to medieval Razia sultan to Queen of Jhansi though paved the way for acceptance but not enough for the fair approval of a woman wearing uniform.

The societal behaviour affected by cultural, social, historical, economical factors towards women has evolved with time but still having complexity in larger terms judging them in front of respect, scrutiny, observation, gender stereotype, performance etc.

Present ratio of Indian women is 12 pc in police, 0.56 pc in Army, 1.08 pc in Air force and 6.5 pc in Navy. The government has vowed for 33 pc induction of women in Indian paramilitary forces. The numbers may be increasing but the public or co-worker's attitudinal issues are same. They range from physical and emotional stereotyping, double standard, over-scrutiny, harassment, sexual objectivism etc.

This study aims at bringing forward various problems related to women in uniform serving in different dimensions, combat or non-combat, attitudinal perspective practical issues faced by them

SINHA, ADITI* (Indira Gandhi National Tribal University, Amarkantak, Madhya Pradesh, India)

Land, Identity, and Autonomy: Emotions and Resistance in the Pathalgadi Movement, India

In the Anthropocene, rogue forms of capitalist exploitation have degraded the environment severely-often at the cost of resource-rich but socio-economically marginalized tracts, especially those dominated by tribal populations. Movements rooted in their socio-cultural contexts have tried to conflate political and economic rights with the right to protect tribal identity. For these groups, land is central not only to economic survival but also to cultural and political resilience.

The Pathalgadi movement in Jharkhand, India, exemplifies how tribal groups utilize strategic essentialism to assert their identity, resist state control, and pursue autonomy. To comprehend this collective resistance formed by the movement, this paper explores the potential role emotions could play. In this regard, particularly focusing on how emotions such as anger and fear drive mobilization.

The initial mobilization fueled by anger over violations of constitutional rights, capitalist exploitation, and land dispossession continues to strongly resonate in the community's collective pain and aspirations. Beyond demands for self-autonomy and environmental justice, protecting their land and resources is at the heart of the movement.

Based on ethnographic approach, this study bases its exploration of emotions shaping collective action in the movement on qualitative narratives from movement leaders and villagers. The study therefore shows how emotion complements political and economic struggles and thus situates tribal resistance within a broader context of material survival and environmental justice.

Tribal identity politics are not about just the better preservation of culture; they involve material contending for the very existence of tribal people. Emotions are what shape collective resistance against environmental destruction and capitalist expansion in the names of fear, solidarity, and anger. The Pathalgadi movement's call for sustainable self-autonomy enacts emotions and uses strategic essentialism against encroachment, a potent response specifically in the Anthropocene.

SALES CEDRO, ANDRÉ (Federal University of São Carlos, Brazil)

Judicial Control of Police Brutality: Examining the Dynamics and Boundaries of Legal Professions in Brazil

In a country with the highest rates of police killings, the study focuses on the intersection of legal professions and the mechanisms of police accountability within the justice system. In Brazil, most police killings are committed by the Military Police during ostensive policing operations. The majority of victims are young Black citizens. The Civil Police are responsible for investigating these cases and forwarding them to the Public Prosecutor's Office, which has the constitutional mandate of external control oversight of police activities through judicial means.

To understand how this external control of police operates in practice, we conducted interviews with legal professionals and document analysis using a semi-structured script. Data were interpreted using concepts related to the interfaces of legal professions and their dynamics of competition, coordination, and symbiosis (Sida Liu; Maria G. Bonelli).

The initial findings reveal blurred boundaries between Public Prosecutors and the Military Police when they collaborate on cases initiated by on-spot detentions, which neutralizes the prosecutor's drive to incriminate police abuse. The Prosecutor's Office lacks Criminalistics experts and thus relies on examinations conducted by Civil Police. It is also common to call Military officials to court to testify about the circumstances of crimes and detentions. Additionally, it is not unusual to find prosecutors who started their careers as police officers. Consequently, the way the mandate of external control of police activities is exercised by these professionals, in a context where legal institutions have these blurred zones of intervention, often leads to impunity for police brutality, perpetuating the normalization of violence and racial injustice.

The Culture of Quotations in Soviet Sociology As a Mode of Correlating Academic Discourse with Political Networks

The academic institutionalization of sociology in Russia began with the 1917 revolution. Throughout the Soviet period, the Marxist approach dominated, which was ensured by the political and ideological support of the state. The relationship between political networks and academic discourse passed through different stages of evolution and took various forms. Embeddedness of sociologists in the political field was accompanied by the development of a special culture of quotations, in which authors focused, on the one hand, on classical works of Marxism, and, on the other hand, on the current political agenda of the communist party and soviet government. Different strategies and interests within the academic community made this culture heterogeneous. On the part of political networks, the citation culture was controlled and supported through stable administrative practices. This gave Soviet sociology the appearance of partisanship, stereotypicality, and practical validity.

Why Reunionese Anti-Colonial Thoughts Have Disappeared? Emergence and Decline of Anti-Colonial Ideas in Réunion in the Second Half of the 20th Century.

During the 1950s, like other Third World countries, and overseas French territories, Réunion Island experienced a wave of anticolonialism movement. In 1959, a local communist party emerged and constructed its political identity with the idea of struggling against French colonialism. It asked for a "political autonomy" from France. Consequently, a certain quantity of publications (mainly political periodicals and newspapers, but also some books) using an anti-colonialist rhetoric was published during the 1960 and 1970s. But at the end of the 1970s and the beginning of the 1980s this Reunionese anti-colonialist literature disappeared. So, this paper proposes to examine the dynamics of anticolonial ideas in Réunion Island. I will begin by looking at anti-colonialist actors and discourses. I will show how they analysed society and what they requested. Then I will present different hypotheses that could explain the downward trend of anticolonialism in the island. I will stress on the strategy of communist party and its relations with intellectuals. The data on which this communication is based are extracted from an archival ethnography conducted for my ongoing doctoral thesis. In this research, I explore the visions of the future that have shaped the Reunionese agri-food system since the end of the colonial status of this Indian ocean island.

SIOZOU, NEFELI* (PhD Candidate, National Technical University of Athens, Greece)

Urban Sociology and Social Movements. the Case of Palestine in the Way Modern Resistance 'develops'.

The development and the impact of social movements is a fundamental element and a key feature of economic, political and social changes. Social reality and social systems themselves are dialectically intertwined with the historical and social examination process, redefining social reality and overturning existing political and socio-economic correlations.

The theory of social movements and their relation to Palestine should not be seen or understood as an empirical examination of political, social,

class and geopolitical contradictions within the frame of space. Rather, it is through the actual flowing reality and the analysis of existing spatial, political, economic and social conditions as well as the mechanisms through which movement predispositions are transformed into realities that they must be understood.

The study of social movements, in the context of a broader field of conflict politics, and its wider connection with war in general, is a constituent branch of both political sociology, political geography and radical theories of space. The case of Palestine, the history of this place and its relation to war, is in itself very special and specific, with diverse and different characteristics that influence and shape its uprising and modes of resistance over time.

Palestine, as a field of spatial-social conflict and as a spatial-social link, can highlight the dynamics of social movements in general and their importance in the way the war is conducted and its final outcome. The current form and development of claims and counterclaims in Palestine is therefore based on the conceptual formation and relation of space and subjects within the framework of a historical - geographical materialism.

Geoengineering and Climate Skepticism: A Digital Netnography of Conspiracy Narratives in the Italian Facebooksphere

Studying the detractors of climate science is crucial for understanding the dynamics and narratives that contribute to the spread of misinformation on a critical issue like climate change. This study is part of a broader research project focused on climate change skepticism within groups and pages in the Italian Facebooksphere. It centers on a specific sub-community opposed to geoengineering. Through a digital netnography nospanning approximately three years, along with interviews with group administrators, content creators, and participant observation at various conferences, the research seeks to explore the narratives surrounding chemtrails and geoengineering and how these narratives fit within the broader context of climate denialism. Observations indicate that many Facebook pages (and some connected Telegram channels) tend to exclude more extreme conspiracy theories, such as those related to eugenics or mass mind control, instead focusing on raising concerns about the military applications of geoengineering and the lack of government transparency. Much of the circulating content adopts a pseudoscientific stance, with research studies and data presented in support. An interesting finding is that there is no outright denial of the existence of climate change itself; rather, in some cases, it is attributed to geoengineering experiments (HAARP, radio frequencies, directed energy weapons, chemtrails), while in others, global warming is linked to solar influences (solar storms, changes in Earth's albedo, magnetic pole shifts). Geoengineering is viewed as a means to mitigate these overheating effects but is also blamed for causing extreme weather events. These varied positions contribute to generating informational confusion and manipulating public opinion on this critical issue.

Globalization, Democracy, and Women in Indian Legislative Bodies

Contemporary globalization was shaped profoundly by the structural consequences of the Second World War. Several nations have emerged as a result of the decolonization process. India which was under British rule gained independence in 1947 and adopted a democratic political system for governance. The women were given adult franchises in the very first election held in 1952. The participation of women in political processes has been a significant phenomenon not only at the level of casting votes but they were also as people's representatives in the legislative assembly and local bodies. However, their representation was limited due to patriarchal social structures and conservative ideology prevailing among the Indian masses. With an increase in the level of education, their participation and representation in the legislative assembly and local bodies has been increased significantly. The measures like reservation of seats in village panchayats enabled them to provide leadership at the grassroots level. A recent bill passed in the Indian parliament which reserves 33 percent of seats for women in state assembly and parliament will further empower the Indian women. The present paper aims to analyze the status of Indian women in Parliament, state assembly, and the local bodies at the empirical level. The study will cover recent parliamentary elections held in 2024, State assembly elections in Uttar Pradesh in 2022, and local bodies elections in Varanasi town of Uttar Pradesh, India.

Impact of Social Media on Women's Empowerment: A Study of Female Graduate Students in a North Indian Town

The usage of social media has tremendously increased in the last decade with the advent of web 2.0 technology, which is characterized by interactivity, user-generated content, and user participation such as social networking, social bookmarking, blogging, podcasting, tagging, user participation, and user-generated content sharing through YouTube and Wikipedia, etc. The social media is a result of the application of this technology. This has a tremendous impact on the communication patterns of the different sections of the society. In Indian society, the advent of smartphones in the second decade of the present century enabled the masses in general and women in particular to interact with the real and virtual world. During the COVID-19 period, the number of smartphones increased among students so that they could attend online classes organized by their schools and colleges during lockdown. Every female student now has a smartphone of her own. They use it not only for education purposes but also for chatting, blogging, uploading videos, and so on. It has an important impact on the social, economic, political, and cultural aspects of their life. The present paper aims to understand the impact of social media on female graduate students in social, economic, political, and cultural aspects of their life in a post-graduate college in Varanasi, India.

'I Feel like I Am Still Sick, Because There Is Long COVID after COVID': An Ethnographic Study of the Illness Experience of COVID-19 Survivors in a Chinese Society

Background: As of 22 November 2023, the coronavirus disease 2019 (COVID-19) pandemic, a global health crisis, has resulted in around 772 million cases and more than 6 million deaths globally. Hong Kong recorded approximately 2.91 million confirmed cases by August 2023. The World Health Organization declared the pandemic over in May 2023. However, many COVID-19 survivors still suffer from the post-COVID condition or "long COVID", remaining in a state of illness. This study argues that the survivors' illness experience should be viewed through the lens of political economy and the capitalist world system as outlined in the Critical Medical Anthropology framework.

Methods: A qualitative study using ethnography and individual semi-structured interviews was conducted in two harmonica classes exclusively for survivors to explore the experiences of COVID-19 survivors. The ethnographic part of the study, which involved comprehensive participant observation, was carried out with 46 survivors from May 2022 to May 2023. Individual semi-structured interviews were conducted with another 30 survivors from January to April 2023, all in Hong Kong.

Results: This article investigates the subjective experiences of the participants by linking up the social context and structure as explanation following the political economy and the social hierarchy concept delineated from the capitalist world system according to the Critical Medical Anthropology framework. Their experiences were shaped by the medical concept of "long COVID", which made them feel perpetually ill and stigmatized. Power disparities arising from the capitalist world system between medical doctors and patients play a significant role in shaping this stigma.

Conclusion: The participants' post-COVID experiences, described as "long COVID", are a sociocultural byproduct of biomedical dominance and medicalization. The idea of their post-COVID experience as "long COVID" stems from the dominance of biomedicine and its propensity to medicalize conditions, keeping survivors under continuous biomedical and medical control even after recovery.

Trapped in Threads: Multifaceted Precarity of Migrant Workers in Cambodia's Garment Industry

This study examines the multifaceted precarity experienced by migrant workers in Cambodia's garment industry, a sector dominated by Chinese investment and crucial to Cambodia's economic development. Drawing on secondary data, qualitative interviews, and questionnaire surveys, we analyze how uneven development and power imbalance in global production shape

the living and working conditions of Cambodian garment workers. The research highlights the complex interplay between Chinese foreign direct investment, Cambodia's institutional environment, and the garment industry's global production network dynamics. We argue that migrant workers face overlapping forms of precariousness that extend beyond economic instability, affecting multiple aspects of their lives. This precarity is exacerbated by subsistence-level wages, short employment contracts, job suspensions, rural-urban migration patterns, remittances and debts, and the workers' position within the global production network. By linking individual experiences to broader structural forces, this study contributes to a nuanced understanding of labor conditions in the context of increasing Chinese investment in the Global South and the ongoing transformation of global production dynamics.

From Glory to Shadow: Grieving and Memorial Practices Around the Martyrs of the Revolution in Counterrevolutionary Egypt.

In Egypt, the demands centered around the rights of the "martyrs of the January 25, 2011 revolution," civilians who fell during clashes with the police and the military, were at the heart of the revolutionary movement (Buckner and Khatib 2014, Mittermaier 2015, Armbrust 2019). In addition to the tributes organized by various revolutionary groups, these martyrs were also praised by the political authorities who held power between 2011 and 2013, whether it was the Supreme Council of the Armed Forces or the Muslim Brotherhood's President Mohamed Morsi. Some of these "martyrs of the revolution" were officially recognized, and their families were entitled to compensation. However, the military regime that seized power in the summer of 2013, putting an end to the pluralist revolutionary fervor, quickly worked to render the revolutionary symbolism invisible, erasing tributes to its dead from both public and media spaces. Momentarily celebrated as heroes who paid the ultimate price for the revolutionary cause, these dead are now excluded from official commemorations, in favor of police and army martyrs killed in the "war on terror" led by the Egyptian state. What happens to mourning when it no longer matters? How do the families of these dead, once celebrated as liberators from an authoritarian regime, survive in a politically hostile space where the revolution is "officially silenced" (Wilson 2023) and where the sacrifice of their children is no longer honored? How is the memory of these dead, now deemed undesirable by the authorities, perpetuated? This presentation, based on interviews with families of revolutionary martyrs and fieldwork carried out in Cairo between 2018 and 2024, aims to illustrate the inherent "ambiguity" (Verdery 1999) of dead bodies through analyzing how the transformation of political circumstances affects grieving, the memory of the dead, and the socio-cultural significance of the sacrifices made.

SIZAIRE, LAURE* (Université libre de Bruxelles, Belgium)

Unveiling Gender Regimes from the Ground up: Insights from Transnational Conjugalities

Intimate encounters now occur on a global scale, extending matrimonial recruitment beyond borders, particularly between Western and non-Western regions (Williams 2010). Transnational families are therefore not only defined by members spread across nation-states but also by individuals forming new family units with host country residents. Within these transnational conjugalities, globalized power dynamics – anchored in gender, race, nationality and class – play a significant role and permeate the intimate sphere (Beck & Beck-Gernsheim 2013). How do couples navigate these power dynamics? Do they challenge or reinforce them? To what extent can we rely on individuals' experiences to document societal rules and norms? Drawing on the literature, my previous research on French-Post-Soviet intimacies and ongoing investigations into transnational conjugality in West Africa, I argue that the concept of gender regimes serves as a heuristic tool for understanding the challenges and potential of transnational relationships. Gender regimes refer to the specific rules and norms each nation develops to organize gender relations, which are intertwined with other power relations like race and class. These norms are historically and geographically situated and constantly evolving, albeit slowly. In transnational conjugalities, these gender regimes often come into confrontation, as the members bring different backgrounds and gender norms into their relationships. This can create liminal spaces where gender and power relations may be renegotiated. At the same time, their experiences are influenced by the dominant norms of the country of settlement. Through their transnational conjugal and migratory experiences, the members elaborate comparisons and reveal gender regimes operating "here" and "there". Understanding gender regimes through the lens of individuals' experiences in transnational conjugalities illuminates how intimate experiences are shaped by global and local power dynamics, while also contributing to their transformation. By examining these dynamics, we gain insight into the transformation of intimacy at the global stage.

SJÖSTEDT, VIVECA* (Uppsala university, Sweden)

Apex Predators in the Meta-Organization

When an organization joins a meta-organization, an extra layer of decision making is added. Consequently, all the members of an organization get concentrated in one representative in the meta-organization. We describe these representatives as *apex predators*, not because they lack enemies but because each of them is a personified accumulation of an organization. The apex predators of organizations play important parts in shaping the meta-organization. They are responsible for bringing issues that the organization find important to the meta-organization's 'table' and in the other direction: the implementation of meta-organization's decision in the organization. Therefore, the apex predators' roles are crucial for the functioning of the meta-organization. We find that these kind of 'inner life' issues of the meta-organization to a large extent has been ignored in the meta-organization literature and that it deserves further study.

The aim of this paper is to explore the apex predators in a local multi-stakeholder meta-organization working for sustainability, the Uppsala Climate Protocol. There are particularly three aspects that we are interested in: activities, loyalties and resources. *Activity* refers to bringing initiatives to the meta-organization from the member organization (lobbying) as well as the implementation of decisions made by the meta-organization in the member organization (adaptation). When it comes to *loyalties*, there are four relevant loyalties of interest: the loyalty to purpose of the meta-organization, the loyalty to the secretariat of the meta-organization, the loyalty to the member organization's purpose and the loyalty to a sustainable transition. Lastly, we focus on the positions that the representatives have in the member organizations and the *resources* that it comes with: are managers the apex predators or are experts apex predators?

FILCAK, RICHARD (Slovak Academy of Sciences, Slovakia)

Life Next to a Landfill: Urban Marginality, Environmental Injustice and the Roma

The site known as Lipnica is a segregated Roma settlement built on the edge of a municipal landfill in the district town of Turčany, central Slovakia. The settlement emerged as a result of processes rooted in neoliberal economic restructuring, accompanied by a sharp rise in unemployment in the 1990s. The settlement was originally built to provide temporary housing for those who were in arrears for rent in municipal flats, and originally consisted of one apartment building and several modular cabins. In the following years it expanded, and today it is an ethnic quasi-ghetto for approximately 400 Roma inhabitants. From a theoretical perspective, an analysis of the Lipnica settlement is situated at the intersection of critical race theory and environmental justice theory. In this article, we describe the trajectory leading to the formation of the settlement and analyse how the impoverishment of the Roma, coupled with the construction of the community as 'maladjusted' anti-social others, facilitated their spatial exclusion. We conclude that the case demythologises culturising explanations for the emergence of Roma settlements, by using empirical data to show how Lipnica developed as a result of intentional discriminatory policies of the local ruling class used against an ethnic minority.

ZLOBINA, OLENA (National Academy of Sciences, Ukraine)

The Image of the Enemy in the Mass Consciousness of Civilians and the Military in the Russian-Ukrainian War

The image of the enemy in war plays an important mobilizing role, marks the difference between "us" and "them," and legitimizes actions to destroy the enemy. Mostly, the formation of the image of the enemy is studied "from the outside" through the analysis of the discourse of the mass media and politicians. Our research uses a "from the inside" approach. Its purpose is to determine which image of the enemy was formed in the minds of civilians and military personnel in the context of the Russian-Ukrainian war. The empirical basis for the study is 127 semi-structured, in-depth interviews with groups of civilians and military personnel.

It was found that in the process of transition from a hybrid to a full-scale war, the image of the enemy is transformed through the specification of key actors who represent the public's perception of the enemy: instead of a

blurred image of the Enemy country, the images of the Russian government, the Russian population, and the Russian army are differentiated in the minds of the population.

The images of these groups are presented in representations as independent constructs, but their formation is a compatible process in which internally consistent elements are reproduced. Key characteristics that form the core of each of the images: for the Russian authorities - immorality combined with self-centeredness and cruelty; for the image of the population - immorality, cruelty, and lack of agency; for the image of the military - aggressiveness; and immorality. The core of the generalized enemy is his personification as an immoral "non-human."

It turned out that the different positions of civilians and military in the confrontation with the enemy and the different experiences of losses due to war do not affect the definition of the key characteristics of the core of the image of the enemy.

Institutionalization of Sociology in Brno: Favorable Political Momentum, Hostile Academics

This is a case study of the institutionalization of sociology in one of the semiperipheral countries of Europe in the interwar period. The Seminar of Sociology at the university in Brno was among the most dynamic of the newly established sociological units in Central Europe. Under the leadership of Inocenc Arnošt Bláha it rose to rival Prague as the main center of academic sociology in Czechoslovakia. Bláha and his associates controlled the Czechoslovak sociological association and edited the first national journal of sociology, *Sociologická Revue*. In the 1930s the Brno group began to conduct increasingly ambitious empirical research projects. Bláha and his associates self-consciously cultivated a large network of contacts in the international sociology of their time, including such figures as Pitirim Sorokin, Earle Eubank or Louis Wirth. But the ambition of sociology to be recognized as an academic discipline had to be asserted against the opposition that existed within the state administration, among an influential portion of the national intelligentsia and among the professors from the humanities and law faculties at the university of Brno. The success would be hardly possible had Bláha not aligned himself and his discipline with the central political objectives of the Czechoslovak Republic (social equalization, land reform, secularism, Czechoslovakism). This despite the fact that he remained a political outsider and his own political activities were a failure. On the other hand, of no small weight was his public persona owed to the role he had as popular educator and media presence. The Second World War and the subsequent Communist dictatorship put an end to the promising growth of the Brno School of Sociology. But the legacy persisted and was revived in the 1960s when sociology was reinstitutionalized in the form of a Department at Brno University which has been in continuous existence until today.

SKOVAJSA, MAREK* (Charles University, Czech Republic)

Social Sciences Responding to the Year 1989 in Central and Eastern Europe: A Comparison Among Disciplines

The comparative study of the history of various social science disciplines remains an infrequent undertaking. The works that present a comprehensive picture of all or most social sciences (e.g., Wagner, Wittrock & Whitley, 1991; Porter & Ross, 2003; Backhouse & Fontaine, 2010; Fleck, Duller & Karády, 2018) contain only a limited comparative element. Arguably drawing broad comparisons among the histories of different social sciences is unlikely to move beyond generalities. But by limiting the scope of attention to specific cases and relatively uniform contexts, it is possible to gain insight into the distinct ways in which various disciplines respond to specific social developments, are shaped by them and shape these in turn.

This paper outlines a comparative analysis of the encounter of sociology, political science, economics, and psychology with the processes referred to variously as democratic transition, market reforms or post-communist transformation in Central and Eastern Europe after 1989. Faced with an instance of major social change, the social science disciplines were differentially predisposed to adapt and expand their research agendas, enter the field as active shapers of social reality, provide support and legitimation to the parties involved in political and ideological struggles, attract institutional resources, establish bridges with social scientists from the region, etc. How can be described the response of each of these social sciences to post-communist transformation in intellectual, institutional, political terms?

The aim of this presentation is to point out the similarities and differences among individual disciplines and to offer explanations for the varying responses observed. The second aim is to reflect on the methodological

requirements and limitations associated with comparative research of the history of various academic disciplines. The paper is based on a critical review of the literature and on case studies of selected institutions, personalities, publications, and policy issues.

SKREPETI, ARTEMIS* (Université Paris Cité, France)

Therapeutic Practices and Spiritual Healing in Lakonia, Greece: The Interplay of Religion and Magic

This study investigates therapeutic practices in Lakonia, Greece, emphasizing the concepts of the evil eye and healing rituals associated with possession by malevolent spirits. It explores the intricate relationship between Greek Orthodox Christian beliefs, magic, spirituality, and healing within this local context, where such practices provide vital therapeutic responses to distress and suffering. By moving beyond dominant biomedical frameworks, this research highlights the enduring significance of local folk medicine in managing health and well-being, particularly through religious and magico-religious rituals that intertwine with state-sanctioned Orthodox Christianity.

The study focuses on the experiences of “*magisses*” (female magicians) who assist the community by lifting curses and warding off evil through plant-based remedies, while navigating the complexities of possession by malevolent spirits. In these situations, locals often seek the help of both magicians and Orthodox priests to combat evil and expel spirits. My field research, conducted as part of a PhD thesis, elucidates the pervasive presence of magic in everyday life, illustrating how local beliefs regarding the evil eye and spirit possession shape understandings of health, culture, and spirituality in both rural and urban contexts. This work identifies interstices where health, religion, and spirituality overlap, contributing to a broader discourse on legitimization strategies in health practices, particularly in the context of the marginalization of traditional knowledge through modernization.

Empowerment through Environmental Governance: Navigating Challenges in Women's Argan Oil Cooperatives in Southwestern Morocco

The development of women's argan oil cooperatives in southwestern Morocco presents a compelling case for discussing rural women's empowerment. Historically marginalized within patriarchal structures that restricted their roles to the domestic sphere and hindered their access to resources—such as argan trees, education, and paid work—up to the present day, Amazigh women have evolved into key contributors to a rural sector of local, national, and international significance, as well as actors with socio-political claims. However, this progress comes with its own set of challenges and risks. This presentation aims to explore the environmental governance mechanisms of this shift, highlighting the formation and achievements of these cooperatives, alongside the challenges, contradictions, and ambivalences inherent in the empowerment process as women navigate the multi-actor landscape of the argan oil boom. We draw on data collected during participatory action research conducted between September and October 2022 in the Souss Massa region, including 17 in-depth semi-structured interviews, focus groups with women from ten argan cooperatives, and one focus group with cooperative presidents. This is complemented by secondary data, and the analysis is framed through a feminist political ecology lens. Our analysis reveals that, through state-backed initiatives, international support, and the leadership of women, argan cooperatives have become more than just workplaces; they are vital spaces where women collectively assert their autonomy and cultivate a shared identity rooted in Amazigh pride and sisterhood. However, as the industry becomes increasingly dominated by foreign cosmetic companies and intermediaries, and as recurrent droughts pose further challenges, these cooperatives face growing difficulties from unfair competition and limited adaptive capacity. Since women's empowerment is intrinsically tied to their control over the critical resource of argan fruit and oil, establishing a more equitable system of resource governance is essential.

SLEVIN, AMANDA* (Queen's University Belfast, Ireland)

Connecting Communities for Climate: The Role of Social Movements in Multi-Level Transformations

Awareness of climate breakdown has prompted people to undertake action across all levels of society. Within such societal shifts, questions arise around where socio-ecological efforts should be directed. Analogous to the oft-quoted chicken and egg situation (what comes first, chicken or egg?), some argue that grassroots, bottom-up responses should be prioritised to enable community-led initiatives for change at micro and meso levels of society whilst influencing macro-level policies and actions. Conversely, others advocate for top-down frameworks, established through law and policy by national and local governments, to foster individual behaviour change and multi-level transformations.

Recognising the need for simultaneous bottom-up and top-down approaches to climate action, premised upon inclusive, active citizen participation, this paper offers unique insights into multi-level socio-ecological action in Northern Ireland (NI). Until 2022, NI was the only part of the island of Ireland and the United Kingdom without climate legislation or appropriate climate policy, a state of affairs overcome by the intervention of Climate Coalition Northern Ireland (CCNI), a community of communities that became NI's most effective social movement for climate action. Formed in early 2020, CCNI facilitated collective action between academics, environmental NGOs, civil society groups, politicians and legal experts, ultimately shifting the trajectory of NI's climate legislation.

Written by the sociologist who served as CCNI's first Chairperson (2020-22) and who continues to be an active CCNI member, this paper draws on empirical research, self-reflexivity, and policy analysis, to analyse the effects of collective action upon climate legislation and policy development in NI. It also examines how NI's subsequent *Climate Change Act* (2022) and evolving policies influence socio-ecological practices to mitigate, adapt and build resilience to the climate crisis. As an example of sustainability praxis in practice, the paper offers lessons into critical reflection and collective action for socio-ecological transformation.

RC24-382.6

SLEVIN, AMANDA* (Queen's University Belfast, Ireland)

People, Place and Peace-Building: Critical Multi-Level Responses to the Triple Planetary Crises

The Triple Planetary Crises of climate change, biodiversity loss and pollution (UN, 2022) presents major socio-ecological challenges and devastating impacts for people across our planet, with vulnerable communities and societies worst affected by associated injustices. Not only do such forces pose existential threats for humanity, they threaten non-human species and are driving some species to extinction (IPBES, 2019). Yet, incredibly, opportunities exist to co-create a better world for all species.

In this paper, I share some conceptual and practical insights into how we can connect transformation of complex society-environment interactions with egalitarian agendas for genuinely sustainable development, locally and globally. Through a case study of Northern Ireland, a complex society still reeling from colonisation and associated ethno-nationalist conflicts, I consider how the Triple Planetary Crises constitutes a critical juncture that can offer new ways of thinking, being and collaborating to transcend traditional visible and invisible divisions.

The paper includes insights from an interdisciplinary, systematic review of literature on anthropogenic development pressures and biodiversity change in Northern Ireland (Ellis, Slevin and Emmerson, 2024), sociological research on climate [in-]action across the region (Slevin, 2023b, 2022), and new evidence on how conflict and segregation has damaged our shared environment (Belfast City Council, 2024). Upon problematising place-specific consequences of contemporary and historic society-environment interactions, I consider mechanisms for socio-ecological transformation. These include fostering socio-ECO-logical imagination as a starting point for alternative human-nature relations (Slevin, 2023a), community and social movement actions for climate and sustainability (*ibid.*), and associations with Johan Galtung's conceptualisation of ‘positive peace’ (1969). This paper connects empirical evidence with an emerging theoretical framework conducive to achievement of the UN's Sustainable Development Goals, and in so doing, illuminates the role of sustainability praxis and critical multi-level responses crucial to tackling the Triple Planetary Crises and enabling just transitions.

PICKETT, JUSTIN (University at Albany, USA)

White Nationalism and Support for Political Violence in the United States

In recent years, concerns have grown about escalating political violence directed against government officials, particularly fueled by white nationalism. The current study examines how white nationalism is associated with support for violent citizen responses to three different types of government actions—those that are non-partisan versus those that benefit either left-wing or right-wing causes. Using data from a national survey experiment (N = 1300), we find sizable support for political violence, especially in response to non-partisan government actions that violate citizens' rights or safety. In addition, white nationalist sentiment significantly predicts support for political violence, particularly when government actions benefit left-wing causes. This relationship persists after controlling for respondents' political views. These results suggest that the rise of white nationalism poses a critical threat to U.S. political stability, underscoring the urgent need for national security strategies to counter this rising movement.

SMIDOVA, IVA* (Masaryk University, Czech Republic)

Ageing Men's Trade-Offs

The paper explores themes of ageing and masculinity in interviews with ageing men. It is based on a qualitative sociological study, face-to-face interviews in several social settings in the Czech Republic. First, it critically reflects on the re/production of gender inequality and some challenges to masculinity connected with ageing. Second, the paper opens questions of knowledge production based on feminist research methods and ethics while exploring privileged actors in the social structure. Such a constellation brought analytical dilemmas for the research team. These involved adhering to caring, partnership, and respectful approach to the people involved in the study when sharing their life disruptions or newly encountered bodily limits connected with age while at the same time tackling explicit as well as implicit and unreflected structural privileges of the men involved in the study. How to do justice to intersections of these in the collected narratives of ageing Czech men?

RC38-628.2

SMIDOVA, IVA* (Masaryk University, Czech Republic)

Care and Power in the Lives of Ageing Men As Narratives of Unbearable Lightness

The choice, resources, and status mark approaches to care, including self-care, in the narratives collected in a qualitative study targeting aging men. Based on fieldwork in several social environments (marginalized as well as privileged) in the Czech Republic, the paper opens a broader discussion on the appropriation of care as well as on the abundance or lack of symbolic recognition of care practiced and provided by men. The "ease" of appropriating some care contrasts with practices of distancing from it as well as with some care being labeled as mere help. The analytical focus is on such a "lightness of caring" in contrast with "the unbearable" accounts of some of the aspects of the ageing process, and on intersections of both. This presentation uses interpretations of transcripts of interviews with men situated in privileged status positions within the social hierarchy. It addresses ageing and masculinity as gendered categories and processes and is informed by CSMM (Critical studies on men and masculinities) approach. It elaborates and critically reflects on how these men experience social relations of care.

SMITH, KIAH* (University of Queensland, Australia)

Civic Food Networks, Justice and Hope: Utopian 'Food Futures' As a Method for Food Systems Change

This paper reflects on the use of co-creation methodologies that connect citizen political action with food justice scholarship, through an investigation of *Fair Food Futures*: an Australian study that used qualitative 'future scenarios' to bring the change narratives of civic food networks into closer dialogue with domestic food system reform in Australia and the global UN Sustainable Development Goals. Theoretically and methodologically, the

study combines food utopias with futures thinking to construct a series of four distinct narratives for food systems change, co-created by food justice actors, initiatives and coalitions. Here I describe how the scenarios were constructed, and then consider their potential as spaces for civic resistance and regeneration within the wider context of food system reform in Australia. What do these 'utopian stories' tell us about possible transformations towards food justice in policy and activism? How can these narratives be used to create new forms of dialogue? In answering the first question, I specifically explore findings associated with 'food as a common good' that reflect civic actors' hopes for transforming future food systems. Opening up new spaces for dialogue via engagement with utopian scenarios has proven more challenging, however. While the project has used innovative and inclusive modes of communication (illustration, animation, podcast) to contribute to public discourse and policy debates about food justice in Australia, I argue that utopian storytelling is most useful when it is accompanied by targeted messages about systemic change. This paper also serves as an introduction to a new edited volume produced from RC40 sessions on innovative methodologies and citizen politics at the previous ISA Congress in Melbourne in 2023, which asks: How might researchers from diverse social science backgrounds play a more active role in supporting the goals of citizen-led food initiatives, through the kinds of research methodologies they employ?

TG03-957.6

SMITH, LINDSAY* (Arizona State University, USA)

Subversive Genes: Civil Disobedience, Techno-Scientific Activism, and the Emergence of Human Rights Genetics.

In this paper, I examine this history of appropriation, innovation, occupation, and creative (mis)use of genetic science in Latin America as a form of scientific civil disobedience that challenges the unjust practices of both the State and Scientific institutions. Through an ethnographically informed archival and material history of genetic technology innovation in Argentina, Guatemala, and Mexico, I demonstrate how activists have fused politics and emergent technologies in disobedient ways that produce science "otherwise" (Escobar, 1994). Communities have reimagined genetic technologies from a tool of law enforcement and surveillance into opportunities for community-centered justice. Resisting narratives that center technology as a magic bullet, I use ethnography and oral history to both *atterizar* (ground) and *encarnar* (en-flesh) emergent genetic technologies, documenting their emplaced histories, specific political and cultural contexts and the care and labor that remade them as tools capable of challenging dictatorial regimes, making visible entrenched structural violence, and transforming scientific and state institutions. Through close attention to cultural and regional networks, I show how the emergence of Latin American forensic genetics challenges dominant innovation paradigms, offering a unique approach to community-led technology development grounded in civil disobedience.

Productive Resistance: Feminist and LGBT+ Responses to Anti-Gender Mobilizations

Despite extensive research on anti-gender mobilizations, there remains a lack of focus on how feminist and LGBT+ movements respond to these challenges. Operating within a socio-political context characterized by post-truth misinformation, radical-right populism, and declining trust in science, feminist and LGBT+ actors face adverse structural conditions that require innovative approaches to sustain collective action, build coalitions, and advocate for inclusive policies. To address this gap, we investigated this issue through the Horizon 2020 project FIERCE – Feminist Movements Revitalizing Democracy in Europe. Based on interviews with feminist and LGBT+ activists from eight European countries (Italy, Slovenia, France, Turkey, Spain, Poland, Greece, Denmark), we identify the following key strategies: public actions, legal and institutional actions, watchdog advocacy, strategic communication, digital activism, strategic withdrawal, community and coalition building, and empowerment and protective advocacy. While many of these strategies have historical roots, their contemporary significance is crucial. Initially, feminist and LGBT+ movements underestimated anti-gender threats, leading to delayed responses and a reactive phase against neoconservative attacks. Currently, movements are transitioning into what we term the "productive resistance" phase, which shifts the focus away from direct confrontations toward proactive policy development, allowing them to avoid reactive engagements and concentrate on advancing their own agendas. In this phase, movements minimize engagement with anti-gender actors and prioritize coalition-building. However, the success of these strategies depends on the strength of democratic institutions, as demonstrated by the constraints faced

in illiberal democratic regimes. The main contribution of our paper lies in conceptualizing “productive” dimension of resistance, providing insight into how feminist and LGBT+ movements, even in a reactive environment, are advancing new, innovative strategies for sustained action.

Traditional Communities at Risk: Land Speculation and Touristification in Colônia Z-13 (Copacabana Beach - City of Rio de Janeiro, Rio de Janeiro State, Brazil) and in Paraty Mirim (City of Paraty, Rio de Janeiro State, Brazil)

This text focuses on two artisanal fishing communities located in different municipalities of the state of Rio de Janeiro: the Z-13 Colony, located on Copacabana Beach (City of Rio de Janeiro, Rio de Janeiro State, Brazil), and the coastal community of Paraty Mirim, a district in the municipality of Paraty (Rio de Janeiro State, Brazil). The Z-13 Colony, officially founded on June 29, 1923, is located at the last stretch of sand before Forte de Copacabana and is home to fishermen, who are mostly migrants from various regions. Due to its geographically concentrated structure, this location has also become an area frequented by other individuals, such as athletes, street vendors, and tourists. Paraty Mirim is a coastal village located about 18 kilometers from the urban center of Paraty (RJ). Its territory includes the ruins of the Archaeological Complex of the former Paraty Mirim Plantation, the Church of Nossa Senhora da Conceição (1731), and is part of the Cairuçu Environmental Protection Area (APA). Although there are numerous studies focused on both areas, there are few publications concerned with understanding how the process of tourism development has transformed the lives of the two traditional communities studied. Using Oral History methodology, the aim of this research is to analyze how public authorities, at the municipal, state, and federal levels have acted contrary to the interests of the poorest and most vulnerable populations. One of the findings of this comparative study is the observation that the territorial disputes in those areas generally resulted in the expulsion of the most vulnerable populations and their displacement from the coast.

Citizen Imaginaries of Democratic Innovations for Inclusive Sustainability Governance

The imperative to address complex sustainability challenges such as climate change, environmental degradation, and rising inequalities endures. Future uncertainty is exacerbated by wars, democratic backsliding, and societal polarisation - all threatening to overturn achieved progress towards sustainability (Xiang, 2024). In this era, dominant sociopolitical narratives have proven insufficient in leading us towards desired ways of living, with a shared responsibility for the environment, and towards a society that embraces inclusivity and sustainability (Stoddard et al., 2021).

To reverse the negative trends, inclusive governance recognises that engaging citizens and communities is critical for a societal transformation (Annahar et al., 2023), including the development of democratic innovations that aim to transform policy making. Innovations, such as participatory budgets and citizen assemblies are designed to enhance citizen participation, thus re-imagining citizen roles in governance (Elstub & Escobar, 2019). Nevertheless, there is still limited insight into what citizens expect from such inclusive participation, and what their imaginaries are.

Further, the adoption of democratic innovations is largely dependent on top-down initiatives, guided by established sociotechnical imaginaries, informed by science, policy and industry-led visions of desired and social and technological futures. It is, therefore, critical to expand the diversity and scope of transformative sustainability visions (Beck et al., 2021), yet learnings of how citizens imagine democratic participation are fragmented. Addressing the gap, this study brings together diverse groups of citizens in three European cities (Lisbon, Potsdam, Rome) who participated in Democracy Labs (see Campos et al., 2024), where they co-created imaginaries for inclusive democratic participation. The analysis of collected survey data (i.e., 78 responses), field diaries (79) and collective imaginaries (15) combines qualitative thematic analysis, sentiment analysis and topic modelling. Citizen expectations and their underlying narratives are examined and assessed against new physical and virtual spaces, new decision-making procedures and novel technologies.

Citizens Take Ownership – Appropriation of Democratic Innovations in Three Case Studies

Democratic innovations, conceptualised as deliberative and/or participatory initiatives promoting citizen participation in decision-making (Smith, 2009; Elstub & Escobar, 2019), emerged in response to criticisms of democratic erosion (Druckman, 2024; Xiang, 2024) and as opportunities for citizen engagement in policy strategies addressing complex sustainability challenges (Pickering et al., 2022; Samaddar et al., 2021).

These innovations include mini-publics, participatory budgeting, and collaborative governance (Elstub & Escobar, 2019). They follow institutionalised rules and methodologies governing participant selection, procedures, roles, and outcomes. Such initiatives face significant challenges and unmet expectations between organisers and participants, framed by political cultures and governance approaches.

This analysis explores how citizen participation develops in the case of mini-publics across governance levels, with a focus on sustainability challenges. Three empirical cases are examined: the Conference on the Future of Europe (CoFoE), the Spanish Citizen Assembly for the Climate, and the Climate Citizen Assembly in Bologna. The research, based on 31 semi-structured interviews with citizens, organisers, and decision-makers, alongside policy document reviews, and analyses the dynamics of citizen engagement throughout these top-down processes.

The findings reveal citizens sometimes “rebel” and take ownership of these processes, subverting organiser-set rules. For instance, in the CoFoE, citizens imposed new plenary session rules. In Spain, participants did not agree with the organisers’ proposal for spokespersons and changed it. In both Bologna and Spain, citizens formed associations to maintain dialogue with policymakers and ensure follow-up on outcomes.

This study demonstrates how citizen engagement in democratic innovations fosters transformative action, raising awareness of sustainability issues and promoting active citizenship. It also highlights the need for these innovations to be adaptive, enabling co-production of inclusive processes that incorporate citizens’ expectations and transformative will.

SOER, ELIZABETH FREDA* (Max Planck Institute for the Study of Societies, Germany)

Neoliberalism’s True Heirs: What Late-Apartheid South Africa Can Teach Us about Contemporary “Right-Wing Populism”

How can we make sense of the resurgence of the far-right across the world? From race riots in the United Kingdom to the flourishing of Hindu nationalism in India, there seems to be an increase of ethno-nationalist movements in strikingly diverse contexts. There is also a burgeoning literature on this topic as scholars attempt to understand whether this is a backlash against neoliberalism, a reactionary form of neoliberalism, or simply a cultural phenomenon produced by “globalisation”. This paper contributes to the vibrant discussion by examining an ideal yet overlooked case of ethno-national neoliberalism- apartheid South Africa in the 1980s. This case

reveals neoliberalism's relationship to colonialism and its contribution to the perpetuation of white rule. In this regard, South Africa should be seen as a microcosm of global colonialism and it can therefore provide broader insights. It encourages us to see characters such as Donald Trump, Jair Bolsonaro and Javier Milei not as "neoliberalism's bastards", but as its true heirs that rear their heads in times of heightened uncertainty. The paper draws on a vast range of archival sources from the late-apartheid period as well as the writings of prominent neoliberals to support this argument.

Theorizing Economic Imagined Futures from the South: Coloniality, Dependency and Radical Alternatives

This paper provides a broad overview of the theoretical contributions a "Global South perspective" can make to the literature on political-economic imagined futures, with a specific focus on Latin America and southern Africa. The vibrant literature on imagined futures in political economy contributes greatly to our understanding of the role that uncertainty and credible expectations play in capitalist dynamics. Although this work is crucial, it has tended to focus on the Global North and therefore it does not adequately capture capitalism as it is experienced by the majority of the world. Conversely, there is a burgeoning and fascinating literature on imagined futures in the Global South. Yet there is a tendency to focus on cultural and literary dimensions instead of political economy. This paper begins to address the gap by attempting to rethink the temporality and future-orientation of capitalism from the vantage point of the South. This perspective would challenge the trope of an "open future" associated with capitalism in the North and would rather foreground experiences of the closure of alternatives to capitalism. Relatedly, it questions a linear temporality of progress, development and "forward movement". Furthermore, it revises concepts of innovation and growth and highlights notions of imperialism, dependency and stagnation. However, the Global South is not simply characterized by exploitation; it is also a source of utopias and socio-economic alternatives to capitalism. These utopias and proposals for a New International Economic Order (NIEO) are often perceived as failures. Yet new perspectives on these "past futures" might provide crucial insights as we attempt to address the current multidimensional crises of capitalism.

SOFOS, SPYROS* (Simon Fraser University, Canada)

The Temporal Dimensions of Populist Discourse and Action in Contemporary Turkey

This paper explores the temporal dimensions of populist discourse and political strategy in contemporary Turkey. It investigates how temporal perceptions—such as nostalgia for a glorified past, crisis-driven urgency in the present, and the promise of a transformative future—shape the populist narrative employed by political actors like the AKP (Justice and Development Party) and President Recep Tayyip Erdoğan. By evoking a national history framed in terms of restoration, populist discourse and action in Turkey employ a linear conception of time to create a sense of continuity between a mythic past and a revitalized future, positioning the present as a moment of crisis and opportunity.

This study also examines the non-linear conceptions of time in populist strategy, particularly the cyclical nature of political crises and their role in maintaining momentum and a perpetual state of mobilization. Drawing on ethnographic and archival research as well as a review of work on the intersection of populism, identity, and crisis, the paper interrogates how these temporal narratives are mobilized to address generational tensions, public memory, and the waves of protest that shape political contention in Turkey.

SOGN, HANNE ELISABETH* (The Norwegian School of Sport Sciences, Norway)

The Social Organization of Gender Inequality in the Norwegian Olympic and Paralympic Committee and Confederation of Sports (NIF) – an Epistemic Paradox?

The overall aim of my PhD project was to contribute to accelerating progress in gender equality among top leaders in The Norwegian Olympic and Paralympic Committee and Confederation of Sports (NIF). To succeed in

this, I used institutional ethnography to dig deeper into the social organization of gender inequality in the organization. During my first interviews with some newly appointed female top leaders, I became aware that what these top leaders said, their practices, ideas and expectations of themselves, were hooked into what I conceptualized as a masculine ruling logic. Because men have traditionally been faced with the requirement to do masculinity, characteristics, actions and attitudes we associate with masculinity are often associated with physical men. It is therefore necessary to emphasize that I do not understand masculinity as a characteristic of the individual (the man), but as an objectifying ruling logic that people through coordinated activity maintain and reproduce, regardless of their gender. The framework points to the fact that there are characteristic forms of ruling in the everyday life in NIF, which regulate and give direction to what top leaders do, perceptions of reality, social interaction and ways of thinking, and being. Gender equality is nevertheless thought of as something that is possible to achieve by recruiting more women into top leader positions - which I, in my presentation, will problematise as an epistemic paradox - or an epistemic illusion, which represents an obstacle for all sports organisations who works to be more diverse and social sustainable. The presentation is based on three years of ethnographic fieldwork, 38 interviews with current and former top leaders (mainly men) in the sports organisation, a large number of observations of meetings and social events and analyses of institutional texts.

Ageing and Epistemic Injustice: On Age Relations and Exclusions of Older Persons in Digitalization Strategies in Romania and Sweden

Despite the transformative changes brought about by digitalization, little is known about how it contributes to age relations and the assumptions of demarcated age groups as epistemologically unproblematic and others as deviant. By making visible how older persons are represented in national digitalization strategies and the absence of measures to include them in the digital transformation, this paper contributes new knowledge about age relations and the mechanisms behind the marginalization of older persons in national digitalization policies.

The analyzed material consists of national digitization strategies from Romania and Sweden, two countries that are among the least and most digitized countries in Europe, respectively. The documents are from the period 2011-2022. The analyses are based on Bacchi's "What's the problem represented to be- approach" (2009). The analyses highlight three key results: (1) A key goal in the two countries is to strengthen the countries position in international comparisons of digitalisation level. (2) Older people are seen as a homogeneous group and as a problem because they are not expected make use of digital opportunities. (3) Even though the issue of older people's lack of digital competence is seen as significant, there are no measures to address this exclusion.

The portrayal of older persons as an obstacle to the national digitalization goals, while simultaneously having no active measures in place to include them, and the absence of their own voices, can be understood as an expression of epistemic injustice; that is, older persons are not seen as reliable epistemological subjects.

SOKOLOV, MIKHAIL* (Nazarbayev University, Kazakhstan)

The Types of Organizational Secrecy and the Micropolitics of Knowledge Production in Soviet-Style Dictatorships

Since Foucault, state bureaucracies have been regarded as producers of knowledge used to control subject populations. In addition to, or even above all, such bureaucracies control the bureaucrats themselves by using data they generate for appraisal and performance evaluation. This makes personnel eager to distort information reaching their superiors or prevent the production of facts that might discredit them in any way. This paper will explore the forms of secrecy that emerge within these complex relationships, using the example of the largest centralized bureaucracy in human history—the Soviet command economy—and the situation of a specific group of knowledge workers within it: Soviet sociologists. It applies theoretical frameworks from Goffman's and Friedell's shared awareness models, as well as approaches from the sociology of scientific knowledge, to analyze various types of secrecy present in bureaucratic organizations. The official mission of Soviet sociologists was to evaluate Soviet society's progress toward communism and to identify problems encountered on this path. In centralized bureaucracies, however, identifying problems often means placing blame on someone who

either failed to predict them or failed to solve them. In the USSR, this tendency was taken to the extreme due to the fact that the central legitimizing myth was the myth of development according to Lenin's all-encompassing plan. In this context, the identification of any problems—which Soviet sociologists were interested in discovering, as it extended their professional jurisdiction—carried an inherently subversive message. As a result, their ability to conduct research was severely restricted. At the same time, the Soviet state prided itself on being scientifically governed and could not publicly admit that it disregarded the possibilities of applying the latest scientific techniques to itself or ignored the results of scientific analysis. This created a complex micropolitical dynamic through which Soviet sociologists had to navigate.

SOLDATIC, KAREN* (Western Sydney University, Australia)

Technology Facilitated Violence Against Women and Girls with Disability in the Sub-Sahara Region: Anthropocentric Intensification, Risk and Resistance.

As technology develops, it broadens the scope for potential opportunities for violence and abuse, both by exacerbating conventional forms of Gender Based Violence and by perpetrating qualitatively new forms of violence that were previously impossible, or which take a fundamentally different form online.

During an era of intensified digital penetration in the sub-Saharan region, digital inclusion not only enabled women and girls with disabilities to shape their narrative and make their voices heard via digital technologies, but also opened up the risk of reproducing and entrenching long standing forms of discrimination, deep social stigmatization and covert everyday forms of microaggressions towards people with disabilities. Anthropocentric modes of engagement heavily rely upon further digitisation across all forms of social, economic and cultural life. Civil society, government and social platforms, Apps, communications and information flows are now built around new AI and algorithmic formulae, modelled on NLP processes that often entail deeply entrenched structural biases, generating further risks. Whilst technology companies such as Microsoft are developing fully accessible everyday technologies, such affordances are not necessarily available to highly vulnerable community members in the Sub-Sahara region. Novel digital affordances thus operate at a distinct place of contradiction for women with disabilities – they offer the promise of new forms of accessible engagement yet simultaneously, are limited in their regulatory capacity to safeguard women and girls with disabilities from technology facilitated sexual violence and vulnerability. Drawing upon the findings of a large-scale national survey across South Africa, this paper will demonstrate new emergent vulnerability and risk for women and girls with disabilities and discuss practices of disruption and hacking practiced by this group to disrupt the everyday forms of violence that they experience when being online.

SOLÉ DELGADO, VICTORIA* (Scuola Normale Superiore (Florence), Italy)

Perceived Legitimacy of Lay Citizens in Decision-Making Processes: The Case of the Citizens' Assembly for Climate of Catalonia

In response to social pressures and activism, particularly the persistent efforts of Extinction Rebellion advocating for greater citizen involvement in climate policy action, the Citizens' Assembly for Climate of Catalonia was launched. From November 2023 to February 2024, 100 randomly selected citizens deliberated on two critical policy dilemmas: the deployment of renewable energy and the future of the agri-food system in the region. This case provides a valuable opportunity to assess how lay citizens perceive their roles in decision-making processes and how they are perceived by policymakers.

This paper explores the perceived legitimacy articulated by two groups: assembly participants and elected officials of the Catalan Parliament. Through document analysis, participant observation, and semi-structured interviews, this research aims to capture how both groups perceive the role of ordinary citizens in decision-making processes, their political competence, and the roles that media and politicians might play in such assemblies. Furthermore, the study examines how the learning, facilitation, deliberation, and recommendation-making processes may promote meaningful engagement, balancing the diverse backgrounds of the participants.

The study also addresses legitimacy demands on how to integrate randomly selected citizens in decision-making processes beyond this case. This includes exploring factors that can enhance both public and institutional trust in the work of randomly selected citizens, how to connect this work with political institutions and broader society, and how to honor the outcomes of

these assemblies. These two types of legitimacy demands will be analyzed to identify points of convergence and potential tensions. The findings will also be contrasted with similar studies from other regions, positioning the Catalan experience within a global framework of democratic innovation and perceived legitimacy in citizen engagement.

MARCHESINI, NICOLÒ (CNR, Italy)

PAVOLINI, EMMANUELE (Università degli Studi di Milano, Italy)

Identifying Demotherisation Regimes: A Comparison across OECD Countries

In comparative welfare state literature many concepts have been introduced to gendering analysis and typologies, such as (de)familisation and work-life balance. Yet, as argued by various feminists, none of these are necessarily gendered to the extent they are silent on the gender distribution of domestic and care work within families or they see care as an obstacle to the full "activation" in the labour market, devaluing it. To avoid false gender neutrality a new conceptual tool— "*demotherization*" — has been introduced. Demotherisation can occur through defamilisation (transferring part of mothers' caregiving responsibilities to the state or the market) or through gender and intergenerational redistribution within families (transferring to grand-parents or to the partner). Yet, only the latter challenges the traditional division of labour and leads to higher gender equality.

Within this debate, in this piece of work we shall conceptualise and measure demotherisation *both at institutional and cultural level*, and we shall see, with means of cluster analysis, how OECD advanced countries are grouped. More precisely, drawing from OECD family database 2022, we shall use three institutional variables, two measuring *demotherisation through defamilisation* (availability of childcare services and public expenditure on childcare), the other measuring *demotherisation through fatherisation* (length and payment of leaves reserved for fathers). Drawing from WVS 2017-2022, we shall also use *two cultural variables*, based on opinions about: (a) A preschool child is likely to suffer if the mother works; (b) When jobs are scarce, men should have more right to a job than women.

Results confirm the Nordic countries as frontrunners and Central-East Europe as laggards. Yet, interestingly, also France and the Netherlands join the frontrunners, while the Mediterranean countries split, with Spain and Portugal similar to Continental Europe, while Italy and Greece (and Austria) similar to East Europe. Asian countries (Japan and Korea) are outliers.

SOLIS, PATRICIO* (El Colegio de México, Mexico)

A Social Origins Index for Comparative Studies of Social Inequalities

Classic sociological studies on inequality of opportunity and social mobility often rely almost exclusively on social class as a reference for individuals' socioeconomic positions, both at origins and destinations. However, using social class to assess socioeconomic circumstances of origin is not only demanding in terms of data requirements but also insufficient to fully capture socioeconomic background. In this paper, using data from a representative national survey in Mexico, a multidimensional socioeconomic index called the Social Origins Index (SOI) is proposed. The SOI incorporates, in addition to parents' occupational status and education, a sub-index measuring the assets, goods, and services in the household of the family of origin. In addition to outlining the methodology used to construct the SOI, the paper presents evidence showing that levels of inequality of opportunity are significantly higher and social mobility is lower when this index is used, compared to the traditional measure based on social class of origin. The paper concludes with a discussion on the potential of this index as a complementary measure to social class of origin in international comparative analyses assessing inequality of opportunity and the rigidity or fluidity of social stratification regimes.

SOLIS, PATRICIO* (El Colegio de México, Mexico)

Social Capital and Social Stratification in Mexico

This paper analyzes the role of social capital in the process of social stratification in Mexico. It uses national data from a representative survey that provides information on the extent, hierarchy, and diversity of personal social capital. The paper examines the extent to which socioeconomic background and education influence access to social capital and analyzes the

association between social capital and socioeconomic outcomes. The results indicate that access to social capital is strongly influenced by socioeconomic background and education. However, they also show that social capital has a relevant independent effect on social stratification in Mexico through its direct association with socioeconomic outcomes. The paper concludes with a discussion about the significant role of personal networks, not only as a mediator between social origins and destinations but also as an important independent factor that may act either as a facilitator or as an obstacle to social mobility.

SOLIS GADEA, HECTOR RAUL* (University of Guadalajara, Mexico)

The Possibility of Launching a "New Theoretical Movement from Latin America

Contemporary Latin American societies are facing deep crises —economic, political and cultural— which require multidimensional approaches for their explanation and interpretation. We need to describe the particularities of the current historical conjunctures of these societies, but in the context of a diagnosis of long-lasting structural problems such as the undermining of social order, the consequences of modernization and globalization, and the loss of a sense of effective social agency. Not only democracy is at risk, but also state sovereignty, security, economic viability, environmental sustainability and social stability.

Is there a theoretical tradition, originated in Latin America or elsewhere, from which to begin coping with this critical situation? What is the current state of theory in Mexico and Latin America? What is the usefulness of the predominant international theoretical frameworks for understanding Latin American countries?

"The new theoretical movement" of the eighties and nineties is a tradition that offers a set of unique analytical tools useful for examining the problems of contemporary Latin American societies. Giddens, Habermas, Touraine and Alexander, among others, built comprehensive frameworks capable of coming to terms with the multiple aspects of the basic processes related to the production of social order and change, integration and conflict, cultural shifts and social action.

This paper will attempt a diagnosis of some of these synthetic frameworks in terms of their usefulness for a rethinking of structural problems of Latin American societies. It will also evaluate the trajectory of social theory in Mexico during the last forty years. From modernization and CEPAL theories to neoliberalism and public management, from Dependency theory and Marxism to democratization theories. Finally, it will imagine some guidelines for a construction of a new theoretical movement in Latin America.

Inversión En Infraestructura, Estrategia China De Desarrollo. Un Desafío Para EE.UU. y Occidente

En años recientes, especialmente desde 2019, China ha impulsado un nuevo enfoque sobre crecimiento y desarrollo en los países del Sur Global a partir de crear infraestructura carretera, portuaria y ferrocarriles. El BRI o Cinturón y Camino de Beijing ha sido una de las iniciativas más importantes para generar y coordinar los proyectos de construcción, la excesiva fuerza laboral de contratación nacional, la expansión internacional de empresas estatales y la participación de los bancos estatales. Esta estrategia seguida por China es facilitada por la estrecha relación entre el sector privado chino y el gobierno; el papel de las aseguradoras estatales, ejemplo Sinosure, dirigido a suavizar la incertidumbre e inestabilidad – riesgo financiero – característico en África, y la tradicional creencia china acerca de primero construir una carretera para después lograr la riqueza. Esta política de China refleja una nueva política de relaciones con los países del Sur Global, a pesar de que sean o no préstamos predatorios los financiamientos de infraestructura.

Ahora, los EE.UU. y otros países de Occidente deberán ser creativos para fortalecer las cadenas de suministro sin presionar a los gobiernos africanos a elegirlos o avanzar con China. Los EE.UU. y la Unión Europea han firmado un acuerdo de entendimiento por cinco años con la República Democrática del Congo, Puerto Angoleño de Lobito y el Centro minero Ndola en Zambia para ampliar en unión con la empresa privada Corporación Financiera de África el ferrocarril que los atraviesa. Una situación es clara, Occidente por la vía de la Asociación para la Inversión en Infraestructura Global, PGII, tratará, sin exigir gobiernos democráticos, mercados libres e instituciones públicas fuertes; reconfigurar su presencia participativa e influencia en África y el Sur Global con similar propósito al de China, fomentar la conectividad comercial.

Informal Parental School Choice and Social Segregation within Public Education: A Case Study in Athens

This paper attempts to examine how social divisions are constituted within the context of public education by exploring unofficial process of school choice and social divergences on parental practices. It is based on research conducted in an area of central Athens with strong social and ethno-cultural heterogeneity. It focuses on neighbouring public primary schools with different social profiles due to the uneven distribution of students in terms of ethnic and social characteristics as well as notable differences related to the neighbourhood context. Through interviews with parents whose children attend these schools, various strategies regarding enrollment along with diverse family approaches to education are highlighted. Despite the fact that enrolment in Greek public school is based on the address of residence, the research shows that some parents choose or avoid the local school. The study investigates the identity characteristics of local schools that influence parental perceptions and shape their educational practices, such as the socio-ethnocultural status of the student population, the activities of the parents' association, the building facilities, and extracurricular activities. One of the parameters studied is the school's digital presence (Mascheroni et al. 2018) -website and social media- as a means of informing parents and promoting school activities. Consistent with relevant studies (Lareau 1989; Vincent 2017), findings of this research indicate that family educational strategies and the criteria on which these strategies are based show similarities among parents who share a common social and ethnocultural background. At the same time, the neighbourhood area and the identity of the local school indicate and activate specific forms of parental action that may not emerge in other spatial/school contexts. Highlighting the differentiated positions of parents in relation to school processes provides tools for understanding the multiple ways in which inequalities and divisions are structured within public education at a micro scale.

Culinary Carework Among Transnational Coorg Foodies

This paper explores 'cultural citizenship' (Winarnita, 2008) and 'carework' (Longman et al., 2013) from the site of (cyber-)kitchens. As part of an increasing cohort of transnational skilled migrants and recognizing themselves to be part of a vanishing community (Ponnappa, 2013), the Coorgs of South India confront community pressures to 'preserve' *Kodavame* (i.e. obligations to the homeland of Kodagu and its customary ways). I explore this distinctly maternal, feminized labour of cooking, feeding, and sustaining culinary heritage among an e-diaspora/digital diaspora. Evidence for my arguments are drawn from a netnography of public weblogs, Facebook, Instagram and TikTok posts/videos, online community websites, and accompanying comments. Content analysis of this visual, textual, audio material from transnational Coorg food bloggers and community conversations sparked by these is then conducted. I discuss how culinary carework manifests online by studying how ancestral and family recipes are creatively adapted in modernity, circulated as a form of intergenerational and horizontal care, and in effect become recipes for performing 'Coorg' identities under migration. I conclude by offering my findings from food blogs as digital spaces of moral community with variant extensions of care curated online as part of kin-keeping and community-building. I discuss affective implications of this 'cyber culinary carework' via the production of community pride, nostalgia, hospitality, and joy. Recipes for being Coorg form part of broader online culturework among transnational Coorg communities which includes work on its endangered language, spiritual practices, music, clothing and identities and so on. This identity performances viz-a-viz other transnational Indians inculcates 'affiliative emplacement' (Somaiah, 2022), and enlivens an effervescent ethnoscape (Appadurai, 1996). Moving beyond 'festival foodwork' (Somaiah, 2022) in-situ, the paper explores online worlds of sense, taste, and memorable meal-making for transnational and diasporic Coorg families.

The Political Consequences of Latin American Urban Revolts

A growing body of social science literature has focused on understanding the roots and dynamics of urban revolts in Latin America. However, while extensive research exists on the consequences of social movements, less is known about the outcomes of revolts, both within the region and beyond. As part of the Fondecyt Regular project (No. 1240777), urban revolts are defined as mass episodes of collective protests in major cities, where multiple actors challenge political authorities using peaceful, violent, and disruptive tactics. This study examines over twenty revolts from 1989 to 2023, exploring their short-term (up to one year) and medium-term (up to three years) political consequences.

The research identifies three ideal types of political outcomes. The first, "containment," involves the government harshly repressing the revolts, deterring further protests without making significant concessions. The second, "reorientation," sees authorities staying in power, making some ministerial changes, and addressing the uprising's demands through specific policy measures. The third type, "ideological replacement," occurs when the executive power falls, leading to the rise or strengthening of sociopolitical forces that embody the revolt's demands, potentially resulting in significant shifts in economic development goals or cultural recognition of previously subordinated groups.

After classifying the Latin American revolts into these categories, the study investigates the characteristics of the revolts (tactics, groups, size, diffusion) and the pre-uprising context that explain variations in their political outcomes. It questions why some uprisings significantly alter the national landscape, while others leave little impact, and whether factors like the legitimacy of the government, state capacity, repressive responses, or international interventions play a role in combination with revolts. The research also explores how these mechanisms might help in understanding uprisings in other regions like Europe, Asia, or Africa.

Resource-Generator Social Capital, Life Satisfaction, and Depression Among Young Adults in Seoul, South Korea

Individual social capital denotes the embedded resources in personal social networks. Resource generators are one of the three representative methods to measure individual social capital along with name and position generators (Van Der Gaag and Snijders 2005). Resource generators probe if one has any social ties that can provide necessary assistance for various needs such as job-search or legal information, provision of helping hands for household chores when sick, lending money, listening ear, or caring about one's well-being. Whether and how resource-generator social capital is associated with life satisfaction and depression in young adults is not well documented in the literature. The present study used a two-wave longitudinal data set from the Seoul Young Adults Panel Study (SYPS) surveys administered in 2021 and 2022 on the respondents aged between 18 and 35 at the first wave. The retention rate between the two waves was 72.4%, and the final sample size was 3,762. The study used the fixed-effects regression model to conservatively estimate within-person changes over time. The multivariable regression results found that resource-generator social capital was positively associated with general life satisfaction. Further, resource-generator social capital was significantly related to thirteen domain-specific life satisfaction such as quality of life, health, achievement, safety, prospects for the future, work, or communal environment. On the contrary, resource-generator social capital was negatively associated with the number of depressive symptoms reported by young adults in Seoul. In conclusion, the presence of social ties that may provide expressive and instrumental resources increases general and specific life satisfaction and decreases depressive symptoms in young adults.

The Relationship between Generalized Self-Efficacy and Volunteer Status, Frequency, and Hours in Singapore

Volunteerism—an indicator of social cohesion—is a choice only a minority of the population in any country adopts in their lives. This is largely because volunteerism is costly, as it requires time investment for public goods with no economic rewards. Moreover, volunteering requires knowledge and skills to resolve nonspecific and difficult challenges demanded by various volunteer activities. Even when one is ready to invest some time into a prosocial activity, one encounters another barrier that asks if the invested time would not be a waste because of the lack of appropriate ability to meet the challenges. Thus, human capital represented by education has been frequently proven to be a necessary condition for or a significant enabler of volunteering. However, education is not a sufficient condition for a person to volunteer. Therefore, the present study proposes that people with a higher level of generalized self-efficacy are more likely to be volunteers, independent of their levels of education and socioeconomic standings. Generalized self-efficacy evaluates the belief in one's ability to "respond to novel or difficult situations and to deal with any associated obstacles or setbacks" (Schwarzer and Jerusalem 1995:35). The study used data from the Individual Giving Study in Singapore, which was administered in 2021 when the pandemic hit the country hard. The results indicate that generalized self-efficacy was significantly associated with (1) volunteer intention, (2) volunteer status, and (3) volunteer frequency. Further, the Cragg exponential hurdle regression model reports that self-efficacy was related to not only the likelihood of volunteering but also the increased volunteer hours, even during the pandemic. Thus, the study concludes that generalized self-efficacy as a stable psychological trait concerning the belief in one's problem-solving ability increases the probability of volunteer behaviors controlling for other powerful confounders such as human capital, socioeconomic status, or religiosity.

Integrated or Isolated? Social Networks and Health Among Older Never-Married Adults

According to U.S. Census data, the number of older (age 50+) never legally married adults (ONMA) has quadrupled from 1960 to 2022, now comprising about 10% of the U.S. older population—a figure expected to increase across future cohorts. ONMA face unique health, caregiving, and financial challenges, with the highest mortality risk among older U.S. adults across marital categories. Despite this, their health remains understudied. Two conceptual models (risk vs. resilience) generate competing predictions with social networks central to the discussion. Analyzing data from two sources (National Social Life, Health and Aging Project and National Health and Aging Trends Study), we explore the associations between social networks and health among ONMA.

Artifacts of the Future. Exploring Imagined Futures with Speculative Design Objects

In a time of rapid technological, social, and environmental change, speculative design offers manifold possibilities and public arena for exploring and interrogating futures. By creating artifacts, scenarios, and narratives that challenge conventional assumptions, speculative design opens up non-linguistic forms of critical reflection on emerging technologies and societal shifts. On the basis of visual analysis, the presentation investigates speculative design as a form of data that provides insights into the social, cultural, and ethical, dimensions of imagined futures. Analyzing design objects on the basis of visual methods, not only imagined futures are explored but also the embedding of these imaginations in contemporary knowledge forms. The data corpus for the visual analysis is made up of design objects and documents on design techniques that are created from October 2024 until June 2025 in a joint project with designers and the Grassi Museum of Applied Arts, Leipzig (Germany), funded by the Fraunhofer Network for Science, Art and Design. The research project aims to use speculative design to harness the transformative potential of residues and waste from agricultural production

in the development and application of new materials. The designer Fiona Raby and Anthony Dunne argue that "design speculations can act as a catalyst for collectively redefining our relationship to reality" (Raby and Dunne 2013). As part of the data analysis, we focus on the problem that design speculations not only imagine futures developments, but also selectively open up ways to realize these futures by drawing on specific knowledge forms while neglecting others. Based on the results of the visual analysis of the design objects, we will explore in what way speculative design objects, embedded in professional discourses and forms of knowledge, can form a space for redefining future realities, i.e. a heterotopia (Foucault 2005).

Domestic Labor Market Construct Professionalism for Migrants: Focusing on Skilled Immigrant Workers in the Japanese Labor Market

In this paper, I focus on foreign workers permitted to work in Japan due to their expertise and examine how their workforce is commoditized in terms of professionalism. Japanese government selects immigrants to deal with labor market shortages by aligning their professional skills with industry needs, making this a critical issue for accepting foreign workers. When considering the conditions and boundaries for cross-border labor markets, a key issue is how the professionalism of these jobs is upheld by both labor and management. I concentrate on some industries where a certain level of expertise is readily acknowledged in the Japanese labor market (specifically the IT industry, research and education, and manufacturing) and analyze how skilled immigrant workers develop their sense of professionalism using qualitative data.

The analysis revealed that in the IT industry, where both labor and management evaluate individual skills according to international standards, an external indicator warrants the professionalism of skilled immigrants. This consensus, in turn, strengthened the labor-management negotiation structure and increased bargaining power for immigrants. Conversely, in the research and education sector, despite the externalization of the process for acquiring professionalism, the evaluation system remains deeply rooted in an internal labor market focused on skill development within the organization. As a result, international evaluation standards do not always align with domestic market value, forcing migrants to ethnicize and racialize their expertise. In the manufacturing industry, which is more heavily characterized by an internal labor market, foreign workers often need to position their professionalism with an added premium due to their foreign status. Through the case of foreign workers in Japan, we explore the relationship between professionalization and cross-border labor markets within an international context.

Ciencia Ciudadana y Fotovoz Como Metodologías Para La Justicia Epistémica: Herramientas Para La Visibilidad De Las Mujeres Rurales

Este proyecto, financiado por la Universidad de Granada, propone la integración de la Ciencia Ciudadana y la metodología de Fotovoz como formas de conocimiento y metodologías participativas que desafían las epistemologías dominantes del norte global. Estas herramientas pueden facilitar que las mujeres rurales sean protagonistas en la investigación social, visibilizando sus propias experiencias y saberes situados. Las mujeres rurales desempeñan un papel crucial en la preservación y sostenibilidad de las comunidades rurales, siendo agentes esenciales en el desarrollo local y en la continuidad de estas áreas en riesgo de despoblación. Sin embargo, sus aportaciones permanecen invisibles tras paradigmas epistemológicos androcéntricos y sociocéntricos.

Este proyecto se nutre teóricamente del marco epistemológico de las teorías del punto de vista (standpoint), que sostienen la necesidad de construir el conocimiento a partir de la experiencia de las mujeres, desplazando a éstas de los márgenes para situarlas en el centro del campo de visión del conocimiento. Así también el enfoque interseccional es clave para poder acceder a las experiencias situadas de las mujeres rurales. Su participación

activa, no solo generando datos e indicadores, sino contribuyendo de manera directa a la mejora de las condiciones de vida de la comunidad general, supone un desafío a las desigualdades históricas y estructurales que las afectan históricamente. Paralelamente, la metodología de fotovoz, al permitir a las participantes capturar visualmente sus experiencias, complementa la Ciencia Ciudadana en la producción de conocimiento situado.

El proyecto no solo enriquece el conocimiento académico, sino que abre nuevas oportunidades para construir soluciones desde la comunidad y a partir del empoderamiento de las mujeres, promoviendo tanto la sostenibilidad como la capacidad de frenar la despoblación en sus comunidades.

Using Scientometrics in the Study of Sociology

Scientometrics has traditionally been associated with the field of science studies, yet it has not garnered significant attention within sociology. This paper aims to highlight the relevance and importance of scientometric methods in the exploration of sociology as a discipline and its various themes. It delves into a diverse range of data sources that can be utilized for applying scientometric analysis, emphasizing the integration of qualitative data into this quantitative framework. The paper presents case studies of scientometric research relevant to sociology, detailing their research objectives, data sources, and methodologies employed. It demonstrates that data can be collected not only from well-known online databases and repositories but also from journals that may not be included in these mainstream platforms. The paper illustrates how demographic data can be gathered to complement scientometric data, enhancing the depth and richness of the analysis. By providing specific examples, this paper underscores the potential of scientometrics to contribute to a more nuanced understanding of sociological research trends, collaboration patterns, and thematic developments within the field. The paper advocates for a broader application of scientometric methods in sociology, encouraging researchers to leverage these tools to enrich their studies and foster interdisciplinary connections.

SORDINI, MARÍA VICTORIA* (INHUS-CONICET / Universidad Nacional de Mar del Plata, Argentina)

Hunger, Disgust and Anger. a Study on Food Programs in Argentina.

In Argentina, since the 1980s, the different government administrations, without exception, implemented assistance food programs, focused on poverty and massive in their coverage, intended to complement the food of three generations.

The state intervention to respond to the food needs of the poor population implemented the following strategies: delivery of food boxes, ready-to-eat food in soup kitchens, monetary transfers of income or food education workshops.

The objective of this work is to identify the emotions that are configured around the food that is eaten with others in soup kitchens, cooked at home or purchased from food programs between 1983 and 2023 in General Pueyrredon, province of Buenos Aires.

The biographical method was implemented in its life stories modality with the in-depth interview technique. The sampling was theoretical and by snowball. The analysis was carried out based on grounded theory.

Among the results, emotions were identified that predominate in each generational group according to the types of food programs received. Flavors structure and reflect social inequality in bodies. Disgust is associated with food boxes with products to cook at home and the food provided in the community kitchen. Anger is linked to the low amounts of benefits for purchasing products in the market.

These emotions and food programs persist from one generation to the next. The disgusted body also feels anger; an anger that originates from the proximity of the object of disgust that the subject wants/must reject. Hunger is violence as external coercion. The condition of poverty is, in some cases, disgusting and sub-human and, as such, enables bonds of violence that reinforce – from the food perspective – the expulsion and rejection that the subjects experience and feel within the framework of a social system that has expelled them and keeps them trapped in its margins.

La Educación Orientada a La Comunidad Como Estrategia De Aproximación a La Epidemiología: Reflexividad y Vigilancia Epistemológica

La reflexión sobre la salud colectiva y la epidemiología como herramienta de investigación, planificación y vigilancia de la salud se encuentra ligada a la práctica del hacer-epidemiología. La epidemiología como ciencia y como praxis resulta clave para definir los contenidos y metas de la acción para mejorar las condiciones de salud de la población. La epidemiología comunitaria sostiene que las personas en sus comunidades son quienes manejan y controlan las herramientas que les permiten describir, comprender y apropiarse de los conocimientos de sus vidas, para compartir la responsabilidad de tomar decisiones que sean un crecimiento en su autonomía.

Las nuevas propuestas curriculares educación superior en medicina generarán un impacto a futuro en la conformación y en los perfiles de los servicios de salud porque proponen un plan de estudios integrado y orientado en la comunidad. El objetivo es analizar las estrategias de enseñanza y las experiencias territoriales implementadas en la asignatura epidemiología y promoción de la salud crítica en el currículo de la carrera de medicina de la Universidad Nacional de Mar del Plata entre 2022 y 2024.

Desde el enfoque de investigación y metodología de Etnografía Institucional se reconstruirán el régimen institucional que contornea relaciones sociales y modos de indagar las problemáticas de salud. Y, de este modo, observar cómo el orden institucional crea las condiciones de la experiencia de enseñanza y de aprendizaje. Se revisará de manera crítica y con vigilancia epistemológica el diseño de las estrategias de enseñanza que guían la implementación de análisis de situación de salud, priorización de problemas socio-ambientales, monitoreos participativos de vigilancia en salud y actividades de promoción de salud que los y las estudiantes aprehenden y construyen junto con la población que habita en barrios periféricos de la ciudad.

SOSSICH, ERASMO* (University of Turin, Italy)

The "Double Regeneration" and the "Double Displacement": The Evacuation of Eleonas, the Last Refugee Camp of Athens, and the Convergence of Migration and Urban Governance.

At the intersection of Urban and Refugees Studies the paper suggests the appearance of new figures of displacement following the turn in European migration governance. As new governmental instruments of containment, dispersal and concentration combine, new geographies of mobility and immobility (Tazzioli, Garelli 2018) gradually reshape the spaces of the "urban diaspora" described by Arbaci (2018) and new figures of global and urban displacement intertwine, reshaping cities, mobilities and subjectivities (Roast *et al.* 2022). The contribution therefore analyzes how border regimes, reception policies, displacement strategies intertwine and combine with urban renewal, regeneration projects and gentrification. Adopting an ethnographic perspective, the article moves on the case of Eleonas "double regeneration project" and Eleonas refugee camp eviction, in Athens, highlighting the link between migration policy and urban displacement, a link residing in the neocolonial character of both phenomena.

Performar La Feminidad En La Identidad Gamer: Analizando Twitch.

Los espacios de socialización online han crecido de manera exponencial en los últimos años, siendo el espacio *gamer* uno de los que más rápido ha crecido (DEV, 2023). Plataformas como Discord, Twitch y YouTube han surgido desde la esfera *gamer*, uniendo y marcando tendencias dentro de la comunidad. Los *gamers* vuelcan y reflejan en estos espacios valores y principios preexistentes.

La comunidad *gamer* se caracteriza por la homosocialidad masculina (Puente y Lasén, 2015), lo que genera dinámicas de exclusión hacia lo femenino. A lo largo de la historia, han surgido fenómenos que evidencian los límites impuestos a la feminidad, como el "#GamerGate" en 2014, un movimiento antifeminista que atacó a creadoras, periodistas y jugadoras (Mortensen, 2018). Este caso trascendió lo virtual, con figuras como Anita Sarkeesian recibiendo acoso, amenazas de muerte e incluso avisos de bomba en conferencias, afectando sus oportunidades laborales. En España, un caso reciente en 2023 fue el de la creadora LittleRagerGirl, quien sufrió acoso en redes y perdió colaboraciones por afirmar en un stream que, en un caso de violencia, preferiría creer a una posible mentirosa antes que a un posible violador.

Estos casos sugieren que la comunidad *gamer* castiga la performatividad de una feminidad no aceptada, especialmente si implica activismo feminista. Para comprobarlo, analizaremos las cifras de mujeres creadoras en Twitch y observaremos mediante una etnografía digital para qué mirada producen su contenido, con el fin de identificar si existe un castigo hacia aquellas que no cumplen con el canon de la comunidad *gamer*.

SOTO SANCHEZ, ALMA PATRICIA* (SECIHTI/CIESAS PACÍFICO SUR, Mexico)

Indigenous Young People, Preserving Community Life from Their Universities.

Indigenous Peoples in Mexico are currently facing the intensification of socio-environmental conflicts from historical development and extractive projects that generate dispossession, and the impossibility to remain and sustain life in the indigenous lands (Soto, 2021). Grassroots and community owned universities - like ISIA and Unixhidza-, have been built as devices whose systemic role is to generate and strengthen various processes that converge in the objective of favouring the permanence of the communities in their territories, within their ways of life, production, relation with environment, organization and the pursue of autonomy.

Since the origin of these universities are processes of social organization, and the demand and exercise of Rights - Indigenous Peoples (UN, 2007); Peasants and other people working on the rural areas (UN, 2018)-, indigenous ontologies, epistemologies, and system of knowledge are present and in permanent tension with the geopolitics of hegemonic knowledge and power systems.

Thus, indigenous young people experience, studying in these universities, becomes interweaved within the historical and geopolitical processes of organization, territory defence and resistance of their communities. They use their own traditional ecological knowledge (TEC) to create and synthesize their experience - their life in community and as students of the university - in order to create projects, that being done in face of current events, they also construct life projects for their future.

The objective of this presentation is to discuss how the projects done by the indigenous young people, students in these universities, involving research and intervention, are part of the social, generational and environmental justice claims from the communities that they are part of.

The methodology used for this research is Action Research (Soto, 2021), done by the author through the orientation and support in the creation of the student's projects in two universities - ISIA and Unixhidza- from 2017, to date.

WG08-JS-181.1

SOTOMAYOR, EVA* (University of Jaen (Spain), Spain)

The FEI Model and Identified Emotions in Social Policies: Compassion, Guilt and Regret.

To analyze emotions from a sociological perspective, we utilize the FEI Model (Felt, Expressed, and Identified Emotions). This three-dimensional model addresses the role of the body in the experience, expression, and recognition of emotions. It distinguishes between felt emotions (internal and indirectly expressed through narrative), expressed emotions (explicitly labeled verbally), and identified emotions (interpreted by the researcher based on cultural or collective expressions). This analytical framework enables a deep exploration of human emotions, acknowledging their variability depending on context and modes of expression.

In this case, we examine the presence of emotions within social policies and how feelings such as nostalgia, regret, or compassion are reflected in programs aimed at reducing inequalities. To do so, we focus on the third dimension of emotion access: identified emotions, also known as representational emotions.

These emotions are not directly articulated by the subject but are instead interpreted by the researcher. They are not tacitly expressed but are conveyed or identified through the design of social actions, programs, regulations and penalties, budgets, and all the elements that constitute social policy. Identified emotions reflect underlying intentions of compassion, guilt, justice, regret or social redress, and are strongly influenced by cultural imprints, political codes, and collective emotions. Although not explicitly expressed, identified emotions play a fundamental role in the formulation of policies, especially in relation to their intended and unintended consequences.

The Role of Emotions in Inclusive Employment Policies: Findings from the Emodi Project on Intellectual Disability and Well-Being

The increasingly evident role of emotions in the labor market is encouraging public policies to begin using them as tools to improve social programs, especially those aimed at increasing social inclusion through labor inclusion. In the Emodi Project (IN3-UJA Group), we have demonstrated how the inclusion of people with intellectual disabilities (ID) in companies improves the work environment and fosters emotions that promote well-being and cohesion. Additionally, through an experimental approach, we have sought evidence to confirm that having a job positively affects both the emotions of people with ID and their families, thus favoring their inclusion in society.

Preliminary results show that, although emotions were similar between the experimental group and the control group in the initial phase (pre-test), once the experimental group obtained employment (post-test week and post-test month), emotions that generate well-being increased, and disruptive emotions decreased. Furthermore, the data from the Inico-Feaps Scale indicate that, after one month of employment, the emotional well-being of people with ID in the experimental group improved significantly compared to those who did not have a job.

When contextualizing these observations within a broader process, where emotions and affections are being commodified, the question arises as to what situation those individuals find themselves in who access employment through such an intervened process, as is the case with people with ID. Although public authorities seek to generate positive emotions towards this group to promote their inclusion, there is a risk that the work they perform may not respond solely to a logic of productivity but rather be part of an emotional artifice in a society where the ability to generate emotions holds value in itself.

Ahmadiyya Muslim Community: Founding of Three Missions in Mexico

The experience of Mexico and Latin America in general in its contact with Islam can be traced back to the time of the Spanish conquest, since some readings refer to Moors among the ranks of Hernán Cortés and other conquerors of America, as well as the arrival of Maghrebi Muslim slaves at the end of the 17th century.

But in Mexico there was a minimal presence of Mohammedans in the colonial era and the 19th century, unlike other Latin American countries, which has been modified since the end of the 20th century, mainly by migrations from countries in conflict or developing countries with a Muslim majority.

The objective of this paper is to outline the actions that the Ahmadiyya community has been taking to establish itself in Merida, Mexico City and Queretaro, focusing on its social, missionary and propaganda work. Analyzing the administrative-missionary structure that has allowed the dissemination of the Ahmadi doctrine and the teachings of Islam around the world, specifically, the institutional apparatus that has allowed the establishment of three missions in Mexico.

RC22-JS-176.4

SOTOMAYOR SANDOVAL, SUSANA* (Universidad de Guadalajara, Mexico)

El Uso Del Hijab Entre Las Conversas Ahmadiís En Las Misiones De Belice y México

El velo islámico ha sufrido una evolución multifacética indiscutible, llegando incluso a fungir como una herramienta política de protesta, por ello dependiendo del espacio geográfico, cultural y temporalidad desde el que se analice sus características son únicas. Siguiendo esta premisa y teniendo en cuenta que cada grupo islámico hace un uso diferenciado del velo; cuando se instaura la fe islamica en un espacio "ajeno" a este sistema religioso, las conversas adquieren o adoptan el uso del velo a la usanza de sus predicadoras o referentes religiosas. Sin embargo, en las jama'at ahmadi, no hay una imposición en el uso y el tipo de velo, lo cual permite un "libre albedrío" entre las nuevas creyentes, que dirigen su búsqueda principalmente en *youtube* bajo el término de "*hijab*". Por lo que no existe una homogeneidad entre los velos usados en las conversas beliceñas, chiapanecas, yucatecas, queretanas y capitalinas, diferenciándose únicamente por la ortodoxia del tipo de velo empleado, uso que en todos marca una clara diferenciación entre las ahmadi de nacimiento y las conversas, así como entre las conversas de las distintas misiones. Además de apreciarse una mayor facilidad de adaptación en la cotidianidad y su uso entre las conversas pertenecientes a comunidades originarias como lo son las chiapanecas y las afrodescendientes beliceñas, a pesar de que su uso responde a lógicas culturales diferenciadas.

Pathways to Independence: The Dynamics of Parental Support in the Transition to Adulthood

Economic independence from parents is increasingly delayed in the United States. This delay has implications for the timing and sequencing of other life transitions such as employment and marriage, and for inequalities in the support young adults receive. In this study, we leverage the Panel Study of Income Dynamics' Transition to Adulthood Supplement. Using sequence analysis, we examine how financial and co-residential support are embedded within the transition to adulthood. We study heterogeneity in support trajectories between and within families and disentangle the temporal order of transition milestones using Cox models. Confirming previous literature, parental economic support serves as both a scaffold for young adults' educational and economic pursuits and a safety net for struggling children. However, we also find evidence of more traditional, gendered pathways to economic independence linked to marriage: marriage facilitates economic independence, but for young men especially, achieving economic independence is an important precursor to marriage.

SOTOUDEH, RAMINA* (Yale University, USA)

Relational Externalities of Institutional Interventions

Institutions seek to shape the behaviors of their constituents. Because individuals are embedded in complex webs of social relations, by intervening in their personal behaviors, institutions may unwittingly reshape network structure. In this paper, I introduce the concept of relational externalities — the unintended relational consequences of a policy or intervention. I elaborate the conditions under which these relational externalities are likely to take place, what they may look like under these different conditions, and the role they play in creating inequalities or amplify existing ones. I then empirically illustrate this concept through the case of the punishment of smoking behavior in a sample of U.S. high schools. I show that harsh punishment of smoking behavior is associated with the social isolation of smokers and increased homophily on smoking status in friendship networks. A subsequent exploration of the mechanisms behind these effects reveals that they are likely driven by non-smokers eschewing friendships with smokers. Finally, I show that relational externalities of anti-smoking policies are most acute for students with the least behavioral elasticity with regards to smoking. Students who are least able to change their behaviors -- have a higher genetic predisposition to nicotine dependence -- change their friends, putting them at a dual disadvantage.

SOUTO GARCIA, ANDREA* (University of A Coruña, Spain)

Analysing Ethnosexual Boundarying in Postcolonial Migration Contexts. the Case of Colombian and Brazilian Women in Spain and Portugal

From an intersectional, decolonial and transnational approach, this research addresses three decades of migrations of Colombian and Brazilian women to Spain and Portugal. In the Iberian countries, nationality has become an ethnosexualization device that dictates the very particular ways in which migrant women are imagined, seriously conditioning their socio-occupational opportunities.

Departing from a multi-situated ethnography carried out between 2017 and 2022 in São Paulo, Porto and Madrid, and including in-depth interviews with forty Colombian and Brazilian migrant women, from different social/racial backgrounds, and with different positions in the migratory cycle; this research furthers the concept of "ethnosexual boundarying".

We track the women's migration/life trajectories from origin to destination contexts to analyze how gender, race and class intersect under different shapes and across different spaces and temporalities, affecting their development. In doing so, we aim to understand ethnosexual boundary work in Brazilian and Colombian women's postcolonial migrations while overcoming methodological nationalism.

Policy restrictions imposed on the poorest and darkest women force them to undertake risky strategies to materialise their migration projects, such as resorting to trafficking networks to cross Iberian borders. Once in destination, they enter the precarious and unregulated labour niches where body plays a predominant role -such as prostitution, care work, hostelry and aesthetics-. And they often marry Portuguese and Spanish men to get residence and work permits, which are more easily obtained when signing a sexual contract with a national citizen. The survival strategies displayed by Brazilian and Colombian women disclose how race and gender enable the violence executed against migrant women in the transnational/postcolonial space. boundary work, the reproduction of colonial identities, and the expansion of sexual markets in the former metropolises.

RC21-334.4SOYTEMEL, EBRU* (Aston University, United Kingdom)
POPOV, ANTON (Aston University, United Kingdom)*Imagining and Acting As the 'other': Cultural Diversity and Navigating Social Boundaries Among Youth in Coventry*

The paper draws on 18 months of ethnographic research exploring cultural practices among two youth groups in Coventry, UK. The groups in question are different in their socio-economic backgrounds and cultural profiles. One group consists mainly of White British middle-class youth who participate in weekly physical theatre workshops run by the city's physical theatre, while the other comprises young people from a culturally diverse youth club, located in one of the city's most socio-economically disadvantaged neighbourhoods. Our research explores how young people from different ethnic and class positions imagine, experience and express cultural diversity.

The theatre group embraced the City of Culture discourse on inclusivity, engaging in performative and charity projects that depicted the experiences of disadvantaged 'Others' (e.g., refugees, migrants, and homeless individuals). Arguably, these middle-class youth utilize diversity as a means of socializing into a more refined liberal identity. In contrast, the young people attending the youth club, who often come from culturally diverse and/or migrant backgrounds, encountered challenges related to stigmatisation, everyday/institutional racism and the imposition of stereotypical perceptions of the 'Other'. They employed various strategies to engage creatively with these projected images, both by internalising them and resisting them through role-playing scenarios such as playing 'the bad, the gang member, portraying themselves as tough individuals involved in illicit activities or ridiculing the working class stereotypes projected to them. While the youth clubs serves as public spaces/sites for 'throwntogetherness, we explore how young people from different social, economic and cultural backgrounds perceive each other, make sense of social segregation and engage with discourses on cultural diversity. Through play, how they construct and resist cultural repertoires and narratives shaped by institutions, policies, and practitioners.

PEŠIĆ, JELENA (University of Belgrade, Serbia)
BABOVIĆ, MARIJA (University of Belgrade, Serbia)*The Role of Sociology in Serbia's Post-Socialist Transformation*

The main objective of this chapter is to examine the role of sociology in Serbian society over the previous three decades and how it has changed alongside changing global and local social contexts, especially those related to post-socialist transformation. Sociology's impact on the processes of post-socialist transformation is explored through its different aspects and roles: of sociology as a science that produces knowledge, as a profession building its own institutional infrastructure and organisational networks, and as expertise that offers applicable knowledge and influences the shaping of public policies. At the individual level, sociologists act as academics, engaged intellectuals, educators, experts, politicians, journalists, civic activists, and political analysts. As a social formation, sociology, therefore, produces structures but also meanings and interpretations of the social world, creating material as well as cultural (ideological) forms. In analyzing the role of sociology in Serbia, we will rely on the cultural political economy approach (CPE). The core of our analysis will be devoted to discourses on post-socialist transformation that circulated within the two most influential sociological journals in Serbia and some other key writings by Serbian sociologists, over the 1990–2020 period. In accordance with the CPE approach, we will address the issues of selection, retention, and possible reinforcement of certain discourses and rejection of other discourses.

Workplace Discrimination in Bulgaria: Trends, Risk Factors, and Coping Mechanisms

The paper explores workplace discrimination in Bulgaria in the context of labor insecurity, focusing on current discriminatory trends during hiring processes and work interactions. Drawing on data from a broad study on individual and institutional strategies to manage risk, the research highlights labor discrimination, particularly affecting marginalized groups. The study also explores the intersections of various protected characteristics, such as gender, age, ethnicity, and disability, showing how discrimination manifests and accumulates across multiple dimensions. The study also analyses public awareness of non-discrimination rights and identifies common strategies utilised by individuals to combat workplace discrimination.

The findings reveal considerable disparities in discrimination experiences among various demographic groups, with vulnerable populations, including women with children and individuals with disabilities, encountering heightened risks of discrimination during the hiring process, whereas aging people and ethnic minorities are at highest risk of discrimination in established employment relationships. The results reveal significant shortcomings in legal awareness and institutional responses to discrimination, emphasising the need for more effective strategies to foster inclusive workplaces.

The key findings regarding coping strategies indicate a significant number of individuals who would refrain from seeking assistance from others, alongside a substantial proportion who would consult a lawyer directly. This suggests a lack of trust in institutions and reflects an organisational culture that normalises discrimination.

SPINA, ELENA* (Università Politecnica delle Marche, Italy)
VICARELLI, MARIA GIOVANNA* (Università Politecnica delle Marche, Italy)

New Generation of Female Doctors: Beyond Gender Segregation

In Italy, the feminization of medicine is a relatively recent phenomenon, which accelerated in the 1970s when the percentage of women practicing the profession rose from 8.8% in 1971 to 23.2% in 1991, reaching 30.1% in 2000 (Vicarelli 2008) and 42.7% in 2018 (a percentage that increased to 43.3% in 2022 among physicians working for the National Health Service) (Conto annuale della Ragioneria generale dello Stato 2022). In this context, the challenging questions are: does the increased presence of women coincide with a shift in the prevailing models of professionalism? And again, how and to what extent are the informal regulatory mechanisms and operational practices, which have been defined around male professional, changing? While asking these questions, it is important to also consider another transformative process: generational change, with the advent of a new generation of professionals (Millennials and Gen Z) who embody values and attitudes completely different from the past. Since young doctors graduating today are predominantly women, there is no doubt that the glass ceiling will be broken, and women will soon acquire top positions. But what changes will occur then? Are women ready to take on these roles and greater responsibility? Some in Italy have been working for years on this passing of the baton: women physicians from Anaa, the main medical union, have asserted their ability to organize themselves and influence roles, knowledge, and both simple and specialized skills in the complex world of healthcare. They are focusing on multidisciplinary and the cross-fertilization of knowledge (Morano 2021). Presenting data from two different empirical studies, this paper attempts to interpret these processes on a theoretical level.

Reframing Climate Protests As Public Order: The Criminalization of Environmental Activism in Italy

Despite the agreements reached at the United Nations Framework Conferences on Climate Change and the decades-long efforts of conventional environmental movements, the climate crisis caused by human activity and environmental exploitation persists. In this context, the voices of new movements of young activists promoting sustainable ways of living should be heard and supported.

Nevertheless, at least in Western democracies, these movements fail to have a significant impact on political decisions. Indeed, their forms of protest, which are often unconventional and occasionally at odds with the law, elicit negative responses from the general public and punitive actions from police and judicial bodies.

Consequently, social issues pertaining to climate change and environmental justice are reframed as matters of security and public order. Furthermore, forms of dissent against production and consumption practices that contribute to ecological disorganisation are increasingly criminalised through the broadening and intensification of criminal sanctions.

The paper addresses this phenomenon, beginning with an examination of the Italian context and proceeding with a comparative analysis of similar jurisdictions. In Italy, a campaign of criminalisation of environmentalist protest has been conducted for several years by the news media, political forces and, more recently, the judicial system. Firstly, the paper analyses the protest actions undertaken by Italian activists associated to the Last Generation climate movement. It then treats the responses these actions have generated, both in public discourse and within the penal system, with a focus on recent amendments to the penal code and the trials held against activists.

The paper proposes to trace the trajectories of the mediatic-judicial circus that limit the right to manifest and delegitimise arguments against the treadmill of production in favour of a civilisational transformation aimed at avoiding the environmental catastrophe.

Child Climate Migrants: A Child Rights Perspective in the Climate Crisis Nexus

Climate change poses several threats to child development, particularly migrant and displaced children. Climate change not only exacerbates existing inequalities but also creates long-term developmental challenges that nospan generations, demanding justice for children impacted by the climate crisis. Child climate migrants are among the most vulnerable and least researched groups impacted by the global climate crisis. As the impacts of climate change increase, millions of families are forced to migrate—both within their countries and across international borders.

Grounded in the theoretical frameworks of childhood development, intergenerational climate justice, and children's rights, the paper underscores the urgency of developing child-centred approaches to climate-induced migration. In this theoretical paper, we seek to comprehensively explore the unique and multifaceted challenges experienced by child climate migrants. We delve into the psychological, social, and developmental effects of displacement, highlighting how childhood trauma, disrupted education, and the loss of community networks can hinder healthy development and long-term well-being. By critically analysing the challenges child migrants face in accessing fundamental rights such as education, healthcare, and protection from exploitation, we evaluate the gaps in current legal and policy frameworks (national and international) that either inadequately address or entirely overlook the specific needs of child climate migrants.

To this end, we argue for a fundamental shift in global climate policy, one that places child migrants at the centre of discussions on climate justice and future sustainability. Based on our findings, we call upon policy-makers to address both the immediate consequences and root causes of migration and displacement, such as more robust climate adaptation measures and child-sensitive migration policies. Such holistic approach is essential to ensuring that child climate migrants are protected and supported in ways that not only mitigate the damage caused by climate-induced displacement but also promote long-term resilience, dignity, and opportunity for the affected children.

Towards a Holistic Conceptualisation of Climate Anxiety in Early Childhood: A Scoping Review

As intensity of the climate crisis increases and the scientific evidence of its impacts on child development become more evident, there is emerging evidence suggesting that young children may be experiencing a noteworthy psychological strain in the shape of climate anxiety, and this can increase as they learn more about it. The distress induced by climate change manifests as heightened anxiety. Despite the increased international recognition of climate anxiety in young children as a valid mental state, there is little empirical evidence detailing how climate anxiety manifests in early childhood, or describing the interventions considered most effective in addressing it. The present scoping review aims to (a) identify available evidence on climate anxiety in children up to age eight; (b) clarify the mental health consequences brought about by the increased awareness of climate change; and (c) identify gaps in the literature that if attended to, could move the field forward. Since research on the topic of climate anxiety in early childhood is still scarce, a scoping review was used. This paper will provide an initial point for scoping climate anxiety in early childhood. Preliminary findings suggest that young children are aware of the impacts of climate change and they are worried about it. Parents and teachers are worried about climate anxiety in young children but they do not feel empowered to support their children's emotional needs in relation to climate change. Available research is presented from a Western perspective, and further research is needed to provide conceptual clarity of climate anxiety in early childhood from non-Western countries and indigenous perspectives. Further research employing diverse methodologies is also needed to respond with evidence-based and child-friendly mitigation and adaptation strategies.

Absent Fathers? Non-Standard Employment and Inequalities in Paternity Leave Take-up

This presentation questions the universalizing appeal of work-life balance policies by exploring why a significant proportion of fathers in non-standard employment do not take paternity leave in France, despite being eligible.

From its introduction in 2002 to its reform in 2021, the two-week paternity leave was an immediate success. Short, generous, and consistent with contemporary norms of 'involved fathering', it ensured high take-up rates. In this context, it is not so much the fathers who take their leave, but those who forgo it that raises questions: in the majority, men without stable salaried employment.

Take-up rates are remarkably low for fathers on short-term contracts (58%), self-employed fathers (33%), and job seekers claiming benefits (20%), compared to fathers with permanent contracts (80%). Why are these men particularly inclined to forfeit this right?

Due to social desirability biases, it is uncommon to find extensive testimonies from fathers who do not take paternity leave. This article uses mixed methods to explore the mechanisms underlying non-take-up. It combines the *Mode de garde et d'accueil des jeunes enfants* survey conducted by the French ministry in 2021 (N=8,351) with 87 longitudinal qualitative interviews with 32 fathers—11 without stable employment—before and after the birth of their last child.

Drawing on insights from political sociology, the results reveal that non-take-up does not necessarily reflect a lack of interest in the policy or a decision to prioritize work. Fathers in non-standard employment face various informational and administrative barriers at different stages of the leave-claiming process. Many take informal breaks that serve the same purpose as paternity leave but without compensation—blurring the distinction between those who take leave and those who don't.

In a context where non-standard employment is rising across Europe, this presentation discusses more generally social inequalities in how families can exercise their rights.

SPONTON, ALIX* (Ined, CRESPPA (Paris Nanterre) and CRIS (Sciences Po Paris), France)

"I Share, I'm Not a Slob!": Involved Fatherhood, Social Inequality, and Symbolic Distinction

This presentation explores how contemporary fatherhood norms, particularly the ideal of the "involved dad," are defined and enacted differently across social classes in France - and the symbolic classification that results from it.

Contemporary fatherhood norms in France, as in many countries, emphasize men's involvement and emotional closeness with their children, in addition to their traditional role as financial providers. While research has documented how the gender gap in childcare involvement has evolved with the spread of these new norms, less attention has been paid to the nuances in paternal practices among men from different social classes. How do men receive and apply contemporary fatherhood norms depending on their socioeconomic status? How do they perceive the parenting styles of other men?

This study argues that, just like cultural tastes and practices (Bourdieu, 1979), discourses and practices surrounding fatherhood are socially situated and socially hierarchized. The way men engage with their children (and whether or not this involvement is made visible) draws "symbolic boundaries" (Lamont, 1992) against social categories with which they do not wish to be associated.

Based on 90 repeated interviews with 32 resident fathers from diverse social backgrounds, this research offers valuable insights into paternal practices during early childhood across different social groups. Participants became fathers for the first time between 2019 and 2021, and interviews were conducted shortly before the birth, shortly after, and 18 months later.

The results show that the injunction to "be there" is widespread yet internalized differently by fathers depending on the socioeconomic characteristics of their family. Some fathers prioritize spending a lot of time playing with the child, others focus on sharing care tasks, etc. Ultimately, I identify four distinct styles of fathering, highlighting how the appearance of egalitarianism in fatherhood contributes to social distinction among upper-middle-class men.

SPORTEL, IRIS* (Radboud University Nijmegen, Netherlands)

"I Am No Longer Free to Raise My Child the Way I Want": the Experiences of Ethnic, Religious, or Cultural Minority Families with the Dutch Child Welfare System

Many social problems linked to ethnic minority families end up in the child welfare system. For example, courts are tasked to decide whether particular cultural practices of migrant and minority families constitute child abuse, and what actions should be taken with families suspected of being involved in practices such as honour-related violence or radicalisation. At the same time, marginalisation as well as differences in decision-making by state actors has been shown to contribute to an overrepresentation of ethnic minority families in the child welfare system.

Child protection cases can be particularly intense and sometimes intrusive encounters with the state for the families involved. In this paper I will focus on the experiences of ethnic, religious, or cultural minority families with the Dutch child welfare system. While some parents actively ask for help, for example when dealing with family conflict or experiencing difficulties in raising their children; others are confronted with unasked-for or even unwanted interventions in their family by state institutions. Especially in cases where children are removed from their parents' care this can lead to struggles over children's belonging and identity, for example with regard to issues such as vaccination, attendance of religious events, food restrictions, or clothing or hair.

The paper is part of a larger research project on the role of conceptualisations of culture, ethnicity and religion in court cases on children. The project is an ethnographic study using different methods including an analysis of court files and court judgements; interviews with parents and other family members; interviews with court actors such as judges and lawyers; with NGOs and child welfare social workers, and with religious representatives.

Touristification on a Southern European Context: The Cases of Athens, Lisbon and Naples

The scope of this presentation is to detect and examine touristification trends on a Southern European (SE) context. The analysis will place under the spotlight, and compare, three major SE cities: two capitals -Athens and Lisbon- and the second biggest Italian city, the capital of southern Italy, Naples.

Acknowledging that the increase in tourism, especially the short-term tourism, fuels changes on preexisting urban structures, the research will underline changes that could help identify undergoing touristification mechanisms. We identify as such real estate and socio-spatial transformations taking place. Methodologically, the analysis will primarily use qualitative data describing the urban spaces in question and not upon economic/ financial indexes.

The common characteristics that the cities share, facilitate the comparisons and helps understand a distinct SE context. All three cities were established as important tourist destinations in the mid 2010s, during a period of extend economic instability, on a national level, which resulted an acute drop of the tourism cost. After all, Portugal, Greece and Italy were major components of what media identified as PIIGS throughout that period. Athens showed high level of tourist inflows much earlier, but low levels of "city break" brief stays, being the main gateway towards the popular Greek island. Lisbon from a second tier city, on the European urban hierarchy, came also to the forefront. Lastly, Naples, already an established, infamous, tourist destination also went through a striking increase on inflows.

Three case studies will be used, seeking to achieve an in-depth, even on the micro-level, analysis of touristification trends. Changes at the neighborhood level and comparisons between *Kypseli* in Athens, *Quartieri Spagnoli* in Naples and *Arroios* in Lisbon will help extract important conclusions

What Kind of Knowledge for a Critical Childhood Studies? Reflections on Epistemic Justice, Humility and the Politics of Knowing/Not-Knowing.

What kind of knowledge does a field like childhood studies which declares itself to be critical need to produce in order to uphold its claim? What forms of knowledge should the field seek to bring forth at a time when the world is experiencing multiple crises and the ethical imperative is not simply to know but to also act? And how, might the field seek to produce this knowledge? Through what knowledge practices, through what partnerships and alliances? And with what anticipated insights but also tradeoffs?

Turning to the notions of epistemic justice and epistemic humility as starting points for a broader discussion on the politics of knowledge production, I will consider what the possibilities but also the limits of critical knowledge production may be for childhood studies. To add to my earlier list of questions: Who gets to produce knowledge that matters, for instance? Who and what is left out from knowledge production in the field? What might be the effects of such absences for our ongoing efforts to represent children and childhood in a careful, responsible and ethically mindful manner? And lastly, what, if any, is the transformative role of childhood research in the context of children's and young people's struggles for justice? Though in this talk I will not seek to answer these questions in any prescriptive manner or settle these matters in any specific way, I nevertheless wish to problematize them sufficiently as a matter of concern and consequence for the development of critical childhood studies as a field at this juncture of its historical development.

Digitalization at the Frontlines: Experiences of ASHA Workers in India

Digital technologies are increasingly permeating traditionally non-digital sectors, including India's public health system, through initiatives like the National Digital Health Mission. This mission seeks to improve healthcare outcomes by leveraging data to inform and optimize strategies. Through an intersectional feminist lens, this paper critically examines who bears the burden of these digitalization efforts and how they impact women frontline community health workers—Accredited Social Health Activists (ASHAs)—who are positioned at the lowest tier of the public health system and entrenched in precarious, informal labour.

The paper explores whether digitalization enables ASHA workers or perpetuates their marginalization, reinforcing existing power imbalances. While digitalization has brought benefits like enhanced accessibility, transparency, and ease of communication, it has also imposed additional pressures on ASHAs. ASHAs are increasingly tasked with digital responsibilities, transforming the nature of their community care work. They are now involved in extensive on-the-ground digital data collection, resulting in increased workloads, the dual burden of managing both digital and paper-based tasks, and the exploitation of their unpaid labour. Moreover, disparities in access to technology, digital skill gaps, and concerns over privacy violations have become critical issues, underscoring how ASHA workers' collectives have effectively resisted the harmful impacts of digital shifts in their work environment.

The research draws on multi-method qualitative fieldwork conducted across four Indian states—Kerala, Haryana, Rajasthan, and Meghalaya—and includes in-depth interviews and focus group discussions with ASHAs, as well as key informant interviews with trade union leaders and public healthcare officials. By examining ASHAs' responses to digitalization, this study highlights the broader implications of platformization beyond the gig economy, particularly in traditional sectors where women often occupy lowest hierarchical positions.

"Sacred Knowledge and Bio-Piracy: Religious Social Movements Resisting Commodification of Indigenous Biodiversity in India"

The valorization of natural resources represents a growing global concern, particularly in regions with rich but endangered indigenous biodiversity. In India, the intensifying monetization of wildlife, native crops, and indigenous knowledge systems poses a hazard to both ecological integrity and the sociocultural frameworks of native communities. Within this context, religious social movements have emerged as vital agents of aversion, drawing upon spiritual cosmologies that underscore the sacredness of nature.

The core problem of the matter arises from the encroachment of neoliberal developmental policies that commodify biodiversity, marginalizing communities whose ontological relationship with nature is central to their cultural identity and livelihood. This process of commodification has encountered formidable opposition from grassroots religious movements, which have been instrumental in articulating resistance but remain underexplored in sociological discourse. This study focuses on emblematic cases such as the Appiko Movement, Bishnoi Movement, Navdanya Movement, and the Sacred Groves Movement. Through these movements, the paper examines how local ecologies, sacralized through religious narratives, serve as spaces of resistance against external capitalist forces.

Adopting a qualitative approach, this study, integrates ethnographic case studies, archival analysis, and content analysis of key actors involved in these movements. Comparative analysis highlights the underlying diversity in spiritual ecologies and their varying roles in the resistance.

A deeper analysis suggests that these religious movements do more than to protect the environment; they actively sustain indigenous epistemologies and counter the forces of globalization that threaten to homogenize cultural landscapes and indigenously inherited knowledge. The research contributes to theoretical discussions on sociology of religion and environmentalism, illustrating religious movements' capacity to mediate environmental justice and assert the epistemic sovereignty of marginalized communities. The study has implications for the policymakers that acknowledging environmental stewardship's cultural and spiritual dimensions may enhance the efficacy of biodiversity conservation strategies, particularly in Indigenous contexts.

Censorship, Solidarity, and Academic Freedom in Italy Since October 7

This paper surveys and discusses the transformations and challenges faced by scholars of and from Palestine in the Italian academia since October 7, 2023. It contextualises them in the history of pro-Palestinian student activism and solidarity in the Italian academia since the 1960s-1970s. The contribution also analyses how forms of solidarity and mobilisation have been policed in the context of the increasing exposure of Italian universities to the International Holocaust Remembrance Alliance definition of anti-Semitism and its adoption by the Italian government in 2020, as well as the detention in Israel of an Italian Palestinian student in late Summer 2023 and the international response generated. The paper discusses the transformations faced since October 7, 2023, unpacking cases of violation of academic freedom, censorship or self-censorship related to Italian scholars within the European framework. The paper highlights the specificity of the Italian case within Europe and beyond, assessed against the political economy of Italian academia, the influence of the military-industrial complex on the educational and academic system, and the work of transnational networks in support of academic freedom. The paper provides comparative insights with other European or Northern American cases and experiences, and reflects on the ruptures post-October 7, as well as on the forms of cooperation and response to violations of academic freedom.

Navigating the Future of Work: Challenging Age Stereotypes in Digital Learning and Redefining Cvet from an Organisational Perspective

Introduction and Research Question

Demographic change will have a significant impact on the labour market, with an increasing shortage of available labour becoming a prominent issue in the future. At the same time, digitalisation is changing work processes and skills requirements, with the process of learning itself becoming increasingly digital.

It is imperative that continuing vocational education and training (CVET) is made available to old(er) workers in order to support them and ensure their employability. However, the way in which the transition to digital learning environments affects both old(er) workers and their training activities remains unclear.

Methodology

Against this background, the present study focuses on the implementation of digital CVET. In addition to the organisational perspective, the configuration of digital training provision is also a key area of investigation.

For this reason, a situational analysis, supplemented by hermeneutic techniques, is used, in which the phenomenon of ageing is recognised as a distributed practice. In order to analyse the perception of the interplay between digital technologies and age(ing) in the context of digital CVET, 36 experts in digital learning were interviewed. The experts were drawn from three companies and represented the fields of HR, IT, education and development. The age-related images in the interviews were identified and their emergence and development was reconstructed as the result of a socio-material practice.

Results and Summary

Initial findings suggest the existence of a stereotypical image of age(ing) which manifests itself in a number of ways, including the neglect or exclusion of old(er) workers from digital CVET due to perceived deficiencies in their (technical) skills. The study therefore sought to identify strategies for competency-based, age-appropriate digital learning in the workplace environment. This was achieved through a critical analysis of age-related images and their origins in socio-material practice.

Wealth, Inequality, and Life Satisfaction: The Impact of Economic Changes across Age Groups and Generations in Europe

Comparative studies usually indicate a positive relationship between GDP per capita and life satisfaction and a negative relationship between the Gini coefficient and life satisfaction. These associations are also detected in longitudinal, cross-sectional, or panel studies conducted within individual countries. However, comparative and longitudinal studies examining contextual variables' effects across countries and over time on the life satisfaction of different population segments are rare. Many studies have identified that life satisfaction varies over the life course (U-shaped age effect), between different cohorts (generation effect), and the effect of time (a period effect) is usually analysed to capture the changes in a country or region's social, economic, or political context. Using data from five waves of the *European Social Survey* (2016–2024), covering three recent crises (the migrant crisis, the COVID-19 pandemic, and the war in Ukraine), we will examine how a) contextual differences between societies and b) changes within societies over time affect the life satisfaction of individuals across different ages and generations in Europe. We assume that differences between European countries and changes within countries over time in GDP per capita, Purchasing Power Standard, and the Gini coefficient affect different age groups and generations in distinct ways. We also assume that these effects vary within age groups and generations depending on their position in the labour market (employment, unemployment, inactivity, type of contract) and their material standard.

To conduct the analysis, we will use a multilevel approach with three levels: the first consists of individuals with their sociodemographic characteristics, the second nests individuals within cohorts (generations) and periods, and

the third nests them within countries. Building on the recent insights of Giesselmann and Schmidt-Catran (2019) and the application of similar data by Czamara (2021), we will attempt to disentangle contextual effects across countries and over time.

STARK, LAURA* (University of Jyväskylä, Finland)

Games and Sports As Socialization Pathways to Being LGBTQ+ in East Africa?

This paper examines queer childhoods and youth from two countries: Tanzania and Malawi, based on over 103 ethnographic interviews with male-assigned-at-birth *geis* (transgender women and 'in between' genders) in Dar es Salaam, Tanzania (2020–2022) and approx. 25 interviews with female-assigned-at-birth lesbians and transmen in Lilongwe, Malawi, in 2024. *Geis* in Tanzania recalled that even if there were no other *geis* when growing up, they experienced being anally penetrated in hide-and-seek and games and in competitive games (if they lost, and younger children lost frequently). Many adult men who later paid to have sex with *geis* also presumably (although I was not able to access them) learned that they enjoyed anal penetration of male-born persons through these games and contests. In Lilongwe, Malawi, female-assigned-at-birth lesbians and transmen told in 2024 how they had 'learned' and practiced intimacy with girls and women at female football camps and boarding schools because others did it, and it was expected of them. These queer football players also told that the majority of their team members were lesbian or transmen. What these games and contests in a low-income urban area of Tanzania, and football camps and boarding schools in a mixed/middle-income urban area of Malawi indicate is that some children learned same-sex practices not from adult 'folk devil' sexual predators (Hopkins 2013), as is feared in these societies, but from older children. It is not adults but older children whom younger children often wish to emulate, it is older children who possess knowledge of immediate relevance to their younger peers' aims of having fun, exploring and feeling secure. These findings challenge current Western assumptions about non-conforming genders and sexualities as solely innate in individuals ('born that way'), and expand our understanding towards what may be 'taught' or internalized through group socialization.

RC53-JS-228.2

STARK, LAURA* (University of Jyväskylä, Finland)

Queer 'Failed' Childhood Innocence and Recollections of Child Sexual Agency in Tanzania

To examine first sexual experiences, this paper uses 103 interviews with male-born *geis* (transgender women and 'in between' gender persons) in Dar es Salaam, conducted in the years 2020–2022. Although some *geis* recalled being coerced or raped by male relatives or neighbors, some *geis* recalled instead that they had initiated first sexual encounters as children. This paper answers the questions: *how did these geis recall these experiences and what does this mean for current theory?* Rather than seeing themselves as sexually exploited minors, they recalled themselves as fully consenting agents, and recounted stories of seducing male adults when they were as young as nine. Their responses challenge the hegemonic concept of 'childhood innocence' as universal and broadens knowledge of 'childhood' as a social construction (Hopkins 2013:67; Alvares 2024 (EASA); Smith & Woodiwiss 2016). *Geis* described themselves as child sexual subjects in three senses: feelings of desire and pleasure that ran contrary to social expectations; self-choosing the man they wanted to be intimate with; and acting on their feelings of intimate desire (Achmat 1995). First sexual experiences were recalled as 'not good' if they had been forced, but *geis* were *not* of the opinion that it was wrong for adults persons to want to engage in sex with children, rather it was 'not good' if children had not reached the point *as agents* where they were ready, desired or had tacitly consented to have sex with *that person* and in *that situation*. This paper examines what these narratives of 'failed' child innocence say about the contingent or illusory nature of social structures within which children are expected to position themselves (Egan & Hawkes 2009; Robinson and Davies 2014). The paper also examines *who* were the adult partners in interviewee's recollections of underage sexual encounters.

STAROSTA, PAWEŁ* (University of Lodz, Poland)

Patterns and Determinants of Civic Participation in Euroope

The process of global transformation has various consequences. One of fundamental theses of globalists assumes that the possibilities of citizens' participation are increasing (S.Huntington 2004). Opponents emphasize in turn, that the processes of globalization lead to completely opposite effects (Sennet 1992).

The aim of the paper is to try to answer three main problematic questions: 1/ What is the general level of civic participation in Europe? 2/ What patterns of civic participation dominate in Europe? 3/ Which of the following models (socio-economic status model, social capital model or attachment model) is best suited to explaining the variation in civic participation in Europe?

Civic participation as a dependent variable is understood as an activity that is implemented through citizens' actions in the public, political and associational spheres (Pattie, Seyed, Whiteley, 2003).

Participation in each activities was coded using the 0,1 system. The empirical basis for the presentation will be the data base of the European Social Survey of 2018, 2020 conducted on representative samples in 34 European Countries.

As a result of the analyses, it was found that the general level of civic participation in Europe is not high. The highest level of civic participation was identified in the Scandinavian Countries, and the lowest in the Post-communist countries and Portugal. The dominant pattern of civic participation is voting in parliamentary elections and campaign participation. The socio-economic status model and the social capital model are equally suited to explaining variability of civic participation in European Countries.

The Capitalist Rise of China Has Strengthened US Hegemony: Understanding Dependent Integration in Contemporary Geopolitical Dynamics

Conventional wisdom has oscillated from US hegemonic decline since the 1970s to a "unipolar moment" in the 1990s to now back to decline especially in the face of the rise of China. This paper argues the opposite, that the capitalist rise of China since the 1990s has rendered US structural power stronger than ever before. This is in large part due to the nature of China's historically unprecedented dependent integration into US-centered global production and financial networks. This paper will map China's techno-dependency on the US in especially advanced semiconductors (using *Bloomberg Professional's* supply chain database, among others), and show how the United States can leverage its techno-supremacy in a manner that was unavailable against Japan in the 1980s let alone the Soviet Union in the 1950s—both of which were much more technologically independent. Concomitantly, China's role as export platform for the world's workshop funnels the world's primary transactions currency (US\$) back into the United States—a familiar story—which then allows the US to spend far more than any other state, whether \$5 trillion on Covid-19 stimulus (more per capita than was spent in the 1930s New Deal) or endless wars, including those that impact China. In regard to the latter, this paper ends with how US-driven geopolitical events—US support for Ukraine in its war with Russia and US support for Israel in its war in the Middle East—has significantly diminished the prospects for Xi Jinping's Eurasian grand strategy of the Belt and Road Initiative and increased the prospects for the US' counter-vision of the India-Middle East-European Economic Corridor. That China has offered very little pushback to this spiralling US aggression reveals its extraordinary weakness stemming from its dependent integration into US-centered global capitalism.

Social Theory on Future: A Case for Hope in Navigating Futurelessness

The understanding of time in sociology has evolved continuously alongside social theory. Time was first recognized as a social problem by scholars of the Durkheimian school, who emphasized the importance of collective rhythms and social integration. Phenomenological sociology and symbolic interactionism later portrayed time as the basis of individual human experience, focusing on how people experience and act in relation to time in their everyday lives. Theorists of modernism and postmodernism introduced the temporal dimension as an element of the social system, demonstrating how time is subject to historical and structural change.

The future has been embraced in sociology as a realized, autonomous and widely explored issue only relatively recently. Contemporary social theorists increasingly focus on the role of future perspectives in shaping modern life, discussing how time is now characterized by acceleration, alienation, and a suspension in the "eternal now". These theories may explain the emerging sense of futurelessness that often accompanies life in the Anthropocene – a period marked by multiple crises, including ecological degradation, political instability, and pandemics. These circumstances force us to rethink traditional notions of time and progress as we face deep uncertainty about the future.

I argue that contemporary theories on time can help us understand this sense of disconnection from the future and point toward possible solutions. In

response, I propose adopting hope as a key concept for reengaging with the future. Drawing on sociological and philosophical frameworks, I suggest that hope offers a way to maintain an open, rather than deterministic, approach to the future. By embracing hope, we might overcome feelings of futurelessness and encourage both individual and collective action to face the current challenges.

Temporalities of Justice Amongst Loss and Damage – a Sociological Reconfiguration

The loss of habitability and irreparable damage are moving to the center of the debate as adaptation and resilience emerge as dominant strategies within the narrowing horizons of future climate action. The COP27 decision to establish a Fund for Responding to Loss and Damage has the potential to mark a turning point in the global climate justice discourse. We consider the recognition of unevenly distributed vulnerability to irreversible loss and damage – whether economic, cultural or environmental – and the possibility of compensation as a point of contention to explore the temporalities of different practices of 'loss and damage'. In doing so, we move beyond a linear, anticipatory understanding of time as well as the binary assumption of in/justice, adopting a praxeological perspective to uncover the plural temporalities of three key practices of loss-management: Restoration, Ruins and Memories. These form the temporal counterpoint to a techno-optimistic vision of a sustainable future and enable theoretical interventions into liberal notions of time and justice.

First, we systematize existing critiques of temporalities in climate justice debates (Hunfeldt 2020) and reconstruct alternative temporalities and their implications for conceptions of justice from a practice-theoretical perspective (Shove et al. 2012, Southerton 2012, Reckwitz 2016). Drawing on two empirical sites – the Just Energy Transition Partnership (JETP) and anti-nuclear resistances – we examine three specific localized practice complexes in terms of their challenges related to temporality and justice.

Our research is oriented toward decolonial critiques of anticipatory futurism (Barad 2019) and Western modernist notions of time within environmental justice debates (Whyte 2021). Instead, we emphasize the 'slow violence' (Nixon 2011) and 'combined and uneven apocalypse' (Williams 2011) that become articulable within practice complexes, highlighting their potential for a justice that must be framed as 'always-to-come' (Barad 2019:536).

Age Stereotypes in Appeals for Intergenerational Solidarity: Revealing the Paradox

Intergenerational solidarity has been a widely discussed normative concept in debates on global and health crises and is considered essential for addressing these challenges in the future. The COVID-19 pandemic can be seen as a case in point and a litmus test for the potential power of solidarity between generations during a crisis that affected age groups differently. Consequently, appeals for solidarity and representations of age(ing) were prevalent themes in the public media coverage. However, how these representations of age(ing) are precisely connected and negotiated in pleas for intergenerational solidarity still needs further exploration.

This paper addresses this gap and investigates how age as a category of identity and difference is inscribed in appeals for solidarity and how intergenerational relations are constructed in the public media discourse. Using qualitative content analysis for a text sample from German newspaper coverage from March 2020 to July 2021, we show that the representation of the young and the old in pleas for solidarity focuses on their physical well-being, social participation, and social justice. Regarding the construction of intergenerational relations, our analysis reveals a paradox which is explained with poststructuralist concepts: In appeals for intergenerational solidarity to avoid discrimination and foster cohesion, representations of age(ing) are (re)produced as *binary oppositions*, leading to a *bisected construction of age* through rhetoric *othering*.

In our conclusion, we are taking these findings as a starting point to consider how focusing on ageing as an anthropological trait and recognising the diversity within age groups and generations could help mitigate and deconstruct the paradox in appeals for intergenerational solidarity.

Commercial Tattooists and Their Professional Self-Understanding As Artists

Tattooing can be located at the intersection of body service work, craft and art. Therefore, tattooists constitute their professional identity from these occupational components to position themselves within the growing and competitive tattooing sector. In this context, the discourse of tattooing as an art is omnipresent, and the self-presentation as an artist is the most prominent among those who tattoo as their gainful work. However, a closer look reveals the diverse criteria and the heterogeneity of interpretations that qualify tattoos as artwork and their creators as (tattoo) artists.

Against this backdrop, this paper questions what notions of art tattooists have and investigates their self-understanding as artists. The data, which consists of autobiographical narrative interviews and ethnographic observations in tattoo parlours and at tattoo conventions in Germany, was analysed using the documentary method.

The analysis results show that tattooists either understand themselves as tattooing artists or as tattooists who developed into artists through their work. Four conceptualisations of tattooing as art were reconstructed: (1) By referring to the genie cult, outstanding artistic or technical skills such as portrait, realistic and naturalistic tattooing define tattooists as gifted artists. (2) Another understanding considers commercial tattooing as commission work, just as other artwork often is. (3) A further perspective regards (economic) success and reputation gained through tattoos that meet the customer's taste as (an) art. (4) In contrast, the individualistic perspective argues that since there are no universal criteria for art, everybody can invoke this status because art develops in the eye of the beholder.

The conclusion points to the practical implications of these conceptualisations on the service for the client: Their skin is either seen as a canvas for the tattoo artist's 'coup de foudre', a surface for the artist's eternal inscription, or a work material that requires more artistic skills than paper.

SURUGIU, ROMINA (Universitatea din București, Romania)

Digital Discourse and Democratic Integrity: Analyzing the Polarization of the Public Sphere through the Rejection of Diana Șoșoacă's Presidential Candidacy in Romania

This paper explores the tension between the democratic promise of the internet and its role in amplifying extremist ideologies, focusing on the recent rejection of Diana Șoșoacă's presidential candidacy by the Constitutional Court of Romania. Șoșoacă, a polarizing political figure, leveraged social media to build visibility and support, particularly from fringe groups aligned with her extremist views. The Constitutional Court's decision not only highlights legal challenges but also underscores the broader issue of how digital platforms can facilitate the spread of radical political narratives.

Using a qualitative content analysis of social media interactions, over 30,000 units of analysis, particularly on TikTok, this study investigates how extremist discourse surrounding Șoșoacă's campaign gained traction and shaped public opinion. TikTok's highly interactive and often unregulated comment sections provide a rich field for observing patterns of extremist rhetoric and deviations from democratic norms. To deepen the analysis, large-scale data collection will be conducted using a specialized TikTok extension, allowing the study to gather significant amounts of data on user interactions. This enhanced data collection method will enable a more comprehensive examination of the ways in which extremist narratives permeate online discourse.

The findings suggest that, while digital platforms have democratized access to political participation, they have also enabled the mainstreaming of extremist ideologies, posing potential risks to democratic stability. This case study highlights the urgent need for more robust regulatory frameworks to monitor and control the influence of radical content as these platforms continue to grow. It also calls for a reassessment of the role digital technologies play in shaping contemporary political discourse, stressing the need to balance open political engagement with the protection of democratic values from the threats posed by extremist ideologies.

STEFANOVIC STAMBUK, PROF. JELICA* (University of Belgrade Faculty of Political Sciences, Serbia)

Digital Epistemologies of the Phygital World or Regeneration of the Humanity's Olfactory Sense Lost for the Cognition of Anthropocene Injustices

Whatever we postulate about digital technologies' capacities to "extend the mind," there is still an insurmountable wall separating them from the past and present physical world. A thinking person is always localised despite the possibility of experiencing many times at once in different places thanks to the encompassing of space by its technological virtualisation. A specific mindset uniquely indents everyone's cognition through the olfactory sense of the earliest relatedness experiences to one's locality. This olfactory sense defies, for now, datafication. Thus, digital cognition, which tends to imprint the eternal, infinite, undying mind into silicon, is stripped of the ubiquity of its dehumanising power since it lacks olfactory immersion. We argue that this lack keeps humanity safe from the command, control and computability of its diverse localisations hyperconnected by digital devices algorithmically dictating how the local scent of injustice is to be overwritten with the codes of the artificialised delusional scents.

Digital epistemology does not come to be dissolvable into representations or experiences, substances or relationships, causations or relations, exogenous or endogenous qualities or quantities. It stands firmly in the plural and on the absence or presence of conditions for knowing justice from injustice in the existing phygital world. Preserving the cognition of the natural odours of human injustices done to nature in the concrete locality is necessary for reconstructing the augmented reality and virtualised life of the Anthropocene to regenerate virtuously creative knowledge of humans' just reconciliation with nature. This research will offer insights into a rebellious relationship within digital epistemologies of humanist naturalness of justice for cognition of nature and humanity's relationship of mutuality against the reductionist digital epistemology of the Anthropocene lacking olfactory immersion although pretending to offer the last word on what and how humans know and what knowledge is in the digitally distributed memories and senses.

Social Mobility of Migrants in Chile

The project "Successful trajectories of social mobility in contemporary Chile: Individual, territorial and structural dynamics in tackling wealth inequality" seeks to understand the ways in which communities, groups and individuals access and negotiate their positions of power and access to resources to which they usually do not have access.

In a context where studies on social mobility tend to focus on the national population, we zoom in on the migrant population in Chile. Based on 40 interviews with migrants in Chile, we reflect on their social mobility processes. The preliminary results reveal key aspects to understand the limitations of mobility when we are in populations that are stigmatized and discriminated against.

First, people face barriers inherent to their migratory situation that hinder the process of social mobility and put their civil, social and cultural rights at risk within the destination societies. These barriers are linked to difficulties in regularizing the migratory situation, recognition of titles and difficulties in accessing bank loans.

Second, the social and cultural capital that migrants bring with them does not have the same validity, recognition and legitimacy at their destination. This forces them to reconstruct a trajectory marked by the tension between their own expectations of growth and development and the stigmatizations that arise from the local/national context.

Third, being a migrant can lead to racialization processes that prevent recognition as an equal within the social structure. This introduces elements of structural inequality that limit their mobility.

Studies on Aging and Migration in Latin America and the Caribbean

The relationship between aging and migration has been developed from different topics of interest, marked by the social and migratory characteristics of the territories where the research is carried out. Through a systematic review of the literature, this chapter analyses how the relationship between aging processes and migration in Latin America and the Caribbean has been approached. The results allow us to identify the following lines of development: a) sociodemographic analysis that seeks to raise the impact of migration on the aging process of populations in the countries of departure and arrival of migrants; b) ageing and care, in particular the (re)organisation of care for the elderly when children emigrate. Here, the unequal distribution of care work according to gender and the family-based nature present in Latin American populations is highlighted, where the "moral obligation to care" prevails; c) voluntary or involuntary return of the aged migrant population and the difficulties experienced in the process of social and economic integration in the places of return. d) well-being, health and mental health of older people with direct migration experience (i.e. they were migrants) or indirect (i.e. when a close relative migrated).

Although scientific production on aging and migration is scarce in Latin America, it is possible to visualize the relationship between migration policies and public health, together with the need for specific approaches to address the needs of this population and the new gaps in access to health that are beginning to emerge.

How Democratic Are the Militants? Right Wing Extremist Political Attitudes in the Bundeswehr

The Bundeswehr's task is to defend the security, the democratic and liberal values, and the freedom of Germany and its partners. Political extremism is incompatible with these tasks, the legal requirements and normative standards of the German Armed Forces. Nevertheless, over the last years, several cases of right-wing extremism among German soldiers gained public attention.

We will present results from the first comprehensive study among Bundeswehr soldiers on their political attitudes and will focus on two core questions: 1) To what extent do soldiers hold extremist political attitudes? 2) What are the correlates and causes of extremist political attitudes? For the second question, we will test the empirical relevance of four hypotheses (1: trust in political institutions and dissatisfaction with democracy, 2: perceived societal support, 3: service-related perceptions and evaluations, 4: soldier images, normative evaluations, and historical perceptions).

The analyses are based on survey data of the research project "Armed Forces in a Democracy" from 2022. We use two datasets, 1) a hybrid (paper-and-pencil and online) survey among Bundeswehr personnel which covers 4,313 soldiers and civilian employees/civil servants, and 2) a public opinion survey, covering 4,632 representative computer-assisted personal interviews (CAPI).

Our main findings show the structure and dynamics of soldiers' political beliefs. The results also deliver a multitude of evidence on the similarities and discrepancies of political attitudes in the military and the German society. In sum, our study provides comprehensive empirical insights into the democratic reliability of the German Armed Forces, which is a necessary condition for the effectiveness of the concept of "militant democracy".

STEINER, SHERRIE* (Purdue University Fort Wayne, USA)

High-Road Carbon Removal As Nonreligious Soft Power Diplomacy with Islam and Catholicism

In this paper, I consider Heirloom technology's promotion of a values-based approach to permanent removal of carbon dioxide from the atmosphere as a form of nonreligion that has an elective affinity with *Laudato si'* in the Catholic Christian tradition and the newly released *Al Mizan* which presents an

Islamic outlook on the environment. Unlike natural regeneration strategies such as reforestation which serve to slow down the processes of climate change, carbon removal at scale, if not greenwashed, has the potential to actually reverse climate change. Heirloom is spearheading a values-based approach to the new climate economy to resist the greenwashing co-optation of carbon removal initiatives as an avenue to continue burning fossil fuels. After consulting with environmental experts, activists, entrepreneurs, and racial equity groups, Heirloom developed four "high-road" principles for responsible carbon removal demonstrating their nonreligious contribution to the industry: 1) that no carbon dioxide removed will be used for enhanced oil recovery; 2) that data will be measured, reported, and verified and available to the community; 3) that projects uphold strong worker protections with competitive wages and benefits; and 4) that companies co-create community benefits agreements and investment plans with room to evolve. The company slogan is "restoring balance to our atmosphere: Harnessing the natural power of limestone to permanently remove billions of tons of carbon dioxide from the air". Restoring ecological balance resonates with the central theme of the newly released *Covenant Al Mizan* which presents an Islamic outlook on the environment, as well as with *Laudato si'*. 'High road' permanent carbon removal can be understood as nonreligious repentance. In diplomatic relations, investment in 'high road' permanent carbon removal represents a type of (non)religious soft power that could improve diplomatic relations with nations that have significant adherence to Muslim and/or Catholic values.

STEINER, SHERRIE* (Purdue University Fort Wayne, USA)

The Potential and Limitations of the G20 Interfaith Forum

The case study of the G20 Interfaith Forum (IF20) is analyzed as a network of networks that contains alliances and tensions among advocates for social inclusion, economic redistribution, ecological protection, and sustainability objectives. The IF20 has offered an annual platform since 2014 where a network of religiously linked institutions and initiatives have engaged on global agendas that are primarily focused on implementation of the Sustainable Development Goals. Operating by analogy to formal G20 engagement groups, the IF20 has been informally linked to the full G20 process. In this presentation, I explore how alliances and tensions shift in tandem with current events and changing contexts as different countries host the G20 Presidency year-to-year. Particular attention will be paid to the South African G20 Presidency where networks within the IF20 advocate for a debt cancellation/climate finance campaign to reduce tension between 'red' and 'green' objectives.

Mapping Financing Ecosystems in Nova Scotia: Implications for Sustainable Food System Transitions

Transitioning to sustainable food and agriculture systems is essential for meeting global targets such as the United Nations Sustainable Development Goals (SDGs). In the Canadian context, governance actors increasingly recognize food system transformation as a cornerstone of sustainable development. However, translating roadmaps, frameworks and partnerships on the ground is laden with friction. Teasing out the way different interests interact in practice is critical for understanding the direction of food systems transitions and identifying potential roadblocks and opportunities. This paper examines how public, private, and non-profit actors in Nova Scotia are investing in sustainable food systems, providing insights into the province's evolving food and agriculture financing ecosystem. Drawing on sustainability transitions theory, this research highlights the underexplored but critical role of finance in shaping the directionality of innovation and sustainability efforts within food systems. Through document analysis and semi-structured interviews with key stakeholders, the study maps patterns of financial investment in Nova Scotia's food sector, identifying roadblocks, opportunities, and interventions to facilitate a more sustainable future. This paper aims to contribute to the growing literature on sustainability transitions, emphasizing the importance of finance in driving structural change in food and agriculture sectors.

STEPHENS, PHOEBE* (Dalhousie University, Canada)

Scaling up Alternative Food Networks: Exploring the Origins and Visions of the Halifax Food Hub

Food hubs are increasingly recognized as key infrastructure for scaling alternative food systems, which prioritize local production, shorter supply chains, and equitable access to food. These hubs act as intermediaries, connecting local producers with broader markets while supporting more

sustainable and resilient food systems. In Canada's highly concentrated food system, food hubs are gaining traction as providing pathways to smaller, diversified food systems to compete in the marketplace. Despite the growing attention on food hubs, much of the research focuses on the U.S. or European contexts, leaving a gap in knowledge about their development and impact in Canada, especially in Atlantic regions like Nova Scotia. This exploratory study investigates the motivations and goals behind the creation of the Halifax Food Hub and implications of standardization and scaling. Drawing on interviews conducted with founders and key stakeholders, this study explores the motivations, values, and goals - as well as challenges - in developing Atlantic Canada's first food hub. In doing so, it brings into conversation scholarship on alternative food networks, food system resilience and corporate concentration.

STERBINI PERTICARÀ, MICHEL* (University of Bologna, Italy)

Coping with a Binary World: Trans Experiences in the Italian Labour Market*

In Italy, sex reassignment and legal gender recognition are granted by Law 164/1982, which forces to a long and pathologizing procedure, ignoring people's self-determination (Voli 2016). A law that protects from transphobic discrimination and violence is absent (Cimaglia 2013), and the norms that safeguard discriminated workers for factors such as disability, race or religion, don't consider gender identity and sexual characteristics amongst vulnerability factors (Spinelli et al. 2022). In a country distinguished by a culture strongly rooted in gender binarism and where working conditions keep getting more and more precarious, having access to fair treatment at work is particularly difficult for trans* people, who face high rates of demotion, unfair dismissal (Lelleri 2011), and harassment (Spinelli et al. 2022), with non-binary people being especially vulnerable (FRA 2020). The mismatch between the ID and the affirmed identity and/or gender expression, and the distribution of tasks based on gender stereotypes, create further barriers in entering the labour market (FRA 2014). Considering the early results of my PhD research - which uses the qualitative methodologies of semi-structured individual interviews, and group discussions as part of an action research - the presentation will discuss obstacles and forms of discrimination faced by trans* people when looking for a job or in the workplace. Leaning on bell hooks (1989), the situated knowledge of who's at the margin of the labour market can offer an epistemic advantage to understand how labour organises itself through the reproduction of social and institutional oppressions. In this perspective, queer experiences can shed light on gendered and racialised capitalism's contradictions emerging when an unexpected subject (Puwar 2004) comes in.

STEUER, MAX* (O.P. Jindal Global University (JGU) and Comenius University in Bratislava, India)

Political Concepts Beyond Disciplines: A Research Agenda of Democratic Global Legal Science

Law struggles with recognition as *science*. While acknowledged as a practice, craft or art, even some legal scholars contest the understanding of law as science. This paper sets out a research agenda studying how the alienation of law from the domain of 'science' fuels a narrower understanding of both concepts, and obfuscates attempts to reach beyond disciplinary boundaries, shaped particularly by US-centric social sciences of the 20th century. The paper explores how, when law is perceived as 'unscientific', distinct from the more neatly delineated domains of knowledge (including sociology), the understanding of science itself narrows down to allegedly value-free, typically theory-testing research, illustrated by academic journals claiming not to be restricted on a disciplinary basis, yet encouraging a standardized structure where theory precedes methods and results in a theory-testing fashion.

The proliferation of notions of 'interdisciplinarity', while generative for collaborations, rarely alters the disciplinary anchoring of knowledge production, as materialized in the organization of academic institutions into faculties and departments. A considerable portion of 'legal scholars' is not innocent in this alienation. Doctrinal scholarship, when leaving no space for other ways of legal knowledge generation, stifles communication with scholars thinking about 'living law'. On the other hand, empirical legal studies, when embracing positivist social science, may succeed to appeal to knowledge consumers beyond law, but alienate doctrinal scholars. Identifying the risk of undermining of both scientific and legal authority via such alienation, this paper asks instead how a focus on overarching *political concepts* instead of *disciplines* might help remedy the gap, when the study of concepts allows for non-dominating, democratic, yet disciplined engagement beyond discipline. Ultimately, the paper calls for surveying the capacity of existing approaches and institutions of 'legal knowledge production' to contribute to such an endeavour. Such surveys should prioritize decolonial approaches emerging from more diverse environments.

RC17-JS-113.3

STEUER, MAX* (O.P. Jindal Global University (JGU) and Comenius University in Bratislava, India)

The Influence of Scholarly Discourses on Socio-Legal Change: The Case of (Withering?) Resilience of Constitutional Courts

Legal scholarship, while rarely presented under the traditional heading of 'science', may nevertheless influentially shape legal regulation and its application as the main manifestation of anthropocentric world ordering as well as challenges thereto. Constitutional scholarly, focusing on the foundational elements of legal systems, have nevertheless been understudied in the literature. This study contributes to the understanding of (socio-)legal knowledge production pertaining to a central institution in authoritative interpretation of the principles political communities are governed by: constitutional courts and constitutional judgeship, with particular emphasis on the rise of concerns over global autocratization undermining more democratic futures since 2010. The paper proposes a framework to address this question via systematic coding of scholarly resources of the scholarship on constitutional court agency, focusing on the potential and limits of constitutional courts' and judges' resilience. In developing the framework for data collection and analysis, the study points to the value of scrutinizing the scholarly conceptualization of democracy, indicating how competing conceptions of democracy have a bearing on the understanding of the constitutional courts' resilience vis-à-vis autocratization. This impact may appear both in terms of normative (in)appropriateness of judicial action and empirical evidence for its presence or absence. The study discusses the potential and limits of the coding process and presents examples of particular scholarly standpoints on constitutional court resilience. While such standpoints might not affect judicial agency, given the linkages between scholarly and judicial discourses, including through judges who are scholars themselves, or legal education, any disempowering effects that scholarship suppressing or denying the relevance of judicial agency might have on judges before they decide require serious attention. Ultimately, the study raises the normative question of scholarly responsibility for self-fulfilling prophecies of eroding constitutional court resilience vis-à-vis autocratization and generating 'constitutional knowledge' in the anthropocene.

STEVENS, CATRIONA* (Edith Cowan University, Australia)

Applied Sociology: Bringing Theory into Practice and Practice into Theory IV

This professional development session targets scholars who wish to bridge the gap between theoretical and applied sociology. Drawing on the rich and diverse experiences of our presenters, all scholars of migration and diversity, session participants will be invited to consider the application of sociology to various sectors and across multiple scales.

Dr Catriona Stevens' current research concerns older adult abuse, particularly abuse that occurs within families and similar close relationships of trust. This field predominantly features health and medical research or legal and criminological approaches and, as such, tends to focus on interventions outcomes and is often framed through Anglo- or West-centric paradigms. Catriona's recent research brings findings on the abuse of ethnically diverse older adults into dialogue with theories from migration studies to imagine new approaches to supporting mobile families through change and ageing.

STEVENS, CATRIONA* (Edith Cowan University, Australia)

Brotherly Conviviality: Care and Connection in the Digital Communities of Older Farang Men in Isaan

Older 'farang' men, meaning White men of European heritage, living in the Isaan region of northern Thailand have typically first departed their countries of origin in later life. Like many older lifestyle migrants, these men simultaneously experience both material privilege and social vulnerability (Ciobano et al. 2016; King et al. 2017). Online communities maintained through closed Facebook groups and public chat forums produce a sense of 'digital togetherness' (Marino 2015) for men who experience varying degrees of spatial, social, and linguistic isolation in their daily lives. Like migrant online spaces observed in other contexts, these communities become critical sites of care exchange where group members may provide and receive practical care, such as advice about visas, property maintenance or local health services, and emotional care, particularly through posting and commenting on pictures of their homes and villages, wives and girlfriends, and (step) children or grandchildren. Although most people participating in these online communities never meet, some exchanges through social media reflect or lead to offline relationships conducted in shared spaces of farang leisure

and consumption. Findings from a qualitative study involving interviews with online group members and online group admins illustrate the important role of digital communities to the home-making practices and successful ageing narratives of older farang men living in northern Thailand.

MARINO, SIMONE* (Edith Cowan University, Australia)

Cultural Polycentricity: A Strengths-Based Approach to Diversity in Australian Aged Care

Australia is witnessing a transformative shift in its healthcare landscape, including in aged care services, as new migrants are recruited in ever greater numbers to meet the growing needs of an ageing population. However, unlike in other global contexts where a migrant workforce provides aged care services to a largely autochthonous ageing population, in Australia, a traditional country of immigration, older people are also very diverse. One in three older Australians were born overseas, with this diversity set to increase over coming decades as today's superdiverse working-age population grows old.

To respond to the increasing complexities of this evolving terrain, this paper proposes 'cultural polycentricity' as a sociological concept that may be applied in service management and care practice to simultaneously address healthcare needs of diverse older people while supporting diverse care workers. Cultural polycentricity validates a plurality of ways of being, and of caregiving practices, and disrupts the cultural monocentricity and 'Anglophone thinking' that is codified in standardised care practices. This shift in perspective enables effective communication, collaborative problem-solving, and the cultivation of both supportive workplaces for care staff and culturally safe care for older migrants. Diversity, the inevitable outcome of decades of migration policy, defines the Australian experience. As such it should be integral to public policy, not treated as an additional 'problem' to solve. Operationalising cultural polycentricity fosters mutual understanding between patients and care providers. In a multicultural society, where individuals of various ethnic backgrounds age within a shared healthcare system, understanding and embracing cultural polycentricity goes beyond mere cultural sensitivity; it is a sociological imperative that recognises health as a socially and culturally constructed phenomenon.

Esencialismo De Género Entre Adolescentes: Análisis Comparativo De Las Creencias Esencialistas Sobre Normas De Sexo y Género En Estudiantes LGBTQ+ y No LGBTQ+

El esencialismo de género, la creencia de que los rasgos de género son innatos e inmutables, tiene un rol fundamental en la formación de normas sociales. Aunque la literatura existente ha abordado el desarrollo y el impacto de estas creencias, se han investigado poco en relación a las diversas expresiones e identidades de género y preferencias de pareja, especialmente durante la adolescencia. Este estudio se propuso explorar las creencias esencialistas en adolescentes LGBTQ+ en comparación con sus pares no LGBTQ+ (n=1037; edades 16-18) mediante un cuestionario autoadministrado. La adolescencia es una etapa clave para el desarrollo de la identidad, y las escuelas pueden ser espacios propicios para cuestionar y desnaturalizar estereotipos y desigualdades de género. Por lo tanto, examinar estos conceptos en este contexto y etapa de la vida es de particular relevancia.

Además de explorar por primera vez nociones de esencialismo en adolescentes en América Latina, el estudio también buscó cuantificar la población adolescente LGBTQ+ en relación con el total de adolescentes en la Ciudad de Buenos Aires. Los resultados revelaron que el 25% de los estudiantes se identifican como LGBTQ+, y este grupo mostró un grado de esencialismo de género significativamente menor que el de sus compañeros. Sin embargo, todos los adolescentes respondieron influidos por las expectativas sociales imperantes. Estos resultados resaltan la importancia de comprender cómo opera el esencialismo de género en las poblaciones vulnerables y sugieren posibles implicaciones para la promoción de la igualdad de género en los entornos educativos, dado que la literatura sugiere que las creencias esencialistas pueden dar lugar a actitudes y creencias discriminatorias.

JUDZIK, DARÍO (Universidad Torcuato Di Tella, Argentina)

Subjective Well-Being Among Adolescents: Comparative Analysis of LGBTQ+ and Non-LGBTQ+ Secondary Students

Although there is considerable international research on subjective well-being within the LGBTQ+ community, few studies in Latin America have managed to measure said community in relation to total community, therefore allowing for a comparison between LGBTQ+ people and non-LGBTQ+ people. This study aimed to assess the LGBTQ+ adolescent population in relation to the overall adolescent demographic in the City of Buenos Aires. Results showed that LGBTQ+ represent 25% of students, and that their subjective well-being is significantly lower than that of their non-LGBTQ+ peers.

Focusing on adolescence, which is crucial for identity development, we used a novel self-reported questionnaire targeting LGBTQ+ adolescents and their non-LGBTQ+ peers, (n=1037; ages 16-18). Its questions aimed to elucidate aspects about emotional status and the existence of support networks. In keeping with existing literature, our study found significant differences between LGBTQ+ and non-LGBTQ+ secondary students, with the LGBTQ+ group tending to perceive themselves as less optimistic about the future and as less accompanied and/or supported than people who are not associable to the community. To the best of our knowledge, this is the first study that collected this data for both LGBTQ+ students and their non-LGBTQ+ peers in Argentina, and could therefore have great potential to inform education policies.

The survey also included questions about gender essentialism - the belief that gender traits are innate and cannot be changed throughout one's lifetime - and the results found that LGBTQ+ adolescents showed significantly lower levels of gender essentialism than their peers. However, they were also still influenced by prevailing societal expectations. Given the established link between higher levels of essentialism and discriminatory beliefs and attitudes, these findings highlight the importance of understanding this issue and suggest potential implications for promoting gender equality in educational settings, ultimately improving subjective well-being for LGBTQ+ youth.

STEYN, IBRAHIM* (Department of Sociology, University of Pretoria, South Africa)

Making Critical Sense of Scholarship on Racism in Post-Apartheid South Africa

This article focuses on two intellectual tendencies related to racism in post-apartheid South Africa. First, I argue while class and gender are sources of significant ideological cleavages, an uncooperative right-left consensus that racism is inconsequential to power and social inequality in post-apartheid South Africa seems to exist. Those on the right treat racism as a private matter and leverage formalism against efforts aimed at addressing the material manifestations of racism (Cronje, 2016). Some left intellectuals and activists reduce racism to ideology and suggest that changes in the class structure have rendered racism largely insignificant and hence generally portray social inequality as a class issue (Satgar, 2019). Yet, as many official statistical reports show (Statistics South Africa, 2018; 2019; 2021), social inequality continues to be partially racialized at different levels of post-apartheid South African society. This calls into question the prevailing common sense narrative of racism both in the post-apartheid South African academy and society at large. In response to this tendency, I employ Feagin's (2017) theory of systemic racism to explore the key mechanisms that are reproducing and maintaining racism in post-apartheid South Africa. Second, I argue that anti-racism has been partly characterized by elite capture. This is reflected in the neoliberal framing of anti-racism that underpins the government's approach to Black Economic Empowerment (Turok, 2015; Steyn, 2023). I shed light on this tendency by venturing a critique of aspects of the South African decolonization discourse.

„That He Really Mustered up the Courage and Said: ‚I Need Help Now!‘“ Female Partners Perspectives on Men’s Coping Strategies for Depression. A Qualitative Study

The perspective of female partners of men with depression and their role in coping with the illness has been little researched. Recognizing the importance of gender role stereotypes for men’s coping strategies for depression, it is also important to explore the extent to which gender norms play a role in co-dealing with the illness together and how female partners reinforce masculinity when dealing with a male partner’s depression. The aim of this study is to investigate the female partners’ perspective on how their male partners deal with the illness. Qualitative semi-structured interviews were conducted online with 13 female partners of men with depression using a semi-structured interview guide including themes on the start and course of treatment, the subjective theory of illness, how the couple deals with the illness and their experiences with private and professional support services. The transcripts were analyzed using qualitative content analysis and reconstructive methods. Traditional norms of masculinity served as a point of reference in the female partners descriptions. Participants positively evaluated characteristics in men that do not correspond to stereotypical norms of masculinity, such as higher emotional capacity, both in relation to coping with the illness and in shaping the relationship. Instead, they characterized their partners as possessing attributes of alternative masculinities. However, Female partners expressed specific expectations regarding their partner’s illness coping, including active coping such as taking the illness seriously, actively seeking help and participating in treatment. Some of these expectations tie in with attitudes that correspond to traditional masculinity. Nevertheless, expectations of the male partner’s health literacy seem also limited, and female partners often took on an active and demanding role during the depression treatment period and showed a high level of caring behavior towards and responsibility for their partner with depression.

Transnational Pedagogical Expeditions. Contesting Knowledge through Formative Research in Teacher Education

This contribution is based on a long-standing academic partnership in teacher training between a public university in Colombia and one in Switzerland. In the frame of this partnership, we have developed a critical approach to a ‘planetary learning’ that promotes cross-border teaching, learning and research, as well as student mobility between the Global North and South. International student mobility between the Global North and South, is even less common in teacher education than in other faculties. This is partly because many teacher education students come from less privileged backgrounds and often cannot afford international mobility.

To address these limitations, we have developed the approach of Transnational Pedagogical Expeditions to foster student mobility between the two national contexts. The approach is based on the experiences of Colombia’s National Pedagogical Movement (NPM) in the early 2000s. The approach involves formative research through pedagogical expeditions within and between Colombia and Switzerland. The expeditions are part of a preparatory course taught collaboratively at both partnering universities. Based on the concept of the ‘teacher as researcher’ developed by Colombia’s NPM, binational tandems of teacher education students and in service-teachers are trained and accompanied by researchers of both universities to conduct ethnographic research together in both national contexts, in a spiral process of observation, irritation, reflection, and analysis.

In our presentation we expose how our approach of a ‘planetary learning’ is conceptualized and how it seeks to challenge knowledge hierarchies and decolonise the curriculum in teacher education in both nation-states. Based on our empirical data we will discuss the potentialities and challenges of this approach.

Border Deaths and Disappearances: How Intimate Memorializing Practices Challenge State Neglect

In the Mediterranean region, the European border regime causes thousands of deaths and disappearances, which are often unacknowledged by official institutions that fail to take responsibility. This leaves families of deceased and missing migrants in a state of struggle. Some families manage to learn what happened to their loved ones and perform funeral rites, often without support from authorities. Others, however, remain in a state of uncertainty, unable to determine whether their relatives are alive or dead, forcing them to live with the ambiguity of considering their loved ones as missing.

This presentation is based on fieldwork conducted in Morocco with families of deceased and disappeared Moroccan migrants. It explores the private lives of family members of dead and missing migrants, examining intimate practices of memory. On one hand, I will discuss personal practices of commemorating death, focusing on the experience of a family whose relative died while attempting to reach Europe. On the other hand, I will delve into both intimate and public practices of remembering disappearance, looking at the experience of a family whose relative disappeared after leaving in a zodiac.

In both cases, families create personal and collective rituals to cope with border-related deaths and disappearances. These rituals shape intimate and social discourses about these phenomena, highlighting how the state neglects their plight. In cases of disappearance, such practices notably give the missing material and social presence, challenging the oblivion to which the state has consigned them. This presence transcends the private sphere, allowing the politicization of the right to dignified death and mourning. Indeed, by examining memorializing practices in border-related deaths and disappearances in Morocco, this presentation underscores the political significance of intimate and social rituals in the face of state neglect.

STOCK, PAUL* (University of Kansas, USA)

Nested Markets, Land, and Community Building: Reciprocity and Repair with Catholic Worker Farms in the United States

The emergence of territorial and nested markets offers nuance related to scale, place, and actor autonomy (both producer and consumer among others) that bolsters our examinations of rural development and challenges from the margins in agri-food relationships (Ploeg 2014, Schneider, Ploeg, Hebinck 2014). This paper extends previous scholarship on the Catholic Worker movement’s farms (Stock 2010) with particular emphasis on partnerships with Native American tribes to reconceptualize and repair relationships between people, communities, and land. The presentation is based on the farm’s zines and newsletters that illustrate elements of reciprocity, relationship-building, and other less explicitly market behavior of Polanyi’s double movement including householding and reciprocity that specifically challenge the idea of the land as resource only. We argue that reciprocity is a key aspect that both illustrates and builds trust, care, and mutual aid and challenges the assumptions about what (non?) economic behavior in agri-food relationships can be like.

STODDART, MARK* (Memorial University of Newfoundland, Canada)

Energy Transitions and Justice: Navigating Conflicts between Decarbonization, Climate Justice, and Energy Justice

Today’s intersecting social-ecological crises are deeply rooted in the energy and transportation systems shaped by coal and oil. This paper begins by examining research on energy within environmental sociology, alongside insights from the fields of energy justice and climate justice. We analyse the global, national, and sub-national inequalities in both social responsibility and vulnerability to climate change. This draws on empirical examples of energy-related conflicts and transitions in Canada, Denmark, and Norway. Through this analysis, we explore the social dynamics of decarbonization, highlighting how transitions away from fossil fuels, while necessary, can generate new forms of inequality or exacerbate existing ones. A particular focus is given to the infringement of Indigenous rights protected under UNDRIP, demonstrating how well-intentioned renewable energy initiatives can perpetuate colonial practices. Finally, we argue that prioritizing fossil fuels and energy systems as the primary drivers of climate solutions risks overshadowing other critical issues, such as agriculture and land use, that must be integrated into a holistic climate strategy.

Navigating Sustainable Tourism: Community Participation and Unesco World Heritage Projects in Greenland and Canada's Maritime Spaces

The UNESCO World Heritage Site program promotes the vital role for local communities in meaningful engagement in cultural and natural heritage preservation as part of tourism development in maritime and coastal regions. In this paper, we provide a comparative analysis of practices of community engagement in proposed and established UNESCO World Heritage projects in Greenland and Newfoundland, Canada. We draw on fieldwork and interviews that were conducted as part of the project, "Towards a Socially Just Transition in the Arctic: Exploring, Theorizing and Disseminating Best Practice in Meaningful Stakeholder Engagement for Communities." Our analysis highlights the challenges and disconnects in translating meaningful engagement in UNESCO-based coastal tourism development into meaningful engagement at the community level. Challenges include disconnects between communities and decision-makers; disconnects between local conversations and extra-local interests; and distributional concerns with the benefits and impacts of UNESCO-based coastal tourism development. At the same time, communities can strategically leverage their ties with UNESCO-based coastal tourism to help shape the social-ecological futures for maritime regions. We see how UNESCO connections are leveraged to resist other forms of development, such as undersea mining exploration and oil and gas development. While the UNESCO World Heritage program emphasizes the role of local participation and engagement in cultural and natural heritage preservation, our analysis of proposed and established coastal UNESCO World Heritage projects in Greenland and Newfoundland highlights the challenges, tensions, and opportunities involved in translating the promise of local participation into actual practices of meaningful engagement for maritime communities. As we demonstrate, more attention needs to be paid to how UNESCO World Heritage goals for local participation and engagement play out at the local level to better understand the challenges and opportunities related to translating broad global goals for sustainable coastal tourism into the contexts of maritime host communities.

Impact of Digitalization and Trust on Non-Voting Behavior from European Comparative Perspective

The concepts of trust and distrust in the digital society are increasingly relevant, particularly in the context of modern data-driven technologies and their implementation. Existing definitions of trust and distrust, when applied to these technologies, shape how citizens engage with political institutions and influence behaviors such as voting or non-voting. This study explores the relationship between digitalization and political engagement, with a focus on non-voting behavior in national and EU elections, which poses a threat to democratic stability by amplifying the impact of populist and right-wing movements.

Building on the premises that unemployment is a key predictor of non-voting (Aasve, et al. 2024), that low trust in political institutions exacerbates disengagement, and that the rise of authoritarian populism is more closely tied to cultural shifts and generational factors than purely political or economic conditions (Norris and Inglehart 2019), this research seeks to understand how digital technologies and trust, in their current conceptualizations, influence voter behavior.

At the individual level, this study examines how digital skills, employment status, age, and residence impact non-voting behavior. We hypothesize that while higher digital skills may foster political engagement, unemployment and age could deepen distrust and contribute to disengagement. On a macro level, the study investigates how trust in institutions and the degree of digitalization, as measured by the Digital Economy and Society Index, interact with national and regional unemployment rates to influence political participation.

Utilizing data from the European Social Survey Round 10, which includes a module on Digital Social Contacts in work and family life across a number of

European countries, this research offers a comparative perspective on how digitalization and the evolving dynamics of trust and distrust shape non-voting behavior. By analyzing these multifaceted factors, the study seeks to inform strategies aimed at enhancing democratic participation in an increasingly digitalized society.

STOLL, LEONIE* (Institute of Educational Science, University of Osnabrück, Germany)

Security and Insecurity from the Perspective of (migrantized) Secondary School Teachers in Germany

Current research shows that German right-wing populism emerges particularly through discourses on 'order and security issues' concerning migration, participation, and opposition to democracy. This threat situation, including the presence of a (violent) far-right scene, particularly affects people who potentially do not fit into the worldview of right-wing individuals.

Schools can be understood as places where nearly all young people come together, thus reflecting a cross-section of society. Discourses on social heterogeneity, including security and migration discourses, manifest in particular ways in schools and can have negative, discriminatory effects on migrantized teachers and students. They are continuously threatened and affected by (symbolic) exclusion. How questions of security and insecurity are negotiated in schools and how the relationship between security and insecurity plays out in the everyday lives of migrantized teachers remains a gap in educational research.

The researcher-team reconstructed the (varied) orientations of (non-) migrantized teachers based on their experiences of security and insecurity in German schools. To protect the target group, which is already at risk due to escalating violence, the decision was made to forgo the survey of students. The researcher-team used problem-centered interviews. Following Witzel this interview method allows for a subject-centered and tailored approach to respondents' narratives. Using Ralf Bohnsack's documentary method, the interview results have been analyzed sequentially. Findings and derived recommendations for action for teachers and other educational professionals will be presented.

Challenging Epistemic Inequalities: Feminist Action Research and Decolonizing Urban Futures in the Majority World

This paper explores the transformative potential of feminist action research in addressing epistemic inequalities, decolonizing knowledge, and rethinking the purposes of knowledge production. To do so, we collectively reflect on our ongoing feminist action project, *Building Feminist Urban Futures in the Majority World*. The project's primary goal is to cultivate feminist urban scholarship aimed at understanding urban dispossessions in the context of intersecting crises affecting cities. It seeks to build a feminist urban community across the Mediterranean and Latin America, fostering regional and intergenerational learning through a series of "traveling urban labs."

These labs focus on feminist urban planning in Chile, Morocco, and Turkey and aim to address vulnerabilities and inequalities exacerbated by recent disasters in these countries. Our project addresses how decolonial feminist urban imaginaries interrogate twenty-first-century urban life fostering feminist praxis from Majority Worlds. As part of our reflexive process, we pose several key questions for discussion in this roundtable: How can feminist action research foster South-to-South collaborations that challenge, without reproducing, epistemic inequalities? Whose knowledge is valued, and why? How can decolonial feminist praxis nurture cultures of care, solidarity, and safe spaces for co-creation and feminist interventions? Finally, how do we decolonize feminist urban imaginaries in the face of ongoing economic and social insecurities? The aim of this presentation is not to provide definitive answers to these questions, but rather to provoke collective learning and reflection among feminist urban scholars.

STRELTSOVA, EKATERINA* (National Research University
Higher School of Economics, Russian Federation)

*'Migration without Migration': Technological Knowledge Flows
and the Influence of External Factors*

The migration of highly qualified professionals is typically regarded as a problem to solve by countries where the emigration of this category significantly exceeds immigration. However, in the context of globalization and internationalization of the economy, the loss of intellectual capital can occur even without a mass exodus of highly qualified professionals from the country. Remote working, the establishment of R&D departments abroad, R&D outsourcing to foreign performers (companies, universities, etc.), and even direct collaboration with individuals, inventors (Sonnenwald, 2007; McAusland, Kuhn, 2009) – these and other strategies are used by many economic actors as a part of their innovation activity, technological upgrading and implementation of the open innovation paradigm (Chesbrough, 2003). Technological knowledge, which can be converted into new technologies and intellectual property (Parayil, 1991), is of a particular value in this 'race for talents'.

Using the case of Russia, the study examines the intensity of these international (inward and outward) flows of technological knowledge, their dynamics and structural characteristics (countries, organizations, technological domains, etc.). It is based on the methodology of patent analysis and – empirically – on the collection of collaborative patents (inventors and assignees from different countries) for the period 2010–2023. It examines how various factors (including the global economic inequality, the specificity of national innovation systems, etc.) influence the positions of countries in the global 'space' of technological knowledge, making some of them predominantly exporters and others – mostly importers. The results of this analysis are also compared with the traditional imbalances in international flows of highly qualified specialists to show how they are reproduced at different levels. Additionally, the study discusses how certain external factors (such as the COVID-19 pandemic and post-2022 geopolitical tensions) shape the international flows of technological knowledge, which (falsely) seem to be immune to borders closures and formal sanctions.

STROBEL, CONNOR* (University of Chicago, USA)

*Special Ed' and Special Knowledge: Expertise, Gatekeeping, and
the Persistence of Resource Inequality*

The number of primary and secondary students with a diagnosed form of neurodiversity has grown dramatically. In many localities, the laws and services supporting neurodivergent students' right to a quality education have lagged, creating complicated legal and resource regimes. Through a comparative study of families with neurodivergent children in three states in the United States (Arizona, New York, and Oregon), this paper explores how they navigate complex, multi-scalar legal and resource environments driven by policy regimes that have lagged behind popular and medical understandings of neurodivergence. In other words, the article details how families with neurodivergent children navigate changing and hotly contested ideas about neurodiversity and disability rights, laws and policies that have been slow to adapt, and how to access continuities of care. The preliminary results of this study suggest that certain forms of legal and resource elasticity meant to improve bureaucratic responsiveness compound educational inequality based on sex, class, race, and immigration status. Furthermore, experts that families hope will open resource pathways can gatekeep resources due to information asymmetries, information and resource scarcity, and debates about their formal and substantive legal obligations to families. This study makes important contributions to studying the persistence of educational inequality, legal elasticity, and neurodiversity, highlighting the crucial role of policymakers, academics, and advocates in addressing these issues.

*Affective-Moralizing Classifications Adolescent Perspectives
of "Violence", "Masculinity" and "Justice" in the Context of
Schools' Normative Order*

The contribution analyses moralising classification practices of adolescents within the context of post-migrant schools in Switzerland. It is based on data gathered through a multi-modal ethnographic approach, centred on a participatory video project with students.

In Switzerland, as elsewhere, schools have undergone significant transformations due to migration, mobility, globalisation, and digitisation. Despite these changes, schools remain positioned in national education policies as key socialising institutions, particularly given the increasing heterogeneity of student populations. The political mandate for integration and inclusion within schools—often interpreted as assimilation—is closely tied to their role in categorising and classifying both knowledge and students. Schools exercise the power of definition through their authority to determine what constitutes legitimate or illegitimate knowledge, while also assessing and positioning students accordingly. Classifications serve as instruments of social control, delineating who is perceived as 'normal' and who is labelled as 'deviant', thus reinforcing hierarchical structures. These processes are informed by an (autochthonous) middle-class orientation, which privileges certain forms of cultural capital over others. In this way, the categorisation and classification processes within schools contribute to the construction of difference, functioning as mechanisms that reproduce social inequalities and sustain existing power structures.

The presentation will focus on the possibilities of counter-classification, exemplified through the analysis of two short films produced by students aged 13-15. The analysis will explore how adolescents engage with and challenge the classifications and subject positions ascribed to them by schools, such as "migrant," "deficient," "weak," or excluded from a collective "we." Through moralising re-classifications, the adolescents reposition themselves in relation to the school's knowledge order—drawing on violence, justice, and masculinity as resources—while simultaneously expressing social belonging to their peer group.

*El Control Constitucional De Normas Generales Por La
Suprema Corte Mexicana*

Una de las funciones más relevantes de los Tribunales Constitucionales es la de revisar la constitucionalidad de las normas generales. Sin embargo, no es una cuestión sencilla ya que presenta diferentes problemas no solo a nivel interpretativo sino político en los sistemas donde esta prevista. Es en el ejercicio de esta función en la cual se presentan los espacios de mayor estrés institucional entre el poder de revisión y los poderes establecidos, ya que en último momento, esta función permite que las normas generales puedan ser expulsadas cuando no cumplan con el parámetro de control de la regularidad constitucional.

A través del estudio de las figuras de la acción de inconstitucionalidad y el amparo contra leyes (indirecto) en el periodo de 1994 a 2024, el artículo que se presenta muestra los espacios de restricción y activismo que ha tenido la Suprema Corte mexicana en la materia, como respuesta al contexto político del momento. Los hallazgos permiten teorizar sobre las circunstancias en las cuales el sistema tolera una mayor o menor participación de los tribunales constitucionales en la labor de control.

The Time, Temporalized Sociology, and Open Future

The topic of time was neglected in sociology for a long time, although one cannot say completely. The issue of time was considered by a number of the great figures of sociological thinking in their time. Philosophical conceptions and discoveries in physics and other sciences also had their influence. We can say that for many decades the question of time was rather marginal as a theme, outside the mainstream of sociological research. The situation changed only in the mid-1970s, when interest grew in the phenomenon of time, and this interest continued in the next two decades. Here we come to the concept of temporalized sociology. According to Patrick Baert - temporalized sociology is sociology in which processuality and diachrony are the ontological and methodological basis for the analysis of social systems. It is sociology which emphasizes social dynamics, development, social change and processuality. As an example of temporalized sociology we can mention the entire field of contemporary historical sociology. Views of the future as a dimension of the life of human individuals and society are something that was shaped and transformed in long-term historical development. This development included ideas of a cyclic nature (the myth of eternal returns), religious expectations of an eschatological nature, a philosophy of history, a philosophy of progress and finally the concept of an open future.

SUDO, NAOKI* (Hitotsubashi University, Japan)

Weak Ties Combined with Strong Ties and Weak Ties Not Combined with Strong Ties: The Case of Japanese Married Women's Personal Networks for Childcare Support

This presentation argues that weak ties observed in social networks should be categorized into two groups: weak ties combined with strong ties and weak ties not combined with strong ties. This distinction is necessary for a more accurate understanding of the concept of "strength of weak ties," which was introduced by M. Granovetter and is frequently cited in studies on social networks.

In this presentation, to differentiate between these two types of weak ties, I defined weak ties combined with strong ties as "mixed ties" and weak ties not combined with strong ties as "weak ties." Subsequently, I examined the differences in their functions within personal networks.

To analyze these differences, I employed multinomial logistic regression models and structural equation modeling. The data used for this analysis was collected from Japanese married women raising children who resided in the Kansai region of Japan. In my analyses, individual subjective well-being was the dependent variable, and types of network ties (weak ties, strong ties, and mixed ties) were the independent variables.

The results of my analyses revealed that mixed ties were most positively associated with individual subjective well-being, while weak ties were least positively associated. This implies that although weak ties themselves are not stronger than strong ties, when combined with strong ties, they can become stronger than strong ties. Overemphasizing the dichotomy of weak ties and strong ties can obscure the weakness of weak ties on their own and the strength of weak ties when combined with strong ties.

Furthermore, the analysis showed that the effects of mixed ties, weak ties, and strong ties on individual subjective well-being were mitigated when controlling for the size of network ties.

SUERO COMELLAS, NÚRIA* (Universitat Autònoma de Barcelona, Spain)

Music and Transnational Activism

Some songs are part of the repertoire of protests of social movements all over the world. These songs have been written in a specific geographic and historical context (and referred to a particular struggle or social movement) but are adopted by activists across the globe and in different historical moments.

These protest songs represent a connection with previous social movements and contribute to inspire and define new movements. Moreover, these protest songs reinforce a global dialogue that contribute to create new imaginaries that may stretch across borders.

This paper analyses the elements contributing to the diffusion of protest songs through time and space and how they enhance the struggle for justice. The understanding of these elements contributes to explain the mechanisms that boost global struggles for justice and human rights through music.

Generational (Dis)Continuities Among Palestinians and Other Arabs in Toronto

This paper investigates the generational (dis)continuity in politicization and solidarity ties among the Palestinian and other Arabs in Toronto. Building on Mannheim's concept of generation, understood as a collective of individuals whose consciousness was influenced by transformative events at a socio-historical proximity, I analyze the political mobilization, grievances, and solidarity relations of four political generations among the Palestinian and other Arab communities in Toronto. These are: The Revolution Generation, The Oslo Generation, The "War on Terror" Generation, and more recently, the Gaza Genocide Generation. By integrating this temporal analysis that accounts for the variations of political contexts, my analysis challenges the unidirectional theorizing of generation, highlights the reciprocity in generations interactions, and shows the interplay between the different generations. My paper is based on fieldwork completed between 2014 and 2019, and then 2022-2024.

Challenges and Opportunities to Improve Working Conditions of Women Ready Made Garment Workers in Bangladesh

The study focuses on the Bangladesh Readymade Garments (RMG) sector's workers' challenges and opportunities to improve their working conditions. The degree of support given to workers by stakeholders like government, producers, and other relevant institutions, highlighting the barriers and opportunities for implementation of an adequate regulatory framework. This research background forms literature on 'class', 'collecting bargaining' and a feminist approach to discuss and analyse issues from participants' perspectives. The first empirical section of this research identifies the opportunities and barriers that women garment workers face. It draws on interviews from owners and workers. Interviews from workers show a range of thoughts about the challenges and barriers to improving workers' working conditions in the RMG industry of Bangladesh. It also sets out the data regarding how the managers think they can contribute to improving women's working conditions. It also highlights the variation between the views of the managers and workers. Their answers were divided into different themes of working conditions, including: salary and leave, safety, skills, medical facilities for workers, and capacity building. This chapter also discusses managers' thoughts on investment, cost, production and different challenges faced by male and female workers, the future of the factories, addressing disagreements within the factory, and feelings about the factory. The research uses a qualitative case study approach focused on Bangladesh. The key method of this research is interviewing with a focus on women workers' working conditions. Research participants involved ready-made garment factory workers, their supervisors, managers of four factories and different stakeholders of the Bangladesh RMG sector. Finally, the research tries to understand women workers' challenges and opportunities from their perspectives.

Maternal Struggles and Institutional Decisions in the Context of Child Removal from Mothers with Intellectual and Psychosocial Disabilities

Objective of the study is to reveal the experiences of mothers with intellectual and psychosocial disabilities whose children have been removed, placing a spotlight on the deeply rooted oppressive societal, institutional, and personal circumstances.

Public discourse legitimizes intervention in the private and family lives of individuals with disabilities, leading to restrictions on the sexual and reproductive rights. Institutional stigma is a contributing factor, as professionals frequently adopt a controlling stance, fuelled by a lack of trust in the abilities of these mothers to care for their children.

Conducted between 2018 and 2022, twelve in-depth qualitative, semi-structured interviews with mothers having intellectual or psychosocial disabilities form the core of this research. The main categories emerged from the research data and shed light on the narratives of mothers who experienced child removal: a) origins: labelled as "deviant" from the beginning, b) the quest for acceptance and attachment, c) the child portrayed as an "incident," both a source of pride and a burden, d) the absence of social affirmation, e) the judgment of removal – swift and irrevocable, and f) feeling abandoned by loved ones, society, and ultimately left childless. The interviews revealed, even if support was offered to women, often it did not come within the timeframe that it was really needed. Having been abandoned during their own childhood, the women later encountered challenges that they couldn't resolve alone. The support offered often came too late and could not fill the void of love, care, and basic survival skills, which were gaps from their own childhood. Their stories challenge societal power structures by highlighting the resistance of institutional frameworks to embrace diverse maternal roles. In societies advocating for diversity and inclusion, there remains a gap, preventing the acknowledgment of various "motherhoods" that extend beyond the conventional roles depicted on the forefront.

Save the Forest! Restorative Practices, Macrocriminology and State Responsibility in Sustainable Forestry Governance

In the face of escalating global environmental challenges, particularly the rapid depletion of forests, this study delves into the nexus of sustainable forestry governance, macrocriminology, and state responsibility. Forests, which store approximately 40% of terrestrial carbon, are pivotal in climate change mitigation. Yet, over 10 million hectares vanish annually, driven predominantly by the demands of industries like timber, pulp, and paper, with China notably leading consumption.

This project critically examines the transnational dynamics between Oceania and China, focusing on four key timber-exporting countries: New Zealand, Australia, Papua New Guinea (PNG), and the Solomon Islands. These nations face significant pressures from international timber markets, notably China, which imports a substantial majority of its timber from natural forests, particularly in PNG.

Employing a global ethnographic approach, our research pursues two primary objectives: First, to evaluate and contrast restorative practices across Oceania, identifying risks and exemplary approaches in timber industries; and second, to analyze the domestic timber sector in key Chinese provinces (Guangxi, Guangdong), exploring the impacts of global supply chains and local practices.

By integrating insights from political economy, macrocriminology, and environmental sociology, this study seeks to illuminate the complexities of statecraft in the Anthropocene era. It examines how states navigate the pressures of 'green' transitions while managing historical developmental legacies. Furthermore, it explores the role of social movements in shaping market transformations and influencing state policies toward sustainability.

Through comprehensive data analysis and stakeholder interviews, this research aims to inform policy recommendations that promote sustainable forest management practices and mitigate the adverse impacts of global timber consumption on climate change. It underscores the urgency of aligning industry standards and state policies with global environmental goals, urging digital retail platforms in China to adopt responsible sourcing practices in the timber sector.

Tragedy of Culture or Tragedy of Cognition? Reimagining Simmel As a Cognitive Sociologist

Georg Simmel's "tragedy of culture" concept is often viewed as central to his discourse on culture and art. This paper reinterprets Simmel's work through the lens of art anthropology and cognitive archaeology's discussions of the "cognitive life of things", positioning him as a precursor to cognitive sociology, whose crucial, yet overlooked, contribution lies in identifying the evolving cognitive ecology between humans and artifacts in modern life.

I argue that Simmel's theory goes beyond common interpretations (e.g., Frisby and Featherstone) that focus on the conflict between transcendental subjects and fixed objects — Instead, it describes a "tragedy of cognition": as humans transcend existing cultural forms (e.g., artifacts, novels, poems), they continuously create new ones, leading to an ever-growing cultural system too complex for individuals to fully comprehend. This ongoing process of cultural creation and accumulation results in escalating cognitive pressure on individuals in the modern world, prompting coping strategies like forgetting, simplifying, indifference and attitude of blasé, which are key to understanding modern life characteristics such as pre-reflexivity, fluidity, and commodity fetishism.

My approach reveals a new dimension in Simmel's work, bridging classical sociological theory with contemporary interdisciplinary perspectives. By reframing the "tragedy of culture" as a cognitive phenomenon, I provide a cohesive framework that interconnects Simmel's diverse discourses on culture, art, and modern life. This reinterpretation not only enriches our understanding of Simmel's contributions but also illuminates the cognitive challenges of our increasingly object-saturated world, offering fresh insights into the interplay between humans and non-humans in the Anthropocene.

Complexity of Parenthood in Forced Migration: Risk, Commitment and Moral Dilemma

Based on the narration of Syrian refugees who were parents at the time of their migration to Europe, this study explores their understanding of the risks involved in the clandestine journey that included sea crossing. In particular, it delves into the transformation of their risk comprehension throughout their narratives. This highlights the contrast between their pre-migration and post-migration risk perceptions and their justifications for undertaking the perilous journey.

In the part of the narrative recalling their pre-migration risk assessment, the commitment to their children was an unstoppable driver for parents to face the perilous journey. At that time, their risk assessment was imbued with a personal and normative value rooted in the feeling of parental duty to provide a safe environment and a sense of future for their children. Parents reasoned that undertaking the risky migration journey was more reasonable than failing to save their children from life in Syria or Turkey.

Although migrating over the sea was fraught with danger, they saw it as the only way to fulfil their parental duty, viewing themselves as virtuous parents. However, when asked to reassess the risk from the perspective of their settled lives, they judged it generally as unrecommendable, unjustifiable, and irrational.

This contradiction is particularly pronounced among parents who embark on journeys with young children. Their testimonies highlight that the functional benefit of migration manifested in providing immediate safety and a sense of future for children does not alleviate the moral dilemma of exposing them to potentially fatal risks. A closer reading of the narratives revealed that the dilemma has a pronounced age- and gender-intersectional character.

Syrians' Sea Migration to Europe: I Carved out My Chest to Remove My Heart and Replace It with a Stone. That Is How I Make Decision to Take the Boat

As the Mediterranean Sea has been recognised as the deadliest migration route in the world, ongoing journeys raise questions about the risk perceptions held by refugees and other migrants who took the journey or planned to do so. Based on narrative interviews with Syrians settled in Sweden, this study delves into their post-factum reflections on the migration decision-making process. It examines how private risk perception, stemming from participants' experiences in the world, interfered with expert risk assessment based on universal calculative methods. Although the latter logic might not support the decision that the participants made, their choice had their own rationality—it was deemed reasonable given the circumstances.

However, the decision deemed reasonable was not sufficient to alleviate anxiety in the face of risks with potentially deadly outcomes. Therefore, the participants drew on both material and non-material strategies to comprehend and manage risk. In particular, this study demonstrates the interplay between mundane and spiritual risk management strategies. It showed that spirituality was neither a last resort on which migrants unquestionably relied, nor a blinding force that hindered their rational reflection techniques. Rather, spirituality is embedded in rational cognitive practices. The latter form a basis for migration decisions, while spirituality has an auxiliary function

Racism in the Structure of Migration: A Case Study of Vietnamese Temporary Migrant Workers' Migration to Japan and Taiwan

Based on the data of semi-structured interviews with 156 Vietnamese people with labor migration experience in Japan as technical intern trainees under the Technical Intern Training Program (TITP) and Taiwan as domestic workers and factory workers conducted between 2014 and 2019, this study will identify the presence of racism in the structure of migration from Vietnam to Japan and Taiwan. Previous studies on racism have often discussed discrimination against visible minorities from the perspective of Western societies, such as discrimination based on skin color. However, in the current migration trajectories between Vietnam and Japan and between Vietnam and Taiwan, temporary migrant workers from rural Vietnam are deprived of fundamental human rights such as the right to family ties and freedom

of workplace mobility due to their nationality, ethnic origin, and residency status, and are placed in exploitative labor markets in the host societies. The structure of migration itself is racialized, categorizing populations with specific nationalities, ethnic origins, and residency statuses as those who can be deprived of their fundamental human rights. In particular, in the case of Japan, since the purpose of the TITP is to transfer skills to developing countries, a narrative is being developed that Japan benefits from "skill transfer" with people from "developing countries" and that the technical intern trainees are inferior to Japanese citizens. This narrative justifies depriving the fundamental rights of migrants and mobilizing them into low-wage sectors.

Constructions and Performances of Disabled Masculinities in Online Disability Platforms

Online spaces have opened up many possibilities for people with disabilities (PWD) to interact with the social world designed for the able-bodied as well as create their own virtual communities. The lack of visual cues in virtual environments eliminates prejudices and stigma attached to impairments, enabling PWDs to be free from judgment based on their disabilities. On the other hand, there is a growing literature on how PWD experience digital inequality and inaccessibility as digital media builds on assumptions about embodiment and personhood (e.g. Dobransky and Hargittai 2016, Ginsburg 2017). However, there has been much less scholarly attention to how PWD interact in online spaces in gendered ways (e.g. Forman et al. 2012) and how gender stereotypes inform the ways in which bodies are drawn on in cyberculture (Springer 1993). Within this literature, there is even more limited focus on how masculinities and disabilities intersect in online identity construction and interaction.

This paper deals with how disabled masculinities are constructed and performed in online spaces, focusing on one of the largest online disability portals in Turkey, *Engelliler.biz* (The disabled.us), with over 120 thousand topics and 1.3 million messages. Based on content analysis of the selected forum messages on *Engelliler.biz* and semi-structured in-depth interviews with disabled users of the portal, this paper explores how disabled masculinities are negotiated online, addressing questions of (i) different forms of masculine identities and performances emerging in interactions and (ii) intersecting aspects crucial in the emergence of these masculinities (e.g. war disability creating a distinctive masculine identity). The paper thus explores the interaction between the gendered impaired body and technology to better understand the implications for online identity management.

Lonely By Comparison: Individual, Network, and Regional Occupational Status and Loneliness across 30 Countries

While social connectedness often alleviates feelings of isolation, certain social ties may exacerbate loneliness. Drawing on theories of social cost and relative deprivation, this study examined whether the occupational status accessible through social networks at the individual and regional levels was associated with loneliness and how these associations were moderated by individuals' own occupational status. Multilevel analysis, applied to data from the 2017 International Social Survey Programme across 30 countries, yielded three main findings. First, four dimensions of network occupational status derived from a position generator—a greater variety, higher level, broader range, and higher cumulative status—were all associated with increased loneliness. Second, these associations were particularly pronounced among individuals with low occupational status. Third, living in regions with higher average network occupational status was associated with greater feelings of loneliness, independent of individual and network occupational status. In short, high-status social ties and contexts can contribute to feelings of loneliness, especially among low-status individuals. These findings highlight the need for tailored interventions that consider the complex interplay between individual status, network status, and social context in addressing loneliness.

Reciprocal Relationship between Oral Health and Social Engagement Among Older Adults: A Gendered Story

Studies have documented an association between oral health and social engagement. However, the causal direction of the association remains unclear. Furthermore, potential gender differences in the association have been underexplored. This study examined the reciprocal relationship between oral health and social engagement in older adults, focusing on gender variation. Data were drawn from 5,735 older adults, aged 55 or above, in the 2018, 2020, and 2022 waves of the Korean Longitudinal Study of Aging. Oral health was assessed using the 12-item Geriatric Oral Health Assessment Index. Social engagement was measured by the frequency of participation in various social activities. A random-intercept cross-lagged panel model was employed. The findings identified a reciprocal relationship between oral health and social engagement, with notable gender differences. Among older men, better oral health predicted more frequent social engagement, but social engagement did not impact oral health. Conversely, among older women, more frequent social engagement predicted better oral health, while oral health did not influence social engagement. These findings contribute to our understanding of gender disparities in the social causation and health selection processes. Interventions should implement gender-specific strategies to promote oral health and social engagement in later life.

Women Who Fleed Ukraine: Gendered Educational and Occupational Paths in Finland

This paper presents spoken biographical narratives of three highly educated Ukrainian women on flee in Finland. Currently they all are the only guardians physically present in their children's daily life, and they carry the main responsibility for earning living for the family. The aim is to find out what kind of gendered aspects there are to be observed in their narrated educational and occupational paths after migration.

The interview data come from the interdisciplinary project Language, engagement and belonging: Ukrainians accessing and transforming rural school and work communities (University of Jyväskylä, Finland, 2023-2027). The study is implemented in a nexus analytical framework (Scollon & Scollon 2003) which sees any social action as located in the intersection of individual life histories, situated interaction patterns and surrounding discourses. The social action initially focused on here is the Finnish language learning taking place in both formal education and informal social networks.

In migration contexts second language learning can be seen as an investment in new social capital (Bourdieu 1991; Darwin & Norton 2015) promoting the individual integration process and employment opportunities in the new living environment. Also the participants of this study seemed to expect such conscious investment to pave the way for a desired type of working life either directly or through vocational education. The findings show, however, that the dominant public discourse on lack of workforce in health sector is quite strongly guiding the decision-making, and the resulting, overtly gendered choices are enhanced by the tailored provision of study programmes in this particular field.

Defining the Nation in a Time of Increasing Migration: The Case of Latvia

As the number of immigrants continues to increase and the country becomes more ethnically diverse, the question of how the country's residents perceive what a nation is becomes relevant. Is the nation conceived of as having an ethnic core or as uniting different ethnic groups on a more or less equal basis? It is a question of the symbolic meaning and collective emotions of different ethnic groups. It is also a question of whose identity is highlighted

to form a national identity. It is also a matter of communication, because in order to build a collective identity, there must be a common language to create a common information space for all citizens.

In the paper, this issue is addressed on the example of Latvia, where the titular nation makes up only 63% of the population, and the strengthening of the role of the national language is still an urgent issue. The basis of the analysis is representative survey data of the entire population of Latvia, where the answers to the questions of surveys conducted in 2010 and 2024 are compared. At the centre of the analysis is the question of which groups make up the Latvian people.

The analysis shows that ethnic Latvians are more in favour of drawing boundaries regarding which population groups should be considered as belonging to the Latvian nation, compared to Russians and representatives of other ethnic groups living in Latvia. However, it should be emphasized that not only ethnicity, but also citizenship, a sense of belonging to the country and Latvian language skills are among the most important principles of national belonging from the point of view of Latvians.

Future Design: A Pathway to Deep-Time Ethics?

The Anthropocene can be viewed as a stimulus for rethinking the assumptions about ethics underpinning dominant models of the future. A "shallow-time" ethics, whose temporal framing extends at most to the length of human lifespans, helps justify sociopolitical systems rooted in extractivism, logics of infinite economic growth and objectification of the more-than-human. What might a "deep-time" ethics look like—one that offers alternative points of departure in imagining possible and desirable futures? This paper explores this question through the concept of future design, which aims to create temporal bridges between those alive in the present and those not yet born. Through role-play and deliberation, future design aims to cultivate empathy towards future imaginary persons and seeks to identify actions in the present that can help reconcile the needs of the present and the future. Reflecting on fieldwork implementing future design in school settings in Japan, the paper discusses the potential of future design for both intellectual and affective re-orientation towards an ethic of deep time, highlighting both the potential of this approach in facing the 'crisis of the future' and its limitations.

Is Human Knowledge Coming to Its End with the Development of Artificial Intelligence?

Human knowledge about the world represents the total accumulation of cognition about the reality reached by man throughout his existence by using different forms of cognition. It is a sum of what man has realized through the history of humanity and what he has learnt during his life in any of the stated manners.

Scientific cognition is characterized primarily by a responsible application of the scientific method, while its aim is acquiring a truthful finding about the world. However, science does contain permanently given facts, but is also based on the principle of merciless criticism of the existing knowledge; the result is not only the development of the existing knowledge, but also its negation.

With the development of AI, several questions arise, two of which are crucial: what happens to scientific heritage which has not been digitized and, not included in the processing procedure of AI, and, if knowledge is delivered to us as a final product of AI, how will some new generations be able to think about it critically? To think critically about scientific findings, it is necessary to possess a certain (and sufficient) level of (scientific) knowledge in general. If with such knowledge the need ceases for man to possess it, how can the man's need for its critical reexamination be expected to continue? In addition, the "delivery of knowledge" does not only question scientific findings as a form of human findings, but also the need for knowledge itself.

Therefore, the question arises whether the outcome of the development of AI be the disappearance of human knowledge about the world and the emergence of an exclusively mechanical interpretation of reality, which would be the bleak future of humanity, or whether AI will still result in further human emancipation and dealienation.

Turkey's Blue Growth in Capitalist Ruins: A Case of Sea Snail Production

This study explores a question how Turkey's blue growth strategy is (un)sustainable by a critical examination of the seasnail trade between Turkey and Japan. Blue growth has been promoted over the last decade by international organisations and nations as an environmentally, economically and socially sustainable development strategy in the marine sectors. While the strategy aims for the reconciliation of economic growth and food security with the conservation of aquatic resources, its inherent contradictions and injustice are pointed out by some critics. This critical study is based on the document analysis of Turkey's seafood production in the last 15 years and the fieldworks, including interviews with the actors of sea snail production, conducted in two countries in the 2010s. The Black Sea seasnail, which was once one of problematic invasive species, suddenly became a food commodity in the late 1990s when two countries' capitalist appetites fed each other: environmentally degrading and economically declining Japan's search for cheap seafoods in the South and economically ambitious Turkey's aggressive export-oriented seafood production. Our research shows that the sea snail is commodified in what Tsing (2015) calls "capitalist ruins": the multiple impoverishments of marine resource in Japanese seas, of Japanese middle class and of the rural households in Black Sea Turkey. Different struggles for survival in the ruins made unexpected local-global connections. The sea snail production is sustainable as long as two cheap resources, nature and women's labour, are supplied. This study argues that Turkey's blue growth is opportunistic, exploitative and volatile. Hence its sustainability is questionable despite its contribution to struggling national economy.

Sociology of Innovation in the Context of Post-Socialist Societies: The Case of Croatia

Sociology of Innovation in the Context of Post-Socialist Societies: The Case of Croatia

Jadranka Švarc, Marina Dabić and Jasminka Lažnjak

This research is motivated by the increasing recognition that innovation policy, as a form of state intervention to promote technological development, is undergoing a normative shift—from driving economic growth to addressing societal challenges and promoting socio-economic sustainability. This discourse creates significant opportunities for sociology of innovation to actively contribute to the socio-technical transformation of society driven by the current technologically and socially disruptive innovations.

However, in post-socialist countries of Central and Eastern Europe, such as Croatia, the principles and methods of innovation policy were not well understood by political elites due to various socio-cultural factors. Sociology in post-transition has been keeping its marginal role in creating analytical concepts that might have influenced any hegemonic discourse, especially in the field of technology and innovation studies. In the attempt to set the ground that alters the current position of the discipline we are proposing the answers on three main research questions:

- What is the intellectual base and the theoretical and conceptual roots of sociology of innovation?
- What is the research subject and tasks of sociology of innovation within the socio-technical transition?
- How the post-transitional sociocultural context influenced Croatian sociology and vice versa?

This research is divided into three parts. The first part discussed the position of sociology in Croatia. The second part delineates how innovation has evolved into one of the key determinants of society and the third part explores the theoretical foundations of the sociology of innovation and its historical embeddedness in neighbouring disciplines, up to the current theories of socio-technical transformation. The remaining sections highlight future perspectives of the sociology of innovation, attempting to establish analytical distinctiveness of its research subject.

SWARTZ, SHARLENE* (University of Cape Town, South Africa)

Young People Changing the World: The Theory and the Practice

Erik Olin Wright, well known for his theorising on the kinds of world we want and need, spoke at length about how to bring about change. He described four kinds of transformation: anarchic change which occurs when people choose to *exit* an existing system; *ruptural* or revolutionary change through protest or seizing power; interstitial change that happens in the small and large gaps and spaces visible to the observant as soft alternatives to existing policy, and has the effect of *eroding* society's harms for some; and symbiotic or negotiated change, in which change for the powerless depends on *taming* existing systems, usually through legislative change. Drawing on a 5-year longitudinal study of university graduates across 6 African countries (n=520), this paper demonstrates how young people choose knowledge practices based on what is possible within their worlds rather than what they want to change. It further argues that young people need to be offered knowledge-based skills in order to bring about higher level 'episthepraxis'. Drawing inspiration from leadership theory (Desmond Tutu, Paolo Freire, Carolyn Shields and Julius Nyerere) it proposes a series of knowledge practices that attempt to change power structures and dynamics in society such that people's access to livelihoods, dignity, rights and wellbeing are systemically ensured, rather than a focus on individual or institutional change.

SWIACZNY, FRANK* (German Federal Institute for Population Research (BiB), Germany)

The Production and Use of Population Projections: Assumptions – Uncertainties – Communication – Policy Making

Population projections are among the most controversial population data. The assumptions on fertility, mortality and migration required for population projections and the ambiguity about their future development are a major source of uncertainty. Even relatively small deviations in the assumptions from actual developments can lead to considerable uncertainty margins over medium to long projection periods. Nevertheless, population projections are often much more accurate than other forecasts in the economic and social sciences because part of the future population development is already inherent in the age structure of a population (demographic momentum). Thus, population projections are often interpreted as unavoidable predictions and used as forecasts they are often the basis for far-reaching planning and policy decisions. By making assumptions, they are prone to the risk of generating results that can negatively impact planning or policy decisions. In order to avoid such misuse, the uncertainty in the selection of assumptions and the subsequent uncertainty ranges of the results should be communicated transparently and the limits of forecasts should be made clear (they are 'if then statements'). Scenarios with different assumptions that show possible influences and limits of planning or policy decisions on population development are suitable for this purpose; alternatively, more recently probabilistic methods are more widely used for this purpose. The presentation addresses these challenges using UN population projections for the world population (WPP), BiB/BBSR projection scenarios for regional population development in Germany and small-scale projections for Dutch municipalities from PBL/CBS.

SYLLA, SERIGNE* (Université Gaston Berger, Senegal)

Télévision Et Société Au Sénégal : Du Théâtre Populaire Filmé Aux Séries Télévisées Locales

Cette communication analyse les relations entre la télévision et le théâtre au Sénégal. On part du contexte de l'évolution du théâtre populaire filmé et de la dynamique du champ télévisuel sénégalais. Cet art majeur que constitue le théâtre populaire filmé a été promu aux années 1970 au Sénégal pour accompagner le programme d'endogénéisation de la télévision. Cependant, au début des années 2000, avec la naissance et le développement des télévisions privées commerciales, un nouveau produit fait surface : ce sont les séries télévisées locales. Ces dernières, plus sensationnelles et émotionnelles, et en attirant plus de commerciaux, ont occasionné le déclin du théâtre populaire filmé.

Sur fond de polémiques d'ordre culturel et moral, on assiste sur les chaînes de télévision publique et privée sénégalaises à un changement radical en ce qui concerne la production et la diffusion de programmes locaux. Les séries télévisées sont en train de se substituer au théâtre populaire filmé. Cela semble poser problème. Quand on parle de théâtre filmé, de quoi s'agit-il exactement ? Quand on parle de séries télévisées, de quoi s'agit-il ? Pourquoi cette politique

de substitution au profit des séries télévisées pose-t-elle problème ? Quels sont les soubassements de cette politique de substitution ? Notre hypothèse de travail est que le problème que cette substitution pose résulte du fait qu'un art mineur est en train de prendre la place d'un art majeur.

Ainsi, on ne pourra faire ressortir les enjeux du problème qu'en interrogeant les contenus et les fonctions du théâtre populaire filmé en les comparant à ceux des séries télévisées. On aurait là deux registres différents dont l'interchangeabilité pose un sérieux problème de société.

SYNNES, KATRINE MAYORA* (University of Agder, Norway)

Ethnic Diversity in Care Institutions

Workplace diversity is often promoted as a key value and as a driver for innovation. However, the discourse of workplace diversity is often vague and ambiguous and lacks contextual meaning and relevance. This ambiguity persists in a political context that simultaneously values diversity and promotes assimilation as an ideal.

Paid employment is positioned as both a goal and a tool within integration policies. To understand how these policies translate into practice, this study employs Institutional Ethnography to explore how ethnic diversity is managed and experienced by migrant-background employees.

This study adopts a non-essentialist view of ethnicity, recognizing ethnic boundaries as fluid, contested, and constantly evolving (Barth, 1969). Unlike conventional workplace diversity research, which typically focuses on productivity outcomes, this study investigates the unique value and challenges of ethnic diversity in care work, where interpersonal relations are vital. It focuses on child welfare institutions, nursing homes, and kindergartens—settings with significant migrant representation that provide fertile ground for examining how diversity is constructed and influences institutional practices.

Through 29 semi-structured interviews with ethnic minority-background employees (12), union representatives (11), and managers (6), this research explores how workers' experiences are structured by broader institutional relations and power dynamics. A central question to be answered is how ethnicity is made relevant in their everyday work, and how it may represent a capital for the employees and for the workplace in general. I also explore the burden and extra challenges their minority position may represent, and mechanism for inclusion and exclusion.

Preliminary findings reveal that while diversity is formally promoted, institutional practices may reinforce existing boundaries and exclusions. This research aims to map these practices, providing a more nuanced understanding of how workplace diversity is enacted and experienced, and offering insights into the complexities and contradictions of diversity in care work.

SZABO, ADRIANA M.* (Arizona State University (HAIC), China)

Investor-State Dispute Settlement: Arbitration Threat As the Backdoor for Neo-Colonial Exploitation of Natural Resources

Extant research on unequal ecological exchange generally, although not exclusively, focuses on the North-South political relationships, using the history of colonialism as a lens through which to explicate contemporary environmental inequality and injustice. However, as the locus of power has shifted from imperialist nations to transnational corporations, contemporary analyses of unequal ecological exchange need to consider the new global economic hierarchies and discuss the role of international trade instruments in not only furthering exploitative ecological exchanges, but also hindering community efforts towards environmental justice, with the cooperation of local and national-level government actors. To address this need, I analyze the case of Roșia Montană Romania, the site of almost two decades of contestation that succeeded in stopping the opening of a polluting gold mining project. The case of Roșia Montană was the object of an arbitration in front of the World Bank, filed by Canadian Corporation Gabriel Resources, that was eventually won by the Romanian state. Data come from a years-long study, drawing from in-depth interviews (n=45), and the analysis of arbitration and governmental documents. The results highlight the role of international treaties in furthering unequal ecological exchanges, namely the role of Investor-State Dispute Settlement (ISDS) system, used by transnational corporations in pressuring local communities in developing countries to choose between poverty and pollution. This study also explains how third-party funding (TPF) is instrumentalized in ISDS by financial speculators, and how such instruments are used to expand the power of transnational corporations, at the expense of the taxpayers in developing countries, continuing the colonial legacy of exploitation of nature, rural communities, and indigenous lands. Finally, I discuss the role of state recreancy in furthering unequal ecological exchange.

FERREIRA, BRUNO (Arizona State University, China)

The Research-Fatigued Community: A Case for Participatory Action-Research?

The intensification of environmental crises, heightened by the threat of climate change, brought communities championing environmental justice to the center of much attention from academia, mainstream media, and civic organizations. Whereas communities usually welcome initiatives that raise awareness for a cause, many are starting to display symptoms of research fatigue. Existing research generally focuses on the causes and consequences of research fatigue in communities in their post-disaster phase (whether caused by natural or technological disasters), as community members often see little benefit in continuing to participate in research efforts. Less is known about situations where research fatigue builds up in anticipation of potential technological disasters and where the communities have successfully forestalled polluting industries from settling in their communities. To address this gap, we examined the case of Roşia Montană in Romania, where the community shut down a proposed gold mining project over concerns about the potential risk to human and environmental health resulting from the use of cyanide in gold extraction. We draw on data from a longitudinal study employing in-depth interviews (n=45), participant observation, document analysis (n=215 news articles), and journaling (e.g., entries reflecting on the excessive number of soft and hard "nos" to our interview requests, even when rapport was built). We have identified three potential reasons that may explain research fatigue in Roşia Montana, which notoriously succeeded in averting environmental contamination: hypervisibility and media attention; misquoting and online vilification; and finally, a desire to move on and focus their efforts on community build-up now that the crisis is over. Our results suggest that continued community participation in research may be contingent on their perceived ability to influence (new) research agendas and secure funds for projects that meet tangible community needs. We conclude by proposing participatory action research as a change of framework in community research.

SZALMA, IVETT* (HUN-REN Centre for Social Sciences, Hungary)

Exploring Attitudes Towards Medically Assisted Reproduction in Hungary's Pronatalist Context

Hungary is a country where politics strongly encourages childbirth through various selective pronatalist family policies, primarily targeting middle-class heteronormative families (Szalma - Sipos 2024). In this context, childbearing is perceived as an expectation, and attitudes towards voluntary childlessness are generally less favourable compared to Western and Northern European countries. To align with these pronatalist goals, the state provides substantial support for couples facing infertility and for single heterosexual women seeking assisted reproductive procedures (Szalma - Sipos 2024). Some right-wing politicians view medically assisted reproduction (MAR) as an effective strategy to promote population growth, reduce immigration, and facilitate the reproduction of "ethnically pure" nations (Korolczuk 2021). For instance, the state covers 100% of the costs for five cycles of MAR, including medications. This study aims to assess how various sociodemographic variables influence attitudes towards MAR in Hungary. Specifically, I will examine whether individuals concerned about population decline and possessing strong national sentiments view medically assisted reproduction more favourably than those who are less concerned and more accepting of voluntary childlessness. Additionally, I will investigate the level of support among different socio-demographic groups for granting access to MAR for single women and lesbian couples. To address these questions, we will rely on a nationwide representative hybrid survey conducted in Hungary in March 2024, with a sample size of 1,500.

Personal Life Course Motivations for Young People's Involvement in Public Life in Hungary

The present research aims to contribute to the findings of the large sample of Hungarian youth studies and to the knowledge about young people. It does this by using qualitative methods to explore the life paths of young people, their motivation for public and political activism, their understanding of democracy, the emergence of traditional and unorthodox forms of activism in their case, and their understanding of the spaces of political publicity within an otherwise less active young age group. Among other things, the research seeks answers to the question of what young people think about public life and political activism, how they define these concepts, and how they define themselves, how they view themselves. In relation to Grasso's (2017) theory, we explore the political context in the early stages of young people's lives, current trends in politics as they are reflected in young people, for example, are there typical public events from their childhood that they remember, consider meaningful, or perhaps participated in? The theoretical framework of the research is provided by theories of civil society, especially its minimalist conception and Fraser's (1990) reflections on the public sphere as changed by the mass media. In addition, theories on activism, international trends in activism, and the transformation of activism, with a particular focus on changes in the political activism of youth, are also discussed. The research methodology is based on the use of essentially qualitative techniques. The research topic and research questions justify the need for softer data, deeper information helps to understand the underlying content and patterns of political activism. The expected results of the research include a deeper understanding of politically active youth, their motivations for activism, the impact of the current political context, and their self-definition related to their activism.

How to Manage Movement Resources? Lessons from the Argentinian Women's Movement

Since the emergence of the Ni Una Menos collective in 2015, the Argentinian women's movement gained recognition. The society voiced its concerns about women's rights, such as femicide, sexual education, reproductive, economic rights and more, during mass protests all over the country. Importantly, the Argentinian women's movement is an example of a successful social movement, as it led to the legalization of abortion in 2020. Moreover, the inclusivity of the movement could be observed, for example, in its incorporation of an intersectional approach to gender discrimination and a horizontal organizational structure. In turn, the situation regarding women's rights in Poland is different, the 2020 Constitutional Tribunal's ruling led to an almost total ban on abortion and despite social unrest, the situation has not changed thus far.

In the present paper, I propose an analysis of factors contributing to the Argentinian women's movement's success by referring to resource mobilization theory. I then contrast these results with an analysis of the way movement resources are mobilized within the Polish women's movement. Specifically, the research question formed in this project was how women's organizations mobilized different types of resources (moral, cultural, socio-organizational, human, and material) to support the women's movement. Moreover, I also focused on the way specific resources were mobilized (self-production, aggregation, co-optation/appropriation, and patronage), also considering the type of organization in question (autonomous, associative, and directed). To answer these questions, I draw on results from ethnographic research conducted between 2015 and 2024 – ethnographic observations, semi-structured interviews with leaders of 9 Argentinian and 3 Polish women's organizations, interviews with local informants, and an analysis of manifestos and statistical data about the situation of women in Argentina and Poland. By emphasising the role of women's organizations, the present findings offer a new perspective on the process of achieving social movements' goals.

SZENAJCH, PIOTR* (University of Lodz, Institute of Sociology, Poland)

Afro-Poles. Plurisocialization, Identity Building, Culture in the Making

For more than a decade now, a generation of Poles born into families of African immigrants from the communist and early transformation era has been entering adulthood. They grew up in Poland and were educated in Polish schools, Polish is their first language and they are saturated with Polish culture. Despite this, their countrymen on the street regularly address them in English, compliment them on their use of Polish, and at times vulgarly send them back 'to where they came from'. In a seemingly mono-ethnic and mono-cultural country until recently, the appearance of Afro-Poles remains a stigma of otherness and foreignness, carried with them constantly.

However, contemporary Poles of African descent – as reported in the press and as my first interviews show – not only consider themselves Polish but want to change Polish culture and society, based on their and their families' difficult experiences.

They have started NGO's, organized large-scale media actions, intercultural workshops and street protests, as well as addressed petitions. They have written memoirs, novels and essays about their condition. In recent years, at least five theatre plays, several books, a major contemporary art exhibition and a research group at an important art institution were devoted to the Black experience.

Within the scope of the study, I am trying to address issues of race and racism in the Polish context through a multi-layered description of the experience of being a Pole of African descent, including aspects such as social and cultural mobility, activism and cultural production.

The study is based on auto-biographical narrative interviews, complemented by a photographic interview.

The paper will be a mid-fieldwork work-in-progress presentation on the most recent findings.

SZEWCZYK, MICHAŁ* (Faculty of Sociology, University of Warsaw, Poland)

New Dimensions of Emotional Work: A Case Study of the Smile Counter

This presentation examines the "Smile Counter," a device developed by the Polish company Quantum to measure employee smiles for enhancing customer service. Positioned within the frameworks of emotional labor and digital Taylorism, the Smile Counter exemplifies how technology can influence workplace dynamics by promoting specific emotional expressions among employees. Functioning as an "affect detection system," it tracks facial expressions to incentivize smiling, thereby fostering a more positive atmosphere for customers.

Through an analysis of various online sources, this study critiques the techno-optimistic beliefs of the device's creators, who assert its potential to improve workplace morale, productivity, and overall employee satisfaction. However, these perspectives face significant public skepticism regarding emotional surveillance and its ethical implications. The expressed critique focuses on the risk that such technologies play a role in commodifying genuine emotions and undermining personal dignity in professional environments.

In this presentation, I explore the tension between embracing technological advancements and critiquing their impact on worker autonomy and psychological well-being. By analyzing the marketing narratives surrounding the Smile Counter and the broader discourse on artificial intelligence in management, I emphasize the necessity for critical ethical reflection on the deployment of such technologies in the workplace.

Ultimately, this discussion aims to illuminate how digital tools can fundamentally reshape emotional labor and influence employee experiences in contemporary organizational contexts. The original article, providing an in-depth analysis of these themes, is accepted for publication in *Miscellanea Anthropologica et Sociologica*. By engaging with these critical issues, I seek to foster a nuanced understanding of the intersection between technology, emotions, and labor in the modern workplace.

TABOADA GOMEZ, VICTORIA* (Georg-August-Universität Göttingen, Germany)

Exploring Leadership and Territory through Indigenous Women's Biographies in the Paraguayan Chaco

By analyzing Indigenous women's biographical reconstructions and intertwining their collective and family histories, we can explain current power imbalances in the Chaco due to long-lasting colonization processes. Here, environmental change is understood as a social process experienced through unequal power relations, where the concepts of territory and leadership gain relevance when focusing on Indigenous women's histories.

When exploring territory through Indigenous women's life histories, we see that its relevance and how it is presented depend on their position within current power imbalances. Analyzing their family experiences provides insight into how territory is shaped across generations and within power struggles between groupings. Additionally, collective memory opens possibilities for assessing territory through rules for interpreting the past. Analyzing how these are contested or supported (often in conflicting, ambivalent ways) enables us to explain current power struggles for narrating the past and how they shape the notion of territory.

Likewise, the concept of leadership depends on how we trace it empirically and understand it as emerging within the relationship between individual and social/historical processes. In this sense, leadership might look like confrontation against settlers or organizing a group towards political claims, but it might also develop around ambivalent relationships with dominant and vulnerable groupings.

Hence, in this presentation I explore how both concepts benefit from an empirical reconstruction and centering Indigenous women's experiences in the analysis. Intertwining the collective past with present circumstances and recognizing dominant discourses prevent us from falling into stereotypical assumptions.

TABOADA GOMEZ, VICTORIA* (Georg-August-Universität Göttingen, Germany)

Unpacking Power Dynamics in the Paraguayan Chaco through Indigenous Women's Biographies: An Historically Informed Sociological Analysis

In this presentation, I discuss how I can explain current power dynamics in the Paraguayan Chaco by focusing on Indigenous women's often marginalized life histories and engaging their collective and family histories. My analysis is based on two Indigenous women's biographical reconstructions, which allows us to open up explanations beyond dominant discourses and static assumptions about the past. By adopting a historical and processual sociological approach, I assert that we can understand the complexities of colonial dynamics in the Chaco, starting with how Indigenous women experience, transform, and narrate them.

The two biographers currently live in Indigenous communities, where their families have established themselves over generations within the dynamics of colonization that started in the late 1800s, brought about by industrial work regimes, war, religious campaigns, and the transformation of their territory from forest to production fields. Each generation experienced these processes differently, transmitting them through their different strategies to survive, adapt, and reposition their perspectives, while transforming and contesting them.

Consequently, the biographers' dialectical relationship with their collective and family past enables them to interpret a fragmented territory, the loss of native languages and/or cultural practices, and stories of collective violence. The biographers have internalized (and transformed) rules for preserving oral memory and frameworks of orientation which help them to (re)interpret their collective history and its dethematized topics, navigate ambivalences between tradition and colonization, and develop strategies for overcoming relations of domination. These processes reflect the power dynamics that shape the social structure of today's Chaco.

Ano Pong Ulam Ninyo?: Makikikain and Salo-Salo As Methods in Food Ethnography

The COVID-19 pandemic posed unprecedented challenges to ethnographic research, particularly in the realm of fieldwork and data collection. The "Great Lockdown" brought forth restrictions that hindered conventional methodologies reliant on in-person interactions and direct observations. This paper addresses the methodological shifts necessitated by these constraints, presenting an autoethnographic account of conducting food ethnography within the boundaries of my home and its immediate surroundings. I enlarge my experiences of making sense out of 'small data' and restricted fieldsite, in an attempt to navigate possible methodological approaches. Drawing from my earlier work on the changing taste of *Sinaing na Tulingan*: I engaged in informal interactions asking "*ano pong ulam n'yo?*" (what's for lunch/dinner?) with our neighbors; I also navigated my positionality as *nakikikain* (eating as an outsider) in attempting to make sense of the emerging patterns in the foodways and food preparations during the pandemic. Reflecting on this extraordinary situation, it demonstrates several methodological approaches centered on local knowledges and practices. It includes *makikikain* (to join a meal) and *nakikikain* (eating as an outsider), *pakikisalo* and *salo-salo* (eating together) as tools to look at the community dynamics, food practices and preferences, and eating patterns. Additionally, *salo-salo* (communal eating) could be a useful set-up for group discussion. These approaches not only provide meaningful data collection strategies but also align with efforts to decolonize food ethnography by centering local forms of social engagement.

On Decolonial Debates in the Arab World: Reflections on One Year of Teaching in the Global South

While the Arab university holds potential as a transformative site for decolonization, it also encounters unique difficulties and challenges in realizing this potential. These challenges highlight the need for a critical examination of how decolonial practices can be meaningfully integrated into the university setting, ensuring that efforts to decolonize do not merely replicate existing power dynamics but genuinely reflect the voices and experiences of those who have been marginalized. In this presentation, I reflect on a year of teaching in the Global South, at the Doha Institute for Graduate Studies based in Qatar, having received my education and engaged in decoloniality debates in the Global North. I reflect on various observations and draw connections between different scenes and settings to explore how decoloniality is understood, challenged, and engaged with in this part of the Global South.

The discussions on decoloniality at different events and interactions highlight a curiosity and familiarity with the nuances of global decolonial debates, but they also reveal multilayered tensions, a sense of caution, and some hurdles with consistent and equitable engagement. These multifaceted discussions reflect an awareness of various decolonization debates coupled with skepticism about decoloniality in the Arab world suggesting that decoloniality is feared by some to serve as intellectual gymnastics that assert contemporary Western superiority without offering substantial benefits to the Global South. It also points at the potential negative consequences of engaging with a version of decoloniality that ignores regional histories and geopolitics which can lead to misinterpretation and misuse of decolonial tenets. These concerns must be taken seriously, and a project of decoloniality in the region must develop methods and pathways that do not fall into such reproductions of hegemonic power.

Understanding Gendered Islamophobia and Housing Insecurity Among Muslim Refugee Women in Canada - a Community-Based Project with Nisa Homes

Intersectional statuses and experiences, such as culture, class, immigration status, and language, complicate the experiences of Muslim women in both disclosing gender-based violence and navigating resettlement. Furthermore, stereotypes, racism, and Islamophobia from both fellow residents and service providers continue to form additional barriers to Muslim women trying to access mainstream shelters.

Nisa Homes is the first and largest network of transitional shelters for Muslim women and children in Canada, with the majority of its residents being racialized newcomers, refugees, asylum seekers, and undocumented individuals. Building on a SSHRC Partnership Engage Grant (PEG), our team—comprising researchers, policy analysts, and service providers—will present early learnings and recommendations from an ongoing research partnership aimed at documenting and evaluating Nisa Homes' culturally responsive shelter model for Muslim women who are experiencing intimate partner violence (IPV), housing precarity and often legal status precarity.

The presentation will highlight the intersectional pathways to homelessness for migrant, refugee, and undocumented Muslim women in Canada, tying it to the compounding impact of precarious immigration status, racialization, and religious identity on those women's increased risk of violence, housing insecurity, and culturally responsive settlement. We will conclude by sharing best practices and strategies for scaling such models nationwide, laying the groundwork for addressing systemic gaps in services for gendered and racialized refugees facing homelessness in Canada.

Police Officers Responses to Young Peoples Experiences of Cyberstalking

Young people in particular utilise digital spaces to create new connections and even initiate, sustain, and carry out part of their intimate relationships online (Lykens et al., 2019; Van Ouytsel et al., 2018). However, in our digitally interconnected world, cyberstalking has emerged as a significant concern which impacts approximately 20 to 40 percent of online users worldwide (Reyns et al., 2012; Spitzberg & Hoobler, 2002; Tokunaga & Aune, 2017).

Prior research highlights technology has also provided opportunities to facilitate online monitoring of others (Verduyn et al., 2017) due to the proficiency and ease at which information can be obtained (Sheridan & Grant, 2007). Consequently, the rise of digital technologies has given perpetrators new avenues and opportunities to target victims (Brady et al., 2023; Van Ouytsel et al., 2018) resulting in a rise of cyberstalking (Fansher & Randa, 2019). However, little work to date has explored young people's perceptions and experiences of cyberstalking. With research consistently revealing very few cyberstalking victims choose to report their experiences to the police (Brady et al., 2023; Fissel 2021; Reyn and Englebrecht 2010), there is a notable research gap regarding young people's reasons not to report cyberstalking incidents.

This study provides critical insights into how young women experience both stalking and cyberstalking, their experiences and barriers to reporting cyberstalking to the police and other agencies. Preliminary findings reveal despite the severe impact, many young women often encounter dismissive attitudes or lack of understanding from police, contributing to underreporting to the police. Additionally, the paper will also explore how police officers perceive and respond to cyberstalking cases. The research aims to contribute to the improvement of victim's support, inform police forces and refine practice within the cyberstalking sector.

RC13-203.3

TAHIRI, YASSINE* (sociology, Morocco)

Well-Being in Morocco

People do not strongly use the term well-being in the Moroccan Darija (informal language). It is a word that is used exclusively in institutional and academic contexts; the majority of people here in Morocco are not well aware of what well-being means as they are when we talk of concepts such as happiness, self-realization and social justice. This may be due to people's preoccupation with day-to-day needs. This is made clear through the daily activities that are achieved by the majority of people depending on traditional tools which make their income low and limited.

My long conversation with these interviewees about what well-being means to them has made us discuss other contexts that are important to them. For example, they start talking about the problems of marginalization, unemployment, social vulnerability, deprivation and instability. Thus, we are no longer looking for the meaning of well-being, but they lead me to find solutions to these problems which are mainly associated with intersectionality including employability and education, far from thinking actually of well-being. This is an important discussion that shows us that the path to well-being goes mainly through addressing all the problems associated with intersectionality (Gender problems, education, social vulnerability).

The majority of those interviewees about well-being have a middle-income job and a middle level of education; they all show their urgent desire to

achieve other goals such as having a better job, a house, a family. Besides, they all express their need to overcome all problems they are facing, and they insist on looking for stability at all levels, economic, social, and psychological. As everyone here in Morocco is looking for stability, it might not be the case if we interviewed some rich men and women who have guaranteed at least their daily higher income though we live in the same country...

TAKAHASHI, KAKO* (Meiji University, Japan)

Discovery of New Public Space in Airports: Potential of Informal Practices By the Elderly in Gentrifying, Aging Cities

The phenomenon of neoliberal urban development in Seoul, the capital city of South Korea, has manifested itself with particular intensity. A noteworthy aspect of Seoul's urban development is the disproportionate emphasis on catering to the younger generation, despite the anticipated accelerated aging of the population. As a result, the extent and variety of urban spaces accessible to the elderly have diminished significantly. This tendency has resulted in a notable shift in the character of public spaces. To illustrate, public spaces such as parks, which were previously regarded as one of the primary domains for the elderly, are increasingly subjected to stringent regulations, which further marginalizes this demographic in urban areas. Nevertheless, it is noteworthy that the elderly are themselves becoming a driving force in the discovery of new public spaces through informal practices. The most illuminating emerging location is the airport. The construction and expansion of international airports has become a prominent strategy in urban planning and development discourse. Such developments frequently entail the involvement of the private sector, thereby advancing the privatization and commercialization of facilities. In recent times, however, there has been an increase in the number of the elderly using airport spaces for recreational and social purposes. While ongoing spatial disparities have a significant impact, it is the elderly who identify and reclaim the "publicness" of airports through their everyday activities. This study aims to investigate the potential of informal practices employed by the elderly to establish and protect their spaces in urban areas undergoing a process of gentrification and an aging population.

TAKAHASHI, KOJI* (Japan Institute for Labour Policy and Training, Japan)

Changes in the Generative Process of Wage Gaps: An Analysis of Employer-Employee Matched Data in Japan

This study aims to clarify changes in the processes through which wage gaps based on individual-level variables—gender, employment type, education, and so on—are generated in the Japanese labor market. Takahashi (2016) argued that analyses of wage-gap generation must account for two key levels of wage determination: the wage level of the firm and the firm's internal wage system. In his analysis, Takahashi estimated wage-function coefficients using pooled ordinary least squares (OLS) and fixed-effects models based on employer-employee matched data, comparing the results to distinguish between these two levels. For example, his analysis showed that wage gaps by education were shaped not only by the intra-firm wage system but also by the wage level of the firm itself. Building on this approach, this study analyzes data from the "General Survey on Diversified Types of Employment," conducted by Japan's Ministry of Health, Labour, and Welfare in 2010 and 2019, to identify changes in the wage-gap generation process. The dependent variable is hourly wages, while the independent variables include gender, age, education, occupation, employment type, and tenure, with firm IDs used in the fixed-effects model. The results show that wage gaps based on education widened slightly, while wage gaps based on gender and employment type narrowed in the overall labor market during the 2010s. Furthermore, a closer examination reveals that intra-firm wage gaps based on education expanded significantly, contributing to the growing wage disparity by education in the broader labor market. These findings suggest that understanding shifts in the intra-firm wage system is essential for comprehending changes in overall labor market dynamics.

Reference: Takahashi (2016) "Two Components of Wage Gaps Induced by Individual-level Variables: Intra-firm or Inter-firm?" *International Journal of Japanese Sociology*, Volume 25, pp.117–130. (<https://doi.org/10.1111/ijjs.12040>)

Societal Governance in an Attention-Seeking Society: A Sociocybernetic Consideration of Cyberspace and the Common Good

Today, information and narratives with every kind of intention circulate in "cyberspace," the communication space on the Internet. Scholars and journalists have been discussing the impact of the expanding cyberspace. Those who are interested in social fragmentation, endangered democracy, and political polarization focus on phenomena such as "filter bubbles" (Pariser, 2011) and "echo chambers" (Sunstein, 2007).

However, some scholars have pointed out that the effects of those phenomena are overstated (Dubois & Blank, 2018; Bruns, 2019). According to a meta-analysis of recent intermedia agenda-setting studies, the traditional news media still have a relatively strong initiative in agenda-setting (Su & Xiao, 2021). A recent review states that studies show the effects of "filter bubbles" and "echo chambers" are much more nuanced than commonly thought (Arguedas et al., 2022).

Just and Latzer (2017) raised two pivotal points to discuss algorithms' selective effects on information exposure, which is the main concern of "filter bubbles": algorithmic personalization and the dominance of private companies in algorithmic reality construction. The personalization of information exposure is designed to maximize time spent on their online platforms. The circumstances tell that the initiative of journalism on public agenda-setting is surrounded by private interests. Of course, the commercialism of news media has been discussed since the early days. This prompts us to question how publicly-minded reports and conversations can survive in today's attention-seeking cyberspace.

In order to find a possible approach to mitigating the impact of commercially driven cyberspace, this paper discusses this research question from the perspective of the sociocybernetic theory of societal governance (Takahashi, 2023) and inquires into solution-oriented activities such as non-profit journalism. This study contributes to finding a sociological pathway to exploring the possibility of introducing publicly minded discourse into cyberspace and building a better mix of information sources.

Embracing AI Creativity: Digital Media Artists' Responses to Generative AI and Evolving Concepts of Creativity

The rise of generative AI as a tool to assist, enhance, and sometimes replace media artists in the content creation process has sparked profound questions about the nature of human creativity. This paper explores how digital media artists are responding to the increasing presence of AI in their creative practices, reshaping both their perceptions of creativity and the methods through which they produce content. Drawing on interviews with filmmakers, illustrators, and comic authors in the UK and Japan, this paper investigates the flexible approaches of digital media artists to generative AI and their evolving conceptions of artistic careers.

Firstly, this paper surveys emergent projects that highlight the integration of generative AI, examining how creators embrace these technologies while maintaining a firm belief in the indispensable role of the human creator as a storyteller grounded in lived experience. This paper introduces the concept of "meta-creativity" as a new skill set that contemporary artists are expected to master.

Secondly, the paper explores the mixed reactions among cultural producers and consumers regarding those who rely heavily on AI for content creation, often referred to as "AI artists." On the one hand, such creators are gaining visibility, with new terminologies emerging to valorize their process. On the other hand, AI artists are frequently stigmatised within professional communities, and there is growing consumer fatigue and dissatisfaction with their outputs—sentiments that are increasingly reflected in new platform policies and guidelines.

Finally, this paper examines how digital media artists' engagement with generative AI aligns with their advocacy efforts to influence AI regulation and promotion policies in both the UK and Japan. By analysing key policy documents, this paper addresses the expectations and concerns these artists hold regarding AI-human relationships and creativity, urging governments to safeguard and support these evolving dynamics.

(Im)Mobility and Belonging of Migrants and Local Residents in the Context of Urban Transformations

Migration and urban studies have focused on localities as multi-layered spheres in which economic, political, and cultural forces are embedded in order to capture migrant incorporation and exclusion, as well as to challenge the binary between mobility and stasis. Along these lines, this presentation explores how migrants and local residents without migration backgrounds cope with the urban transformations brought about by neoliberal restructuring and expanding border controls by taking up the case of Ikuno-ward, Osaka, Japan. It also examines how their practices interact with their (im)mobility and belongings.

Osaka is the second largest city in Japan and is undergoing urban transformations. It is a so-called "post-colonial" city, where many descendants of colonial-era migrants from the Korean Peninsula have long lived there. Specifically, Ikuno-ward is known for having the highest percentage of Korean residents in Japan. At the same time, the ethnic composition of the local population has recently changed with the influx of Chinese, Vietnamese, Nepalese, and other migrants. Moreover, the local government has been actively implementing neoliberal restructuring to address economic recession. In addition, migration control is increasingly being carried out at the local level, as in other migrant-receiving societies.

Using the data from the fieldwork at Ikuno-ward as well as approximately 60 in-depth interviews with migrants and local residents, this presentation argues that while some migrants can find opportunities for upward mobility through entrepreneurship, others have become immobile and are in precarious situations that may jeopardize their belongings, even after long-term settlement. It shows that the ways of coping with urban transformation are stratified, and that stasis is not always the basis of belonging. Based on these considerations, it discusses the complex relationships between (im) mobility and belonging.

TAKENOSHITA, HIROHISA* (Keio University, Japan)

How Does Migration Infrastructure Enable the Transfer of Human Capitals across Countries? the Roles of Place of Education and Field of Study in the Cross-Border Labor Market

Immigration researchers from the sociological perspective argue that the formation of the cross-border labor market requires the emergence of institutions and organizations that can reduce the uncertainty and information asymmetry between workers and employers (Shire 2020). As immigration control policies produce complexities in crossing the national border, both migrant workers in the sending countries and employers in the receiving countries necessitate migration intermediaries that mediate between the two actors. While the conception of a cross-border labor market underscores the importance of organizational and institutional perspectives, it overlooks the conventional argument of immigration research, such as the assimilation and integration perspectives. Research on immigrant's human capital argues that immigrants tend to have a significant disadvantage in the host society's labor market because of the limited transferability of skills acquired abroad. Meanwhile, recent studies discuss the heterogeneity in their international transferability between science, technology, and math (STEM) degrees and non-STEM degrees because STEM skills tend to be universal and less country-specific. In other words, STEM degrees can be more transferable across countries. However, these studies also lack the organizational and institutional perspectives concerning how STEM skills acquired abroad were transferred to the host society's labor market. Summarizing the discussions on the job-matching mechanisms among immigrants in the cross-border labor market and the conventional arguments about immigrants' human capital and their integration into the host society, we need to combine these two theoretical perspectives and fill the gap in our knowledge of immigrants' job-matching and their integration in the labor market in the receiving countries. We use the data derived from the panel survey targeting immigrants in specific municipalities in Tokyo, Japan. Using the quantitative longitudinal data set following the career trajectories of migrant workers in Tokyo, we investigate the roles of job-matching mechanisms for migrant workers with STEM education acquired abroad.

Changing Values Served By the Wholesale Market System: A Case Study of Japan's 2018 Wholesale Market Law Amendment

This report aims to analyze the significance and potential of Japan's wholesale market system for diverse food systems, including alternative food.

Background

Japan's modern wholesale market system was first established by the "Central Wholesale Market Act" (old law) in 1923. In 2018, a new law was enacted that fundamentally transformed the wholesale market system.

The system and farmers

The old law of 1923 was enacted in response to the inflation and food riots that accompanied WWI. It was seen that wholesalers were making exorbitant profits, and that producers and consumers were suffering as a result. For this reason, the old law aimed to balance public interests such as stable food supplies, fair trade, producer protection, supply and demand adjustment, trade facilitation, and the efficiency of food distribution. Wholesale markets were established and managed by local governments, and the transactions of wholesalers operating in the markets were subject to certain regulations stipulated by law. The two-tiered system that strictly divided wholesalers into two phases within the market, the emphasis on auctions, and the existence of powerful agricultural cooperatives were all measures that contributed to the protection of Japan's generally small-scale farmers. Since the 2000s, there has been a movement among organic vegetable producers and others to penetrate wholesale markets to expand distribution, and it is thought that this is because the wholesale market mechanism, which is suitable for small-scale farmers, is also suitable for alternative foods.

Impact of the new law

This report describes the characteristics of Japan's wholesale markets (which are similar to those of South Korea and Taiwan), including the two-tiered wholesale system and the auction system, and analyzes how the new law, which focuses only on economic benefits and ignores the wholesale market's nature as a public infrastructure, will affect the values of the old law.

TAKEUCHI, KYOKO* (Kwansei Gakuin University, Japan)

Surviving Discrimination in Transgender Communities: An Analysis of Japanese Nonbinary Online Communities from 2005 to the 2010s

This study aims to clarify how nonbinary individuals in Japan have created their spaces in online communities while facing discrimination. In transgender communities, stories that do not conform to the norm of binary gender transitions have been shared through online networks. In Japan, communities of people with gender identity disorder began to form around the year 2000, and transgender individuals used personal websites to disseminate information. However, much of this community-building left nonbinary individuals, such as those identifying as *X-jendā*, neither female nor male, largely invisible. The practices of nonbinary people who faced exclusion and struggled to find their place while creating online spaces in Japan remain unclear. Therefore, this study analyzes texts and discussions on platforms such as the social networking service mixi, the anonymous bulletin board 2channel, and Twitter (now X) from around 2005 to the 2010s, as well as data from interviews with transgender/nonbinary individuals about those online discussions.

The analysis reveals that around 2005, mixi and 2channel functioned as spaces where *X-jendā* individuals could share their processes of identity formation. However, around 2010, discussions about the definition of *X-jendā* began to arise on 2channel, and on Twitter, comments reflecting binary transgender individuals' difficulty in understanding nonbinary people started surfacing. Comments on 2channel in the latter half of the 2010s show an increase in discriminatory interpretations, such as labeling nonbinary identities as *chūnibyō* (a term mocking self-consciousness) or as an escape from gender roles. These biased discourses resulted in both the movement within nonbinary online communities to clarify the definition of *X-jendā* and the creation of the norm that various personal definitions of *X-jendā* should be respected.

This study sheds light on nonbinary individuals' discriminatory online experiences and contributes to understanding the prejudicial behaviors and community-building efforts within Japan's trans/nonbinary communities, often overlooked in English-speaking contexts.

ICT Use and Inequality in Japan before and after the Pandemic

Japan has been known as a society that experienced early economic development in East Asia and has been recognized as a technologically advanced country. However, Japan is actually among the most delayed countries in the world when it comes to the usage of ICT in schools (MEXT 2019, Ma and Cheng 2022).

However, this situation has drastically changed in recent years. Due to the spread of COVID-19, schools in Japan were closed for three months starting at the end of February 2020, and even after reopening, they faced prolonged disruptions from regular operations. In response to this situation, the Ministry of Education in Japan accelerated the initial plans of ICT implementation policy forward by several years. However, some scholars including sociologists expressed concerns that the sudden introduction of ICT into schools that had not previously used could lead digital divides between families and across schools.

This study aims to clarify how the significant shift in ICT usage policies under the Covid impacted the nature of education by quantitatively analyzing PISA data and a survey conducted in collaboration with the government. In the analysis, we will first descriptively compare the 2018 and 2022 PISA data to examine ICT usage within Japan, and then compare them to the other countries. As the second step, we will examine how the effect of socioeconomic status on the usage of ICTs in schools changed before and after the pandemic.

Although the main focus of this research is on Japan, it also seeks to make a theoretical contribution as a case study of non-Western late industrialized country which imported policy from Western societies. Furthermore, it aims to provide insight of generative mechanisms of digital divide within and between schools when ICT is rapidly introduced during the pandemic.

Conceptualizing and Measuring Cultural Capital with Dual Process Theory

Cultural capital is one of the most important concepts for understanding the mechanisms of reproduction of social and power structure. What distinguishes cultural capital from material capital is that it functions by relying on people's cognition and dispositions. Therefore, a theory of human cognitive mechanisms is necessary for the appropriate conceptualization and measurement of cultural capital. This study categorizes cultural capital based on the dual-process theory of cognition and proposes a valid measurement method. Specifically, it distinguishes between embodied cultural capital, which operates at the level of System 1, and institutionalized cultural capital, which operates at the level of System 2. The differences in cognitive mechanisms are linked to differences in acquisition methods. Embodied cultural capital is primarily inherited through childhood experiences in the family, while institutionalized cultural capital is acquired through formal education. To measure embodied cultural capital, this study suggests using the Affect Misattribution Procedure (AMP), a method for measuring implicit affection related to a given object. Institutionalized cultural capital can be measured using explicit survey questions about cultural preferences. This study compares 'implicit cultural preferences' measured by AMP with 'explicit cultural preferences' measured by traditional survey items, demonstrating that while the two are weakly correlated, they are based on different mental processes. Additionally, some aspects of 'implicit cultural preferences' are shaped by childhood cultural experiences, while educational background is unrelated to 'implicit cultural preferences' but strongly related to 'explicit cultural preferences.' These results suggest the validity of the conceptualization and measurement of cultural capital proposed in this study. In short, cultural capital operates at both System 1 and System 2 levels. The former, in particular, cannot be measured by traditional survey items and must be assessed using AMP, which measures implicit affection.

Re-Weaving the Japanese American Incarceration Experience from the Perspective of Mingei: An Attempt at Buddhist Sociology

By applying a Buddhist sociological perspective, this study reconsiders the worldview of 'Japanese Americans (especially Japanese speakers) in the concentration camps' during the World War II. Specifically, two examples will

be examined and re-evaluated from the 'mingei' perspective by Muneyoshi (a.k.a. Soetsu) Yanagi (Japanese philosopher, 1889-1961): 1) the contents in the Japanese-language literary magazine *Tessaku* (Iron Fence), published within the Tule Lake segregation camp; 2) 'handicrafts' created by the unknown inmates within Japanese American concentration camps. Through mingei thoughts, we hope to find an alternative sociological perspective that focuses on relational existence and being (or 'resonance' in Hartmut Rosa 2016) in the Nature (World). We will consider the relationship between expressed knowledge and unexpressed knowledge, with Yanagi Muneyoshi's 'Mingei no Shiso' (philosophy of Mingei) as the axis in which, I believe, the religious and social levels are not antithetical (David Preston 1988).

Bosnian Women Survivors of War and Ecologies of Peace

My presentation will draw upon my recent book, *Unforgetting: Contemporary Voices from Bosnia and Herzegovina and the Politics of Representation* (forthcoming, Routledge 2025). Based on interviews and conversations with women survivors of war rape, young women who belong to the group Children Born of War, and a woman who took up arms during the conflict and fought on the frontlines, I challenge one-dimensional representations of the Yugoslav war and subsequent peacebuilding processes. Relying on feminist epistemology which foregrounds individual ways of knowing, I focus on the complex role that women survivors have played in transforming current conceptions of peace and justice within Bosnian society over the 30 years since the end of the war.

Based on careful reading of their first-person accounts, I develop the concept of peace ecologies. I posit that traumatic experiences are multifaceted, encompassing individual, social and physical ecologies or "ecosystems" that constitute people's habitats and life histories. The continuities between personal and public, individual and collective are evident in survivor accounts of violence inflicted against them as something affecting not only themselves, but also their families, communities, and all those who may have witnessed the violence over the long term, thus acquiring a social or discursive dimension. Focusing attention on individual women survivors and their stories shows the diverse ways in which their perspectives actively participate in the weaving of communicative and cultural memory within the larger context of justice and peacebuilding. Such an approach entails that we think of peacebuilding in terms of individual, community- based, and state-level capacities to develop ecologies of peace, challenging totalizing accounts of women's victimization, and revealing understudied aspects of women's political agency across different personal and social spheres.

TAKSEVA, TATJANA* (Saint Mary's University, Canada)

Sarajevo, the Beautiful

My presentation will draw upon my recent book, *Unforgetting: Contemporary Voices from Bosnia and Herzegovina and the Politics of Representation* (forthcoming, Routledge 2025), focusing specifically on the role that memories of Sarajevo's multi-ethnic history have played in the process of peace building after the war. Arguing that the siege of Sarajevo has acquired the status of memorial form now more than 30 years after the war, through rich ethnographic accounts I collected from Sarajevans themselves, references to the published records of Bosnia's independent media company FAMA and Dževad Karahasan's brief war memoir of the city, *Dnevnik Selidbe/ Sarajevo, Exodus of a City* (1993/1994), I will show that the siege is reconstructed in the contemporary cultural sphere as an affirmative act of multi-ethnic survival, revealing the vibrant, darkly humorous, and resilient way in which the city and its people see their connection with the multi-ethnic past. In these narratives and testimonies, as a memorial form the siege of Sarajevo contains references that link remembrances to the present moment and to the future, as they tend to take a longer, historical view based on different aspects of Sarajevo's multi-ethnic history. A memorial form depends not only on the relationship between past and present, but on the accumulation of previous such relationships and their ongoing construction and reconstruction. The memorial form of Sarajevo under siege is thus constructively connected to people's current orientation toward the city and its evolving cosmopolitanism. This perspective is grounded in a longer history and knowledge, one that preceded the war, and to which the war simply added another memorial dimension.

Understanding the Multilayered 'Social Pact' in North Africa through Agricultural Subsidies

In Algeria, the debate surrounding subsidy reform has been longstanding, with international economists and experts advocating for the transition from broad-based subsidies to targeted cash transfers. Unlike in Egypt and Jordan, where substantial reforms have been enacted, Algerian policymakers have been resistant to such changes. Despite the 2022 finance law proposing revisions to the list of subsidized products, family categories, eligibility criteria, and methods of monetary transfer, these changes were not reflected in subsequent finance laws for 2023 and 2024. Public expenditure demonstrates an upward trajectory.

This study seeks to explore the structure of subsidies in Algeria's cereal sector by examining the direct and indirect subsidies at various stages—importation, distribution, production, and consumption. Utilizing a "sector approach," the research maps the entire cereal supply chain, which revolves around the Office Algérien Interprofessionnel des Céréales (OAIC). Several interdependent structures are involved in the cereals supply-chain. The OAIC oversees wheat procurement both domestically and internationally, selling it at subsidized rates in Algeria. Local cooperatives (CCLS) handle collection, purchasing wheat from local producers at higher-than-market prices, which also constitutes a subsidy. The Union of Agricultural Cooperatives (UCA) manages storage, while the transport of cereals, subsidized through the "Fonds de Péréquation des Coûts de Transport," is handled by the Société de Transport des Grains (STG) and Agro Route. Public and private mills, industries of flour and semolina, bakeries, and consumers also play roles in this interconnected supply chain.

This mapping allows us to identify the different actors in the cereals chain, their interdependencies and diverging interests, and conceptualize the sector as a field of struggle. It thereby seeks to dissect the Algerian "social pact," and help us understand how wheat subsidies are deeply embedded in intricate socio-economic networks, power relations, and administrative structures, and how social interactions and interdependencies sustain the existence of subsidies.

Comparative Analysis of Ordinal Social Indicators: The Latent Copula Approach

Comparative social indicator research often involves analyzing discrete ordered data. This type of data presents challenges when trying to identify statistical relationships in a multivariate context without any contamination from univariate marginal distributions. The problem is widespread. For example, in comparative social mobility research using categorical data, this issue is known as the problem of margin-free association. This paper discusses the limitations of current approaches and introduces the Latent Copula (LACOP) approach to address the demand for margin-free measures of association. The LACOP approach enables new analytic questions to be addressed while delivering quantitative results that are comparable across different time periods, birth cohorts, social groups, or societies. We discuss software implementations and extensions to multi-level modeling and present numerical examples to illustrate the methodological framework.

Global Marxism. Decolonisation and Revolutionary Politics.

For much of the twentieth century, the ideas of Karl Marx provided the backbone for social justice around the world. But today the legacy of Marxism is contested, with some seeing it as Eurocentric and irrelevant to the wider global struggle.

In 'Global Marxism. Decolonisation and Revolutionary Politics', Simin Fadaee, argues that Marxism remains a living tradition and the cornerstone of revolutionary theory and practice in the Global South. She explores the lives, ideas and legacies of a group of revolutionaries who played an exceptional role in contributing to counter- hegemonic change. Figures such as Ho Chi Minh, Kwame Nkrumah, Ali Shariati and Subcomandante Marcos

did not simply accept the version of Marxism that was given to them - they adapted it to local conditions and contexts. In doing this they demonstrated that Marxism is not a rigid set of propositions but an evolving force whose transformative potential remains enormous. In simple words, Global Marxism has much to teach us in the never-ending task of grasping the changing historical conditions of capitalism and the complex world in which we live.

In this Author meets their Critics session, Simin Fadaee will debate the ideas of her book with Kaan Agartan (RC48 Vice President) and other two ISA colleagues serving as commentators, followed by opening the floor to the audience in order to reflect together on the role of Global Marxism in contemporary times.

TAMBE, SHRUTI* (Savitribai Phule Pune University, India)

Decolonial Epistemological Revisions: Recontextualizing Concepts of Democracy and Protest

Social movement studies emerged as a field of knowledge after decolonisation, in the ex-colonies with peripheral capitalism and decolonial struggles, it emerged later. While sociology of social movements coined many terms making sociology robust from the people's perspective and emancipatory agendas; the reinterpretation of terms and concepts in decolonial contexts brings refreshingly new meanings in the era of anthropocene.

This paper focuses on radical revisions from decolonial epistemological perspective of concepts like democracy and protest altering and subverting these concepts and the field of movement studies. While we agree that sociology and social movements are siblings of modernity, Southern reality complicates this. While the content of Southern social movements has remained anti-colonial in nature; Sociology, on the contrary, had become a colonial epistemic instrument to label and stereotype ethnic groups, racialize and subjugate them.

I argue that democracy is not just reinterpreted by anti-colonial struggles in colonial societies, it was also radically recontextualized to encompass new dimensions like self-rule-Swaraj, judicious rule-suraj, and people's rule-jantantra in India to bring in radical transformations on the epistemological level. Similarly protests in its decolonial epistemological revision became all encompassing-where the state was the adversary and yet was owned as a democratic process by the oppressed, and the resourceless masses.

This paper asks how the field of social movements recontextualizes concepts with varied histories and aspirations for an emancipatory global future. While the underlining collective subjectivities change and shift as the political economy and the symbolic sphere are redefined by hegemonic global processes; how do common people decolonize the street protest repertoires with creativity and counter-hegemonic agendas? The ongoing Himalayan movement in the Ladakh region of India for demanding creation of new administrative categories and redefining citizenship for Sustainability of the planet on the backdrop of the Anthropocene is an example of the argument in question.

TAMBE, SHRUTI* (Department of Sociology, Savitribai Phule Pune University, Pune, India)

Who Cares and Who Leads: Building Resilient and Sustainable Communities in the South and Democratic Alliance Politics

The working population is decreasing and Care becomes the central issue. While Care workers are considered important subjects of policy making, in concrete micro contexts unions and organizations in the south are rarely aware of the growing importance of Paid Domestic Workers in the labour market. The awakening and consciousness of the need to provide care to a large population in a country like India can act as a catalyst in bringing the mobilizations of Paid Domestic Workers in the policy making contexts.

While changing socio-economic conditions must force the unions of paid Domestic Workers to redefine themselves as Essential Workers and Front line Workers, without whom the cities will come to a halt, policy makers are still targeting them as 'beneficiaries' of government welfare schemes.

This paper argues that acknowledging paid Domestic Workers as an important category and demand for identity as workers is not enough today and Anthropocene has made survival and everyday work practices more taxing for the care workers. The extreme weather seriously affects health conditions including life expectancy, privatisation leads to expensive urban mobility and crony capitalism coupled with aggressive privatisation making the future bleak for working class families.

Domestic workers represent the last frontier of the spectrum of informal workers in urban India today. Lack of potable water and sanitation facilities for the working-class neighbourhoods, scarce public health facilities and changing requirements to access citizenship rights are rarely taken as common rallying points for the broader alliances of labourers.

Through case studies of building alliances for dignity, access and control over resources and democratic representation to survive in the era of Anthropocene I argue that building sustainable and resilient communities should be the aim of mobilisations across cities to re-imagine new collectivities and democratic futures

TAME -, BIANCA* (University of Cape Town, South Africa)

Private Employment Agencies' Response to a 'Crisis of Representation' in South Africa's Domestic Work Sector

South Africa's domestic work sector remains a lifeline for many black African women seeking work opportunities to support their households. While employment opportunities have contracted, there is a concerning increase in part-time and precarious working conditions among domestic workers. These changes are attributed to an ailing economy, the aftermath of the Covid-19 pandemic and a proliferation of intermediaries (formal and informal) competing with each other to meet the demands of clients/employers seeking affordable domestic workers primarily through indirect employment arrangements. The objective of this paper is two-fold. First, to make visible the role of and demand for the services of private employment agencies (PEAs) among employers and domestic workers. Second, to demonstrate why and how PEAs are driving the decent work agenda between employers and domestic workers. Drawing on the Flexible Worlds of Work model and ethnographic research among employers, migrant domestic workers and agencies, this paper shifts attention to permanently employed domestic workers (the core workforce) and agencies specializing in placements in post-apartheid South Africa. The findings point to both employers and domestic workers seeking an alternative to insecure and problematic employment relationship with and through PEAs because of a crisis of representation. In other words, who represents their interests towards meeting or achieving decent work. I argue that PEAs serve as an exemplar for transforming the domestic work sector and promoting a decent work agenda. However, PEAs response to transforming the domestic work sector emanates from their pragmatic response to the crisis of representation among employers and domestic workers seeking an alternative to a demobilized trade union and ineffective state intervention in the domestic work sector. Yet, PEAs response to a crisis of representation has serious implications for challenging the status quo in the domestic work sector and contributing meaningfully to multi-layered approach to achieving decent work.

Youth Perceptions of Inter- and Intragenerational Justice and Their Participation in Sustainability Transition Politics

Based on research done in the context of the European Topic Centre for Sustainability Transitions on youth inclusion in sustainability transitions and specifically just transition-related policy processes, this contribution analyses how the European institutions relate to, address and seek to involve young people in dialogues on sustainability transitions and justice and how that matches with the interests, concerns and participation wishes of young people. In our approach, sustainability transitions are understood more broadly and include climate activism among other environmental and socio-economic concerns. Intragenerational justice refers to fairness and equity within the same generation, addressing inequalities among currently living individuals and groups. When considering youth in this context, intragenerational justice focuses on ensuring that young people have equal access to opportunities, resources, and rights, regardless of their socioeconomic status, race, gender, or geographic location. Intergenerational justice, which refers to the ethical and moral principles that ensure fairness and equity between different generations, is not only a new and contested topic for policymakers but also for young people. It emphasises the responsibility of current generations to consider the rights and needs of future generations when making decisions about resources, environmental sustainability, social policies, and economic practices and includes many open questions. This analysis seeks to highlight some of the most crucial blind spots and weaknesses of the current approaches and suggest practices and methods that could help to foster more substantial and equitable dialogues on emerging topics between policymakers and young people with varying degrees of social and environmental awareness. This contribution is based on a qualitative study on the transnational perceptions of intra- and intergenerational justice and its implications on political participation of young people in the context of just sustainability transitions in the EU and seeks to enter the broader international discussion.

Water Management Transformation in Japan: Focusing on the Introduction of the Land Improvement Act

The purpose of the paper is to clarify how the introduction of the state-led water management system has been integrated with village-based water management system. In Japan, which has a long history of rice cultivation, even before modernization, village-based water management system was highly developed to use water for irrigation. This pre-modern village-based water management system has been altered by the intervention of state-led development and management policies. While The Japanese government placed a pre-modern village-based management system in modern law without ruining this management system, it created a new policy of hydraulic organizations called land improvement districts and reorganized a wider range of hydraulic organizations beyond village. Concretely, the Land Improvement Act introduced electoral districts, and Board Members consisting of representatives of those districts were organized. This created a new organization on a larger water development scale than village-based water management system. This study focuses on the board members who represent these districts and analyzes how the board members have affected village-based water management system, or, conversely, how the electoral districts are defined by village-based water management system. Furthermore, the impact of climate change on water management systems has become more pronounced in recent years, with the increased burden of water management for rice crops due to extreme heat waves and the demand for better control of water quantity in reservoirs and irrigation channels due to sudden heavy rainfall. How are current systems coping with these impacts of the natural environment? This paper will consider the transformation of the water management system and its limitations with a particular focus on the Mannoike Land Improvement District located in the area with the lowest rainfall in Japan as a case study, based on an analysis of interviews conducted with 16 board members. of interviews conducted with 16 board members.

TANIGUCHI, MASATO* (Keio University, Japan)

Making "Rapport"—Fieldwork on Social Movements

Fieldwork in social movements is challenging. Particularly, conducting fieldwork and participating in the activities of social movements are inseparable. While science is founded on the principle of observation, in the study of social movements, it is not feasible to remain a mere observer. Another difficulty arises from the constantly changing situation of social

movements. Social movements do not possess an established system of values or customary practices. To shape the movement, new rules must be created, which are formed not only within the movement itself but also through interactions with external societal circumstances. Therefore, for researchers, it is not always clear what theoretical framework to adopt.

This presentation will address the challenges of conducting fieldwork on social movements, drawing on Bruno Latour's concept of "Rapport." Latour highlights the dual meaning of "Rapport" in French: it signifies both a report and a relationship. If we put this into a proposition, one could say that to write a report is to form a relationship. For Latour, fieldwork is not about conducting research according to a predefined theoretical framework. Rather, it involves tracing and describing the connections between actors. By undertaking this description, the researcher illuminates relationships that would have otherwise remained obscure. How can we rethink the challenges of social movement fieldwork through the application of "Rapport"? This is the central question.

In Japan, social movements were revitalized following the 2011 Fukushima nuclear disaster. At the heart of these movements were the areas in front of the Prime Minister's Office and the National Diet. Historically, these political centers were not typical sites for protests in Japan. However, following the anti-nuclear movement that began in 2011, these areas became center for various protests. The presenter has been conducting fieldwork on these social movements in these area. This report is based on this fieldwork.

TANJEELA, MUMITA* (Department of Sociology, East West University, Dhaka, Bangladesh)

Water, Women, and Climate Change in Bangladesh: Insights from Feminist Political Ecology Perspective

Bangladesh faces profound challenges due to its vulnerability to climate change, particularly in the water sector. Climate-induced disasters frequently disrupt water availability, disproportionately affecting women who are traditionally responsible for household water management and water-dependent subsistence agricultural activities like homestead gardening and livestock rearing. In rural areas, where fixed water supply infrastructure is scarce, women rely on various natural water sources, making water collection a critical part of their daily responsibilities. Access to water resources varies across social classes in both urban and rural settings, adding layers of complexity to the issue.

This paper explores the lived experiences of Bangladeshi women dealing with water crises, offering insights into the vital role water plays in their lives amidst environmental challenges. Using a feminist political ecology framework, the study examines how women's labor, knowledge, and social networks contribute to addressing water-related issues. The research employs qualitative methods, adopting case study approach in three climate vulnerable areas from three districts of Bangladesh—Khulna (cyclone-prone), Naogaon (drought-prone), and Cox's Bazar (urban hilly slope) where water became a major issue of concern for living community. Data collection methods includes non-participant observation, focus group discussions, in-depth interviews, key informant interviews in the selected areas.

The findings reveal that women are disproportionately affected by climate change, as water scarcity increases their socioeconomic vulnerabilities, impacting food security, health, and overall livelihood. Despite their critical role in household and community water management, women's efforts and indigenous knowledge are often under-appreciated in formal adaptation discourse. The study emphasizes that adaptation strategies can be more effective when linked with women's traditional practices, such as rainwater harvesting, small-scale irrigation, and water-saving techniques. Highlighting the need for gender-responsive and transformative approaches, the research underscores that incorporating women's perspectives into climate adaptation strategies is essential for building climate-resilient communities with women at the forefront.

TARANTINO, GIULIA* (CESIE ETS, Italy)
ALBANESE, ANTONINA* (Università degli Studi di Palermo, Italy)

The Impact of EU-Funded Initiatives on Transforming Capabilities and Agencies in the Swana Region through Multi-Stakeholders' Partnerships

This paper critically assesses the impact of EU-funded initiatives on transforming capabilities and agencies in the SWANA region through the cultivation of multi-stakeholder partnerships in a phase of anthropogenic conflicts touching upon climate, participation, and citizenship.

Traditionally viewed as mere support mechanisms for multilateralism, these partnerships are undergoing a paradigm shift, evolving into alternative narratives that might have the potential to reinvigorate agencies. Given the urgency to address diverse global conflicts and their implications for regional development, this study advocates for a transformative approach of cross-Mediterranean cooperation, emphasising partnerships with the private sector and civil society in response to limited government commitment and power imbalances.

Informed by insights from EU-funded initiatives on community involvement, the paper examines the role of these initiatives in fostering alternative narratives and dialogue among communities entrenched in mistrust, thereby nurturing a healing process at community level, giving citizens agencies needed to co-produce effective solutions to the conflicts brought by anthropocene.

Beyond conflict zones, the study explores multi-stakeholder partnerships' expansive transformative capacity. It contends that advancing regional cooperation in the SWANA region through these partnerships mandates the promotion of inclusive diplomacy featuring diverse participation, investments in capacity building, and support for research and innovation at a non-State level.

The proposed holistic approach aims to formulate an integrated and effective strategy for confronting regional challenges while empowering the people. The incorporation of continuous improvement, grounded in lessons learned, is intrinsic to the proposed model, ensuring adaptability and resilience. Through this exploration, the paper contributes to the discourse on the evolving nature of multi-stakeholder partnerships and their potential to shape a more responsive and inclusive framework for addressing complex regional issues in the SWANA region and reversing anthropocene premises.

TAREK ELRAGGAL, ALY* (Scuola Normale Superiore, Florence, Italy, Italy)

"Checkpoints, Law, and Coercion: Egypt's 30-Year State of Exception and Its Social Impacts"

This paper delves into the intricate relationship between Egypt's legal system and the establishment of a police state during Hosni Mubarak's 30-year rule (1981–2011). It argues that rather than existing independently, the legal and police apparatuses worked in tandem to create and sustain a state of exception. Central to this analysis is Egypt's longstanding emergency law, which provided a legal framework for the extension of police powers, including arbitrary arrests, surveillance, and restrictions on freedom of movement.

The research focuses on the critical role of checkpoints, a widespread form of physical control, and their effect on the Egyptian public's daily lives. These checkpoints became symbols of state authority, heavily concentrated in Greater Cairo and other major cities, and served not only to regulate movement but also to segregate and control different populations. The presence of such checkpoints transformed urban spaces into sites of surveillance and control, enabling the state to classify and monitor citizens while reinforcing its power.

By examining the intersection of legal and coercive mechanisms, the paper highlights how the Egyptian state managed to sustain this exceptional political order over time, embedding itself in the everyday practices of governance. The paper also considers how these systems of control contributed to broader social divisions, exacerbating inequality and fostering an atmosphere of fear and subjugation.

The study contributes to a broader understanding of how states of exception function within authoritarian regimes, demonstrating that legal frameworks can support, rather than challenge, the construction of a police state. Through its focus on Egypt, the paper sheds light on the intricate processes through which political power, legal frameworks, and coercive force can combine to create a highly controlled and monitored society.

RC56-862.3

TAREK ELRAGGAL, ALY* (Scuola Normale Superiore, Florence, Italy, Italy)

The History of the Formation of the Exception in Egypt: How Did the Legal State Combine with the Police State?

This paper critically engages with Giorgio Agamben's notion of the "state of exception" within the context of modern Egypt, arguing that his analysis inadequately addresses the political economy underlying this phenomenon. By applying a qualitative methodology that incorporates archival research and document analysis, the study reveals how the permanent exception in Egypt is less about existential threats to the state and more about territorial arrangements and labor control.

This text attempts to engage with the history of the formation of the exception in Egypt and to understand some of the conditions for its emergence and continuity by answering the following questions: When did the exception begin in Egypt? What are the historical conditions for this birth? How can we understand and identify the factors that produced it? How can we interpret this long continuity?

Unlike Agamben's emphasis on the legal and philosophical dimensions, this research posits that the state of exception is intrinsically linked to Egypt's economic structures and the failure of capital accumulation, which necessitates repressive governance. The findings indicate that marginalized populations are systematically categorized as threats, reflecting a broader socio-economic strategy aimed at maintaining state control.

This case study of Egypt, situated in the Global South, underscores the interplay between legal frameworks and state practices, illustrating how exceptional measures become normalized within a context of economic instability. The paper concludes that a deeper understanding of these dynamics is essential for analyzing the intersections of law, power, and economy, thus offering new insights for scholars and policymakers concerned with the implications of state repression in postcolonial countries.

L'Université Et La Jeunesse : Du Développement à La Société De La Connaissance

L'université joue un rôle remarquable dans la formation de la jeunesse à travers de multiples approches au niveau des compétences et des valeurs dans le but de parvenir à un développement intégral.

Elle est un domaine vital pour construire l'être humain de demain et créer une société de la connaissance, car la jeunesse en est le fondement. Cela nécessite de doter l'université des outils nécessaires pour affronter les défis aux niveaux local, régional et mondial. Ainsi se pose la question de la qualification de la jeunesse de nos sociétés arabes pour leur permettre d'entrer dans les contextes mondiaux présentés par la révolution numérique avec ses exigences et ses conditions matérielles et symboliques. La réalité actuelle exige d'effectuer un changement en créant des opportunités pour permettre aux jeunes de construire des sociétés capables de contribuer au système mondial de connaissances et au progrès de la civilisation humaine.

Pour y parvenir, l'université joue deux rôles majeurs : créer une société de la connaissance et permettre aux jeunes d'y participer efficacement.

L'université doit créer une société du savoir en élargissant les opportunités pour les jeunes. Cela repose sur leur efficacité cognitive, l'acquisition de connaissances, les compétences économiques et des valeurs d'implication dans la société de la connaissance.

Un environnement favorable est donc nécessaire pour intégrer les jeunes dans des contextes d'apprentissage et de formation, favorisant ainsi un développement basé sur la connaissance et la recherche scientifique.

Developing IE in Criminological and Socio-Legal Studies: Contemporary and Future Challenges and Paths

This paper aims to present a review of literature and research conducted so far with IE in the field of criminological and socio-legal studies, to discuss the challenges and opportunities arising from the application of IE in these fields, and outline new challenges and opportunities for the future.

The use of IE to study the experience of people with the civil and criminal justice systems has been continuously in expansion since its creation. The classical studies from Smith (2014), Pence (2001), and Pence & Smith (2004) offered evidence to the needs and benefits to use IE in these fields. However, recent contributions (e.g., Doll & Walby 2019) have more clearly outlined the applications and the advantages produced by IE in the field of criminal justice and socio-legal studies.

Reflecting on how to develop the use of IE in criminological and socio-legal studies concerns not only discussing about what has been done until now in terms of empirical research and what has been envisioned for the future, but also reviewing the methodological tools that have been applied, the peculiar needs of these fields, what the approach of IE can offer also in theoretical/

epistemological terms, how IE has been mixed with other approaches, how IE as an alternative sociology is perceived in systems like the civil and criminal justice ones in which the issue of power and power imbalance between institutions and people – such as petitioners, claimants, plaintiffs, appellants, victims, perpetrators, etc. – is prominent and relevant. Moreover, this reflection also includes an analysis of the interdisciplinary, cross-cultural and cross-national applications of IE, and the research impact generated.

This presentation will provide insights on the above mentioned aspects, envision new fields of (interdisciplinary) application, and new challenges for the IE approach in the European context.

Migration Justice, Social Class, and the Post-Multicultural Turn from the Case of Japan

How should migrants be treated from a justice perspective in the globalised migration age? Since the 1970s, multiculturalism had been dominant in migration justice, but after the 2000s it came under rapid criticism, leading to the declaration that "Multiculturalism is dead." Instead, the neoliberal and neo-nationalist treatment of migrants came to the fore in Western countries, emphasising migrants' skills and values in the labour market and social integration. Is this post-multicultural turn compatible with migration justice? To explore this question, this paper takes an East Asian country, Japan as a case study. For a long period, Japan was regarded a "no-immigration country" with few foreign residents such as Oldcomers, but it started to receive Newcomers in the 1980s. In the process, Japan has allowed only high-skilled migrants only to enter and stay in line with its immigration policy principle of "no admission of unskilled migrants". However, Japan has de facto accepted lower-skilled workers through the "side doors," such as technical trainees, and for the first time in its immigration history began to formally accept lower-skilled workers through the "specified skill" residence status. Japan then has decided to completely replace technical internships with "training for employment" in 2027. In this way, Japan changed its perception to admit lower-class migrants with less public antipathy. However, Japanese integration policy is rather weak and lacks multiculturalism. If Japan were to adopt the post-multicultural policies of Western countries, it would not be in line with migration justice. Rather, Japan should adopt multiculturalism for vulnerable lower-class immigrants, especially with respect for their cultures, identities and existence. This leads to a rethinking of migration justice in social class across the globe.

TAS, ARJIN* (University of Vienna, Austria)

Limbo of Diyarbakır: Ambiguous Urban Redevelopment Processes and Counterinsurgency

In August 2015, after the declarations of self-governance in the Kurdish region of Turkey, Sur (the old town of Diyarbakır) turned into an urban front in the armed conflicts between the Turkish armed forces and the PKK (Kurdistan Workers' Party). During and after the clashes, through bulldozing, urgent expropriation, and urban redevelopment, more than 22,000 low-income Kurdish inhabitants were forcefully displaced and dispossessed. The counterinsurgent urban redevelopment project in Sur has not been finished and seems paused. The systematic subjugation of the low-income Kurdish population has not remained limited to the areas of self-governance declarations or clashes, either. Recently, in 2020, inner Bağlar, the poorest and densest urban section of Diyarbakır, has become the target of urban redevelopment by the Turkish state. Like Sur, the urban redevelopment project of Bağlar proceeds unnervingly slow, even though a neighborhood of Bağlar has been selected for the start of the project and a pilot area has been declared "risky" on paper.

Based on ethnographic research in Diyarbakır, this paper explores the relationship between lengthy urban redevelopment processes and counterinsurgency strategies with a particular focus on dispossession and displacement. It conceptualizes urban regeneration processes as a part of governance (governing the city, dissent, conflict, and counterinsurgency). I argue that a redevelopment project does not need to be finished for displacement and dispossession to take place. On the contrary, the lengthy, non-transparent, and ambiguous urban redevelopment processes characterized by messy and constantly shifting bureaucratic and administrative structures form a threatening space, *a limbo*, aiming to disseminate the clustered, political, and mobilized low-income Kurdish families. In addition, the constant threat of displacement, facing empty lots and dilapidated surroundings, and police points set up at corners all lead to (de)securitization and depopulation in both Sur and inner Bağlar, creating a space that prevents political mobilization and insurgency.

TG04-974.4

TAS, ARJIN* (University of Vienna, Austria)

'Risky Areas' of Diyarbakir: The Formation of Risk and (De) Securitization

In August 2015, after the declarations of self-governance in the Kurdish region of Turkey, Sur (the old town of Diyarbakir) turned into an urban front in the armed conflicts between the Turkish armed forces and the PKK (Kurdistan Workers' Party). During and after the clashes, through bulldozing, urgent expropriation, and urban redevelopment, more than 22,000 low-income Kurdish inhabitants were forcefully displaced and dispossessed. The systematic subjugation of the low-income Kurdish population has not remained limited to the areas of self-governance declarations or clashes, either. Recently, inner Bağlar, the poorest and densest urban section of Diyarbakir, has become the target of urban redevelopment by the Turkish state. In both cases, through Law No:6306, Code for Transforming Areas Under (Natural) Disasters Risk, the top-down imposed "risky" characteristic of the districts has been utilized to facilitate expropriation, eviction, and destruction.

Based on ethnographic research in Diyarbakir, this paper explores how creating a "risk" area is related to urban restructuring and counterinsurgency. It conceptualizes urban restructuring processes as a part of governance (governing the city, dissent, conflict, and counterinsurgency). The additional article to Law No:6306, "*Areas where public order or security is disrupted in such a way as to stop or interrupt normal life [...], can be determined as risky areas by the President...*", implemented in Kaynartepe neighborhood of Bağlar in 2020 based on "terrorist activities," has not only opened the legal way of urban redevelopment but also led to the justification of policing. Yet, despite the constant existence of police forces in the neighborhood, the area has become even more "dangerous" with increasing activities of drugs since. I argue that following the formation of the "risk" area, a (de)securitized and ambiguous space has been formed, securitizing political mobilization and insurgency while allowing and using "the drug problem" to marginalize and instabilize the area.

Department of Sociology, Canada)
KAZAKOU, EVANGELIA (Saint Mary's University, Canada)*The Role of the State, Law and Policy in the Gender-Based Violence Experiences of Asylum Seeking Women in the Eastern Mediterranean*

This paper focuses on gender-based violence (GBV) in a forced migration context at the external, common border of the EU in Greece in the second decade of the 21st century. As EU countries in the north of Greece have been erecting walls to prevent asylum seekers from reaching their territories, and EU Asylum regulations and enforcement have been turning to an increased neo-liberal securitization approach, hundreds of thousands of asylum seekers have found themselves either trapped within Greek borders or taking more dangerous routes, following the EU-Turkey agreement of 2016. EU refugee protection and border regimes have rapidly deteriorated. GBV is violence against a person on account of their gender; it also encompasses gendered consequences of systemic/structural and institutional violence. Moreover, gender inequalities that are mutually constitutive with class, race and other forms of social divisions make the experiences of some asylum seekers even more challenging. Drawing upon the qualitative analysis of interviews with 20 key informants and 35 asylum-seeking women arriving in Greece in the second decade of the 21st century, we explore how interpersonal experiences of GBV during the journey and upon arrival to EU "safety" can be traced to state bordering practices, and EU and Greek legal and policy frameworks.

The Role of Personal Networks in Disaster Resilience

This study will focus on the personal network of disaster victims as a resource of resilience for individual and community. It will also examine the role of personal network in preparedness. This study used qualitative methods such as some in-depth interview for 33 cases in the field of Saint Petersburg Florida USA.

Based on the analysis so far, the following can be said about the role of personal networks in time of disaster. First, family members who live nearby can be great help. Second, in addition if there is no family living nearby, there is mutual aid among neighbors.

Family members nearby and neighbors are expected to provide physical support due to their proximity, while personal networks distributed over long distances provide physical support such as emotional and psychological support and shelter, proved to be an important support resource in other respects.

On the other hand, there were cases where evacuation was difficult when there were elderly people, disabilities, and pets in household. In particular, pets are being kept in many households, but it is worth considering that there are cases where people give up on evacuation to shelters because of this.

Lastly, support from strangers during evacuation and support from people not directly acquainted were reported. It can be said that the importance of strength of weak tie.

Biographical Consequences of Activism at the Collective Level: Campesino Communities Against Extractivism in Colombia

Studies on the biographical consequences of activism have primarily focused on the individual level. However, as Passy and Molosch (2019) note, participation in social movements can also have significant consequences at the collective level. This paper, based on historiographic and hemerographic analysis, participant observation, and interviews with key actors, examines the impact of the movimiento defensor against the Quebradona mining project in Antioquia, Colombia, on the campesino communities involved. Specifically, it explores the cognitive-relational processes that shaped identity changes and political perspectives on extractivism, popular resistance, and state-society relations at the community level.

Inte-13.2TAVERA FENOLLOSA, LIGIA* (Facultad Latinoamericana de
Ciencias Sociales, Mexico)*Resistance to Extractivism: Mobilizing for sustainability and social justice*

Latin America's environmental defenders stand at the intersection of struggles for social justice, cultural preservation, and ecological sustainability. Their resistance to extractivism is not just a local fight, but a global one, as the health of the region's ecosystems is crucial to the future of the planet. In this presentation I examine social mobilization against extractivism in the region, focusing on social movements that have succeeded in their struggles against mining companies. I argue that social movements have a greater possibility to successfully resist extractivist projects and thus create a more sustainable future when: a) they consolidate a broad network of actors—including local communities, Indigenous groups, environmental organizations, lawyers, and activists—, b) resort to a repertoire of contention that comprises mobilization in the public space with legal mobilization; c) when they actively seek shifts in public opinion through the framing of their struggle as one not just against a particular project, but against a larger, systematic threat to the land, culture, and way of life, and d) when they are able to come up with alternative and more sustainable economic projects.

TAMAYO GOMEZ, CAMILO (The University of Huddersfield,
United Kingdom)MONTROYA, CATALINA (Liverpool Hope University, United
Kingdom)*The Necropolitics of Memory in Transitions: A Proposed Framework*

This paper sets out for discussion a proposed framework for understanding forced disappearance, bringing together scholarship on necropolitical theories, transitional justice, and 'from below' perspectives. After an overview of the key debates in each of these, it suggests that by combining insights from these three bodies of research we can illuminate the interrelated dimensions of what we term the 'necropolitics of memory'. Providing brief examples from case studies from Colombia, the paper explores how the concept of necropolitics encapsulates the ways in which individuals in positions of political power and state governance assert control over matters of life and death, often infringing upon human dignity, and often imposing slow and structural

violence. In particular, the case studies will reveal how grassroots memory practices in Colombia often work to highlight the implication of the state itself in the perpetration of violence – both direct, individual acts of violence, and structural or slow violence. We thus argue that such memory practices can be understood as forms of critiquing the necropolitics of the state, and, ultimately, of advocating for a *transformative* as much as a *transitional* justice.

As a form of conclusion, the paper suggests that such a framework – the necropolitics of memory – could be employed to interrogate other, similar situations in other countries undergoing processes of transitional justice.

TAYLOR, FAITH* (Yale University, USA)

Assessing Natural Disaster Risks for Incarcerated Individuals in the Gulf Coast of the United States

In the United States, the aims of disaster preparedness have shifted over time. The relatively new conception of natural disasters as the focus of disaster preparedness efforts has led to increasing research regarding how sociodemographic characteristics increase vulnerability to natural disasters. Incarcerated individuals are hyper-vulnerable to natural disasters because many disaster preparedness and mitigation strategies are impractical and/or infeasible in correctional settings. This paper aims to examine the level of natural disaster risk faced by incarcerated individuals in the Gulf Coast region of the United States. Furthermore, this paper also disaggregates data on correctional facilities to account for subgroups (women, juveniles, ICE detainees, degree of facility overcrowding) that are likely to increase susceptibility to the negative impacts of natural disasters in correctional settings. The primary sources of data for this project were National Risk Index (NRI) maps produced by the Federal Emergency Management Agency (FEMA) and Heat and Heat-related Illness (HHI) maps published by the Centers for Disease Control and Prevention (CDC) National Environmental Public Health Tracking Network. The results of this research showed that overall extreme temperature is the greatest natural disaster risk for incarcerated individuals in the Gulf Coast region. Thirty-eight percent of all correctional facilities in the Gulf Coast region are in a county deemed “very high” risk for extreme temperatures, but importantly, these facilities house nearly half of all the region’s detainees. Riverine flooding posed the second greatest risk in terms of the number of detainees and the number of facilities that could be impacted. The results from this research can be directly mobilized by emergency managers at the state, county, and correctional facility levels by highlighting actual risks faced by correctional facilities so that more detailed and targeted disaster preparedness plans can be developed in the future.

Carceral Geographies and Disparities in the Proximity to Environmental Hazards in Washington D.C., Maryland, and Virginia

The United States has had a long-standing history of incarceration and the use of carceral logic, which has resulted in the US having one of the highest incarceration rates in the world. Research on incarceration has expanded into new disciplines, such as green criminology and environmental studies. Environmental Justice (EJ) researchers have begun to integrate concerns for incarcerated individuals into their work. The EJ scholarship has long prioritized understanding how race, socioeconomic status, and procedural injustice exacerbate exposure to environmental toxins and produce poor health outcomes. All of these concerns are manifested in carceral settings, but incarceration intensifies these problems in ways that create a hyper-vulnerability that is unique to incarcerated individuals. However, studies that examine the intersections of environment and incarceration are often limited because they do not address the gender or age of detainees, focus on relatively few locales, and only consider prisons as the primary unit of analysis. The research in this project examined the locations of 199 prisons, jails, and juvenile detention centers in Washington D.C., Maryland, and Virginia (DMV) and their proximity to superfund sites, Toxic Release Inventory (TRI) sites, and municipal waste facilities. One-, three- and five-mile buffers were drawn around each carceral facility to determine the number of hazards within a given radius. A two-step nonlinear regression was performed if there are variations in the distribution of environmental hazards based on the gender or age of the detainees. The results of these tests show that, in general, correctional facilities that house youth or women are just as likely or more likely than those that house only adults or only men to have environmental hazardous at any given radius. The results suggest an urgent need to consider gender and age dynamics in analyses of carceral institutions.

New Visions of a Feminist Social Justice from the Experiences of the Carceral Archipelago

In this paper I explore the futures of social justice from the experiences of women and girls detained as refugees in the carceral archipelago of the Asia-Pacific. Building on feminist theorization including Black Feminist, anti-colonial and Indigenous scholarship, the paper presents the narratives and creative work of refugee women and girls as integral to formulating social justice from the lived experience of marginalized and minoritized populations. Forms of story-telling figure prominently to foreground the hidden histories and untold stories of women and girl refugees. In such story-telling all creative forms of expression, visual, textual, filmic, performance and others accumulate to retell colonial histories of oppression and also imagine alternative futures of social justice. The carceral archipelago, includes remote sites where states move populations to sites external to their own territories, thereby also removing responsibility for harms through remote carceral systems. One state to practice such externalization of borders is Australia with its off-shore refugee detention centres on Manus Island, Papua New Guinea and the impoverished island state of Nauru. The synergies between radical feminist, trans and queer theorists provide critical theorization of the lived experiences of excluded and minoritized populations through the historical epochs of colonialism and capitalism, (hooks 2014, Davis 1972, 2019, Federici 1999, Wynter 1995, Fraser 2017, Hill Collins 2019). Importantly, many of these theorists and others develop detailed insights and empirical detail of the marginalization and exploitation specific to migrant and refugee women and girls that is the focus of this paper.

MOREA, VALERIA (Erasmus University Rotterdam, Netherlands)

Alpha Territorialisation Venice Edition

In cities and territories that do not have the characteristics of global cities, but that are substantially invested by certain types of global flows, such as luxury tourism, a ‘special kind’ of alpha territory emerges, that deserves attention. The implications are relevant to many heritage-rich contexts around the world where tourism is increasingly becoming a primary socio-economic driver and is contributing to the increase of socio-spatial inequalities.

Within this context, Venice can be considered an extreme case. In Venice old town, the presence of transnational elites contributing to increasing socio-spatial inequalities is linked both to the ‘traditional’ luxury hotels and to the stock of historic buildings bought by foreign investors who use them for very short periods of the year. In recent times, luxury tourism has taken over the peripheral parts of the Venetian archipelago, where exclusive experiences are possible, away from the mass tourism crowds.

Drawing on this idea, this contribution investigates space-time daily routines of both residents and tourists in relation to specific parts of the city, highlighting places where the super-rich engage with local communities (including local elites) and places where they are completely excluded from local life, contributing to the disruption to the values of established elites. This disruption can be seen as characteristic of alpha territorialization phenomena.

Knowledge in Dialogue: An Interdisciplinary Approach to Green Certifications in Tourism

The study investigates the intersection between environmental certifications and tourism, emphasizing the need for an interdisciplinary approach to address the challenges of climate emergency. The research adopts a rigorous methodology, including bibliometric analyses using Web

of Science and Biblioshiny, along with a critical literature review, focusing on articles published between 2014 and 2023. The systematic search resulted in the selection of 64 relevant articles, which were analyzed to identify gaps and opportunities in the research on green certifications. The results reveal that most studies focus on performance metrics and tangible outcomes, often neglecting the social, cultural, and political dimensions that influence the effectiveness of certifications. The critical analysis highlights the fragmentation of knowledge, suggesting that overcoming this limitation is essential to develop a solid theoretical foundation that effectively addresses global risks. The research proposes that the humanities and social sciences play a central role in reconfiguring academic practices, offering a critical lens to examine the narratives and values that shape tourism practices. Furthermore, the study emphasizes the importance of considering local identities and ethical perspectives in the formulation of environmental accreditation systems, promoting a holistic approach that respects cultural diversity. Recommendations include the need for collaboration between disciplines to create innovative knowledge that reflects the complexity of global realities. In summary, the work concludes that integrating multiple disciplinary perspectives is fundamental to addressing sustainability challenges in tourism, ensuring that green certifications are relevant and beneficial to local communities.

TEIXEIRA, FRANCIELLY SANTOS* (Universidade Federal de Santa Catarina, Brazil)

Sustainability-Based Destination Brand Equity Modeling

In a global context where socio-environmental responsibility emerges as a critical determinant in consumer choices, this study proposes to investigate the influence of signs and symbols associated with green certifications on the enhancement of *Destination Brand Equity*, as well as its impact on visitation intentions. To this end, a quantitative survey-based research is conducted, collecting data from a convenience sample of consumers who have already visited environmentally certified tourist destinations and those who express an intention to do so. The research is structured around an analytical methodological approach, which includes descriptive statistical analyses for characterizing the sample. Partial Least Squares Structural Equation Modeling (PLS-SEM) is implemented, an advanced technique that enables the validation of the proposed theoretical model while allowing the simultaneous analysis of multiple relationships between latent and observable variables. The SPSS® and SmartPLS software are used complementarily to carry out the analyses, ensuring consistency in statistical procedures, accuracy, and reliability of the results. The research examines how green certifications, acting as semiotic resources, are integrated into a visual communication system that interacts with cultural values and visitors' perceptions. It advances the understanding of the theoretical intersection between *Destination Brand Equity* (DBE), the semiotics of green certifications, and visitation intentions in the context of green tourism, aiming for a deep understanding of the dynamics that influence the perception of value in sustainable tourist destinations. Therefore, it is estimated that the *Sustainability-Based Destination Brand Equity Modeling* will provide theoretical and practical recommendations for researchers and branding professionals. It proposes the effective integration of sustainable elements into branding strategies to promote tourism that meets market demands while contributing to environmental, cultural preservation, and sustainable development, in alignment with the Sustainable Development Goals (SDGs) set by the United Nations' 2030 Agenda.

TEJERINA, BENJAMIN* (Department of Sociology and Social Work, University of the Basque Country, Spain)

Climate Regeneration. New Actors and New Strategies in the Climate Movement

Human activities developed during the Anthropocene are leading the planet to a critical situation that requires urgent collective action. The degradation of living conditions has given rise to various conflicts and social mobilizations. The global justice movement, can be considered precedent and precursor of the discourse and social mobilization in favor of a change in our lifestyle in accordance with the limitations of the planet, which is the focus of today's climate mobilization. Three elements stand out in the social mobilization against the climate emergency: 1) the protagonism of the younger generations; 2) the construction of a new collective identity based on a discourse that integrates the role of nature, animal life and the relationships between human and non-human interactions; and 3) the impact on daily life, the political dimension, governance and global policies.

In any case, there are other previous mobilizations related to the possible reversal of climate change, such as the movements of resistance to neoliberalism (Almeida and Pérez Martín, 2023), mobilizations against extractivism (Bebbington and Bury, 2013), environmental conflicts (Cuenca et

al., 2022), alternative movements around "good living" and the philosophy of life of indigenous communities (Acosta, 2012). In addition, collective actions and movements claiming the recognition of legal rights over rivers, plants, animals, which will remain in the background in this communication, are having great visibility.

The objective is twofold: 1) to analyze the different strategies, from the most classic mobilizations to civil disobedience, deployed by organizations such as Fridays for Future, Youth Climate Strike, Sunrise Movement, Extinction Rebellion, Scientist Rebellion, Australian Youth Climate Coalition, Gender CC-Women for climate change, Futuro Vegetal, Riposte Alimentaire and Just Stop Oil; and 2) to reconstruct the interpretative frameworks of the aforementioned actors around the diagnosis of the current situation, the Sustainable Development Goals, sustainability and climate change.

Considering Moldovan Return Migration with a Focus on Children: Stratified, Multi-Focal, Step-By-Step?

The ReMiReM project (started July 2024) addresses the return migration perspectives, capacities and actions of Moldovan migrants and their families. During preliminary fieldwork, we have thematized 'return migration' within transnational family experience. We observe the complexity of transnational strategies where not a single act of 'departure' leads to a single 'return', but several strata of migrancy coalesce into a multi-focal transnationality, including a maintained reverse transnational outlook. Therein, Moldovans' double (Moldovan-Romanian, Moldovan-Italian, Moldovan-Bulgarian etc.) citizenships and their previous migration experience to other post-communist countries allow access to interim places for migration or return within a step-wise longer-distance migration scheme.

On the other hand, recent developments in former sending countries as well as destination countries prompted a renewed return intent in many transnational family members; among their motives are imperfect integration and slowing economies in destination countries, need for maintaining identities and ties to home countries and regions, as well as new opportunities in home countries and in the transnational space. The position of children in this situation is however ambivalent: while they might have home country experience and may even opt for a future in that country (as observed in previous research by the authors), their institutional status and implicit socialization limit them in the long run through factors such as the loss of professional qualifications that are frequently unrecognized in either direction (sic).

In our study, we will address reverse transnationalism and chances of return migration from the direct or indirect perspective of children and adolescents in this context.

Obstetric Violence in Spanish Correctional Facilities

Research on the application of the Bangkok Rules in female correctional facilities in Spain uncovered obstetric violent situations. We refer to obstetric violence as those mistreating or abusive practices of different professionals in the care of women in the process of pregnancy, childbirth or gynaecological check-ups.

Based on 44 in-depth interviews with imprisoned women in 16 Spanish penitentiary centres, two situations of obstetric violence are exposed.

Firstly, women are always handcuffed, even when diagnostic tests such as cytology or ultrasound are performed.

Secondly, when they are in the doctor's surgery, the police stay indoors to maintain custody. This situation leads to a loss of intimacy and confidentiality between the gynaecologist or obstetrician and the women, who cannot

complain or protest about the problem. This type of custodial zeal is not understandable when female prisoners commit less serious, less dangerous crimes and are less violent in their behaviour, with recidivism and escapes being rare and anecdotal.

Findings come from the research project The Bangkok Rules: Assessing the progress and challenges of inequalities faced by women deprived of their liberty in penitentiary centres, R+D+I Project, Ministry of Science, Innovation and Universities, with reference number PID2022-140134OB-I00.

TELVE, KEIU* (University of Tartu/ Edith Cowan University, Estonia)

From Caring Transnational Families to Caring Communities and Nations: Developing the Concept of Transnational Civic Inclusion

The paper examines how the well-established field of transnational family studies can serve as a model (Greschke and Ott 2020) for exploring broader societal care networks that extend beyond the family and encompass communities at various scales (e.g., town, province, region, nation, continent). It asks what caregiving roles communities or nations play at the grassroots level and how transnational (digital) social inclusion can help ease the tensions caused by 'immobilizing regimes of migration' (Merla, Kilkey & Baldassar 2020).

This study draws on six months of ethnographic fieldwork and 45 in-depth interviews with Estonian migrants from two migration waves and three generations, exploring their identity and purpose-finding journeys toward Estonia, which increasingly take place in digital realms. Estonia, known for its strong online presence, ranks among the top three most advanced digital societies globally (United Nations 2020). As an e-state with a notable diaspora policy, Estonia provides its mobile citizens with extensive e-services, offering numerous opportunities to maintain connections with their homeland (European Commission Internal Market 2013; Kumer-Haukanömm, Telve 2017). The war in Ukraine, in particular, has galvanized Estonian communities worldwide, inspiring them to find creative ways to stay engaged from afar. Estonia has also emerged as a leading international advocate for Ukraine, and the empirical data reveals how international political discussions resonate at the grassroots level, uncovering a layer of everyday activism."

The key findings from the field contribute to the emerging field of transnational civic studies and help develop the concept of transnational (digital) civic engagement. This term can describe acts of societal care and explore how individuals participate in activities that transcend national borders to support or engage with their country of origin and previous local communities or maintain deeper connections with their homeland.

TENDO, MUTSUKE* (Miyagi Gakuin Women's University, Japan)
ASAKURA, KYOKO (Tohoku University, Japan)

Hidden Patriarchy and Empowerment of Women in Disaster: A Case Study of Recovery, Miyagi Japan

This presentation aims to provide a gender perspective on disasters, and challenge against hidden patriarchy theoretically and empirically, based on the case studies of women's empowerment and recovery after the East Japan Great Earthquake in 2011.

The focus of this presentation is not only on the disaster, as it also seeks to draw on academic debates on hidden patriarchy and women's empowerment and to problematize current disaster thinking and policies.

Tendo and colleagues (2021) created a new academic field called "Disaster and Women's Studies" prompted by the Great East Japan Earthquake, by tracing back through the research and practices of civic groups that put women in the center. It is an academic field, made up of practical and interdisciplinary expertise that draw from the realities on the ground involving women and disasters.

Disasters do not affect people equally. The inequitable gender order that pervades social, economic, and political systems is revealed in the division of labor by gender roles in running evacuation centers; the emphasis on women's household responsibilities; the uneven distribution of care responsibilities.

In this presentation, we focus on care and dignity, and invisible gender norms, then show a theoretical model of grassroots women's empowerment. We also examine a case study of recovery based on empirical research in Miyagi: a questionnaire survey of women who experienced disaster 2011, and in-depth interview cases of local women leaders.

Women are often constructed as a vulnerable group, however, our research findings show that women's were able to empower themselves. This was driven by our belief in the need to identify the various issues and background factors that women face whenever disasters occur, and to develop women's studies as an academic and theoretical framework and a tangible, practical tool to empower women to solve these issues.

« De La Catastrophe Naturelle Au "Massacre". Lutttes Et Mobilisations Post-Séisme Des Sinistrés Alévis Dans Le Province Du Hatay En Turquie »

Le séisme de « Kahramanmaraş » survenu le 6 février 2023, ayant causé la mort d'au moins 50 000 personnes, a mis en évidence les inégalités d'exposition aux risques environnementaux qui touchent les communautés minoritaires en Turquie. Particulièrement affectées par la catastrophe et délaissées par les autorités turques, les populations alévis de la province du Hatay – courant ethno-confessionnel hétérodoxe de l'islam – ont vu leur condition de vie se détériorer, exacerbant ainsi des fractures sociales, économiques et politiques préexistantes.

Depuis, les acteurs communautaires alévis se mobilisent pour dénoncer la gestion de la catastrophe par le gouvernement AKP (*Adalet ve Kalkınma Partisi*), accusé de profiter de la crise humanitaire pour intensifier la marginalisation des groupes minoritaires « hostiles » au pouvoir central. Des collectifs-militants de solidarité aux victimes du séisme, basés en Turquie ainsi qu'au sein de la diaspora en Allemagne, en Autriche, en France et au Royaume-Uni, interviennent également au Hatay pour s'engager auprès des sinistrés de leur communauté, défendre leurs intérêts et contester les politiques discriminatoires de l'État.

Cette communication se propose d'analyser les modalités de luttes et de mobilisations des sinistrés alévis du Hatay face à l'(in)action de l'État dans la gestion des communautés vulnérables, à la fois minoritaires, racisées et sinistrées, suite aux tremblements de terre du 6 février 2023. Dans la Turquie post-séisme, la justice environnementale se présente alors comme un cadre d'action incontournable du mouvement alévi ; notamment investi comme un levier de résistance face aux politiques de *sunniisation* des autorités turques. À partir de ce cas, nous nous proposons d'interroger plus largement les logiques et les enjeux de l'articulation des luttes environnementales à celles des minorités ethniques, religieuses et culturelles en Turquie, mais aussi dans les pays du Sud global.

Counter-Archives of the Rif: Contemporary Art, Memory, and Resistance between Morocco and the Netherlands

This paper examines artistic practices from and about Morocco's northern Rif region that engage with its turbulent history, marked by colonial chemical warfare, post-independence repression, and massive emigration to Europe. Drawing on ethnographic fieldwork with Riffian Amazigh (Berber) artists in Morocco and the Netherlands, I argue that their art - particularly in the forms of painting, music, and film - serves not only as a means of nostalgic memory work, but also as a counter-archive (Brusius 2023) in the face of undisclosed historical documentation sitting in colonial archives. Using Michel-Rolph Trouillot's critical work (1995), which posits that narratives of the past are often manipulated by those in power but still hold potential for resistance, I analyze these artistic expressions, alongside the more recent work of forensic architecture (Fuller & Weizman 2021), as alternative historical accounts that address the region's violent past and its lingering effects, challenging official narratives that seek to silence this history. At the same time, these artworks and their transnational circulation construct a distinct Riffian identity, that transcends the geographical boundaries of the region, with themes of marginalization, misrecognition, and resistance at the heart of these artworks, which can be adopted by Riffians living in different contexts.

Aesthetic Autonomy Revisited: Toward a Model of Literature As Powerful Social Agent

While literary works have repeatedly demonstrated their significant impact on social action on a global scale, sociology has often been reluctant to acknowledge literature's agency. Instead, sociologists tend to emphasize the social determinants of literature, overlooking its potential as an active force. The current sociology of literature, dominated by Bourdieu's field theory, primarily focuses on literary production.

To remedy this epistemological asymmetry, we reintroduce a modified notion of *aesthetic autonomy*. Drawing on the phenomenology of reading (particularly the Constance School) and Actor-Network Theory, we argue that literary works exercise a degree of agency within the reading process. Rather than viewing literary texts merely as resources or critical material, most empirical readers engage in a more symmetrical dialogue with the text. We reject the objectifying approach that treats literary works as mere objects of analysis and instead embrace an objective perspective that allows texts to "object to what is said about them" (Latour 2005).

Methodologically, we explore this interaction between readers and texts through the aesthetic experience of reading, which we treat as a combination of intra-textual elements (literary devices) and extra-textual contexts (socio-historical realities in which the work was produced and received). We perceive the production and reception of literature as co-constitutive of literary meaning rather than purely deterministic.

Empirically, we investigate the aesthetic experience of reading the novel *Fama o biciklistima* (The Cyclist Conspiracy, 1987) by Serbian author Svetislav Basara. An enduring bestseller and highly consecrated work, the novel re-examines and deconstructs ideologies through its vigorous adoption of postmodern aesthetics. Esteemed for its deep understanding of the late 20th century Zeitgeist, the novel acts as a powerful agent of social action. We analyze its agency through triangulation, examining its production and reception together with a formal analysis of its structure.

Deconstructing the Role of Media in Sports, Leisure & Culture: Studying Disadvantaged Groups

Sports, Leisure and Cultural facilities have over the passage of time become more commercialized, and as a consequence, they are turning to be not only expensive, but in the process, increasingly exclusive for people living under disadvantageous positions and neighborhoods. Naturally, activities and situations vary in contexts, but then in all cases the cultural, sportive and leisurely practices can assist in formulation of social cohesion and harmony within communities.

Youth dwelling in disadvantaged neighborhoods do not have proper admittance to a full range of leisure, sport, and cultural openings because they have become progressively more expensive and exclusive, or there is a deficiency of information about available opportunities. Also, very often, they are not always aware of the range of such opportunities that are available to them. The Youth should have access to accessible, affordable and youth-friendly sports, leisure and cultural opportunities.

Public authorities should recognize that leisure, sport, and culture have many benefits and should make out ways how the local public can decide about different policies and programs that support sport, leisure and culture. Furthermore these authorities should ensure that sport, youth work and other activities are accessed by young men and young women from different cultural backgrounds.

The role of media in identifying these gaps is indeed useful. The media has more access to know how of the education facilities; access to health facilities; access to information; access to employment opportunities and access to non-formal education and youth participation. This study traces results from an outcome of a study in Portugal on youth between the age of 18 – 27 years and demonstrates how the media can be used to promote and disseminate social rights as they have a broad idea of the gaps and how it can be used to the best advantage for disadvantageous groups.

Encounters and Efforts in Adversity: Gendered Experiences of Im/Mobility in Sundarbans Delta, India

Sundarbans, an actively retrograding and prograding delta, is a region marked by extreme poverty, underdevelopment, and ecological degradation manifested by both anthropogenic changes and compounded in the current times by climate change and disasters. In the coastal margins of the Indian Part of the delta, a complex mobility grid operates. This paper uses a qualitative methodology to explore the gendered lived experiences of im/mobility. It draws from the theoretical framework of feminist political ecology to comprehend the physical and emotional labour involved in living in a climate hotspot and dealing with mobility and immobility. Using the concepts of "koshto" (suffering/hardship) and "cheshta" (struggle/endeavour) and the dynamic interplay between them, the paper reveals that everyday suffering and hardship (koshto) are the backdrops against which the women's hard work, struggle and endeavour (cheshta) are forged. The embodied experiences highlight how women's bodies perform arduous labour to survive and nurture life in a degrading environment. Being more mobile, men venture to distant places to earn wages; in their absence, women's workload increases due to care and labour responsibilities, mainly when growing crops, fruits, and vegetables is no longer feasible. However, this dynamic shifts in families where men are not available/cannot/or do not want to earn a living. In such cases, young, able-bodied women move out to work as domestic workers or caregivers. Families where neither men nor women can migrate out to work are worse off; in the absence of the men's ability to work, women provide both caregiving and full-day labour to support their household in degrading environments. By examining everyday relationships, this paper reveals the invisible yet complex ways that micro-scaled geopolitics of forced mobility and immobility are entangled with daily life, coping practices and gender relations and how these dynamics intersect with the embodied experiences of women are delved upon.

Women's Lived Experiences of Im/Mobility in the Sundarbans Delta India: A Gendered Intersectional Analysis

The Sundarbans Delta in India is a climate-stressed region where women use mobility as a livelihood diversification strategy. In contrast, others are left behind to cope with climate-related risks in fragile locations. This qualitative research paper provides a granular understanding of women's lived experiences and their struggle to deal with climate-related disasters, such as cyclones, floods, and coastal erosion, by considering how the embodied intersections of gender, age, ability, motherhood and marital status shape mobility and immobility in the delta. The paper relates to the idea that women reside at the intersections of multiple identities, which are fluid depending on the spaces they occupy. Therefore, drawing from the theories of gendered intersectionality from a feminist political ecology framework, it challenges the notion that all women occupy the same position in the patriarchal order and experience the same oppression and looks at the multiple axes of differences that intersect historically, politically and socially specific contexts to determine the degree of powerlessness in society. The findings suggest that only able-bodied young women become adaptive agents and undertake circular/seasonal/temporary labour migration to deal with the impact of stressors. In contrast, vulnerable women, such as those with children, disabled women, and elderly women, are typically unable to mobilise the human capital necessary to enter the virtuous flow of skilled labour migration. Additionally, even women who undertake migratory labour journeys are exposed to numerous additional risks while trying to support their families back home in dealing with stressors. The findings provide a nuanced understanding of power relations and the challenges faced by women, which is crucial in understanding the complex nexus between gender, climate change and immobility and underscores the need for gender transformative policies to address root causes of climate-related mobility and immobility in the Sundarbans.

The Digital Public Sphere and Epistemic Justice: A Sociological Analysis of Algorithm-Driven News Consumption and Its Impact on Political Opinions Among Young Indians

This study examines how algorithmic content curation influences the formation and distribution of political knowledge and opinions among Indian university students, addressing the theme of political socialization in the digital age. We investigate how algorithm-driven content curation acts as a new agent of socialization for young Indians, potentially complementing or supplanting traditional agents like family and educational institutions. Employing a mixed-methods approach, including surveys (n = 800), in-depth interviews (n = 50), and content analysis across social media platforms, we explore the emergence of digital tribes, the reinforcement of echo chambers, and their implications for political socialization. This approach allows us to examine how digital ecosystems contribute to the formation of political beliefs and attitudes among youth, impacting their preparation for citizenship and democratic participation. Our research is underpinned by a Digital Sociological framework, incorporating theories such as the Social Construction of Technology and Network Society Theory. This foundation helps analyze how algorithmic curation is becoming a new social institution with significant implications for power dynamics, epistemic justice, and gatekeeping in the digital public sphere. By examining this phenomenon through a digital sociological lens, we aim to contribute to a deeper understanding of the complex interplay between technology, society, and political discourse in the 21st century. Our findings offer insights into how younger generations acquire political knowledge in an era of algorithmic content curation, contributing to discussions about evolving political socialization in the face of global digital transformations. This research not only illuminates the Indian context but also offers a methodological approach adaptable to other global contexts, addressing challenges that rapid technological changes pose to our understanding of political socialization processes, particularly considering generational differences in media consumption.

TEXTORES, LARA* (German Police University, Germany)

Comparison between Germany and Mexico: How Do Patriarchal Attitudes Influence Femicides?

Even after the ratification of the Istanbul Convention and the Inter-American Convention on the Prevention, Punishment and Eradication of Violence Against Women, femicide is still one of the most common causes of death among women and girls worldwide. Femicide refers to the killing of a woman or a girl for gender-specific reasons and can be linked to the attribution of roles or characteristics. Research shows that high femicide rates can be associated with a high tolerance of violence against women in general, as well as with a sense of control and ownership and hierarchical gender relations. It is therefore necessary to take a closer look at patriarchal attitudes, i.e. society's prevailing views on gender roles and gender inequality, and to examine them as a potential cause of femicide. A comparison of culturally different countries is useful in order to understand their influences.

In a socio-cultural approach, this research focuses on patriarchal attitudes as a cause of femicide, based on Bronfenbrenner's ecological model. It presents preliminary findings from a comparative file analysis in Germany and Mexico. The data is analysed with a focus on individual patriarchal attitudes of the perpetrators. The aim is to identify individual justification and neutralisation strategies behind femicides in two culturally different countries.

The results will be discussed with regards to socially embedded narratives and argumentation patterns and compared between the two countries being analysed. Recommendations for effective prevention measures that address patriarchal ways of thinking will be derived from this.

Taking the Core Online

Even though most universities by now have returned to in-person instruction after the COVID-19 pandemic, it is becoming increasingly clear that hybrid and fully online options are here to stay. In Canada, the demand for online courses, including online Sociology courses, remains very high. In our

conversation with students, we've learned that online courses are attractive because they offer greater flexibility, independence, self-paced learning, and are more accommodating to students' busy schedules. For our department, online options are appealing because we face an increasing number of sociology majors, fiscal constraints and a shrinking faculty, which together have created logistical and pragmatic challenges that can be addressed by offering classes in different modalities. This presentation discusses the benefits and limitations of offering core courses, such as Social Research Methods online. Such online courses can not only mirror in-person learning, but they can also avoid some of the barriers to learning in-person classes create and thus equalize access to education for diverse student populations. We will describe our approach to teaching the online section of Introductory Social Research Methods, which was designed with Universal Design for Learning (UDL) and Equity, Diversity, Inclusivity and Accessibility (EDIA) principles in mind. We will then address how students responded to the course and how they perceived their learning in this class.

Sociological Theorizing of Resistance through the Writings of Basil Al-Araj

"If you want to be an intellectual, you need to be engaged in the struggle. If you don't want to engage... then you and your so-called 'intellect' are not needed."

This study highlights the awareness of Basil al-Araj's language and its contexts in the theory and reality of the Palestinian revolutionary resistance. It is an awareness that takes on functions that extend over several historical stages. The language becomes present in the glow of our awareness of resistance and martyrdom and abstract values built in our minds, making Bassel's narrative a reality that go into the space of clash.

Basil was known as the man of the protests and sit-ins that fought Oslo, normalization, and the occupation. Its existence, systems and tools. He organized introductory trips and field tours about Palestine and its land. Basil was active in blogging on social media platforms until his last breath when he was martyred and those around him wrote about it.

In this paper, I will study the function of Basil's language in its resistive dimension, for a group of texts that gathered from different places and published them through platforms, drafts, and research articles, in addition to his brief will. In it, you read the functional power of language in its resistance and awareness dimensions, conflict and its tools, and the concepts of awareness and struggle with a high philosophical intensity.

His theory of resistance consciousness was inspired by Ali Shariati, Frantz Fanon, Imam Hussein, Hassan Nasrallah, Che Guevara, Wadih Haddad, and Ghassan Kanafani. He represented an integrated model between resistance and consciousness, between what is a field of knowledge and revolutionary consciousness. He also drew a clear philosophy regarding martyrdom and its jurisprudence and was not elitist in presenting its concept.

THAKKER, HEMAL* (INRAE - Laboratoire Interdisciplinaire Sciences Innovations Sociétés (LISIS), France)

Institutionalizing Agroecology: Community-Managed Natural Farming within Governance Frameworks in Andhra Pradesh

The Green Revolution has left a lasting legacy on India's agricultural sector, embedding an industrial model that prioritizes productivity over ecological sustainability. Supported by state-led initiatives and international foundations, this model institutionalized practices that often marginalized local knowledge systems and led to significant environmental impacts, such as soil degradation, water depletion, and loss of biodiversity. In response, Andhra Pradesh's Community-Managed Natural Farming (CMNF) initiative presents an agroecological alternative grounded in local ecological knowledge and community agency. CMNF promotes farming methods that rely on natural inputs, enhance soil biodiversity, and reduce chemical dependencies. It is thereby positioned as a counter-narrative that challenges the Green Revolution paradigm by fostering resilience through ecological diversity and farmer autonomy.

This study explores how CMNF navigates institutional challenges while interacting with established governance structures to promote sustainable agricultural practices. Using Structuration Theory, the research examines the dynamic between individual agency and institutional frameworks, focusing on how farmers and communities adapt to, and influence, policy environments. Additionally, a Multi-Level Governance framework is employed to investigate how state policies, community networks, and knowledge systems intersect to

either enable or restrict the scaling of agroecological practices. By investigating the case of Andhra Pradesh, this research contributes to the discourse on global governance, sustainable agriculture, and the role of state interventions in fostering systemic change. The study emphasizes the need for governance models that support locally-adapted, knowledge-driven approaches to food security, offering insights into how institutional flexibility can enhance sustainability in the Anthropocene. It raises critical questions about the future of agricultural transitions and the role of agroecological models in addressing sustainability challenges on both local and global scales.

THAKORE, BHOOMI* (University of Connecticut, USA)

Perceptions of Legitimacy and Influence of Youtube

Launched in 2005, YouTube is now the second-most visited website in the world (only following its parent company, Google), generating billions of daily views. While many users may assume that YouTube is simply a website for video playback, the range of its technological advancements have altered content and significantly impacted media socialization. YouTube remains significant as a resource that straddles the line between traditional (news/entertainment) media and new media (internet-based) platforms.

According to a 2021 study by the Pew Research Center, about 81% of adults and 95% of young adults (ages 18-29) in the U.S. watch YouTube. A 2019 study by the Pew Research Center found that users are turning to YouTube for much more than entertainment. Half of users reported that YouTube is very important for helping them learn how to do things they have never done before and about 20% of users report it is very important for helping them understand events that are happening in the world.

Relying on data from interviews with U.S. based YouTube consumers, I will analyze the myriad ways in which users perceive and make choices about the content they consume. For my presentation, I will focus on qualitative perceptions of content legitimacy, and the impact and perceptions of the YouTube algorithm and its role in perpetuating misinformation. As most new content is posted by a small percentage of YouTube channels with high numbers of subscribers, I will also focus on perceptions of the role of popular influencers as today's opinion makers. I will conclude with a reflection on the sociological impacts of YouTube, as one platform amid all emergent social media platforms.

RC41-666.2

THAMILARASAN, MAHAMUNI* (University of Madras, Chennai INDIA, India)

Population and Development in Chennai City of Tamil Nadu, India

The urban population in India has grown from 286.1 million in 2001 to 508.3 million in 2021. Tamilnadu has emerged as the third largest economy in India. Cities exist and grow because of economies of urban agglomeration associated with industrial and trade activities. In the recent past, liberalisation, rapidly growing IT sector, an educated, hardworking and disciplined work force etc, accelerating economic development also contributed to the growth of urban areas in Tamilnadu. The extent of the State is 130,058 sq.km. of which the urban area accounts for 12,525 sq.km. Tamilnadu is the most urbanised state in India. It is one of the few states in India with hierarchy of urban areas dispersed fairly uniformly through-out the State. The population of Tamil Nadu is 8,31 million as per 2022. Its urban population has grown from 27,48 million in 2001 to 34.91 million in 2022. The present study is descriptive in nature and tries to understand the nature of population and development in Chennai City and its social consequences.

Chennai (earlier called as Madras) was established in 1639, as one of the East India Company's earliest trading Ports and later became the centre of the company's control over Southern India. The study stated that Chennai has become the place of attraction among young graduates, masses those seeking for employment opportunities and better education, health facilities and urban services. The infrastructural development in Chennai city facilitate the people immigration to the city as floating population every day in approximately 85,000 migrants labourers per day. It also results in facing problems in access to basic facilities by the floating population, crowdedness, and environmental pollution etc. The study suggests to take measures by the state and union government to control the problems of population and development in the Chennai city.

THAMPI, BINITHA VELAYUDHAN* (IIT Madras, India)

Feminist Labor Politics in the Neo-Liberal Era: Tea Plantation Labor Struggle in Munnar Tea Plantations, India

A labor protest in 2015 by around 5000 women workers belonging to Kannan Devan Hills Plantations (KDHP) in Munnar of Kerala state, India, has received wider media attention. After around three weeks of struggle, both by stopping the plucking of tea leaves and staging their protest by blocking the main roads, the government of Kerala intervened and assured to increase the bonus and minimum wage that the protesters demanded. Women raised severe criticism against their organized trade unions for failing to represent the collective interest of workers and formed their own trade union, namely, "Pembilai Orumai" (Women's Unity). In response to the global crisis in the tea market, there was a significant shift in the management structure of the tea plantations in 2004 from Tata Tea, a multi-national Indian company, to a workers' owned KDH Private Limited Company by mooting employee buy-out scheme and allowing the workers to become the shareholders of the company.

It is against this backdrop this paper analyses the factors that led to the struggle and the impact of the protest on labor rights and working conditions. It employed the feminist labor geography framework - how gender, labour and geography (places with their changing spatial markers and the mobility of capital) created certain disabling conditions for women that produced greater resentment and collective resistance. By examining the modes of protest, slogans raised, collectivization strategies employed, forms of negotiations with the State and the Company, and efforts to forge solidarity with various civil society movements, I argue that there is a marked shift in their articulation of politics from rigid trade unionism towards building a feminist socialist politics of claim-making. In the context of the Indian State's neo-liberal transition, this protest should be documented as an interesting example of changing capital-labor relations constraining labor.

RC24-398.5

THEA, WIESLI* (University of Innsbruck, Austria)

Factors Affecting Meat Consumption of Social Groups and Classes

Overconsumption of meat causes substantial environmental, climate, and justice challenges. According to the Intergovernmental Panel on Climate Change and the United Nations, a minimum 50% reduction in global red meat consumption will be necessary to establish a sustainable, healthy, and equitable global food system. Reducing average meat consumption is particularly required in high-income countries, where inhabitants consume two-and-a-half times more than inhabitants of low-income countries.

However, daily habits like diets are part of a lifestyle shaped by a complex interplay of social, cultural, and economic factors. For example, Pierre Bourdieu already showed in the 1960s and 1970s that social classes differ in their preferences for food and how and situations they prepare food and eat based on their life circumstances. Current research confirms that diet preferences and conditions are distinguished between socioeconomic groups and social classes. Meat particularly has a social significance, symbolising affiliation or distinction from other social groups.

Nevertheless, very little is known about the factors influencing the meat consumption of different social groups and classes. Science and policy actors must understand the factors affecting their diet decisions to effectively and specifically support different social groups and classes in reducing unsustainable meat consumption.

The research I aim to present at the ISA 2025 identifies these factors influencing meat consumption among various socio-economic groups and social classes in high-income countries and develops support strategies. I will present the first results of a representative factorial survey from Austria, England, and Finland, which I analysed using a multi-level analysis to test influencing factors. The results provide novel and urgently needed knowledge into consumer behaviour for science, practice and policy to support consumers by informing actions for sustainable and just food transformation in the Anthropocene.

THEJUS, RUHAMAH* (University of St Andrews, United Kingdom)

Home As Assemblage: A More Just Approach to Technology-Enabled Ageing in Place?

As the proportion of older people increases globally, ageing in place is given increasing value as a strategy for care. Considering the ubiquitous presence of technology in the home and in society in general, healthy ageing in place involves significant interactions between older people and digital technology to foster a dignified and independent experience of ageing.

This paper applies assemblage thinking to technology-enabled homes of older people. Assemblage thinking enables reflection on the home as not only a physical space, but also as a conflation of decisions, influences and actions, which may not always occur within the physical space conventionally called home, but that affect the experience of home. Listening to the voices of older people in Germany and Scotland, the paper will highlight the nature of interactions between older people and technology and will encourage a shift in approach to not only better understand these interactions, but to suggest ways in which they can be made more humane and just, and ultimately result in a more flexible and adaptable experience of ageing at home.

The application of qualitative tools such as home tours and interviews will enable older people to articulate their reflections on home around the use of technology for healthy ageing. The empirical focus will be Scotland and Germany. The findings are intended to shed light on the complexity of 'home', especially for older people, and to highlight some key theoretical as well as practical aspects of these important ideas to be considered when thinking of a more just approach to ageing in place.

THEMELIS, SPYROS* (University of East Anglia, United Kingdom)

Pluriversal Pedagogies for the Post-Anthropocene: Radicalising Democracy through Social Movements

How do diverse social movements strive for social justice? How do they connect this struggle with attendant ones for symbolic, racial, ethnic, gender and environmental justice? What kind of pedagogies underpin such movements? This paper draws on empirical work with social movements that spans over the last 12 years in Latin America (i.e. Brazil and Chile) and Europe (i.e. Greece and Britain). I discuss the repertoires of action they utilise and the responses they generate to some urgent societal and planetary challenges of our times, such as climate change, the crisis of democracy and the debunking of mainstream politics. I offer a novel theoretical framework that juxtaposes the realist pedagogies that are dominant in the Anthropocene with the pluriversal pedagogies that progressive social movements advocate. I argue that the pedagogies these movements engender and the politics they propound contribute to the generation of alternative epistemologies, prefigurative ontologies and socially just axiological frameworks. I develop further this framework to consider the potential of these movements to transcend the triumvirate of capitalist-colonialist-ecocidal relations associated with in the Anthropocene. The aim of this paper is to enrich the global tapestry of alternatives (TAP, 2020) that are being weaved by social movements, activists and a multitude of groups around the world with empirically-grounded work that is generative of new praxiological and theoretical possibilities.

THEOBALD, HILDEGARD* (University of Vechta, Germany)

Elderly Care Reforms in Germany: Policies, Implementation and Inequalities

As in many western countries, in Germany the expansion and marketization of elderly care services were followed by a worsening of working conditions in the female-connotated sector. In response to the poor working conditions, reform policies were instituted on the national level with the aim of improving labour conditions and thus ensuring a socially sustainable elderly care services infrastructure.

This paper seeks to determine whether elderly care reforms contribute to a reduction of inequalities among care workers within the sector as a decisive element of a socially sustainable care infrastructure. To this end, it selects the implementation of two key reforms in nursing home facilities – policies for increasing staffing levels and policies for promoting international recruitment of care staff. The increase in staffing levels in nursing homes is implemented by a significant change in the composition and cooperation of differently skilled care staff. In this research, skill levels are defined as central component

of class and therefore inequality dynamics on this basis are explored. The increasing recruitment of care migrants suggests inequality dynamics based on migration status, which are also explored. Conceptually, the paper draws on the paradigm of multi-level intersectionality for an analysis of the intersection of inequalities based on class and migration status in the female-connotated sector. Multilevel intersectional research assumes that inequality is the product of an interplay of various factors on different societal levels. On the macro level, this research includes social policies; on the meso level work organizations as well as working conditions and practices and on the micro level, social practices and social interactions between individuals. Empirically, it is based on a research project including a nationwide questionnaire study and case studies in nursing homes, which examine the implementation and outcomes of the reforms in nursing homes.

THERRIEN, STEVEN* (Université de Montréal, Canada)

De l'Excès Émotionnel Au Contrôle De Soi. Quelle Mise En Scène De La Masculinité Dans La Formation Des Traders Professionnels ?

Le milieu financier est historiquement dominé par les hommes, et cela est particulièrement vrai pour des catégories professionnelles comme les « traders », c'est-à-dire celles et ceux qui achètent et vendent des actifs sur les marchés. Témoins de cette tendance, plusieurs enquêtes réalisées dans les années 1980-90 auprès des professionnels de la finance ont permis d'émettre des constats qui relèvent les enjeux d'égalité et d'inclusivité dans ce secteur, en montrant que le travail des traders dans les salles de marchés à la crie s'accompagnait de la « performance » d'une masculinité agressive qui marginalisait la place des femmes. Dans cette communication, nous souhaitons remettre à l'examen cette thèse à la lumière des récentes évolutions de la pratique du trader, dont la virtualisation de l'activité, ainsi que la diffusion de nouvelles formes de savoirs issues de la finance comportementale. Pour ce faire, nous présenterons les résultats d'une analyse documentaire réalisée auprès des ouvrages de « psychologie du trading » les plus influents dans les communautés de traders, avec pour objectif d'étudier les nouvelles normes, pratiques et représentations auxquelles ces acteurs sont sensibilisés dans leur formation, et leur influence sur la marginalisation des femmes et des minorités de genre. Nous verrons que cette littérature prescrit aux traders un important « travail émotionnel », fondé sur le contrôle des émotions ressenties dans le contexte de leur pratique. Bien qu'il s'agisse d'une transformation majeure, ces représentations reproduisent en réalité d'importantes discriminations, alors que le contrôle émotionnel et la maîtrise de soi sont traditionnellement associés à la masculinité. En étudiant les normes émotionnelles prescrites dans cette littérature, notre communication souhaite mettre en exergue le rôle des savoirs professionnels dans la (re) production d'inégalités de genre dans le secteur financier, à un moment où la participation des femmes et des minorités de genre connaît paradoxalement une croissance.

RC05-77.12

THIBAULT, ADRIEN* (Institut de recherche sur le Maghreb contemporain (IRMC), Tunisia)

The Status Precariousness of Tunisian "Talents" in France: Glass Ceiling, Assignments and Microaggressions

The literature on privileged mobility has recently developed the concept of 'precarious privilege' to capture the ambivalence of some of these migratory experiences. Significantly, the concept has been used almost exclusively in relation to white individuals from the global North (Bunnell&Poole 2022; Green, 2022; Poole, 2022). The concept proves difficult to transpose to the case of privileged mobility from the global South, since at least two types of privilege, migratory and racial, can only be observed for North→South migration. In the case of South→North mobility, these privileges are, conversely, transformed into two forms of precariousness, administrative and statutory. It therefore seems more appropriate to reverse the phrase and speak of 'privileged precariousness' to characterise privileged mobility from South to North (Thibault 2025).

Based on a survey of 30 semi-directive interviews conducted with Tunisian engineers, consultants, researchers and artists who hold/have held the French 'talent passport' residence permit, the paper pays particular attention to the status precariousness of these expatriates, situated at the intersection of a dominant socio-professional position (as members of the upper middle class in France) and a dominated national and racial position (as 'Arabs'/North Africans/Muslims). It shows that these highly qualified Tunisian professionals in France are caught up in a double division of labour, both vertical (glass ceiling) and horizontal (assignment to certain specialties), which limits their prospects of professional advancement and confines them to the periphery of the upper middle class. They are also constantly exposed, in their ordinary

interactions in France, to the risk of being racialised by the majority group –in the dual sense of being ‘othered’ and ‘inferiorised’. This can lead them to experience repeated microaggressions which, when they are not able to ignore them completely, force them to question the racist nature of the acts and comments made against them.

THIBAUT, ADRIEN* (Institut de recherche sur le Maghreb contemporain (IRMC), Tunisia)

When the Global City Chooses Its Expatriates. Reasons Why Highly Qualified Tunisian Professionals Move to Paris

Since the end of the 1990s (Wagner, 1998; O'Reilly, 2000), research on migration has taken a growing interest in ‘expatriates’. Until now, however, most of this research has focused on white migration from Western Europe and North America. There are far fewer studies of expatriates from the Global South, especially those from Africa. What is more, the term ‘expatriate’ itself is rarely used to describe these non-white and non-Western ‘privileged migrants’ (Croucher, 2012), making the migration category an implicit racial category. Yet a growing number of North African nationals are working in Europe in professional jobs similar to those commonly regarded as ‘expatriates’ (engineers, doctors, lecturers, etc.). Of the 18,000 new ‘talent passport’ residence permits issued in France in 2022 to non-European nationals, more than 3,000 were issued to Tunisian nationals (17%), making Tunisia the main beneficiary of the scheme, ahead of India (2,000, 12%) and Morocco (1,900, 11%).

Based on a survey of more than 20 semi-directive interviews conducted in Paris and Tunis with Tunisian engineers, consultants, doctors and researchers working or planning to work in Paris, the paper sets out to examine their migratory motivations. It shows that, in their case, it is not so much the expatriates who choose their preferred global city than the global city of Paris that chooses its expatriates, in the sense that the choice of destination is largely imposed on them, not only for labour market reasons, but also for linguistic, cultural, family and friendship reasons that have much to do with the colonial history linking France and Tunisia.

Climate Justice in Tourism to Omani Cities: Bahla and Salalah

The effects of climate change are being felt in Oman: rising temperatures, more extreme weather events and sea level rise (e.g. storms/cyclones, heavy rainfall), less and more erratic rainfall are leading to aridity, drought, soil salinity, water scarcity and desertification (Ahmed & Choudri, 2012; Al-Awadhi et al., 2019; Gunawardhana et al., 2016). As a result, aquifers and other water resources are under stress (Al-Kalbani et al., 2014; Al-Maktoumi et al., 2018), flora is being lost (Al-Kindi et al., 2023; McLaren 2016), invasive species are gaining ground (Al Ruheili et al., 2022), and mangroves, aquaculture, and agriculture are threatened (Buerkert et al., 2020; Choudri et al., 2013; Schütze et al., 2011; Shabani et al., 2018; Sharifian et al., 2021; Engelhard et al. 2022). In general, coastal tourism infrastructure is at risk (Arabadzhan et al., 2021). Because of these impacts, heritage sites in Oman are also at risk because they are made of clay, such as Bahla Fort, and/or exposed to extreme weather conditions, such as the Frankincense Park in Wadi Dawkah near Salalah. Both can suffer from heavy rains that damage the unbaked brick walls (Bahla Fort) or flood the wadi (Frankincense Park Wadi Dawkah), a form of extreme weather that is becoming more likely with global warming (Wang et al. 2017). Local communities in Oman are aware of the importance of tourism and its potential for Omani heritage, but also of the positive and negative impacts of tourism on the environment (Fida et al. 2022, Ravikumar et al. 2022). This paper examines climate justice in the Omani heritage cities of Bahla and Salalah in the form of *net-zero travel*, a form of tourism that has no net impact on the climate system (Baumgartner et al. 2024).

La Conciliation De l'Entreprenariat/Travail Et De La Famille Au Sénégal : Craintes Et Contraintes .

Les capitales subsahariennes, dont Dakar, ont connu des bouleversements socio-économiques et démographiques importants au cours des dernières décennies (augmentation de la scolarisation des filles et des taux d'activité féminins ; participation accrue des femmes aux budgets des ménages ; changement des modèles conjugaux) qui interrogent les transformations des rôles féminins et masculins au sein des familles.

En milieu entrepreneurial, dans la banlieue dakaroise (Pikine et Guédiawaye) les femmes évoquent souvent les questions des contraintes domestiques qui ralentissent leur productivité. Cependant, nous avons remarqué que celles qui ont un niveau d'étude avancé ou une prospérité de revenus arrivent à exprimer une liberté dans leurs façons de gérer leurs foyers. Malgré l'intérêt porté par la communauté internationale et les politiques nationales sur l'émergence des rôles féminins dans les ménages, ces questions restent un angle de recherche encore peu étudiée au Sénégal. Elles constituent peu un objet de recherche central et sont le plus souvent abordées de manière périphérique, par exemple dans les études sur le travail ou la migration des enfants, ou la scolarisation des filles. Elles sont évoquées dans des recherches, essentiellement qualitatives, ciblant la difficile articulation du travail et de la famille des femmes actives. Le fait de traiter la posture de ces femmes comme des cheffes de famille bouleverserait l'ordre social et participe donc à enfoncer la connotation péjorative des outils théoriques du féminisme. Et pourtant, l'exclusivité de la subsistance et des biens détenus par les hommes est de plus en plus déconstruite, le modèle de famille monoparentale est assumé par les femmes qui assurent l'éducation et le bien-être de l'enfant, ou alors les charges financières du couple sont partagées ce qui permet à la femme d'être « libres » .

Le Silence Autour De La Maternité Au Sénégal, Une Forme Domination De Patriarcale.

Les femmes au Sénégal sont contraintes au silence public et à des expressions limitées en privé, ce qui entrave la transmission intergénérationnelle sur l'expérience de la maternité. Elles ont été socialisées dans le silence et l'endurance dès l'enfance et ont fini par accepter les restrictions de liberté qui leur sont imposées. Les grossesses, maternité et parentalité sont considérées comme des compétences automatiques dès lors qu'elles sont dans le cadre du mariage et sont encouragées à subir ces changements dans leurs vies comme une bénédiction qui vient donner sens à leur mission de femme. Elles portent une lourde charge mentale dans les chemins qui mènent vers la vertu qui devrait être la marque de fabrique de chacune pour la bonne marche du foyer et l'éducation des enfants. On attend d'elles d'enfanter et s'oublier dans un silence total. La grande expérience de la maternité est tue dans ses différents détails et empêche aux jeunes mères d'avoir des grossesses « conscientes ». Leur environnement devient hostile à leur libération et favorise l'enfermement autour de changements hormonaux pendant la grossesse, une phobie de l'accouchement, un rejet du deuil périnatal. Les femmes entretiennent ce silence et se plient à la volonté d'un système social qui a défini les critères d'une « bonne sénégalaise ». Celles qui essaieront de dire tout haut ce qui est murmuré sous les voiles des aînées, sont vues comme des marginales, des femmes qui prônent la liberté en essayant de copier l'Occident qui a d'autres valeurs. Le discours paternaliste encourage les femmes à rester dans les rangs traditionnels or, la catégorie de bonnes femmes qui a été choisie comme conjointe, n'a pas été épargnée de violences conjugales, d'abandon, d'indifférence et ne bénéficie pas plus de soutien et d'estime par rapport aux femmes rebelles qui ne sont pas dans les rangs du mutisme.

Paradoxes of Ethnolinguistic Marginalization: Examining Minority Hierarchies and Exclusion in South Tyrol's Primary Schools

The paper focuses on a current debate about the planned separation of ethnolinguistically marginalized children at a primary school in South Tyrol. It addresses the paradox of regional minorities, who have a legitimate place in nation-states and, by invoking their minority status, exclude other minorities. We outline the hierarchy of minority rights (Thoma 2022) based on articles from German- and Italian-language newspapers, examine phenomena of this hierarchy in the field through two ethnographic projects, and explore possibilities for discourse-shifting cooperation between researchers and actors in the field.

Identification of Educational Barriers of Young Refugees in Vocational Training in the Participatory and Transdisciplinary Research Project Laeneas

As a result of the large-scale arrival of refugees and migrants since 2015, Germany is faced with the challenge of providing inclusive educational pathways for successful integration into the labour market. In this paper we present findings from our research project laeneAs (Ländliche Bildungsumwelten junger Geflüchteter in der beruflichen Ausbildung / The Rural Educational Environments of Young Refugees in Vocational Training). The project focuses on educational barriers and the development of good practice within the VET system for refugees in rural counties (Korntheuer & Thomas 2022; Thomas et al. 2024). In four German municipalities, real-world laboratories were organised as future workshops and group discussions to shape participatory knowledge production and practice development in a transdisciplinary way (Defila/Di Giulio 2019; Di Giulio/Defila 2018). Stakeholders from formal, non-formal and informal educational institutions - vocational schools, administration, companies, chambers, social work - as well as young refugees in training came together in research coalitions.

Our data shows that restrictive and contradictory migration regimes act as central barriers to education and lead to the reproduction of social inequalities. The analysis identified the following areas as important barriers to education and for practice transformation: 1) infrastructural and cultural barriers; 2) day-to-day problems in vocational schools and companies 3) restrictive immigration policies and regulations. The interacting educational barriers for refugee trainees are particularly characterised by asylum regulations and an exclusionary bureaucracy, a lack of intercultural sensitivity on the part of authorities, companies and schools. Racism and discrimination are significant barriers to the participation of refugees in society and education. The development of good practice in real laboratories also revealed defence mechanisms in the local negotiation of good practice models to overcome educational barriers on the part of participating actors.

Participatory Action Research and the Research Forum. Conceptual Considerations and Practical Challenges

Participatory action research is based on a collaborative research process that relies on communication and understanding between practitioners, citizens and academic researchers (Thomas et al. 2021). In the paper, I would like to conceptualise the research forum as a communicative space (Kemmis & McTaggart 2005) that aims at the active participation of co-researchers in the research cycle. The research forum unfolds on four levels, which I would like to illustrate against the background of my research experience:

- Opening spaces for social encounters
- Establishing communicative exchange
- Developing social self-understanding
- Formation of public opinion and counter-public discourse

Citizen engagement can make a difference in the search for knowledge about societal issues. Participation in science can lead to a new and deeper understanding of one's own situation as a basis for new opportunities for action and empowerment. The Research Forum provides a collaborative framework for understanding in which science and lived experience can exchange perspectives. It is characterised by conversation and discussion of common issues and social challenges in an open, safe space where everyone can speak and be heard. The aim is to achieve a convergence of perspectives in an actionable interpretation of the situation and of reality (also in differentiation from each other), in order to promote the effectiveness of one's own knowledge in social practice. Guidelines and quality criteria of the Research Forum will be discussed in a reflection on my research practice.

THOMÉ, JOMA* (FGCSS University Fulda, Germany)

„Yallah, Riskiw.“ How Illegalised Migrants from the Maghreb Experience and Challenge Risks and Uncertainty on the Balkan Route and upon Arrival.

This contribution offers an ethnographic insight into understanding how illegalised migrants from the Maghreb experience and challenge risks and uncertainty on the Balkan Route. In the face of high mortality rates for crossing attempts via the Mediterranean Sea or after several failed attempts, migrants from the Maghreb countries increasingly choose to migrate towards Europe via the Balkan Route. While the Balkan Route may not be directly as deadly as the Mediterranean passage, there is more and more documentation being published on cases of unidentified corpses and “the disappeared” (Hameršak, 2024). Besides death, “travelling” the Balkan Route carries a variety of risks and uncertainty to be kept in mind before departure or to discover while *en route*, ranging from torture and rape to detainment to permanently high exposure to psychological and physical stress over an extended period, several months and even years. The verb “to risk” even found its way from the French language into North African dialects of Arabic, meaning “to risk one's life in an attempt to make it to Europe”. Unlike migrants that are considered refugees under the Geneva convention (e.g. Syrian or Afghan citizens), upon arrival in the EU, migrants from the Maghreb also face the looming uncertainty of whether they will ever be able to legalise their stay and finding ways to provide stable income for themselves and family members back home. This contribution explores and analyses migrants' ways of dealing with the risks and encounters of violence on the Balkan Route and the uncertainty upon arrival.

Unpacking Young Adults' Voting Preferences: The Role of Neighborhood Trust

Compared to previous generations, young adults in the United States today report lower levels of trust in government, law enforcement, and their communities. This study investigates neighborhood factors influencing social trust among Arizona young adults during the lead-up to the 2020 presidential election. Through an analysis of online survey data for a sample of young adults ($N = 1,376$) who participated in the Arizona Youth Identity Project, we explore how neighborhood diversity, population density, racial identity, and political affiliation are associated with social trust and voting preferences. We find that Arizona young adults' trust in police and their neighbors varies by neighborhood diversity and racial identity, with residents of mostly White neighborhoods reporting higher levels of trust. Additionally, support for Trump is highest among young adults who expressed high trust in local police. This study underscores and begins to unpack the interplay between race, space, and trust in shaping political identities and preferences.

“They Have Black in Their Blood”: Exploring How Genetic Ancestry Tests Affect Racial Classifications and Evaluations

How do genetic ancestry tests (GATs) affect Black Americans' beliefs about when others should – or should not – identify as Black? Using two nationally representative survey experiments ($n=3,100$ and $n=3489$) that integrate causal inference with computational text analysis, we disentangle the effects of GAT results, context, and prior identification on Black Americans' racial classification and evaluation logics. While *racial classifications* – categorizing another person into one racial category or another – capture important information about how racial boundaries are drawn, the process through which these classifications are made and narrated – which we term *racial evaluation* – also provides essential details about the underlying cognitive and discursive practices that shape how people ‘do’ race.

We find that respondents have an increased likelihood of approving of a person's decision to identify as Black and classifying them as Black if that person has higher levels of GAT-measured Sub-Saharan African ancestry. Nonetheless, respondents tend to classify even individuals with low levels of such ancestry as Black. We also identify meaningful gaps between the responses made by respondents themselves and their perception of the typical classification response that would be made by members of their

own racial group, a pattern that we also find among White Americans in a comparison sample. These results suggest broad pluralistic ignorance towards the social rules governing racialization and legitimacy.

Further, free text responses reveal a range of strategies used to evaluate another's self-identification. However, the characteristics that affect evaluations differ from those that affect classifications; respondents selectively integrate different sources of information, including GAT results, via a dual classification and evaluation process which we term *racial contextualism*. In doing so, we bridge literatures on dual processes of thinking and culture with literatures on racial boundary-making, illustrating the cognitive and deliberative dimensions that shape perceptions of race.

THOMSON, CAMPBELL* (University College London (UCL), United Kingdom)

"Free-Thinking" on Telegram (mostly): Hybrid Ethnography, 'Flat Methodologies' and the UK Freedom Movement

Reflecting on fieldwork conducted with the UK Freedom Movement, I explore how a hybrid online and offline approach, following the flow of people and (counter)knowledge practices across multiple sites, supported a sustained engagement with the Movement, as a self-recognising "epistemological community". A "conspiracy attuned" social movement (Davis 2024), the Freedom Movement first emerged in opposition to COVID-19 lockdowns and mass vaccination. However, it has since embedded itself as a network of campaign groups, political parties and "off-grid" communities, united in opposing an allegedly-unfolding "Great Reset". I consider how the public channels and discussion groups of the social media platform Telegram represented ethnographic gateways. Firstly, in picking up the threads of its cross-platform ecology of ("conspiracy") theory sharing; and secondly, in engaging directly with individual Movement members and campaign groups.

I highlight some of the ethical challenges of conducting ethnography within "counterpublic" spaces such as "Freedom Movement Telegram" (Warner 2002), focusing on one instance of planned militant (and legally questionable) action. I draw attention to discrepancies between the easily-accessible – and by default, *unencrypted* – nature of Telegram's public discussion groups, and the affects of secrecy and subversiveness associated with the platform by many Movement members. In doing so, I ask how one might respond as an ethnographer to such instances of very-private behaviour in very-public (digital) spaces.

While highlighting Telegram's centrality for the UK Freedom Movement's activist organising and (counter)theorising, I demonstrate how a "platform neutral" approach to ethnography allowed me to "follow the issues" most flexibly, across social media threads, podcasts, blogs, marches and meetups. In doing so, I signpost John Postill's description of digital ethnography as a 'flat methodology' (2024), pragmatically utilising "whatever works" when studying social movements. I argue that "following the narrative" in this way unlocks ethnographic proximity to Freedom Movement practices of digitally mediated "truth-seeking".

THORAT, SANTOSH* (Serie Architects, Mumbai, India)

Stiegler's Artisanal Turn

In Stieglerian fashion, this paper is concerned with both the loss and the re-creation of knowledge in the field of architecture. The student of architecture must be the one who learns new tools and new forms of knowledge and this has profound implications and applicability for the philosophy of education as it is a question of the recuperation of architecture with negentropic tools. Why? In the realm of the digital, it is the case that architectural student is at risk of dis-individualisation, the loss of knowledge of such. Therefore, the paper concerns itself with questions of maturity, critical intelligence, trans-individualisation, the crisis of noetic being, the artisanal mode of learning and finally the proletarianization of the faculties. It is concerned with the reclamation of noetic space and the search for negentropic tools. This paper is thus pertinent to the philosophy of education because it pertains to the act of creation, the question of imagination and to the loss of thinking as such. Focusing on the history of architecture it demonstrates the loss of knowledge in the history of architecture and shows this has clear implications for the philosophy of education, which is precisely concerned with the nurturing and maturing of the thinking subject. The crisis in the proletarianization of the faculties in architecture pinpoints the role of the artisan's mode of learning and its crisis brought by the digitisation of architecture. Using Stiegler's *pharmakon* philosophy, this paper examines the shifting landscape of learning, highlighting new approaches for the present.

Digital Psychiatry in Denmark: DIY Treatment?

Mental illness is a growing global problem posing constraints on healthcare providers. To remedy this, there is a call for digitalization. Digital psychiatry is supposed to mitigate the problem of long waiting lists and promote participation and involvement among psychiatric patients. However, critics fear that digital psychiatry is a neoliberal technofix reducing treatment quality.

The paper examines psychiatric patients' self-help practices when intertwined with digital technologies. The paper focuses on a Danish case of digital, psychiatric therapy. In Denmark, psychiatry has become a pivotal political issue, and the healthcare sector is generally highly digitalized.

Theoretically, the paper synthesizes a Foucauldian understanding of self-technologies with insights from Actor-Network-Theory (ANT). In this regard, self-technologies are explored via practices of self-monitorization and, consequently, self-altering behavior. However, ANT helps to emphasize the agency of the technology and displaces focus from the "self" understood in a narrow sense; it illuminates how changing care practices happen in the assemblage of patients and technologies.

Further, the paper examines to what extent mental health digital technologies conjoin lay experience-based knowledge with clinical, expert knowledge. The experience-based knowledge emanates from psychiatric patients' subjective experiences of e.g., "feeling down" and the clinical, expert knowledge derives from self-monitoring categories in mental health digital technologies, e.g., "negative affective symptoms". In this way, the article explores what kind of knowledge is produced via the intertwining between patients and mental health digital technologies. Moreover, it illuminates what kind of expertise patients obtain by engaging in self-helping practices. The paper is empirically rooted in interviews with psychiatric patients and ethnographic observations providing an in-depth understanding of the patients' understanding of their own expertise and their relation to digital technologies and healthcare providers.

RC15-JS-221.2

THORSEN, EMILIE* (Department of Political Science, Aarhus University, Denmark)

Warm Hands Entangled in Cold Technology? How Psychologists Provide Therapy in Digital Psychiatry

Mental illness is a growing global problem posing constraints on healthcare providers. To remedy this, there is a call for digitalization. Digital psychiatry is supposed to mitigate the problem of long waiting lists, enable healthcare providers to spend more time on each psychiatric patient, and promote personalized treatment. However, critics fear that digital psychiatry reduces treatment quality for the patient and erodes the core professional expertise of healthcare providers. From this perspective, the crisis of psychiatry is due to a lack of the so-called warm hands, which cannot be replaced by cold technology.

This study examines how digital psychiatry affects the professional jurisdiction and expertise of psychologists. I do this by focusing on a Danish case of digital, psychiatric therapy. In Denmark, psychiatry has become a pivotal political issue, and the healthcare sector is highly digitalized in general.

Several scholars have suggested that digitalization challenges the expertise of healthcare providers. Drawing on Eyal, the study examines the extent to which digital technologies challenge the expertise of psychologists or enable new forms of expertise. At the Danish digital therapy initiative, some of the conventional tasks of psychologists are carried out via online programs. On the one hand, this can be interpreted as a form of deskilling. On the other hand, the new stream of interactions between psychologists, patients, and technologies may enable new forms of expertise for psychologists. The study uses a host of different qualitative methods including ethnographic observations, semi-structured interviews, and focus group interviews.

The study shows that digital psychiatry poses challenges for the professional expertise of psychologists, possibly instigating a form of digital fatigue among psychologists. At the same time, digital technologies open new jurisdictional avenues for psychologists suggesting that the cold technology of digital psychiatry is displacing, rather than replacing, the warm hands of healthcare providers.

What Constitutes a Subjective Class? a Comparative Study of 64 Countries

Subject class refers to how individuals perceive their class position, which is shaped by their sense of belonging to a particular class and how they view their position within a broader social structure. Many studies have consistently identify a gap between the objective class and the subjective class. One potential reason is that subjective class is associated with more than objective measures such as income, education, or occupation. But so far, few have explored this question systematically, let alone comparatively. This study aims to find what values constitute a subjective class and compare the commonalities and differences across countries.

Our study employs a belief network approach to comprehensively examine the correlation between subjective class and its associated values. We utilize the most recent WVS on 64 countries to create a value network around the subjective class in each country. This comprehensive approach yields three interesting results, providing a thorough understanding of the complex nature of the subjective class. First, subjective class is a mixture of various values, not just economic well-being. It is also associated with a plethora of values, including political values, attitudes toward social issues, values about family and gender, and culture and religion. Second, in most countries, subjective class is associated with four core values: financial satisfaction, subjective health, feeling happiness, and life satisfaction. Third, the main difference between countries is how subjective class connects to political and social values. While higher economic development strengthens these links, the connection logic across countries varies, leading to the identification of two categories of countries: participation and trust, a division more geographically dispersed than development-related. In summary, our study provides a comprehensive understanding of how subjective class is shaped by a mixture of value systems, and how countries with different political values enjoy different conceptual connection logic.

TIBAJEV, ANDREY* (Institute for Futures Studies, Sweden)

Acculturation Among Newly Arrived Immigrants in Sweden

This study investigates the process of opinion change among newly arrived immigrants in Sweden, focusing on how their opinions on various moral issues change over time in relation to the opinions of the native-born Swedish population, i.e., acculturation. Previous studies suffer from several deficits, including a reliance on cross-sectional designs that impede causal claims, and the tendency to measure opinions on only a few, or even just one, issue, missing important nuances. Most severe, however, is that the opinions of the native-born population—the theoretical endpoint of acculturation processes—are not explicitly articulated or included in the analysis. Instead, there is often an implicit assumption that the Western native-born hold the most liberal or progressive opinions, toward which all immigrants are expected to move. This view hinders nuanced analysis, risks exaggerating cultural differences and tensions, and misinforms public policy and debates.

Using longitudinal data from a sample of 1,209 immigrants from 111 countries, surveyed in 2021 and 2024 in Sweden, we analyse opinion change on 34 different issues, with an emphasis on areas where significant cultural differences exist between non-Western immigrants and Western societies such as gender equality and sexual and reproductive rights. We additionally compare immigrants' opinion change with the opinions of native-born Swedes, gathered from external sources. Preliminary findings indicate that, within three years, immigrants' opinions shift modestly toward more socially liberal positions. Importantly, opinion change across different issues is positively correlated with the average opinions of native-born Swedes. This suggests acculturation, as immigrants' opinion change is influenced by the positions of the Swedish population. By addressing limitations in previous research, this study offers new insights into the early stages of acculturation as a dynamic process. It highlights a movement toward social cohesion and underscores the importance of not assuming opinions among either immigrants or the native-born population.

TIBAJEV, ANDREY* (Institute for Futures Studies, Sweden)

Gender Differences in Recognition of Immigrants' Foreign Credentials

European policymakers consider recognition of foreign educational credentials a crucial policy for improving immigrant labour market outcomes. By verifying and translating foreign qualifications, recognition reduces employer uncertainty about immigrants' education. Previous research shows that recognition leads to higher employment rates and wages, and immigrants view it as key to regaining their pre-migration societal positions. However, gender—a fundamental factor in migration and labour market outcomes—has not previously been central in analysing recognition. Immigrant women's double disadvantage in the labour market, having worse outcomes compared to both native-born women and immigrant men, may stem from unequal valuation of gender-typical education, and from cultural and institutional expectations pushing women toward household care. Understanding gender differences in recognition is thus essential to both assess the effectiveness and equity of the policy instrument and reveal broader mechanisms of labour market inequality.

This study analyses gender differences in applying for and obtaining recognition, and in labour market outcomes between those with and without recognised credentials. Data consist of all immigrants from outside the EU in the three rounds of the European Union Labour Force Survey containing the ad hoc module on migrants, augmented with comparative country data and analysed with multi-level models. Preliminary results point to immigrant women applying for and obtaining recognition to a larger degree than immigrant men in the Nordic countries with the most comprehensive welfare states and family provisions. The largest gender differences in outcomes favouring immigrant men, between those who obtained and did not obtain recognition, are found in countries with the highest share of regulated professions. By linking gender differences in credential recognition to welfare, labour market, and gender regimes, this study highlights how policy is embedded in societal contexts and fills a notable gap in understanding labour market inequalities.

TIEBOSCH, LOT* (Erasmus School of Health, Policy, and Management, Netherlands)

Deconstructing 'Vulnerability': Epistemics, Identity, and Agency

Vulnerability is a term often invoked in academic discourse, with concepts like precariousness, risk, and resilience becoming commonplace. These theoretical terms increasingly permeate Dutch healthcare and social support practices, where individuals are empirically categorised through assessments such as the 'frailty index'. However, labelling people as 'vulnerable' oversimplifies their lived realities. Individuals do not merely embody these labels or resist them; instead, they relate to them in far more complex and nuanced ways. This paper, grounded in ethnographic research in neighbourhoods within a middle-sized city in the Netherlands, explores these precarious pathways in which individuals labelled as 'vulnerable' navigate and make sense of their everyday lives in relation to the difficulties in accessing healthcare and social support in their neighbourhood networks. Inspired by Saba Mahmood's (2009) notion of agency as 'pious movements', this study frames agency not as resistance to imposed power structures, but as the capacity to act within the constraints of those structures – agency as inhabited and lived movements. By critically engaging with the epistemological assumptions underlying these societal labels of 'vulnerability', the paper challenges the diminutive view of vulnerability as passive and subservient, asking instead how vulnerability is 'done' in practice and becomes both part of but underdetermines the lives of people in precarious situations. Ultimately, this research calls for a more nuanced and deconstructed understanding of vulnerability that goes beyond conventional epistemic labels, framing it as a fluid, intersectional, and dynamic concept shaped by the (re)negotiation of identity in response to socially constructed dimensions through daily, embodied movements that defy simple categorisation.

TIERNEY, HILARY* (MAYNOOTH UNIVERSITY, Ireland)
 DALY, SALLY* (National Youth Council of Ireland, Ireland)

Global Youth Work – Earth Justice in the Youth Worker Education Curriculum

Global Youth Work (GYW) is core to the National Youth Council of Ireland's (NYCI) Youth2030 long term strategic partnership funded by the Irish Aid. Influenced by Sallah (2014), GYW aims to empower young people to explore their own values, beliefs, and connections with the wider world. It engages

young people in critical analysis of local and global influences on their own lives and communities and supports them to become active global citizens. Maynooth University and the NYCI collaborate on the design and delivery of the NUI Certificate in Global Youth Work, an accredited continuing practice and professional development programme designed to equip youth workers with the capacity to embed a global youth work approach in their practice. The programme is run part-time on a 'block and blend' basis over two semesters and has been offered for three cycles with the next due in 2026.

Certain commitments such as a global perspective, informal and non-formal learning approaches, social justice, decentring western assumptions and anti-oppressive practice are principles of GYW (Sallah 2014), many of which are already central to professional youth work education which is rooted in a Freirean pedagogy. The emerging literature invites us to reconsider the Anthropocentric orientation of youth work (Cooper et al 204, Gorman et al 2024) and in doing so, at the least, to develop an expanded conceptualisation of 'the wider world' to incorporate Earth Justice as a central principle.

This proposed contribution to the roundtable, considers how we might expand on the already featured 'ecophilosophical' work of Macy and Brown (2014) to embed an explicit 'ecopedagogy' (Gadotti 2010, Misiaszek 2023) in the curriculum. We explore the challenges and possibilities, grapple with the imperatives and in doing so, contribute to the discourse on the theoretical underpinnings of youth worker education and training.

TIJMES, JAIME* (Universidad de La Frontera, Chile)

SAGNER TAPIA, JOHANNA (Universidad de La Frontera, Chile)

Biographical Insights into Chile's Post-Dictatorship Economic Continuity

In 1990, a new democratic government assumed power in Chile after Pinochet's nearly 17-year dictatorship. This government maintained the dictatorship's international commercial policy of unilaterally opening and deregulating markets and expanded it by promoting regional economic integration. Why did politicians who had previously supported Marxist or state-centered economic policies during Allende's government (1970-1973) — and who had faced brutal repression and exile under Pinochet's dictatorship (1973-1990) — preserve an economic model central to the dictatorship's vision once democratically elected in 1990? We analyze this decision-making process from a biographical and historical perspective, exploring the contextual and structural factors that shaped their choices during the transition to democracy. We argue that to critique present-day Chile and the policies adopted during this period, it is crucial to examine the personal biographies of these political actors and the political and economic frameworks that led them to further deepen international economic integration.

Digital Transformation of Retail Work: The Rise of Chaotic Rationalization

In this paper, we will contribute to debates about the impact of new digital technologies are reshaping work by examining how such technologies are transforming labor processes in frontline jobs (cashier, stocker, salesperson) in US store-based retail. Retail is a large employment sector across middle- and high-income economies. Though retail labor is often viewed as "unskilled", it incorporates a significant share of non-routine tasks. Moreover, globally and in the US in particular the retail sector, long a technological laggard except in the field of logistics, has recently made large investments in new digital technologies, including AI. We note that the USA marks something of a polar case among wealthy countries, given extremely low retail union density, relatively weak and decentralized collective bargaining and a generally liberal and decentralized regulatory environment. We focus on large national chains of food and general merchandise retailers.

There is minimal evidence of technology-enhanced job enrichment. The diffusion of self-checkout has led to significant job loss among cashiers, but other technological shifts have led to *growth* in other jobs, notably order-picker jobs. Retailers have used digital technologies to heighten Taylorization, speedup, and surveillance in some frontline jobs. However, interviews point to multiple sources of chaos in the frontline jobs, including unpredictable customer behavior, a combination of lean staffing and high turnover that makes it hard for retail workers to be able to count on coworkers for help, and digital technologies that are themselves flawed. Thus we summarize the

current impact of digital technology adoption on US store-based retail work as "chaotic rationalization"—retail employers try to use technology to rationalize work, but the result diverges from Taylorism because of the chaotic elements in the store and industry context.

Challenges to the Re-Organisation of Global Production for Net Zero and Just Transition: The Case of Green Work in Sustainable Horticulture

The twin challenges of working towards net zero and pursuing just transitions for regions suffering most from climate crisis within the Anthropocene, require radical change to the organisation of production and work at the global level. Sociology has a key role to play in understanding these challenges from a historical and evidence-based perspective. On one hand, just transition addresses the need to acknowledge power imbalances that have caused structural inequalities and the need to develop strategies so those more responsible for environmental crisis to make reparation. On the other hand, the pressing need to transform carbon emission to achieve net zero, necessitates new ways of structuring networks of production and supply to ensure workers, materials and goods are more locally based and move around the world less.

The twin crises of global capitalism, ecological disaster and class polarization (Sklair, 2002), can be seen reflected in the case of sustainable horticulture, the focus of this paper. The global cut flower market is worth more than \$36 billion, with countries like Britain importing about 90% of their blooms. This paper identifies key environmental and labour rights impacts from the flower industry and sets out the dilemmas faced when global supply chains have created dependency and structural inequalities where workers and natural resources are devalued. The work is precarious and thirsty flowers need water in production and transportation. Many are grown in hot, drought-prone regions such as Ethiopia and Kenya, where food production is the priority for local communities. The flying of flowers, usually north, also brings 'sky-high' carbon footprints that consumers are still often unaware of. Research on more sustainable trends in horticulture is presented and piloted innovations for the scaling up of local, seasonal and smaller scale growing and the role of green jobs is explored.

Networked Disobedience to Social Datafication: Backlash Against Smart Urban Technologies in (Post-)Movement Hong Kong

Burgeoning studies have examined how AI systems and data technologies have constituted both a new locus and a tool of contentious politics. Yet much remains to be understood about the ways in which social datafication opens up or closes off political opportunities for the articulation of networked activism and political contention, especially in the context of emergent authoritarian or hybrid regimes, which have thus far been neglected in the literature. During the anti-extradition bill movement (AEBM) and in its aftermath, opposing public perceptions of and responses to one of Hong Kong's prominent projects of social datafication, namely smart lampposts, were marked by intense episodes of discontent. The case of Hong Kong offers a vantage point into the latest contours of data disobedience to smart urban technologies – that is, direct action self-mobilised and self-organised by digitally enabled citizens and activists to subvert or disrupt the dominant structure of the smart city.

Drawing on the case of Hong Kong, this paper sets out to investigate the networked dynamics and practices of data disobedience that (re)appropriates the saturated digital environment of smart city to resist and counter data-intensive technologies of the state. Using digital analysis and archival research, it uncovers how citizens and activists developed and adapted to different logics of data disobedience through 1) crowding, 2) curating and 3) crowdsourcing in the networked urban setting. By analysing the types of counter-imaginaries and citizen actions involved, it highlights how the development and evolution of the networked action repertoires of data disobedience open up mediation opportunity structure for dissent, amidst and despite the increasingly authoritarian protocols. In doing so, this paper illustrates how seemingly ordinary issues of smart city development may be repurposed as a new stake in the (re)production of contentious politics during movement protests.

TINSLEY, MEGHAN* (University of Manchester, United Kingdom)

Contesting Urban Space and Postcolonial Heritage in Accra

This paper engages with the contested memory of Kwame Nkrumah in contemporary Accra. Since the 1966 coup that overthrew Ghana's first postcolonial head of state, successive governments—both authoritarian and democratic—have negated and rehabilitated various aspects of his memory. This contestation has taken material form in urban space through the construction, alteration, and ruination of statues. I approach the contested memory of Nkrumah in Accra by critically analysing the (re)development of Kwame Nkrumah Circle, a three-story traffic circle, public transportation hub, informal market, and memorial park. Since 2015, it has been the location of a bar notorious for trafficking minors, of a devastating fire and flood that killed nearly 200 people, and of a laser and lights exhibition dubbed 'mini Dubai'. At present, the focal point of the circle is a towering statue of Kwame Nkrumah that is gradually falling into ruin, amidst long-delayed promises of refurbishment. I argue that the fate of Kwame Nkrumah Circle encapsulates the difficulty of remembering a complex, anticolonial leader in a neoliberal, postcolonial state.

TINSLEY, MEGHAN* (University of Manchester, United Kingdom)

Silencing and Unsilencing the Memory of Ahmed Sékou Touré

Thinking with Michel-Rolph Trouillot, this paper critically examines the memory of Ahmed Sékou Touré in postcolonial Guinea (Conakry). In 1958, under the leadership of Touré and the Parti Démocratique de Guinée (PDG), Guinea became the only West African country to vote against membership in the Communauté française and in favour of immediate independence. Since then, Guinean national narrative has been built upon the 'mythe du "non"' (Goerg et al 2008), even as Touré's legacy has been hotly contested by his successors. In particular, two key historical events have revisited the memory of Touré: in 1984, Lansana Conté negated Touré and his ideology during a military coup. In 2021, Mamadi Doumbouya set about rehabilitating Touré following his own military coup. Each event sought to redress the silencing of the past whilst introducing new silences into the archive and the historical narrative. I trace the production of silence through the lens of Trouillot's (1995) four moments: the moment of fact creation, the moment of fact collection, the moment of fact retrieval, and the moment of retrospective significance. To do so, I draw from interviews with archivists, heritage workers, and PDG activists, as well as case studies of contested sites of memory linked to Touré. I argue that in Guinea, Trouillot's four moments—and national memory at large (Ho Tai 2001)—are overlapping and non-linear, such that successive regimes have suppressed the archival traces of their immediate predecessors whilst identifying the retrospective significance of earlier, previously silenced historical figures. Yet in each instance, counterpublics have resisted the selective silencing of the past, troubling both the negation of Touré's memory and his rehabilitation.

Empirically Researching Gerotranscendence in Nursing Home Residents: A Literature Review of Data Collecting Methodology in a Hard to Study Population

Gerotranscendence is a late-life development theory in gerontology about ageing well. This empowering life perspective is supposed to be particularly beneficial for nursing home residents, whose fragile health requires round-the-clock care. However, several complicating methodological factors influencing data quality were identified in our previous empirical study in this frail population. This current methodological literature review aims to provide an overview of the advantages and disadvantages of methods used in interaction with this target group in gerotranscendence research and related concepts. It also aims to provide insight into how to develop tailored methodology for this diverse and hard to study population.

Complicating factors are among others co-morbidity of health problems, cognitive decline and dementia, hearing loss and other sensory impairments, diminished energy levels and reduced mobility. Methodologically, this influences cognitive and communicative processes, interactive aspects, verbal and non-verbal behaviour, and the interview setting such as proximity to the respondent. This leads to the following research question: What kind of complicating factors have been identified and subsequently addressed in the methodology for data collection in the study of this target group and what are the underlying mechanisms that affect data quality?

The method used is a systematic search of multidisciplinary literature in empirical, quantitative, and qualitative studies with nursing home residents. Topics include gerotranscendence and related themes such as meaning in life, wisdom and positive ageing, in relation to life events, socio-psychological and spiritual development and (dis)abilities. A specific focus is on data collection regarding retrospective accounts of life history, introspective reflections on life perspectives, spiritual beliefs, and explorations of hopes, fears and expectations for the future in the context of loss, death and dying.

TIRATELLI, MATTEO* (University College London, United Kingdom)

Strategizing for Abolition: A Bionian Account of Strategic Debates within Radical Alternatives to Prison

Founded in 1970, Radical Alternatives to Prison (RAP) represented the most militant wing of Britain's penal reform movement, calling for the abolition of prisons, refusing 'humanitarian' impulses, and remaining sceptical of other organisations in the field. But despite its dogmatic politics, RAP found itself repeatedly stuck before three strategic dilemmas: 1) How to balance concern for prisoners' wellbeing with the desire not to 'prettify' a fundamentally unjust institution? 2) Whether they could develop genuine alternatives to prison that didn't just extend carceral logics beyond the prison walls? 3) Whether RAP should concentrate on delivering practical support or on making theoretical interventions?

By examining two decades of debate and strategizing within RAP, this paper will make three contributions to the study of social movement strategy. First, it will help to excavate the story of British prison abolition in a field dominated by North American histories and frameworks (Ruggiero 2010, Ryan & Ward 2014). Second, these strategic dilemmas are not unique to RAP but are rather three versions of the much more general tension between reform and revolution (Jasper 2004). Finally, in most approaches to the study of social movement strategy – from resource mobilisation theory (Oberschall 1973) and the structuralist accounts of the 1970s and 1980s (Gamson 1975, McAdam 1982) to more recent interest in agency and culture (Ganz 2000, Doherty & Hayes 2012, Rossi 2017) – strategy emerges either out of external structures, or out of a black box of purposive reasoning. In neither case is there any attempt to directly address the question of how groups think. As a partial redress, this paper will therefore borrow from Wilfred Bion's (1961) psychoanalytic theory of group dynamics to illuminate twenty years of strategic debates within RAP.

TITI, NEZISWA* (University of Cape Town, South Africa)

Creating an Inclusive Student-Centred Classroom in Feminist Ethic of Care Pedagogy By Building Community through Music in Home Languages

Navigating the occupational hazards inherent a feminist ethics of care pedagogy presents opportunities for thoughtful consideration. Making informed decisions on critical moral matters is significantly pertinent in today's educational landscape and teaching climate. Universities encompass diverse representation, necessitating an inclusive, student-centred pedagogy that nurtures a sense of belonging amidst educational transformations and decolonization efforts. Gen Z students, like their predecessors, often grapple with identity and role confusion in their initial four years of university. Some students also confront personal identity issues covered in the course curriculum, which influence classroom discussions and the overall learning experience. Consequently, effective teaching extends beyond subject matter expertise, encompassing a pedagogy that acknowledges students' personal challenges and allows them to address these at their own pace. An activist curriculum challenging gender norm, heteronormativity and the dominance of Euro-American centric perspectives that seeks to reshape learning environments, prioritize Afrocentric learning, and reinforces communal connections requires practical wisdom to inspire learning, unlearning, and relearning about oneself, the world, and society. This paper outlines a pedagogy centred on authenticity, belonging, and community through music. By leveraging music as a teaching tool, educators can sensitively navigate introducing curriculum topics in collaboration with students, fostering their active participation in the learning process. Moreover, Gen Z students are already engaging in such music and when invited bring music and dance into the classroom in their languages of choice. Thus, the paper offers a pedagogy to help educators navigate complex material and relational difficulties in the classroom to mitigate the occupational hazards associated with a feminist ethic of care pedagogy in an activist curriculum that is situated in decolonial theory. Ultimately, this pedagogy facilitates student learning, the exploration of personal challenges, and active classroom engagement in the home language by fostering an understanding of their own experiences and those of others.

Decolonising Methodologies with Children: Protocol and Ethics Dilemmas in African-Centered Child-Centric and Child-Rights Research

This paper offers a framework for addressing ethical dilemmas encountered in research with Indigenous children in African cultural settings. It provides contextual, culturally- and developmentally appropriate research methods that inform relevant study findings that can better guide a deeper, better-informed, and responsive mental health praxis through decolonising research practice are needed. The framework is derived from my doctoral project, *How Children Make Meaning of sexual violence: Towards decolonising African-centred child-centric psychological interventions*. The research process upheld the highest ethical standards and demonstrated that decolonising research can present competing ethical protocol dilemmas between [Western] institutional ethics boards, African ethics, and child rights. The framework I offer informs ethical fieldwork in collecting data that centres children's voices, is child-led, culturally situated, and a true reflection of the ontological and social realities children experience. I demonstrate the application of decolonial theory as a methodological, ethical consideration that calls for the self-representation of children living in marginalised communities. I further address questions of ethics, inclusivity, and practical challenges of conducting cross-cultural research.

TITKOV, ALEKSEI* (University of Manchester, United Kingdom)

Knowledge Production and Boundary Setting in Polarised Social Media: Competing Narratives of the Odesa Fire 2014

The Odesa Fire of 2014 is one of the key contested topics in the context of the Russian-Ukrainian confrontation of the last decade. The incident occurred during street clashes between pro-Ukrainian and pro-Russian activists on May 2, 2014 in Odesa (Odessa), Ukraine's third-largest city. In the decisive moment, more than forty pro-Russian activists were killed in a deadly fire in the Trade Union building, which pro-Ukrainian activists were trying to storm. This episode became the basis of a atrocity narrative, blaming the pro-Ukrainian party for (allegedly) deliberately burning their opponents alive. One of its main tropes, the 'Odesa Khatyn', compares the incident to a famous Nazi war crime against civilians. In parallel, a rival pro-Ukrainian narrative has shaped, equally irreconcilable. According to this, the incident in Odesa was an early episode of the Russian-Ukrainian war, in which 'patriots saved the city'.

Previous studies of this case focused on early representations of the incident, with a particular interest in media manipulation, distortion and collective affects. The presentation aims to show other trends emerging over longer time period. These were shifts towards versions, albeit biased, but based on reliable video documents, as well as rational discussions about the facts in social media, which were limited in time but important in their consequences. Thus, the case under study provides grounds for reconsidering popular models of knowledge formation in social media, primarily the concept of echo chambers. As an alternative, a symmetric model of knowledge dynamics in polarised social media is proposed to explain both the prerequisites for producing valid collective knowledge and the strong limitations to doing so. The model is developed in a Durkheimian paradigm, primarily based on Mary Douglas's 'grid - group' concept, combined with the ideas of David Bloor's 'strong program' in the sociology of scientific knowledge.

RC32-507.1

TITOUAN, FANTONI* (EHESS, Iris, Ined, France)

The « First Time » ? Timing and Definitions of the First Intercourse of Sexual and Gender Minorities in France (18 to 29 years old).

French literature on the first intercourse focuses primarily on its timing and shows that it is almost always heterosexual (Bozon, 1993; Fantoni-Decayeux and Régnier-Loilier, forthcoming), making the experiences of gender and sexuality minorities almost invisible, despite their growing numerical importance (Rault and Trachman, 2023). Homo-bisexuals are thus described as "more precocious", which would indicate a "more open" and "interested attitude towards sexuality" (Bozon, 2008). Taking a greater interest in their experiences, however, opens new perspectives on understanding better how these minorities enter adult sexual life, and more generally what entering sexuality means.

This communication is based on an ongoing qualitative (interviews with 18 to 29 years old) and quantitative study in France (with data from the ENVIE study, on affective lives of 18 to 29 years old, with around 10.000 respondents).

This communication first shows that the distribution of ages at first intercourse is more spread out for sexual and gender minorities than for cisgender and heterosexual people. Despite their specificities, these minorities are indeed both "precocious" and "late", whether in terms of unforced first intercourse or forced, to which these groups are more often subjected. Secondly, the analysis is shifted to return to the very notion of 'first intercourse' in sociology. It shows the interest of interrogating the definitions of "first intercourse" and "entering sexuality" to understand the differences previously evoked. Belonging to a gender and/or sexual minority leads some young people to think of experiences prior to their first peno-genital intercourse as their "first time". This destabilization of the category of sexuality itself by a reflexive movement, both forced and chosen because linked to its politicization, provokes in turn changes in individual practices and experiences of sexuality.

RC53-JS-228.6

TITOUAN, FANTONI* (EHESS, Iris, Ined, France)

Understanding the Experiences of Sexuality during Childhood in France: Methodological Concerns and Some Results.

In a context of growing moral panics around sex education over the last decades in Europe, it is essential to understand how sexuality occurs in childhood to defend and to construct effective public policies of sex education. Even though children are often considered innocent and asexual (Davies and Robinson, 2010), sexuality is experienced and learned as early as childhood.

Retrospective data seems the most obvious way for Sociology to approach this object (de Graaf et Rademakers, 2006; Martin, 2007). Yet, it raises many questions: how can we understand the meaning of the category of sexuality during childhood through the memories of adults without projecting adult-centered views?

Based on an ongoing study in the French contemporary context, this communication addresses first the ethical and methodological challenges that such an object of study poses for Sociology. It shows how the combination of ethnographic observation of sex education sessions and retrospective (both qualitative and quantitative) data can be heuristic. Then, it develops some of the forms and meanings that childhood sexual experiences take and how these experiences are shaped by gender, class, and race. It proposes to consider the "first sexual encounter" less as the moment of entry into sexuality than as marking the end of a process of learning about sexuality. This allows Sociology to explore the significance of various experiences for children that have so far been understudied: caresses and masturbatory exploration, exposure to pornography, the learning of sensations of bodily pleasure... The construction of gendered relationships to sexuality (and then, bodies) is thus particularly visible: while girls report more masturbatory exploration before the age of 10 compared to boys, this imbalance is completely reversed upon entering middle school.

WG10-917.2

TITTEL, KATHARINA* (Sciences Po Paris | Institut Convergences Migrations, France)

Consistent Dominance, Isolated Resonance: Mapping Discursive Power, Intersectional Inequalities, and Counter-Hegemonic Solidarity in the French Twitter Immigration Discourse

The internet is often celebrated as a space where marginalized voices can express themselves, mobilize collective action, and engage in public discourse (Benkler, 2006; Shirky, 2011). Movements like the Arab Spring and Black Lives Matter highlight this potential. However, critics argue that digital platforms often reproduce existing power structures, allowing political and media elites to maintain their dominance (Schrader, 2019). This tension between social media's democratizing potential and elite control continues to shape debates on power dynamics in digital spaces.

This study explores how intersectional inequalities, institutional power, and solidarity manifest in migration-related discourse on French Twitter/X. Through a computational analysis of 250,000 users over 18 months (2020–2021), digital ethnography, and in-depth interviews with 45 contributors, we analyze visibility patterns, focusing on how race, class, and religious affiliation affect access to "discursive power" (Jungherr et al, 2022). Our findings show that elite institutional actors dominate visibility on the platform through reinforcing media and political networks. While marginalized groups, particularly young people with experiences of discrimination, occasionally achieve visibility through counter-hegemonic content, their influence is fleeting and rarely gains sustained media or institutional attention.

Intersectional inequalities have a dual effect. They amplify the harassment and violence faced particularly by women, people of color, and Muslims, exacerbating emotional labor of digital engagement. Moreover they affect inequitable access to material resources and time, limiting marginalized users' capacity to maintain visibility. Simultaneously, these same inequalities serve as rallying points for solidarity, enabling users to build counterpublics that challenge dominant narratives (Fraser, 1990; Squires, 2002).

By combining large-scale data analysis with digital ethnography, this study contributes to feminist digital scholarship by examining how digital platforms both reinforce and resist traditional power structures. It underscores the need for more critical exploration of how race, class, and gender inequalities shape visibility and participation in the digital public sphere.

TITTEL, KATHARINA* (Sciences Po Paris | Institut
Convergences Migrations, France)

Disinformation and Framing Battles in French Immigration Debates on X

Disinformation and "fake news" around immigration have long been contentious in France. While misleading stories have circulated in the press for decades (Tucher 2022), the concern that social media magnifies their impact has pushed the topic to the forefront of public debate.

This paper presents an empirical analysis of (dis)information and framing contests in the immigration debate on X, a key battleground in the technomediatic public sphere due to its popularity among media and political elites. Focusing on France, we analyze 1.1 million posts (2020-2021) employing ideological embedding techniques to estimate users' ideological leanings, exploring how established news sources and alternative online ones circulate. Drawing on 42 interviews with users, we examine the motivations and strategies behind the production and sharing of immigration-related (dis)information.

We identify a significant disparity in the reach of far-right media compared to mainstream sources, where a small yet hyperactive far-right faction disproportionately amplifies hyperpartisan content. These actors initiate targeted campaigns by highlighting isolated incidents and leveraging alternative media, often positioning themselves as defenders of truth against perceived media bias. Instead of relying solely on factually false information, they selectively use statistics or incidents, obscuring essential context to frame narratives that serve their agenda. When these narratives gain traction on social media, traditional outlets often pick them up, typically presenting alternative framings.

Our analysis moves beyond content to examine the social and technological dynamics shaping the spread of (dis)information. We show that far-right actors strategically use digital platforms to reframe immigration narratives countering what they describe as biased mainstream coverage, while left-leaning users tend to disengage, contributing to asymmetries in online participation. This selective amplification allows fringe sources to gain disproportionate visibility, especially through retweets. This underscores the need to address the socio-technical infrastructures facilitating content amplification, and investigating message diffusion and motivations beyond false/true binaries.

Placing the Continued Hyper-Securitisation of Islam and Muslims in Australia in Global Context

Following 9/11 the Howard government embarked on one of the most muscular legislative regimes in the West to combat terrorism. From late 2001 to 2007 no less than 48 pieces of anti-terror legislation were introduced that, despite being neutral in language, disproportionately targets and securitises Muslims. In establishing this program, Howard likened the advent of terrorism as a 'continuous threat' akin to that of the Cold War. As a result of this framing, combined with the fact that Australia had never experienced a major attack on home soil, terrorism became an abstract existential fear. Subsequently, we argue that successive governments have continued to introduce further legislation on account of being triggered by external terror events both near and far, despite the actual risk of a major terror event in Australia being low. Further, we contend that a second wave of securitisation across Europe sparked by the Charlie Hebdo attack in 2015 has developed into a global turn that has normalised the securitisation of Islam and Muslims.

Nagar Extension, Ghaziabad-201017, India)

Civilizing and Democratizing Globalization: Limits and Scope in Contemporary Society

The hyperglobalizers claimed that contemporary globalization is associated with new limits to politics and the erosion of state power. But globalization has not only triggered or reinforced the significant politicization of a growing array of issue areas but is also accompanied by an extraordinary growth of institutional arenas and networks of political mobilization, surveillance, decision-making, and regulatory activity across borders. Thus, globalization does not prefigure the 'end of politics' so much as its continuation by new means. The prospects for civilizing and democratizing globalization are thus not so bleak as suggested by hyperglobalizers. However, there are some profound intellectual, institutional, and normative challenges that it presents to the existing organization of political communities. The political communities are in the process of being transformed. At the heart of this lies a growth in transborder or transboundary political issues and problems that erode the distinctions between domestic and foreign affairs, internal political issues and external questions, the sovereign concerns of the nation-state, and international considerations. States and governments face issues like AIDS, BSE, the spread of COVID-19, the use of non-renewable resources, the management of nuclear waste, diaspora cultures, and the proliferation of weapons of mass destruction which can not easily be categorized in traditional political terms, that is, domestic or international. Global transformations have affected the concept of political community and in particular, the concept of the democratic political community, which often gets split into 'inner' and 'outer' spheres of political life. The effective power is shared, bartered, and struggled over by diverse forces and agencies at national, regional, and global levels. The present paper aims to analyze the prospects of civilizing and democratizing contemporary globalization in terms of its scope and limits.

Nagar Extension, Ghaziabad-201017, India)

Globalization and Urbanism As a Way of Life in India

Globalization has aggravated the challenges facing cities around the world, it also makes room for cities and local governments to play a revitalized political role. Cities have become more important as nation-states are increasingly unable to manage global trends. Ecological risks and volatile financial markets operate at levels above that of the nation-state, and individual countries the most powerful are too "small" to counter such forces. Yet nation-states also remain too 'large' to address adequately the diverse needs found within cosmopolitan urban areas. Where the nation-state is unable to act effectively, local and city governments may be more suited to the task. Connectivity becomes the hallmark of network society facilitated by digital technologies. Cities are fundamentally well-connected, fast-growing, communicative, and global in outlook. Cities are also known for media concentration, as the structures and people there extensively create and exchange messages - social, political, economic, and cultural. The urban communication landscape is very complex, and therefore, a robust media and communication infrastructure is required to form, reform, and transform urban communities from a sustainable development perspective. The present paper aims to analyze urbanism as a way of life from a social ecology perspective in the era of globalization focusing on the National Capital Region of India.

RC32-JS-204.2

TIWARI, RUPAM* (Banaras Hindu University, India)

Decolonizing Indigenous Feminist Epistemology in Adivasi Communities of Jharkhand

In the Indian social context, the term "Indigenous" refers to *Adivasis*, derived from the Sanskrit words "adi" (meaning original) and "vasi" (meaning inhabitant). *Adivasis* are classified as Scheduled Tribes (STs) under the Indian constitution. However, the category of tribe is a colonial construct and does not fully capture the essence or diversity of indigenous cultures.

If a subject is marginalized and misrepresented it inherently becomes a central concern of feminist inquiry. Indian Tribal women have mostly been studied from a Western, colonial gaze which renders them oriental and mysterious or through the privileged lens of upper caste-class researchers, who portray them as primitive and backward. This paper, focusing on the Jharkhand region of India, seeks to decolonize Indigenous feminist

epistemology by exploring the precolonial roots of gender inequality, oppression, and power relations within tribal societies.

The phenomenology of *Adivasi* women in the contemporary feminist theory in India is massively underrepresented. By employing qualitative interviews and narrative analysis, this paper argues that in order to study *Adivasi* feminist epistemology and develop an *Adivasi* feminist standpoint we must comprehend their perception, lived experience and lifeworld. Research work in this discipline would be a process of co-creation of knowledge and would be free from the constraints of Western research methodologies and rooted in Indigenous frameworks of understanding.

Is There Already a Place for Local Alliances and Digital Mental Health Tools Against Depression in EU and Beyond?

I will discuss how, in our search for ways to socially destigmatize mental health crises and promote the willingness of people to seek psychological help, crisis intervention, or psychiatric support, we have been drawn to methods that focus on working with the media and local communities. Through action research, we are examining whether there is space today in 8 EU countries for public mental health initiatives to meet local communities, combined with digital interventions for mental health. We are applying the alliance against depression (AAD) method, developed by the international network European Alliance Against Depression (EAAD), which, as part of a European drive for global mental health, has also reached other continents, such as Australia. In this method, local organizers begin forming a local alliance, where both formal and informal allies become individuals, institutions, and media interested in the area, who want to spread the message that depression can affect anyone, it is a real illness, and it can be treated. In semi-peripheral Poland we initially created such an alliance in the central district of Warsaw, using a grant from the EU's Third Health Programme. Moreover, as an extension of local interventions, we are introducing a non-commercial digital psychoeducational tool, EU4Health-funded iFightDepression, for certified mental health professionals across Poland, also in the displacement, migration and refugee context. Certified mental health specialists, including psychologists providing support to students, can offer this online tool, funded by EU grants, to their clients and patients across Poland and five other countries during the course of local interventions. The presentation and discussion will be theorized in terms of clinical sociology, action research, community-based intervention and guideline-oriented treatment as well as mixed top-down and bottom-up impulse of Europeanization towards European Health Union.

Through the Ideological Lenses: Perception of Social Consequences of Immigration across Europe

Recent waves of immigration have had significant consequences for European societies. However, the perception of the consequences of immigration varies: in some accounts, the economic consequences are emphasized, and in others, the priority is given to the cultural ones. This paper examines the possible connection between the perceiver's ideological orientation and views on the economic and cultural consequences of immigration.

Two main hypotheses are tested. The first one states, uncontroversially, that the general anti-immigrant orientation is more characteristic of the right-wing identifiers across Europe. The second hypothesis concerns the difference between the left and right in specific anti-immigrant attitudes. More minor differences are expected in the economic sphere, i.e., left and right should be more similar regarding the economic consequences of immigration. This hypothesis is based on the notion of welfare chauvinism. However, significantly larger ideological differences are expected in the cultural sphere, where the left is expected to be more tolerant. At the same time, the right should be more concerned with protecting the "country's cultural life".

The analysis focuses on individual-level attitudes and the situation in Europe. Data are taken from the European Social Survey (ESS) project. The statistical analysis focuses on the association between the left-right ideological self-identification scale and relevant attitudes about immigration. The study provides novel insights into this vital aspect of the relationship between immigration and social development in Europe. Overall, leftist ideological identification is associated with more positive attitudes towards immigrants, especially regarding the cultural consequences. However, while the overall attitude towards immigrants is more negative in Eastern Europe, the association with ideological identification is mainly absent.

TOMA, STEFANIA* (Romanian Institute for Research on National Minorities / Babes-Bolyai University, Romania)

Return Migration: Rurbanization and Social Inequalities in Romania

Half of Romania's population lives in rural areas, despite heavy industrialization processes during the socialist period before 1989. The rural-urban dichotomy has lost meaning over the last two decades as the urban has begun to "invade" the rural, a process known as peri-urbanisation. The country was originally migrant-sending and remittance-receiving in the EU, but recently, new mobility processes have changed the Romanian social landscape and created new inequalities.

Former international migrants are returning to Romania's rural areas, regardless of their previous places of origin or experiences in villages. These people may have spent decades in several European metropolitan areas and are now seeking healthy living conditions, proximity to nature, relaxing pensioner days, and cheaper and autonomous activities.

Additionally, the Covid-19 pandemic has caused a massive relocation of urban dwellers to more or less remote villages, mostly in the mountainous regions of Transylvania

Both processes have impacted local social relations, hierarchies, and processes. While international migration replaced traditional "naveta" (commuting) and mobility to local urban agglomerations, the pandemic has moved the urban praxis into the rural, contributing to creating a specific rural super-diversity that combines local and global urban practices and expectations.

These changes have brought about new inequalities that can be captured on diverse dimensions, such as urban-rural dwellers, ethnic lines, socio-economic status, and so on. These inequalities are also a source of tensions and conflicts on a local level, challenging the local authorities, both locally and nationally.

This proposal focuses on two questions: what motivates people to move into rural areas and what are the effects of their mobility on the local level? The presentation draws on ethnographic fieldwork in Transylvanian villages and the results of a recent quantitative survey in Romania.

David Versus Goliath: Power Resources and Collective Action in the Context of Gafam's Outsourcing Practices in Portugal

The digital transition is dominated by multinational tech companies like GAFAM, which operate outside national regulatory frameworks. The hypermobility of capital undermines nation-state sovereignty, weakening the power of workers and trade unions (Kindleberger, 1969; Reich, 1991; Silver, 2003).

In Portugal, these tech giants rely heavily on outsourcing schemes to avoid the responsibilities of direct employment, freeing them from legal burdens while reinforcing their power to impose standards through subcontracted firms that don't align with national laws and create work environments hostile to trade unions.

The power imbalance between large tech companies and workers is significant, putting unions at a disadvantage both structurally and in negotiations. However, as recalling the Polanyian analysis, there are signs of a counter-movement, with workers and trade unions mobilizing in various countries. The capacity for innovation and resistance among unions is being tested, as seen in recent strikes at Concentrix and Teleperformance, companies that serve Apple and Facebook. These strikes illustrate the challenges unions face in these outsourced contexts but also indicate a renewal in union strategies, practices and membership.

This communication examines how different power resources - structural, organizational, institutional, and societal - can be mobilized to address the power imbalance in the employment relationship. The analysis, based on case studies of Apple and Facebook, highlights how unions and workers can respond to the growing power of GAFAM through collective action and strategic innovation.

Sociologists As Intellectuals and Their Role in Post-Communist Transformation

The author discusses the role of sociologists in a role of intellectuals in the process of post-communist transformation. His main claim is that the intellectual engagement of sociologists is necessary for successful societal transformation in former communist countries. However, it threatens the ideologisation and politicisation of academic space. For developmentally beneficial intellectual engagement to take place, several conditions (at both the personal and systemic levels) must be fulfilled. One can speak about intellectual imagination in terms of avoidance of stereotypes and clichés; autonomy toward the political elite and other powerholders; critical distance, especially toward one's ideological orientations and political beliefs; dedication in terms of devoting time and energy to public causes; and pluralism, meaning the existence of different ideological strains within the intellectual circle.

Making the Town: Afro-Brazilian Returnees (Tabom) and the Transformation of Accra, Ghana from the Early Colonial Times

During the first half of the 19th century several hundred ex-slaves, freed slaves and wealthy individuals and families of persons of African descent returned to West Africa from Bahia, Brazil. These returnees and their retinue settled in towns such as Lagos, Ouidah, Lome and Accra. The impact of the Afro-Brazilian returnees on the social, cultural and economic lives of the indigenous population amongst whom they settled have been considerable. This paper examines the contribution of the Afro-Brazilian (Tabom) returnees to Accra, particularly from 1820 till 1900. During this period Accra was under Dutch, and later British jurisdiction.

The paper examines the contributions of the Afro-Brazilian returnees to the development of Accra. The Tabom influenced several aspects of the lives and livelihood of the indigenous Ga population including their housing architecture, warfare techniques, music and dance, food, fashion, carpentry, tailoring, and other specialized areas. However, the Tabom were not always a force for good. They were also involved in the ignominious slave trade and slavery in exchange for imported goods. Furthermore, the poor management and internal struggles for land among the Tabom also contributed to the chaotic and poor land management situation in Accra.

Although integrated into the local Ga population, the Tabom have till today cultivated their Afro-Brazilian identity and maintained their unique hybrid culture in Accra. Descendants of the Tabom returnees have over the decades become highly stratified with a small wealthy, educated and cosmopolitan elite living in the leafy suburbs while many others reside in a vibrant, congested but breezy part of Central Accra.

RC38-623.2TONAH, STEVE* (University of Ghana, Ghana)
CODJOE, EMMANUEL, OBENG (Department of Sociology,
University of Ghana, Legon, Ghana)*Migrant Associations and the Reintegration of Return Migrants into Their Families and Communities in the Nkoranza Districts of Central Ghana*

Central Ghana is noted for the large number of residents travelling abroad to Libya and Europe in search of greener pastures. The Nkoranza area, in particular, receives a high number of return migrants (returnees) each year. These return migrants rely mainly on their individual (personal) networks such as family members, friends, neighbours, school mates, church members

etc, to cope with the challenges of settling down and reintegration. But they also have a well-organized return migrant association that support left-behind family members of migrants and returnees.

This paper examines the role that family and kin members, friends as well as migrant associations in the Nkoranza districts offer to left-behind relatives of immigrants whilst they are abroad as well as the returnees themselves upon their return to their communities. The paper indicates that migrant associations in the Nkoranza area are voluntary, self-organized, informal, not-for-profit associations set up for the mutual benefits of its members. They mainly exist to share experiences and support returnees upon their return.

The paper also assesses the changed position/role of the returnees in their families, communities as well as groups that they join upon their return home. How do returnees react to the familiar as well as the changed situation in their communities upon their return? What kind of support do the family and kin members as well as migrant associations provide to their membership and recent returnees etc.? What social, psychological, and economic support do they provide to their members?

TORCHIA, LUCA* (La Sapienza University of Rome, Italy)

Cultural Deserts: Accessibility, Enjoyment, and Potential of Cultural Infrastructures between Urban Centers and Peripheries

This research delves into the pressing issue of 'cultural deserts' – areas with insufficient access to cultural institutions – from the lens of social inequality. Traditionally associated with the concept of 'food deserts' (Rodier et al., 2017), cultural deserts are spaces where communities lack adequate cultural provisions, such as museums, libraries, and performance venues (Cramaris et al., 2022; Ballatore & Candlin, 2022; Brook, 2016). This study specifically investigates these deserts within metropolitan areas, with the city of Rome as a focal point. The research aims to map cultural infrastructures across Rome, utilizing diverse national datasets, to offer a spatial analysis of the locations of cultural deserts and the demographics affected by them.

The project is built on three main objectives: firstly, to spatially map cultural infrastructures, with a focus on accessibility and usability; secondly, to assess the socio-economic implications of identified cultural deserts by correlating them with other forms of social inequality; and thirdly, to understand the catalytic role of cultural infrastructures in local economies and social mobility. The hypothesis is that cultural deserts are not isolated phenomena but are intertwined with broader socio-economic dynamics. Cultural centrality or marginality could be closely linked to housing conditions, residential mobility, labour markets, educational opportunities and attainments. This approach is key to understand the cultural deserts as a constitutive element of social inequality.

By adopting a quantitative approach, this research contributes to the ongoing academic discourse on social inequality by proposing comprehensive indices that integrate multiple dimensions of disparity, starting from the cultural field. Studying how cultural deserts are linked to wider social inequities helps us to identify potential remedies to bridge these gaps. Indeed, the research is designed to provide crucial insights to policy-makers and stakeholders about the broader implications of cultural accessibility.

TORINO, GIULIA* (King's College London, United Kingdom)

Inhabiting Unsettlement: Migration, Labour, and Housing in the Black Mediterranean

This paper investigates the complex interplay between migration, housing politics, and the Mediterranean border regime, framed within the dynamics of racial capitalism at Europe's southern frontier. It critically examines how migrants, especially those who are undocumented, experience displacement and precarious living conditions in the agro-urban peripheries of Southern Italy, where they are systematically exploited within the agricultural sector to sustain Italy's renowned food production. The study brings attention to the often overlooked and increasingly unstable conditions of migrant inhabitation, marked by marginalization and insecurity.

Drawing new connections between critical border and migration studies, racial capitalism, and urban studies, the paper offers an in-depth analysis of the processes shaping migrant "unsettlement" (Torino, 2023a,b) in Europe's agro-urban margins, with a focus on Sicily as a key case study. Utilizing qualitative data gathered over several months of fieldwork in 2024, it explores migrant dwelling and labour across various sites, including informal "migrant ghettos" (as they are known locally), squatted farms, greenhouses, and institutional camps. Often, these spaces not only capture and exploit migrant labour but also impose a panopticon-like securitization and surveillance on their lives that work against spatial agency and dignity.

In situating Sicily and Southern Italy within the broader framework of racial capitalism and the Mediterranean border regime, this paper reveals how these global structures manifest locally through the repeated cycles of migrant capture, displacement, and exploitation of Italy's agro-industry. Lastly, the paper foregrounds migrant-led initiatives to reclaim rights and dignity, offering concrete examples that resist the necropolitics of border control and of the agro-economy under globalised racial capitalism.

This presentation builds on the author's British Academy-funded research project: "Extending Urbanisation: Migration, Camps, and Labour in the Black Mediterranean" (2022-2025).

TORINO, GIULIA* (King's College London, United Kingdom)

Mestizo Urbanism: Dinsentangling Whiteness in Latin American Cities

Across Latin American cities, there continues to be strong resistance to the claim that racism and the historical construction of whiteness play any role in the production of the urban space. Deemed antipatriotic, this issue remains widely unaddressed in urban studies. Based on ethnographic and mixed-method research conducted in Bogotá between 2016 and 2022, and secondary literature on other Latin American cities, this paper explores the afterlife of *mestizaje* as a racial-colonial project based upon "whitening" (*blanqueamiento*), from the viewpoint of its materialisation into post-colonial and contemporary cities and their society-space relations and at the intersection of class, gender, regional, and racial lines of difference.

As a racialised fabulation constructed upon a form of white supremacy, *mestizaje*'s historical and socio-cultural role in Latin America was two-fold: despite its purported claims of universal equality and mixed-race syncretism (based on an ideology that assumed the task of dismantling colonial difference), it became the chief apparatus of social stratification in everyday life, "in both public and intimate spheres" (Wade, 2010). By introducing and discussing the notion of "mestizo urbanism" (Torino, 2024), this paper illustrates how everyday practices and ideologies of *mestizaje* and whitening have transformed urban spaces in Bogotá and other Latin American cities, thanks to *discursive*, *operational*, and *normative* devices of city-making.

Through the analysis of specific examples, the paper will expose how whiteness is always (re-)constructed –even in the contemporary "multicultural city" (Torino, 2021)– as a spatial system of power and how racial privileges are fixated in the urban space (Alves, 2018; Picker, Murji, Boatcă, 2018) while hiding behind the normalisation of Latin American cities as *mestizo* – that is, theoretically, non-racial. Finally, the paper will suggest the need to divest from the racial hegemony of *mestizaje* in Latin America's urban planning and studies, and to unlearn urbanity as whiteness.

TORRE, FILIPPO* (University of Genoa, Italy)

Emigration from the Maghreb: Southern Perspectives on Travel, Borders and Social Media

The Maghreb region can be understood as a social space where citizens find themselves pushed into immobility, while they are increasingly exposed to the pervasive influence of communication technologies, social media, and transnational connections. What are often perceived as migratory flows of desperate migrants from the southern Mediterranean may instead be interpreted as efforts to reach the Global North, adapting to the structural limitations and constraints on freedom of movement imposed by the European border regime. These restrictions do not halt the journeys of Maghrebi migrants; rather, they lead to a rise in the number of *harraga* (irregularised migrants) and prompt the diversification of migration routes, leading to fragmented and convoluted adventures. While the fortification of borders tends to encourage migrants towards permanent settlement in Europe, it simultaneously compels them to move continuously from one country to another, both within and beyond Fortress Europe, in search of basic necessities such as housing, work, and documentation.

This intervention draws on digital and trajectory ethnography conducted with Tunisians, Moroccans, and Algerians on their way to Europe between 2021 and 2024, exploring the role of social media and the use of smartphones in structuring new migration routes and destinations to adapt to visa regulations and border control. Digital apps such as Facebook, Instagram, WhatsApp, Maps.me serve as tools for crafting alternative narrations of the journey, providing information on risks and opportunities, and facilitating collaboration and connections among *harraga* and both migrant and non-migrant actors along their journeys. As migration from the Maghreb increasingly becomes an individualised endeavor, largely undertaken by young men, these travellers increasingly depend on these online networks of solidarity to resist the rising costs of irregularised migration. This digital space fosters specific cultural and linguistic networks that transcend national bounds, reshaping new imaginaries and aspirations.

TORRES, ANALIA* (CIEG/ISCSP - University of Lisbon Comp. 5162300210, Portugal)

Gender Issues on the Battlefield

Gender issues, as well as women's and LGBTQ+ rights, are hot topics on the polarized political debate in many countries around the world. Gender issues are a real battlefield, and we can even read striking phrases in prochoice demonstrations like "Fighting a Battle Our Grandmothers Won". After decades of progress concerning gender equality rights, and the constitution of a study field that impacted on not only social sciences and humanities, but also on natural sciences, today gender issues, and gender studies are controversial matters. What has been called antigenderism became a central theme in extreme right wing political agendas. How come that granddaughters and grandmothers now join the same demonstrations and file for rights that years ago seemed guaranteed? How did we get here? I will discuss this topic using sociological tools, mainly benefitting from a very rich field of knowledge constituted by theoretical frameworks and empirical research coming from women, gender and feminist studies.

Older Migrants on Civic Engagement

Scholars on civic engagement have long debated if we should use broad or narrow conceptualizations of this notion. Even though scholarship on migrants' civic engagement takes for granted that there is something distinctively unique about them that merits studying them separately, no research has addressed how migrants themselves make sense of this notion. Instead, research on migrants' civic engagement has primarily focused on their experiences with regards to a limited number of civic activities, the measurement of their engagement in these activities, and the factors

that influence their participation. Thus, we do not know whether migrants rely on broad or narrow conceptualizations of civic engagement when they explain how they make sense of this notion, which is why we use 60 qualitative interviews with older migrants in Belgium, Finland, Spain, and Sweden (+ 60 socio-demographic and civic participation questionnaires) to address this knowledge gap. The analysis shows that although some of the interviewed migrants could not formulate how they make sense of this notion, most of their conceptualizations relied on a combination of allusions to a limited number of civic activities and to what these activities accomplish. It is also noted that the two civic activities that were most often mentioned were associational activities and helping behaviors (as opposed to formal volunteering and political participation which are the activities that have been researched the most when focusing on older migrants). By exposing the ways in which some older migrants make sense of this notion, this paper questions some of the taken-for-granted assumptions underlying research on migrants' civic engagement.

TORRES CIERPE, JUANA* (Inria, France)

A Typological Approach to Analyzing AI Integration in Public Administration

In the face of the advent of artificial intelligence, negative positions arise, pointing to the reduction of jobs, while positive stances focus on the augmentation of the human being and the emergence of new jobs (Julián-Vejar and Velázquez, 2024). However, these approaches tend to focus on the quantitative dimension of the problem, overlooking the qualitative aspects inherent to the world of work (De Stefano, 2019).

The introduction of AI is a reality today, and like any other technique, it must be understood not as an isolated tool, nor as inherently negative or neutral, but as a capacity to build social relationships (Latour, 2018). Based on this line of analysis, this presentation is based on fieldwork conducted within a public organization in France. Although the designers in this entity view the introduction of AI as a mere tool, the reality is that it is a project of greater scope, with implications for the organization and work culture. Including workers in these projects is crucial for a successful and iterative introduction, but public administration has inherent limitations.

For this reason, a typology of analysis is proposed, consisting of four axes to examine the introduction of an AI project in a public institution: "constitution of the project," "construction of worker acceptance," "organizational scope," and "inclusion of workers." This typology can reveal a vertical project with limited worker inclusion and acceptance focused on their professions, resulting in organizational disruption. However, it can also illustrate a co-construction approach that fosters an understanding of workers' "real activity," leading to a technological introduction that minimizes disruptions. Based on a study of the various stakeholders involved in an AI project within a French public institution, this typology seeks to improve our understanding of innovation production and the implementation of technological solutions in the public sector.

Experiencias Sentipensantes En La Terapia De Constelaciones Familiares En México: Un Análisis Desde Las Espiritualidades Contemporáneas

La Terapia de Constelaciones Familiares (TCF) llegó a México hacia 1990. Desde entonces esta práctica se ha expandido en México y ha ido adquiriendo formas variadas, de tal manera que se usa en dos áreas de especialización, la psicología y la espiritualidad, aunque a veces no son distantes, pues su bisagra está en la cultura psy donde se desenvuelve.

Se comprende para esta presentación a la TCF como un sistema que provee sentido a la vida, por lo que se considera un sistema de creencia. Parto de describir su práctica como la puesta en escena de performatividades donde se generan técnicas corporales ritualizadas acompañadas de discursos en formato de oraciones o peticiones.

En este trabajo expondré la diversidad de adaptaciones que ha tenido la TCF insertándose así en circuitos de prácticas espirituales variadas, incluso religiosas como el islam sufi. En estas prácticas haré énfasis en su capacidad adaptativa en los escenarios espirituales y su performatividad que permite generar en las personas que "constelan" experiencias sentipensantes, con ello deseo abarcar, experiencias emocionales y somáticas que comprenden los afectos propuestos desde la filosofía de Spinoza y la lectura de Deleuze y Guattari.

Mexican Muslims in Mexico and United States: Identity and De-Arabization of Islam

Islam in Mexico is a religious minority but has a presence throughout the country. The majority of Muslims in Mexico are converts, and very few are of migrant origin. Islam has been historically since the conquest and has passed through several stages that differentiate its presence and practice in the country, but all these stages can be observed from a transnational perspective.

In this transnational process, Muslims in Mexico have been in contact with proposals of Islam coming from various places, Arab countries, the United States, proselytizing movements, and communication technologies.

In this paper I want to present two stages that link Islam in Mexico with Islam in the United States. The first one deals with proselytism or networks of connection of some Islamic communities in the United States where Latinx people have been integrated, where the Mexicans are located. This is early in 1920 when the Moorish Science Temple and The Nation of Islam (NOI) include Latinx through their own liberatory Islamic message. The NOI arrived in Mexico with the idea of establishing a community. Other movement was the Halveti Yerráhi sufi tariqa of New York and this order has been successful in Mexico City in 1987.

The other stage corresponds to the construction of Latin Islamic communities in the United States and their process of de-arabization of Islam to convert a practice appropriate to the Latin culture, understanding that Latin is diverse, where Mexicans have created their own identity discourses. These communities, whether collectively or individually, maintain connections with communities in Latin America. Several Muslim Mexicans have arrived in Mexico and are in contact with the border region. One of the characteristics of these visits is the dissemination of his ethnic discourse, which in the Mexican context has not been successful.

Mapping Platform Cooperatives: Identities, Dimensions and Challenges

A young and digital cooperative movement is trying to emerge in reaction to the triumphant platform capitalism of the last thirty years. Despite the growing scholarship, the numbers and dimensions of platform cooperatives are not well known. There are no quantitative studies describing a large number of platform cooperatives. This paper constitutes a first attempt to map platform cooperatives globally. On the basis of the first international economic survey on platform cooperatives, it constitutes a comprehensive international economic chart of the identities, dimensions and challenges of platform cooperatives. Data from 86 respondents registered legally in 5 continents outline 27 platform cooperatives' geographies, dimensions, legal

forms, values, the number of workers, co-owners, users and providers of these platforms, the amount of capital involved, where their original capital comes from, their relationship with blockchain, their governance, their legislation obstacles, and their main challenges. The paper distinguishes platform cooperativism from platform cooperatives, and it addresses definitional issues that have arisen since they were defined. It finally offers a grounded understanding of platform cooperatives' challenges and their most up-to-date empirical picture.

Decent Work Deficits Faced By Seasonal Agricultural Workers in Türkiye within the Context of Global Supply Chains

Türkiye is situated in the fertile lands of the Asia Minor, yielding diversity of agricultural crops. Five million agricultural workers in the country work to feed not only the domestic population but also the consumers from across the world regardless of proximity, with the EU, Russia, the USA and Syria being among the primary destinations. Agricultural products travel along complex routes of global supply chains after which small agricultural producers, peasants and agricultural workers are left at the margins with gradually declining terms of trade in this global food regime. Fruits and vegetables including high-value crops with high market demand constitute one third of total agricultural exports of Türkiye. These crops require labour-intensive methods making agriculture a significant employment generator. Majority of agricultural labour force comprises the seasonal agricultural workers including the poorest households from certain geographical parts of the country and an increasing number of refugees. Seasonal agricultural workers mostly inherit family legacies of mobile and casual work without decent housing and access to basic services. They offer their labour into a loosely regulated market on the basis of exploitation and self-exploitation, intersectional discriminations, lack of social protection and formal employment, intergenerational transfer of poverty with low levels of education and high prevalence of negative coping mechanisms such as child labour. Against this backdrop, Government of Türkiye, development partners, Multinational Enterprises, producers, NGOs and the wider consumer society assume diverse roles and interests within the causality chain of this decent work deficit in vegetable and fruit production in Türkiye. In this respect, this paper will question the actors, conditions and labour relations in seasonal agriculture and the broader policy ecosystem in Türkiye that generate and address decent work deficits for seasonal agricultural workers in the context of conflicting interests within global supply chains of fruits and vegetables.

The Evolution of a Radicalised Mainstream: A Comprehensive Analysis of the Far-Right Shift in Italy

The present paper investigates the significant rightward shift in Italy's political mainstream. The rise to power of the Italian radical right is the result of a long-term process in which political, cultural, and social causes played a role: historical context, socio-political dynamics, and ideological shifts.

Through an analysis of electoral data and public discourses, this paper identifies key drivers of the radicalization of the Italian mainstream. Within the others, it will focus on three fundamental aspects:

a) the global economic crisis, which has increased competition for diminishing resources, including employment and the use of public services, thus widening old socioeconomic cleavages and generating new, more pertinent ones; b) the role played by Silvio Berlusconi and the governments he led from

1994 onwards, participated by a post-fascist right that has been normalized; c) the normalisation of discourses and positions opposing migration processes in the name of a fictitious theory of ethnic substitution.

Intersectional Family Policies in the EU: Comparing Two Cases Studies

People access and benefit differently from family policies in relation to their social identities, shaped by gender, racialized ethnicities, age, citizenship, class, disability, etc. While there has been increasing recognition of these multiple forms of inequality within the EU - particularly those based on gender - inequalities are often addressed with a single-axis or a target-specific approach, frequently neglecting their intersecting nature. Consequently, the effectiveness of family policies in fostering inclusiveness is limited.

This paper argues that adopting an intersectional approach is essential for addressing the complex, and often invisible, inequalities that affect access to and benefitting from family policies. Drawing on McCall's (2005) concept of inter-categorical complexity, this study conducts an intersectional analysis of the access criteria for Early Childhood Education and Care (ECEC) in Italy and the Netherlands. We ask: To what extent do ECEC policies consider the intersecting dimensions of social inequality and with what consequences for families?

The comparative analysis reveals that both Italy and the Netherlands exhibit significant inequalities in their access criteria for ECEC services. These inequalities disproportionately affect marginalized groups, suggesting that current policies fall short of fostering true inclusiveness. By applying an intersectional lens, this paper highlights the need for more inclusive family policy design that can effectively address the intersecting and multi-dimensional nature of social inequalities, thereby enhancing the reach and impact of family policies.

TOTA, ANNA LISA* (University Roma Tre, Italy)

Arts for Social Justice. Deconstructing Powerful Visual Regimes of Migration in 2024 Art Biennale, Venice

There is a long tradition of scholars documenting the relevance of the arts in creating the conditions of visibility for controversial pasts, inscribing the unspoken and revealing the silence in social memories. This is a consolidated tradition of critical interpretive analysis that considers structural and cultural aspects of institutions, memory and the arts, the importance of cultural forms of art in addressing that which one cannot otherwise directly address (i.e. Wagner-Pacifici and Schwartz 1991; Zolberg 1995, 1998; Erll 2011; Vinitzky-Seroussi and Teeger 2010; Zerubavel 2007; Tota and Hagen 2016; Dekel 2013). In this paper I will present some results of the ongoing project TRAMIGRART (www.tramigrart.it) which investigates under what conditions artistic practices can contribute to the memories of migrants en route to Europe, re-elaborating the past and re-configuring the present of migrants' experiences. It explores the relationships between arts, traumatic events, and resilience with a special focus on two different kinds of diasporic memories: a) memories of forced migration through the Mediterranean and b) memories of migrants escaping from Russia's war on Ukraine. This project aims at producing a reflective knowledge of how dominant narratives can be subverted by alternative ways of displaying memories of forced migration and war. It analyses: a) how art can undermine the powerful visual regime of migration that is strongly established by public discourse; b) what kinds of aesthetics are applied by artists to deconstruct common ways of seeing; c) what kind of experiences of migration are addressed with what kind of aesthetic and visual strategies. Arts are considered as negotiating arena, where rights, memories, and identities are questioned and claimed. I will focus on a case study within TRAMIGRART relating to the 2024 Art Biennale "Foreigners everywhere", the Venice exhibition which included 88 National Participations.

TÓTH, FRUZZSINA* (assistant professor, Hungary)

Beyond Alienation: Legal Consciousness and Legal Experience in Hungary

Legal alienation is currently a key theoretical concept to understand how the law works – or fail – in everyday use. (Hertogh 2018) Moreover, from a broader perspective, this concept also can help us to analyze the structural problems in our modern democracies. It also prompts us to consider what happens in a society where there has almost certainly never been a basic trust in the law. Thus, the people, in general, have never been able to alienate from it. (Fleck 2017)

Our research aims to understand how the family history, family experiences and the memory of these influence individual's attitude and trust toward the law. Based on our preliminary result, we have found that there is a fundamental distrust in the law in Hungary. It may be said that legal alienation is the norm rather than the exception. Additionally, this situation is deeply rooted in the family histories as nearly every family has experiences in which the law – or most certainly the legal and political system – caused harm, caused trauma.

In my presentation, I will explore a possible connection between the legal alienation and the historical experiences according to narrative family and life history interviews, and a representative survey.

TOYONAGA, KOHEI* (Kindai University, Japan)

Unpacking Gender Bias in Hiring: Insights from Japan's Synthetic Personality Inventory

Sociologists, economists, and psychologists consistently emphasize that an individual's socioeconomic status is influenced not only by cognitive abilities but also by non-cognitive skills, including personality traits (for a review, see Farkas, 2003). Furthermore, it has been repeatedly noted that the impacts of cognitive abilities and non-cognitive aspects often reflect gender bias, contributing to gender inequality in the labor market (e.g., Quadlin, 2019). To comprehensively assess how gender shapes evaluations of cognitive and non-cognitive skills, greater attention should be directed toward demand-side mechanisms.

This paper delves into employers' gender bias regarding job seekers' cognitive and non-cognitive abilities in the Japanese labor market. Japan has widely adopted the Synthetic Personality Inventory (SPI) due to advancements in psychological testing theory. Approximately 80% of private companies in Japan require candidates to take the SPI, which includes basic ability tests and personality assessments when submitting their resumes. Japanese employers can utilize information on candidates' basic ability scores and personality traits based on the Big Five, in addition to resume details such as educational qualifications. This unique job hiring process in Japan allows for the objective verification of employers' gender bias in evaluating applicants' cognitive and non-cognitive skills, as well as the assessment of the relative importance of these traits.

I conducted a vignette study simulating a hiring process for university graduates. I asked 2,095 employers in private companies located in the Tokyo metropolitan area to evaluate 16 sets of vignettes featuring job applicants competing for the same position. Participants were asked to assess the hiring potential based on simulated screens of resumes and SPI test results. The analysis revealed that the gender bias identified in existing research from Western countries was not significantly observed. These findings in a non-Western context suggest that gender bias in ability evaluations is embedded in social contexts.

TRABUCO, EUGENE DALE ESLIRA* (University of the Philippines Los Baños, Philippines)

Media Constructions of Typhoon Non-Evacuees: The Case of Philippines

In a country with shared typhoon nightmares, it might be unfathomable to many why some Filipinos remained resistant to the calls for evacuation by authorities. Accounts of evacuation reluctance are a consistent journalistic angle among various news media outlets in the Philippines. Yet, the history of scholarship in the sociology of disaster and media reminds us that uncritical reading of the news risks the potential misrepresentation of disaster behaviors. As a response, I qualitatively examined numerous disaster-related online news articles among various news outlets in the Philippines from 2014 to 2024 to figure out how non-evacuees are portrayed in the media. Following a social constructivist approach, I presented emergent discursive patterns characterizing non-evacuees. Such patterns lean towards the portrayal of the non-evacuees as unreasonably dismissive of dangers, unmoved by their current dire situation, unwarrantedly defiant against authorities, overconfident in their subjective risk perceptions, and overly concerned with material possessions more than their lives. Collectively, it affirmed other scholars' concern that non-evacuees are typically misunderstood as ignorant, hardheaded, and irrational (in local terms, as "pasaway") even though existing studies already pointed out that such disaster behaviors and decisions are shaped by various social and cultural factors. Above all, the findings from these news articles is a long overdue addition to the conversations about the tensions between differing epistemologies employed by authorities and laypeople in assessing risks when confronting these natural hazards. It is crucial to problematize it, as such representations, when reproduced, inform institutional reactions by the authorities to the disaster situations.

Exploring the "Illegal" Motherhood of Migrant Domestic Workers Under the Kafala System in Lebanon: An Arts-Based Research

West Asia is home to the Kafala system, a labor migration system known as "modern day slavery". Under the Kafala, migrant domestic workers' (MDWs) lives are under the tight control of the state and its citizens. While the Kafala is renowned for the abuses and lack of protection it provides migrant workers, it also entails another side of intimate control over migrant women's bodies and reproductive lives. In Lebanon, MDWs' intimate lives and reproduction are tightly controlled under Kafala. Domestic workers are subject to pregnancy tests upon arrival in the country and are deported if found pregnant. It is illegal for them to start a family in Lebanon and doing so often irregularizes them. Despite this illegality, migrant women employ an intimate resistance (Pande, 2018) defying the state's claim to their bodies, as some of them have children and create families in Lebanon. This research paper builds upon seven artistic research sessions with a group of eight Ethiopian MDWs founders and members of the community-based "Tsenat" group for migrant mothers in Lebanon. Using an arts-based, feminist and participatory methodology, it explores the experiences of women MDWs who become pregnant and raise their children in the country. This paper studies the visible and invisible barriers they face, the solidarity network they created, and their imagining of their futures. As arts-based research has not been commonly used with research involving MDWs in Lebanon, this paper combines an under researched topic with an under practiced methodology.

TRAD, RIM* (The European Master in Migration and Intercultural Relations (EMMIR), Lebanon)

Trajectories of Young African Domestic Workers to Lebanon: From Social Imaginary to Reality

This research paper examines the trajectories of five young African women that partake in a journey to become domestic workers (DWs) in Lebanon, working under *Kafala*, "an inherently abusive migration sponsorship system" (Amnesty International, 2019, p. 5). The paper studies the lives of the women through a timeline, starting from when they migrate from their countries until after they arrive in Lebanon. It seeks to answer the question: **What are the self-narrated journeys and experiences of African domestic workers in Lebanon?** After recording the narrative of five women that have worked as domestic workers in the country, I present several aspects of their stories in chronological order. The aspects are migration decision; experience upon arrival in Lebanon; experiences of the Kafala system; resistance, activism, and community support. From social imaginary to reality in Lebanon, the paper highlights the oppressive nature of the Kafala system through the individual stories of the women, centered around their resistance. The paper looks for the intersections of gender, race, age, and education in the migration narratives. I conducted online storytelling meetings with participants, using a free-flowing interview with guiding questions and a flexible methodology to ensure the agency of the participants in narrating their own experiences. The purpose of using storytelling is to stir away from classical empirical methods that might not put participants at the center of the research.

Power, Images and Stereotypes. a Visual Analysis of Gender-Based Violence on Instagram

Considering the relevant role of images in everyday life, here we would like to consider the impact they have not only in the reproduction of roles and thus of stereotypes and prejudices, but also on gender-based power dynamics.

In this perspective I will present the first results of an analysis conducted on a corpus of 1.000 images extracted from Instagram using #violenzadigenere during 25th November 2022 (The International Day for the Elimination of Violence Against Women).

Given the direct relationship between the iconic sphere and social life, the field in which the research is conducted is sociological aesthetics. To this end, a Qualitative Content Analysis was conducted using the visual field as a unit of analysis. The results show not only how the symbolic order of gender-based violence manifests itself, but also what forms of representation of alternative imaginary emerge from the prejudices and stereotypes with which this kind of imaginary is visually represented on Instagram.

RC26-429.3

TRAMONTANA, ANTONIO* (University of Messina, Italy)
MEO, MILENA (University of Messina, Italy)

The Ideologies of the Radical Right in Italy and Power Asymmetries in a Gender Perspective

The persistent reproduction of gender inequality, from which material disparities arise, is fed by symbolic elements that legitimize and sustain this condition. While we witness the to the emergence of new sensibilities that are determined from gender issues, in contrast to the progressive demand for the recognition of new civil rights, there is a constant and dynamic development of misogynistic and sexist spheres of influence that reproduces the symbolic apparatus on which gender-based power asymmetries are based.

Such reproduction is based in part on an angry response to the loss of privileges, in part as a political dimension in relation to which to oppose opponents and exercise hegemony in order to gain power. On the one hand, what emerges is an articulated galaxy known as Manosphere from which a process of constructing masculinity is produced online through the use of gender stereotypes. On the other, stereotypes based on a traditional and hierarchical view of gender roles are present in social communication by far-right leaders, in their respective political manifestos and election programs.

In order to highlight the constitution of new types of convergence between political parties and movements based on symbolic reproduction that legitimize gender inequalities, our analysis will focus on Men's Rights Activism (MRA), their anti-feminist, misogynist and sexist imaginary. Far from considering MRA as a peripheral opinion movement, the aim is to highlight the convergences with the gender imaginary that shapes the perspective of the mainstream Italian Far-right Parties, focusing on Fratelli d'Italia and Lega for Salvini.

TRAN, ANH* (University of Bremen, Germany)

The Political Economy of Social Transfer Institutionalisation in Cambodia and the Philippines during Periods of Crises

In comparative studies of social protection politics in the Global South, democratisation processes have been linked to waves of social policy expansion, most notably through the widespread introduction of child-centred social transfers. Promoted by international actors as mechanisms to reduce poverty and enhance human capital development, conditional cash transfers (CCTs) have however been introduced across many low- and middle-income contexts, including variations of democratic and authoritarian regimes. In the politically diverse region of Southeast Asia, CCTs were introduced widely after the consecutive Asian Financial Crisis (1997-98) and Global Financial Crisis (2008-09).

Based on analysis of documents and data collected through 35 interviews with policy actors and experts during fieldwork in April to June 2024, this study compares the institutionalisation and expansion of social transfers in the contexts of electoral democracy in the Philippines and electoral authoritarianism in Cambodia, representing 'strong' and 'weak' cases in terms of the institutional capacity to provide targeted social protection in Southeast Asia. It questions why family- and child-focused social protection policies were adopted in these different political contexts and to what extent competitive elections were drivers for their expansion. Preliminary findings show that periods of global and national crises created moments of political contestation as governments were faced with the challenge of addressing widespread socio-economic insecurities and maintaining their legitimacy. In the newly democratic space of the Philippines, contestation among political actors, powerful elite classes and non-state actors enabled policy agendas to advance in the aftermath of economic crises during the 2000s when its flagship CCT – the Pantawid Pamilyang Pilipino Program – was introduced. In Cambodia, CCTs which were simultaneously piloted did not expand in its fragmented policy space, and significant expansion only occurred during the recent Covid-19 crisis.

Strengthening the Transdisciplinary Network of the Amazon (RETA) for Advancing Climate Justice and Democratic Participation

The Purus-Madeira interfluvium, one of the most preserved regions of the Amazon in Brazil, faces escalating threats from illegal deforestation driven by logging, mining, industrial-scale agriculture, and cattle ranching. These pressures disproportionately impact Indigenous and traditional populations, particularly women and young people, who are on the front lines of defending their territories. In response, the Transdisciplinary Network of the Amazon (RETA) was established to foster a collaborative model of governance that integrates climate justice and democratic participation. In democratic regimes, the dynamics of collaboration and conflict often reveal tensions between local communities and external stakeholders, such as government agencies, corporations, and NGOs. Local communities possess deep knowledge of their environment and sustainable practices, but their voices are frequently marginalized in decision-making processes dominated by external actors. RETA counters this marginalization by building solidarity with these communities and ensuring their active role in governance. By leveraging a network of local communities, public authorities, artists, and civil society organizations, RETA focuses on biodiversity conservation and advocates for collective action. RETA exemplifies how grassroots movements in Latin America can amplify the voices of vulnerable populations and mobilize collective efforts for social and environmental justice. Its transdisciplinary approach offers valuable insights into how social movements can drive both climate justice and democratic reform, particularly in regions facing environmental and political crises.

RETA is a collective that de-emphasizes individual authorship; therefore, this abstract is attributed to RETA. Contributors to the writing (in alphabetical order) include: Cláudio Bueno, Jolemia Chagas, Dionéia Ferreira, Ligia Nobre, and Eduardo Staszowski.

DNA Reveals the Growing Ancestral Diversity of the United States

Today, over 60 million Americans have taken so-called genetic ancestry tests (offered by companies like Ancestry.com and 23andMe), which categorize the similarity of a person's genome to various reference populations from around the world. Race and ancestry, while distinct concepts, have an intertwined and fraught history in the United States. Though once firmly rooted in biological definitions, race is now widely understood to be a socially constructed category based on a range of physical and social characteristics. In contrast, ancestry describes kinship and an individual's place in the expansive family tree of humanity. Importantly, while a person's racial identity or classification may change across place and time, their ancestry remains fixed. In this study, we leverage nationally representative data from the Health & Retirement Study (n= 10,819) and the National Longitudinal Study of Adolescent to Adult Health (n=8,162) to explore the dynamic relationship between race and ancestry over time. We leverage genotype data and genomic methods to obtain individual-level measures similar to those provided by popular genetic ancestry tests, which we call *genetic similarity proportions*. We then compare these genetic similarity proportions across three distinct American birth cohorts: 1945, 1980, and 2015. We find evidence of meaningful average changes in genetic similarity proportions among members of the same self-identified racial group over time. Moreover, in some cases, the relationship between an individual's genetic similarity proportions and their racial identification has also changed. Overall, we find support for an idea that we term *ancestral diffusion*: that over time, the U.S. has become increasingly diverse in terms of ancestry, even within racial groups. Taken altogether, our results illustrate the ever-evolving nature of racial conceptions and boundaries.

RC04-51.5

TREJO QUINTANA, JANNETH* (Universidad Nacional Autónoma de México, México)

Educación En Tiempos De Covid-19: El Reto Del Aprende En Casa En México

El programa Aprende en Casa fue la respuesta emergente del gobierno mexicano para mantener la continuidad educativa durante el confinamiento provocado por la pandemia de COVID-19 en 2020. Utilizando una combinación de televisión, radio y plataformas digitales, esta iniciativa buscó garantizar que estudiantes de educación básica y media superior siguieran aprendiendo desde casa, en un contexto marcado por la desigualdad, la brecha digital y la falta de infraestructura.

Este estudio se inserta en un proyecto de investigación más amplio que examina cómo la incorporación de medios de comunicación y TIC en la educación impacta en las relaciones entre el profesorado y el estudiantado y, en consecuencia, en el proceso educativo, especialmente en situaciones de crisis. Mediante de una metodología mixta que incluye la revisión de literatura sobre el programa y entrevistas con actores clave que participaron en su diseño e implementación, se busca explorar los éxitos, desafíos y aprendizajes derivados de esta estrategia.

El análisis preliminar revela que, aunque Aprende en Casa logró mitigar parcialmente la interrupción educativa, enfrentó críticas relacionadas con su implementación apresurada, la falta de capacitación docente en competencias digitales y las limitadas condiciones tecnológicas de muchas familias. En la presente ponencia se destacará el papel de actores como la Secretaría de Educación Pública (SEP), los medios de comunicación públicos y privados, y las plataformas digitales que apoyaron la estrategia.

Este trabajo ofrece una reflexión crítica sobre los programas de educación a distancia en contextos de emergencia, subrayando la necesidad de políticas más inclusivas y equitativas para el uso de tecnologías educativas en el futuro.

Predictors of Food Insecurity and Food Assistance Program Usage Among Puerto Ricans before and during the COVID-19 Pandemic in Holyoke, Massachusetts

Background/Objectives: With a population of 5.8 million, Puerto Ricans are the second largest Hinospanic/Latino group in the United States. Puerto Rican households often face elevated rates of food insecurity. Frequently, households experiencing food insecurity turn to federal and emergency food programs for immediate or long-term assistance. The study examines factors related to food insecurity and participation in food assistance programs among Puerto Ricans living in Holyoke, Massachusetts, during the COVID-19 pandemic. **Methods:** Using an interplay of community-based participatory recruitment, purposive sampling, and web-based tools, we collected 284 survey responses from April 2022 to August 2022. Pearson's chi-square, logistic regression, and hierarchical linear models assessed relationships between demographic attributes, household factors, and food access outcomes. **Results:** The factors of children in the household and age significantly influenced food assistance participation and food insecurity outcomes. Puerto Rican heritage and lower educational attainment were predictors of access to federal food assistance programs. Low-income households disproportionately relied on emergency food programs and experienced food insecurity. Our findings indicate that demographic characteristics and household factors intersect and significantly influence food insecurity and food assistance safety net access. **Conclusions:** Our study demonstrates that the COVID-19 pandemic made it difficult for households to obtain safe and nutritious food consistently. Our findings demonstrate that the impact of the pandemic was not evenly distributed across demographics and households.

TRELOAR, DESTINY* (Yale University, USA)

Understanding Food Insecurity and Participation in Food Assistance Programs Among Hispanic/Latino Residents of Hialeah, Florida, before and during the COVID-19 Pandemic

The 63.6 million Hinospanic individuals living in the United States constitute the largest ethnic or racial minority group in the country. Hinospanic/Latino households report a high prevalence of food insecurity, and often, food-insecure individuals cope by turning to emergency and federal food assistance programs for immediate or long-term assistance. This paper focuses on Hialeah, Florida, a predominantly Hinospanic/Latino city in Miami-Dade County. It examines which demographic factors influence participation

in food assistance programs and the occurrences of periods of disrupted food access. This study examines two questions: (1) What factors are associated with participation in food assistance programs? (2) To what extent did study participants use food assistance programs before and during the COVID-19 pandemic? We conducted a survey and collected 684 responses from April to August 2022. We gathered data on participants' identities, household attributes, and their usage of federal and emergency food assistance programs. We used Pearson's chi-square tests to identify significant associations between food assistance usage, food access, and respondents' demographic characteristics. We also used binary logistic regression models to assess probabilities. The findings of this research are significant, indicating that the COVID-19 pandemic exacerbated food access challenges in Hinospanic/Latino households in 2022. The data also revealed that low-income households, respondents below the age of 40, individuals born in the United States, those with low educational attainment, and those living in multifamily households had the highest likelihood of using food assistance programs. Single- and non-single-parent households, employment status, languages spoken at home, and number of children in the household were also statistically significant factors in predicting food assistance usage. This research provides valuable insights into how individuals in a city responded to the pandemic by utilizing food assistance programs.

TRETJAKOVA, VAIDA* (Lithuanian Centre for Social Sciences, Lithuania)

Transition to Motherhood in Adolescence: The Case of Peripheral Lithuania

The adolescent fertility rate (AFR) in Lithuania is 2-4 times higher than AFR in the countries of Northern and Western Europe. Furthermore, there is a high degree of regional differentiation within the country – AFR is significantly higher in peripheral rural regions and lower in the municipalities of major cities. In this paper, I aim to explore the process of becoming a mother in adolescence in peripheral, socially and economically underprivileged regions of Lithuania. Combining quantitative and qualitative research methods, I provide the overall demographic context of adolescent fertility in the country; analyse regional differentiation of adolescent births (by parity, marital status and age of the baby's father); and explore the experiences of teenage motherhood. Based on 20 semi-structured interviews conducted in districts with high AFR with girls who had their child(ren) in adolescence, I analyse their transition from teenagerhood to sudden adulthood through the stages of conception, pregnancy, birth, early mothering experiences. Structural socio-economic inequalities are important determinants of adolescent fertility (Santelli et al. 2017) and the behavioural ecological perspective on fertility (Dickins et al. 2012) suggests, that under certain conditions (poverty, risky environment, unstable family background) early motherhood may even be an adaptive strategy. Thus, I specifically focus on the way socio-economic inequalities shape the transition to teenage motherhood.

Togetherness or Antagonism? the Experience of Urban Public Space in 'Porous' Naples

Naples' city centre is characterised by an extremely compact, informal urban fabric entailing a significant degree of physical proximity between different social groups. In light of most trends of urban seclusion and segregation observed across Europe, this is often regarded as an exception to modernity with a socially virtuous component favouring interclass solidarity and a general sense of togetherness, as Benjamin and Laci famously captured in their metaphor of the 'porous city'. In fact, the experience of Naples' urban public space is more about antagonism than togetherness, inasmuch as social differences work beneath the surface to informally discipline the accessibility and usage of its crowded streets and alleys. This has become blatantly evident with the recent touristification of many central neighbourhoods, where a plethora of new economic activities in the hospitality sector are exploiting the 'porosity' of the city to informally appropriate and monetise public space. Drawing from the observation of one of these neighbourhoods, namely the Quartieri Spagnoli, we illustrate the politics of physical class proximity in Naples and unpack its implications for the local experience of urban public space. In doing so, we aim to challenge abstract definitions of 'good' public space and rethink the latter in relation to the histories and institutions in which is embedded, with particular regard to the informal character of southern European cities like Naples.

Epistemic Authorities on the Backside of Cultures of Ignorance: Genesis and Loss of Speaking Positions in Illegitimate Knowledge Using the Example of the Corona Pandemic

Our contribution is based on the observation that the COVID-19 pandemic not only reinforced the authority of epistemic figures within legitimate knowledge (e.g. epidemiologists, virologists), but also opened powerful speaking positions for epistemic authorities in the realm of illegitimate knowledge in small life-worlds.

Grounded in the sociology of knowledge and inspired by Foucault's and Bourdieu's theories of power and discourse, our study provides a deeper understanding of how these authorities gain and lose legitimacy within small life-worlds. Methodologically, the study presented employs qualitative interviews and group discussions, focusing on the experiences of individuals critical of COVID-19 measures, particularly regarding vaccination.

Our findings show that the knowledge regime of the pandemic has inadvertently fostered speaking positions in the illegitimate sphere that challenge established scientific discourse. This is enabled by institutionalized symbolic capital, such as formal titles (e.g. Doctor of Medicine), which serve as a form of legitimation within illegitimate knowledge. Furthermore, the non-institutionalized status of these speaking positions makes them highly dependent on the ongoing discourse surrounding the pandemic. As the pandemic discourse fades, so does the stability of the speaking positions of epistemic authorities in the illegitimate sphere.

Theoretically, our work deepens the understanding of the interdependence between discourse and small life-worlds by distinguishing between the institutionalized speaker positions within discourse and the precarious, non-institutionalized speaking positions in life-worlds that are stabilized by mutual acts of recognition in face-to-face interaction.

Meso-Level Organisational Factors Influencing Healthcare Workers' Resilience: Evidence from a Qualitative Study in Seven Countries

Background

Multiple scholarly contributions studied factors that impact on healthcare professionals' resilience and well-being (e.g. Diehl et al., 2021; Kelly et al., 2021; Kohnen et al., 2021). Existing research mostly focuses on individual characteristics or overall organisational factors, devoting less attention to meso-level organizational factors (e.g. Rees et al., 2019; Teoh et al., 2020). Furthermore, it often collects evidence from diverse settings (acute care, nursing homes, general practice) overlooking the specificities of work in hospital contexts, and concentrates exclusively on nurses or physicians (e.g. Hall et al., 2016). Also, we have limited contributions (e.g. Aiken et al., 2024) comparing evidence from different countries.

Methods

In our study, developed within the Horizon Apollo2028 project, we run 30 interviews with doctors, nurses and administrators in the hospitals of seven Western countries (France, Italy, Sweden, Finland, Ireland, Lithuania, US), for a total of 210 interviews. On the basis of a literature review, we developed a codebook for data analysis. Data interpretation allows to identify how the main factors at the meso-organizational level (e.g. leadership, teamwork, etc.) affect the well-being, mental health and resilience of healthcare workers, highlighting differences across countries, professions, and hierarchical levels within organizations.

Findings

Data collection is ongoing in the seven countries and will end in December 2024. Following data analysis and interpretation will be developed. By July 2025 preliminary results will be ready for presentation.

Challenges and Role of English Language Medium of Instruction in Colleges of Sundergarh.

This paper investigates the view of lecturers regarding the challenges of teaching English language as a medium of instruction (ELMI) and its impact on students of various colleges in Sundergarh. The study uses quantitative and qualitative method of interview as a research instrument. In total 20 lecturers from 3 different streams and 14 subjects are selected using purposive sampling techniques. The technique of Stratified Random Sampling was used to collect the data from 60 students of different colleges of various streams from Sundergarh, Rourkela. Thematic analysis is used to examine interview transcripts.

In general it was found that the students can take notes, read academic texts, interact and listen through ELMI instructions but they lack verbal fluency and do not prefer to write answer scripts in English language. Those subjects in which text books are not published in native language (odia) students are more inclined to write answer scripts in English than in subjects where in odia scripted books are available. The three language formula is extensively used amongst the students were in understanding of concepts comes more precisely in the native language odia, than English and Hindi. There is also a visible disparity among the students inhabiting in urban areas prefers to write in English with that of rural areas.

The study provides suggestions for development of ELMI in various higher educational institutions for implementation purpose.

Beyond the Human: Digital Visual Media in Anthropocene Discourse

This presentation explores the role of visual digital media in shaping Anthropocene imaginaries through the works of Robert Sochacki, Karolina Sobecka, Rosalie, and the collaborative project by Corrie Francis Parks and Kelley Bell. By engaging with digital and visual media, these artists create immersive, speculative environments that challenge existing representations of nature, species extinction, and post-human landscapes. Sochacki's *Domesticated*, for example, uses a simulated post-apocalyptic setting to visualize a world after human impact, using digital media techniques to blur the lines between fiction and reality. The installation becomes a mediatized space where the audience negotiates new, contingent worldviews about life beyond capitalism and human expansion. Karolina Sobecka's *Wildlife* utilizes digital projection technologies to insert a disappearing tiger into the urban environment, directly critiquing the human-mediated destruction of animal habitats. The fleeting appearance of the tiger invites viewers to reflect on the Anthropocene's impact, using the cityscape as a canvas for protest and awareness. Similarly, Rosalie's *Marathon der Tiere (marathon of animals)* and Parks & Bell's *Projected Aquaculture* use large-scale visual projections to engage with ecological crises and regeneration narratives. These works highlight how digital visual media can function as "mediascapes" (Appadurai), offering imaginative horizons that shape public discourse on human-nature relationships. The presentation will address the following questions: Which aesthetic strategies and social conventions are employed to frame these visual worlds? And how do the artists position themselves and their audiences within public discourses on ecological awareness and activism through their use of digital media?

TRITTHART, MARTINA* (University of Klagenfurt, Austria)

Subverting History: Vandalism and the Reconfiguration of Public Monuments

The Karl Lueger Monument in Vienna has become a focal point of social protest, symbolizing the conflict between the legacy of a prominent but antisemitic politician and contemporary moral responsibility. Since the global Black Lives Matter protests in 2020, it has been repeatedly targeted by vandalism and temporary art interventions. Graffiti, such as the word "Shame," has redefined the monument, offering alternative interpretations that challenge established power structures in public space. Artist Klemens Wihlidal's proposal to tilt the monument by 3.5 degrees represents an official attempt to respond to these protests. However, it remains uncertain whether this intervention will calm the discourse or if further acts of vandalism will continue transforming the monument. This debate is closely linked to theories of visual culture, which emphasise the role of vandalism as an expression of resistant subjectivity. W.J.T. Mitchell's concept of "monumental power" and Nicholas Mirzoeff's "right to look" are relevant, as both explore how defacement challenges dominant societal narratives and asserts alternative perspectives in public space. Further examples of monument recontextualization highlight this global phenomenon. Krzysztof Wodiczko's *Monument for the Living* (New York, 2020) projected images of social justice movements onto existing statues, subverting their historical meanings. The Brazilian collective Visualfarm's *Monumento remix FSLP 18* (São Paulo, 2018) reimagined the controversial Bandeiras monument in São Paulo with projections that integrated it into the current socio-political context. These cases show how visual protests function as tools for renegotiating social and political narratives, dynamically challenging the meaning and authority of public monuments.

TROCHYMIK, MATEUSZ* (University of Warsaw, Poland)

Breaking Down the Silos: Smart City Development. Case for Warsaw, Poland.

The concept of "smart cities" has gained traction as urban centers increasingly adopt advanced technologies to enhance the quality of life, efficiency, and sustainability. However, despite the promise of technological integration, a significant challenge persists: the management of smart city initiatives is often fragmented due to departmental silos. These silos, where information and functions are compartmentalized within individual sectors (e.g., transportation, energy, health), limit collaboration and impede holistic problem-solving.

Drawing on Warsaw case study, the paper will explore how these silos emerge from traditional bureaucratic structures that resist the cross-departmental collaboration and sharing of data and resources, hindering the overarching goals of smart cities.

In the paper I will focus particularly on how establishing smart city agency interrupts existing power structures and relation between institutions within the city administration. Despite promise of "interoperability and cost optimization" the process of consolidation forced by the smart city policy can lead to much lower the level of efficiency, increase the administrative burden and bring less transparent policy of each department. Moreover, the paper I will argue that not every project of digitalization are "fit" to the idea of smart city governance.

The findings aim to contribute to the broader sociological understanding of urban governance and emphasize the importance of addressing structural barriers in smart city management to achieve truly intelligent urban environments.

Professionalization Vs Digital Managerialism in Care Work Services. Case of the Electronic Care System in Poland

The Electronic Care System (ECS) is a comprehensive system designed for "coordination and monitoring" of care services in a Polish municipality. Its introduction marked the second phase of a long-term strategy to reform the care sector. Previously, care services were organized using a quasi-market model, outsourcing to private companies, decentralizing and fragmenting management, leading to control issues and declining service quality. The reform aimed to regain control by integrating services, professionalizing and enhancing the quality of care work, and digitizing to streamline communication and reduce administrative burdens. The initial step focused on professionalizing care workers through task standards, a code of ethics

for caregivers and recipients, qualification requirements, and quality control procedures, resulting in improved work conditions and higher recipient satisfaction. The ECS introduced various tools for care sector managers, including a digital platform for communication, planning, and payments, a mobile app with NFC devices to monitor caregivers' tasks and movements, and a data repository with reporting tools.

The paper presents findings from a three-year research project on the digitalization of the care work sector in Polish municipalities. It examines how digitalization alters power dynamics between care workers and managers, as well as among institutional actors (care work companies, city authorities, and welfare administration). Utilizing the street-level bureaucracy framework (Lipski, 1980; Brodtkin, 2020; Zacka, 2017) and the concept of new professionalism (Evetts, 2011), the study particularly focuses on how digitalization reversed the effects of the initial professionalization reform, altered care workers' discretion, and established a new line of professional frontline management in the care work sector.

Green Hydrogen in Poland: A Press Discourse Analysis (2016-2022) in the Context of Energy Justice

As the media are the main factor influencing public perceptions of the technology and shaping narratives about the benefits or risks of energy transition, the aim of this study is to analyse the "hydrogen energy" content in press in the context of just energy transition in Poland. This study is based on an analysis of the press discourse on hydrogen from 2016 to 2022, utilising Corpus-Assisted Discourse Studies techniques to analyze large corpora of text. The dataset includes 1,896 articles (amounting to 1.75 million words) from Poland's leading press by circulation. Then, qualitative content analysis, mainly framing analysis, was used to describe the narratives.

The results show the dominance of one type of expert hydrogen narrative, and the media communication is primarily controlled by representatives of energy companies and businesses. At the same time, the voices of the academic community, local governments, and the third sector are marginal. Furthermore, the authority of science is often employed to mask the rhetorical strategies present in expert discourse.

We describe the emerging hydrogen narratives and show the relationship between the expertise for the field and the way it is communicated to lay people. The findings highlight the need for a critical reassessment of communication strategies and greater inclusion of diverse social groups in the energy transition dialogue to ensure equality, justice, and inclusion in the shift toward net-zero. The use of CADS methods and qualitative analysis allows us to thoroughly examine the role of language—particularly collocations and metaphors—in shaping public awareness of the energy transition.

BEIER, RAFFAEL* (TU Dortmund University, Germany)

New Densities behind Closed Doors: Shared Flats As the Last Resort of Morocco's Urban Working-Class

Since the beginning of colonial oppression and city planning in Morocco, rooms (chambres) and flats (étages) for rent with shared facilities (sometimes kitchen, always bathrooms) have been central components of the available housing options for working-class population in urban Morocco, in particular Casablanca. They have appeared 'out of necessity' in response to a lack of housing rather than representing deliberate choices. However, compared to other classic forms of informalised housing of the urban majority, prominently including shantytowns (bidonvilles, karyan) and informal settlements (habitat non-réglementaire), shared rental accommodation has hardly been central to both academic and political attention. Yet, in recent years, enhanced political commitment to demolish bidonvilles in combination with undesired and/or unaffordable resettlement options have increased the demand for shared housing. In the peripheral neighbourhoods within Morocco's larger metropolises, rooms for rent have remained the last available resort for working-class population. Consequently, densities as well as precarity seem to have enhanced behind closed doors, where different concerns and conflicts of a co-habitation 'out of necessity' (privacy issues, hygiene, insecurity, instability, pressures to pay rent) remain hidden to the outside view. Building on long-term local research experience and qualitative interviews with residents about their housing biographies, we shed light on shared housing as a last, yet threatened and precarious affordable housing option in the former centres of working-class residency within Casablanca as well as Rabat-Salé.

RC05-77.3

TRUCCO, NOEMI* (Université de Luxembourg, Luxembourg)

Living without Living: Testimonials of Stateless People

Statelessness has long been studied primarily from a legal perspective, given that nationality is understood as a human right, but is implemented in particularistic ways in the citizenship laws of individual states. What has been lacking so far is a sociological perspective on statelessness that places the experience of being stateless in the context of subjectivation processes, i.e. that focuses on the interplay between subjects and symbolic and material orders and therefore also critically examines the inherent social relations of power and inequality. The exclusions and marginalisations resulting from the contradiction between a universal human right and its particularistic implementation, the associated subjectivating role of the state and the ensuing profound effects of statelessness on those affected are of sociological interest. Statelessness makes it difficult to fulfil even basic needs such as health care, employment or family life. This contribution highlights the lived experience of being stateless by conducting a discourse analysis of testimonials in online communities and on websites founded and run by stateless people. It proposes that stateless individuals, by adopting speaker positions, experience themselves as possessing agency in some form despite the obstacles resulting from their status, such as having no freedom of movement. The aim of the project is to reconstruct subject positions and notions of belonging of stateless people in order to uncover political imaginaries beyond the dominant notion of national belonging and potentially provide new starting points for reflections on ending statelessness.

TRUDA, GIOVANNA* (University of Salerno, Italy)

The Gender of Corruption. Corrupt Practices and Prevention Policies

Corruption scholars agree that promoting gender equality and improving women's representation at all levels of decision-making can reduce corruption.

Corruption is installed on structures of inequality already rooted in the social system, positions of vulnerability, poverty and still patriarchal laws and becomes a mechanism that excludes women from decision-making processes, making it difficult for them to obtain justice or economic opportunities. Therefore, the inclusion of a gender perspective in governance can reduce corruption and improve transparency and have a positive impact on the quality of the country's institutions and governance.

However, women are immune to corruption, but it is conceivable that the lower participation in corruption episodes could be a direct consequence of their lower presence in top positions rather than greater intrinsic integrity. Although there is no extensive specific literature on "women and corruption" in Italy, there are several international studies that indicate general trends that can also be applied to the Italian context. In Italy, as in the rest of the world, female participation in institutions has increased, the law on "gender quotas" has certainly contributed to the increase in the boards of directors of public and private companies, contributing to greater diversity and transparency. However, women in leadership positions have often had to face additional challenges related to sexism and discrimination.

Italy has adopted various anti-corruption measures in recent years, the Severino Law (2012), the National Anti-Corruption Authority (ANAC). Another important factor in this relationship is the "sexism" present in the cultural and work context in some areas of the country, the rootedness of patriarchal culture and organized crime makes it particularly difficult for women to emerge in leadership roles, thus hindering their contribution to the fight against corruption.

The paper proposes a research among female and male university students on the relationship between women and corruption.

TRUDA, GIOVANNA* (University of Salerno, Italy)

Women's Environmental Justice Movements: Inequalities and Rights

The main goal of women's environmental justice movements is to address environmental inequalities, but at the same time promote social justice. These movements are aware that environmental issues, such as climate change, pollution and the management of natural resources, have a disproportionate impact on some communities, especially marginalized ones, and that women, especially in developing countries, are often among the most affected. An approach that recognizes this interconnectedness considers it essential to integrate women's rights into solutions for environmental change. Women

around the world are often at the forefront of environmental justice movements and it is these movements that combine the fight for women's rights with environmental protection, when they call for a more inclusive and just approach to natural resource management and climate policies. Environmental changes can amplify existing inequalities, for example in the health sector, nevertheless women, due to their socioeconomic position, face specific environmental risks, such as increased water scarcity, loss of arable land and natural disasters¹. However, women have developed forms of resilience through community and solidarity practices and are involved in informal networks of support and cooperation that help them face environmental challenges.

The paper presents a survey of the major women's movements for environmental justice in the world and in Italy, this survey aims to identify common elements, in order to understand which dynamics are activated in the forms of environmental change where women are protagonists and which social dynamics this commitment affects.

L'Intelligence Artificielle à L'épreuve Des Pratiques Et Des Réflexivités Professionnelles En Dermatologie. Le Cas De La Détection Précoce Des Mélanomes

Si l'IA n'est pas (encore) véritablement intégrée dans les pratiques quotidiennes des professionnels de santé, un nombre grandissant d'applications font leur apparition dans le monde médical. L'engouement autour de ces systèmes apprenants est porté par des discours et des promesses dont l'ampleur dépasse bien souvent celle des usages qui en sont faits concrètement par les praticiens. L'objectif de cette intervention est de rendre compte de la manière dont les nouveaux dispositifs d'IA sont intégrés concrètement aux pratiques et aux réflexivités médicales. Le terrain d'enquête est celui de la détection précoce des mélanomes par des dermatologues, qui est particulièrement intéressant pour étudier le développement les usages de l'IA, notamment des outils de diagnostic automatique par apprentissage machine (*machine learning*). Que se passe-t-il quand le dermatologue n'est pas d'accord avec le verdict formulé par l'IA ? Comment identifie-t-il, perçoit-il, vérifie-t-il et évite-t-il les erreurs ? Comment intègre-t-il l'IA concrètement dans le cadre de son activité de consultation et quelle place (ou statut) lui donne-t-il dans sa pratique ? Comment la confiance en l'IA est-elle construite ? Nous proposons d'étudier ces questions à partir d'une recherche qualitative fondée sur des entretiens semi-directifs menés auprès de dermatologues (n = 21) qui utilisent et/ou participent au développement des dispositifs d'IA dans le domaine de la dermatologie. Les principaux résultats sont présentés en trois temps. Nous aborderons d'abord les principaux enjeux du développement de l'IA dans cette spécialité, en caractérisant notamment le contexte et les spécificités de la pratique dermatologique. Nous dresserons ensuite une typologie des différents positionnements à l'égard de l'utilisation de l'IA dans la pratique quotidienne. En nous focalisant sur le contexte clinique, nous décrirons enfin la manière dont l'IA se confronte aux pratiques et aux réflexivités professionnelles, pour comprendre comment elle peut faire évoluer la « vision professionnelle » qu'elle vient équiper.

WG01-889.8

TSAPKO, DEMYAN* (Russian State University for the Humanities, Russian Federation)

Creative Intelligentsia As an Actualizer of the Social Contract

The challenges of the times provoke a revision of the social contract. The digitalization of all major spheres of life has given rise to digital hygiene, which is designed to minimize the negative consequences of the loss of privacy, lack of control and verification of data, an avalanche of incoming data from the expanded information field. However, maintaining personal digital hygiene cannot ensure the necessary level of human security without special mechanisms set up by the state. And the state itself and its individual institutions often suffer from modern digital technologies, requiring a certain moral code observed by its citizens. Another pressing problem of the modern world is the revision of the rules of international coexistence developed as a result of the Second World War. Complex geopolitical processes have led to changes in both the political and economic life of most countries in the world. These problems are unfolding against the backdrop of global environmental

transformations, the consequences of which have not yet been fully predicted. Thus, new conditions of human life are created, new needs are formed and require the state to satisfy them. In turn, the state needs greater sacrifices from its citizens, since it is forced to maintain its own political, economic and communication security. The formation of specific provisions of the social contract that meet the needs of both the citizen and the state is produced and broadcast by people who have the ability to express the opinions of different social groups, including

through formats that are easily perceived by a wide audience. These are literary and musical works, films, plays, television programs, works of fine art. In the Russian tradition, it is called the creative intelligentsia. Its representatives have always been perceived by sociologists as cultural subjects who create models and norms for the entire society. The role of the creative intelligentsia in actualizing the social contract is a topic for discussion in the international sociological community.

WG01-889.3

TSAPKO, MIROSLAVA* (Russian State University for the Humanities, Russian Federation)

Quality of Life As an Indicator of the Successful Civil Contract

The civil contract, as a set of agreements between a person and the state, shows the system of opportunities received by the person from state institutions in exchange for part of his freedoms. These opportunities are provided by authorities at various levels, and they also limit freedoms in the form of civic duties. The authorities aim to meet the needs of citizens, which affect the quality of life. Objective measurements are expressed in specific indicators and subjective ones are related to the degree of a person's satisfaction with any sphere or general perception of his life. Satisfaction depends not only on the quality of services and functions provided by the state, but also on the level of aspirations. The balance between the value of the benefits received from the state and the burden of responsibilities is regarded as the effectiveness of a current civil contract.

In order to ensure the implementation of the social contract in relation to the quality of life in the Russian Federation, laws and regulation at various levels have been developed. There is also a whole system of Decrees of the President of the Russian Federation aimed at developing social infrastructure and certain spheres of everyday life.

This approach is consistent with the "blueprint to achieve a better and more sustainable future for all" developed in 2015 by the UN General Assembly.

It is important for governance, is built on the basis of sociological surveys, which allow not only to prioritize projects that meet the needs of the population, but also to identify opportunities for effective providing of information. It is assumed that this approach is an adequate reply to the request for a new social contract in the Russian society.

The main results of specialized sociological surveys will be shown in the presentation.

TSARITOVA, NATIA* (Bielefeld University, Germany)

Between Organization and Environment: Conceptualizing the Observer Category of International Organizations

International organizations operate within dynamic and complex environments where cooperation, overlap, and interaction with other actors are inevitable. While studies on inter-organizational relations have often focused on such cooperation, the category of observers within international organizations has seldom been thoroughly examined. This presentation aims to introduce a conceptualization of the observer category from an open systems perspective (Scott 1992) and considers it as an intermediary space between the organization and its immediate environment. It offers a theoretical framework for understanding what observing entails and how it functions. I argue that observers are neither members of the international organization nor simply partners for cooperation; they occupy an intermediary position and exist at the organizational boundaries of an international organization. Consequently, this presentation approaches observers through the sociological neo-institutionalist lens and the concepts of organizational boundaries. To gain a deeper understanding of how observers position themselves within international organizations, I examine the case of the Arctic Council and its state and non-state observers. Given the Arctic Council's large number of observers and highly regulated observer rules, it provides valuable insights into how observers can be integrated into organizational structures and why they engage in close cooperation. By conceptualizing observers, I address both similarities and differences in the modes of interaction and characteristics of the observer category, such as flexibility, durability, and purpose. This concept is based on a broader comparative study of

observers in the Arctic Council, involving the analysis of expert interviews, official documents, and secondary literature. This presentation contributes to research on international organizations and organizational sociology by highlighting a specific form of close inter-organizational cooperation.

'Digital Good' and Vulnerable People's Digital Inclusion: Key Findings from Testing a Social Lab Framework

In this paper, we present findings from a pilot study exploring what 'digital good' looks like from the perspective of vulnerable people in relation to their digital inclusion and associated socio-digital inequalities. The study adopted a social lab framework (Tsatsou & Polizzi, under review) to explore the concept of the 'digital good' and to test whether such a framework is effective in generating insights into the relationship between 'digital good' and the digital inclusion of three vulnerable groups - ethnic minorities, older people and people with disabilities. Methodologically, the study was informed by Participatory Action Research (PAR), which is often championed for generating social change (Abma et al., 2017; Penfield et al., 2014), and it adopted a decolonising research approach (Thambinathan and Kinsella 2021), thus addressing three questions:

1. In what ways, if any, do vulnerable people's perceptions and experiences of 'digital good' (re)shape their digital inclusion and associated inequalities in the digital and broader social realm?
2. What initial conclusions can we reach about individual agency and resistance as part of how 'digital good' is perceived and experienced by vulnerable people in relation to their digital and broader social inclusion?
3. How effective is the proposed social lab framework in enabling research to explore how 'digital good' speaks to vulnerable people's digital inclusion and associated socio-digital inequalities?

Exploring the Nexus between Democracy and Subjective Wellbeing

The quality of a political regime, governance, and political factors strongly influence individuals' subjective well-being. As a young democracy, and the only democratic country positioned between China and Russia, Mongolia faces significant challenges, including global democratic decline, growing socio-economic inequality, and rising geopolitical tensions. Mongolia has experienced democratic backsliding according to various political indicators. This makes it timely to examine how these political shifts impact the well-being of Mongolian society, including trust, participation, cooperation, and life satisfaction.

This paper explores the nexus between democracy and subjective well-being in Mongolia, focusing on whether there is a meaningful relationship between democracy and subjective well-being in the first place. Furthermore, how democratic governance influences trust, life satisfaction, happiness, sense of purpose, and other well-being dimensions and vice versa. By

analyzing data from the World Values Survey, Asia Barometer, and the Subjective Wellbeing Survey of Mongolia, the paper uses social indicators to explore these relationships across key study areas such as trust in institutions, political participation, generational values, and life satisfaction. Additionally, it discusses the implications of rising geopolitical tensions on democratic satisfaction in Mongolia and examines whether these factors further affect the subjective well-being of its people.

Through this examination of social indicators, the paper contributes valuable insights into how democracy and well-being intersect in a young and transitioning democracy. The authors explore possibilities to revitalize democratic trust, support, and participation as crucial conditions for improving citizens' well-being.

Informal Employment in Mongolia and Russia: State and Challenges

New challenges of scientific and technological achievements of mankind and manifestations of the approaching fourth industrial revolution demonstrate the possibilities of spreading new types of employment in the labor market. Economic foundations and formulas of functioning of world and regional labor markets are changing. A kind of reformatting of responsibility of subjects of the labor market to the state and civil society continues. Therefore, the topic of informal employment acquires special significance for society and its future. In connection with low socio-economic indicators, globalization and intensification of processes of neotraditionalism and neoarchaization in the Russian-Mongolian cross-border area, a comprehensive assessment of processes in the labor market is required. Historical, cultural and ethnic identity with the Mongolian world, similar traditional economic practices become a significant factor in studying issues of informal employment in Mongolia and the national regions of the Russian Federation bordering it - the republics of Buryatia and Tuva.

The paper "Informal Employment in Russia and Mongolia in Modern Conditions" will present the results of research conducted in Russia and Mongolia, from Russian side project manager, Doctor of Philosophy, Professor Z. T. Golenkova, from the Mongolian side Ph.D., Associate Professor Ts. Tsetsenbileg.

There are several approaches examining the issues of informal sector, labor and employment and consequently the research methodology. The paper outlines a brief history of the terms "informal sector and employment", a discussion of associated conceptual problems. The theory of Zygmunt Bauman and Robert Reich are presented as applicable to describe the phenomenon of informal employment in globalizing circumstances of 21 century. Based on their concepts the methodology for studying the informal employment was developed. The paper represents the findings of the survey conducted in 2022-2023 in Mongolia, Tuva and Buryatia. The results approve the initial hypothesis of polarization among informal employers.

WG11-943.1

TSILI, ANDRIANI* (University of Cyprus, Cyprus)

Exploring Victimhood and Responsibility in Femicides through Media Narratives

Over the past decade, femicides committed by partners or husbands in Greece and Cyprus have rapidly increased. This rise has attracted intense media attention (Brodie, 2019) and sparked discussions that explore various aspects of the phenomenon (Crenshaw, 1999). Central to these discussions are efforts to prevent femicide and understand its complex dynamics (Corradi & Stockl, 2014).

A key part of prevention involves examining how victimhood is portrayed when understood in a broad sense—from the immediate victim to family and society—and how responsibility is assigned or deflected in media narratives.

This presentation draws on the literature surrounding media representations of femicide and aims to answer two key questions: "how is

victimhood portrayed when a femicide occurs?" and, "how is responsibility portrayed, transferred, or silenced through the media narratives?" The selection of online media articles for femicides in Greece and Cyprus for the period 2019-2023 was conducted as follows: a week's news coverage was constructed for each femicide which means that each femicide is represented in the data base by the articles that were written on a Monday, the articles that were written on Tuesday and so forth. The total number of femicides for this period is 111 for Greece and 29 for Cyprus. The selected articles were coded using Atlas.ti 8 software and analysed through discourse analysis. The coding is based on a matrix that captures discursive elements of victimhood and responsibility.

Preliminary findings indicate that the concept of victimhood is fluid. In some cases, it refers exclusively to the immediate victim—the murdered woman—while in other cases, it expands to include the family, neighbours, or even institutional actors such as police officers and politicians. On the other hand, responsibility is consistently attributed to the perpetrator while institutional factors are rarely held accountable for maintaining a reactive rather than proactive role in addressing femicide.

Governing the Commons in Exceptional Conditions. the Importance of Socio-Political Leadership in Governing Sustainable Development.

Greece considers the 100 anniversary of the events which led to the disaster of the three millennium old Ionian Communities (Asia Minor) as the dramatic events which shaped her modern identity. The arrivals of almost 1,5 million refugees of Hellenic heritage to the mainland Greece is considered as the birth registry of Modern Greece. The protagonist who gave shape to these socio-political institutions, Refugee Settlement in agro-ecological cooperative schemes, emergency finance for agro-industrial development, all under austerity financial conditions, was the Political Sociologist Alexander Papanastasiou. He acted as a catalyst to the democratic government of Venizelos participating as Minister in his Cabinet. He became twice Prime Minister. His education and leadership skills allowed him to institutionalize an organizational regime which developed cooperation for development combining, an acute crisis, the settlement of refugees, with community development solutions in the manner of cooperatives, founding the Agricultural Bank to combat usury, and setting in place (Thessaloniki) agricultural research and development to develop new seeds, while establishing a unique Import Substitution mechanism to finance all these, as credit was not available (The Papanastasiou-Koryzis Model). The role of social-scientific applications in the administration of this dramatic social crisis in Greece was key. Clientelism and similar problems, which defined the political situation in the country, were put aside and emergency governance, based on the ethics of cooperation and scientific applications, under endogenous community development reformed, the Public Interest. The paper focuses on this unique moment of Greek socio-political history to illustrate that the present Greek crisis may need such leadership skills and intervention to get the country out of the acute social crisis it is found in at present. The complexity of these forgotten policy needs to be considered when dealing with current Greek and similar challenges in sustaining agro-ecological socio-political development issues.

Sustaining Local Development through Enabling Social Financing Instruments in Euro-Mediterranean Countries

In post-crisis EU landscape, EU Mediterranean countries are making steps in alleviating the burdens that citizens have carried at individual and collective level by restructuring their economies and re-designing social protection measures. Social and solidarity economy (SSE) is a sector that despite its growth and positive impact towards vulnerable groups during the crisis has also seen several impediments in its development most notably regulatory and financial obstacles and an uneven development of the sector among E.U. countries.

In this new landscape, endogenous local development and the sustainability of the sector relies on stable and recurring funding sources, as it is necessary to answer the financial needs of social economy actors and operators in the current and next E.U. programming period (2021-2027), to sustain the emerging dynamic of SSE. The paper addresses the pivotal role of social financing in supporting social economy organizations endeavors and presents data based on a literature review regarding the EU framework on financing social enterprises and operators and the specific social investment initiatives that are taking place in Euro-Mediterranean countries such as Portugal, Spain, Italy, Cyprus, and Greece.

Japan's Disaster Recovery Governance and Historically Configured Local Community Institutions: Insights from the Great East Japan Earthquake

Disaster recovery governance has gained significance in recent years, highlighting the critical role of community involvement in recovery processes. The governance of disaster recovery varies across countries, shaped by the socio-political system and its path dependencies. In particular, decentralization and citizen participation in local governance before a disaster are key factors in analyzing the structure and functions of disaster recovery governance. This study examines the historical evolution of local governance and community involvement in Japan, one of the world's most disaster-prone countries, to identify the unique characteristics of its disaster recovery governance. Previous research suggests Japan's recovery governance has been dominated by top-down frameworks, with limited citizen participation during the 2011 Great East Japan Earthquake recovery. We tested these assumptions by analyzing data obtained from case studies of three tsunami-affected areas (Onagawa, Higashimatsushima, and Natori) and two nuclear accident-affected areas (Okuma and Futaba) following the earthquake. Our findings reveal that, in tsunami-affected areas, the influence of community organizations on policymaking and their collaboration with municipalities varied significantly even before the disaster, impacting the success of stakeholder coordination in post-tsunami community relocation programs. In nuclear accident-affected areas, pre-disaster policy regimes related to nuclear plant construction influenced citizen participation in recovery processes. Overall, the study reveals that Japan's disaster recovery governance is deeply rooted in local community institutions that were historically configured before the disaster. This collaboration has become customary among municipalities and community organizations and is embedded in local contexts. However, the local variations of these communities often result in regional inequalities in recovery. The study raises concerns that applying a bottom-up approach in such a context could further exacerbate these inequalities. Additionally, our study highlights the potential effectiveness of adaptive disaster recovery governance that moves beyond rigid top-down or bottom-up approaches.

Workplace or "Campus": Youth Identity Construction and Labor Control in China's High-Tech Industry

China's high-tech industry has witnessed rapid growth given the country's emphasis on technological innovation and digital transformation over the past decades. High-tech giants have embraced new workplace ideals of non-authoritarianism, anti-bureaucracy, and informality, and aspire to construct an image as the utopia of 'freedom, equality, and openness' against existing social hierarchies in the workplace. However, Chinese tech workers experience a prevalent '996' overwork norm and a severe age-bounded unemployment crisis. This study examines how such contradictions are formed based on a workplace culture with a metaphor of 'campus'. Unlike the well-known cultural imaginaries of 'family' and 'religion' in existing labor scholarship, the 'campus' metaphor poses hegemonic control by evoking workers' spirit and experience of being young. Drawing on 12 months' participant observation at a high-tech company in Shenzhen (China's Silicon Valley) and 36 in-depth interviews with its employees, this study finds that the metaphor of 'campus' emerged in the daily interactions and work practices of tech workers. This youth-admiring culture effectively disciplined their behaviors by shaping workers' subjectivities, workplace discourses, and employment norms. This study develops a conceptual framework of 'doing metaphor' to explain the processes where employees internalize and reproduce work culture, values, and hierarchies. Findings demonstrate three processes of identity construction: (1) employee as apprentice: workers identify themselves as apprentice in the company; (2) workplace as campus: workers perceive the organizational structure as flat, equal, and open; (3) layoff as graduation: workers view layoffs as a natural end to a periodic life stage. Correspondingly, these cultural processes impose informal labor control on workers by: (1) encouraging competitive self-management; (2) creating an imaginary of equality and cultural fit for youths; (3) justifying precarity and instability of programmers' occupation. The findings reveal how a workplace culture that promotes belonging, passion, and satisfaction also sustains traditional power relations and social hierarchies.

Mixed-Mode Design and Quality of Response in Panel Surveys

Mixed modes are commonly used in large-scale panel surveys, and the mode effects they evoke have been widely discussed. The mode effects associated with mode sequences in mixed-mode surveys, particularly in the concurrent or sequential designs, have attracted considerable attention. Concurrent designs offer participants a choice of modes at the first contact. Sequential designs offer one mode first, followed by another mode for those who did not participate in the first mode. Both designs are subject to selection effects, as participants can choose the mode they like. Concerning cost, response rates, or data quality, previous mixed-mode surveys have explored alternative designs by tailoring mode sequences or initial contact strategies for subgroup, based on the cost of modes, previous response behaviors, respondent characteristics, and incentives. Selection effects, however, remain to bias the estimates of mode effects.

This study examines mode effects across the alternative designs different from traditional concurrent and sequential mixed-mode approaches, using four-wave panel data from the Panel Study of Family Dynamics surveys collected in 2018, 2020, 2022, and 2024. A common feature of the four waves is that the targeted samples were pre-assigned to web mode or face-to-face mode, primarily based on their level of cooperation in previous waves and the availability of email addresses. In the 2018 and 2020 surveys, web mode and face-to-face interviews were conducted simultaneously. In the 2022 and 2024 surveys, web mode was conducted first, followed by face-to-face interviews. We use propensity score matching to control for selection effects, enabling us to estimate the mode effects on response behaviors. The outcome variables include item nonresponse (e.g., "refusal" and "don't know" answers), response styles on attitude scales, and socially desirable responses. This study helps to understand the difference in mode effects on response behaviors between two types of mixed-mode surveys activated simultaneously and sequentially.

Digital Reputation: Social Media Usage of Top-Level Corporate Executives

Digital reputation, which has come to the forefront for employees and companies with the spread of technology and the internet, refers to how a person or organization presents themselves and is perceived in digital media. Drawing on Erving Goffman's concepts of dramaturgy and impression management, self-presentation in the digital world—an aspect of identity performance in social interactions shaped by the individual's position and the impressions they convey or intend to convey—can vary according to individuals' careers and status in the workplace.

This dissertation research, which examines the social trajectory, educational capital, and professional identities of senior corporate executives, is conducted in light of the concept of digital reputation. The research analyzes the importance executives attribute to visibility on social media in managing their careers and maintaining their status, as well as how they present themselves in the digital world, based on qualitative interviews.

Interviews were conducted with 33 participants, who are board members and senior executives from companies on the list of "Turkey's 500 Largest Private Companies," published in the August 2024 issue of *Capital* magazine. It was observed that executives place a strong emphasis on building their personal brands and protecting their image. Interestingly, they distinguish between the professional status conferred by their company identity and the profile created by their personal skills and career achievements. To support their digital reputation, executives view their social interactions and work-life connections as aspects that must be actively managed and reflected.

Is the Rise of the Far Right Overstated? a Comparison of "Thick" and "Thin" Cases

Over the last ten years, the far right has made surges at the ballot box in democratic and semi-democratic countries (France, Italy, Germany, Brazil, Turkey, Hungary, Israel, Argentina, India). It has also shifted the center dramatically to the right in established democracies, as can be seen throughout Europe and North America. Furthermore, it appears to be either at the helm or growing in influence in countries without meaningful elections, such as Iran, Russia, and arguably China. However, unlike the interwar years, and despite all talk of an anti-cosmopolitan "nationalist International," there seems to be no emergent fascist ideology and movement with a consistent line and a solid alternative to market economics and liberal democracy. As importantly, except in a couple of semi-peripheral cases (Turkey, Hungary, Israel), the far right has not been able to hold on to power for longer than ten years.

We need to ask: Is today's far right incomparably weaker than interwar fascism, as its overreliance on memes, social media, and non-ideological leaders would seem to suggest? In fact, unlike Mussolini and Hitler, many of today's leaders – e.g. Trump, Bolsonaro, Duterte – appear to have no durable social base. None of the mentioned contemporary leaders come from, or build, social movements and mass organizations.

Or, are Erdoğan, Modi, and Netanyahu more representative of what is to come, despite their current marginality to "generalizing" theorizations of the far right? Yet, even if they are, are they really (or about to become) as destructive and violent as interwar fascists? This paper seeks tentative answers to these questions by comparing "thick" cases of the contemporary far right with the "thinner" cases, and discussing to what extent either has the potential to build durable dictatorships and/or finalize ongoing ethnic cleansings.

SEMUSHKINA, EKATERINA (Higher School of Economics in St.Petersburg, Russian Federation)

"People Together, Garbage Apart": The Global Environmental Agenda and Traditional Values in the Grassroots Environmental Movement in Russia

Between 1990 and 2020, Russia's environmental movement evolved under the strong influence of the global environmental community. International eco-NGOs actively introduced global values related to biodiversity conservation, waste sorting, recycling, and the protection of oceans from pollution, among others. These efforts led to the gradual adoption of global environmental practices by grassroots eco-activists across Russia. However, since 2022, the movement has undergone significant transformations due to shifts in the country's political course. Ideas of "sovereign ecology" and environmental patriotism have gained prominence, reconfiguring the movement's goals and narratives.

Global environmental practices have not disappeared but have been adapted to fit the changing political context. Russian eco-activists continue to promote these practices, but they are now intertwined with patriotic and traditionalist narratives. This study explores how grassroots eco-activists are reinterpreting global environmental values in light of Russia's growing focus on traditionalist environmental agendas. Specifically, it examines the socio-cultural practices that merge global environmental ideals with local, traditionalist frameworks.

This research draws on the cultural sociology paradigm and employs qualitative methods, with empirical data collected across various Russian regions in 2024. The analysis focuses on the symbolic meanings attached to environmental actions and how these actions are framed. In some instances, global environmental values are embedded within military-historical or spiritual narratives. Examples include redirecting recycling revenues to support military efforts, incorporating traditional rituals into environmental campaigns, promoting waste sorting through religious practices, and organizing patriotic events in significant natural landmarks.

TUNCBILEK, SEYDA SEVDE* (Istanbul University, Turkey)

Il Était Une Fois l'Algérie: Les Contributions De Germaine Tillion à l'Ethnographie Méditerranéenne

Marcel Mauss (1872-1950) est souvent critiqué pour être un *anthropologue de fauteuil*, qui n'a pas mené de recherches sur le terrain auprès des peuples qui faisaient l'objet de son étude. Malgré le fait qu'il n'ait pas pu trouver l'occasion d'entreprendre des enquêtes ethnographiques de longue durée, les jeunes ethnologues français des années trente qui gravitent autour de Mauss se dispersent dans différentes parties du monde.

C'est le cas de Germaine Tillion (1907-2008). En octobre 1934, cette élève de Mauss, âgée de 27 ans, embarque pour l'Algérie. Jusqu'en 1940, elle effectue quatre long terrains chez Chaouiâs des Aurès, a quatorze heures de cheval du premier centre urbain. Après son arrestation en France en 1942, conséquence de son engagement dans la Résistance, et après des années éprouvantes, d'abord en prison puis au camp de concentration de Ravensbrück, elle revient en Algérie au lendemain du soulèvement de 1954 en mission officielle. À partir de 1958, elle anime une équipe de recherche sur les sociétés maghrébines à l'EPHE.

Outre le fait de constituer un témoignage d'une société en voie de changement dans un climat extrêmement crispé, les recherches de Tillion en Algérie sont les pionnières de l'ethnographie méditerranéenne. En mettant en pratique l'enseignement de Mauss, elle aborde les faits par leur « totalité » et traite de sujets tels que la « clochardisation » du peuple algérien, le système de parenté, les règles matrimoniales et la condition féminine. Son approche comparative, marquée par une attention méticuleuse aux détails, sa sensibilité à la diversité et sa prise en compte du contexte politique, en font une figure incontournable de l'histoire de l'anthropologie. L'objectif de cette intervention est de mettre en valeur les contributions méthodologiques et théoriques des recherches de Germaine Tillion au développement de l'ethnographie, voire de l'anthropologie méditerranéenne.

TURAN, YUNUS* (Scuola Normale Superiore, Italy)

Contextualizing Institutional and Extra-Institutional Strategies: A Comparison between the Spanish Indignados and French Yellow Vests

This work aims to understand the evolution of social movement trajectories by examining the interplay between extra-institutional and institutional political strategies. I understand social movement trajectory as a result of multi-dimensional interactions evolving through strategic choices made by collective action actors. Using a processual approach combined with a most-similar-case comparison strategy, I analyze the trajectories of the French Yellow Vests and the Spanish Indignados movements to understand the dynamics of (extra)institutional strategies employed by these two movements. Both began with participatory and horizontal organizational structures, initially distancing themselves from institutional politics. Despite their shared non-institutional structure, criticism of institutional politics, and common extra-institutional repertoires of action, their trajectories diverged over time. Podemos emerged as a movement party in Spain in addition to local election coalitions such as Ahora Madrid and Barcelona en Comú, channeling the Indignados' demands and several activists into institutional politics and causing an electoral turn within the movement. This change altered the strategic options for the activists by opening up the institutions for them. However, a similar change in strategic choices did not emerge in France.

By examining these similarities and differences, I seek to explain how these two movements developed different trajectories forcing the actors to make different strategic choices despite their similarities at the outset. For this, I resort to political opportunity structure and resource mobilization theories to frame the structural factors of social movement trajectories while leaning on cultural approaches to define the internal factors affecting movement trajectories over time. On this basis, I demonstrate that the structural and internal factors affecting social movement trajectories evolved in different directions in these two contexts over time despite their similarities at the outset of the two movements, leading to differentiated movement trajectories and strategic shifts in the repertoires such as institutionalization.

TURAN, YUNUS* (Scuola Normale Superiore, Italy)

Navigating the (Non)Institutionalization Dilemma: Democratic Innovations from the Spanish Indignados Movement

This paper examines bottom-up democratic innovations that emerged from the Spanish Indignados movement. Democratic innovations refer to the renewal of democratic practices on a more participative and deliberative basis. The (non)institutionalization dilemma highlights the tension between horizontal, participatory, loosely structured collective action repertoires and vertical, hierarchical, formalized practices, posing the challenge of aligning extra-institutional politics with existing political institutions. Beyond simply arguing that the (non)institutionalization dilemma was the driving force of democratic innovations in Spain, I aim to show the evolution of democratic innovations is dependent on dynamic interactions at micro, meso, and macro levels through within-case comparisons. I identify three distinct strategies that emerged throughout institutionalization processes to navigate the pitfalls of the (non)institutionalization dilemma: a mixture of assembly-based and e-democratic practices attempted by Podemos at the national level, the assembly-based strategy of Barcelona en Comú, and the e-democracy practices of Ahora Madrid. These cases offer rich insights into how different strategies emerged to navigate the (non)institutionalization dilemma and how their trajectories evolved over time according to different political levels and environments.

To analyze these three examples, I use a processual approach by focusing on the multi-dimensional interactions between different actors of contention. In that regard, I focus on the interactions among the insiders (activists engaged in institutional strategies) and outsiders (activists stayed in extra-institutional spaces), and the local-level initiatives (Ahora Madrid and Barcelona en Comú) and the national-level actors (Podemos) to understand the evolution of their innovative practices in line with co-optation/success nexus. Thus, firstly, I aim to understand the embedded dynamic mechanisms that led to democratic innovations. Secondly, I aim to show that the fate of democratic innovations is contingent since being shaped by dynamic multi-dimensional interactions among different actors, unfolding as different processes each time.

TURCHETTI, ALESSANDRA* (University of Milan-Bicocca, Italy)

MAGARAGGIA, SVEVA (University of Milan-Bicocca, Italy)

Performing Citizenship, Decolonizing 'Italianness': North African Migrants' Descendants in Italy between Activism and Everyday Life

Citizenship is a central issue in public debate in Italy. In recent years, the 'children of migrants' have played a crucial role in promoting a reform of the law on the acquisition of Italian citizenship, which is seen as anachronistic and discriminatory. However, citizenship is more than a legal issue; it has a lived and performative dimension, embedded in everyday life (Kallio et al., 2020).

This paper presents the first findings of the research project 'Growing old, feeling like citizens?' (PRIN, University of Padua & Milan-Bicocca) - a multi-site qualitative study based on biographical interviews, focus groups and ethnographic observation - which investigates the transition to adulthood of young Muslims of North African origin in Italy and their 'in-between' experiences of identity and citizenship (Besozzi, Colombo, Santagati, 2009; Caneva, 2011).

Drawing on intersectional and decolonial perspectives (hooks, 2020, Lugones, 2010, Vergès, 2019), the study explores the multiple ways in which the descendants of North African migrants in Italy perform citizenship and identity in their everyday lives, navigating through different categories and practices of gender, race, class, religion, etc. These youth have to confront persistent processes of exclusion and racialisation determined by historically constituted power relations (Mellino, 2012). However, in constructing their own sense of 'multiple belongings' (Valtolina, Marazzi, 2006), they are able to mobilise different resources and strategies of resistance, political engagement and cultural activism, creating a wide network of transnational and diasporic connections (Accella & Pepicelli, 2018; Camozzi et al., 2019; Cingolani, Ricucci, 2014). These strategies often imply the political use of art (Frisina, Kyeremeh 2021; Frisina, Houbabi, 2022) to assert overtly feminist and anti-racist positions (Chiappelli, Bernacchi, 2024). Through these practices, this 'new generation of Italians' is making an essential contribution to rethinking 'Italianness' in a postcolonial sense (Grimaldi, Vicini, 2024).

RC18-JS-134.3

TURCSAN, BALAZS* (Student, Hungary)

The Special Relationship: National Conservatism in the US, Illiberalism in Hungary, and a New Right-Wing Hegemony

A paradoxically growing global network of self-branded right-wing "anti-globalists" and "illiberal nationalists" has been emerging to hegemonic heights within global conservative circles. Not only are right-wing politicians and parties exclaiming to counter neoliberal globalization getting more popular within the right or in general, but they are also forming a growing international platform. This network's discursive rejection of neoliberalism and globalization is at least a narrative break from the previously hegemonic Reaganite-Thatcherite neoconservative consensus. In this paper, I take a closer look at a *movement-in-the-making* by analyzing Viktor Orbán and Fidesz's ties to a faction of the US Republican Party, the "National Conservatives." I hypothesize that an increasingly hegemonic faction within the US Republican party regards Orbán's Hungary as a test-ground for conducting right-wing populist political campaigns and implementing increasingly authoritarian policies providing ideological and institutional support in exchange. First, I look at the interrelated self-mythologies of these movements: the narratives of anti-globalization, the importance of a strongman or "black sheep" figure, and how they legitimize their ambitions for power. Then I shortly delineate some of the ruptures and continuities between this model of hegemony and legitimacy creation using the concepts of ordonationalism (Geva, 2021) and post-fascism (Tamás, 2000) and previous neoconservative models. In the core of the paper, I conduct an institutional analysis looking at the organizational basis of this network I call the Nationalist Fusionists working on the ideological diplomacy between Fidesz and the National Conservatives. Lastly, I point out the wider implications of this movement to international political economy, more particularly, how this emerging movement might transform the second phase of neoliberalism. I aim to contribute to the literature on right-wing populist politics by looking at the dynamics of global networking between aspirant "anti-globalist" populists and the influence this network has on methods of legitimizing power.

TURRELL, MOLLY* (La Trobe University, Australia)

Exploring How Women Navigate Sexual and Reproductive Health Decision-Making While Experiencing Homelessness

There is a stark knowledge gap on the sexual and reproductive health (SRH) of women experiencing homelessness. The limited research that does exist foregrounds the challenges that they face at every stage of their reproductive lives.

This presentation outlines findings from doctoral research undertaken in England and Australia, which adopts a qualitative design incorporating interviews and collaging sessions with women who have experienced homelessness to explore how they negotiate and experience SRH decision-making. A theoretical lens combining concepts of reproductive justice, structural violence, and stigma informs the study. Findings suggest that contrary to pathologising representations of women as irresponsible, immoral, and unable to make choices about their SRH, women are, in fact, continuously undertaking invisible labour to make difficult decisions in extremely restricted contexts. Despite differences in geopolitical contexts and lived experiences, overarching themes of the loss of support structures, restricting expectations of femininity, the denial of maternal identity, and institutional and interpersonal violence feature across their narratives.

By centring the structural conditions that shape the SRH decision-making of women experiencing homelessness, this research offers a novel and nuanced understanding of their reproductive lives. It examines reproductive rights not in isolation, but rather as inextricably linked to the structures that shape the lives of women, and in turn reveals the invisible forces that constrain their decision-making processes.

Student Population Characteristics and Territorial Gaps: A Focus on Distance Learning

The article, starting from the spread of distance learning in the Italian university system and, specifically, from the development of online universities, focuses on the characteristics of the student population that enrolls in an online degree course. Starting from the literature, which allows us to hypothesize the denoting elements of those who opt for distance learning, the authors, on the basis of data from the National Student Registry, illustrate the characteristics of male and female students based on their preferences for teaching (in person or at a distance) and their territorial origin (north/center/south). The analysis, also through a comparison between different European countries, allows us to verify that the population that turns to online learning presents specificities of age and scholastic background and that, in Italy, the south is particularly affected by the phenomenon.

Fear of Missing out Real Life: Tensions and Contradictions of Youths' Screen Time

The youth's own and non-controlled use of digital technologies has been created a bad narrative, in which what is outside the 'screen' is defined as good and desirable – and threatened. This concern around youth and their time use is not new. Young people's 'own time' has been seen as a risk causing anxiety among adults: a dangerous thing with possibilities of becoming disturbed by external inducements. Within the rise of urbanization, leisure increase, entertainment, and consciousness industry (movies, television, internet, phones, and technology in general) have been leading to the continuous atmosphere of dislocation of social control around youth: to a slackening of adults' hold as an educating element and to a moral panic around the issue.

In Finland, the concept of screen time has risen regularly in the debate on the use of media by young people. In general, it refers to the time spent using a digital display device. In this presentation, we analyze the intertwining

of moral concern and moralizing control around youth's screen time as one expression of adult suspicion about young people's digitized actions. We also reflect how this concern becomes internalized and self-excused by the young ones themselves. Empirically we focus on concern about the digital media use of young people by examining how they recognize and react to screen time by describing about the adult control they experience and thinking themselves how the time spent on 'screens' means that something more 'real' and 'important' is missed.

The analysis is based on qualitative interviews and quantitative questionnaire data collected in 2021–2022 in Finland with a target group of young people aged 15 years. The paper is part of "Capturing digital social inequality: Young digi-natives' asymmetrical agencies within socio-technical imperatives and imaginaries (DEQUAL) project.

TWUM-DANSO IMOH, AFUA* (Bristol University, United Kingdom)

Searching for the Everyday in African Childhoods

Much attention on childhoods and children's lives in sub-Saharan Africa has focused on marginalised childhoods or children living in difficult circumstances. In particular, there is an abundance of literature on: street children; child workers; the impact of HIV/AIDS on children; and children's involvement in conflict. While the focus of these studies is valid, they have arguably contributed to portraying African childhoods in a rather negative and pessimistic light and contributed to reinforcing the binary between the Global North and the Global South. Such an overwhelming focus on the challenges that much of the continent and its peoples face is problematic not least because it becomes the focus of many of the publications that are produced about the continent which are, in turn, consumed not only by academic colleagues, but also by students and other members of the public. The resulting outcome, then, is that the knowledge that is produced and subsequently consumed about childhoods in sub-Saharan Africa is one which is characterised by 'lacks'. My contribution to the dialogue will seek to highlight the need for more focus on everyday childhoods on the continent. Additionally, I will illuminate the existing work of scholars, primarily those based in African institutions, some of whom have long sought to explore the mundane and everyday aspects of a range of children's lives but yet have not received adequate attention due to the inequalities that exist in the journal publishing industry which has created challenges for many African-based academics seeking to publish articles in top journals in the Global North. It is my hope that my contribution, overall, will facilitate the process of moving beyond a one-dimensional understanding of childhoods and children's lives in the region as well as illuminate the important role African-based scholars have to play in that process.

TYSIACHNIOUK, MARIA* (University of Eastern Finland, Finland)

"Forced to Flee: The Migration of Russian Environmentalists and Europe's Response"

Following the intensification of repressions by the Russian regime after its full-scale invasion of Ukraine in February 2022, the migration of environmental activists and professionals has significantly increased. This paper examines how relocation to Europe has transformed the professional activities of environmentalists in exile compared to their work in Russia. Has migration to Europe marked a critical juncture for these individuals, or have they been able to maintain continuity in their work?

This study analyzes how the political, economic, and social landscapes of host countries shape the conditions for environmental activism. The research, conducted between 2022 and 2024, is based on participant observation and biographical interviews (58 in total: Finland (N=7), Germany (N=11), France (N=7), the UK (N=11), Serbia (N=9), and Montenegro (N=19)).

Findings reveal that many environmentalists integrated into transnational networks continue to address global issues despite relocation. However, their migration destinations are often chosen strategically. For instance, the World Wildlife Fund (WWF) relocated its Global Forest Program to Serbia in 2021, and Greenpeace moved its GIS hub to Amsterdam.

The study shows that the UK, Germany, France, and Finland offer better conditions for environmentalists seeking employment and long-term settlement while Germany and France became safe havens for at-risk activists, providing humanitarian visas and support structures. In contrast, Serbia and Montenegro present more challenges, with environmentalists often facing uncertainty and actively seeking better opportunities.

The study highlights that in regions with less developed environmental infrastructure, such as Serbia and Montenegro, migrants often engage

in lifestyle activism, including clean-ups, waste separation, and recycling. Meanwhile, in countries like Germany, Finland, and France, environmentalists tend to join established professional NGOs.

Ultimately, this research illuminates the complexities of environmentalists' migration, the persistence and adaptation of their work, and the challenges and opportunities they navigate in diverse host-country environments.

TYSIACHNIOUK, MARIA* (University of Eastern Finland, Finland)

Refugees for a Cause: Russian Environmentalists in Exile Confronting War and Ecological Harm

Following Russia's full-scale invasion of Ukraine in February 2022, many Russian environmental professionals with antiwar stances sought exile in Europe. This paper examines their pathways in exile and their roles in addressing both war-related environmental problems and antiwar activism.

Between 2022 and 2024, research was conducted through participant observations and 58 qualitative biographical interviews across six countries: Finland (N=7), Germany (N=11), France (N=7), the UK (N=11), Serbia (N=9), and Montenegro (N=19). The findings reveal that Germany emerged as a key hub for exiled activists, many of whom faced the risk of arrest in Russia. Several now collaborate on transnational environmental and antiwar projects, often in partnership with German NGOs. For example, a Russian climate expert coordinates projects with a Berlin-based transnational journalism network and contributes to the Ukraine War Environmental Consequences Work Group (UWEC), which assesses the environmental impacts of the war, such as the destruction of the Kakhovka dam.

Eco-Defense members, now scattered across EU countries, are involved in antiwar efforts by leveraging their expertise on supply chains to help identify violations of EU trade sanctions. Their work in collaboration with German NGOs has been instrumental in sharing information with the European Parliament.

France has become a sanctuary for Russian activists at risk. The humanitarian visa program offers a vital lifeline, and exiled environmentalists have found supportive networks within the Russian anti-Putin diaspora. Several continue to combine environmental work with antiwar and human rights activism. Notable figures include a former Ozersk NGO leader now advocating for Ukraine on French TV and a prominent human rights expert who founded the Sakharov Institute in Paris to support at-risk activists.

This paper highlights the resilience and adaptability of Russian environmentalists in exile, showing how they continue to advocate for both ecological and human rights causes amid war.

Labour Market Outcomes of Immigrants in Five Bilingual Contexts: The Effects of Host Country Majority and Minority Language Skills

Competency in the host country's language plays a crucial role in the economic integration of international immigrants. Immigrants who arrive with linguistic skills and/or learn the language of the host country are more likely to find employment and better jobs. However, there are few studies that analyse the role of linguistic skills developed in the bilingual territories of host countries. In this study, we analyse to what extent immigrants benefit from the acquisition of the minority language when integrating into the labour market. To address this issue, this article compares the effect on employment and occupational status of both majority and minority languages in five regions with unequal ethnolinguistic vitality (Catalonia, Galicia, Balearic Islands, Valencia, Basque Country). We use data from the Spanish Labour Force Survey (2021, 2014), in which over 5,000 foreign-born individuals were surveyed about their language competence (speaking fluency). Estimates associated with bilingual competencies are obtained through linear probability models, using both the current knowledge variable and an instrument based on pre-arrival knowledge before coming to Spain (via 2SLS). Preliminary results show that, across the five territories, proficiency in the majority language, Spanish, has a strong impact on both employability and the likelihood of occupying better positions. Exclusive proficiency in the minority language, whether Catalan, Galician, or Basque, does not seem to have a relevant effect on either labour outcome. However, bilingual proficiency, that is, having mastery in the minority language in addition to Spanish, exerts a superior effect. These results remain unchanged after including different sociodemographic variables and the use of IV. We conclude by assessing the importance of acquiring not only the majority language but also the minority one for a successful integration that respects territorial diversity.

Crafting Collective Futures: Exploring the Process of Vision Creation

The purpose of this study is to clarify the process in which the imagined futures are constructed in social movements. A specific imagined future observed in social movements is not something that participants have from the beginning. As Melucci (1989) pointed out, these imagined futures are the result of interactions among diverse participants in the movement. Therefore, the imagined future that emerge in social movements do not necessarily align with the individual visions held by participants, but rather are the result of adjustments among multiple futures.

To clarify the process of creating these futures, it is necessary to identify the components of the futures. To achieve this, I analyze imagined future held by participants in several past social movements. Two key aspects are identified: First, what components constitute the observed imagined future. Second, how these visions of the future were constructed.

By comparing the results of these analyses across different cases, I aim to examine the mechanisms behind the creation of visions of the future in social movements.

Lessons from Fukushima: Food and Environmental Ethics, Arts and Philosophy

On March 11, 2011, a massive earthquake and tsunami attacked the Fukushima Daiichi Nuclear Power Plant in Japan, releasing radioactive materials. Since then, the farmland has been decontaminated, and some

residents have returned, but the Fukushima problem is far from over. What lessons should we learn for Fukushima and for “sustainability transition” in our planet? This presentation reports on the field survey conducted in Iitate Village, Fukushima, in 2024, conducted by the Japanese social lab of RE4GREEN (an EU Horizon grant research project). Iitate Village is located 30-50 km from the nuclear plant and had a population of 6,500 before the accident. Although the evacuation order was lifted in 2017, 80% of the villagers chose not to return. This survey aimed to clarify the *living/lived* environmental ethics through interviews with villagers and stakeholders and visits to sites such as experimental farms, difficult-to-return contaminated areas (Nagadōro district), and a new art hub, Zuzu Warehouse, focusing on the critical role of the NPO, Resurrection of Fukushima. The phase of recovery has shifted from science (decontamination and radiation measurement) to economics (agriculture) and further to the integration of philosophy and art, underpinning the creation of new communities. Here, “community” refer to a “new public space” built by diverse stakeholders, including NPOs at the mediator, researchers, artists, entrepreneurs, and younger generations, who gather voluntarily and utilize their expertise. In this new public space, the concept of “nature” is being redefined—not as an objective entity but as “living/lived nature.” This concept can be clarified through the critical examinations of modern Japanese philosophy (such as Tetsurō Watsuji’s *milieu*), and comparative studies with Western philosophy (such as *umwelt*). Additionally, new practices, such as the fusion of science and art or agriculture and art, represented by Zuzu Warehouse, express the essence of “nature” and “humanity” from within.

Linguicism in Caregiving: Insights from Japanese Migrant Care Workers in Institutional Care Settings in Aotearoa New Zealand

Language communication in institutional care settings between care recipients and care workers is essential for the wellbeing and overall care experiences of both parties. However, significant challenges arise in language communication when care workers and/or care recipients are *Indigenous/Tribal, minority and minoritized languages and peoples* (ITMs). With the increasing reliance on migrant workforces in the care industry across many countries, language communication challenges are becoming troublesome and require careful attention. Research indicates that migrant care workers (MCWs) in care facilities often report lower job satisfaction due to high job demands, limited social support, stress related to acculturation, and discrimination both within work and outside of their care roles. However, current studies on aging and migration often overlook the exploration of language communication experiences in care settings from the perspective of MCWs who are more likely ITMs. Unlike conventional research that frames language communication challenges merely as “language barriers”, our study critically examines the experiences of Japanese MCWs’ experiences, through the lens of linguicism. Drawing insights from in-depth interviews conducted with 10 Japanese MCWs, our analysis reveals various forms of linguicism faced by the study participants. Some participants experienced discrimination due to their accents and overall language proficiency, both from care recipients and co-workers. Interpersonal linguicism is evident, but many participants also internalized language oppression. However, most Japanese MCW participants demonstrated resilient responses in coping with linguicism in their work environments.

Overcoming or Reinforcing Linguicism through Multilingual Research?

This paper critically reflects on a multilingual research project that aimed to investigate and address the issue of disaster linguicism in New Zealand. The project, which involved a diverse team of linguistic minority researchers, sought to overcome linguicism by using culturally and linguistically responsive research methods. Through qualitative interviews conducted in participants’ preferred languages, the project aimed to provide a safe space for linguistic minority communities to share their experiences of multilingual disaster/health communication during the COVID-19 pandemic. However, the research team encountered unexpected challenges. Despite the intention to elevate the voices of underrepresented linguistic minority communities, the project inadvertently reinforced linguicism at times. Researchers’ cultural and linguistic competencies, while valuable, also led to power imbalances and reinforced

English language ideology in subtle ways. The study’s critical collective self-reflection reveals that even well-intentioned efforts to overcome linguicism can reproduce it through research practices. The paper highlights the complexity of conducting inclusive research in linguistically diverse contexts and emphasizes the need for constant reflexivity when working with linguistic minorities. This collective self-reflection offers valuable insights into both the transformative potential and the challenges of conducting inclusive and multilingual research, particularly in the contexts of decolonizing research.

Job Application Requirements and Inequalities: Insights from Job Seekers in Japan

Past research on recruitment and hiring inequalities have focused on how work organizations selectively recruit certain workers and make biased decisions in callbacks and job offers. However, employer requirements for job applications and interviews also create inequalities by preventing certain workers from completing applications and staying in the applicant pool. The present study extends this literature by focusing on unique conventions of application and interview procedures in Japan and examining the implications for LGBTQ prospective graduates as a socially marginalized job-seeker group. Analysis of in-depth interview data shows that LGBTQ people’s job search and career prospects are constrained by three aspects of application and interview conventions in Japan—an annual cycle schedule, an early start of the recruitment season, and use of standard questions in applications and interviews. Other national conditions, such as gender stratification in the labor market and a lack of legal protections of LGBTQ workers, endorse this process. Overall, these results extend the existing knowledge on recruitment and hiring inequalities by showing that the national conventions of application and interview procedures create unique patterns of inequalities in the country.

Euro-American Models, Asian Realities: Rethinking Interculturalism from in East Asian Cities

This research critically examines how East Asian cities navigate and reinterpret Euro-American intercultural models of diversity management in their own unique contexts, focusing on Japan, South Korea, and Taiwan. While European and American ideals such as universal human rights, multiculturalism and, more recently, intercultural dialogue have significantly influenced global migration policies, this study explores the complexities and challenges that arise when these models are applied in East Asian cities, where local political, cultural, and social realities diverge from those of Europe and North America, but also diverse inside the region.

Japan has long resisted comprehensive immigration policies, yet paradoxically, local governments have selectively adopted aspects of European interculturalism, leading to fragmented but proactive policy learning from Europe. South Korea initially embraced a top-down multicultural framework focused on “multicultural families” but has recently shifted towards a more flexible intercultural model to address the diverse needs of its cities. With its grassroots indigenous movements and community-based intercultural education initiatives, Taiwan presents a unique approach, though its contested international status limits its ability to engage in transnational policy dialogues.

Through qualitative interviews and document analysis, this study sheds light on how East Asian cities balance local realities with mainly Euro-American intercultural ideals under the aforementioned conditions, highlighting both the opportunities and limitations of applying Euro-American models of diversity management in different national and transnational contexts. This study also critically examines the state’s role in policy diffusion as East Asian cities, unlike their European and American counterparts, often lack regional cooperation mechanisms for addressing shared challenges in migrant integration due to the absence of a broader state-level consensus.

From Disbelonging to Public Agency: Theatre As a Space for New Political Imaginaries in Contemporary Turkey

This paper investigates the intersection of disbelonging and public agency through alternative theatre practices in Turkey, particularly following the 2013 Gezi Park movement. Drawing on empirical fieldwork conducted for my doctoral research, which includes semi-structured interviews and participant

observation with independent theatres in Istanbul from 2019 to 2023, this study explores how theatre serves as a space for collective action, where shared feelings of disbelonging transform into drivers for public engagement.

Focusing on two women playwrights and directors, chosen from the fieldwork, the paper examines how disbelonging—understood as exclusion from dominant norms—has been reappropriated by these artists to cultivate new forms of belonging. Their productions challenge growing authoritarianism and rapid urban transformation in Istanbul by using theatre as a means to critique power structures and develop horizontal relationships within communities.

The study highlights how these artists use theatre to engage in a form of public agency that creates alternative political imaginaries, offering spaces where new social bonds and collective identities can emerge. As a political and performative public space, alternative theatre contributes to reshaping civic participation and fostering communal experiences that challenge established norms.

Through an analysis of contemporary theatre in Istanbul, this paper argues that the collaborative nature of alternative theatre allows for the formation of new pathways for political expression, offering audiences and performers opportunities to co-create spaces of resistance and reimagined futures.

Practices of Resistance, Practices of Care: The Role of Indigenous Women in the Peruvian Central Amazon Region in the Context of Dispossession of Territory

The ashaninka population is the largest indigenous population in the Amazon basin, with residences in Peru and in Brasil. In Peru, their communities are distributed along the central Amazon region. This is the region with the highest rates of coca production and the growth of illicit economies, which provoked abandonment and displacement of populations and communities, poverty, lack of better living opportunities, enslavement population and degraded lands. In this context, the role of women, organized in indigenous's associations as leaders in their communities, is crucial as caregivers in domestic and in public domains. Women not only take care of their families and relatives, but also of the communities and their territories building new forms of political participation. We have been working on recovery practices after Covid-19 pandemic in an interdisciplinary research project "Voices of recovery" in three ashaninka communities (Shankivironi, San Jerónimo and Potsoteni) in Junin, Peru.

Junin is located in the central Amazon region. Among these practices of recovery, we have found the importance of women's roles in caring practices and how they are recovering the use of plants. Based on long-term anthropological field research in these three ashaninka communities, we will argue about how caring and care practices are composed of interconnected power systems whose main actors are women. Thus, we will discuss women's strategies of political participation that strain the traditional leaderships of men as chiefs in the local community. There are political tensions but also, as we will show, there are new forms of knowledge that emerge in these practices in which women play important leading roles.

Who Sets Deadlines? from Niklas Luhmann's Sociological Theory of Time and Deadlines

We encounter numerous "deadlines" in our everyday lives. In fact, I will only be able to present at the 5th ISA Forum of Sociology if I complete all the

necessary procedures, such as the submission of the abstract, the registration for participation, the application for travel expenses, and so on, within the fixed deadlines. In this presentation, we will consider "who sets deadlines" in organizations and society, based on Niklas Luhmann's thoughts on deadlines.

Similar to decision-making, deadlines are set through certain processes, and within those processes, there are the people who participate in setting the deadline. However, the deadlines set within organizations and society, as well as all other types of decision-making, are not determined solely by the arbitrary decisions of specific individuals. Rather, they are fixed through various processes of social learning and negotiations involving many actors, following precedents. Therefore, just as the abstract of this session discusses about decision-making, the algorithmization of deadline setting can also be discussed as an issue.

In this presentation, I first examine a theoretical framework for discussing deadlines sociologically, specifically for considering who sets deadlines in organizations and society, how they are set, how these deadlines are used, and what consequences they bring about. To do so, I refer to Niklas Luhmann's sociological theory of time and his article "The Scarcity of Time and the Urgency of Deadlines," which focuses on deadlines as an issue. From Luhmann's discussion on this issue, I particularly utilize the conception of time as a medium of communication and the idea of deadlines as a temporal form for observing social events.

ÜMIT ATILGAN, EYLEM* (University of Kyrenia, Turkey)

As a Transformative Force in Masculine Legal Culture, Feminist Advocacy "Feminists at the Court Room"

As in many other countries, the demand for gender equality has long been the most dynamic wing of the struggle for rights in Turkey. Rising criticism of policies related to women and gender has led to the positioning of activism in Turkey alongside various forms of collective action, organizational structures, and political stances. Today, networks of feminist lawyers who voluntarily follow femicide and LGBTI+ violence cases in Turkey and collect data on them cover the whole country. Since the neoliberal right-wing government withdrew its signature from the Istanbul Convention, the number of feminist lawyers joining solidarity networks to combat increasing masculine violence is increasing day by day. While patterns of masculine legal culture, such as impunity and misogynistic judicial practices, narrow women's access to justice, a stronger army of lawyers is emerging to support victims of masculine violence.

Based on data from qualitative research with activists advocating for rights against masculine violence against women and LGBTI+ in Turkey, this paper primarily addresses the following questions: Can we talk about the transformative effect of feminist advocacy in cases of masculine violence on legal culture? What role do feminist lawyer networks that provide voluntary advocacy support in cases of masculine violence play on women's access to justice? While seeking answers to these questions, it is also aimed to produce local knowledge of this field and support advocacy by revealing the difficulties faced by rights defenders and activists who struggle for gender equality and the strategies and suggestions they have developed to overcome them. Using NVIVO12, I analyzed the qualitative data from in-depth interviews and focus groups with lawyers defending victims and/or their relatives in cases of masculine violence, interpreting it in the context of theories on advocacy, legal culture, and women's access to justice.

Changes in Migrants' Preferences for Socialization and Leisure Spaces: The Experiences of Syrian Migrants in Istanbul

Migrants need spaces where they can spend their leisure time and socialize amid the crowded and noisy urban environment. For tens of thousands of Syrian migrants living in Istanbul, historic grand mosques, parks, and city squares serve as key locations for socialization. These spaces are significant for migrant families during both leisure time and religious occasions. They provide low-cost venues where middle-class and low-income migrant women can gather outside their homes and where their children can interact with local children or other migrant children.

For adults, particularly the first generation of migrants, historic grand mosques play a crucial role in strengthening existing relationships and performing religious duties, especially during Ramadan and feasts. Notable examples of such spaces include the Fatih Mosque and the Sultanahmet Mosque, located in Istanbul's Fatih district. These places are significant points

in the city where migrants can simultaneously meet their religious, cultural, and recreational needs. The proximity of these spaces to migrant settlements, both geographically and culturally, makes them preferred destinations for many migrants.

This study focuses on how social spaces in Istanbul, such as the Fatih and Sultanahmet Mosques, have been transformed through the experiences of Syrian migrants. In recent years, rising anti-migrant sentiments, economic challenges, and Turkey's evolving migration policies have forced many Syrian families to change their spatial preferences and seek alternative venues. Increasingly, migrant families are forgoing spending religious occasions, like Ramadan and holidays, as well as their free time on weekends, at the Fatih and Sultanahmet Mosques, and are exploring new opportunities in other parts of the city. This study examines the factors behind the changing social spaces preferred by Syrian migrants in Istanbul for leisure and religious activities, as well as the alternatives they are exploring.

"Do You Eat Pork?": Religion, Heritage and Culturalization of Citizenship

We are what we eat. But we are also what we eat exclusively, namely what others do not eat or do not want to eat. The consumption of pork is one of the questions that continues to divide the European public, but also certain parts of the Muslim World. Is it European to eat pork and Middle Eastern or Muslim to avoid it? Is it secular, is it Christian? Is it culture, is it heritage? Pork is a material object that enters the physical body of the individual and the political body of the nation while determining its health. It draws the line between those who belong unconditionally and those who belong only conditionally to the nation. In European countries, particularly in France, the Netherlands, Denmark and Germany, there have been heated debates about the consumption of pork and its avoidance in schools and public institutions as a sign of a civilizational divide. In this paper, I will trace the legal and cultural classification of pork as part of *laïcité* in France and as a kind of national culture in Germany by analyzing public controversies in these two countries over the last decade. The paper aims to show the affective and material dynamics of the increasing culturalization of Christian practices with the simultaneous religionization of people from Middle Eastern backgrounds.

Addressing Participation Inequalities in Aging Research: Reflexive Use of Participatory Approaches with Older Adults

In aging research, participatory approaches offer valuable methodological frameworks for involving older adults in the co-production of knowledge. Despite their potential, implementing participatory methods presents challenges, particularly in addressing participation inequalities that arise due to individual and organisational barriers. This paper explores these methodological issues, emphasizing the need for reflexive practices to ensure more equitable participation among diverse groups of older adults.

Participatory approaches, by design, seek to democratize the research process, involving older adults not just as subjects but as active contributors. However, the persistence of participation inequalities indicates that such methods often fall short of their inclusive goals. This paper critically examines methodological strategies to mitigate these inequalities, such as tailoring engagement formats to accommodate varying capacities, providing ongoing support, and creating adaptive, accessible environments. Through these strategies, participatory methods can better account for the diverse realities of older adults, promoting meaningful involvement across different demographic and health profiles.

Reflexivity is positioned as a core methodological principle in this process, requiring researchers to continuously assess and adapt their approaches. By reflecting on the power dynamics, biases, and limitations within their research practices, researchers can better understand how these factors influence participation and shape data outcomes. Reflexivity thus enhances the participatory process by enabling more responsive and adaptive methodological adjustments that promote inclusivity.

This paper contributes to the field of age and aging research by advocating for a reflexive use of participatory approaches that explicitly address participation inequalities. It provides practical insights and critical reflections aimed at improving research designs, ensuring that diverse perspectives of older adults are not only included but meaningfully integrated into the knowledge production process.

PEREK-BIALAS, JOLANTA (Jagiellonian University, Poland)

Enhancing Older Adults' Health: The Role of Participatory Approaches in Informal Care Research

Participatory approaches are increasingly recognized as essential in researching the health and well-being of older adults and their informal caregivers, enabling deeper engagement with the lived experiences of those involved in caregiving. This paper highlights the significance of employing participatory methods in studying informal care, drawing insights from two projects: INTERCARE, focusing on young caregivers in education, and SIWSON, examining informal caregiving for older individuals with dementia.

Early findings from INTERCARE indicate that young carers face significant challenges in balancing caregiving responsibilities with educational commitments, leading to increased stress and decreased academic performance. By engaging young caregivers and persons they care for in participatory manner the project ensures that the research accurately reflects their real-life challenges and needs.

The SIWSON project addresses the experiences of informal caregivers during the early stages of caregiving for individuals with dementia. Participatory methods capture the complexities of stress and social exclusion experienced by caregivers, revealing that those who lack support networks report higher levels of emotional distress. Insights gained from caregiver involvement emphasize the need for targeted interventions that strengthen social connections and improve mental well-being.

Participatory methods are critical in this both projects as they facilitate a comprehensive understanding of caregiving's impact beyond clinical symptoms by incorporating the social dimensions of caregivers' experiences. This approach not only identifies gaps in existing support systems but also co-creates solutions that directly respond to caregivers' needs, ultimately enhancing the health and well-being of older adults. This paper argues that participatory approaches are crucial for researching informal care, ensuring that caregivers' voices are central to the inquiry, leading to findings that are more accurate, relevant, and actionable.

URBAŃSKA, SYLWIA* (University of Warsaw, Poland)

A Divorce in a Polish Village: Gender, Class and Forms of Solidarity and Resistance in Traditional Communities.

Traditional rural communities are unquestionably fascinating laboratories of social change in an increasingly diverse world. One clear example of such changes is the increasing experience of divorce, conflict and tensions in rural communities as they confront and negotiate postmodern patterns of family life. I will show how rural divorce can activate potential for solidarity and resistance in small, patriarchal and Catholic communities in eastern Poland.

The findings are based on dozens of autobiographical narratives (30 IDs) of female rural residents of eastern Poland and over a year-long participatory ethnographies conducted between 2018 and 2023 in the border region of Mazovia and Podlasie.

I will demonstrate how the biographical and everyday experiences of divorcing rural working-class women were shaped by various local social networks. I will also discuss which social positions, affiliations and forms of capital are activated by rural divorce, and how gender and social class mediate it. Furthermore, I will discuss whether and what kind of support and solidarity for divorcing women can be found among other rural women (rural sisterhood)? The analysis will reveal how traditional and new patterns of practices and discourses reproduce dynamics of exclusion and inclusion in traditional rural communities. The transformation of rural areas and family life in Poland over the last three decades provides an essential context for understanding the findings.

URBINA CORTES, GUSTAVO* (El Colegio de Mexico, Mexico)

Biographical Contours and Life Consequences of Activism Among Women Members of Collectives Searching for Disappeared Relatives in Mexico

This study aims to problematize the biographical contours and life consequences of high-risk activism undertaken by women belonging to collectives searching for disappeared relatives in Mexico. Over the past three decades, criminal violence has become a primary catalyst for disappearances across various regions of Mexico. Given the state's inability to combat

impunity and provide justice to families victimized by disappearances, various collectives have assumed responsibilities including search operations, emotional support, and assistance with investigations conducted by state prosecutors. Within this context, women have played a crucial role, assuming leadership and prominence in activism related to the search for disappeared persons.

Against this backdrop, this work seeks to elucidate the principal biographical ruptures precipitated by the phenomenon of forced disappearances. The research aims to demonstrate that beyond the evident communal and familial consequences, this situation imposes substantial emotional, political, productive, and reproductive burdens on women, who often simultaneously fulfill roles as parents, heads of households, sisters, or wives. In addition to exploring the complexities associated with this disruptive political activation, the study intends to examine the primary effects on these women's truncated life projects and the consequences that extend into their domestic and private spheres.

In essence, this research endeavors to offer a perspective that integrates a dialogue between gender analysis, the debate on high-risk activism, and the biographical consequences of social mobilization. The methodology employs approximately thirty biographically oriented interviews with women from various search collectives in three Mexican territories most affected by criminal violence (Guanajuato, Sinaloa, and Sonora).

URIBE VARGAS, MARIA PIA* (CERMES3, France)

« L'Hyperactivité Des Filles, Entre Anomalie Et Normativité » Discours Et Pratiques De Médecins Autour Du TDAH Au Chili.

Cette contribution a pour objectif de montrer comment la dimension de genre traverse les discours et les pratiques des médecins à l'égard d'un groupe qui ne correspond pas à la représentation commune du trouble de déficit de l'attention et de l'hyperactivité (TDAH) : les filles hyperactives. En effet, globalement, davantage de garçons que de filles sont diagnostiqués avec un TDAH. Cependant, au Chili, la prévalence chez les filles est aussi élevée que chez les garçons, en particulier à l'adolescence. Basé sur des entretiens avec des médecins de différentes spécialités et perspectives cliniques, exerçant dans divers contextes de soins au Chili, cette communication propose l'analyse en profondeur de deux cas rapportés par deux médecins. Elle montre comment les représentations genrées, variant selon les âges et les milieux sociaux, modèlent les attentes, les diagnostics, les interactions et les prises en charge des patientes. La façon dont sont perçues et soignées les « filles avec TDAH » dépend de la perspective clinique du médecin, de son lieu d'exercice, de sa propre position sociale mais aussi du cadre normatif de la santé mentale au Chili. L'analyse des cas met au jour le double mouvement à l'œuvre dans l'approche du TDAH des filles : normaliser ce qui apparaît comme atypique par rapport au masculin et simultanément rendre typique et pathologiser un type de TDAH féminin différencié selon la classe sociale.

"the Happiness Promised By Genital Aesthetics": Female Genital Cosmetic Surgeries in Türkiye

The advertisements circulating online with the theme "enhancing happiness through genital aesthetics" suggest that the female genitalia are perceived as having a "disturbing appearance," which can lead to psychological issues, negatively impacting women's sexual and family lives. Female genital aesthetic surgeries (FGCS), which include procedures such as labiaplasty, vaginoplasty, perineoplasty, G-spot enhancement, clitoral hood reduction, genital whitening, and hymenoplasty, involve altering the structure and appearance of a "healthy" female sexual organ without medical indications. These surgeries are motivated by aesthetic, functional, sexual, and cultural reasons. Traditionally, medical discourse, as well as the state and family, has focused on the vagina from a penetration-centered perspective (virginity checks, vaginismus, hymenoplasty) and its heteronormative functionality. However, in this study, I argue that with the increasing prevalence of female genital aesthetic surgeries, a new discourse on the vagina is emerging in Türkiye (and globally). This new discourse emphasizes that the aesthetic appearance of the vagina is as important as its function. In this context, my research explores 1) how clinics and doctors' market FGCS on their websites, what justifications they offer, and what risks are overlooked; 2) how FGCS is linked to women's psychological and sexual well-being. Employing digital ethnography and content analysis of clinic and doctors' websites, I explore the rise of female genital aesthetic surgeries in Türkiye from a feminist perspective, by focusing on global medical discourse, healthcare privatization, and evolving gender and cultural norms.

Sensory and Temporal Dimensions of Homemaking Among Syrian Female Refugees in Istanbul

This study examines the temporal, spatial and sensory dimensions of homemaking among female Syrian refugees in Istanbul, focusing on how nostalgia, memory, and sensory experiences shape the processes of home-making and home-unmaking. Drawing from my PhD research, I explore refugees' sensory interactions across various urban scales—from dwellings and neighborhoods to public spaces and migrant hubs—highlighting how memories of past homes and aspirations for the future influence their engagement with the present environment.

Using sensory ethnography, sensory walks, and in-depth interviews, the research investigates how everyday routines and sensory interactions involving tastes, smells, sounds, sights and textures either foster or disrupt feelings of continuity, familiarity, security, and belonging in new surroundings. Sensory memories and embodied daily practices, such as cooking and commensal eating of traditional meals or engaging with personal/ biographical objects, play a crucial role in reassembling identities and creating a sense of home. These routines not only link past experiences to present environments but also contribute to the formation of diasporic places and cultures.

However, the study also reveals that beyond recreating familiar sensory worlds, refugees adapt to new temporal rhythms and sensory dynamics in the host city. This adaptation, which unfolds over time, reflects a dynamic process of both "making" and "unmaking" homes. As refugees accumulate new memories and experiences, they either build stronger attachments to their new environment or, in many cases, face exclusion, prompting further displacement.

The study highlights the crucial role of time and sensory engagement in post-migration homemaking and demonstrates how sensory ethnography can capture the emotional and embodied dimensions of these processes in the context of displacement.

UWE, VORMBUSCH* (FernUniversität in Hagen, Faculty of Humanities and Social Sciences, Institute of Sociology, Germany)

Prognostic Cultures in the Digital Age. Epistemic and Authoritarian Forms of Governing the Future

Different kinds of future predictive techniques such as scenario analyses and forecasts, roadmaps and predictive policing contribute to an epistemic culture of the present, which is primarily concerned with its potential futures. These futures may be envisioned as socially desirable disruption, driven by technology and leading to human progress, as is the case in what Barbrook and Cameron (1996) called *The Californian Ideology*. Or they are bound up with proliferating fears of harm and catastrophe, as in sociological analyses criticizing precautionary strategies and the *Emergency Imaginary* (Calhoun 2004) in general. In any case, these futures are technically constructed, algorithmically calculated and digitally mediated. Their origin is not, like in former times, the disclosure of an eremite, they spring from serverfarms and digital infrastructures. But just like yesterday, envisioning the future implies new systems of social ordering and control as well.

Against this backdrop, the talk sorts contemporary cultures of prognostics using three contrasting, empirical examples. These can be assigned to two ideal types of modelling uncertain futures by data: an *authoritarian future* as the product of autonomized algorithmic decision-making systems (ADMs) on the one hand, and (referring to the works of Rheinberger and Knorr-Cetina) *epistemic futures* on the other. The latter appear paradigmatically in two contrasting social arenas: first, as the systematic multiplication of competing futures in financial-economic arbitrage trading (e.g. Beunza and Stark 2005), and second as unattainable futures in the mundane practices of self-measurement/self-tracking (Noji and Vormbusch 2018). The former (ADMs) appear as calculative infrastructures accumulating and synthesizing Data, thereby assigning resources and social positions to people without them having control. The talk contrasts these techniques of producing future knowledge with regard to the opening and closing of attainable futures, the relationship between human and machine knowledge, and the embedded power relations.

ÜZÜMCÜ, HAMIDE ELIF* (University of Edinburgh, United Kingdom)

Narrative Traditions in Children's Everyday Lives: A Case Study from the UK

Children grow up within diverse narratives rooted in their geographies, cultures and social contexts. Stories and grand narratives help them navigate various aspects of life, particularly its challenges, and learn the ways of everyday living in their respective cultures. This paper focuses on the Sufi storytelling tradition as a critical site for children and young people's negotiation of Islamic values. Specifically, it investigates the role of Sufi storytelling in constructing and reconstructing environmental ethics within Sufi family life. Sufism offers a wealthy heritage of various genres of written and oral culture, including Quranic parables, tales and hymns. The UK context is particularly intriguing, as it hosts Sufis from diverse ethnic, cultural and social backgrounds.

The paper will share findings on how children and parents engage with stories as storytellers themselves, based on interviews with them, as well as storytelling workshops conducted with children from Sufi families in the UK. It aims to contribute to broader practices and scholarship in the social studies of childhood, youth and family through artful and decolonial approaches.

VACCARO, ALTEA* (Université Lumière Lyon 2, Belgium)

Reclaiming the Self: The Role of Incarceration in Disrupting Gendered Violence and Control

This presentation explores the intersection of gender-based violence and the sociology of bodies and emotions in the context of female incarceration. Based on a qualitative study conducted in prisons in France, Italy, and Spain, the research reveals how incarceration modifies gendered inequalities, especially within conjugal dynamics. The study involved semi-structured interviews and participant observation.

Female prisoners are often abandoned by their partners, with 56% of incarcerated women in France receiving no visits (El Hatifi & Le Mer, 2021). Moreover, a significant majority of these women have experienced intimate partner violence (Rostaing, 1998), with the most insidious forms of aggression being those within the couple (Bajos et al., 2008; Brown et al., 2020). Across the three countries studied, multiple women were found to be under the control of their partners—a control characterized by progressive domination and affective dependency, leading to a loss of autonomy (Jamoulle, 2021). Paradoxically, prison can provide a space for these women to break free from abusive relationships and oppressive gender norms. The confinement environment, though restrictive, offers a secure space far removed from violent partners, enabling women to reconstruct their identities (Comfort, 2007).

This presentation analyzes these phenomena through the lens of the sociology of bodies and emotions, offering a multidimensional perspective on gender-based violence. It reveals how incarceration disrupts cycles of abuse by imposing a new form of bodily discipline that mirrors, yet cannot coexist with, the control exerted in abusive relationships. As (quasi-)total institutions, prisons impose constant surveillance, precluding external partners from maintaining control over incarcerated women. Thus, while incarceration imposes prison confinement, it can simultaneously liberate women from domestic confinement. This analysis deepens our understanding of institutional violence and gendered power relations, shedding light on how incarcerated women navigate emotional and bodily experiences in response to both violence and liberation.

I Would Rather Start Dealing with My Own Identity Than Flee from Missiles to a Shelter – Migrating Back and Forth between Hungary and Israel

Évi was born in 1979 in Budapest. Her maternal grandparents were both survivors of the Shoah. The maternal grandfather was also persecuted by the communist regime after the liberation of Hungary. Being released from jail, he left the country illegally and did not meet his children again for years. The paternal grandparents were both Catholic. We interviewed her in our project "Democracy and Family History" as a returnee from Israel after the 7th of October 2023.

Today's Jewish renaissance in Hungary has led many to realize that, even after the Shoah, it is possible to enjoy being Jewish while not forgetting about the past persecution and its traces in family history. This cultural phenomenon appeared alongside the increasingly right-wing government and the rising level of overt anti-Semitism, which prompted many young Hungarian Jews to make aliyah to Israel. Among them was Évi, who, while attending Jewish services also experienced anti-Semitism while searching for a new job. She and her husband migrated to Israel in 2016, she gave birth to a child in 2019 and their new life in the country seemed to be stable. However, the Palestinian attack against Israel on 7th of October made them question their earlier decision: they returned to Hungary, and since then, Évi has been struggling with how to raise her son. She is unsure whether the psychological problems caused by hiding their identity or the attacks pose the greater risk. In conclusion, she must decide which tradition to follow: the one that views seeking refuge as a possible solution, or the other that says one should not leave their own culture.

A Comparative Analysis of Cultural Beliefs and Their Effect on Oral Care in Morocco, South Africa and South Korea. Government Measure Implementation to Influence and Form Healthy Oral Care Habits and Behavioral Patterns

The aim of this paper is to determine the role of cultural beliefs and the effect they have on human health, particularly oral care. The paper focuses on healthcare cultures of 3 countries: Morocco, the Republic of Korea and the South African Republic. A comparative analysis of their oral care cultures and behavioral patterns has not been researched prior to this, so the paper provides a fresh view on the problems oral care faces in these countries.

The idea discussed in the paper was largely influenced by a healthcare program launched by the Ministry of Health and Welfare of South Korea in 2011. The program promoted oral hygiene by creating tooth brushing rooms nationwide to encourage tooth brushing. According to various reports, the program has had immense success. This could be linked to the South Korean culture itself, as their most popular foods increase the people's desire to have fresh breath, therefore, the installation of tooth brushing facilities proved popular with the citizens, as the demand was met.

The analysis of the Moroccan and South African oral care problems showed that they differed from those of South Korea. The reason being cultural differences which formed the cultural beliefs around such topics as oral care and human health in general. The national oral care program in South Korea showed the success of government-imposed measures. This paper discusses the cultural background aspects important for discussing oral care and cultural beliefs tied to it in such countries as Morocco and South Africa.

Culture plays an important role in the mindset of people forming various beliefs influenced by culture which sometimes poses problems for the human healthcare in some countries. A solution may be sought through government projects to influence a nation through its culture and emphasize the importance of human healthcare.

MURILLO, CATALINA MURILLO (DUOC, Chile)

Lo Que Deja La Primavera Chilena: El Efecto De Las Políticas De Igualdad Educativa y De Género En Dos Territorios Del Sur En Chile

En Chile, las movilizaciones estudiantiles que se llevaron a cabo entre 2011 y 2019, tuvieron como objetivo confrontar la desigualdad educativa, cuestionar las lógicas neoliberales predominantes en las dinámicas sociales y las políticas, y, posteriormente, asegurar el derecho a la educación y la igualdad de género.

Este ciclo, denominado la "primavera chilena" (Labraña, 2018), dio lugar al desarrollo de políticas destinadas asegurar el derecho a la educación mediante el incremento del acceso y la eliminación prácticas de discriminación por género que afectan las trayectorias juveniles. Entre las iniciativas más destacadas se encuentran la creación de los Centros de Educación Técnica Estatales (CFTE) en áreas de bajo acceso y la Ley 21.369, que enfrenta la discriminación de género en la educación superior.

El estudio realizado en 2023 tuvo como objetivo identificar los avances de estas políticas en dos regiones del sur del país, caracterizados por una alta presencia de población indígena y desigualdad: Maule y Araucanía. A través de una metodología cualitativa, se exploraron las estrategias implementadas por los CFTE para apoyar las transiciones y trayectorias de mujeres de estas zonas rurales. Además, se indagó en la experiencia de ocho mujeres a fin de conocer las estrategias que han utilizado para enfrentar los desafíos que conlleva la experiencia de la educación superior.

Bajo el enfoque de la sociología de la experiencia (Dubet, 2010) y los anclajes socioculturales (Araujo, 2015), el estudio evidencia que las experiencias de las jóvenes son diversas y que sus posibilidades de ejercer agencia en contextos de alta discriminación y reproducción de estereotipos de género están mediadas por los apoyos institucionales. Asimismo, la capacidad de las instituciones para desarrollar iniciativas de apoyo se ve influenciada por las lógicas de interacción con el entorno y por las dinámicas de recontextualización de las políticas nacionales y territoriales.

Rumbo a La Educación Superior: Desafíos y Expectativas De Los Jóvenes De Rapanui

Las transformaciones en el mundo y en Latinoamérica están asociadas a la expansión de sistemas educativos y a políticas diseñadas para aumentar el acceso a la educación. Este giro cultural ha llevado a la legitimización social de ciertas trayectorias educativas y laborales, así como a la creación de políticas educativas que buscan establecer mecanismos específicos de acceso para grupos con menos recursos. Las transformaciones ocurridas en Chile se alinean con esta tendencia, reflejando un notable incremento en las tasas de finalización de la educación secundaria, acompañado de un aumento en las aspiraciones juveniles. Desde el fin de la dictadura, el ingreso a las instituciones de educación superior se ha triplicado, alcanzando cifras que superan el 70% de cada cohorte de egresados de secundaria. Sin embargo, a pesar de estas cifras alentadoras, el acceso no ha venido acompañado de condiciones equitativas, debido a la desigualdad en el país y en el sistema escolar. Además, los datos revelan altas tasas de deserción en la educación terciaria, correlacionadas con la disponibilidad de diversos tipos de capital.

Para analizar este fenómeno, esta investigación se centra en los jóvenes de Rapanui. Los datos indican que la proporción de jóvenes egresados de secundaria es considerablemente menor que la media nacional. Esta cifra contrasta con las altas expectativas que estos jóvenes tienen respecto a su ingreso a la educación superior. El estudio, basado en análisis cualitativos y cuantitativo longitudinales, explora la experiencia de los egresados de secundaria. Los resultados muestran que los estudiantes carecen de herramientas adecuadas para tomar decisiones después de egresar. Asimismo, indican que poseen limitadas capacidades para enfrentar los procesos académicos en la educación superior y para sortear los desafíos socioemocionales y económicos que implica dejar su isla.

Beyond the Diagnosis: The Role of Spirituality in the Care of Patients with HIV

This article investigates the role of spirituality and religion in the healthcare of people living with HIV in the border city of Tijuana, Baja California, Mexico. Although medical services in the country tend to downplay the importance of the spiritual dimension, reducing it to practices like meditation, this study highlights its significant impact on the patients' experience. Based on a project exploring healthcare access for migrants frozen in movement who live with HIV, it was found that spirituality and faith are key elements in the lives of many of these individuals. The analysis focuses on how spirituality influences treatment adherence and the emotional management of the disease. In a context marked by marginalization and constant mobility, faith provides psychosocial support that goes beyond conventional medical intervention. The study suggests that incorporating the spiritual dimension into medical care could improve the quality of life and treatment adherence for these patients, offering a comprehensive perspective that recognizes the complex interactions between body, mind, and spirit in the experience of living with HIV. This work proposes a reevaluation of the role of spirituality in healthcare, emphasizing the need for healthcare professionals to integrate more holistic approaches in the treatment of chronic illnesses such as HIV. Ultimately, the study opens a dialogue on how spiritual practices can contribute to the well-

being of patients in a border context, where physical and symbolic barriers deeply affect the health and lives of individuals.

Community Care Infrastructures for Sustaining Life in Barcelona

Care work continues to be primarily shouldered by women in cities worldwide. The lack of both material and immaterial conditions for caregiving penalizes caregivers who face poorer physical and mental health, worse economic conditions and time scarcity. This negative impact is evident among both paid and unpaid caregivers of dependents.

This precarious situation has led grassroots organizations to come together to democratize care from a local standpoint. Some groups focus on advocating for improved conditions for those engaged in high-intensity caregiving, while others work on building community infrastructures to share everyday care responsibilities. In the neighborhoods, self-management and public resources are mixed to reproduce life, carrying out social tasks that complete and replace deficient or non-existent services (Cavallero and Gago, 2022).

The distribution of these groups is not uniform across the city. The research question driving this work examines which social and urban factors facilitate the development of community care infrastructures.

The distribution of these groups is not homogeneous throughout the city. The research question of this work is what social and urban elements favor the construction of community care infrastructures.

The methodology used in this work has been the case study approach, allowing for the analysis of three different groups: a collective that supports migrant women working in domestic and care roles; a group of mothers caring for children with disabilities; and a food bank in a community center.

The results obtained point to the intrinsic difficulties faced by caregivers in organizing themselves due to the intensity of caregiving work and the need to combine it with wage-earning jobs. Furthermore, the importance of urban configuration for collective organization around care has been confirmed. Physical proximity, being connected by public transport, and having physical spaces to gather, meet, or share care are key factors in building community care infrastructures.

Financialization, Dispossession and Collective Struggles in Barcelona. Reflections from Feminist Urbanism.

Barcelona is a city of great contrasts. In recent years it has become the scene of major international events such as the America's Cup or the Mobil congress; it has become one of the European cities with the highest number of visitors (9.7 million tourists in 2022); and it prides itself on having carried out innovative urban projects such as the superblocks or the green axes. However, the everyday life of an important part of the city's neighbors has worsened in recent years with exorbitant housing prices that force many people to leave their neighborhoods; an extreme commodification of public space; and hygienist and social control policies that pursue practices of use of public space and stigmatize neighborhoods and collectives. This reality has generated a great rejection on the part of different social, neighborhood, environmental and feminist movements that organize themselves to respond to the different problems.

This paper analyzes the major problems of the city from an ecofeminist perspective, the response by grassroots groups and some proposals made by Col·lectiu Punt 6, as a collective of feminist urbanists who seek to have a socially and territorially fairer city.

Carnaval Para Cambiar El Mundo. El Papel De Los Discursos Carnavalescos En La Construcción Del Conflicto Social.

Los discursos desde la literatura han tenido un papel fundamental a la hora de articular el conflicto y las relaciones sociales. Desde las obras del siglo XIX hasta la literatura contemporánea, el estudio de las obras literarias ha permitido conocer los pensamientos, ideas y valores de la época, así como las perspectivas del conflicto y las relaciones existentes.

En nuestra comunicación presentamos la investigación en curso que estamos desarrollando en torno al rol del discurso literario presente en el Carnaval de Cádiz, principal tradición de la ciudad de Cádiz, en la construcción del conflicto social a través de la creación de imaginarios alternativos a los hegemónicos mediante las coplas de Carnaval. Nos preguntamos en torno al papel de las obras literarias de las agrupaciones carnalescas en la representación de las tensiones sociales, empezando a hallar discursos que apuntan hacia la idea del Carnaval como periodismo cantado para algunos y alta literatura popular para otros.

Mediante una metodología cualitativa, basada en el análisis del discurso literario a través del análisis sociometafórico desarrollado por Lakoff y ampliado por Lizcano, estudiaremos como las obras de Carnaval, sobre todo en lo referente a las metáforas y los marcos discursivos, representan el conflicto social por vía de la simbolización de las ideas de la clase dominante y la presentación de las alternativas del pueblo.

Mexico: Democracy and Social Mobilization. Movimiento De Regeneración Nacional and the "Marea Rosa"

Since the 1980s, political discussion in Mexico has primarily focused on electoral democracy, which became the primary indicator of political organization and conflict. The presence of political parties reduced political struggle to the electoral arena. The 1988 social mobilization aimed to create a center-left political party that concentrated the main conflicts and social movements. The struggle for greater democratic channels was focused on opening electoral spaces, leading to electoral reforms and the institutionalization of political-electoral processes. The exhaustion of this model, resulting from disputed elections and party bureaucracies, led to the emergence of movements and parties that once again focused their struggle on achieving political power through the electoral road. This was the case with the Movement for National Regeneration (MORENA), born from a split within the PRD and from other social movements. It defined itself as a party-movement, although its tendency toward bureaucratization and electoral participation has shaped it into a party with an electoral vocation. Its victory in the 2018 election turned it into a government, and the priority of having a majority in the legislative branch distanced it further from its roots as a movement. In the 2024 election, the groups that maintained their vision as a movement sought to influence candidacies and the government project. During the federal government from 2018 to 2024, the right-wing opposition suffered electoral defeats and formed a social movement that confronted the government's initiatives: the "Marea Rosa" (Pink Tide). Thus, Mexico's political life and its democratic struggle center on the confrontation between two social movements, but with political parties behind them. This paper analyzes the actions and presence of these two movements and their confrontation over national democracy.

Quality of Trust in Science and the Need for Scientific Citizenship

We explore the issue of trust in science in order to detect the way educational levels influence trust and possible impact of the pandemic experience, based on international survey data - Eurobarometers on Science and Technology, Wellcome Global Monitor, Pew Survey. Moving from some studies that found a positive impact of the pandemic on trust in science, our analysis shows the trends in trust as not completely dependent on pandemics.

In spite of different contexts, variables as education and scientific knowledge levels play a relevant role.

Based on last decade Eurobarometers on Science and Technology, we further investigate in depth trust in science conceptions in the context of Europe, focusing on the five largest European Union countries by population: Germany, France, Italy, Spain and Poland, in addition to Finland, a Northern European country, particularly interesting due to its scientific knowledge performances.

We highlight the emergence of two different visions: a "salvific" science, capable of making the earth's resources inexhaustible and sorting out any problem; and a "tangible", secular science, which makes our lives easier, more comfortable and healthier and that overall has a beneficial influence on society. Our findings show that scientific knowledge levels positively impact only tangible science.

Our study shows that what is urgent to detect is not only the *level* of trust in science per se, but the *"quality"* of this trust. What emerges is the need to act at two levels: strengthening education and scientific knowledge; fostering a "tangible" vision of science, that allows a mature relationship between science and society, aligned with the concept of scientific citizenship. To this aim, it would also be appropriate to promote non-sensationalistic narratives of science, giving space to the methods, concepts of ongoing progress, uncertainty and self-correction that are inherent in the processes of building scientific knowledge.

The Intersection of Ethnicity, Gender, and Environmental Justice: A Study on Double Discrimination Faced By Kurdish Women amidst the Desiccation of Lake Urmia

Lake Urmia, once one of the largest saline lakes in the Middle East, has lost over 90% of its volume due to a combination of human and natural factors. This environmental crisis has affected the lives of millions of people and has led to extensive social economic and cultural consequences. This study employs a case study approach, conducting semi-structured interviews with Kurdish women in the village of Maskin, located in the Urmia Lake basin, to examine environmental justice through the lens of intersecting ethnicity and gender.

The findings indicate that the desiccation of Lake Urmia exacerbates both gender and ethnic discrimination exposes Kurdish women to double discrimination. Migration has emerged as the primary strategy to adapt to this crisis. While men migrate to urban areas in search of employment and livelihoods, women are compelled to engage in agricultural and livestock activities alongside traditional household responsibilities including childcare and elder care. This situation not only jeopardizes women's mental health but also constrains their opportunities for education and personal growth. Prevailing cultural norms dictate that girls are assigned household and care giving duties at an early age often resulting in the cessation of their education. Moreover, cultural expectations around women's dress and public presence add to the burden of responsibilities, limiting their active participation in family and community decision-making. Overall, the desiccation of Lake Urmia has intensified existing gender inequalities within society rendering Kurdish women doubly vulnerable.

The findings of this study can be valuable for policymakers, development planners, social activists, and researchers in the fields of gender, environment, and social justice, offering insights for designing interventions and support policies for women in vulnerable areas. Additionally, this research lays the groundwork for future studies on the impacts of multiple discrimination and environmental changes on marginalized populations.

VALLEE, MANUEL* (University of Auckland, New Zealand)

Managing Uncomfortable Knowledge about Pesticides: New Zealand's Handling of Glyphosate Information

The knowledge that a population possesses will significantly mediate their resistance to environmental injustices. For instance, if people are aware of the harmfulness of pesticides applied in public parks, they will be more likely to organize and pressure politicians to create laws that will curb or perhaps even ban the application of such pesticides on public lands, as has occurred in Montréal. Drawing on the previous scholarship about the management of uncomfortable knowledge, this paper analyses the way government agencies manage uncomfortable knowledge about pesticides. Towards that end, I focused on the New Zealand government's production of knowledge about Monsanto's glyphosate herbicide. This herbicide makes for a remarkable

case to study. While the United Nations' International Agency for Research on Cancer classified glyphosate as a group 2A carcinogen in 2015, it has since become the world's best-selling herbicide. New Zealand is also a strategic case selection. While the country regularly presents itself as being environmentally responsible, its restrictions on glyphosate are comparatively low and has a relatively high use. Moreover, in Auckland (i.e. New Zealand's largest city) the herbicide is regularly applied to roadways, sidewalks, parks and sports fields.

This paper traces the country's use of glyphosate to the knowledge ecosystem that government agencies perpetuate about the herbicide. Towards that end the paper identifies the tactics government agents have used, which include interfering with the production and dissemination of uncomfortable knowledge about glyphosate. As well, based on a content analysis of their communications campaign (which includes press releases, quotes in the media, and other means of communication) about glyphosate, the paper identifies the tactics they used to neutralise uncomfortable knowledge that couldn't be suppressed, which will include denial, downplaying and distraction tactics.

Urban Gardens As a Solution to Food Insecurity, Food Inequities, and Hunger

Food inequities, food insufficiency, and food insecurity are a growing problem, with recent supply-chain breakdowns exacerbating existing problems, and increasing the number of people experiencing food precarity. An innovative way to increase food self-sufficiency, food insecurity and social resilience in urban contexts is to develop urban gardens. These give communities the opportunity to grow their own food, thereby increasing their food security. In addition, the social innovation provides numerous other health-mediating benefits, including raising self-esteem, providing outdoor time, socializing, and providing an opportunity for the intergenerational transmission of food production knowledge.

This project focuses on identifying the factors that mediate the successful implementation of community gardens. Towards that end, we carried out a trans-disciplinary and comparative analysis of cases in New Zealand, Mexico, Colombia and the United Kingdom. Analysing cases that ranged in levels of success, we identify: 1) the social processes through which particular urban gardens were established; 2) the economic, political, legal and cultural obstacles that needed to be navigated; 3) how groups sought to circumnavigate those obstacles; and 4) what mediated the effectiveness of those responses. The research provides a blueprint for communities who are endeavouring to develop a social response to 21st century food crises.

La Visualización De Los Resultados Deportivos De Los Países Con Desventajas Naturales: Una Propuesta Metodológica

Los países y sus gobernantes han dado siempre importancia a los resultados deportivos obtenidos, dada su impacto en la economía, la imagen del país y sus implicaciones políticas. Asimismo, al margen de los grandes rankings, los investigadores de la rama se han interesado también en encontrar métodos alternativos para presentar mediciones alternativas. Debemos considerar que los países con mayor población y calidad de vida obtienen una gran ventaja para dominar las clasificaciones. Este artículo presenta una propuesta metodológica para medir los resultados deportivos tratando de ponderar el efecto de la población y de la renta per cápita (calidad de vida). El estudio se basa en los resultados de los Juegos Olímpicos de Tokio 2020 (celebrados en 2021). Para ello, se crearon cuatro índices. El primero incluía los diplomas olímpicos en el sistema de puntuación; el segundo contabilizaba el número de atletas medallistas; por último, el tercer y cuarto índices ponderaban los resultados anteriores en función de la población y la renta per cápita. Su aplicación permitirá destacar los resultados de los países perjudicados por el elevado peso de los factores identificados.

New Methodologies for Enhancing Access and Self-Disclosure Among Underprivileged First-Generation Students

Research on underprivileged first-generation students indicates that they are challenging to reach, as they face unique obstacles such as low self-esteem, distrust, limited networking skills, the need to balance earning income with study, and feelings of alienation from their peers. These factors contribute to their underrepresentation within research.

Current research methods are often inadequate for underprivileged groups as they frequently disregard power imbalances and underestimate the emotional complexity, and the time and space needed for students to fully share their experiences. This emphasizes the need for the development of new methodological approaches.

The method used is an analytic literature review which will critically evaluate the strength and weaknesses of existing studies in relation to key aspects such as the researcher's position and the cognitive, emotional, relational, and contextual aspects within the research cycle (i.e. the design, involvement of respondents, the data collection, the analysis and reporting).

Initial results show limitations on emotional and relational key aspects and many researchers fail to describe their own role. 'Low-threshold' approaches and suitable methodologies may increase access, create better rapport and can enhance the quality of data from underprivileged students.

It will be concluded that this integrative review synthesizes knowledge from a broad range of studies among first generation students, including empirical as well as theoretical work. It aims to provide a better understanding of the strengths and weaknesses of different methodologies and methodological approaches in relations to key issues such as for example the position and role of the researcher, the recruitment process, trust building and timing.

VAN DE VELDE, CECILE* (Université de Montréal, Canada)

Hope As a Generational Divide

In this presentation, we aim to offer empirical insights into the contributions of the sociology of hope for a better understanding of contemporary generational dynamics. We will demonstrate how hope—both individual and collective—has become a significant dividing factor in the trajectories of young adults worldwide, positioning it as a key concept for future comparative research on younger generations. Drawing on a comparative study of young people facing crises in various parts of the world (Montreal, Santiago de Chile, Madrid, Paris, Hong Kong), we will highlight that, despite shared generational dynamics, societal structures continue to strongly influence the experience of becoming an adult. To understand these global differences in the destinies of young generations, we must account for the varying capacities of societies to foster both individual and collective hope. Through diverse examples, we will explore how contemporary experiences of adulthood are shaped by different attitudes towards the future, which vary across societies. Ultimately, we will discuss how the sociology of hope can bridge with youth studies and the sociology of global generations.

VAN DE VELDE, SARAH* (University of Antwerp, Belgium)

The Weight of Identity: Exploring the Crossroads of Gender Salience, Depression, and Equality in Europe

The gender gap in depression, with women consistently reporting higher levels of depressive symptoms than men, is a well-established finding in mental health research. However, the role of gender identity salience—the extent to which individuals see their gender identity as central to their sense of self—in shaping these outcomes remains largely unexplored. While previous research has shown that this gender gap is linked to broader societal levels of gender equality, no studies have yet investigated how gender salience interacts with societal structures to influence mental health.

Building on Ridgeway and Correll's (2004) multilevel gender system framework, this paper proposes that the relationship between individual gender salience and depressive feelings is influenced by societal-level gender equality. Gender operates not only as an individual identity but also as a social structure that shapes interactions and expectations. In contexts of low gender equality, individuals with high gender salience may experience greater psychological strain due to rigid gender norms. Conversely, in more gender-equal societies, these negative effects may be alleviated. This study addresses

the research question: How does societal-level gender equality moderate the relationship between individual gender salience and depressive feelings across European countries?

We make use of the 11th round of the European Social Survey (2023-2024), which collected detailed data on gender identity, salience, and equality, as well as on depressive symptoms through the CES-D 8 inventory. Data were collected in 156 regions in 13 countries. Preliminary estimates were calculated through multilevel modeling. These results confirm the gender gap in depressive symptoms, with women reporting more depressive symptoms than men. A more pronounced gender salience was also associated with more depressive symptoms, particularly in men. The association between depressive symptoms and gender salience, however, became less important in more gender egalitarian contexts.

Racialising the Study of Religious Exit: Thinking through Stories of Former Christians and Muslims in the UK and the Netherlands

In existing studies of leaving religion, there is a lack of discussion of structures and experiences of constructions of race. This presentation aims to further trouble terminology and categories around religious exit: utilizing an intersectional perspective, it does not only foreground the constituting role of gender and sexuality but also that of the religion-race nexus in trajectories out of religion. It discusses how women's trajectories of leaving Christianity and Islam in Western contexts such as the UK and the Netherlands are informed by everyday embodied experiences, as well as by intimate and social relations. They are moreover informed by a larger context of constructions of religion, secularity and race that position those who are losing faith and leaving their community in particular ways. This presentation draws on life story research emerging from the project 'Women Leaving Religion in the UK and the Netherlands'. It rethinks and makes use of the concept religio-racial formations to explore and analyse the role of whiteness, blackness, racialisation and Islamophobia in processes and experiences of leaving Christian and Islamic traditions and communities. As such, the chapter unravels gendered religio-secular-racial formations, and argues for a much more profound engagement with and integration of critical perspectives on race in studies of religious exit.

Territorial Transformations and the Quest for Authenticity in Taghazout, Morocco: Exploring the Evolving Tourism Landscape

Following the arrival of the first surfers in the 1970s, the once-quiet traditional fishing village of Taghazout (Morocco), located 20 kilometres from Agadir, has rapidly transformed into a must-visit beach resort. Over the past decade, tourist-catering ventures have diversified with the emergence of new activities such as skateboarding, yoga, and various sports, relaxation, disconnection, or spiritual retreats.

The new lifestyle in Taghazout attracts new residents, both Moroccan and foreign, affecting the local economy. Among these "nomadic entrepreneurs" are digital nomads, seasonal workers, and "lifestyle" entrepreneurs who temporarily (or perhaps permanently) settle to develop businesses in favourable locations. These new entrepreneurial trends are visibly impacting the local landscape. Away from the historical dwellings of local populations built in the mountains, hostels, surf camps, and co-working spaces for digital nomads now rise along the traditional fisherman's huts along the coast, at the heart of the village neighbouring the brand new luxury hotel resorts, golf courses, and private beach clubs.

Along these transformations, a new offer of "experiential tourism" emerges, centring around "authenticity", sometimes "staged authenticity" (MacCannell), and highlighting the local Amazigh identity and traditions. Drawing upon ethnographic data, semi-structured interviews with entrepreneurs, and netnography of social media content and residents' group conversation, this research examines the territorial transformations of Taghazout—whether economic, demographic, or cultural—through its diverse actors through the lens of entrepreneurship.

VAN DER BLY, MARTHA* (University of Amsterdam, Netherlands)

An Exploration of the Elementary Forms of Religious Integration and the Futures of the Gynocene'

Elsewhere (Van Der Bly, 2021) I coined the term the Gynocene, whilst strongly rejecting the idea of calling the next phase of humanity's relationship with Earth the *Anthropocene*. Following the Greek singular 'anthropos' referring to 'man' and the plural 'anthropoi' to 'humanity', the term the *Anthropocene* effectively semantically excludes over half of the world's population from our collective future. Yes, there is a new epoch dawning for humanity, let's call it the Gynocene.

In this presentation, I explore pathways towards of a non-war world society within the Gynocene. I do so by exploring a common cause of war, religion, in a society free of religious strife. This is a society not free from either war or conflict, and not Utopian in any way – yet free from *religious* conflict. I present the preliminary findings of a longitudinal research study and I do so on film, democratizing the idea to whom futures studies are accessible.

Yet, paraphrasing Durkheim, I am not describing this society for its own sake, my interest is primarily the present, the practical, the global: scenarios for the future. I attempt to show how sociological futures research can engage with broader publics through the medium that drives our imagination, namely film. While our history has widely demonstrated our talent for war and terror – I argue that the scientific study of a multi-religious society that nonetheless is characterized by an absence of religious strife, offers us valuable insights into developing scenarios to futures of global solidarity within the Gynocene, through the sociological construction of a 'collective global totem', within one society, on one earth - under one sky.

Embedded Research, Positionality and Situated Knowledges in Military Institutions

Researchers in military institutions often face double expectations: contributing to both academic discussions and military research and education. Approaching these researchers as embedded researchers highlights this duality or 'insider-outsider' status, which raises questions of positionality and reflexivity (Carreiras, 2016; Ben-Ari et al., 2023). We study how embedded military researchers make sense of their own position and the challenges they face, using the framework of situated knowledges introduced by feminist theorist Donna Haraway. Situated knowledges refer to the idea that all knowledge is produced within the material, social, and cultural contexts in which it is constructed. People's positionality shapes what they can know about a given phenomenon, which in military contexts is strongly influenced by military rank, access, and contemporary security landscapes. We identify two categories of embedded military researchers: those holding civilian academic positions and those in military research roles. Through empirical analysis, we explore how embedded military researchers perceive their own positionality, potential differences between these groups, and how they interact within military institutions. We argue that all actors negotiate their positionality in different situations, revealing a fluidity in insider-outsider status. This demonstrates that researchers are aware of the situated knowledges they hold in different settings. Our study also shows that researchers can experience role ambiguity and, in some cases, struggle with deep-seated doubts and discomfort in their research. This study contributes to a better understanding of positionality and insider/outsider dynamics in military research institutions, as well as broader discussions of embedded research.

Embedding Creative Methods in the Life History Calendar Approach: Enhancing DATA Quality of Biographical Research in Vulnerable Populations

Many studies in biographical research employ retrospective interviewee reports, often involving lengthy or remote recall periods. Given the difficult answering task involved, researchers developed supportive data collection approaches, like aided recall procedures and conversational interviewing. One principal approach – the Life History Calendar methodology (LHC) – fits biographical research well and offers opportunities for creative methods. Through a narrative literature review, this paper explores how creative methods may expand the LHC and add to tailor-made methods that fit vulnerable populations like older people, refugees, low literate persons, or mental health patients.

The LHC employs a visual tool to gather life history data about multiple life domains. Core to the tool is a graphical timeframe that aims to facilitate access to long-term memory and help participants to interconnect events mentally and/or visually. This paper focuses on the impact that embedding visual and creative methods in LHC procedures has on gathering sensitive biographical data as well as on the interaction between interviewer and interviewee.

Research indicates that the visual display of the LHC-tool makes it easier to refer indirectly (e.g., without words) to sensitive topics, resulting in more self-disclosure. On the other hand, the visual display of sensitive information (e.g., stressful events) may also evoke emotional distress. Often less emphasized, is the possibility to employ the LHC as a cooperative effort between interviewer and interviewee. The impact of co-construction – using (visual) creative methods – on the power relation within the interview setting, adds to the LHC impact on data quality. Research suggests that such an interactive LHC approach helps build rapport and especially enhances capturing narratives of emotionally sensitive events.

This paper seeks to integrate theoretical and empirical findings on the stated issues and draws conclusions about opportunities that creative methods in LHC methodology provide for data collection in vulnerable populations.

Revisiting the Relationship between Labour and Nationalist Movements in Southern Africa

The important role played by African trade unions in struggles against neo-liberalism, autocracies, and apartheid in the 1980s and 1990s – and more recently, in the Arab Spring – renewed scholarly interest in union politics and history. This included numerous case studies and comparative-historical analyses, focussing on issues like the causes of union involvement in such struggles, the sources of union resilience in the face of difficult economic and political conditions, and the impact of unions on political reform, including on new governments; the new body of work also sought antecedents of current union activity in unionism under European colonialism. Focusing on Eswatini, Namibia, South Africa, Zambia, and Zimbabwe from the 1930s, this paper revisits this literature, arguing that Southern Africa's unions have a richer, and more complicated history and politics than often acknowledged. Structuralist explanations, reliance on general categories like democratisation, political alignment and protest, a naturalisation of nationalism, and a focus on dominant union federations and political parties, have tended to homogenise labour movements, elide the importance of union and workers' politics, and underplay the different modalities of union-party relationships and of union engagement in larger struggles. The paper draws attention to the fraught relationship between unions and nationalist movements, dating back well into the colonial era, the role of moderate and right-wing unionism and of religious and leftist influences, the persistence of anti-party and anti-politics sentiments, the importance of looking at union-based co-operatives, production and services, and workers' complicated relationship to neo-liberalism. In closing, the paper suggests some new directions in categorising types of trade unionism, and for southern African labour studies more generally.

Music & Aesthetic Reflexivity: Morals, Values & Symbolic Boundary Work in Everyday Musical Practices

This paper explores how contemporary youth engage with music in their everyday lives within a globalized, digitized context. Late modern societies and its globalized musical field are characterized as highly individualised, and streaming platforms have reshaped music consumption. Streaming's decentralization of music distribution has fragmented the musical field, which may weaken the foundation for durable collective musical subcultures, raising new questions about music and its link with identity-construction. Because of the limitations associated with age young people remain bound to the local and reliant on their own strategies of creating spaces of belonging. Thus, music, due to its ubiquitous nature, is one of the most readily available cultural resources youngsters have at their disposal, and because it is a domain ruled by feelings (DeNora, 2000), it becomes a valuable resource for meaning-making. By further expanding on the concept of 'aesthetic reflexivity' we pose that the inherently reflexive project of 're-configuring agency' through music is above all a value-oriented and moral process. Based on music-diary reports and in-depth interviews with 28 young adults (aged 18-25 in Antwerp), we find that young people engage in a process of reflexive musical self-selection, curating a varied and highly personal music collection that helps in the constructing of a narrative of the self where the values expressed by or projected upon music play a crucial role in their negotiation of socio-cultural identities. By considering the moral dimension of music appropriation we aim to better understand how music's 'affordances' are informed by the socio-cultural meanings infused within the musical object. We show how respondents actively turn to music as a means of self-management; seeking recognition and resonance with their own issues, values, and aspirations and thus show how music becomes a strategic resource to create spaces of belonging and resistance.

Memory Activism and Difficult Heritage in Chile : A Geo-Sociological Approach to the Routes of Memory

The spatial traces of state terrorism committed during the Chilean dictatorship (1973-1990) represent a difficult heritage that continues to face resistance and spark controversy. Attempts to erase these remnants were systematic during the dictatorship, when many sites were destroyed; these demolitions and gradual dismantling continued after the restoration of democracy. Given the vulnerability of these sites, and within the broader context of demands for justice and symbolic reparation, civil society groups have been mobilizing since the mid-1990s to demand the protection of these sites—through their designation as heritage sites—and to publicize the memories of the atrocities they bear witness to.

In this context, this paper aims to examine the actions and demands carried out by various citizen associations engaged with memory sites designated as national monuments, which are part of a 'memory route' in the Valparaíso region. The objective is to explore how citizens' struggles to reclaim and bring life to these sites, confronted both with the spatialization of power asymmetries inherited from the dictatorship and with the weaknesses of public action in these matters, allow us to rethink heritage categories. Who are the actors involved in these "labors of memory"? What are their demands, their practices, as well as their uses and perceptions of the multiple heritage categories at stake? What are the limits of the patrimonialization and transmission of these legacies of violence rooted in the territory?

The fieldwork, initiated as part of a postdoctoral research project, took place between 2018 and 2024.

Remaking European Futures through Digital Innovation Politics

Amidst the unfolding of global economic and geopolitical challenges, the European Union (EU) has increasingly projected its future as closely intertwined with its 'power to innovate'. From artificial intelligence (AI) to blockchain, from digital health to personalised medicine, emerging areas of digital innovation have been targeted by the Union for major investments, as well as governance and regulatory efforts. EU-led initiatives in digital sciences and technologies, which cut across other prominent innovation sectors such as life sciences, are widely seen as promising to address complex societal challenges and transform the way we live, move, communicate

and are cared for. Moreover, while they aim to provide the knowledge and material infrastructures for an ever more integrated and globally competitive European knowledge economy, they are heralded as the 'European way' to digital innovation, tailored to what are framed as distinctive European values and principles such as privacy, solidarity and fairness.

Drawing on insights from STS-informed infrastructure studies, the sociology of European integration and the political economy of digital technologies, we explore how the constitutive elements of European 'post-digital' societies, such as AI algorithms and genome sequencing, are increasingly assuming the role once assigned to coal and steel as building blocks of the European integration process. Based on the book 'Project Europe: Remaking European Futures through Digital Innovation Policies' (Edward Elgar, 2025, co-edited together with L. Marelli, J.Dratwa), we address the question of how novel digital orders are co-produced with distinctly European social, political and economic identities, institutions and practices, and provide an understanding of how 'Europe' is being reimagined and repositioned in a wider debate about the identity, shape and future of the EU, including in relation to other geopolitical entities such as the US and China.

Teaching the Zen of Ethnography: Cultivating Consciousness and Compassion through a Sociology of Awareness

In self-reflective ethnography, the fieldworker is recognized as "the research instrument" (Emerson, Fretz, Shaw, 1995) through which perceptions of the field — and of field relations — not only flow, but are made sense of and gathered. These perceptions are then written up as "data," again assigned meaning and value, coded and sorted, ultimately becoming a final account, discovery, or tale of the field. Thus, as the research instrument, a fieldworker's presence, person, self, and body — not to mention, their interactional understandings and cultural competence, matter in fundamental ways. But so, too, does their self-awareness, their consciousness, their habitual patterns of thought, and their ability to exist in states of flux and disquiet — as these aspects can affect experiences, actions, and outcomes.

However, there is surprisingly little to no training or focus on the role of self-awareness in ethnography, even as many experience fieldwork as insightful, transformative, and emotionally impactful.

So what happens when we actively include Awareness (self, other, general), mindful attention, liminality, and embodied experiences, as a sociological practice, and a feature of learning ethnography?

In this presentation, I discuss my experiences teaching field research methods as "The Zen of Ethnography", a two quarter intensive, that was part of UCLA's Sociology Immersion Program. Using classic fieldwork texts, students also read Shunryu Suzuki, Pema Chodron, engaged in writing practice, and "doing nothing". We used Suzuki's concept of "Beginner's Mind" to frame the class, inviting a sense of wonder, alongside a sense of "unknowing" and "undoing." Students were encouraged to be curious about their assumptions — both sociological and the everyday — as they researched, analyzed, and wrote; and to explore "uncertainty" as fertile ground. All of which had implications for cultivating open minds and open hearts: states of being, helpful in ethnographic research and in everyday living.

Fertile Ground for Social Support: Understanding Men's Use of Online Peer Support Groups for Fertility Issues

Men facing fertility issues often experience significant emotional distress. A beneficial factor in enhancing psychosocial well-being is the presence of peer support. Recently, the internet has become a popular source of peer support and information for health-related issues, including fertility issues. However, research in this area often focuses on women, leading to a lack of understanding of men's use of online peer support groups for fertility issues (OPSFI).

This study aims to fill this gap, and its research question are threefold: (1) What is the sociodemographic profile of men who use OPSFI? (2) How do men make use of OPSFI? And (3) why do men make use of OPSFI? This study hypothesizes that online peer support groups for fertility issues can either complement or substitute for a lack of offline social support. It also examines whether perceived stigma and a lack of disclosure are more prevalent among lurkers compared to active participants of OPSFI, and if there is a difference between Belgian and Dutch men.

To answer these research questions, we designed an online survey about men's use and experiences of OPSFI together with the stakeholder organizations De Verdwaalde Ooievaar (Flanders, Belgium) and Freya (The Netherlands).

The stakeholder organizations will advertise the study to recruit men with fertility issues to participate. The survey will collect data on demographics, fertility, internet use, motivation to use, social support, infertility stigma and disclosure, and overall satisfaction with the peer support group.

We look forward to share the results at the ISA conference. This ongoing research aims to understand the current and future role of online peer support in addressing men's fertility issues. Our goal is to better meet the needs of men in Flanders and the Netherlands through professional healthcare and informal peer networks.

VANA, JAN* (Institute for Czech Literature, Czech Republic)

Theorizing the Social through Literary Fiction: Toward a Social-Aesthetic Dialogue

I propose a model for theorizing social phenomena through literary fiction, drawing on Georg Simmel's *Soziologische Ästhetik* and Arnold Berleant's social aesthetics. Unlike classical emergentism in sociology, Simmel's "relational emergence" emphasizes non-hierarchical and non-causal interactions, suggesting that emergent social entities form through unique constellations of relations that may also solidify into enduring cultural structures. Literary texts, through their "aesthetic totality" (as in the sociology of literature by Lukács and Goldmann), enact these dynamic interactions within the reading process, functioning as a laboratory of social becoming and dissolving. Particularly, I argue for a sensitive *social-aesthetic* dialogue with literary works as a viable alternative for theorizing "nondeclarative cultural knowledge" (Rotolo 2022, Lizardo 2017).

As an example, I demonstrate theorizing via two literary works that vary greatly in style, scope, level of literary consecration, and the socio-historical milieu of their origin: Robert Musil's *The Man Without Qualities* (1930) and *Normal People* (2018) by Sally Rooney. By selecting such vastly different texts, I aim to show how particular ways of literary theorizing are bound with literature's specific intra- and extra-textual attributes. On a more abstract level, both novels excel at *presenting* (rather than re-presenting) the dynamic interplay between human bodies and environments as well as collective representations and cultural structures.

Rather than locating social action within the "physicalism" of (neuro) cognitive cultural sociology, or in collective representations, as in Durkheimian sociology (see the debate on "The neuro-cognitive turn in cultural sociology" in Smith 2020), literary texts allow to elaborate social action through the Simmelian *Stimmung*—the mood, also conceptualized as attunement or atmosphere. By means of their aesthetic forms, novels capture social moods without fixing them in discursive definitions, enabling what I call social theorizing in "happening."

Integrating Sustainable Development Goals in Higher Education: A Case Study of the University of Barcelona

The 2030 Agenda, adopted by the United Nations General Assembly in 2015, establishes 17 Sustainable Development Goals (SDGs) aimed at eradicating poverty, reducing inequality, addressing climate change, and ensuring global peace, justice, and prosperity. These universal goals require the mobilization of creativity, technology, and resources from all societies, involving governments, businesses, civil organizations, and individuals. Integrating the SDGs into university educational programs is crucial for promoting a more just and sustainable society. Various strategies have been proposed to incorporate sustainability into university curricula, such as including environmental topics in existing courses, developing new chairs, and offering specializations. The University of Barcelona has begun implementing actions aligned with the SDGs and the 2030 Agenda, committing to a transformative education model. This study examines how the SDGs are integrated into education degrees, highlighting the importance of fostering sustainability competencies as defined by UNESCO. The results suggest that, although training programs include content related to the SDGs, there is a need to increase the direct representation of these goals and sustainability competencies in teaching plans. It concludes that the effective incorporation of the SDGs in higher education is essential for preparing future professionals as change agents in building a more sustainable and just society.

VANCEA, MIHAELA* (Universitat de Barcelona, Spain)

University Students' Engagement with European Politics: Insights from the European Parliament Elections

This study analyzes university students' interest, knowledge, and perceptions of European politics, with a particular focus on the European Parliament elections. By evaluating students' understanding of the frequency and functions of these elections, as well as their interest in European politics and opinions on the European Parliament's representation of young citizens' interests, we aim to provide a comprehensive overview of young people's engagement with European political processes.

Our findings reveal that while a significant proportion of students correctly identified the frequency of European Parliament elections, a majority were uncertain. Moreover, around 75% were unaware of the foreseeable European election results. Additionally, although a notable proportion expressed a positive view regarding the European Parliament's representation of their interests and showed great interest in European politics, a majority perceived the representation as somewhat poor. This indicates areas for improvement and reflects a general disinterest or unclear stance on European politics.

In summary, while university students generally hold a significant interest and favorable opinion of European institutions and politics, the data suggest a need for enhanced efforts to improve their political knowledge and better address and represent their interests. This study underscores the importance of fostering greater political awareness and engagement among young citizens to ensure their voices are effectively heard in European political discourse.

Les Revenus Des Artistes-Auteurs En France. Explorations Des Bases De Données Administratives.

Cette communication vise à présenter les résultats de l'exploitation d'une base de données originale, celle des déclarations de revenus des artistes-auteurs en France. Cette base de données, est constituée par l'Urssaf Caisse nationale (Acoss) et exploitée par le Département des études, de la prospective, de la statistique et de la documentation (Deps-doc) du ministère de la Culture, à partir des déclarations remplies auprès de l'Urssaf par les artistes-auteurs ou par leurs diffuseurs. En effet, les artistes-auteurs percevant des revenus artistiques associés à la création d'œuvre de l'esprit, que ce soit dans la branche des écrivains, des compositeurs de musique, des arts graphiques et plastiques, du cinéma et de l'audiovisuel, de la photographie, ou même du logiciel, doivent déclarer ces revenus afin d'éventuellement bénéficier du régime de protection sociale associé. En 2024, une nouvelle base de données a été constituée, à partir des déclarations de l'année 2022, incluant pour la première fois des nomenclatures qui n'avaient pas été implémentées dans les bases précédentes : notamment celle de la nature de l'activité principale exercée. Cela nous permet ainsi d'accéder à une vision précise des revenus de ces artistes-auteurs, en les distinguant selon le domaine artistique dans lequel ils ou elles exercent. Qui plus est, grâce à un appariement de ces données, il nous est possible de connaître la nature et le montant d'autres types de revenus d'activité perçus par les artistes-auteurs : salaires du privé ou du public ou revenus de travailleurs indépendants. Tous ces éléments nous permettent ainsi d'explorer les différentes problématiques liées aux revenus en général et aux revenus artistiques en particulier : inégalité entre hommes et femmes, concentration des revenus et pluriactivité. Cette communication s'inscrit enfin dans le cadre théorique propre à la sociologie du travail artistique, visant à approcher par les revenus les spécificités de ces activités.

Environmental Rights from Human to Non-Human Rights

Today, most human rights can be used as environmental rights. However, these human rights do not seem sufficient to guarantee environmental protection. That's why some legal systems have imagined some non-human rights or rights of Nature or natural elements to improve the legal protection of the environment.

The question of considering Nature as a person may seem far-fetched. The answer seems obvious: Nature is not a person. However, the concept

of person is increasingly being extended to include Nature itself or certain elements of it. This extension is now being advocated by certain peoples who consider nature to be 'Mother Earth' and proclaim themselves her representatives. In 2008, for example, the Ecuadorian Constitution gave Nature, as Mother Earth, the status of a subject of law. It derives genuine subjective rights from this. Similarly, since 2009, the Bolivian Constitution has recognised the right to a healthy environment for 'individuals and groups of present and future generations, as well as other living beings, so that they can develop normally'. In essence, it is about enabling Nature to take legal action to defend and restore its rights.

Similarly, the issue of the personification of animals is a recurring one. For example, a court in Argentina has recognised a female orangutan as a 'non-human subject of law', following New Zealand's decision in 1999 to extend human status to great apes, as India has done for dolphins.

Questions are being asked about the usefulness of this recognition. Does this recognition of rights of Nature or animals contribute more to the defence of the environment than the possibility given to associations? What would be the added value, other than symbolic, of personifying Nature or animals?

VANESSA, BARBÉ* (UPHF, France)

MAUCLAIR, STEPHANIE* (FACULTE DE DROIT ECONOMIE GESTION ORLEANS, France)

The Digital Revolution: A Threat or a Blessing for Older Peoples' Access to the Law (from Inclusion to Exclusion)

Article 1 of the French Declaration of Human Rights of 1789 sets out the principle that everyone is equal before the law from birth. If this principle exists, there is no doubt that we are not all equal in fact, because we are all different. One of the purposes of the law is therefore to restore the balance between individuals. For several years now, public policy has sought to ensure that all individuals have equal access to the law and justice. However, the inequalities encountered are of several kinds. There are generational inequalities, which stem from the difficulties that people of different ages have in gaining equal access to the law. Here, it should be noted that the populations whose access to the norm is weakened are very often the oldest. Added to this are territorial inequalities relating to the isolation of certain rural populations who will not be able to access certain legal or judicial access points. One of the measures designed to remedy this problem is the dematerialisation of access to law and justice. The aim is to give everyone access to the same level of knowledge, but also to make it easier for individuals and litigants to do their work. But this digital revolution is not without its problems. The deployment of digital technology is creating a real digital divide across the country. This might not be so serious if new technologies did not play such an important role, especially in fundamental areas such as access to the law and justice. The digital revolution is also creating new forms of vulnerability. The question then arises as to how to deal with these new tools to ensure that older people have access to the law, while at the same time not exacerbating their vulnerability.

VARELA FERNÁNDEZ, PAULA* (University of A Coruña, Spain)

From Ancestral Ritualism to Cyberanthropomorphism: An Ethnographic Analysis of Technology Uses and Body Modification

Nowadays, bodily practices have been significantly influenced by emerging technologies, the new era of digital communication and modern consumer dynamics. This work problematises the relationship between body and technology through the phenomenon of body modification, exploring the conception of the body as a place of cultural reproduction and symbolic expression.

Body modification is considered as a total social fact that involves socio-historical and physio-psychological factors, and groups a variety of practices and disciplines. Between the diversity of body modification nowadays, this research focuses specifically on tattooing. It is analysed through a qualitative methodology –based on ethnographic fieldwork in the form of participant observation sessions and in-depth interviews–. The methodological design is complemented by an approach to autoethnography –exploring the dual role of researcher and tattoo consumer–, in order to understand the role played by artistic styles, identity patterns and market logics around the skin marking.

In this context, it is interesting to observe the evolution of new technical, aesthetic and ideological trends of body modification, especially those phenomena related to the posthumanist challenges in today's mass culture –such as *cyberanthropomorphism* or *AI*–. Tattooing fosters the materialisation of emotions and narratives, adapting to the current digital era. It is a mode

of embodied expression which allows to examine the (bio)technological *dispositives* of body regulation, and even questioning the fugacity or durability of the body and its stigmas –by looking, for example, at the rapid development of tattoo removal technologies or, conversely, the preservation of tattooed skin in museums–.

Therefore, this investigation offers a holistic viewpoint with potential to enrich current academic debates about socio-anthropology of the body, intersectional analysis of new technologies and epistemological challenges posed by the situated production of knowledge.

VARGHESE, ASHWIN* (University of Cambridge, United Kingdom)

The Dialectics of Discretion in Algorithmic Governance and Smart Policing

Algorithmic systems are slowly transforming policing and governing practices. Their manifestations, however, vary in particularistic settings. While proponents argue that algorithmic infrastructures will make policing impartial and objective, critics argue that they automate systems of inequality, exacerbate marginalisations and insulate institutions from democratic accountability. In this paper, I draw from a postcolonial nation in the global south to engage with the literature on algorithmic governance and unpack the effect of algorithmic systems on the discretion of subordinate-level police personnel.

I propose that practices of algorithmic governance may be better documented and understood through the dialectics of discretion. Demonstrating this, I note the emergence of two tendencies in the incorporation of algorithmic frameworks in policing in Kerala – one, insulation of subordinate personnel from the public, and two, invisibilisation of the discretion of subordinate personnel.

This paper is derived from a research study conducted between August 2022 and August 2024, documenting the digital transformation of policing and state practices in Kerala, India. Building on a separate 11-month long ethnographic study of everyday practices and power relations in police stations in India in 2019, this study focused on investigating how e-governance and smart policing initiatives are linked to 'effective governance' and 'effective policing' in the dominant rhetoric of the state.

For the purposes of this paper, I turn the gaze inwards to explore how algorithmic infrastructures affect the practice of discretion *within* the police force. To do so, I take recourse to a discourse analysis of how algorithmic governance and policing are perceived in the context of Kerala, drawing from interviews with key participants (police personnel and state functionaries) and extensive documentation of state initiatives and their reportage.

The "Lame" Pendulum of Urban Justice: The Struggle for Our Yerevan

Following the collapse of the Soviet Union, Yerevan, the capital of the newly independent Republic of Armenia, has undergone significant transformation. The transition from a socialist, state-controlled city to a landscape dominated by privatization has redefined the socio-political and economic fabric of urban life. This presentation explores the dynamics of urban justice in Yerevan, focusing on the effects of privatization and the commercialization of public spaces.

Key elements of urban development have fallen under the control of semi-criminal oligarchic groups, tightly connected to the emerging political elite. These processes have led to a significant narrowing of Yerevan's ontological and social dimensions, as economic interests now prevail. Public spaces have been commodified, and large-scale construction projects have replaced the voids of the industrial past with dubious skyscrapers, further alienating ordinary citizens from the urban fabric.

At the same time, citizens themselves have engaged in the opportunistic use of urban spaces, contributing to the fragmentation of the city. This presentation examines the competing regimes of justice at play, focusing on the conflict between the adaptive practices of individuals and the revolutionary ambitions of Yerevan's new political authorities. The latter are attempting to reclaim spaces previously appropriated for private benefit, aiming to redefine urban justice. However, this process has been met with widespread distrust, as the political elite faces a legitimacy crisis.

By analyzing the socio-historical underpinnings and behavioral practices of urban justice across various social groups, this research reveals the paradoxical nature of justice in Yerevan today. The simultaneous pursuit of two conflicting justice regimes—individual adaptive use and state-led re-appropriation—offers unique insights into the evolving urban landscape of post-Soviet Yerevan.

VASCONCELOS DE CASTRO MOREIRA, LEONARDO* (KU Leuven, Belgium)

Exorcisms Online and Online Exorcisms: Differences between Two Pentecostal Churches' Digitalized Rituals of Exorcism

This paper aims to observe the differences between the digitalized exorcisms by two Pentecostal churches, The Universal Church of the Kingdom of God, founded by Brazilians in Rio de Janeiro, and the church Hungry Generation, founded by Ukrainian immigrants in the United States. Although both churches practice rituals of exorcisms or deliverance within their services, the exorcisms on the internet are quite different; while The Universal Church of the Kingdom of God rituals are recorded or streamed in a manner in which the pastor/exorcist is present at the same place as the exorcized. The Hungry Generation offers the possibility of exorcisms from a distance through apps such as Zoom, where the pastor and exorcized are not in the same geographical space. By following the literature about digitalized rituals and religions, this paper will differentiate these two forms of exorcisms, 'exorcisms online' and 'online exorcisms', respectively. The difference between the institutional objectives of these rituals within both churches will also be analyzed, which points to the Brazilian church being more focused on exorcisms as a manner to control members and convert new ones, while the Ukrainian-American one focuses more on a spiritual service to receive donations. Therefore, we can observe a distinctive characteristic between Brazilian and American Pentecostal leaders since the beginning of televangelist shows. The former aims to transform spectators into loyal members of a specific church; the latter usually seeks to sell a religious product or receive a donation.

What Is the Flip Side of This Coin? Investigating the Impact of Automation Risk at Work on Health Outcomes in Germany

Automation transforms work at a rapid pace, with gradually increasing shares of the workforce being at risk of replacement by machines. However, little is known about how this risk is affecting workers. In this study, we investigate the impact of high risk of automation at work on subjective (self-reported health, anxiety, and health satisfaction) and objective (healthcare use and sickness absence) health outcomes of workers in Germany. We build our analysis on the survey data from the German Socio-Economic Panel (SOEP) and administrative data from the Occupational Panel for Germany (2013-2018). Employing panel regression, we demonstrate that exposure to high risk of automation at the occupational level worsens self-reported health and health satisfaction of workers and increases their sickness absence and, depending on how the risk is measured, anxiety. No effect is found on healthcare use. We also conduct several robustness checks with results remaining mostly consistent with our main findings, while uncovering some heterogeneity in effects among the analyzed groups.

Social Networks and Long-Term Condition Management: A Critical Realist Review

Long-term conditions have emerged as a central policy issue. There is also a large body of literature that addresses different aspects of prevention, treatment, and the management of long-term conditions. The challenges of chronic illness are often associated with questions of the capacity of the health services and the welfare state, the adequacy of the existing structure of healthcare provision and the current division of labour between professionals.

These different challenges are addressed within a dominant discourse organised around the notions of *self-care* and *self-management*. These tend to be centred on individual responsibility and interactions with healthcare

professionals, and prioritise the provision of information, education, health literacy, and individual behaviour-focused psychological models to improve established measures of health outcomes.

The extensive literature on the role of social networks in the context of self-management offers conceptualisations and methodologies that offer critical perspective on the dominant set of arguments and can help improve our understanding of the processes involved in everyday illness management. This is by offering a relational perspective on self-management and recognising the centrality of informal relations and support. This paper takes a critical realist perspective in reviewing this literature and distinguishes between uses of social networks as a metaphor, concept, method and structure. We discuss the underlying assumptions, boundaries of different uses, their limitations, the sets of questions that could be explored and the added value, the contexts in which they can be helpful, and the possible slippages between them.

Transforming Higher Education: Artificial Intelligence in the Training and Monitoring of University Students.

The latest generation of technologies, including artificial intelligence, the internet of things, robotics, and nanotechnology, among others, are one of the sources of the great transformations in organizations and society. In the contemporary era, it is increasingly challenging for a company or institution to survive if it does not adopt any of the technologies. Higher education institutions are well-versed in the utilization of novel technologies, serving as both pioneers and advocates for innovation through their various core functions, including teaching, research, and extension. The objective of this study is to examine the role of artificial intelligence (AI) in the context of teaching and learning, as well as in the planning and monitoring of university students' academic trajectories. This analysis aims to identify the factors and potential risks associated with the use of AI in these areas. The study performs a comprehensive analysis of the literature on the central concepts of the research project, with the objective of elucidating the significance of AI in the educational processes and monitoring of the academic trajectories of university students. This permitted the creation of an instrument to be utilized with students at a higher education institution, with the objective of identifying the factors and potential conflicts associated with the integration of technology in the educational process of the subject under study. This study employs a qualitative research methodology. Ultimately, the objective is to identify the factors that facilitate the integration of AI in student training, which are often constrained by limitations in human, technical, and financial resources. This results in inadequate monitoring of student progress, as well as the potential risks associated with AI utilization. This study aims to serve as a reference point for research on student trajectories and support systems.

Mortalidad Por Armas De Fuego y Su Impacto En La Esperanza De Vida Masculina En México

Este estudio analiza la tendencia de la mortalidad masculina por armas de fuego (AF) en México en las últimas tres décadas, estima su impacto en la esperanza de vida (EV) –comparado con otras causas de muerte– entre los trienios 1990-1992 y 2020-2022 e identifica el peso de los grupos de edad en la pérdida de años de EV por esta causa. A partir de datos oficiales se calcularon tasas estandarizadas de mortalidad por AF y se elaboraron tablas de vida masculinas abreviadas para México para cada uno de los 11 trienios comprendidos entre 1990 y 2022; esto permitió calcular la EV temporaria entre 15 y 75 años y los años de esperanza de vida perdidos (AEVP) entre ambas edades, por causa. Entre los hombres, la mortalidad por AF –sobre todo por homicidios, pero también por suicidios, accidentes y eventos de intención no determinada– se incrementó sustancialmente, primero entre 2007 y 2011 y después a partir de 2014; pasó de ser una de las causas que menos AEVP provocó entre las causas de muerte estudiadas (Diabetes, Enfermedades del Corazón, entre otras) entre 2002 y 2007 a ser la principal causa de AEVP entre 15 y 75 años en 2017-2019, y una de las primeras en 2020-2022. El mayor aumento de los AEVP por AF se observó entre 20 y 34 años. Los hallazgos indican que el aumento de la mortalidad por AF, sobre todo entre los jóvenes, ha contribuido sustancialmente al estancamiento de la esperanza de vida masculina en México. Esto refleja que la violencia ligada a

las AF es tanto un problema de seguridad como un problema social y de salud colectiva, que debe ser afrontado de forma interdisciplinaria e intersectorial si se pretende incrementar la esperanza de vida del país.

Putting Reproductive Labor at the Center of the Just Transition

Today's energy transition has been called upon not only to be urgent but also just. The call for a just transition originated from labor movements demanding responsible solutions to communities' social and environmental struggles, particularly for workers with high stakes in greenhouse-gas-intensive sectors. These workers seek secure job opportunities in low-carbon industries while addressing the urgent need to combat climate change. While debates around just transitions have considerably increased concerning energy democracy, participation, phasing-out, and new technologies, climate initiatives still place insufficient attention to the intertwined nature of labor regimes, resource extraction and the entrenched neocolonial endeavors. Indeed, land, workers and raw materials located in resource-rich regions will be essential to the realization of transitions everywhere in the world and these regions continue to face high levels of inequality and the largest consequence of climate change. This study aims to examine the role of social reproduction by looking at labor regimes connected to the supply chains of raw materials in the energy transition. I argue that the energy transition in industrialized rich societies is benefiting from essential reproductive and care work, largely done by marginalized, poor and exploited women. This reproductive work subsidizes and makes the energy transition financially profitable within the current capitalist system of accumulation. If the discussion ignores reproductive labor, what is "just" about the energy transition? An effective just transition goes beyond merely greening energy systems, it must put social reproduction at the center of the transition.

Exploring the Gender Productivity Gap

Academic publishing is increasingly shaped by two opposing forces: the escalating pressure for productivity in a competitive, neoliberal environment, and the emergence of predatory publishing practices that exploit this demand. This manuscript investigates the persistent gender productivity gap within this landscape, linking it to broader systemic inequities and questionable research practices (QRPs) that undermine the integrity of scientific work.

Drawing on extensive data from the Zurich Survey of Academics (approx. N = 4,500) and integrated bibliometric sources, we analyze how gendered work ethics, risk-taking behaviors, and publication strategies contribute to differences in research output across disciplines. By exploring the intersection of gender, and the commodification of scholarly knowledge, we reveal how women's cautious publishing strategies and adherence to ethical norms often position them at a disadvantage in a system increasingly geared toward rapid output and questionable shortcuts.

Preliminary findings reveal a gender gap in total publications, fractionalized peer-reviewed publications, and the H-index. Surprisingly, traditional hypotheses about writing null results and time allocation are unsupported by the data. However, positive correlations emerge between explicit attitudes toward QRP, risky publication strategies, and higher productivity measures. Our findings suggest that women are disproportionately excluded from the rewards of academic productivity, while men more readily engage in high-risk, high-reward publishing strategies. In an era marked by the platformisation of scientific research and the opaque operations of predatory journals, this research highlights the need for structural reforms to ensure transparency, equity, and sustainability in academic publishing.

This project calls for a critical reevaluation of research evaluation policies, questioning the role of academic publishing in perpetuating inequality and academic pollution, and advocating for more inclusive, ethical, and open-access approaches to the dissemination of knowledge.

VELIKAYA, NATALIYA* (Institute of Socio-Political Research of the Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences (Moscow, Russian Federation), Russian Federation)

Anti-Migrant Discourse in the Context of Strengthening Nationalism in Russia

The paper is devoted to the peculiarities of Russian political discourse and features of public consciousness linked with migration. Migration as a sociocultural threat has acquired special significance in Russia due to the active influx of migrants into the country after the collapse of the USSR. On the one hand, expanded the boundaries of migration analysis in line with the theory of the "clash of civilizations", and on the other, it gave rise to a huge amount of speculation on this topic in the public sphere.

We consider Russian society as multination and multireligious society with new-authoritarian regime which surely needs special mechanism of legitimization. Spreading and supporting nationalistic ideas at all level of state power become one of these mechanism.

Our research task is to find out main resources, social base of anti-migrant discourse determined by nationalism in modern Russian society.

As an empirical date, we used monitoring data from the Institute of Socio-Political Studies of the Russian Academy of Sciences (1992-2025) which let us see dynamic of public opinion during long term and data of discourse analysis of public discourse.

Analyzing public consciousness we pay attention to such indicators as political values, ideological orientation and ideas about the future, which let us see the increasing the share of people supporting ultra-patriotic and nationalistic ideas expressed by the slogan "Russia for Russians".

We describe the main centers producing migrant-phobia and antimigrant sentiment as some NGO, political parties and even state agencies. We show how revival of civil nationalism leads to ethnic intolerance and migrant-phobia which is accompanied by a number of negative social practices.

Legitimization of Civil Nationalism and Political Repression in the Context of Hybrid Conflicts in Russia

Global transformations of the political realm, and attempts to reshape the global world order create internal risks and threats to democracy. Current military conflicts and kind of hybrid wars can undermine the stability of regimes leads to authorization of political system.

We consider Russian society as multination and multireligious society with new-authoritarian regime which surely needs special mechanism of legitimization. Spreading and supporting different kinds of nationalistic ideas at all level of state power become one of these mechanism. After the collapse of the Soviet Union and a short period of de-ideologization, the Russian government has repeatedly attempted to develop a nationwide general civil ideology, mainly using the concepts of the "Russian world" and of "neo-Eurasianism", considered as neo-imperial ideologies that determined the content of public discourse in Russia. Paper is based on content and discourse analysis data collected by discourse analysis of speeches of politicians and articles issued from July, 2013 to July, 2014 and from July, 2022 to July, 2023. The general sample includes 521 articles

Nationalism is both an ideology and a political practice based on the nation's value as the highest form of social unity. States widely use this kind of nationalism through official rhetoric, symbols and ideological institutions (education, social sciences, mass media) to assert civil loyalty and disseminate national legal norms and cultural values. As the enemies of the Russian society in actual political discourse are considered oppositionists and everybody who do not support the special military operation and policy of President in general). The fact of existing enemies mainly is interpreted as necessity to defend them and exclude from Russian society. Civil Nationalism and neo-conservative ideology becomes the sociocultural base of the whole process of power legitimization, leaving little space for democratic confrontation and electoral alternation.

Digitized Education As a Key Factor for Changing and Formatting Social Contract

Since social contract is based on the idea of social group agreeing to abide by the rules of the government for safety, defence and stability, in order for this agreement to be efficient so that the government were able to defend the citizens and meet their requests as well as the society were able to find the compromise and realize the ability of the government to fulfil the society's needs there has to be an understanding of several levels of such interaction.

We believe that one of the key elements of efficiently working social contract is education since as an institute it performs several essential functions. However, there has to be an understanding that education is a system that always changes due to external factors, such as the pandemic of 2019, politics of the government, and internal factors like the progress of science.

In the new era of technology and Internet digitalization has become a new power that affects all areas of our life and different institutions. Education as it comes has also become much more digitalized in the past decade which has led to several consequences and the process of global digitalization has brought not only a new format of education but also the ability for the students to reach almost every existing knowledge.

In our paper we would like to research the extent to which education has an effect on changing and formatting social contract using the example of Russia. We will base our research on several theories: social contract, information society, digital culture, theory of generations and digital inequality.

Experiencing the Gilded Cage of Multilingualism: How Global Language Enculturation Normalizes Global Inequality

This study shows how experiencing multilingualism—a political economy process driving global language enculturation—can be a socialization mechanism normalizing global inequality. I distinguish multilingualism as a spontaneously occurring phenomenon in which individuals adopt and use linguistic practices associated with various languages from multilingualism as a political economy process. My concern is with the latter in a global context. Multilingualism as a political economy process involves a language ideology promoting multiple languages. The ideology of multilingualism produces policies and practices resulting in multilingual enculturation and intervening in the global language economy. The global language economy is characterized by a language prestige hierarchy in which languages are valued unequally. A few dominant languages associated with former empires (e.g. English, French, Spanish, German, Russian, etc.) are more valuable than other languages in terms of offering access to knowledge, expertise, and to other valued resources globally. Native language practitioners of non-dominant languages find themselves needing to acquire competences in dominant languages or risk exclusion from the global economy. In these circumstances, multilingualism commonly means learning dominant languages in addition to one's native language. The embodied experience of multilingual enculturation can thus socialize practitioners of non-dominant languages into taking global inequality for granted. Multilingualism inculcates in them awareness of the world pecking order and of their less advantaged position in this order. For practitioners of non-dominant languages, multilingual competences can constitute a gilded cage. They can provide access to valuable knowledge and expertise and ensure a privileged position relative to fellow practitioners of non-dominant languages. However, multilingual competences simultaneously represent the price for this privilege by creating negative distinctions from both the linguistic community of origin and the communities of native practitioners of dominant languages. The study is based on the extended case method combined with autoethnography.

Somatic Learning of Violence As a Type of Negative Social Capital Accumulation in the Case of Mass Violence in the United States

This study examines violent forms of participation in the United States, including mass shootings and acts defined as political terror. It proposes somatic learning as a type of negative social capital accumulation. Individuals exposed to violence in the context of various social institutions, most notably the family, the community, and the state, can acquire embodied capacities

to engage in violence if they are triggered. Violent institutional culture can become violent embodied culture through somatic learning of violence. This argument is based on an embodied theory of violence I have proposed elsewhere (Velitchkova 2022). To examine the argument empirically, the study analyzes several data sources with information on violent participation in the United States. First, the study relies on a census of perpetrators of mass shootings collected by the Violence Project. The study provides descriptive statistics for variables associated with somatic learning of violence in the family, in the community, and through interactions with state agencies. The results indicate that in 95% of mass shooting cases in the United States, the perpetrator had acquired violent capital through interactions in the family, in the community, and/or with the state. In most remaining cases, perpetrators had severe mental illness and were in crisis. To further examine the theory, the study will also analyze the PIRUS dataset of extremist radicalization, which contains information on both violent and nonviolent individuals associated with organizations considered to be "extremist." The study will consider the implications of a somatic learning mechanism in the development of negative social capital. It will also provide recommendations for violence mitigation efforts in the context of families, communities, and violent state agencies.

The Impact of Gender-Based Violence on Women, Children, and Youth in Conflict Zones in the Southern Philippines: The Experiences of Internally Displaced People from Zamboanga and Marawi

This paper examines the risk for gender-based violence in conflict zones in the southern Philippines, focusing on the experiences of people displaced by the 2013 Zamboanga Siege and the 2017 Marawi Siege. The researcher examines the dynamics of violence, conflict, and war from a gendered perspective and illuminates the continuum of gender-based violence, ranging from personal to community based and/or state-sponsored violence during war and conflict. Drawing upon interviews and focus group discussions with the internally displaced people (IDPs) in evacuation centers and/or transitory sites, and duty-bearers from Zamboanga City and the Islamic City of Marawi, the researcher discusses common themes and nuances in the experiences of private and community and/or state-sponsored violence among women, children, and youth, and the impact thereof on their well-being.

The researcher exposes the incidences of lawlessness and violence experienced by IDPs in Zamboanga, the vulnerability of women, children, and youth to domestic violence and/or human trafficking, and the covert attempts to recruit young men into extremist groups. Moreover, this research looks into the experiences of militarism and other forms of gendered violence among IDPs from Marawi City and the risk of clan feud upon their return to their communities. This study also illuminates the issues and service needs of IDPs who relocated either to transitory sites, in the case of evacuees from Zamboanga, or home-based evacuation centers in Iligan City, in the case of evacuees from Marawi, and the challenges they confront due to the lack of affordable and/or permanent housing, livelihood opportunities, and health care interventions.

The researcher highlights the links between racial, ethnic, religious, gender, and social class inequality in the Philippines and the vulnerability of people displaced by armed conflict. This paper highlights the human rights issues confronting IDPs from Zamboanga and Marawi, and local and international responses to their situation.

The Support to the Unaccompanied Foreign Minors in Italy between Law's Logic and Gift's Ethics

The Welfare State, through the tax system, distributes resources in the name of solidarity between the members of society. This solidarity should be broader than that of the primary networks, and more equitable than the private charitable network. However, over time, the state has often relied on volunteer networks. This produces new conflicts between "competent" professionals and volunteers, and within the self-perception of the voluntary (Godbout 1992). Godbout, in the wake of Polanyi (1944) and Titmuss (1970), critically studies the various mixed forms of collaboration between ethics of gift and state solidarity.

The coexistence of the two models (that of professional work paid and voluntary work) is not easy, since the spirit of giving contradicts the principle of state equality. Furthermore, it risks transforming someone's free act into simple unpaid work, modifying it thus the deepest meaning and carrying out a social deconstruction of it.

This research will analyze the figure of the voluntary guardian for unaccompanied foreign minors, formalized in Italy by Law 47/2017, to understand the main effects of this new frontier in the relationship between public welfare and voluntary commitment.

The investigation will be conducted with both quantitative and qualitative tools. In the first phase, the data collected from institutional sites (Ministry of the Interior, Juvenile Courts, etc.), will allow us to reconstruct the identity profile of the voluntary guardian (gender, age, qualification and profession). We will then move on to delve deeper into some of specific aspects relating to the experience of volunteer tutoring through the administration of semi-structured interviews with privileged witnesses. We identified them according to the method snowball sampling (Salganik, Heckathorn 2004), with the collaboration of the operators of the Don Calabria Foundation, which organizes and coordinates the activities of the guardians for unaccompanied minors in Calabria.

The Affluence of Religious Socialization and Social Connectedness on Young Adults Mental Well-Being

Young people's social learning and internalization of religious beliefs, attitudes, values, and behavior is known as religious socialization. Often used in research to understand the social patterns emphasizing the formation and course of religious attitudes. Similar to socialization, religious socialization is also a lifelong process with crucial significance for children and youth. Marked by the significant shift from parental to peer influenced social learning the young adults stand for religious understanding lightens and is replaced with contemporary ideologies. Witnessing the shift of parental control and attitudes the young adult's social connectedness and reciprocity alters affecting one's mental health and their state of living. This empirical study is influenced by constructivist social network models aimed at understanding the process of religious socialization and its outcome specifically its orientation to mental well-being. Additionally, the study tries to explore the mediating role of social connectedness on the religious social learning and mental well-being of young adults. The study is quantitatively designed by descriptive, cross-sectional, convenient sampling methodology with questionnaire as the tool of data collection among the youth adults in diverse educational settings from select colleges of Tamilnadu, India. The study results display the mediating influence of social connectedness on religious social learning and the mental well-being of young adults. Therefore, preserving a balanced mental well-being is essential for realizing one's abilities, religious potentials, and social skills for meaningful social survival with the actualization of social control mechanism and its norms, values, and standards. The study results would potentially benefit the individual self, policy makers, institution administrators, parents, and many others in understanding the affluence of religiosity in the social learning process.

Unemployment, Social Isolation and Emotional Distress. Disentangling a Complex Connection.

Most research carried out to date has convincingly shown the relationship between psychosocial risks and lack of emotional well-being and poor labour market conditions (either in the form of unemployment or in the form of employment insecurity). However, the literature is not so clear when the relationship between poor labour market conditions and social isolation is addressed. Although this relation could seem obvious when unemployed people are considered, the freeing of time produced by unemployment could be an opportunity to build new social relations out of the sphere of paid work. On the other hand, it could happen that stigmatization and shame (i.e. emotional factors) had an influence on the willingness to relate to other people when a person is unemployed or has a unwanted job. The relationship between these three elements (employment situation and conditions, social isolation and lack of emotional well-being) will be addressed in the paper we present to disentangle the association between them. To study this possible (and multiple) association, data obtained through a survey to 3,000 young people between 18 and 29 years old residing in Spain will be used. These data are useful to address social isolation both from the subjective point of view, as unwanted loneliness, and from a more 'objective' point of view, linked to the network of personal connections and the support (both emotional and instrumental) obtained from this network. The results show that the social isolation of the young people studied can be attributed to emotional distress and financial problems resulting from reduced income. But the most direct effect between unemployment and isolation is through the disappearance of the sphere of employment as an environment of sociability.

Le Développement Des Énergies Renouvelables Comme Moyen De Réduire Les Subventions À L'électricité : Genèse, Premier Bilan De Mise En Œuvre Et Politisation De Ces Résultats À Partir Des Cas Tunisien Et Jordanien

En Jordanie et en Tunisie, l'endettement des compagnies publiques d'électricité, attribué en large partie à l'augmentation des subventions publiques pour compenser la hausse des prix du gaz, apparaît de plus en plus insupportable. Si des augmentations de tarif régulières ont été menées, une nouvelle orientation de politique publique se dessine dans les deux pays, consistant à promouvoir l'autoproduction électrique via des équipements photovoltaïques de toit, qui ont connu depuis plus d'une dizaine d'années un essor spectaculaire. Une des justifications de ces programmes est qu'ils permettent de réduire la consommation de gaz. Plus récemment, les deux pays ont mis en place des programmes ciblant spécifiquement les ménages des bas paliers tarifaires de l'électricité, dont la consommation est entièrement et lourdement subventionnée. Il s'agit en Tunisie des programmes PROSOL Elec populaire et en Jordanie du Jordan Renewable Energy and Energy Efficiency Fund.

Cette élimination présentée comme financièrement ingénieuse et rentable, écologiquement positive et socialement indolore ne s'est toutefois pas mise en place aisément. Dans un premier temps, les effets d'aubaine pour les ménages aisés et pour les acteurs de la filière des installateurs ont été très importants, tandis que les moyens consacrés à ces programmes étaient rapidement consommés. Les décisions d'ajustement des gouvernements ont également suscité des levées de bouclier de ces bénéficiaires initiaux. Quant à l'ajustement du ciblage sur les ménages les plus pauvres, il est dépendant d'une mise en œuvre complexe et coûteuse qui n'évite pas, selon les premières observations, des mécanismes de clientélisme politique. Basé sur des enquêtes auprès des acteurs publics, des consultants en politiques publiques et d'observations dans des quartiers populaires concernés, cette intervention propose un premier bilan de ce mécanisme de réforme des subventions électriques par la promotion du renouvelable.

Children's Involvement in Personal and Collective Decision-Making: Orientations for Research in South America

In a perspective that seeks to contribute to the articulation of Childhood studies and Children's rights studies, this article conceives children's civil and political rights as forms of legitimising their involvement in personal and collective decision-making. Within this framework, it analyses some of the controversies that have arisen in South America about children's powers in this subject and the relationship to be established with parents and the State, as well as the scenarios in which these controversies are situated. At the same time, it proposes preliminary theoretical and methodological orientations for research in this subject, which: facilitate the understanding of complex regional situations involving both forms of historical sedimentation and emerging processes; allow us to explore the socially 'living' and not merely juridical-formal character of rights; and are oriented towards both the understanding of current forms of interpretation and action and the intentional production of forms of social imagination of new social practices.

VERGARA RODRÍGUEZ, ROXANA* (Pontificia Universidad Católica del Perú, Peru)

The Emergence of the "Kukama Mothers" in the Defense of Their Territories Under Oil Pollution (2014-2022)

There is growing interest in the organization of indigenous women against pollution from extractive activities, but local studies on them are still scarce. The proposal seeks to describe how women identify as "kukamas mothers" configured organizations in four indigenous communities that are part of the Federation of United Cocama Peoples of Marañón, during the 2014 and 2022 oil spills in the lower basin of the Marañón River in the North Peruvian Amazon. The spills caused by the ruptures of the North Peruvian Oil Pipeline contaminated water sources and territories, and people's bodies. They also affected women's roles, positions, and care work. The analysis is conducted based on concepts of subjectivity and care, addressed by gender studies and Amazonian anthropology, to explain the women's motivations and strategies to strengthen their leaderships and to organize themselves to defend their territories, including the "underwater space", and to achieve benefits for their families and communities.

The ethnographic study involved fieldwork in the Cuninico community and Nauta and Iquitos cities, conducting interviews, and reviewing state and academic documents. This research shows how Kukama women organized themselves by appealing to their political motherhood and ethnicity (Kukama, native or Indigenous mothers) in a context of questioning the identity claim of the Kukama people. That allowed them to legitimize their participation in communal and state settings and raise problems and proposals based on expanded notions of care and territory that challenge those contained in state remediation policies.

 KUNDU, RATOOLA (Centre for Urban Policy and Governance, TISS, Mumbai, India)

Climate Change and Ordinary Cities: A Comparative Analysis of Climate Change and Livelihoods in Mediterranean and Indian Coastal Communities.

The world over, extreme events due to climate change are responsible for destruction of lives, livelihoods, and property, especially acute in urban centers. In addition, the rapid climate change combined with growing inequality poses an existential threat to human well-being and jeopardizes the prospects of communities and future generations. However, what happens when extreme events such as flash floods, forest fires, landslides occur in smaller coastal towns? How do these small towns deal with extreme events and the displacement of populations? What kinds of actors and institutions are involved in the fishing or tourist sector in these smaller towns? How do different groups of people in the town grow support networks, collectivize, develop strategies against risks, adapt to help them tide over these situations? Through case studies in small urban coastal communities, the paper examines the implications of climate change on the economy of such coastal towns in both the Global North

(Greece) and the Global South (India). The paper focuses on the ways in which fishing communities are being impacted and in turn responding to extreme events and what kinds of local knowledge and practices they are following to do so. Furthermore, what are the governance arrangements in dealing with the fallout of these extreme events and the impact on the transformation of coastal communities. In methodological terms, the article based on ethnographic fieldwork in different socio-economic and cultural contexts, considers case studies, to identify the different institutional and policy responses to climate change and extreme events, giving rise to different paths and forms of informal practices, community innovation and institutional responses. Reading climate urbanism both within formal institutions and people's everyday actions in urban coastal communities, the paper seeks to rethink how we understand urban transformations in a climate-change world and the heterogeneous character of climate-changed urban futures.

VERGOU, PINELOPI* (University of Thessaly, Greece)

Making up the City "from below": Community Care Practices, Gender and Vulnerability in Southern European Context

The paper explores, through case studies in medium and small sized cities, alternatives in the welfare provision and care for homeless and vulnerable groups, such as women who have experienced domestic violence or poverty. Focusing in the transition from public intervention to the involvement of civil society the study draws on the Greek experience and the Southern European cities which mostly effected by the economic crisis with extreme recession conditions and lack of welfare policies. The recent reforms in migration policy regarding refugee reception and the decentralisation of accommodation policies led to a new form of local governance where municipalities developed new regulatory powers. Moreover, community-based alternatives were developed to address social problems. Practices of community care, such as organised community approaches to poverty, mental health and homelessness and informal and spontaneous acts of solidarity gave rise to different paths and forms of social care and community innovation. In methodological terms, the article considers three case studies, to identify the different institutional and policy responses to homelessness and vulnerable groups, giving rise to different paths and forms of social care and community innovation. The empirical material is based on ethnographic fieldwork, interviews with welfare authorities, community-voluntary organizations and homeless people. The research not only points to constraints and barriers for anti-poverty and social care like bureaucratic rigidity, lack of control, and strong clientelistic networks but also looks for possible new forms of civic participation in local welfare and sustainable alternatives to social care in cities.

VERHOEVEN, MARIE* (UCLouvain, Belgium)

Le Dispositif D'accueil Et Scolarisation Pour Primo-Arrivants En Belgique Francophone : Une Éducationnalisation De La Question Migratoire Par Le Dispositif?

Cette communication entend examiner les évolutions politiques et sémantiques récentes du Dispositif d'accueil et de Scolarisation pour primo-arrivants en Belgique francophone (décrets 2012 et 2019), à la lumière des concepts de dispositif (Barrère 2013) et d'éducationnalisation (Smeyers & De Paep 2008), dans un contexte de politique éducative largement dominé par la sémantique de l'inclusion (Verhoeven & Bernal 2023).

Nous pointerons d'abord les éléments légaux et organisationnels permettant de caractériser le DASPA comme un « dispositif » au sens sociologique (Barrère 2013), en montrant les aspects d'*inflexion* (logiques de l'urgence et du particulier) mais aussi de *continuité* avec la forme scolaire (centralité croissante de l'acquisition de la « langue de scolarisation » et de la « culture scolaire »). La tension entre projet de scolarisation universelle et dispositif particulariste y est portée à son paroxysme, dans un contexte où l'injonction à l'inclusion traverse tout le système éducatif et où, d'autre part, la sémantique de la « reconnaissance de la diversité culturelle » fait son entrée dans la rhétorique politique (Pacte d'Excellence) et se traduit aujourd'hui par un lent processus d'éducationnalisation des enjeux de « diversité » au sein des curricula et référentiels.

Deux mouvements de requalification sémantique de cette politique seront examinés: d'une part, la montée d'une requalification linguistique universaliste (et non plus particulariste, basée sur l'origine ou le statut) pour définir le public cible; d'autre part, l'hybridation de la logique différentialiste avec le référentiel de l'inclusion, au sein même du dispositif DASPA (injonctions d'articulation organisationnelle croissante et d'intégration progressive de l'élève).

La communication visera à mettre ces tensions et requalifications sémantiques et les tensions qu'elles suscitent pour les décideurs et acteurs scolaires, à partir d'une analyse documentaire et d'entretiens avec des acteurs ressources clés.

Beyond Disciplinary Commodification: Infrastructure, Water Losses and the Government of the Poor in the Anthropocene

In the mid 2000s the concept of disciplinary commodification was introduced into the South African sociological lexicon to highlight the ways in which the introduction of prepaid water meters (PPWM) as technologies in the delivery of water to urban users was articulated with the imperative towards the commodification of water. The statement of this critique aligned closely with the terms of a more organically emergent social movement campaign in opposition to the introduction of PPWM in the city of Johannesburg, and which included a 'participatory research project' that argued that the deployment of PPWM was a stark attempt to reshape the conducts of the black poor. And for both academic and social movement critics of PPWM these devices clarified a distinctly neoliberal framework for the management and delivery of water resources. Drawing on, but also going beyond these lines of critique, this paper insists on a deeper interrogation of the nexus between the management of water infrastructures, indigent management policies and the modalities of development for governmental norms. Focusing in on this nexus, the paper shows how developing practices in the management of 'water losses' not only informed the adoption of new metering technologies, but also a wide range of management techniques and strategies for which the consumption of the poor was a persistent concern that interventions endeavoured to 'fix'. These developing practices, including linked frameworks for administering to and managing township 'indigent populations', emerged not with the imposition of externally defined norms, but through a complex, multi-scale and ongoing 'interplay between normalities'. More critically, such practices are shaped within this interplay by similarly emergent ideas of international best practice, the contingencies of climate crisis driven threats to water security, and crucially, wide ranging resistance to the governmental frameworks attempting to shape the water consumption of the urban poor.

VERIAVA, AHMED* (University of the Witwatersrand, South Africa)

Frank-Talking: Biko, Foucault, and the Possibilities of Telling the Truth in a Post Truth World

In 2016 the Oxford English Dictionary selected as its 'word of the year' 'post-truth', defined as "relating to or denoting circumstances in which objective facts are less influential in shaping public opinion than appeals to emotion and personal belief", and chosen as a marker of "the ethos, mood, or preoccupations" of the moment with a "lasting potential as a word of cultural significance". That same year, The New York Times published an OpEd which highlighted the prominence (and success) of a mode of doing politics that cynically spread misinformation and fake news, heralding for the author a new 'age of post truth politics'. This apparent post truth politics nevertheless sat alongside a developing techno-politics – with its own regime of truth claims – that establish, fix and reproduce the practical systems which organise social life and in which we are formed as governed subjects. What we call post truth politics has in fact settled in a context characterised by a deepening chasm between the public-political realm and the field of practice of modern governmentality. In this context, does it still make sense to speak truth to power? My interest in this paper is less to mark the significance of a post-truth politics for the futures of liberal democracy, but instead to begin thinking about the kinds of critical practices that might serve as effective support to political struggles. In so doing I work at fictioning a relation between Michel Foucault's final two courses at the College de France, focused on the theme of parrhesia, and Steve Biko's last public statement delivered during his 1976 court testimony, as a way of rethinking how our critiques of the present might establish new modes of truth telling that simultaneously work at constituting forms of subjectivity and epistemological frameworks.

Modes and Measurement of Subjective Well-Being in Flanders: The Impact of Changing Survey Strategies

Statistics Flanders considers subjective well-being (SWB) of its inhabitants as a core statistic. In alignment with OECD guidelines (2013, 2025 forthcoming), we include various indicators of SWB in our surveys, along with potential determinants such as optimism, social integration, interpersonal trust and

sense of control. This paper examines the impact of a changed survey strategy on the measurement of SWB and its correlates.

We compare results from two types of surveys: a face-to-face mode and a self-completion mode (combining an online and paper version). From 2008 to 2018, SWB in Flanders was measured through large-scale face-to-face surveys, which consistently reported an average life satisfaction score of 7.6 (on a scale from 0 to 10). In 2021, we shifted to a mobile-first designed web and paper self-completion survey, leading to a noticeable drop in reported SWB levels. For the period 2021–2024, with six measurements, life satisfaction is also stable but averages 7.3, which is lower than pre-2018 results.

In this paper, we reflect on whether this decrease represents an actual change in well-being or is linked to the shift in survey mode. We also analyze how the correlates and determinants of SWB, such as socio-demographic factors and internal/external buffers, vary depending on the survey methodology.

By examining these differences, we aim to contribute to the broader discussion on how survey modes influence SWB reporting and the importance of these findings for policymakers relying on such data.

Motorised Two-Wheeler Trauma in Urban India: A Mix-Method Approach

Road traffic injuries and trauma constitute a significant global public health crisis, claiming approximately 1.19 million lives annually. These incidents are the leading cause of fatalities among individuals aged 5–29 years. Most global road-related deaths occur in low- and middle-income countries, accounting for about 60% of the world's motor vehicles. Vulnerable road users, including pedestrians, cyclists, and motorcyclists, represent a large portion of these fatalities. Economically, road traffic accidents incur a cost equivalent to approximately 3% of the gross domestic product for many nations.

In urban India, injuries involving motorised two-wheelers (MTWs) are a substantial public health concern, characterised by high fatality and injury rates. Metropolitan areas demonstrate a high prevalence of MTWs due to their cost-effectiveness, despite their disproportionate contribution to road traffic injuries (RTIs) and fatalities. However, there is a notable lack of qualitative studies on the lived experiences of road traffic injury survivors in urban India.

This paper explores the experiences of two-wheeler injury survivors, highlighting challenges faced post-crash and after hospital discharge. Employing a mixed-methods approach, the study focuses on RTI victims aged 18 and above admitted to a tertiary care hospital in Delhi. Structured questionnaires were administered at the hospital, complemented by semi-structured telephone interviews for post-discharge follow-up.

Findings reveal that most survivors are men of reproductive age from lower socio-economic backgrounds, facing physical, psychological, and socio-economic challenges. Survivors demonstrate resilience and develop coping strategies for navigating urban life after injuries. The study underscores the profound impact of road traffic injuries, particularly among two-wheeler users, emphasising the urgent need for comprehensive support systems and targeted interventions to address their diverse needs effectively.

VERMA, MANISH K.* (Babasaheb Bhimrao Ambedkar University, India)

Development, Displacement and Human Rights: Contemporary Trends in India

India being the fastest developing economy and home to highest population has shown a new degree of development preference. The governance is putting its best foot forward for industrial development, creation of infrastructural facilities' and thereby inclusion of the marginal to the mainstream society. But behind such admired development achievements lays the grave for the underdevelopment of millions of marginal whose land is utilized for the sake of attaining national goal – creating paradoxical situation of 'development of under development' and 'crisis of success'. By virtue of claim of sustainable and inclusive growth of the marginal farmers, the development endeavours carried out in Independent India caused the problem of involuntary displacement, loss of land and livelihood, unemployment, food insecurity, and

human rights violation. The introduction of SEZs in 2005 opened flood gates for MNCs and big industries, further aggravating the problem. However, the Right to Fair Compensation and Transparency in Land Acquisition, Rehabilitation and Resettlement Act, 2013 (LAAR Act or, RFCTLARR Act) launched by the NDA government is a welcome step in this direction aiming to make land acquisition process more robust, transparent, open, inclusive and just. In case of land acquisition for development projects, the act made provisions for providing compensation four times the market value in rural areas and twice in urban areas apart from guaranteeing rehabilitation of the affected individuals and families and making them partners in development. In this background, the paper critically examines the predicament of development induced displacement vis-à-vis state of farmers in India especially after the initiation of 2013 LAAR Act by taking instances of *Poorvanchal Expressway* and *Lucknow Metro* from the state of Uttar Pradesh India. To draw a comparative picture, it also attempts to juxtapose the pattern of resettlement and rehabilitation practised before the introduction of LARR Act and its aftermath.

PATNAIK, APARUPA (Kalinga Institute of Industrial Technology & Kalinga Institute of Social Sciences, India)

Transforming India Towards Nation-Building and Global Citizenship: Through the Lens of National Education Policy and Sustainable Development Goals

India, the world's largest democracy and fastest growing economy, is interwoven with a rich heritage, diverse languages, traditions and customs. It is the youngest nation in the world where more than 55% people are below 25 years of age, and around 60% of the population is in the working-age in between 15 to 60 years. To protect the rich cultural heritage, traditional knowledge and to invest in the youth of India, National Education Policy (NEP) unfurled in 2020 by the government to improve and strengthen its education system strongly aligned with Sustainable Development Goals (SDGs) envisioned by the United Nations (UN) in 2015. The NEP 2020 initiated by the Government of India in convergence with SDGs heavily emphasize on Skill Development, Community Development, Environmental Protection, propitiation of Indian Knowledge System (IKS) eventually skilling India and empowering the youth by promoting inclusivity, helping them nurture their own skills which make them unique. The NEP serves as a framework to harness the transformative power of education to achieve the Sustainable Development Goals especially the SDG 4 (quality education and lifelong learning opportunities for all) by 2030 as adopted by the United Nations. Through the NEP framework, India is nurturing a generation of socially conscious and environmentally responsible youth eventually turning into globally accountable citizens. In this background, the paper provides a comprehensive analysis of the NEP 2020 and its implications for sustainable development and nation-building in India. It highlights the significance of going back to our roots by including the IKS as the core of pedagogy along with enveloping the emerging global practices in the curriculum of education system. Finally, the paper examines how NEP is going to play a crucial role in future for a sustainable path of development and global citizenship.

Psychiatric Reform in Portugal and Brazil: 'One Principle, Two Experiences'

The presentation contextualizes the similarities and differences between two processes of psychiatric reform or deinstitutionalization in mental health, in Brazil and Portugal. It is the result of a research conducted by the author in both countries between 2017 and 2020. In Portugal, the main empirical record was a co-operative in the food and housing sector, whose members are people suffering from mental illness, users of the Portuguese public health system. Methodologically, the study was conducted in a participatory-ethnographic way, which guided the theoretical discussions and bibliographical analyses. Theoretically, the concepts of ecology of knowledge and ecology of recognition were inspirational. The findings indicate that in Portugal, the technical-scientific field was the driving force behind the reform, not producing social movements or substitutive services. The lack of public policies motivated the creation of the above-mentioned cooperative. In Brazil, there was a social movement for the anti-asylum struggle. Since the creation of the Unified Health System (SUS, acronym in Portuguese), substitutive services have been created. The problem is that there is insufficient capacity to provide care for all those who need it, due to underfunding and privatizations carried out by neoliberal anti-popular governments.

Working on Digital Platforms in Brazil: Between Opportunity, Ideology and Job Insecurity

This presentation proposes to analyse the rise of platform cooperatives (Scholz, 2016) or the **digital solidarity economy**, as it has been called in Brazil recently (Rubim and Milanez, 2024). The digital information society has produced fundamental changes in the work and subjectivities of workers and citizens, being the *ubiquity* of digital platforms pointed out by Sadowski (2020) as a dominant form of rent-seeking in contemporary capitalism. The political scene in Brazil has been strongly influenced by extreme right-wing ideology in recent years, and we can see a trend towards the tendency to identify themselves as 'entrepreneurial' and 'right-wing' among platform workers. This ideology also influences the ways of being and working of this precarious and underpaid professional category. According to Grohmann (2021, p.13), work on platforms is a "laboratory of class struggle": it can mean both the increase of exploitation, through the control and management of labour - such as Amazon, Rappi, Uber, 99 and other "giant" companies of platform capitalism, and the possibility of construction of alternatives by workers, when they are engaged in processes of self-managed association. Thus, to escape the precariousness of labour through the big investors' platforms, some workers are trying cooperative models for their activities. Through ongoing participatory research in Brazil, we are analysing this scenario of transformations. The main empirical record is a cooperative of women and transgender people in São Paulo-SP, *Señoritas Courier*. Theoretically, our goal is to reflect on the present and future of work from critical epistemologies, considering the legacy of the sociology of work (Antunes, 2018), but also incorporating the perspective of decoloniality and decolonial pedagogies (Walsh, 2015), which propose forms of resistance to the movements of capital. In this sense, work and activism can be articulated, from the use of digital platforms.

Social Appropriation and Diagonal Solidarities Facing Vulnerable Futures

Our approach questions in the modalities of appropriation facing a vulnerable future and the construction of a sustainable society. The technics and visions of future can be apprehended inside social configurations (Forester, Urry, Hajer). Our approach will present a typification of three modes of appropriation of the sustainable future (Schutz) within socio-historical conjecture of 2000's

-Horizontal appropriation concerns territorial protection by local groups (eco farming, activist groups) and the territorial mobilizations around environmental issues (Thoreau, Amis de la Terre, Latour 2022)

-The vertical futures underline the constraints and their coordination by State authorities. Statist forecasts align these constraints into perspectives, such as the fordist logic, the fuel logic and carbon society (Wagner, Fuller); The democratic future requires how these logics will be deliberated in democratic configurations and political spaces.

-The elaboration of a diagonal future, includes top / down socio-environmental mobilizations (Tejerina, Verpraet). It requires micro and macro links (Alexander 1990). It also includes the progressive politics of sustainable development in friction or in co-determination with social and environmental mobilizations. The social construction for a sustainable future is based on the capacity to federate ecological activities in Region and in Metropolis.

The tensions between horizontal future and vertical future increase by the absence of a progressive policy of sustainable development. The french yellow Vests meet Gaullist sovereignty and the verticality of power. In Italy, territorial ecology and the digital ecologists meet the nationalist and regionalist verticalities. The protection of the Amazon and the Indian peoples, clash with the agro-industry, and the oil logic in a divided Brazilian federal state.

The social theory of futures and socio-political configurations help to specify the social dynamics in the social construction of mixed futures (Touraine, Etzioni, Rosa). The debate focuses on the deep sociological and political diagonal dimensions composing sustainable futures.

RC35-585.1

VERPRAET, GILLES* (University Paris Ouest Nanterre, France)

Sociological Classes, Economic Classes, Ecological Class: Social Conjugation and Time Differentiation

In the classic sociology, the classification of sociological rites and practices requires to recognize explicitly the value system allowing a progressive identification of social practices (Durkheim and Mauss, 1905). Those methodological approach links the modalities of classification with the type of society in order to reveal the type of beliefs within social reflexivity.

Sociological studies on the different forms of recognition invite to specify how similarities and differences are composed in the construction of social identities (identity and discrimination), in the configuration of cultural exchanges (Honneth, Lamont). This approach specifies the role of coding in the construction of social classifications (Bowker and Star, 1994, Strauss, 1994)

In socio-economic studies, the working class is underlined by the division of value and working time (Marx 1). The separation of fixed capital and circulating capital delineate the productive class and finance (Grundrisse). The end of a financialization cycle set up the large extension of the patrimonial classes indexed on the extended valorization of financial circulation (Piketty, 2015)

The "ecological class as unified" takes charge of the question of habitability of the earth. "It support a broader, longer, more complex vision of history" (Latour 2023). It supposes a class of mobilization, so to occupy the public spaces and their issues of vulnerability. This expansion of long-term issues questions the tension between the patrimonial class (requalification of property) and the wage class (energy costs, mobility...) and their dialectics of control. These two frameworks of environmental justice (medium term/short term) distinguish the priorities of sustainable development. The notion of new climate regime formulated by Latour et Charbonnier progresses through the formation of multiple coalitions and multiple political channels. The unified process construction of an ecological class remains fragmented unless the purposive conditions for convergence are created (Gramsci).

Ethnoracial Demographic Change in Europe and the Cultivation of Fear

Building on a burgeoning, primarily US-based literature on 'population politics' (e.g. Alba 2020, Rodriguez Muniz, 2021), my contribution focuses on the political discourse and rhetoric of demographic change in Europe, particularly in relation to ethno-racial demographic change, by highlighting a) how demographic knowledge about ethno-racial change (e.g. categories of ethno-racial groups) is produced and how this can lead to a 'racialisation' of demographic processes, and b) how different actors use these population statistics, in particular demographic projections about ethno-racial change, to cultivate 'demographic anxieties' among specific audiences.

Drawing on the specific case of contemporary population policy in Flanders (Belgium), I will show how public discourse and different political actors have actively worked to (re)construct a dramatic view of ethno-racial changes in the population, and how the political cultivation of demographic change feeds into the status insecurities and fears of status loss of specific population groups.

Exploring the Organizational Dilemma between Formality and Informality: The Paradox of Innovation in the Italian Justice System

The literature on organizational innovation has long debated the role of formality and informality. Many scholars, adopting different theoretical and methodological perspectives, agree that a highly formalized structure can hinder innovation. High levels of formalization can reduce both individual and organizational propensity for developing innovative solutions. Conversely, a lack of formalization can slow or block the full implementation and spread of innovation, particularly in complex organizational systems.

This paper argues that innovation processes bring to light an organizational dilemma between formality and informality, often leading to paradoxical effects. Formality and informality can be compared to two magnetic poles exerting equal yet opposite forces, pushing organizations to find a balance point that is elusive and precarious, constantly shifting over time.

To explore these dynamics, the paper focuses on the case of innovation in the Italian justice system. Over the past twenty years, two distinct phases have alternated, driven by the frequency of formal rules, each producing paradoxical effects.

When the system leaned towards informality, many local courts developed informal agreements with the legal profession and started bottom-up innovation projects, yielding positive outcomes for local communities. However, this also increased disparities in justice service delivery across the country, creating a map of inequalities for citizens.

When the system shifted towards formality, the judicial administration reduced disparities and improved legal certainty, but this discouraged local courts from seeking innovative solutions to local challenges. As a result, local innovations were abandoned or forgotten, even when they had proven effective in serving citizens.

This paper, based on the findings of a multi-year research project combining both quantitative and qualitative methods, aims to contribute to the understanding of the dilemma between formality and informality in public sector innovation processes.

VIANA KRIEGER, MABEL* (Instituto Nacional de Câncer, Brazil)

From Acute to Chronic: Palliative Care and the Standardization of Cancer Survivorship

Western societies have been experiencing a continuous increase in the longevity of their populations. This is due to factors such as changes in people's quality of life and advances in the field of health, especially in preventive medicine. However, many countries are also witnessing a significant demographic change, with the inversion of the age pyramid. The increase in the elderly population, combined with the development of new medical technologies, generates a new demand for care for the chronicity of previously potentially fatal diseases, such as cancer. This study discusses the social repositioning of the oncology patient as a chronic patient based on the notions of relationality and survivorship. The objective is to investigate the discursive practices in Palliative Care in order to characterize the values from which this field normalizes the experience of surviving cancer. The methodology adopted involves a critical and discursive analysis of the reference literature on the subject. The results indicate that the biological perspective of oncology, by using survival curves and prognostic projections, reduces the complexity of "living" with cancer, focusing on a model centered on the disease and specific solutions, often limiting the experience to a binary outcome of cure or death. In this way, the cancer survivor occupies a non-place in the medical oncology discourse. Palliative Care, on the other hand, strives in a pedagogical process of acquiring new values about the disease, seeking to positively value and treat the "incurable" patient as the target of its interventions, even though it continues to be stigmatized as a practice focused exclusively on the end of life. In any case, Palliative Care occupies the space of formulating the quality of life parameters that should organize the experience of cancer survivorship.

RC22-JS-31.4

VIANA KRIEGER, MABEL* (Instituto Nacional de Câncer, Brazil)

Religiosity, Biopower and Comprehensiveness in Palliative Care: A Field of Tension

The development of Western medicine, based on the positivist scientific paradigm, distanced medical epistemology from experiences of spirituality, delegitimizing practices and epistemologies considered non-scientific. Palliative Care (PC) emerged proposing a recomposition of the medical perspective on the human person and a revaluation, in the health field, of the experience of illness, especially at the end of life. The discourse of comprehensive health care promoted by PC repositions subjectivity, spirituality and religiosity with the same centrality given to the physical care of the sick person. This study uses an analytical and critical approach to examine the discourse of the comprehensive approach in Palliative Care. The objective is to problematize the discourse of comprehensive care, investigating how it may reflect a normativity influenced by religious values. The methodology adopted involves a critical and discursive analysis of the reference literature on PC and spirituality and religiosity. The research focuses on the

intersections between medicine, religiosity and biopower, questioning how the rhetoric of integrality can be linked to a normative religious model. The results indicate that the modern hospice movement, inspired by the Christian charity of Victorian hospices, and the influence of the religiosity of Cicely Saunders, its main founder, suggest that the discourse of integrality in PC is strongly permeated by Christian values. These values shape practices such as the rejection of euthanasia, imposing a certain normativity and attitude towards illness and death. We conclude that, although integrality in PC offers a more holistic approach to care, it can also extend medical control over personal aspects, such as spirituality. Religious influence on this care can act in a normative way, informing practices through values of Christian virtues, limiting other expressions of spirituality and religiosity and reinforcing certain attitudes towards suffering and death.

VIANNA, PAULA* (PUCRS, Brazil)

Lifestyles of the "Alpha Generation", Reading Experiences and Visual Culture: An Interpretive and Biographical Analysis of Reading Among Youth in Contemporary Brazil

We live in an accelerated society, states Harmut Rosa (2019). Combined with acceleration, contemporary society is also characterized by individualization. According to Ulrich Beck, "individualization means that people's biographies become independent of pre-established determinations, open, available, and become a task to be performed by each individual" (Beck, 2010, p.199). In the process of individualization, the subject becomes "the center of the biographical process" while family ties and class differences occupy "the background" (Beck, 2010, p.194). Beck also states that the individual "designs his or her own biography", that is, the "socially predetermined biography is transformed into a biography made and to be made by each individual" (Beck, 2010, p.199). Given this scenario, the precocity in the search for identity within society is understandable (Santos, 2015, p.404). The increasingly younger individual seeks his identity, his lifestyle, his self-definition within his social group. In other words, the individual's singularity is gradually and prematurely demanded, which must be confirmed in his daily life. The text addresses the interpretation of the biographical experiences of members of the so-called "Alpha generation" (born after 2010) in order to understand their lifestyles, especially regarding the practice of reading, based on reconstructive biographical narrative interviews and on discussion groups with adolescents in Brazil between 12 to 14 years old. The text provides a summary of the results of this study conducted with a diversity of youth, from the middle class, but also with indigenous youths, as well as with adolescents from urban peripheries and inhabitants from *Quilombos* (communities initiated by former slaves that escaped from slavery). The focus on the biographical discussion will be around the role played by visual components for the reading practice among these youths in contemporary Brazil.

Gender Based Violence Prevention Campaigns in Brazil: Advances and Challenges in the Face of the Far Right's Rise (2000-2023)

Over the past few decades, significant efforts have been made to tackle gender-based violence and bring it out of the private sphere into the public eye, emphasizing the role of society and organizations in its prevention. In Brazil, one of the critical public policies introduced by the Maria da Penha Law is prevention campaigns designed to raise awareness of gender-based violence as a social issue. These campaigns aim to shift public attitudes and norms, helping to reshape how the problem is perceived. By informing individuals about actions they can take to intervene on behalf of victims, the campaigns also seek to change the behavior of those around them—from passive silence and tolerance to active intervention and condemnation. Government agencies play a central role in driving these campaigns forward. In recent years, however, we have witnessed the gender-driven impeachment of Brazil's first female president and the rise of far-right leadership in the Federal Government. This political shift has been accompanied by an increase in femicides (FBSP, 2023), a trend that contrasts with the decline in other types of homicides in the country. This study aims to

analyze the content of public campaigns to prevent gender-based violence in Brazil, launched by federal governments between 2000 and 2023. It seeks to understand how these governments addressed the issue, including what was defined as violence, which the campaigns targeted, and the primary focus of prevention efforts.

VICARELLI, MARIA GIOVANNA* (Università Politecnica delle Marche, Italy)

SPINA, ELENA* (Università Politecnica delle Marche, Italy)

Doctors and the State in Italy after 2020: Increased Weakness or Recovery By the Medical Profession?

In Italy, the sociological debate highlighted the creeping loss of power of the medical profession following the NHS managerialization and regionalization. The crisis in medical professionalism was identified in the loss of influence in the seven areas that had characterized its dominance in the past (Freidson 1970; Tousijn 2004): the political arena, the labor market, university education, professional associations, workplace, the system of interprofessional relationships in medicine, the scope of therapeutic relationships (Vicarelli 2017; 2024). Specifically, the low capacity to veto neoliberal policies and austerity policies in healthcare that were adopted in 2010s, was highlighted. This weakness has been interpreted in terms of low presence and limited incisiveness of the medical associations in the government, legislative arena and electoral arenas. However, compared to this scenario, the years of the Covid-19 pandemic have produced some changes in several dimensions of medical dominance, such as the labor market and university education control, as well as the ability to mobilize public opinion and affect policy-making. These ongoing transformations could indicate the beginning of new trends towards a re-assertion of the influence of the medical profession, despite the continuing reduction in health financial resources. The paper investigates this hypothesis by examining each area or dimension of medical dominance by carrying out a documentary analysis which is based on official and non-official sources. This is matched with semi-structured interviews to representatives of the main actors in the Italian healthcare policy arena.

VICENCIO VEGA, CÉSAR* (The University of Manchester, United Kingdom)

Urban Discarding in the Anthropocene: The Case of Chuquicamata and a Vision of Left-behind Places in Chile

In 2007, the Chuquicamata housing camp in northern Chile became a ghost town. The state-owned company CODELCO Chile, prioritising mining business continuity, updated copper extraction operations and implemented a housing relocation plan. After 92 years, the housing area was abandoned and partly buried, with its entire population moved to neighbouring Calama. This action of urban discarding exemplifies an accelerated creation of "left-behind places" in Latin America.

The Chuquicamata case presents a unique instance where "leaving behind" is not a gradual disinvestment but an active, strategic decision driven by industrial imperatives. This article posits that "urban discarding" represents a more deliberate form of creating left-behind places, where industrial needs supersede existing social and spatial fabrics. The content develops in three parts: First, it examines urban discarding in relation to extractive operations, linking housing development to the Anthropocene and globalisation. Second, it analyses how operational logistics influence social and community organisation, exploring conditions of belonging and abandonment through community-expressed collective actions. Finally, it presents a vision of abandoned regions in Chile, challenging current conceptions of left-behind places and reconsidering value assignment to communities amidst global economic restructuring and resource extraction.

This study contributes to the broader understanding of urban abandonment processes in extractive industries, offering insights into the rapid transformation of mining communities in the Global South. By examining Chuquicamata's urban discarding, the research illuminates the complex interplay between industrial progress, community displacement, and the creation of left-behind places in the context of the Anthropocene.

*Addressing Methodological Considerations in the Study of
 Generative AI: A Case Study on Bias*

Exploring the dynamics of generative AI systems requires flexible methodological frameworks to adapt to their continuous changes and complexity. This presentation discusses methodological considerations for effectively studying generative AI systems based on a case example. We draw on one of our previous studies, in which we analyzed responses from two popular AI models to homophobic statements. The prompts varied by including or omitting contextual user information. Our interest lay in how such information might alter the responses. The subtleties in the responses necessitated qualitative in-depth analysis besides quantitative statistics to effectively identify nuanced differences between categories. We argue that although quantitative methods are valuable for broad analyses, in-depth qualitative analysis should be considered to fully capture the complexities and subtle biases of newer generative AI systems. Our study demonstrates the application of mixed-methods research in AI bias studies, providing a framework for when and how to integrate these methodologies.

Additionally, our methodological decisions included strategies for eliciting responses from the models (opting for bias attack instructions by formulating negative statements), determining the formulation of these negative statements compared to standard survey questions, managing variability in responses under identical conditions, and addressing potential differences in responses based on the user's location. We also evaluated whether to utilize generative AI tools in the analysis process, such as for category creation. This presentation outlines the solutions we adopted to address these considerations.

VIDAL, GREGORIO* (Universidad Autónoma Metropolitana-
 Iztapalapa, Mexico)

*La Disputa ENTRE Estados Unidos Y China Y EL Avance De Las
 Empresas Transnacionales Chinas.*

La relación comercial entre Estados Unidos y China está marcada desde finales de los 80s por un crecimiento constante del déficit de la mayor economía del mundo. Es una tendencia que solo se desaceleró por crisis financieras y económicas en Estados Unidos (2001 y 2008-2009) o por movimientos cambiarios importantes del yuan (2005 y 2011) y en los mercados bursátiles en China (2015). En 2018, cuando China era el mayor socio comercial, el gobierno estadounidense decide aumentar abruptamente los aranceles para ciertos artículos importados desde China y la ejecución de otras barreras a la importación. Se afectan equipos domésticos y paneles solares, también productos de sectores como la metalurgia, la automotriz, la aeronáutica, la robótica, las tecnologías de la información, la comunicación y los equipos médicos. Después, la disputa alcanza un nuevo nivel estableciéndose sanciones contra empresas chinas que incluyen prohibirles uso de insumos hechos en Estados Unidos. En adelante, aún con el cambio de gobierno hay nuevas sanciones para firmas con matriz en China. Sostengo que en el terreno de las grandes empresas esta un elemento relevante de la disputa entre ambos países. Las compañías con matriz en China tienen importancia global en sectores como: automotriz, telefonía, telecomunicaciones, ferrocarriles, aviación. En todas ellas cuentan con capacidad tecnológica propia y avanzan en una implantación global. Es un campo central en la reconfiguración global de la economía y da contenido a las propuestas políticas del gobierno chino como la Ruta de la Seda. El despliegue hacia el exterior de los capitales chinos también considera inversiones en su entorno y en África y América Latina. En estos casos son importantes los mercados, pero también la garantía de contar con materias primas para mantener su expansión económica. Ello también es parte de la disputa con Estados Unidos y otros países desarrollados.

VIDAL, JOSHUA* (Coastal Cities At Risk in the Philippines-
 Ateneo De Manila University, Philippines)

*Navigating Resilience: Confronting Climate-Induced Localized
 and Regional Shocks and Human Insecurities in Cities of the
 Global South*

The Global south, indeed, faces complex challenges, where rapid urbanization, environmental vulnerability, and socio-economic disparities intersect to produce a distinct set of pressures. Central to this analysis is the growing prevalence of climate-induced localized shocks, such as extreme weather events and resource disruptions, which escalate into regional crises. These localized impacts not only disrupt food supply chains but also lead to a cascading effect that threatens human securities—transforming access to food, health, shelter, and other basic needs into widespread human insecurities. The study also investigates how governance deficiencies and policy gaps exacerbate these insecurities by failing to mitigate or adapt to these growing risks. Case studies of cities such as Lagos, Manila, and Dhaka reveal how these human insecurities ripple through communities, deepening vulnerabilities and creating long-term challenges for urban resilience. Additionally, the paper highlights innovative urban strategies—such as adaptive governance and green infrastructure—that offer pathways to building more resilient cities. By integrating contemporary research and real-world examples, this paper aims to spark dialogue on developing multidimensional, inclusive solutions that address the transition from human security to insecurity as cities confront the mounting effects of climate change from local to regional levels.

Making Sexuality, Gender, and Migration Intersectional

This presentation brings together recent literatures on migration, sexuality, and gender in order to account for an intersectional lens, particularly in sociology. Based on one of the chapters in Mary Romero's *Research Handbook on Intersectionality*, and focusing on two Dossiers - one from *Sexualities* journal on Queer Migration, Asylum, and Displacement, the other in the *Ethnic and Racial Studies* journal, focused on Sexual Politics of Border Control - the chapter offers a critical review of these, and illustrates how the themes of gender, sexuality, and migration may or may not flow from those individual contributions. Special issues/dossiers are ideal site of analysis to explore the uses and limitations of intersectionality in terms of the research methods applied, intended and successful application of intersectionality, and analysis of findings through the lens of intersectionality. A central proposition is to better connect the focus of gender and sexuality (which at times is reduced to LGBTQI communities, or cisgender women's issues) with the focus on migration (immigration and, by extension, displacement and refugee and asylum status). The conclusion offers lessons learned and propose alternatives to making sociological work intersectional..

*Methodological Challenges and the Search for Innovative
 Solutions in Detecting and Addressing Elder Abuse and Neglect*

The project FEANCI: "The EAN phenomenon (abuse, neglect and maltreatment of the older persons) in the context of social services in the Czech Republic: innovations in detection, prevention and care" is a search for answers to the current and expected challenges inherent in the process of demographic and social changes in society, especially the increase in the proportion and number of older people. The abuse and neglect of older persons is a complex problem, straddling the line between individual suffering and societal trauma, affecting fundamental human rights. It contains both a reflection of the biologically determined changes in older age that increase the fragility of older victims (or persons "at risk") and the (in)functionality of (early) detection mechanisms and support systems to deal with these incidents. The project is interdisciplinary, using sociological, socio-political and anthropological-ethnographic paradigms with overlaps into the field of gender studies, it brings innovative ways of remedying this problem by recognizing the hierarchical sets of causes of these phenomena, and finding innovative ways of incident detection and care for victims and for (potentially) violent persons. In this presentation we mainly concentrate

on methodological aspect of the measurement of prevalence of EAN within institutional settings and debate the shortcomings of available methods. We use the FEANCI survey and expert interviews to illustrate these challenges and point to possible remedies.

The FEANCI project is supported by the Technology Agency of the Czech Republic (TA CR) grant No. TQ01000510.

Three Ways to Understand "Digital Good": Policies, Actors and Lived Experiences

Digitalisation is widely regarded as a transformative force in contemporary and future societies, with both international and national policy discourses emphasizing its significance. Older adults are often perceived as lagging in this digital shift, facing barriers related to education, skills, and access, which contribute to a widening digital divide and subsequent social exclusion.

This paper employs a multisource inquiry to challenge this perspective by examining older adults' own views on quality of life and satisfaction with their lifestyles, even when "offline" or "disconnected." We analyze policy discourse from international and national sources alongside findings from academic literature, juxtaposing these with insights gained from in-depth interviews with older adults. Special attention is given to the time dynamics before and after the COVID-19 pandemic.

Our analysis critically interrogates the prevailing assumption that increased digitalisation is inherently positive and that limited use of digital technologies undermines the quality of life for older (non-)users. We contend that concepts such as the digital gap and digital divide serve primarily as policy tools that obscure the complexities of lived experiences. Their uncritical adoption in socio-gerontological research fails to enhance our understanding of digitalisation's effects on older adults. The ongoing focus on measuring digital competencies across different demographics, in light of rapid technological changes, can perpetuate oppressive narratives of individual shortcomings while masking systemic ageism. This paper advocates for a shift away from simplistic monitoring frameworks towards a nuanced examination of the diverse realities of older adults' (non-)digitalized lives.

The study was funded by the Czech Science Foundation (GAČR), project No. 22-05059L and by the Slovenian Research Agency (ARRS), project No. J5-4580 „Effect of digitalisation in (post)COVID-19 era on quality of life, and social inclusion of older adults“ (DIGOLD).

VIDŪNAITĖ, MORTA* (Vytautas Magnus University, Lithuania)

Challenges of Lived Religion Research during "Gender Wars": the Case of Study of Lithuanian Catholic and Lutheran Women's Agency and Leadership

There has long been a perception in social sciences that secular people have the most agency and religious women have the least. The notion of false consciousness has been used to describe religious women. From a traditional secular point of view, agency lies in deliberate action, individual autonomy and freedom. Scholars of lived religion approach have dug deeper into the essence of agency, recognizing its modality and different forms, which go beyond the conventional secular understanding. The "secular" and "religious" concepts of agency reflect a dichotomy between the secular and the religious, as the former is often presented as rational, progressive, and associated with public and male sphere, while the latter is seen as irrational, backward, and associated with private and female sphere.

The case of lived religion research on the Lithuanian Catholic and Lutheran women's agency and leadership unsurprisingly reveal the complexity of the religious and the secular as reflected in the religious women's narratives about the image of God and their relationship with God, their multiply leadership in church, professional career, family and elsewhere, their agency (non)provided by religion for leadership and life in general or attitudes on gender and sexuality.

This study still uncovers the ethical and moral challenges faced by the researcher, when doing research in the conservative religious organisations, where women are not ordained (also in the Lithuanian Evangelical Lutheran church), but still find the space for their leadership and agency. The sources of the latter also prove to be very complex, including individual autonomy, feminist aspirations as well as religious goals of piety, morality, the observance of religion, etc. The researcher correspondingly should navigate while constructing the initial research design, interviewing women and analysing the results of the fieldwork data.

Digital Populism and Political Polarization in Portugal: A Social Network Analysis of the 2022 Legislative Election

This study employs big data and Social Network Analysis (SNA) to examine the digital public sphere during Portugal's 2022 and 2024 legislative elections, focusing on the rise of populist discourse and political polarization. Despite Portugal's historical resistance to populism, the emergence of the far-right party Chega has altered the political landscape. Therefore, the research is guided by the following questions: Are Portuguese parties and leaders using populism for online political communication? Has the emergence of an outsider party shifted the content of online campaigns and the flow of political communication online? Using data from Twitter, we analyze the communication strategies of parties and leaders during the two electoral campaigns. Our research applies SNA techniques to map the networks of political communication, identifying key influencers and the flow of information across different ideological communities. We pay particular attention to the rhetoric employed by Chega and its leader, André Ventura, examining how populist messages are crafted and disseminated in the digital space. The study also investigates political polarization in the Portuguese context, examining how emotional appeals and misinformation contribute to this phenomenon. By examining the interactions between users, political figures, and media outlets, we aim to understand the dynamics of echo chambers and their impact on public opinion formation. Our findings contribute to the growing body of literature on digital populism in Southern Europe, offering insights into Portugal's unique position within this regional context. The results shed light on the evolving nature of political communication in Portugal and provide valuable insights for policymakers and civil society actors working to maintain democratic resilience in the face of growing polarization and populist challenges.

Navigating Migration Policy in Brazil: Legal Reforms, Pandemic Responses, and Future Prospects

The present paper examines recent changes in migration policy in Brazil focusing on the process of enacting a new migration law, the Brazilian government's response to the COVID-19 pandemic, and how different sectors of Brazilian society reacted to such changes. Brazil's new migration law came into effect on November 20, 2017, marking the first major revision in 37 years since the old law was enacted under the military regime in 1980. The former legislation heavily focused on "security" with the goal of protecting Brazil's borders, restricting many rights of foreigners. In contrast, the new law emphasizes "human rights protection", including the protection of stateless persons and refugees. Discussions leading to the enactment of the new law began during President Dilma Rousseff's administration (January 2011 – August 2016). However, President Rousseff was impeached in 2016, and her successor, President Michel Temer (August 2016 – January 2019), exercised veto power to limit the scope and effectiveness of the law. Under President Jair Bolsonaro (January 2019 – January 2023), policies emphasizing the "securitization of migration" increased, with foreign nationals being portrayed negatively and narratives calling for stronger protection of national borders gaining prominence. Some of the regulations implemented by the Brazilian government during the COVID-19 pandemic were not necessarily intended to achieve public health goals. Instead, they reflect the administration's intention to frame immigration as a security issue. However, entities within the justice system and civil society took decisive action to safeguard the rights of migrants and refugees. We focus our analysis on the role played by Public Defender's Offices in their efforts to ensure access to justice for vulnerable citizens. We intend to highlight the specific dynamics of migration policy in Brazil and draw prospects for the new administration that came into power in 2023.

VIJAYAKUMAR, GOWRI* (Brandeis University, USA)

Friendship As Method in Collaborative Research

Autobiography has long been an important genre for articulating political selfhood in the contemporary sexual minority and transgender rights movement in India (Jameela 2007; Revathi 2010; 2016; Padmashali 2022). Within scholarly literature, the autobiography has been analyzed within the context of the colonial history of feminine sexuality (Mitra 2020) and as reflecting the negotiations of rights politics with both neoliberal and social justice imaginaries (Mokkil 2019). In this paper, I reflect on the collaborative process of producing autobiographies with sex worker and transgender activists, based on my experience with three recent collaborative autobiography and storytelling projects. Activist autobiographies are textual products, but they also result from an embodied process of writing and storytelling, dialogic across class and caste, a process an ethnographic eye is best equipped to elucidate. Following collaborations like that of Richa Nagar and the Sangtin Writers (2006), I use friendship as an analytic to consider the process as one fraught with tensions and erasures but also acts of generosity and connection. Though the concept of sisterhood has rightly been subjected to critique, it can hold potential as a model of feminist relationships and intellectual and political solidarities (Lugones 1995). Here, I use the concept of friendship to name the emotional valence of research and writing collaboration, one in which feelings of love, inspiration, disappointment, or betrayal coexist in a co-writing process structured by a broader set of inequalities of material resources and political representation. In this way, though research collaborations rarely achieve the mutuality and accountability of friendship, friendship can offer an opening to reflect on the emotional commitments fieldwork can sometimes produce.

VIJAYAKUMAR, GOWRI* (Brandeis University, USA)

Labors of Love: Sex, Care, and Migration in Bangalore

Long a destination for rural migrants, Bangalore has become one of the world's "hotspots" for climate in-migration (Rigaud 2018). This paper, bringing together literature on sex work (e.g. Shah 2021; Agustín 2007; Mai 2018) and sexuality (Carrillo 2020; Saria 2021) in relation to livelihood and migration, traces the ways sexuality shapes migration pathways to the city, and how existing systems of kinship are both redefined and reproduced in the process. Drawing on a decade of ethnographic and collaborative work with sex worker and transgender communities, and over a hundred life-history interviews with poor and working-class migrant women across the city and its outskirts, including garment workers, sex workers, and street vendors, I trace circular pathways to and from the city, within which women, both cisgender and transgender, bear the burden of caring for kin in the face of increasing economic precarity. Rather than revealing a linear pathway from deprivation to sexual liberation (Choi, Hwang, and Parreñas 2018), my interviews show that various ruptures—family violence after an inter-caste marriage, an abusive partner, or the rejection of gender non-normativity—shape pathways both to the city and back to the small town and village. These migration pathways often redefine dominant systems of femininity and sexual morality, while sustaining patriarchal arrangements within the family. My cisgender women interviewees describe bending the norms of respectable femininity—including by leaving husbands or pursuing sex work—to sustain the demands of mothering and elder care and generate value within their natal families (Ramberg 2014). My transgender interviewees describe caring for relatives or sending remittances even as their inclusion remains precarious. In the context of urban precarity and the instability of rural livelihoods, undergirded by climate change, these migrants, even when marked as deviant or object, become those best equipped to ensure the family's material sustenance.

JOHNSEN, JAHN PETTER (UiT The Arctic University of Norway. The Norwegian College of Fishery Science, Norway)

SØNVISEN, SIGNE ANNIE (UiT The Arctic University of Norway. The Norwegian College of Fishery Science, Norway)

Navigating the Trilemma. Fishery Policy between Economic, Societal and Environmental Sustainability.

Worldwide, national fishery policy agencies struggle to navigate between resource management, economic development for fishermen, and concerns for the livelihood of coastal communities. These concerns overlap the three

pillars of sustainability: environmental, economic and social. The challenges tend to be ascribed to either limited access to fishery resources, limited economic resources, or downward demographic trends in coastal regions. However, we argue that the problem of fisheries sustainability is one of an inherent fishery policy trilemma that faces coastal nations across the globe. The trilemma consists of three policy goals that imply that solving any two, counter solving of the third. The three policy goals are 1) to secure a sustainable resource management, 2) to secure economic sustainability through increased productivity for the fleet, and 3) to secure jobs and livelihood for the coastal population – a social sustainability.

We demonstrate the trilemma through a critical case study of the Norwegian fisheries policy. Norway is one of the richest countries in the world. It is also one of the largest fishing nations, as well as a country with a well-functioning welfare state. Thus, if challenges facing fishery nations worldwide was a result of limited fish resources, economic resources, or lack of rural development options, Norway would be one of the least likely countries to face such challenges. Yet, in this paper we demonstrate a series of fishery policy problems in Norway best ascribed to the fishery policy trilemma, and based on this, we discuss the challenges of sustainable development in fisheries.

The data in this study is policy documents from the last 30 years, as well as statistics on the structural development of fisheries and coastal communities.

The Contested Display of Formal Organization: Exploring the Multiple Roles of Corporate Charts in Organizational and Regulatory Action

The organization chart is a contested artifact. Some see it as representing key features of organizations, while others regard it as less relevant in today's increasingly networked, team-based, and digitized environments. Additionally, some consider it a performative device, used primarily to legitimate or impress. The paper addresses this ambiguity by examining the role of corporate charts in organizational and regulatory activities. Using the distinction between manifest, assumed, extant, and requisite organization (Brown, 1965), it explores the charts of Danske Bank's functional structure in the context of the money-laundering scandal that unfolded at the bank. The paper demonstrates that although the bank's own charts manifested only a fluctuating and incomplete formal organization, they were accepted by stakeholders for a considerable time. Later, legal investigators of the scandal created new charts to represent the bank's extant organization – i.e. revealing the actual authority structure during the money-laundering activities – and to clarify what the requisite organization should have been. The paper argues that these multiple roles of organization charts make them valuable objects of analysis and that their inherent ambiguity reflects broader tensions surrounding formal organization.

PESAVENTO, ALBERTO (independent researcher, Italy)

Grammars of Struggles Against Extractivism: Learning from Italy and Serbia

This paper explores the evolving grammars and vocabularies of resistance against extractivist policies, focusing on the No TAV movement against the Turin-Lyon high-speed railway in Italy and the Movement against Rio Tinto lithium mining in Serbia. These two cases exemplify how communities resist dispossession and environmental degradation, challenging state and corporate power. In examining these movements, we focus on three critical aspects: the forms of extractivism, infrastructures of resistance, and the criminalization of dissent. First, we analyze how extractivism manifests beyond the traditional focus on natural resources, extending into the imposition of infrastructural mega-projects such as high-speed railways and lithium mining for green transition. Both movements illustrate the ways in which land, communities, and livelihoods are threatened by extractivist policies that prioritize profit over local needs and ecological sustainability. Second, we delve into the infrastructures of resistance, understanding how communities build networks of solidarity and mobilize against these projects. The No TAV movement and the anti-Rio Tinto campaign demonstrate the importance of grassroots organizing, and combative uses of space—whether occupying land or creating alternative spaces for political education and community building. Finally, we explore the increasing criminalization of resistance, as both movements have faced repression through legal measures, media stigmatization, and state violence. This section discusses how criminalizing dissent serves to delegitimize struggles and silence noncomplying voices. This paper is part of an ongoing dialogue between two authors, seeking to better

understand how to resist extractivist attacks and imagine new ways of living beyond extractivist logics. By examining the intersections of political economy of extractivism, infrastructure of activism, and strategies of repression, we aim to contribute to the broader discourse on counter-practices of dispossession.

RC35-578.2

VILLA FLORES, ARTURO* (Universidad de Guadalajara, Mexico)

La Crisis Crónica De La Teoría Sociológica: El Parteaguas Del Siglo XXI

En su momento Robert Merton escribió sobre la crisis crónica de la Sociología. A partir de una lectura de Kuhn, Merton consideraba que la disciplina se encontraba en una fase de permanente competencia entre paradigmas, por tanto, sería incapaz de alcanzar una fase de ciencia normal. Además, debido a la persistencia de “anomalías” refractarias a la explicación a partir de las teorías existentes y la emergencia de nuevos problemas la crisis no podía ni debía superarse.

Las teorías surgen con el propósito de explicar realidades sociales históricas y frecuentemente situadas en regiones concretas. Por tanto, los cambios sociales, culturales, económicos y políticos tienden a producir desfas entre los sistemas sociales y los sistemas de pensamiento creados con el objetivo de comprenderlos.

Actualmente somos testigos de una etapa de profundización de la crisis crónica de la teoría sociológica en general y en particular en América Latina. Los fenómenos que las teorías de finales del siglo pasado intentaban explicar se han modificado, y muchos de esos problemas se han agudizado. Las crisis del estado y de los partidos, la deriva democrática, el surgimiento de nuevos populismos, antiguas y recientes demandas y reivindicaciones sociales, nuevas realidades geopolíticas; tales fenómenos parecen mutaciones de antiguos problemas de conocimiento que no se han respondido y que sugieren una nueva etapa de la crisis.

En esta ponencia se propone una revisión de los principales paradigmas sociológicos de los años noventa y su relación con las problemáticas sociales, económicas y políticas de la época con énfasis en América Latina y una comparación con los problemas y vacíos en las teorías actuales. También se busca incorporar propuestas de la sociología clásica y contemporánea con la intención de esbozar algunas estipulaciones útiles, aunque preliminares para una sociología latinoamericana del S. XXI.

RC07-JS-202.3

VILLALOBOS, CRISTÓBAL* (Pontificia Universidad Católica de Chile, Chile)

Edtech Companies and the Digitalization of Education in Chile. the Growth and Consolidation of Technosolucionism in Global South.

In Global South, recent research shows that transnational technology corporations have increased their engagement in educational development following variegated institutional logics and rationales (Patil, 2023), with special emphasis to commercial digital platforms provided by Big Tech companies -the so-called GAMAMS- (Williamson and Hogan, 2020). In contrast, to date, the role of national edtech companies in public policies and educational policies has been little studied.

This article analyses the network of actors involved in the contemporary digitalization of the Chilean school system and the role of private EdTech corporations in this ecosystem. Using a framework based on new modes of education governance and contributions from the cultural political economy, three sources were triangulated: i) 22 semi structured interviews with key actors and policymakers, ii) a database of startups in the EdTech sector in Chile and iii) a systematization of the main digital education policies implemented in the country.

The findings reveal a poorly coordinated network of actors, which has allowed the inorganic and heterogeneous growth of EdTech corporations, whose role encompasses not only the production of technology but also its articulation and management. Secondly, the results show that edtech companies (along with BigTech) promote educational techno-solutionism, promoting images that directly connect students with technology and diminishing the role of schools in education. Finally, EdTech companies, although with national roots, seek to expand their models to other countries in the Global South, through the idea of “local solutions, global problems.” To this form, EdTech companies play a central role not only as producers of technology, but also as articulators and administrators, illustrating a displacement of the State from some of its historic functions.

RC10-149.3

VILLALOBOS, CRISTÓBAL* (Pontificia Universidad Católica de Chile, Chile)

Understanding the “Small-Philanthropy” in Education: Networks, School Engagement and Public-Private Collaboration in Chile.

The expanding influence of philanthropy in education has become a key contemporary global phenomenon (UNESCO, 2023), which has sparked increased research interest in recent years (Erfurth & Ridge, 2020). Existing research has primarily focused on the rise of ‘venture’ philanthropy, and on foundations’ strategies to mobilize nationwide privatization reforms (Ball, 2013; Reckhow & Tompkins, 2018). Yet, besides mainly proceeding from the Global North, literature has tended to focus on so-called “big players” (Ball, 2019) while overlooking the diversity within the philanthropic sector and the national/local expressions of their educational involvement (Hogan et al., 2022).

With the goal of contributing to emerging interest on understanding the local/national manifestations of this global phenomenon (Hogan et al., 2022), this paper analyzes the rise, logic of actions and networks of edu-philanthropy in Chile. The case of Chile is particularly interesting to this respect, given its extreme exogenous privatization (Verger et al., 2017) and philanthropy’s increasing support to educational initiatives (Aninat & Fuenzalida, 2021), which have largely remained unexplored. Methodologically, we draw on a combination of research techniques, including online search based on philanthropic foundations operating in Chile in K-12 education; desk research of these philanthropic foundations in diverse dimensions and; individual interviews with executive directors of 15 philanthropic foundations.

Our findings suggest three main trends. Firstly, we emphasize the spread of a so-called ‘professionalization’ trend within foundations, closely linked to the increased use of metrics for evaluating their impact. Secondly, despite a variety of forms of action, foundations primarily focus on direct philanthropy to public schools. Finally, while we identify the emergence of new public-private networks and formal and informal strategies for influencing national education policy, most foundations rely on a ‘bottom-up’ approach. In sum, the paper allows us to discuss how philanthropic foundations influence the construction of education in the Global South.

RC14-213.1

VILLEGAS ARTEAGA, JANETH* (Universidad Nacional Mayor de San Marcos, Peru)

El Rol De La Comunicación En Las Tradiciones Culturales Que Provocan Incendios Forestales En El Perú.

Entre agosto y septiembre de 2024, los incendios forestales devastaron más de 20 regiones del Perú, afectando miles de hectáreas de bosques y cultivos. El impacto fue crítico, con 15 fallecidos, 155 heridos y más de 1.800 personas afectadas directamente (Indeci, 2024). En muchas regiones rurales del país, la quema de terrenos se considera una práctica agrícola necesaria, lo que complica las acciones preventivas contra estos incendios. En este contexto, la comunicación juega un papel clave para cambiar percepciones y reducir la prevalencia de estas prácticas. Según Tapia (2020), la transmisión de saberes ancestrales que incluye la quema de terrenos se justifica por la falta de alternativas sostenibles, poniendo en riesgo el ecosistema y la vida humana.

Este estudio utiliza un enfoque mixto para analizar el rol de la comunicación en las tradiciones culturales que favorecen los incendios forestales. A nivel cualitativo, se realizaron entrevistas a líderes comunitarios, agricultores y ancianos para comprender las creencias que justifican la quema de terrenos y la percepción del cambio climático. En el ámbito cuantitativo, se llevaron a cabo encuestas a 100 personas en comunidades afectadas para medir la efectividad de las campañas de comunicación y la disposición a adoptar prácticas agrícolas sostenibles. Ríos (2019) señala que la educación ambiental debe ser culturalmente adecuada para impactar en las comunidades rurales, y las campañas son más efectivas cuando se alinean con creencias locales.

Los resultados cualitativos muestran que las tradiciones culturales, arraigadas en la comunidad, son una barrera para la adopción de métodos agrícolas modernos. Sin embargo, las encuestas revelan que las campañas de comunicación han comenzado a influir en la percepción de los riesgos. Este análisis evidencia la necesidad urgente de una estrategia comunicacional más fuerte y culturalmente adaptada para enfrentar los incendios forestales en Perú (Indeci, 2024; Tapia, 2020; Ríos, 2019).

VILLEGAS ARTEAGA, JANETH* (Universidad Nacional Mayor de San Marcos, Peru)

El Rol De La Red Social Tik Tok En El Posicionamiento De Las Instituciones Públicas En El Perú En El 2023

El TikTok ha emergido como una herramienta crucial para las instituciones públicas en Perú, destacando en la promoción de servicios y en la interacción con sus públicos. Con un enfoque descriptivo y cuantitativo, se empleó el machine learning para analizar las reacciones de más de 36,000 usuarios a los contenidos de estas instituciones en la plataforma. La metodología aplicada incluyó la segmentación de las reacciones en categorías de análisis de sentimientos: positivo, negativo y neutro, así como el análisis de variables como horarios de publicación y tipos de contenido.

Además, se aplicó una encuesta a 10 responsables de instituciones públicas en TikTok, en la que se analizaron los objetivos, estrategias empleadas, tipos de contenidos e impactos, entre otros aspectos. Los resultados son reveladores e importantes para las instituciones públicas, ya que evidencian desafíos en la creación de contenido relevante y en la gestión continua de la plataforma. Asimismo, subrayan la importancia de adaptar los tiempos de publicación para maximizar el impacto.

Hate Speech Is Not Fun: Self-Control As a Mediating Variable between Adolescent Victims and Perpetrators of Hate Speech

In this paper we present the results of a moderation analysis of a convenience sample (n=446) of adolescents from 4 secondary schools in Almería (Spain). Our results show that perpetration of hate speech is explained by having been treated in a hurtful way online, but that adolescents' self-control significantly mediates the behavior (low self-control increases the likelihood of perpetrating hate speech) and is only significantly moderated when adolescents think that hate messages are not funny, in which case the likelihood of perpetrating hate speech significantly decreases. Prevention campaigns should aim to make adolescents aware that hate speech is not funny, but that it harms those who experience it and makes them react with more hate speech.

Transiciones Juveniles En Contextos De Desplazamiento Por Crisis. El Caso De Las Juventudes Venezolanas En Perú

¿Cómo se desarrollan las transiciones juveniles en contextos migratorios recientes marcados por crisis? ¿Qué nos aporta el desplazamiento para entender las transiciones de los jóvenes migrantes desde un enfoque interseccional? ¿De qué manera podemos abordar las transiciones en las nuevas migraciones sur-sur desde un estudio longitudinal? Estas son preguntas que plantea la presente investigación acerca de las juventudes migrantes venezolanas en un escenario de desplazamiento en países sudamericanos. En las últimas dos décadas se registra una creciente transformación en los flujos migratorios vinculado con los efectos de la globalización. En este nuevo escenario, desde un enfoque transnacional, las migraciones sur-sur permiten dar cuenta de la necesidad de ampliar el análisis y campo de observación de los sujetos en los procesos migratorios. En ello, Perú es un caso que cobra relevancia, puesto que es uno de los países receptores de población migrante venezolana, la cual es principalmente población joven. En este contexto, las transiciones de los jóvenes que ingresan a Perú, se producen en el marco de un continuo desplazamiento territorial, el cual no necesariamente se desarrolla bajo la lógica origen-destino. Esto significa que si bien pueden tener proyectos iniciales, el desplazamiento entre fronteras implicará adoptar estrategias continuas a fin de reducir riesgos en nuevos escenarios de incertidumbre. Por otro lado, el desplazamiento transnacional supone arreglos y negociaciones con las familias de origen, siendo estas la principal red de soporte afectivo y económico. De esta manera, transitar entre la educación, el trabajo, la vida familiar y autopercepción como joven, adquiere nuevos matices al estar permeados por nuevos escenarios y la transformación de los lazos familiares en la distancia. Así, propuesta mostrará transiciones en contextos de movilidad con el objetivo de identificar cambios y permanencias en las transiciones donde las prácticas cotidianas de los sujetos migrantes no se desarrollan bajo la lógica origen-destino.

Far-Manosphere: The Intersection of Antifeminism and Far-Right Discourses. Case Studies from Italy, Spain and Portugal

Online men's communities built around misogyny and opposition to feminist values - commonly known as the manosphere - have recently attracted academic attention. In research, the manosphere is usually described as a backlash movement in countries where gender equality is most advanced, and refers to an online movement of anti-feminist websites/media that focus primarily on 'men's issues'. At the same time, far-right groups are also increasing their focus on misogynist propaganda and activism, particularly as they recognise that misogyny is becoming an increasingly effective recruitment tool. The paper reflects on the intersection of anti-feminist and anti-immigration agendas in the Portuguese, Spanish and Italian far-right by critically analysing the discursive positions of Chega, Vox and Lega Nord on immigration, feminism and gender equality. After an overview of the current misogynist spaces and ideological narratives, the paper samples the online ecosystem of misogyny both within and across the parties' social media. Discursive positions on immigration, feminism, family law, gender-based violence and gender equality will be analysed to identify the discursive and organisational overlap with the far right.

VIRÁG, TÜNDE* (Centre for Economic and Regional Studies, Hungary)

The Capacity of the State to Govern the Spatial Marginality of Roma in Bulgaria and Hungary

This paper explores and compares the spatial marginalization of Roma in Bulgaria and Hungary framed within a historical context (cf. Powell and Lever 2017). It posits that the patterns of marginalization are intertwined with the capacity of the state to control spatial mobility. During state socialism, both countries implemented policies to improve housing conditions, but with highly different outcomes. In Bulgaria, the lack of the state's capacity to control the spatial mobility of Roma resulted in large informal neighborhoods organized by ethnic belonging. In Hungary, the powerful assimilation policy and the state's ability to control the marginalized led to the emergence of mixed-ethnic neighborhoods. These deprived neighborhoods were organized on class position and comprised individuals from similar social categories.

In recent times, socio-spatial dynamics have resulted in the convergence of segregation patterns in both countries. As a consequence of mass privatization, the residualized social housing and the absence of policies to improve housing conditions drove individuals to homeownership with market-based solutions endorsed by both states compelled the most vulnerable families to seek informal solutions. The upscaling of the urban centers and the implementation of various policies often resulted in displacement. The role of the state manifested in the absence of social and legal housing protection has resulted in evictions. The state's primary roles are to regulate the social and political order, to determine who is desirable and who is undesirable (cf. Gans, 1994), and to facilitate the spatial channeling of the marginalized through their filtering dynamics (Aguelira, 2024, Virág 2024). Consequently, in Hungary, mixed-ethnic neighborhoods have almost disappeared, and informal and racialized housing has become increasingly prevalent. In Bulgaria the large informal Roma neighborhood remains the primary segregation pattern but, due to the growing social stratification of Roma within the neighborhood, the socio-economic and ethnic boundaries have become increasingly salient.

Twisting the Rule of Law into Rule By Law in MENA Countries: The Role of Religion

The selective application of religious norms in MENA countries illustrates how religion can function as both a tool of political control and a means of maintaining religious orthodoxy, often at the expense of the rule of law.

This control is facilitated by constitutional ambiguities surrounding Islam and secularism in post-independence MENA. In Morocco and Algeria, the recognition of Islam as the state religion raises questions about whether these

declarations are symbolic or carry legal weight. Tunisian constitutions have been even more ambiguous, leaving unclear whether Islam or its “objectives” hold symbolic, sociological, or legally binding significance. Such vagueness allows regimes to control religion and its authorities, resembling a pseudo-secularism termed “Maghrebian Gallicanism” (Fregosi).

In multi-confessional Lebanon, religion's institutional role is even more pronounced, as the state architecture is organized along religious lines, and Christian and Muslim laws are granted exclusive authority over family matters (Messarra, Gannagé). This shows how religion affects not only institutional dynamics but also individual rights, with statutes and case law restricting gender equality, sexual self-determination and freedom of conscience under the guise of religious orthodoxy. This use of religion opposes the rule of law, which upholds individual liberties and procedural safeguards. Instead, it reflects an instance of rule by law – specifically, a divine law that defines the substantive limits of government and legislation (El Fadl).

Our analysis will thus explore the interplay between positive law and religion: 1) how states exploit religion to reinforce their authority; and 2) how they bend the rule of law to uphold religious dogmata. We will work on: a) historical debates on the place of religion from the colonial and post-colonial periods; b) contemporary scholarly debates; and c) empirical evaluation of secular and religious elements in the institutional architecture, legislation and case law of Algeria, Morocco, Tunisia and Lebanon.

The Worlding Practices of Autonomous Stores

‘Autonomous stores’ are often characterized in the media as the future of shopping: physical environments made smart by augmentation through digital technologies that can process data automatically, seamlessly, and without the need for workers, identifying both consumers and their actions. References to autonomy and automation conjure a set of imaginaries of technology in the service of consumption and progress: for consumers these novel environments are purported to mean gains in convenience, whereby saving time is saving money. For retailers, they mean the possibility of gathering significant amounts of information on the behaviour of customers in a store environment, thus being another manifestation of what Zuboff (2019) calls ‘*Surveillance Capitalism*’.

Despite being hailed as autonomous, these spaces are vast digital assemblages that rely upon networked infrastructures composed of people, knowledges, values and numerous technological entities (such as, AI, sensors, algorithms, computer vision, cameras). Departing from the premise that “technology is society made durable” (Latour 1990), this paper draws upon 17 semi-structured interviews conducted with three Portuguese corporations – Sensei (a startup tech developer of autonomous stores), Continente (large food retailer) and Galp (large oil and gas retailer) – who are collaborating in the development and implementation of autonomous stores in the Portuguese context, to examine the discourses and practices that drive, justify and sustain their collaborations.

We pay particular attention to the discourses through which they are built: Who is pushing for them? Why? What are the main issues that are being discussed both in terms of advantages and problems? Who is included/excluded? And, finally, what futures are being built? This will then allow us to shed light on the concepts that underlie these spaces – What are “autonomy” and “smartness” in autonomous stores?

VITALE, TOMMASO* (Sciences Po Urban School (CEE), France)

Temporary Shelters and Roma Housing Inclusion: Policy Learning and the Politics of Incremental Care

In Europe, a considerable number of cities have established provisional accommodations for the Roma population, based on ethnicity, to address acute housing insecurity. In the event of eviction, fire, or destruction of a shantytown, individuals may be offered shelter in these facilities. In certain instances, access may be granted in the event of extreme weather conditions or following the birth of a child. The shelters provide a range of housing assistance programs, offering temporary accommodation for women and their children or for the entire household.

Emergency shelters are designed to be provisional solutions, to prevent individuals from residing in unsuitable locations or on the streets. Such facilities are staffed on-site to provide social support, focusing on facilitating

access to stable employment and housing. How did they successfully navigate the inherent tension between providing care and maintaining control? This study aims to analyze whether these facilities are merely substandard shelters or represent a potential avenue for social care, support, and empowerment. What forms of criticism have social workers, volunteers, recipients, and local policymakers encountered regarding these shelters? Has there been an observable improvement in the quality of care provided?

A total of 128 in-depth interviews and 10 focus groups were conducted with individuals who self-identified as Roma. Furthermore, 27 interviews were conducted with policymakers and administrators, activists, and other key informants at the local, regional, and national levels. The case studies were conducted in Paris, Milan, Barcelona, Gyöngyös, Miskolc, Sighişoara, and Sfântu Gheorghe.

The paper elucidates how temporary shelters facilitate the formation of emotional connections, resolve issues about the relationship with the local environment, and create a sense of belonging in a manner that incrementally empowers the recipients. The tensions between identity, community, and security proved an effective means of understanding the complex interrelationship between shelters, neighbourhoods, and care practices.

VITE PÉREZ, MIGUEL ANGEL* (IPN, Mexico)

The Dispute over Profits in Territories Organized By Crime

This analysis aims to construct interpretations about the probable link between violence and territory from testimonies collected in Apatzingán (Michoacán, Mexico) with those who participate in the drug trafficking business, which showed firstly the articulation between illegal and legal businesses, and then, the characteristics of commercial competition driven by illicit businesses that attempt to displace local businesses and simultaneously take over their markets. According to the testimonies, this fact sought to reinforce the dominance of criminal businesses in the area, by controlling the profits derived from regional economic activity (Lyon, 2024).

However, criminal control of economic activity did not reduce the vulnerability of its inhabitants facing situations of violence. This resulted in ongoing precariousness in their social context, manifesting as fear that has turned into individual suffering (Butler, 2018).

Moreover, the establishment of illegal commercial businesses on the streets in certain urban spaces or territories has favored the emergence of organizations that seek to protect these from probable intervention by the authorities, in exchange for payment. This has led to disputes, not only over the inclusion of new members, but also concerning these spaces. This was apparent in the Cuauhtémoc area located in the Gustavo A. Madero municipality of Mexico City.

In this way, testimonial information from these cases has helped create a narrative of violence, perceived as a dispute justified by values and beliefs, for which material interests may be the only manifestation (Alexander, 2011).

VITE PÉREZ, MIGUEL ANGEL* (IPN, Mexico)

Vulnerabilidad y Violencia En Un No Lugar Mexicano

La elaboración de interpretaciones mediante el concepto de vulnerabilidad y violencia (Butler, 2018, p. 15) tendría como objetivo comprender lo sucedido en un no lugar (Augé, 2007, p. 127), Plaza Bruno Giordano, localizada en la ciudad de México, ocupada por migrantes de origen centroamericano, esperando su permiso para ir a los Estados Unidos, lo que generó diversas percepciones de parte de los residentes (dueños y empleados de negocios), contrarias a esa ocupación, demandando su desalojo cuando se reforzó la creencia colectiva acerca de que los no lugares no deberían de transformarse en lugares de residencia permanente.

Por tal motivo, se realizaron algunas entrevistas (mayo 2024) para establecer en qué consistía su vulnerabilidad y cómo se ligaría con la violencia, con otras palabras, si lo simbólico (Bourdieu, 2012, p. 1), por ejemplo, sólo se limitaría a un tipo de dominación concretado en el uso de la fuerza policiaca de parte de los dominadores o más en acciones de exclusión que negaban sus derechos a una vida más vivible en México.

Pero, la narrativa de los migrantes entrevistados expresó lo siguiente: El no permanecer, en ese no lugar, sino seguir su tránsito, mientras, no se emitiera, en México, su estatuto legal, aceptaban su segregación en un espacio público

ocupado de manera ilegal donde apareció la violencia como soberanía del Estado Mexicano (Panthers, 2024, p. 528).

Contaminations Among Religions, Ecology and Society. a Case Study from the Catholic Church

In the Encyclical *Laudato Si'*, Pope Francis states: "We come together to take charge of this home which has been entrusted to us", adding that only through unity can "Creation" be saved from destruction. In recent years, the Encyclical has opened an intense social, theological and political debate on the environment which has provoked reactions from several religious and political leaders, and encouraged religious and secular communities to promote actions in defence of the environment. Beyond official and institutional actions - such as the signing of the Document on Human Fraternity for World Peace and Coexistence or the G20 Interfaith Forum - this call for unity has opened a period of religious effervescence and innovation to promote sustainable lifestyles. This presentation will explore with the contribution of some practical case studies, how the lens of the sociology of religions can help to explore how climate crisis has led to new religious practices, interreligious dialogues, religious-secular debates, but also new conflicts.

Contradicciones y Propuestas Afectivo-Sexuales En La Barcelona Neoliberal

En esta comunicación presentamos los resultados principales de un artículo que explora las experiencias y representaciones sobre el amor y la sexo-afectividad de personas jóvenes-adultas y adultas sin hijos, residentes en Barcelona, en el contexto del régimen neoliberal. Se analizan, en particular, las contradicciones amorosas y afectivo-sexuales que surgen en una sociedad inserta en el capitalismo tardío donde aparentemente coexisten los modelos de amor romántico, confluyente y líquido. Los datos de la Encuesta sobre las relaciones sociales y afectivas postpandemia (III) del CIS (2023) nos plantean un escenario inicial, en el que este artículo indaga, donde las relaciones fluctúan entre el ideal de amor duradero, la flexibilidad de vínculos negociados y la inestabilidad de conexiones pasajeras. Partimos de la idea de que esta realidad se inserta en un contexto más amplio, donde el neoliberalismo, en sus dimensiones política, social y subjetiva (Foucault, 2007; Laval, 2020; Laval y Dardot, 2013), reconfigura las formas de vincularse y concebir el amor y la sexualidad. Asimismo, se toma como punto de partida que este proceso de transformación está marcado por una contradicción estructural propia del capitalismo tardío neoliberal, que es la de la sociedad que se encuentra atrapada entre las demandas del capital y las necesidades de cuidado (Fraser, 2016). Se han llevado a cabo cuatro grupos de discusión acotando el estudio a las percepciones y contradicciones amorosas de un total de 21 hombres y mujeres cis, de entre 26 y 37 años, residentes en Barcelona, con distintas orientaciones sexuales y distintos vínculos sexo afectivos. Los resultados nos muestran que estas contradicciones se dan en tres ámbitos concretos: 1) emocional-material; 2) tecnológico y 3) social, que el amor va más allá de los ideales románticos, confluentes y líquidos, y que hay diferencias notables en el discurso de mujeres feministas y personas del colectivo LGTBIQ+.

RC26-430.1

VIVIANI, LORENZO* (University of Pisa, Italy)

Democracy in Flux: The Project of Modernity and the Rise of New Authoritarianism

This paper explores the democratic crisis by examining its deep entanglement with the ongoing evolution of the modernity project. Traditionally, democracy was seen as a natural byproduct of economic development and modernization, yet this assumption has been increasingly questioned. The research challenges simplistic interpretations of democratic decline, investigating the complex interplay between political legitimacy, cultural fragmentation, and social order. Drawing on the work of theorists like Lipset and Hall, I argue that democracy's foundations are being destabilized by a profound dislocation of identities, as modernity's promises of security and cohesion unravel in the face of rapid social acceleration and economic precarity.

The analysis extends to the paradoxical reconfiguration of democracy since the late 20th century. Rather than being purely under threat from neoliberal elites, democracy is caught in a dual tension: on the one hand, it faces rising demands for greater participation and representation; on the other, it is seen as a vehicle of exclusion, manipulated by those defending their status within increasingly fragmented social hierarchies. The post-1989 model of democracy, rooted in liberal representative ideals, no longer holds the same emancipatory potential, as socio-economic inequalities and cultural divisions deepen.

By framing contemporary populism and sovereignism as products of advanced modernity, this paper reveals how these movements, far from rejecting modernization, co-opt democratic mechanisms to reinforce exclusionary identities. The traditional link between individual autonomy and collective governance is disintegrating, replaced by neo-communitarian strategies of recognition that undermine egalitarian values. This shift reflects a broader crisis of self-fulfilment, which threatens to transform democracy from an inclusive political project into a tool for division. In conclusion, this study calls for a critical re-evaluation of modernity's democratic promises, as political sociology faces the challenge of understanding the rise of exclusionary populism and neo-authoritarianism in contemporary society.

Imagining Regulation of AI: Comparing Czech and Portuguese Media Representations with Cads

Artificial Intelligence (AI) has become an inevitable part of the visions of the digital future. Thus, the possibility of AI regulation is one of the most crucial questions in shaping it. The development of technologies like AI depends on media-shaped public perception (Chuan et al., 2019). This research focuses on media debates about AI regulation from an interdisciplinary comparative perspective. It analyses imaginaries in the Czech and Portuguese online mainstream media, using Corpus Approaches to Discourse Studies (CADS) (Baker et al., 2008). CADS combines corpus linguistics with CDA while reflecting on critiques of the latter (Orpin, 2005). It mainly strengthens data representativeness and interpretative transparency of the analysis. CADS allows the investigation of the aggregate effects of language, highlighting typical discursive patterns. Czechia and Portugal represent intriguing study cases; the countries similar in area size, population, or GDP (Eurostat, 2024) differ significantly regarding their tech sectors and the length of the EU membership. Conceptually, this study approaches AI regulation visions with "sociotechnical imaginaries" (Jasanoff and Kim, 2015, p. 4), which have been plagued by conceptual ambiguity recently (Rudek, 2022). This research overcomes it by adopting a three-level imaginary concept (Sau, 2021). It structures the analysis of media representations by asking for imaginary's (1) social commentary, (2) vision of the future, and (3) means to achieve it. The research also highlights the roles of different related actors. Comparable corpora are collected from digitally available media in each country, covering the period of discussions about the EU's "AI Act" regulation (3/2018-12/2023). Results are explored and compared using Sketch Engine (Kilgariff et al., 2014), analysing keywords, collocations and concordances. Such research provides innovative, empirically rooted comparative insights into the current media debate on the future of AI. Also, it provides a clearer perspective of sociotechnical imaginaries by grounding these to objective linguistic cues.

VOGT, ALICIA* (EHESS & Goethe Universität Frankfurt/Main, France)

Life Course, Biography, Career. the Migrant Musicians of the Orchestra Orpheus XXI (Jordi Savall)

Orpheus XXI is an orchestra which was created in 2016 by the Catalan conductor and gambist Jordi Savall through a grant of €200,000 from the European programme *Creative Europe*. Orpheus is part of Jordi Savall's recurring concern to link humanist commitment and artistic practice. The orchestra is aimed at "musician refugees and migrants"[1] who are professional musicians. It allows musicians to continue to perform in exile. They enrich this activity by transmitting their knowledge to young people and children whom they meet during educational workshops.

With tools drawn from the anthropology of music and the anthropology of biographical life courses, I study the *life course* (*parcours*), the *biography*, the *career* (Zimmermann, 2013) of migrant musicians of the Orpheus XXI ensemble. The *life course* is concerned with the paths that the person takes in the private or public spaces, and the environments (professional, family related, institutional) that he or she crosses which shape his or her possibilities and resources but over which he or she can exercise influence. The *career* focuses on the world of work and analyses the path of a person in this world. Career is also a form of statutory attribution. It depends on an external authority. *Biography* is the construction of a narrative, the establishment of a continuity after the fact by the reflexivity of the actor to an external audience. How do musicians adjust to the structures of their new societies? and how do the structural devices – whether legal, social, administrative, cultural and familial – understand music: as a cultural tool for society? as a tool of inclusion for people who find themselves in a situation of migration?

[1] See Orpheus XXI website: <https://orpheus21.eu/en/description-project/>, accessed on 19.01.2023.

A Digital Papereality: Experiencing and Negotiating Welfare Surveillance

The digitalisation of the welfare state involves the adoption of new technologies and practices that transform the relations between citizens and the state. These can support the work processes of welfare institutions with improved efficiency, but can also reduce the human discretion of practitioners, integrate hidden biases into evaluation procedures, or cast a net of perpetual suspicion on citizens claiming a right to social assistance in their time of need. This paper addresses the surveillance technologies adopted by social security institutions in determining citizens' eligibility to social assistance and detecting incidents of fraud. Drawing on findings from fieldwork in Slovenia and Jerusalem (Israel/Palestine), it examines how welfare claimants experience and negotiate welfare surveillance, presenting the concept of a digital papereality to understand how such digital surveillance shape claimants' actions.

The paper suggests that the spectre of disqualifying to social support can lead those who are placed under suspicion to mould their digital presence into a digital papereality, as evidenced in the public web and government databases, into what Woolford and Nelund (2013) called 'a performance of a qualifying version of the self'. Within this performance they continuously try and 'present to different surveillance actors and their information databases a single corroborated qualifying script' (Volinz 2021) of their life. This paper concludes with examining the potential social and political consequences to the introduction of digital welfare surveillance, and the transformation it brings to the modern face of the welfare state.

Network Control Effects on Trust: Aggregating Evidence from Multiple Studies

In earlier work, we have developed a typology of effects of networks of social relations on trust problems along two dimensions. First, we distinguish the embeddedness of a trust problem in the dyadic trustor-trustee relation from the embeddedness in networked interactions of the trustor and trustee with third parties. Second, we distinguish two mechanisms affecting trust:

learning and control. Empirical evidence consistently confirms hypotheses on dyadic learning and control effects as well as on network learning effects. This includes evidence from studies employing complementary designs such as experiments, surveys, and vignette studies. On the other hand, the empirical evidence on network control effects is ambiguous. This is an empirical puzzle for research on trust and social networks. This paper assesses the evidence for network control effects on trust and cooperation by reanalyzing the data from heterogeneous experimental studies. We attempt to include all available experimental studies suitable for studying network control effects in two-person dilemma games. To tackle this problem, we employ a novel method called Bayesian Evidence Synthesis. The aggregated empirical evidence provides strong support for network control hypotheses. This evidence supports these hypotheses, especially in studies where network relations are implemented without repeated dyadic interactions. In the studies with network relations implemented in the presence of repeated dyadic interactions, the support is weaker and less consistent. The paper ends with a discussion of our findings and their implications for research on trust and social networks, addressing further theoretical, empirical, and methodological work.

Co-Creation in Climate Research. the Experience of the Horizon Regace Project

In light of the increasing urgency of climate change, scientific research is shifting toward more inclusive and participatory approaches to bridge the growing gap between academia and society. Traditional science communication, often centered on disseminating information to a passive audience in a post-innovation process, has proven faulty in addressing public skepticism and mistrust of scientific discovery and innovation, especially when dealing with complex subjects like climate change. Recent innovations in participatory science, particularly in eco-technological fields highlight the importance of an early engagement of communities from the outset to foster a deeper understanding and a societal acceptance of scientific advancements.

The idea of participatory processes involving those considered beneficiaries changes how technological innovation is co-constructed and the growth of awareness of the environmental sustainability of possible innovation actions.

This paper explores the emerging paradigm of co-creation in climate research, which involves the active participation of various stakeholders and community members in the research process. This approach transforms how scientific knowledge is produced and communicated. The REGACE project, which focuses on innovative agri-photovoltaics in greenhouses, demonstrates the potential of integrating farmers directly into the innovation process from the scientific co-design perspective. By engaging users early and meaningfully, such initiatives ensure that technological advancements are socially embedded and collaboratively developed. Drawing from the first months' empirical findings of farmer participation in five European partner states, this paper discusses that eco-innovation success, like innovative agri-photovoltaics, hinges on bottom-up engagement. This participatory model reconfigures the traditional notion of scientific authority, transforming it into a more relational and responsive to societal needs pattern. By analyzing the risks and benefits of this social-technological collaboration, the paper highlights the crucial role of direct societal involvement in reshaping the relationship between science and society in the context of the climate crisis.

VOLTERRANI, ANDREA* (University of Rome Tor Vergata, Italy)

BATTISTI, FABIANA (University of Rome Tor Vergata, Italy)

The Social Development of Liminal Communities through Hybrid Participation Processes. European and Italian Experiences in Comparison

The paper analyses the potential protagonism of vulnerable subjects (Castel 1995; Fineman 2016; Karwacki, Volterrani 2024) within liminal and marginal communities (Blokland 2017), profoundly reshaped and permeated by social tensions after the COVID-19 pandemic and undergoing a profound transformation. Focusing on the interplay between digital communication ecosystems and urban spaces, particularly those identified as 'liminal' (Antonucci, Sorce, Volterrani 2024), in transition, the research highlights the central role of hybrid (on-site and online) participatory processes in civic engagement for the broader social development

of communities. The analysis of participatory practices considers the potentially inclusive uses of digital communication technologies while acknowledging the risk of neoliberal rationality absorbing resistance practices. Emphasising the issue of widespread vulnerabilities in all spheres of life in liminal communities, the paper argues for the need to incorporate the principles of edu-communication (Barbas 2020) into participatory processes for the social development of communities themselves, highlighting the potential of the media not only as a tool for empowerment and conscientization (Freire 1970; 1985), but also as an environment in which to promote inclusive practices, even within liminal and marginalised communities. The paper explores whether and how hybrid participatory processes can serve as a subspace for empowerment and mobilisation. The participatory action research (PAR) is based on an empirical analysis (in-depth interviews, participant observation) conducted in liminal spaces in four European countries (Italy, Poland, Croatia and Greece). Subsequently, spaces for facilitating inhabitants' participation were constructed to initiate co-design processes to imagine the future of the liminal communities. The results present the main opportunities of a participatory approach to development (decision-making protagonism, awareness of the possibilities, increased civic imagination and trust) and the main difficulties and obstacles encountered (low mutual trust, widespread presence of personalistic interests, inability to imagine the future) in the liminal communities of the four European countries involved.

Curtains up: How Ukrainians Turned to Theater during the War

The Russian invasion of Ukraine has brought uncertainty to the lives of most Ukrainian citizens. Despite the traumatic experiences caused by the war, Ukrainian theaters got a new life, benefiting from the unprecedented popularity, according to representatives of the theatrical community. One notable example is the theatrical adaptation of *The Witch* from Konotop, a satirical fiction story written by Ukrainian author Hryhorii Kvitka-Osnovianenko in 1833, which has rapidly gained popularity among the audience in Kyiv. The play premiered on 28 April 2023, coinciding with another air attack by Russia on the country. Since then, tickets for this play have become highly coveted. What arouses interest is that this illustrates only one case of the surge in theater attendance happening during the Russian-Ukrainian war.

This paper explores the rising popularity of Ukrainian theaters and provides supportive evidence using Google Trends data on search interest. After that, we analyze publications by theater-goers on social media (Instagram) and discuss how the unexpected theater boom can be attributed to various factors, including coping escapism mechanisms, the practice of consumer citizenship, and the reactualization of authentic Ukrainian narratives by both consumers and producers of cultural products.

Revisiting Aristotle's Legacy: Ethics, Economics, Politics and Justice in the Anthropocene

This paper explores the relationship between ethics, economics, politics and justice, revisiting ancient philosophical concepts to address the challenges of the Anthropocene. It examines the translations and dissemination of the concepts of Aristotle's practical philosophy into Ottoman Turkish via Arabic, Persian and Latin-rooted Western languages, especially French. By considering the relation between translation and philosophy this paper positions Ottoman Turkish in global historiography as an inheritor of Classical Tradition, and as a producer of heteronomous texts.

Given that *oikonomia* was translated in Arabic as *ilm-i tedbir-i menzil*, and the Ottomans used the same term until the 19th century, it is notable that *économie politique* from French was also translated as *ilm-i tedbir-i menzil* into Turkish. Utilizing textual analysis this paper reveals the references to Aristotelian understanding of justice both in the Ottoman reception of *ilm-i tedbir-i menzil* and *économie politique*.

The powerful literary and cultural critics of historiography inspired an appeal to write global histories encompassing every aspect of the human experience and have enhanced awareness of the role language plays. Emphasizing the references to Aristotle between heteronomous texts, this paper argues that Aristotle's practical philosophy merged into political economy ultimately framing it as the science of acquiring wealth. This raises the critical question of what happens to justice within this merger. The references to Aristotle are examined through several works: *Ahlak-ı Alai* of Kinalızade Ali Efendi (1510-1572), *Traité d'économie politique* (1615) of Antoine de Montchrestien, *Cateschism d'économie politique* of J. Baptiste Say and its Ottoman Turkish translation *Ilm-i tedbir-i menzil* (1852) by Abru Sehak Efendi.

[Note: This presentation is a part of my dissertation: from *Oikonomia* to *Ilm-i Tedbir-i Menzil*: the Reception of Political Economy in Ottoman].

Pre-Service and in-Service Teacher Training to Tackle Disinformation and Promote Critical Digital Literacy

This paper will present a large-scale transnational project with partners from seven European countries, funded by the European Commission (EU) under the 'Forward Looking' call included in the 3rd EU priority on 'Digital literacy / tackling disinformation'. The project which started in December 2023 and is expected to be completed in November 2026 brings together 15 partners (educational institutions, ministries and universities) from Cyprus, Greece, Bulgaria, Romania, Italy, Poland and Belgium.

The project titled "Teachers 4.0 Digital Age: Tackling Disinformation and Promoting Digital Literacy through Education and Training in European Classrooms" aims to provide the framework, tools and means to ensure that teachers across Europe are adequately supported in tackling disinformation issues and in promoting critical digital literacy and is implemented at three (3) levels:

- initial teacher training, *through education departments at six (6) European universities,*
- continuous professional development of in-service teachers, *through adult / teacher training institutions,*
- policy making, *involving ministries of education and civic authorities.*

Within the framework of the project, training will be offered to a total of two thousand and one hundred (2,100) teachers (pre-service and in-service) on digital disinformation issues so that they can collectively contribute to the education of young people to think critically, to make informed online choices and to stay safe from misinformation circulating freely in the digital world. The paper will demonstrate the curriculum and the educational material that has been produced, the methodology of offering training both in a face-to-face mode and in an e-learning mode, as well as preliminary findings on teachers' evaluation and feedback.

VUKOVIC, ANA* (Institute of Social Sciences, Serbia)

Digital (Il)Literacy and (Un)Dignified Ageing in Contemporary Europe: Comparing Statistical Data for Serbia, BiH, and Montenegro

The shared experience of ageing in the European Union and beyond is recognizable through common problems of lack of digital literacy and even the interest in mastering the knowledge and skills for navigating and maintaining dignity in the digital age. The elderly cohort experiences twofold alienation in personal agency and respect in the public sphere because of ageing and digital knowledge deprivation.

The constant pressure of "digital protocols" upon them in everyday life, from the apps for m-banking to ATM money withdrawal, e-delivery of communal bills and obligatory tax payments, even grocery shopping to scheduling medical appointments, underlines and augments the lack of skills and often the abilities for the digital interactions and transactions that this mature populace usually does not wield. Digital technology older generations encounter relatively late in their lives makes them vulnerable and sometimes heightens their insecurity. This strips them of their dignity, turning their living into a "bare existence" invaluable to society, burdening governing institutions with their rights to live a life of dignity, value, and virtue.

Comparing the statistical data on digital habits and skills for the cohort of 65+ in Serbia, Bosnia and Herzegovina (BiH) and Montenegro intersectionally with the same Eurostat statistics for the European Union, Norway and Switzerland, we will try to discern the patterns of twofold alienation primarily aiming to outline the deprivation of dignity that older people experience. One of the main possible findings will be how the abuse of elderly rights to dignity and dignified living springs from their digital illiteracy or naivety of their genuine living habits before the digital epoch.

VUKOVIĆ, DANILO* (University of Belgrade Faculty of Law, Serbia)

DORĐEVIĆ, MILA* (University of Belgrade Faculty of Law, Serbia)

From the Bottom to the Top: Legal Skepticism in Serbia

Various empirical researches conducted during the last two decades consistently indicate that two sets of values and attitudes coexist in Serbia: support to the rule of law and legality and skepticism with regards to the legal system and courts. This includes low trust in courts and other public institutions, belief that law is not neutral, but an expression of interests of powerful groups and individuals, and unwillingness to go to courts due to the high costs, length of proceedings, lack of trust in courts and corruption. Furthermore, legal professionals demonstrate a lack of trust in judicial institutions, while businesspersons do not perceive laws and courts as channels to challenge governments' decisions and achieve justice or their interests.

Social context in which these values and attitudes coexist is marked, on one hand, by high income inequality and poverty rates, and prominent role of the state in economy and other spheres of social life (often designated as political capitalism and "society capture"), on the other. Bearing in mind these features of contemporary Serbian society, the aim of the research is to explore narratives about the law, legal system and judiciary and clarify structural determinants of legal skepticism across various social strata.

We aim to conduct exploratory qualitative research (in depth interviews and focus group discussions) with three groups of respondents: (1) citizens of lower socio-economic position (with lower education and lower material status), (2) middle and higher socio-economic position (with higher education and material status), and (3) businesspersons (owners or managers of small and medium enterprises). By comparing these groups, we seek to examine whether there are significant differences in their attitudes towards the law and the legal system. We aim to understand if socio-economic status and professional background shape opinions on the rule of law, legal institutions, and access to justice.

Human Rights, Societies and Role of Government

Human rights play an important role in an individual's life. The democratic governments ensure the freedom and all rights of their citizens for a better life. In modern times Its a good happy indicator for a country.

India is a vast country; the social fabric of Indian society is well knitted with many societies. It's a good example of amalgamation of cultures, aboriginals, beliefs and their different religions. The country is ruled from ancient times by many kings, dynasties and government. Many laws were made in colonial time by British rulers, which were helpful for their ruling system over India. Human rights had no meaning in that era and law became a tool for colonial India.

In this world of information both the government and societies are aware of human rights, separate law courts, human rights watch agencies, public awareness programmes are working for the same cause.

In independent India for the first time the law department of government of India identified several such laws and removed them. This historical action set a milestone.

VYŠNIAUSKAS, VIDMANTAS* (The Institute of Sociology at the Lithuanian Centre for Social Sciences, Lithuania)

Identities of National Minority Youths in the Vilnius Region: From Regional to Supranational

Youth in the Vilnius region (Eastern Lithuania) feel strong tensions between their regional and supranational (European) identities. The former was handed down to them by their parents, grandparents and local community via social memory which was expressed as narratives. The latter is being formed by forces such as globalisation, mass media and EU institutions, just to name a few.

The data I will present was collected during my anthropological fieldwork in the rural areas of the Vilnius region (from 2017 to 2019 and again in 2024), focusing on biographical interviews, observation, and participant observation among the young people I studied.

Drawing on social memory (Assmann 2006) and identity theory, I will argue that because of historical circumstances in the region, older generations (who were born and grew up during the Soviet period) have a strong regional identity. These people call themselves locals (tutejszy in the local language). They tried to hand down regional identity to their children and grandchildren via narratives.

The young people (born after 1990) often understand regional identity as indicating low social status, even being shameful. They try to distance themselves from regional identity and instead emphasise being European or a citizen of the world.

During my presentation, I would like to explain in detail how young people deal with "shameful" regional identities and why and how youth create their supranational identities.

This project has received funding from the Research Council of Lithuania (LMTLT), agreement No S-PD-24-57 2024-01-22 (Identities of National Minority Youths: From Regional to Supranational (the Case of Šalčininkai District)).

Assessing the Role of Generative AI in Protest Event Analysis: A Comparison with Manually Created Data

This study examines the feasibility of applying generative AI technologies, such as OpenAI's ChatGPT, to event analysis and data development. Event analysis is a popular method for sociologists and political scientists studying popular protests and social movements. Traditionally, researchers develop data in three steps: (1) gather newspaper data, (2) extract core components of protest events (who, did what, to whom, when, where, and why), and (3) assign theoretical/analytical codes to these components for analysis (e.g., assign a code "president" to an expression of the whom component "Joe Biden"). This process is typically manual, involving research assistants who read newspaper articles, identify relevant "codes" from a "codebook" (a list of theoretical/analytical codes), and input the codes into databases. However, this approach is costly, difficult to keep updated, and, oftentimes, undesirable because it is these assistants, not the researchers, who decide which theoretical codes to be used in practice.

To address these challenges, this study focuses on the third step—assigning theoretical/analytical codes—and assesses AI's performance in this task, which is complex for both humans and AI. We then compare AI-generated protest event data with manually developed data. For this purpose, we use protest event dataset provided by the Observatory of Conflicts of the Centre for Social Conflict and Cohesion Studies (COES) in Santiago, Chile. It includes 23,398 protest events in Chile from 2009 to 2019. The digitization of original newspaper articles by the COES permits us to apply generative AI processing to exactly the same set of articles. Therefore the COES data offers a rare opportunity to compare human and AI-generated data. By analyzing historical trends and patterns across both datasets, this paper explores the benefits and limitations of AI-based data methods compared to traditional manual approaches.

Possibilities and Challenges of Constructing a Comparative Political Event Database from Multilingual News Sources Using Generative AI

By leveraging generative AI technologies and multilingual newspapers, our project aims to create a new type of political event database encompassing a variety of political interactions involving state officials, political parties, and civil society actors such as social movements. Over the past decades, event analysis has gained popularity among scholars studying social movements, protests, and civil wars. Traditionally, researchers rely on human coders who review newspapers in one language from one specific country and extract six key elements about events: Who (actor), What (action), Whom (target), When (time), Where (location), and Why (claim)—a framework commonly referred to as the "6Ws."

While this human approach has successfully uncovered historical and geographical trends in political activities that other methods have not, it faces major challenges. These include the high costs of continuously updating data and the difficulty of working with news sources written in other languages.

To address these challenges, our project employs generative AI, which shows promise in extracting the 6Ws as accurately and reliably as human coders but at a fraction of the cost and time. Crucially, AI appears to process information from multilingual sources well. But, is the AI approach truly more effective than the human approach in terms of data extraction accuracy? Is it equally effective in all languages? To date, no comprehensive evaluation has been conducted.

This study fills that gap by comparing the 6Ws extraction capabilities of AI with those of human experts using newspapers in four languages: The New York Times (English) from the United States, La Jornada (Spanish) from Mexico, The Hankyoreh (Korean) from South Korea, and Asahi Shimbun (Japanese) from Japan. By assessing the accuracy in each language, this study will highlight AI's strengths and limitations and contribute to the broader

conversation on how AI can revolutionize event analysis globally.

How to Make the World a Better Place: Qualitative Findings on Young People's Ideas of Political Participation and Expectations from Politics

Connecting to the overall concern of young people's diminishing trust in core political institutions such as governments, parliaments and political parties, this presentation explores young people's ideas of how they can contribute to social change. Our research is based on the theoretical approach of young people's agency (e.g., Nico and Caetano, 2021) which means understanding young people as actors of social change and as contributing to shaping society and politics. We have investigated if and in which ways young people feel responsible for making the future a better place, or, if they trust in adult institutions to solve the problems.

For our contribution in the roundtable session, we have used data which was collected in the frame of the "Global Gen Z Study" carried out with members of Generation Z aged 18-26 in 2022 in 31 countries worldwide (Seemiller and Grace, 2024). We have focused on the open survey question "How can your generation make the future a better place?" and consider short text answers from about N=500 Austrian young adults. For data analysis we have conducted thematic analysis on brief texts, applying the structured tabular approach (ST-TA) (Robinson, 2022). This approach combines deductive and inductive elements of qualitative data analysis and is well suited for analyzing a large number of brief texts.

In the process of data analysis, political action appeared as a main category of how young people want to engage for a better future: Thereby, political action includes conventional as well as unconventional forms of political engagement. The young people's voices contain many hints of how trust in political institutions could be reestablished. For example, they miss to be better represented in politics, and they would like to see politicians take action for a better future.

Developing Global Citizenship in a Multidisciplinary Cross-Cultural Study Visit on Urban Sustainability

The wicked problems of climate change, social inequality, and infrastructure challenges at municipal and community level require innovative solutions from multiple perspectives. The United Nation's Sustainable Development Goals aim to achieve a better and more sustainable world for all and tertiary institutions play a crucial role in educating students to make a significant contribution to global concerns. This paper describes the experiences of a study visit to Germany for 15 students from South Africa. The focus of the study visit was to exchange subject-related knowledge about infrastructure – water, green spaces, transport – in relation to politics/governance, the economy, social inequality and climate change among three disciplines (psychology, sociology, urban planning) as well as to discuss the use of social research methods to analyze infrastructure arrangements. We will firstly explain how we designed the study visit to address knowledge hierarchies and ensure inclusive and equitable education for all and secondly reflect on the experiences of the study visit and how well it prepared students for knowledge exchange and global citizenship.

"a Newfound Sense of Agency": Students' Experiences of Reducing Consumption and Consumerism

This paper will describe possibilities for change in consumption and consumerism amongst a group of master's students who participated in an intervention to reduce their ecological footprint. The intervention was implemented across three cohorts (2021-2023) of students in an environmental psychology course. Diaries, spreadsheets and course assignments submitted by the students were analysed to determine whether the intervention resulted in a reduction of their ecological footprint and to generate themes about how the students experienced the

transformative effect of the sustainable practices they chose on their consumption. We consider how theories on consumerism relate to our findings and indicate possibilities for bringing about sustainable behaviour patterns.

How to be Both: Water Shortage and Abundance As Crisis

Extreme weather changes in the Middle East and North Africa have exacerbated the chronic lack and damaging abundance of water. With regional temperatures exceeding 40 degrees Celsius, states have engaged in megaprojects designed to improve water security in the region and invested in new water technologies. Yet, while state-led development struggles to catch up with the lack and abundance of water, urban communities have developed their own methods of sustainable access to water, especially in times of crisis like the COVID 19 Pandemic. Communities lie at the crux of water supply, maintenance, and quality and water governance operates as part of self-built networks in urban milieus; and is constructed through grassroots efforts, and heterogeneous configurations of socio-technical relations. Negotiations between state, non-state actors and within communities determine how livelihoods are affected by water in/security such as food security, sanitation, and citizenship. My study explores how communities come together and compete to create networks of sustainable and localized efforts to guarantee access, supply, repair and maintenance of public commons such as water. This research builds on doctoral study on the role of the state in urban water security in Cairo (Egypt) to map infrastructural community efforts in informal and elite neighbourhoods. Since the pandemic and under International Monetary Fund conditionalities, the Egyptian state is steadily removing subsidies for water and energy prices, leading communities to depend on self-help networks to provide their basic needs. I employ qualitative research methods to study grassroots resilience practices to analyse future pathways for development.

Strategic Scaling in Alternative Food Initiatives: Expanding Neo-Materialist Movements through Institutional Engagement

Alternative, localised food initiatives address the inherent problems of the industrialised, globalised food system. This paper builds on a conceptual framework for understanding the scaling strategies of consumer collective action within these initiatives through the lens of neo-materialist movement organisations (NMMOs), which are collective endeavors that foster experimental initiatives, bringing the material aspects of collective action to life. They challenge neoliberal capitalist structures at the local level by spreading values and practices centered on sustainability, solidarity, and communal well-being—values often marginalized within the mainstream food system.

This paper examines four strategic NMMO scaling pathways – scaling deep, scaling up, scaling out and scaling through. **Scaling deep** entails transforming individual beliefs, practices, and everyday consumption patterns to engender more profound cultural shifts. **Scaling up** concentrates on amplifying collective demands, exerting pressure on systemic structures, and influencing public policies to enact broader societal changes. **Scaling out** places emphasis on replicating successful initiatives across diverse contexts, creating networks that connect local actions globally. Finally, **scaling through** engages directly with institutional frameworks, such as local governments, to transform existing structures from within.

The paper places a notable focus on the scaling through strategy, a perspective that has been relatively underrepresented in the context of alternatives, including food initiatives. By engaging with local governments and permeating institutional frameworks, NMMOs can extend their influence beyond local contexts, thereby catalysing systemic change within the mainstream food system. This paper makes a contribution to both theoretical and empirical discussions on food system capitalism by elucidating the ways in which values such as sustainability, solidarity, and equity can be effectively scaled. Within agrifood contexts our perspective ultimately addresses the deficiencies of the current food system and fosters the development of a more just and sustainable future.

WAITES, MATTHEW* (University of Glasgow, United Kingdom)

Genocide, Necropolitics and Anti-Homosexuality in Uganda: Sociological and Critical Analysis

This paper discusses how the Anti-Homosexuality Act of 2023 in Uganda relates to concepts of genocide and necropolitics. The author has previously published an article in the *Journal of Genocide Research* in 2018, which related the concept genocide to earlier anti-homosexual processes in Uganda. Since then, certain leading activist voices associated with the Ugandan LGBTI+ movement have invoked ideas such as early warning signs of genocide in their public statements. Meanwhile the concept genocide has become used by certain actors in LGBTI+ politics in Western contexts such as the United Kingdom and in the United States. Analysis of genocide in relation to sexualities and genders, including homosexuality but also wider conceptual frames, has expanded through published contributions. Yet the relationship between the conceptualisation of genocide and Mbembe's concept necropolitics lacks adequate discussion in such respects. This paper will discuss the relationship between theoretical conceptualisations of genocide and of necropolitics as these relate to anti-homosexuality, including consideration of how the sociology of genocide and sociological consideration of necropolitics can contribute to analysis. Methodologically the paper will proceed through examining Uganda's Anti-Homosexuality Act 2023 and responses and resistances to it, including in online media comments from leading Ugandan LGBTI+ activists and commentators. Implications in African and global contexts can be considered.

RC02-JS-198.1

WALBY, SYLVIA* (Royal Holloway, University of London, United Kingdom)

Theorising Violence and Society

Political economy rarely gives prominence to violence in its theory. Feminist and postcolonial theories often give more prominence to violence and less to political economy. This paper will review this tension and seek to resolve it for social theory. Political economy often marginalises violence in its theory of society, with detrimental consequences for theorising coloniality and gender inequality. Even when violence is noted, there are two types of problems. One is that violence is merely described empirically as if it has little causal impact (Wallerstein, Harvey). A second is that the term is over-extended into symbolic or other forms of harm (Bourdieu) thereby losing its specificity as a form of power (for example, I will argue that sanctions are not violence). There are exceptions, where coercion and consent are distinguished as part of a theory of crisis (Gramsci). Postcolonial (DuBois, Go, Williams) and feminist (Kelly, MacKinnon) theories show the importance of including violence at a theoretical level for the analysis of empire, slavery, decolonisation, domestic subordination, and trafficking. Violence is connected to political economy since reducing inequality and increasing the depth of democracy reduce violence. Including violence in theory improves the analysis of the intersection of class, coloniality and gender inequalities. Further, this is essential to understanding the authoritarian turn. Debates within feminism about whether some calls to mobilise the state to address violence against women are carceral and authoritarian rather than progressive, are often shaped by differences towards the relationship between political economy and violence (Davies, Fraser, Bernstein, Crenshaw). In conclusion, I argue that violence should be theorised as an institutional domain, alongside economy, polity, and civil society in a theory of society to enable better analysis of the intersection of capitalism, coloniality and gender, and of projects for societal change and transformation.

Classrooms for Climate Justice: Educators' Use of Images in Justice-Oriented Approaches to Climate Education

In this paper, we reflect on the pedagogic value of images to prompt discussions about climate justice, and thereby engender more democratic learning on climate and interrelated justice issues. Since the publication of Agenda 21 (United Nations, 1992), education has been promoted by the United Nations Educational, Scientific and Cultural Organisation (UNESCO) and national governments as an indispensable tool for sustainable futures, particularly in the context of climate change. Subsequently, scholars have advocated for more justice-oriented approaches to teaching on and talking about climate change. Justice-oriented approaches can support students and teachers as they engage with the differential impacts and implications of climate change, as they process emotions, and as they reflect on their responses to climate change in the context of emerging citizenship and unequal political opportunities (Bryan, 2022; McGregor & Christie, 2021; Verlie, 2022; Walker, 2024). These are complex but urgent questions and, to date, little research has considered the use of images in generating dialogue and personal and collective reflection around climate justice, and thus in further supporting justice-oriented climate education.

The paper will showcase and discuss images used in research activities for the 'Classrooms for Climate Justice' project, conducted by the authors with primary and secondary educators in England and Ireland. In this project, educators first reflected on the opportunities and challenges of raising intersecting justice aspects of climate change they encounter in their teaching. Through image-based focus group discussions inspired by the Inquiry Graphics method (Lackovic, 2020), educators then collectively imagined and individually designed a climate justice pedagogic intervention. In the paper, we will present images used in the focus groups, and discuss how they promoted dialogic peer-peer learning between educators, and how they were used by educators in the course of their climate justice pedagogic interventions.

WALKER, SARAH* (University of Bologna, Italy)

GIACOMELLI, ELENA (University of Bologna, Italy)

"Fishing communities' blues - the impacts of the climate crisis in Senegal"

Drawing on research conducted for the EU-funded project #ClimateOfChange, this action-research documentary focuses on the climate crisis in Senegal and its devastating impacts on the livelihoods of those living in fishing communities around Dakar and Saint Louis. Due to a combination of the climate crisis, overfishing (including by the EU), rapid urbanisation, as well as waste, some fisherfolk feel they have 'no choice' but to risk their lives crossing the Atlantic Ocean to Europe. Through the stories of local people and activists, the film draws attention to the ongoing colonial continuities underpinning the climate crisis and the structures of racial capitalism that create socio-spatial inequalities in environment and mobility, with a particular focus on the role of the EU. A counternarrative is then given to contest depoliticised narratives of climate migrants as threat to the Global North, visibilising instead the unequal power structures at the heart of the climate crisis.

Writing for Research Review, Collaborative Writing and Open Research

Presented jointly with Dr. Su-ming Khoo, this session discusses strategies and considerations for academic writing and editing at different career stages – for early-career, mid-career and established authors. It explores different writing strategies that academics can attempt as sole author, as part of collaborative research, through collaborative methodologies, collaborative theorizing and through different types of writing projects.

We discuss some considerations when writing for different academic formats, audiences, and impact, covering some of the following, with special emphasis on creativity in academic writing and the possibilities of open research, collaboration and open publishing:

- Setting up collaborative writing
- Finding writing time and embedding your writing practice
- Responding to calls and writing an abstract
- Responding to reviewers and editors
- Collaborative research and writing
- Open research, writing and publication strategies
- Pitching and publishing in popular publications

The session forms part of a proposed RC09 professional development programme, which is targeted primarily at PhD early career researchers and new members, aiming to enhance professional writing skills and help to build academic networks.

Equipping Sociologists and Citizens to Contribute to Public Discussions of the Anthropocene: A Practical Guide to Amplifying Youth Voices

Recognition of the Anthropocene and environmental concerns accompanying it are unsurprisingly evident in the concerns of young Australians about climate change. Until relatively recently, under the previous federal government there was a decade of inaction in relation to the issues and concerns of young people. The author sought to amplify young people's voices.

Although some disciplines already contribute to public debates, sociology could be better positioned at the centre of debates regarding the conditions of living with and in the Anthropocene. This presentation provides a practical guide to better equip sociologists and citizens to contribute to public and government discussions of the Anthropocene in relation to individual and collective capacities to live together in such an epoch.

Since 2021, the Australian Youth Barometer (Walsh et al., 2024) series surveyed over 2,500 young Australians aged 18-24 and interviewed 150 to highlight the experiences of young people on a wide variety of areas, such as climate anxiety. The series routinely gained significant media engagement (with probable audiences of millions), as well as governments and organisations seeking to improve the lives of young people. This presentation walks through the deliberate strategy to achieve this reach, as well as the methodological limitations of such an approach, such as questions of contested knowledges. Whose knowledge counts? Can lived-experience be captured in the approach outlined above? This presentation traces how forms of knowing in a relational sense are prioritized (by "adults"), with potentially dire consequences to societal change.

Understanding how to better engage publics and inform government can enable sociology to contribute to improved understanding and responses to aspects of young people's social worlds, such as environmental justice. This presents productive possibilities and new questions when conditions of the Anthropocene are taken seriously; particularly in relation to climate adaptation and its sociological, ontological and practical implications.

RC20-JS-218.3

WALTHER, LISA* (University of Hannover, Germany)

Boundaries in Case Study Research - a Process-Oriented Perspective

In case study research, boundaries and process orientation seem to be interrelated. In the context of case studies in social science, the most frequently cited author defines a case study as "an empirical method that investigates a contemporary phenomenon (the 'case') in depth and within its real-world context, especially when the boundaries between phenomenon and context may not be clearly evident" (Yin 2018, p. 15). The literature on case study research posits that case studies are not merely an empirical method. They are more commonly defined as a 'research design' (Merriam

1998) or a 'research strategy' (Pflüger 2023), which more accurately reflects the processual nature of case study research. Although Yin recommends defining the case and its boundaries at the outset, he acknowledges that these boundaries can be fuzzy. It is not only Yin who employs the term 'boundaries' to describe case studies. In her qualitative case study approach, Merriam also employs the term in her definition: "A case study is an in-depth description and analysis of a bounded system" (Merriam 2009, p. 40).

But how do we delineate the boundaries of a research process? What types of boundaries exist? Can the boundaries change during the research process? If so, how do they change and by whom? The aim of this contribution is to respond to these questions, by sharing and reflecting on my experiences in conducting a case study.

The case study material is part of a research project investigating paths of knowledge transfer in biomedical research at universities and non-university research institutions in Germany that lead to new drugs and therapies. Our case is the research and development process of PSMA-617, a medicine used to treat metastatic prostate cancer. The multi-methodological research design enables us to address micro-, meso-, and macro-perspectives on the research and development process.

Health and Well-Being of Children in Kinship Care: Patterns and Mechanisms

Caregiving setting plays a critical role in shaping children's health and development. Due to their distinct family dynamics, children in kinship care (i.e. those living with people other than parents) require special scholarly attention. While some studies have evaluated health outcomes for children in kinship care, the varied circumstances of these arrangements call for more research on the heterogeneity in kinship care settings. Also, it is unclear through which mechanisms nonparental caregiving settings may affect children's health and well-being.

With data from the National Survey of Children's Health (2011-2012) and the 2013 National Survey of Children in Nonparental Care, this study will start with a categorization of kinship care based on the level of child welfare system involvement: (1) public kinship care, where child welfare agencies hold legal custody and place children with relatives; (2) voluntary kinship care, where children are placed with relatives by child welfare agencies but legal custody remains with the parent or caregiver and (3) private kinship care, where relatives care for children without child welfare involvement. Then, I will compare the health outcomes of children in each type of kinship care to their counterparts in parent-led families. The outcomes to be assessed include physical, developmental, and emotional conditions, as well as healthcare access. Considering that the probability of being in each type of caregiving setting differs considerably across children, I will use the Generalized Propensity Score method to adjust for potential selection bias. Finally, to identify factors that may explain the health effects of kinship care settings, I will test the mediating effects of two important mechanisms: caregiving behaviors (e.g., emotional support) and caregiving resources (e.g., family resilience, received help coordinating care, etc.). For the categorical health outcomes, I will use a recently developed mediation analysis method that addresses re-scaling issues in non-linear models.

Making Sense of Temporariness in China's Immigration System: An Institutional Ethnography of International Students' Experiences

Statistic data reflects that China has gained increased popularity among students as an international study destination; however, existing scholarship also reveals that China faces great challenges in streamlining its immigration rules to regulate foreign students' migration. Our research analyzes international students' experiences in China using the Institutional Ethnography methodology. We analyze empirical data collected through 22 interviews with international students in China. Results reveal that the easy access to scholarships and the lenient visa regime help China enhance its competency in the international educational market, but the lack of post-migration transition pathways within China's immigration regime might impair the sustainability of the Chinese immigration progress. To provide additional perspectives, we also conduct systematic document analysis to analyze China's immigration latest laws, regulations, and policies that affect

foreign students' study-to-work transition. During the data analysis stage, we use temporariness as a central analytic lens. We reveal that temporariness is a key factor that shapes international students' adaptation patterns and post-graduation strategies. We argue that China is a beginner to strengthening national building through immigration; its further immigration policymaking should give consideration to the correlation between immigrants' permitted length of stay, their contributions to thriving national economy and cultural enrichment, and their human rights protection.

Being Gay and Grey in Taiwan: Ideological Codes behind the Interview between Young and Old Gay Men

This presentation reflects on the oral history interview project I collaborated on with the LGBTQ+ Hotline in 2005, focusing on the lived experiences of older gay men. It explores the social organization of misunderstanding occurs in the interview between younger and older gay men. Using ideological codes from institutional ethnography, I analyze the barriers that hinder younger gay men from accessing the life experiences of older gay men during the oral history interviews.

The first ideological code is "identity." For younger gay individuals, identity is the starting point of their homosexual identity; therefore, they often ask, "When did you start identifying as gay?" In contrast, for older gay individuals, their experience begins not with identity but with behavior, so the same question would be, "When did you start having relationships with men?" or "When did you realize you liked guys?"

The second code is "marriage." For younger gay people, rejecting heterosexual marriage is seen as a sincere acknowledgment of their gay identity. However, for older gay men, marriage was something that everyone was expected to undertake, and for them at that time, there were no other choices.

The third code is "coming out." For younger gay men, coming out is a daily performance confirming their gay identity, and it is common for them to discuss LGBTQ+ topics openly. On the other hand, older gay individuals who grew up during the period of martial law view their gay identity as unspeakable; public displays of homosexuality could cause anxiety.

The mutual understanding between different generations of gay men could not be taken for granted. The ideological codes embedded within age, class, and educational disparities create barriers to solidarity within the LGBTQ+ community during interviews. The oral history project is a political action to reveal and to transcend these ideological divides.

Frames of War and War Perceptions: Towards a Renewed Conceptualization of the War-Society Nexus

This paper aims to establish a theoretical foundation for the analytical framework essential to a comprehensive understanding of this monograph's overarching themes. In so doing, it also makes contributions to advancing the research agenda in the sociological exploration of war-related issues. Drawing upon Judith Butler's seminal work, combined with the Goffmanian sociology of frame analysis, first I aim to conceptualize frames of war in a way that will offer innovative insights into the intricate relations between war and society. I will furthermore introduce the concept of war perceptions as the way in which war is perceived by members of different societal sectors—policy-makers, journalists, specialists, professionals, civic activists, and ordinary people—emphasizing its relationship to frames of war and its dependence on social, cultural, and historical contexts. Specifically, war can frame society by shaping people's perceptions of war; conversely, war perceptions can also profoundly influence the risks that certain societies become involved in warfare. Through the illustrative cases of Eastern Europe and East Asia examined in this monograph, our analytical framework can help comprehend the complex interplay between war and society in the contemporary global context, using a comparative lens that considers the diverse natures of historical events, geopolitical tensions, and cultural identities. Finally, echoing West and Matthewman (2016)'s invitation for a sociology of war and the military that gives more attention to the influence of state violence on the shaping of social relations, the conclusion suggests directions for future research in light of the analytical framework elaborated here and highlights valuable insights that can be obtained from integrating sociological perspectives into the study of war-related issues.

Subnational Welfare Variations in Social Protection Programs: A Comparative Analysis between Big and Small Cities in East Asia

Cross-national comparative welfare studies often neglect subnational variations in welfare design, obscuring the extent of geographic equity in welfare rights within societies. By examining welfare disparities within countries, the relative positions across societies can vary substantially. In this paper, we focus on East Asia (Japan, South Korea, Mainland China, and Taiwan) and aim to challenge methodological nationalism in welfare literature. Our objective is to compare the generosity of social protection systems both across and within these four East Asian societies. To achieve this, we have selected cities representing the top and bottom 10 percent in population size within each respective society: Tokyo, Aomori, Seoul, Iksan, Beijing, Tongchuan, Taipei, and Chiayi. Employing a model family approach, we collect income packaging data for three hypothetical family profiles (single adult female, single mother with one child aged 5 years, and two adults with two children aged 7 and 14) across three income levels (no earnings, 50% and 100% of national average earnings), totaling nine families per city. The income packaging data encompasses labor income, income tax, social security contributions, essential costs, and social benefits. Our results reveal the most pronounced discrepancies in welfare entitlements between big and small cities in Taiwan and mainland China, while regional disparities are comparatively minimal in Korea, followed by Japan. To deepen our understanding, we incorporate additional data to explore whether these findings stem from differences in the cost of living, the presence and tolerance of inequality, fiscal capacity, or demographic factors.

Diaspora Diplomacy and the Geopolitics of Standards: Chinese Tech Entrepreneurs in Kenya

The growing body of scholarship on Global China has called for a closer examination of the eventful moments when Chinese capital, enterprises, and models expand beyond national borders. Recent studies on the geopolitics of standards highlight China's increasing participation in international standardization bodies, reflecting a strategic shift by the Party-state. This phenomenon can be understood as part of what STS scholars describe as the "middle of the event"—the active construction of technical zones for global markets and "trans-territorial production" spaces, where existing standards are challenged and redefined.

In this eventful moment, this paper draws attention to a surge in Chinese tech professionals venturing abroad to establish their own businesses. These professionals, through their everyday negotiations and mediations, may serve as informal agents of diaspora diplomacy. We adopt a "low-flying" approach to observe the bodily practices of Chinese tech entrepreneurs as they intervene in the global geopolitics of standards in Kenya. These interventions are not merely peripheral; they often disrupt and transform production chains through practices of imaginary new geographies construction and resultant spatial reconfiguration. For example, through their entrepreneurial activities, products originally "made in China" are rebranded as "made in Kenya."

Our analysis of three cases—Golden Lion in battery production, Transsion in mobile phones, and Konnect in broadband services—allows us to explore these entrepreneurs' roles as liminal actors operating between domestic and foreign spheres. The heterogeneity of this tech diaspora complicates the simplistic portrayal of China's global economic expansion as driven solely by statist actions. Instead, these actors navigate and shape a complex terrain, reflecting the broader dynamics of authoritarian capitalism, where the Chinese state's reach is mediated by market forces and informal practices in foreign contexts.

WANG, JUNWEN* (The Chinese University of Hong Kong, Hong Kong)

Comparative Analysis of Socioeconomic Gaps on Achievement Test Scores: A Rank-Based Approach

Comparative studies of educational inequality often face challenges in ensuring comparability because the marginal distribution of original data in each country sample can affect the estimation of the impact of children's family socioeconomic status (SES) on educational achievement. In this study, we aim to apply rank-based methods to address these problems.

We introduce a theoretical construct called Generalized Socioeconomic Status for Origin (GSESO), which aggregates multiple content dimensions of the socioeconomic status of a child's family, including parental education, parental occupational status (ISEI), household income, and household wealth. Using data from 11 societies in the PISA 2012 survey, we compare the effect of GSESO on children's educational achievements. Given the unidimensional structure of GSESO, we use this unidimensional measure as the independent variable. Testing scores are the dependent variable. For parental education and occupational status, we used the highest value of either parent. Household wealth was measured through a series of possessions aggregated by principal component analysis (PCA). To ensure comparability, we applied percentile ranking transformations to these variables, eliminating the impact of marginal distribution differences across societies. Multiple imputation was used to address missing data problems. We used PCA to test dimensionality and found strong evidence for a one-dimensional composite measure.

According to copula theory, applying percentile ranking transformations to the dependent and independent variables ensures that the parameters of GSESO are free from the marginal distributions in each society, as their percentile rankings follow the uniform distribution. Finally, we use rank-rank regression to estimate the impact of GSESO on educational outcomes.

RC55-846.5

WANG, JUNWEN* (The Chinese University of Hong Kong, Hong Kong)

Generalized Socioeconomic Status of Family Origin: A One-Dimensional Index for Comparative Research on Educational Achievement Inequality

Comparative studies of educational inequality often face challenges in ensuring comparability. First, the marginal distribution of original data in each country sample can affect the estimation of the impact of children's family socioeconomic status (SES). Second, while composite indices for SES are not new, their feasibility and validity in comparative studies remain underexplored.

This study develops a theoretical construct of Generalized Socioeconomic Status for Origin (GSES-O), aggregating multiple socioeconomic traits of children's families. We aim to assess the dimensionality and comparability of the GSES-O measure to ensure its validity and facilitate its application in cross-national datasets.

Using data from 11 societies in the PISA 2012 survey, we examined the big four content dimensions of GSES-O: parental education, parental occupational status (ISEI), household income, and household wealth. For parental education and occupational status, we used the highest value of either parent. Household wealth was measured through a series of possessions aggregated by principal component analysis (PCA). To ensure comparability, we applied percentile ranking transformations to these variables, eliminating the impact of marginal distribution differences across societies. Multiple imputation was used to address missing data problems. We used PCA to test dimensionality and found strong evidence for a one-dimensional composite measure.

The results suggest a unidimensional structure among the four GSES-O content variables across the 11 societies. PC1 explains 45%-68% of the variance, while PC2 accounts for 10%-23%. The absolute and relative dominance of PC1 supports the unidimensionality of the GSES-O measure. Preliminary robustness checks using PISA 2006 data also support these findings.

A unidimensional measure of GSES-O suggests that it is conceptually and methodologically feasible to apply in future comparative studies of SES achievement gaps. Further analysis will extend to additional waves of PISA and TIMSS to strengthen the evidence and conduct robustness of the evidence for this unidimensional measure.

Gendered Integration and Remigration Strategies in China's Internal Migration: Through the Lens of Risk Shaped By Institutions

This study focuses on how institutional factors, represented by the household registration (hukou) system, a form of civic stratification, and social norms jointly influence the risks and coping strategies in the migration process, and ultimately shape migration outcomes— integration and remigration, within a China internal migration context. A mixed-methods approach is employed in this paper, drawing on data from the China Labor-force Dynamics Survey (CLDS) from 2012 to 2018, and 35 semi-structured interviews conducted with migrants and natives in Shanghai.

The hukou system limits migrants' access to local social welfare and public services, creating a stratified civic structure that restricts their social integration and impacts remigration decisions. This paper explores how integration outcomes and remigration intentions are closely linked to migrants' risk perceptions. Migrants balance the uncertainties of remaining in cities against economic opportunities and long-term stability, further shaping these decisions by family needs and prospects for their children.

Gendered social roles play a critical role in shaping migration outcomes. While male migrants often face economic pressure to support their families, female migrants experience different dynamics. Women are less burdened with financial responsibilities, reducing perceived risks, and are more likely to remain in host cities or relocate to nearby areas rather than returning to their hometowns. They are more likely to expect to mitigate the disadvantages of non-local Hukou status through marriage. However, women's bargaining power in the market is also shaped by their hukou statuses, which may impair their agency, especially for those higher SES groups. Caregiving duties, social expectations, and career advancement disadvantages often push women toward returning to their hometowns.

The study argues that the interaction between institutional constraints and gender roles underpins integration and remigration decisions, offering a nuanced understanding of how internal migrants in China cope with migration risks and opportunities.

WANG, LUPING* (University of York, United Kingdom)

Gendered Phenomenon of Remigration Choice: A Case from China's Internal Migration

This paper explores the gendered dynamics of remigration within China's internal migration, examining how societal expectations and institutional constraints shape remigration decisions for both genders, through a life-course lens. Traditional migration theories, primarily centred on economic motivations, overlook female migrants' distinct experiences, shaped by caregiving responsibilities and limited career mobility. Recent studies position migration as a gendered process, highlighting how gender interweaves with migration outcomes.

Drawing from 35 interviews with migrants and natives in Shanghai, this study explores how men and women experience contrasting trajectories in their remigration decisions. Male migrants often view return migration through an economic lens, driven by the desire to reduce the financial burden of family support in high-cost cities. In contrast, female migrants may find fewer economic opportunities but also experience less pressure to be the primary earners for their families, making it more feasible for them to remain in certain cities or relocate to other cities, and they are more likely to mitigate the disadvantages of non-local household registration (Hukou) status through marriage. However, women's bargaining power in the market is also shaped by their hukou statuses, which may impair their agency, especially for those higher SES groups. Caregiving duties, social expectations, and barriers to career advancement often push women toward returning to their hometowns.

Using a life-course perspective, the research highlights opportunities, challenges and expectations that differ across genders in different life stages, particularly before and after their first marriages. This approach reveals how gendered (in-)justice is experienced and navigated by migrants, showing both the reproduction of societal norms and the coping strategies, interweaved with institutional constraints of the hukou system, a form of civic stratification. This study contributes to understanding the intersection of gender and internal migration under China's unique social and institutional conditions.

Comparing Social Openness: A Tale of Two Mobility Regimes

Comparative studies centering on long-term trends in social mobility have attracted much attention in recent years (e.g., Zhou & Xie 2019; Bukodi et al. 2021; Xie et al. 2022), which encounter challenges related to margin sensitivity and multidimensional analysis. This paper compared the intergenerational status closure (IGC) of China and the United States using a rank-based method, namely, the Latent Copula (LACOP) framework, which enables multidimensional closure analysis and provides estimates that are independent of differences in marginal distributions. We draw on two similarly designed data series, supplemented by the 1996 survey of Life Histories and Social Change in Contemporary China. By pooling data from GSS (1972-2018) for the USA and nine waves of CGSS for China, we conducted a comparative analysis of the status of IGC for four decades of birth cohorts (1946-1985).

The LACOP framework enabled us to uncover three sets of comparative results that are challenging or impossible to obtain using other methods. (1) Level of overall status IGC: (a) the levels in China are more than double the levels in the USA; (b) farm-sector (farm-nonfarm) barrier is the main source of status IGC for China but trivial for the USA. (2) Trend of overall status IGC: (a) the level has been stable in the USA, but steadily declining in China, (b) the reasons for the decline in China are the sizable reduction in the farm-sector barrier (slope-reduction effect) and the rapid shrinkage in the relative size of the farm sector (compositional shift effect). (3) Nonfarm status IGC: net of the farm-sector barrier effect, the level of nonfarm status IGC is numerically and statistically the same and persistent for both countries. Paradoxically, then, the urban population in China has long shared the same low level of relative mobility as those in capitalist America.

Skill Transformation and Precarious Employment in China: A New Form of Segmented Labor Market in the Era of Artificial Intelligence

In recent years, the profound impact of Artificial Intelligence and related technological changes on China's labor market has garnered increasing scholarly attention, particularly regarding the implications of AI on precarious employment (Xie et al., 2021; Zhou et al., 2020; Wang et al., 2022). This study employed large-scale online job advertisement data to investigate the skill requirements and its impact on precarious employment in China. Utilizing unsupervised machine learning methodologies, detailed skill sets were identified and categorized based on real-time labor market data to reduce biases and offer a more precise evaluation of occupational skill structures. By integrating insights on these structures derived from big data with individual-level information sourced from the China General Social Survey (2012-2021), this study investigated the impact of skill transformation on the prevalence of precarious employment. The analysis yielded three key findings: 1) Varied skill dimensions have distinct effects on job security, with individuals engaged in STEM-skill-intensive occupations exhibiting lower vulnerability to precarious employment, while those in manual-skill-intensive and service-skill-intensive occupations facing heightened job insecurity. 2) The cross-wave analysis revealed a growing positive impact of creative-operating skills in mitigating the risk of precarious employment, alongside an escalating negative impact of routine-cognitive skills. 3) Classification of occupations into competitive-skill and uncompetitive-skill categories highlighted a widening gap in the likelihood of precarious employment between these two groups. These findings suggest the emergence of a segmented labor market driven by skill transformation in China amidst the era of artificial intelligence.

Tucao: Unveiling Social Injustice and Education with a Chinese Culturally Responsive Feminist Interview Approach

This study introduces *Tucao* (吐槽) as a culturally responsive feminist interviewing approach, applicable to research on education and social justice in China's context. I argue that *Tucao* serves as a platform for expressing frustrations, criticisms, and complaints. While mainstream narratives often dismiss these complaints as unproductive, *Tucao* holds profound potential in breaking silences, challenging normative discourses, and creating a shared space for catharsis and empowerment.

Drawing upon the research process where I conducted a study on race and education in China, I create and develop *Tucao* as a culturally responsive feminist approach to interview and reflect on the significance of this approach in critical education research. This innovative method enriches the scope of qualitative inquiry by integrating culturally responsive practices into research design, yielding locally relevant and socially significant knowledge and pushing the boundaries of conventional interview techniques.

RC05-84.4

WANG, SHULING* (University of Southampton, China)

"Parents Just Want Foreign Teachers": Chinese Women Quietly Resisting the White Profitability of the English Language Industry

English language teaching (ELT) is a racially stratified industry that privileges whiteness as a norm. Research on race in China's ELT industry has centered on the experiences of White, particularly male, teachers, which risks normalising whiteness in the field. This Women of Colour feminist research explores Chinese women teachers' experiences, and reveals how the industry constructs whiteness as a profitable investment for Chinese people—and, in so doing, constructs Chinese women as subordinate, exploitable, and ineffective teachers. It then highlights the strategy of quiet resistance these teachers deployed to resist racism in the workplace. While this study focuses on the Chinese context, the study introduces the concept of "White profitability", which is useful in understanding how the commodification of whiteness underpins intersectional racism experienced by teachers of colour in the global ELT industry. The study contributes methodologically, empirically and theoretically to understanding and interrupting intersectional racism in English-language education.

Mental Health, Intergenerational Gap, and Cultural Conflict Among South Asian Ethnic Minority Youth in Hong Kong: A Qualitative Study

Mental health of ethnic minority youth has been extensively studied. However, extant literature has been mostly focusing on Western multicultural societies, while the Asian context is largely overlooked. Among the mental health stressors, intergenerational gaps and cultural conflict between parents and children have been proven to affect youth mental health. However, nuanced exploration of how the gaps and conflicts manifest is limited. Also, the existing literature on Asian immigrants in Western societies has been discussing the contrast between collectivism and individualism in family relationships, while the cultural value conflicts of Asian immigrants in the Asian context are largely ignored. This qualitative study explores how South Asian ethnic minority youth experience intergenerational gap, cultural conflict, and related psychological distress in Hong Kong, a multicultural Asian society. Four themes were identified: (1) limited parental awareness and involvement in youth's education; (2) conflict between homework and housework for girls' education; (3) authoritarian parenting for male children and neglectful parenting for female children; (4) taboo and stigma of mental health problems and help-seeking in South Asian family. Unlike the more explicit cultural conflicts in Western societies, the intergenerational gap and cultural conflicts of the South Asian youth in Hong Kong are more implicit, hidden, and subtle, because the South Asian culture is partially similar to the Chinese culture. This hidden conflict makes it harder to solve South Asian youth's mental health issues. Our findings provide policy implications for policy of education, social work, and mental health services.

Unique Low Fertility Patterns and Their Causes in the Demographic Transition of East Asia

The major economies of East Asia have undergone a profound transition from high fertility rates to levels far below replacement, becoming global "fertility gaps." These economies, deeply influenced by shared cultural factors, face the common challenge of low fertility. Therefore, exploring the trends, causes, and potential mechanisms of fertility changes within East Asia's cultural context offers important insights for understanding and addressing China's fertility issues. This paper analyzes East Asia's distinct fertility patterns, including low rates of non-marital births, delayed marriage and childbirth, declining birth order, increasing lifetime unmarried rates, and a preference for male children. These patterns result from both global factors and region-specific

influences. Direct factors include "compressed modernity," which has driven transformations in family and social structures, while expanded education has shifted women's economic status and attitudes towards marriage and childbirth. Economic uncertainty and the high costs of child-rearing also constrain decisions about marriage and fertility. At a deeper level, Confucian values centered on familism, collectivism, and elitism shape gender roles, family divisions of labor, intergenerational relationships, and fertility preferences. These values influence educational priorities and the psychological costs of parenting, limiting the effectiveness of policy interventions. The persistence of low fertility rates and East Asia's unique fertility patterns suggest that Confucian culture's influence on fertility is neither singular nor static. As economic, social, and cultural conditions evolve, so does the impact of Confucianism on fertility. This provides crucial guidance for future fertility policies. East Asia should recognize its unique cultural constraints and integrate Confucian values into policy design. Emphasizing family harmony and intergenerational support, policies must align with shifting traditional values to enhance cultural sensitivity and societal impact, ultimately promoting long-term population balance and sustainable development across the region.

Digital Violence Against Chinese Feminists: Nationalist Hatred or a Ground for Feminist Solidarity?

While digital technology has been extensively utilised by feminists to facilitate their activism, it has also become a breeding ground for hatred and violence against them. In the context of China, digitally mediated violence against feminists is interwoven with not only misogynist online culture but also a solid nationalist sentiment that the regime has been promoting. On the other hand, the state's control of public discourses and suppression of social conflicts obstruct feminists' resistance to pervasive anti-feminist speech and actions. Despite the increasing research on recent feminist movements in China, what kinds of violence Chinese feminists encountered and how they grappled with the violence have received limited scholarly attention.

This research aims to map out how the repressive regime in China shaped the intricate dynamics between feminists and their adversaries. Drawing upon interviews with feminist activists and ethnographic observations in online feminist communities, it investigates Chinese feminists' experiences of digitally mediated violence and their strategies for resistance. The findings suggest that China's nationalist propaganda played a critical role in the growth of recent years' anti-feminist forces. Meanwhile, the authorities' online censorship and their apathy of digital (and in some cases extended to offline) violence impede the feminists' defence against anti-feminist narratives and actions. However, the feminists refused to remain passive in the face of such nationalist hostility. They have been actively engaging in countering digital violence and, more impressively, employed violence as an effective means of mobilising the public and building solidarity among women.

Livestreaming Genocide? – How Digital Media and Technologies Transform Social Movements in Solidarity with Palestine

Digital media have empowered people in organizing transnational activism without limits on time, space, identity, and ideology (Bennett, 2003; Castell, 2010; Howard & Hussain, 2013; Olaniran & Williams, 2020). Theories of social movements (McAdam, McCarthy & Zald, 1996; Meyer & Tarrow, 1998; Tarrow, 2011) explain how diaspora communities could transform regional resistance movements into transnational solidarity campaigns through the use of digital media (Kumar, 2018). For decades, Palestinians in Israel/Palestine and the diaspora have utilized digital media to amplify the effects of political activism beyond the borderlines (Kumar, 2018; Siaper, 2014; Shehadeh, 2023; Tawil-Souri & Aouragh, 2014). The genocide in Gaza since October 2023, which Palestinian writer Susan Abulhawa described as "the first livestreamed genocide in history" (Sanders & Al Jazeera Investigative Unit, Al-Jazeera, 2024), has further transformed the ways in which local and global social movements and collective actions connect and take place.

This proposed research will critically look at how changes in the narratives and the framing of the #FreePalestine movements across the globe transform and reshape online and offline social movement spaces and discourses. It seeks to illustrate the extent to which mediated visualities (Mirzoeff, 2018) are interconnected with the nexus of power, shaping the perception of humanity within the realm of Palestinian resistance and activism. This proposed research asks the following questions: How do the portrayals and representations of Palestinians become intricately involved in the visual politics of who is considered human, what it means to bear witness, and how one should respond in the context of humanity, and ultimately shape and transform movements led by diasporic Palestinians on the ground?

TG12-JS-36.2

WANG WANG, KUANYUN* (York University, Canada)

Who Cares? – What It Means to (Continue to) Love and Hope during a Genocide

At least 40,000 Palestinian lives have been killed in Gaza, as October 7, 2024, marked the first anniversary of the genocidal campaign unleashed by the Israeli government since October 2023. UN Deputy Secretary-General Amina Mohammed described it as the loss of its "moral compass" among international communities' inaction to stop the genocide. The haunting images and news continue to roll out from the ground in Gaza. On the one hand, digital media and technologies brought "truths" and emotions right in front of distant spectators in the West, forcing the gazes to be met. The genocide in Gaza has undoubtedly transformed the ways in which local and global social movements and people across nation-state borders "connect." On the other hand, while lives are undeniably devastating in Gaza and the West Bank, which are undergoing ongoing genocide and ethnic cleansing, Palestinians living in the diaspora have been continually and systemically gaslit by the colonial regimes and experiencing extreme guilt and pain from reliving the intergenerational trauma of the ongoing dispossession and displacement since the 1948 Nakbah.

However, an unprecedented sense of strength, love, unity, care and community belonging has sprung out and grown from the effects of this genocide at the same time. This has become increasingly evident through my fieldwork interviewing over 30 Palestinian women who have been advocating for the rights and liberation of Palestine in Canada. I also observe their activism works in various forms online and offline. By scrutinizing the diverse conditions of production, circulation, and reception of digital media that shape the visual and discursive construction of humanity and contemporary warfare on transnational, national and local scales, this proposed research examines critically how transnational solidarity and community/self-care are facilitated and made possible in the context of the interconnected world we are currently living in.

Refugees on the Polish-Belarusian Border: Between Suffering and Being an "Object" of a Political Game

This paper is an attempt to grasp the pitfalls and paradoxes of providing assistance in the situation of the ongoing humanitarian crisis on the Polish-Belarusian border (which is also the border of the European Union) since the second half of 2021. The considerations undertaken herein aim at a preliminary sketching of the scope, dynamics and directions of the transformation of attitudes and practices (including those related to the silencing or positioning of this issue in public discourse) undertaken towards refugees in Poland (and Europe), as well as the ways of depicting, interpreting and explaining the related political issues and social questions. The issues discussed are based on the assumption that we are dealing with refugees in the first place: people fleeing a trajectory (i.e., associated with chaos and suffering) of their life situation and seeking a safe haven. In this light, the intention of answering the question of why Ukrainians and Ukrainians have been treated differently in Poland, and those arriving from the Middle East and Africa. The dissimilarity is addressed to the interpretative patterns present in the public discourse rooted in culturally fixed and socially conditioned ways of talking about Others and Strangers, as well as the political and discursive "utility" of the Stranger for both the politics practiced in Poland and Europe, through which political interests can be played out sowing fear and insecurity. These activities will be contrasted with the commitment of the few who provide assistance. Finally, an ethical move is proposed to stop treating refugees solely in terms of physical and cultural threat and to commit to taking their suffering into account.

Bottled Fluids and Fluid Assemblages: Alcohol Consumption in Later Life As a Material-Discursive Practice

Objective: In this paper, we explore the question how – that is, in which discursive-material practices and arrangements – alcohol is consumed in later life, reconstruct how this changes in the retirement transition and where boundaries between 'good' and 'bad' alcohol consumption are being drawn.

Method: We present empirical material from a qualitative longitudinal study, comprising interview and photo diaries and following 30 older adults through their retirement transition. We analyse alcohol consumption as a material-discursive practices,

Findings: We identify five categories of elements that constitute drinking practice assemblages: (i) things and spaces, (ii) people, (iii) temporalities, (iv) discourses, and (v) bodies. Across those elements, research participants drew boundaries between positive, responsible and negative, irresponsible alcohol consumption. These boundaries, however, were different than those drawn by researchers – research boundaries mainly drawn based on the quantity and frequency of alcohol consumption, whereas participants draw boundaries based on quality, i.e. the 'how' of alcohol consumption.

Conclusions: Approaching alcohol consumption from a material gerontology perspective can enhance our understanding of alcohol consumption as 'multiple' and an embedded, situated practice with blurry boundaries between problematic and non-problematic use.

Violence in a Caring Society – Boundary-Making Practices of Violence in Institutional Elder Care from a Transdisciplinary Perspective

Violence in institutional elder care is still under-researched (Görge, 2010; Gröning & Yardley, 2020). This is partly because violence is a taboo topic, and partly because there is no shared understanding of what constitutes violence in institutional eldercare. Different disciplines, practice fields and people affected share differing views about what violence "is", use differing explanations of the emergence of and solutions to minimize violence, and perform different boundaries between protection and endangering. Consequently, violence becomes harder to detect, voice, and sanction. Drawing on agential realism (Barad, 2003), the contributions asks which boundaries are drawn between caring practices that are defined as violent and not violent - and by whom - and which explanations are used for the emergence of violence and solutions to minimize violence in different fields. Data from focus group discussions with professionals of different disciplinary backgrounds as well as with older adults are analysed to identify collective orientation frameworks on violence that are expressed in the form of a conjunctive knowledge during the group discussions (documentary method: Bohnsack, 2003). Findings show which boundaries are drawn between caring and violent treatment in LTC settings, and highlight the age-specificity of such boundary-making practices. From a Linkign-Ages perspective, we finally discuss how understands of violence differ across the life course, and how barriers to implementing effective protection measures in LTC settings could be resolved.

A Hope for Hope: Refocusing Policy on Hopefulness to Support Alcohol Reduction with Midlife Women in Different Social Classes

Our paper will focus on the sociology of hope, and in particular, a call to action for policy makers to create the conditions for hopefulness and embed hope into alcohol reduction policy, advocacy and programs. At present, alcohol reduction strategies convey mostly individualised risk messages and imply personal responsibility for behaviour change, stripped from contexts, and heavy drinking persists among groups. New targeted approaches are necessary considering alcohol harms that address the norms, identities and practices that operate to sustain heavy drinking. We argue that focusing on supporting hopeful futures may create hope for women to reduce alcohol consumption. Our focus on building hope into alcohol reduction strategies intends to shift focus from the individual as the 'problem' towards hope being a 'solution'.

Our paper analyses data from a qualitative study undertaken in Australia with midlife women (aged 45-64 years) from different social classes who consumed different amounts of alcohol. We show how midlife women's narratives manifest different typologies of hopes (big/small hopes, near/far hopes, achievable/out of reach hopes) according to social class inequities and that unequal distributions of social power hopes available to middle and affluent classes are mediated (even blocked) for working class women, creating a difference in the type of hopes they exhibit and the use of alcohol as an object of hope. We utilise these differentiated (and sometimes stigmatised) hopes to show how, for all midlife women to have agency to reduce alcohol, policy and programs need to enable hopefulness commensurate with contexts

that contour women's hopes – enabling women limited in life chances to imagine hopeful futures. At present, these prospective hopes are often out of reach for women depending on their more or less oppressive social contexts.

Moving from a Pedagogy of Oppression to Hope: A New Way of Supporting Alcohol Reduction for Heavy Drinking Groups of Midlife Women

Australian midlife women (45-64 years) consume more alcohol than previous generations of midlife women and more than other age groups of women currently. While men consume more alcohol than women, midlife women experience specific gendered risks from drinking alcohol, including increased risk of breast cancer. Midlife women who drink alcohol face a triple burden: 1) *all midlife women* (irrespective of alcohol consumption) are at risk of breast cancer due to their age; 2) *midlife women who drink alcohol* have an increased risk of breast cancer (a dose-response relationship); and 3) *midlife women in specific socio-cultural groups* face structural disadvantages which increase their likelihood of heavy alcohol consumption, further increasing their breast cancer risk.

Our paper will present data from a qualitative study with midlife women from four different heavy-drinking social worlds to highlight the 'forces of oppression' currently shaping their drinking: 1) women living in regional centres; 2) lesbian, bisexual or queer (LBQ) cis-gender women; 3) women living in poverty; and 4) women working in the corporate sector. Options for reducing alcohol harms are analysed with an intersectional lens, considering social class, sexuality, and ethnicity. During the interviews, women were empowered to recognise, through raising their critical consciousness, the forms of oppression shaping their heavy-drinking practices. Our paper will draw on and critique Freire's theories and methodology to understand if/how women recognise the Pedagogies of Oppression that shape their alcohol consumption practices, if/how they can develop a critical consciousness about the forms of oppression and identify changes within their social worlds to disrupt and re-shape drinking practices via Pedagogies of Hope. Rather than emphasise the behaviours of individual women (avoiding victim blaming/stigma), we will analyse the interconnected gendered social practices located within 'social worlds' that frame heavy-drinking in specific social groups and place women at risk of alcohol harms.

WARDI, CLARA* (Graduate Programme in Sociology from University of Brasília (PPGSOL), Brazil)

Institutional Violence As Gender-Based Violence: Forms and Categories in Abortion Criminal Cases in Brazil

Institutional violence perpetrated by institutions meant to protect women and girls, such as the Judiciary, remains an underexplored area in gender violence studies from an intersectional perspective in Sociology. While much of the existing analysis focuses on women as victims of crime, there has been limited discussion on institutional violence targeting women and girls who have undergone unsafe self-managed abortions or even had a miscarriage and are subsequently criminalized for it, particularly in countries across Latin America and the Caribbean.

Seeking to contribute to filling this gap, this paper analyzes judicial processes involving women accused of clandestine abortion in Brazil over the last 13 years (2012- 2024). These quantitative data are analyzed from a feminist and intersectional lens based on the reproductive justice framework and the feminist criminology. The main objectives of this work are 1) to identify forms of institutional violence perpetrated against women accused of clandestine abortion at the national level by the Judiciary; and 2) to investigate how this violence is printed with values attributed to social constructions of gender, race, class, generation, territory and other intersections.

The findings reveal that violence perpetrated by the Judiciary reinforces and updates the violence committed in healthcare facilities and by the public security system, forming an inter-institutional collaboration aimed at punishing women. The results highlight various forms of institutional violence, including obstetric violence and psychological abuse, violations of privacy and confidentiality, infringements on the right to equality and non-discrimination, breaches of the right to be free from torture, and failure to uphold judicial rulings free from gender stereotypes. Additionally, the findings show how institutional violence in this context is intricately tied to negative constructions of social roles based on gender, race, and class.

Central Eastern European Contribution to Documentary Cinema – Festival Trends of Cinematic Diversity.

The examination of qualitative developments in documentary cinema often centers around the contrasting themes of escapist focus on external and social dilemmas and intimate, individual auto-expressive portraits. What films are promoted, and for what are they awarded in specific regions? What social reality do they reflect, and what heroes do they present? The objective of this study is to elucidate the range of variation evident within the documentary genre as perceived by journalists, filmmakers, and film festival selectors in Central Eastern Europe. The academic literature and reports provide the necessity for regional analysis. We discuss the social dimension of documentary film festivals and then conduct a content analysis of the awarded movies from the last 5 years. The documents distinguished with the EUROPEAN FILM AWARD and grand prix on the most prominent and biggest documentary film festivals in Poland, the Czech Republic, and Romania are examined. The constructed visual identity of main film heroes is discussed using visual semiotics. Captions of hero portraits from trailers are described both on a connotative and ideological level. The "everyman" and social motives (not organizational, nor family-oriented) dominate in the films, as well as the motives of migration and war. The aim of this study is to identify patterns within documentary films that focus on regional cinematic events in Central Eastern Europe, thereby shedding light on the fringes of the European film industry. The research is part of the REBOOT project awarded with EU grant Horizon 2023-2026.

Discourse and Reality of Smart City in Post-Growth Society: A Case Study of the Tokyo Metropolitan Area

[Purpose]

This study uses the Tokyo Metropolitan Area in Japan as a case study to examine how smart city planning, which makes use of Information and Communication Technology (ICT) and the Internet of Things (IoT), affects the lives of urban residents, the redevelopment of urban spaces and the response to urban problems. In particular, we will critically study how the concepts, plans and policies concerning smart city in the urban and suburban areas of Tokyo metropolitan area are implemented and how they affect the lives of urban residents, focusing on the discourse on smart cities.

[Research Questions]

How are the smart city concepts planned and implemented in the Tokyo Metropolitan Area in Japan, a metropolis in a post-growth society and one of the most aging society in the world? How are they having a positive/negative impact on the urban population and on the urban inhabitants?

How are smart cities planned and implemented in Japan's metropolitan areas Smartmentality (Vanolo 2014), that is, The Smart City as a Disciplinary Strategy?

How is platform urbanism or technological urbanism (Sadowski 2021), dominated by platform capitalism by tech companies, accepted (or not) in the Tokyo Metropolitan Area in Japan?

Are there any harmful effects or conflicts caused by "tech goggles" (Green 2019) in smart cities in Tokyo Metropolitan Area in Japan?

To answer these research questions, this paper analyses discourses on smart cities.

[Methodology]

The Sociology of Knowledge Approach to Discourse (SKAD) is used in this study as a method for analysing the discourse of policy documents and data based on interviews with relevant actors.

[Anticipated Outcomes]

The study reveals that smart city planning in post-growth ageing society, while partially successful, has created a small number of conflicts.

RC43-682.4

WATANABE, SHUN* (Nihon University, Japan)

*Urban Environment and Housing Inequality in Post-Growth Society: A Case Study of Tokyo***[Purpose]**

This study examines how urban policies implemented in the name of 'environmental', 'sustainable' and 'green' in the cities of contemporary post-growth society affect serious urban problems such as urban redevelopment, and housing inequality in a case study of Tokyo, Japan. In particular, this paper critically studies how recent urban redevelopment, real estate and housing financialization, private/public housing development and The Tokyo Metropolitan Government's (TMG) policies related to sustainable cities and Green Finance are mutually interrelated in Tokyo.

[Research Questions]

How are Tokyo's urban redevelopment, property and housing financialization and private/public housing development and TMG's housing policies implemented and how are they relevant?

How are "sustainable" and "eco-friendly" housing policies developed in Tokyo, and to what extent are they currently realized? How are these environmental discourses related to housing inequality?

What kinds of discourses on urban redevelopment, financialization of property and housing, and housing and livelihoods are (or are not) present in TMG's sustainable cities and Green Finance urban policies?

To answer these research questions, this paper analyses TMG's policy discourses on sustainable cities and Green Finance to illustrate how contemporary urban issues such as urban redevelopment and the financialization of property and housing are addressed in the name of 'urban environment' policies.

[Methodology]

The Sociology of Knowledge Approach to Discourse (SKAD) is used in this study as a method for analyzing the discourse of TMG policy documents and data based on interviews with relevant actors.

[Anticipated Outcomes]

The case study of Tokyo in this paper reveals the discourse formation around the urban environment of the metropolis in a post-growth society. The study is expected to show that TMG's discourse of 'sustainable' and 'environmentally friendly' functions in a sense to mask 'inconvenient truths' such as urban redevelopment, and the reality of inequalities in access to housing.

WATERS, ANTHONY* (Institute for Sociology and Cultural Organization, Germany)

KIRCHBERG, VOLKER (Leuphana University Lüneburg, Germany)

Crisis Bequests Conflict: A Sociological Analysis of Their Relationship

Crisis highlights political, public policy and social imperatives. Crisis implies that a conscious intervention is needed to address a perceived threat in a context of insecurity and contingency (cf. Luhmann 1982) and implies a removal or mitigation of the causes of the crisis. This in turn implicitly assumes conditions of security as outcome. Implicit to any crisis though is an acknowledgment of urgency, and the potential for conflict before a return to the normal.

Implicit to policies addressing a crisis is a belief that as the desired goal is achieved, there will be resumption of a putative "normal" or even an improvement to the situation prior to crisis. Such assumptions are implicit to the practice of fields seeking to mitigate conflict and re-establish security, such as Social Work, Policing and International Relations. On the micro-level such assumptions are implicit like Social Work and Policing. In international relations, confrontation and conflict followed by a desire for de-escalation is also a part of policy goals, and strategy.

Judgments about how to intervene in and implicitly solve a crisis (or not) are also the reason for designing and realizing alternative conditions or "Real Utopias" (Wright 2010) that avoid the underlying reasons for social crisis with its potential for conflict. The relationship between crisis, conflict, intervention, and the search for crises-free alternatives is largely undertheorized from a sociological perspective. Thus, a systematic description of the relationships between these concepts and development of hypothesis about the current links of current crises and conflicts is of interest.

The relationships between insecurity, contingency, crisis, conflict, and de-escalation is sociologically explored by developing illustrative examples from Real Utopias as "alternative life concepts" in Social Work, Policing, and International Relations.

Life in Drought: Challenges and Local Adaptations to the Climate Crisis in Petorca, Chile

Petorca is a rural commune located in the Valparaíso Region in central Chile. This town is known for its arid climate, which has been significantly exacerbated by an ongoing water crisis. The region experiences frequent droughts, and water scarcity is a major concern due to limited rainfall, over-extraction of water for agricultural purposes, and environmental changes. While widely recognised as one of the regions hardest hit by the climate crisis, the experiences of Petorca's residents reveal a more intricate, complex reality than commonly acknowledged.

Drawing on ethnographic fieldwork conducted in Petorca in 2024, this study uncovers how water shortages have disrupted multiple aspects of domestic life, complicating access to essential resources and affecting the sustainability of life. Nevertheless, we examine the various adaptation strategies that residents have devised to cope with water scarcity and other effects of the climate crisis in their daily lives, identifying multiple ways in which residents reuse water in their domestic spaces. These adaptive practices have become so deeply embedded in their routines that water scarcity is not perceived as an urgent or critical issue in their daily lives.

We further observe that, paradoxically, in a community long adapted to drought, recent rainfall has introduced unexpected challenges. Schools have closed due to inadequate infrastructure, roads are blocked by floods, and rising river levels disrupt school transportation. These events highlight the broader impacts of the climate crisis on the region and underscore the importance of flexible and adaptive strategies to extreme weather events, as focusing solely on drought limits the long-term resilience of this population.

Overall, this study offers a nuanced perspective on Petorca, highlighting residents' struggle with drought and adaptation strategies, identifying the multifaceted effects and challenges of living the climate crisis.

WATSON, JULIET* (RMIT University, Australia)

Becoming a Mother without a Home: Pregnancy, Homelessness and Early Motherhood

This paper explores the processes through which women without homes become mothers. The subjectivities of pregnant women and new mothers experiencing homelessness are mediated by 'good' mothering discourses, and they face multiple barriers associated with structural oppression to meet societal expectations and to enact these discourses. Drawing on qualitative research conducted in Australia that investigated women's experiences of homelessness, pregnancy and early motherhood, constructions of the 'good' mother are contested through an exploration of how mothering subjectivities are produced under the conditions of homelessness.

Building on Beverley Skeggs' conceptualisation of subjectivity and how it is inextricably linked to exchange value, and how for women this is profoundly attached to their femininity and their capacity to hold respectable distinctions, this study revealed the following key findings. First, the process of becoming a mother without a home encompasses value regimes, intersectional structures of oppression, and questions of respectability that shape how women without homes prepare for and experience motherhood. Second, mothering while homeless can be imbued with feelings of shame and, because constructed notions of 'good' motherhood are incompatible with homelessness, can result in a sense of abjectness for not meeting these moral standards. And last, becoming a mother without a home encompasses ongoing and invisible labour, occurs in the absence of structural support, but can also be transformational.

WATSON, JULIET* (RMIT University, Australia)

Breaking the Cycle of Homelessness for Mums and Babies: What Is Effective Intersectional Health and Wellbeing Support?

Pregnant women experiencing homelessness face multiple barriers when navigating service systems and accessing appropriate health and housing support. These obstacles are compounded by social structures such as race, class, disability, sexuality, faith and place, which are disproportionately

linked to homelessness and poorer health outcomes. The consequences for pregnant women and their babies are serious with homelessness being associated with numerous health risks such as pre-term labour, low birth weight, and poorer perinatal outcomes. Without targeted health and housing support, it can also be difficult for women to keep their babies in their care once they are born. Despite these risks, few specialised services exist. There is a critical need for innovative and sustained models of integrated health and housing support that are accessible to those experiencing intersecting oppressions, and that enable women to commence motherhood positively rather than with fear and marginalisation.

This paper presents findings from an evaluation of the Cornelia Program. The first of its kind in Australia, the Cornelia Program is a partnership between health and housing providers that uses a multidisciplinary model of care to give pregnant women access to maternal and neonatal health services, supported accommodation, psychosocial support, and assistance to enter long-term housing. Empirical research was conducted through interviews and/or focus groups with pregnant women and new mothers, operational staff, senior managers, and external service providers. Additionally, comparative data analysis between routine perinatal data from Cornelia service users and birthing services at a maternity hospital was conducted to measure outcomes for women and their babies supported by the Cornelia Program. Through an exploration of the support provided by the Cornelia Program, this presentation will analyse what entails effective support for mothers and babies experiencing the multiple and coexisting deprivations associated with homelessness.

WATT, PAUL* (London School of Economics and Political Science, United Kingdom)

Older Adults, Place Belonging and Gentrification at a Regenerating Housing Estate in London

This paper examines place belonging and gentrification with reference to older social tenants living at a housing estate in London (England) which is undergoing a lengthy regeneration process. It is based on ethnographic research, involving participant observation and semi-structured interviews with older adults from multi-ethnic, working-class backgrounds. The estate regeneration process has, on the one hand, resulted in the rehousing of older tenants into new social housing properties. On the other hand, regeneration has also led to the building of large numbers of upmarket 'luxury' flats for sale which has brought about a radically changed neighbourhood demographic involving a much more affluent population, alongside visible social and economic signs of gentrification. While many of the older social tenants welcomed their new flats as being an improvement on their older, often poorly-maintained flats, they had considerable reservations regarding several aspects of the regeneration which affected their sense of place belonging. First, was the increased costs associated with their new flats. Second, was the loss of their previous relatively low-cost retail and leisure facilities, and their replacement with much more expensive retail and leisure services. Third, was how the elderly persons' social club lacked a dedicated space which made them feel excluded within the revamped area. Fourth, was a sense that 'us and them' class-based lines had been clearly drawn in which they were effectively second class citizens. Although the older people managed to maintain some of their long-term neighbourhood social connections, there was also a strong sense of non-belonging among many of them within the new regenerated, increasingly gentrifying neighbourhood.

RC43-690.1

WATT, PAUL* (London School of Economics and Political Science, United Kingdom)

'Not Social Mixing' at a Regenerating Housing Estate in London

This paper examines social mixing at a mixed-tenure neighbourhood in London (England) – a former social housing estate which is undergoing a radical regeneration process. This process involves some rehousing of tenants into newly-built social housing properties, alongside extensive building of large numbers of upmarket 'luxury' flats for sale which has brought about a radically changed neighbourhood demographic involving a much more affluent population, alongside visible social and economic signs of gentrification. The paper is based on survey research as well as ethnographic research involving participant observation and semi-structured interviews with residents and officials. The paper explores social mixing between the established social tenants and the newer residents living in the new private housing blocks, and highlights several reasons why such social mixing is extremely limited. The first reason is the way that the social housing blocks are physically separated from the private housing blocks. Secondly, and following on from such physical segregation, is how the spatial focus of the private residents is often the block itself, a process which is reinforced by social media usage, as well as usage of the exclusive gyms and swimming pools which

are unavailable to social tenants. Thirdly, are the large socio-demographic differences between the social tenants and the incoming private residents. Fourthly, is the different usage of public space, with the social tenants more likely to attend community centre events, whilst the private incomers are more likely to use the commercial cafes which are prohibitively expensive for social tenants. Fifthly, is the inter-personal tensions which exist between the two groups, in terms of stigma, snobbery and mutual suspicion. The paper concludes that, despite the ubiquitous policy claims which are made for the benefits of mixed-tenure communities, 'not social mixing' is the actual result of estate regeneration in this part of London.

WATTS, ROB* (Global Urban and Social Studies, RMIT University, Australia)

Liberal-Democratic States and the Politics of Criminalising Climate Activism in the Anthropocene, Australia-2007-2024.

Global warming driven by increasing emissions of greenhouse gases, is the most significant political feature of the Anthropocene. Since 1997 successive Australian governments have used spin and greenwashing to cover up their active policy support for Australia's fossil fuel industry while avoiding compliance with the 2016 Paris Agreement. In response a climate movement comprising hundreds of environmental organisations, has mobilised hundreds of thousands of Australians, including children and young people, to demand government action. Ostensibly liberal-democratic Australian governments have responded by criminalising climate action and especially direct action. Why do liberal-democratic governments criminalise non-violent dissent? Why in particular do these governments add to extensive police powers and a vast array of existing repressive legislation, by introducing new laws criminalising peaceful protest activity? The paper begins by documenting the scale of repressive Australian legislation criminalising direct action by environmental activists introduced between 2007-2024. The paper then focusses on a recent case when the NSW government responded to climate activists engaged in direct action in 2022-3 with savage new laws criminalising direct action which even Italy's current far-right *Fratelli d'Italia* government has merely threatened to introduce. Using this case, I propose an ideal-typical account of how governments come to introduce new repressive legislation. The paper then addresses the problem posed by the fact that Australian governments already have a massive body of law with which to quash dissent: why pass new legislation? I ask whether one body of recent work by scholars interested in the criminalisation process sheds any light on the matter. Given my negative assessment of that literature, I draw on Bourdieu's theory of the state as the source of symbolic violence to interrogate the (il)liberal trope that liberal-democratic states are always compelled to balance the needs of order versus freedom.

WEAKLIEM, DAVID L.* (University of Connecticut, USA)

Citizens of the World? Education and National Differences in Opinion

Education affects a wide range of opinions. This paper considers the interaction between educational and national differences: specifically, whether the amount of cross-national variation in opinions differs by level of education. It is sometimes said that national differences are smaller among more educated people, particularly among university graduates. The argument is that higher education around the world is dominated by a common structure and ethos, and that educated people are more likely to travel, have contact with educated people from other nations, and obtain information from the national and international media. As a result, a common culture develops among educated people, while less educated people continue to follow distinct national traditions. The paper looks at a range of political opinions measured in the 2017-2022 wave of the World Values Survey and European Values Survey. For many opinions, the extent of variation among nations does not differ by education. However, when there are differences, cross-national variation in opinion is usually *larger* among more educated people. That is, education is more likely to reinforce national differences in opinion than to reduce them. An increase in national variation by educational level occurs when there is an association between the effects of education and the opinions of less educated people. For example, education is generally associated with more acceptance of abortion, but this effect is stronger in nations where less educated people have more favorable views of abortion. The paper considers the possible causes and consequences of this pattern.

WEDAM, ELFRIEDE* (United States, USA)

Explorations in the Culture of Violence in Chicago: Comparing Outcomes of Faith-Based with Secular Violence Prevention Programs

The goal of this research is to compare the anti-violence program outcomes of faith-based organizations with that of secular nonprofit organizations. What solutions to violent behavior among adults and youth do religious vs. secular actors propose and apply? How effective are their respective interventions or prevention work against violence and how do they measure this? In this project, I posit that violence at both the personal and community levels is an endemic, but solvable, social problem. However, using the conclusions of the Centers for Disease Control and Prevention, it is a public health rather than policing problem that requires a multi-institutional and multi-sector response. Therefore, I will present initial findings explaining how comparative approaches are brought to bear on solutions to violence with a focus on the city of Chicago and, importantly, how these comparative programs justify their approaches and demonstrate their effectiveness. Hence, an important component will be to identify the measures they use to claim successful anti-violence outcomes. I will also examine to what degree explicit and named nonviolent strategies and tactics are used to achieve their results. However, beyond logistical questions lies the cultural inquiry into how religiously informed paths to social change may compare to perspectives without a motivating spiritual component. The principal method is inductive, collecting both qualitative and quantitative data from six organizations (three of each type) that claim anti-violence programs.

How Does a Standardized Curriculum Influence Labor Market Integration of VET Graduates? Evidence from the German Case

Previous research has demonstrated that the institutional characteristics of vocational education and training (VET) programs contribute to inequalities in the early career outcomes of VET graduates. This study extends those findings by exploring the impact of an under-examined institutional characteristic: **input standardization**, i.e., the extent to which the government dictates what curriculum to be taught in training programs. Specifically, we investigate how input standardization affects the labor market integration of graduates in German dual system, a VET model that combines school-based education with firm-provided training. We hypothesize that a **lower level of input standardization** in VET programs leads to smoother labor market integration. This is characterized by graduates needing less time to secure their first regular job (lasting at least six months), achieving better job matches, accumulating fewer days of non-employment, and experiencing fewer status changes within the first five years of entering the labor market. This occurs because a less standardized curriculum equips VET graduates with more firm-specific skills which make retaining in the training firm attractive for both VET graduates and training firms. We test the hypothesis using rich administrative data on the employment biography of VET graduates. To account for factors that influenced VET graduates' selection into training programs, this study employs a **difference-in-difference approach** to exploit a reform in Germany that gradually decreased the input standardization of training programs by increasing the autonomy of training firms in curriculum selection. This study makes two major contributions. First, it enhances our understanding of the mechanisms that connect the institutional characteristics of education systems to labor market outcomes, with a focus on the school-to-work transition phase for VET graduates. Second, it addresses an important institutional design question by providing insights into how to organize VET systems for optimal labor market integration.

WEI, SAITE* (Taiyuan University of Technology, China)

ZHANG, ZHENLONG (Taiyuan University of Technology, China)

*The Social Transformation of China Under the Development of Table Tennis***Introduction**

The concept of cultural identity involves the collision between individuals and external cultural influences, shaped by their own cognitive processes, and represents a consensus and recognition of people's cultural inclinations. Despite its status as a foreign sport, table tennis has emerged as the predominant athletic activity in China; however, its fundamental nature is seldom examined through the lens of cultural identity.

Methods

Drawing on social identity theory, this paper employs a holistic ethnographic approach, utilizing the Chinese nation as the reference group and integrating China's historical development and specific national conditions to examine social reform in China.

Results

This paper provides an analysis of the dissemination and evolution of Western sports culture and table tennis culture in China within the context of national dynamics, delineating three distinct temporal phases: 1840-1949 (the apex of national identity), 1949-2000 (the imperative for national identity), and 2000-present (the metamorphosis of cultural identity). Prior to the establishment of New China, there was a pressing demand within the Chinese nation for a sense of national identity. Subsequently, post-revolutionary China sought to assert itself on the global stage. In the 21st century, China has been dedicated to fortifying its cultural self-assurance. In contemporary China, the Chinese people's appreciation of table tennis culture is still considered as part of a broader Western sports culture. However, influenced by the needs of national identity, table tennis culture has gradually evolved into "Chinese table tennis culture", which is widely embraced by the Chinese populace in terms of national image, pride, historical legacy, global leadership and other elements.

Discussion

Social needs are different in different periods and backgrounds. The development of table tennis cannot be separated from the historical background of China. From the development of table tennis culture in China, we can find the whole development course of Chinese society.

Paradata and How Interviewers Perceive Interview Quality – an Explorative Study Based on the Social Survey Austria 2021

Despite advances in computer-assisted web interviewing (CAWI), face-to-face (F2F) interviews remain widely regarded as the gold standard for collecting high-quality survey data. This is primarily due to the interviewer's ability to control the interview environment, monitor social surroundings, and ensure that questions are correctly understood by respondents. In particular, the interviewer's capacity to interact directly with respondents allows for clarification of misunderstandings and supports more accurate responses.

While interviewer effects can influence data quality researchers employing F2F methods often implement strategies to mitigate such biases (e.g. interviewer training, standardization of interview protocols) as well as plausibility checks (e.g. such as cross-referencing education levels with respondents' ages or comparing income with living situations) to assure data quality.

However, (1) how do interviewers assess whether an interview was successful or of high quality? (2) To what extent do these assessments relate to situational issues or the broader social context of the interview? (3) How do those assessments relate to traditional measurement quality indicators?

We discuss these questions, using data from Austrian Social Survey 2021, which included 352 face-to-face interviews, with the aim to contribute to the growing body of survey data quality assessments, published in the aftermath of the COVID-19 pandemic.

As our the data was collected during the covid-19-pandemic ample paradata is available to research the social situation (interview-constellation, presence of third parties, interruptions etc.), mandates tied to covid-19 (mask wearing, distance between parties etc.) as well as typical interview-related information (needs for assistance or clarification, delays in responses etc.). Furthermore, more traditional measure of interview quality like e.g. straight lining answers or using only extreme categories are used as control variables.

Industrial Afterlives: Histories, Memories, and Contemporary Life in Mumbai's Colonial Port

This paper reflects on the concept of "difficult heritage" through the histories, memories, and contemporary life of the primarily informal neighborhood of Darukhana in Mumbai's eastern dock lands. The site of Bombay's primary industrial port from the mid-19th century through the 1980s, Darukhana and its three main shipping docks (or bandars) – Lakri Banda, Tank Bandar, and Coal Bandar – tend to be regarded as relics of the past, situated less in the present than in a time when "king cotton" ruled and Darukhana was a site of labor and protest and economic might. By late-1970s and throughout the 1980s, amid industrial decline, Darukhana became a sight of illicit goods smuggling and organized criminal activity. This era, still vivid in the minds of Mumbaikars, helped produce the territorial stigma that continues to shape the communities of Darukhana. Drawing on oral histories, extensive archival research, and two years of ethnographic research in Dharkhana's 12,000-person informal settlement of Kaula Bandar, this paper highlights some of the tensions between the area's historical significance and heritage value and its current residents' and workers' abandonment, invisibility, and stigma. The paper uses the concept of "difficult heritage" to refer (perhaps not exactly as Sharon McDonald intended) to the uncomfortable coexistence of the past and present in the site of labor struggles, class and caste exploitation, criminality, and post-industrial abandonment. While the archival data and oral histories help excavate difficult memories, the ethnography and interviews with current residents and workers reveals the contemporary meanings of Darukhana's difficult heritage.

How Can We Study Transnational Contexts Comparatively? Quasi-Experimental Research on the Glocalization of Medical Professional Knowledge

Transnational analyses are a challenge for comparative sociologists. How can we organize comparisons without clearly defined and bounded country units? Suppose we engage with the transnational contexts that might be relevant for studying, e.g., professions. How can we consider a variety of potentially relevant contexts, such as professional language, organizational networks, or epistemic communities at the same time? We need to solve both problems if we want to avoid methodological nationalism and the oversimplification of flat globalism, as these pitfalls can hinder our understanding of complex transnational phenomena.

The paper explains and exemplifies a transnationally comparative research design based on an international and interdisciplinary study of medical professional knowledge and practice. Focusing on a prevalent cardiological disease, chronic heart failure, we first followed the insights of neo-institutionalist theory. Here, global scope is achieved by focusing on the formal organization and published knowledge of cardiologists treating heart failure.

In line with cultural sociologist Robertson (1992), we expect local practice to adapt or vernacularize global standards (Levi et al. 2009). Therefore, in the second part of our study, we video-observed the professional practice of 71 physicians in Ankara (Turkey), Beijing (PRChina), Groningen (Netherlands) and Wuerzburg (Germany) in a quasi-experimental setting where they were asked to treat a patient actor simulating heart failure.

Our design can serve as a blueprint for global-scope comparative research on non-bounded contexts. Thanks to the contrasts in the sample, similarities would lend credence to the claim that the medical profession has transnationalized. Due to the heterogeneity in the sample, differences cannot be causally explained. Still, by combining descriptive statistics and grounded theory, we gained some insights into the relative salience of transnational vs. inter-country vs. inter-individual explanatory factors.

Gender Pay Gap Among Content Creators

Despite improvements in pay equity between men and women in recent decades, the gender pay gap (GPG) persists. Research suggest several explanations for these differences: occupational segregation (Busch, 2020), job position in the life course (Meara et al., 2020), and workforce interruptions (Blau & Kahn, 2017). We know, however, little about the extent of GPG and the mechanisms contributing to the GPG in the digital sphere, particularly regarding the new group of algorithm-dependent occupations on digital platforms.

Evidence suggests that the GPG for digital work on some platforms (e.g., Twitch, Instagram, Uber) is smaller than in many established "offline" occupations but cannot fully be mitigated through increased job flexibility or algorithmic curation (Cook et al., 2020; Gaenssle, 2024). However, there has been no systematic GPG study among content creators (CCs) on YouTube, the first platform to offer monetization for digital workers. This paper fills this gap by answering the following research question: Is there a GPG among content creators on YouTube across topics? What are the decisive factors enforcing or diminishing the GPG on that platform?

The study employs the Duncan-Duncan segregation index as well as multivariate regressions and matching analyses (Meara et al., 2020). Empirically, we use a random sample of N=4,000 CCs from German-speaking countries and add socio-structural characteristics using a standardized classification survey (Seewann et al., 2022). The average monthly earnings from the YouTube Partner Program (using AdSense rates and view counts) is our dependent variable. First results show a strong inequality of earnings on YouTube (Gini: 86,6). Nonetheless, regression and matching analyses indicate a reversed GPG in the overall sample which is driven by favorable earnings of women in topics like gaming. That reversed GPG completely disappears when looking at the top 20% of CCs.

WELLS, KAREN* (Birkbeck, University of London, United Kingdom)

Homo Faber: Children's Making Practices and 4A Agency

Drawing on research from our research project *Development Education in the Vernacular of children and Infants in West Africa* (DEVI), this paper describes how young children in craft and farming communities in West Africa play at making and describes how this making involves the repeated copying of tasks they see, feel and hear around them. We use the concept of mimesis to capture the ways that the material world (material culture but also 'nature') is worked on by young children as they copy and remake or innovate the activities of their parents and older children. It emphasizes the repetitious character of young children's activities of making, moving, bricolage and how this repetition, which involves at the same time slippage from the original, produces new ways for the child to think about/experience the socio-cultural world and in doing so forms their own subjectivity as agential, participatory beings. We offer a typology of 4A (audience, assistant, apprentice, artisan) agency to explore how the mimetic activity of young children shapes their cognition and sense of agency. We use this schema to develop our argument that agency is not the property of individuals. It emerges in and through action. It is therefore always hybrid, enacted and participatory. Agency, in other words, is not a possession but an event.

Inducing Innovation in Anaerobic Digestion Technology for Small- and Medium-Scale Farms through International Exchanges China, Brazil, and the United States

We address an important gap in knowledge, science, technology, policy and extension practices regarding innovation in and diffusion of anaerobic digester technology for small- and medium-scale farms. The paper presents the current situation in the U.S., Brazil, and China regarding the state-of-art of AD technologies for such farms; and explores the potential for innovation in scale-appropriate AD technology through international exchanges among scientists and producers in the three nations. The U.S., Brazil, and China are major methane emitters with very large livestock sectors including a substantial number of small- and medium-scale farms. In the U.S. the vast majority of state resources to develop and install AD technology, useful for reducing methane emissions and producing power for the farm, are dedicated to larger-scale producers, and there has not been significant innovation in AD technologies for smaller farms. This situation occurs despite documented interest by smaller livestock producers in the U.S. for such investment and innovation. The same is true for Brazil. In China, by contrast, there is substantial investment and innovation in appropriate-sized AD for livestock farms. We explore the possible farm structure, policy and other explanations for the differences, and discuss our longer-term project to induce innovation in the smaller farm livestock sector along these lines through promoting the appropriate research trajectories, and the sharing of resources and information across the three nations. We wish to induce innovation in scale-appropriate AD technology for small-and medium-farms in the U.S. and Brazil especially- but also inform ongoing work in China. In the U.S. we are working with farmers, universities and the cooperative extension system. In Brazil we are working with scientists and the Landless Workers Movement, Latin America's largest smallholder social movement, with over 1 million members. And the International Food Policy Institute is facilitating connections with Chinese scientists and producers.

Justice: From Principles to Practice – and Back Again. a Historical-Epistemological Analysis

My contribution first analyzes various faces of justice in politics and philosophy to distinguish it *sociologically* as a demand that is only possible in modern society. However, what exactly is justice? How should it be conceived sociologically? Sociologically, justice must be understood as a socio-structural demand and analyzed regarding social participation.

In the second step, the historical epistemology of three phases of change in the form of demands for "social justice" is typified. In *pre-modern society*, following Emile Durkheim, the moral and justice-relevant feeling of obligation towards others arises mechanically, as it were. In *capitalist society* based on the division of labor, on the other hand, the "solidarity" between people, which is not automatically generated, becomes the overriding problem, the possible absence of which considerably shakes the stability of society unless it is possible to institutionalize social responsibility. This type, which a later French thinker, Michel Foucault, still sees in the welfare state of the German social market economy, has been replaced by *neoliberal capitalism*. The latter delegates social responsibility to individual shoulders. The demand for social justice dissolves into the struggle for the particular rights of countless differences, which makes the joint endeavor for justice - sociologically understood - a task for Sisyphus.

The Rise of Gender-Restricted Job Positions in China's Civil Service Exams: Trends and "Justifications"

While explicit gender-restricted job requirements are prohibited in most advanced labor markets, they remain common in many societies that account for a substantial share of the global population. Previous research on gender discrimination in the labor market has mainly focused on the private sector. In this study, we aim to fill this gap by examining the rise of gender-restricted job positions in China's civil service exams. Since 2000, the Chinese government has introduced an open, standardized examination for entry-level political positions. Specifically, the National Civil Service Examination (NCSE) transformed a previously closed selection process into one that is more inclusive and rule-based. In recent years, taking the civil service exam and joining the public sector has become an increasingly popular choice among Chinese college graduates. However, despite claims of meritocracy in the recruitment process, we have observed a growing number of positions in the NCSE that are restricted to a specific gender over time. Using a dataset containing the universe of job postings from the NCSE between 2005 and 2024, we document that the proportion of gender-restricted job postings has significantly increased, with male-only positions rising more than female-only positions. By comparing the TF-IDF scores (Term Frequency-Inverse Document Frequency) for terms in the description of jobs across years, we further show that terms describing adverse working conditions, such as overtime work, frequent business trips, remote areas, and economically underdeveloped regions, have generally become more able to distinguish male-only job postings from other jobs. This finding suggests that protecting women from adverse working conditions may be used as a justification for excluding female applicants from an increasing number of entry-level government jobs. Our findings shed new light on women's disadvantages in the labor market: explicit gender discrimination is justified even in the presence of competitive recruitment exams.

The Role of Face and Stigma in the Mental Health of UK Chinese International Students

Stigma can devalue an individual's social identity, particularly when linked to mental health challenges (Goffman, 1963). In Chinese culture, mental health is often framed as an interpersonal conflict, with the concept of 'face' (Hu, 1944)—the desire to maintain a positive social image—playing a significant role in social interactions. Research suggests that Chinese international students may experience heightened stigma due to these cultural pressures. Interpersonal conflicts are not the only challenges that Chinese international students encounter in the host country; they are also expected to resolve these issues with their families back home. Furthermore, societal and parental expectations for outstanding academic performance can lead to elevated levels of mental health distress. Despite facing mental health difficulties, studies show that these students are often reluctant to seek professional support. However, little research has examined how stigma and 'face' interact among UK Chinese international students. This paper draws on a study which aims to explore how concerns about 'face' contribute to mental health challenges for UK Chinese international students, considering the dual impact of stigma and cultural expectations.

The study uses interviews to gain in-depth insights into the intersection of face and stigma in shaping mental health experiences. Thematic analysis identifies recurring patterns in these interactions, informed by Link and Phelan's (2001) modified labeling theory. This paper reports initial findings from this ongoing project.

The Role of Media for Preventive Healthcare Adopted By Older People in India

In this paper, we assess health literacy among senior citizens in India, scrutinize the patterns of visual media utilization for health information, and evaluate the effectiveness of visual media in shaping preventive healthcare behaviors. Additionally, the study aims to explore cultural

variations, identify barriers to health literacy, and analyze preventive healthcare strategies. In our paper we provide first results of the qualitative interviews from different local settings in India. In Maharashtra, interviews were conducted in urban areas at Mumbai locations such as Lokhandwala, Dahisar, Virar, Worli, and Navi Mumbai's Kharghar and Panvel. Additionally, interviews in rural areas of Maharashtra were conducted in Manor, Chipale, and Harigram. In Tamil Nadu, interviews were conducted in urban areas at Chennai locations including Kottupuram, Virugambakkam, Besant Nagar, Vadapalani, Padmanabha Nagar, Shastri Nagar, Pallavaram, Hastinapuram, and K.K. Nagar. Interviews in rural areas of Tamil Nadu were conducted in Kunnathur, Mambakkam, Padur, and Paiyanur. Respondents in both rural and urban areas showed similar responses regarding media influence on health practices in Maharashtra and Tamil Nadu. People relied on media for pandemic updates and traditional Indian remedies, homemade preparations like Kadha and Rasam, to boost immunity and fight COVID-19 infections. Regarding immunity-boosting practices, individuals in both states adopted traditional practices learned from their ancestors and also relied on media to some extent. Some people focused on animal-based food, others on plant-based food, and some on a combination of both to enhance their immunity against COVID19.

Epistemological Struggles over Growth Pathways for Social Housing in Australia's Multi-Provider Housing Sector

This paper investigates growth models in Australia's multi-provider housing sector, and how they compare to those found in other OECD countries. Social housing in Australia is comprised of public, private, co-operative, and charity based non-profit housing providers within a housing sector dominated by the private market. The rate of social housing is much lower in Australia than in the UK, France, Denmark and Finland, with 3.9% of households housed in social housing across Australia. While stated aims in state and federal policy documents and funding initiatives are to grow the social housing sector, this research investigates growth models and data from interviews with people who work in the sector to identify how growth pathways are conceptualised, who has access to them, how they are accessed, and the consequences for residents experiencing housing distress, according to their advocates. The paper shows there is no agreed understanding in the Australian housing sector over how growth pathways for social housing should be conceptualised, regulated, or implemented. It offers case studies from other OECD countries to propose sustainable models for growth that could be translated to Australia's various state and territory contexts.

Building a Model for Māori Data Governance in New Zealand Universities

Universities in Aotearoa hold a vast but unknown amount of Māori data which has been collected since their establishment. In the past two decades especially, policies such as Vision Mātauranga have increased the volume of Māori led and Māori focused research being conducted within Aotearoa universities. This is likely to have contributed to an increase in the size scope and diversity of Māori data held by these institutions. The full extent and nature of this data remain unclear, as do the practices of universities in safeguarding the mana and mauri of data as taonga. What is clear is that universities hold significant power over the collection, storage, access, and use of Māori data; power that is not equally shared with the communities that the data comes from.

Māori Data Sovereignty (MDSov) challenges these power imbalances and centre the needs and aspirations of Māori communities in controlling, accessing and managing Māori data. Despite foregrounding Māori rights and responsibilities in MDSov and MDGov, there remain knowledge and implementation gaps which act as barriers for Māori to realise MDSov.

The recently funded research program 'Activating Māori Research Data Sovereignty in universities', responds to these challenges of findability, governance and accessibility. The program has been designed to explore the ways in which we can understand and implement Māori led data governance and sovereignty within institutions that claim a commitment to te Tiriti (the Treaty) and MDSov.

In this presentation I will speak to the second objective of the program, related to Māori data governance. I will outline how the project plans to develop and implement Māori governance policies over Māori research data and build upon existing maturity models to hold universities accountable in their role as data stewards and assert the inherent rights of Māori as kaitiaki (guardians/stewards) of Māori data.

Emotions, Bodies, and Digital Mediation in Postmodern Times – Georg Simmel's Approach and Beyond

Simmel's sociological reflections provide a valuable framework for understanding the complexities of postmodern emotional life. His work on the interaction between individual emotions and societal structures offers insights into how experiences of pain, fear, and anxiety are mediated by modern social forms. In today's digital age, where technology shapes human interaction, the tension between private suffering and public displays of well-being is critical. Social media forces individuals to curate emotions, blending the personal and public. Simmel's concept of *Vergesellschaftung* (socialization) emphasizes that emotions are not isolated but socially constructed, shaped by interactions within an increasingly fragmented society. This dynamic echoes his analysis of the alienation of the self in modern life, as seen in *The Metropolis and Mental Life* (1903), where he examines how modern individuals become emotionally detached in the face of overwhelming societal pressures. Moreover, Simmel's exploration of the *Tragedy of Culture* (1911) shows how the expansion of social structures can burden individuals, leading to a disconnect between internal emotional experiences and external societal expectations.

Hypothesis 1: Social media intensifies emotional labour, compelling individuals to perform emotional well-being while masking internal experiences of stress and anxiety.

Hypothesis 2: The pressure to publicly display well-being on digital platforms exacerbates psychosomatic conditions, as the body becomes a site of unresolved emotional conflict.

These hypotheses align with Simmel's theories, which suggest that individuals in modernity face increasing fragmentation of the self, leading to alienation. Arlie Hochschild's work on emotional labour (*The Managed Heart*, 1983) and Eva Illouz's exploration of emotional commodification (*Cold Intimacies*, 2007) support this view, revealing how emotions are managed and sold in the digital age. Situating Simmel's thought within current sociological debates on emotions, bodies, and digital mediation, I offer a theoretical and methodological approach to understand how modern affective states are shaped by technology and social expectations.

WETZEL, DIETMAR* (MSH Medical School, Hamburg & University of Basel, Switzerland)

Love in the Anthropocene: Emotional Politics and Ecological Crises

As humanity faces the ecological crises of the Anthropocene, love emerges as a powerful political force, deeply entangled in collective struggles over the environment. This paper argues that love, far from being a purely private emotion, serves as a relational ethic that connects human and non-human actors, guiding collective action and resistance against environmental destruction. In the face of climate change and ecological collapse, love becomes a practice of care, responsibility, and solidarity that challenges the exploitative logics of neoliberal capitalism. Building on the works of Anna Tsing (2015) and Donna Haraway (2016), my contribution reframes love as a multispecies, interdependent practice that disrupts anthropocentric thinking. Tsing's *The Mushroom at the End of the World* and Haraway's *Staying with the Trouble* illustrate how love in the Anthropocene demands a recognition of the interconnections between humans, non-humans, and ecosystems. This relational approach fosters new forms of sociality and ethical responsibility that oppose the extractive practices of contemporary capitalism.

An example of this political dimension of love can be seen in the ongoing protests against the expansion of the Hambach Forest coal mine in Germany. Here, activists and local communities organized to protect one of Europe's last ancient forests from destruction by the coal industry. Framing their actions as acts of love for the forest, the climate, and future generations, these activists built a long-standing movement of resistance. Their defence of the forest became a symbol of broader struggles against climate change and ecological degradation, showing how love can galvanize collective action for environmental justice.

Right on the End: Youth Belonging in English Coastal Towns

This paper examines young people's sense of belonging and marginalisation in English coastal towns. Popular imaginaries of England's coastal towns evoke nostalgic memories of sea, sand and ice-cream, yet many of these towns are reeling from decades of stark economic decline. As a result, today, coastal youth in England face a future of low-wage, precarious employment, low educational attainment and skills, a degraded built and natural environment, and the stigmatisation of their towns in policy and media discourse as 'left behind' 'ghost towns' that are 'on the margins'.

In this paper, drawing on participatory, coproduction and interview data with over 100 young people, we compare the experiences of youth growing up in a range of towns (e.g. resort, industrial, port) across four coastal areas. We examine their leisure activities, use of public space, safety, opportunity structures and sense of place. In particular, we focus on their sense of belonging and how this is shaped (and in some cases weakened) by: their exclusion from public space; the loss of youth-oriented activities and spaces; 'competition' with others for a stake in their towns; and the marginalisation of their towns in relation to elsewhere.

By doing so, we elucidate nuanced perspectives on belonging, tied up with uncertain mobility aspirations, contradictory feelings about the peripherality and small size of their coastal communities, and a lack of optimism about the future of their towns. As a result, we hope that this paper can contribute to broader conceptual and theoretical discussions around the fluidity and complex nature of young people's sense of belonging.

Faculty Well-Being during the Intermediate Stage of the COVID-19 Pandemic

As the COVID-19 pandemic progressed from the immediate crisis in the spring of 2020 to its intermediate stage a year later, workers and their families continued to struggle to meet the challenges of what was becoming the new normal, raising the question of how the pandemic affected people's well-being as it dragged on. Using survey data collected from the late spring through the summer of 2021, this paper analyzes the well-being of 157 academic staff at three private small liberal arts colleges (SLACs) in New York State along six dimensions during the intermediate stage of the pandemic: satisfaction with work-life balance (WLB), feeling used up, depression, anxiety, stress, and sleep problems.

We conducted six regressions to identify the significant predictors of each well-being measure. The one predictor that was significantly associated with all six measures was the work-family conflict scale. In contrast, the family-work conflict scale was not significantly associated with any of the six well-being measures. The regression analysis revealed that the more work interfered with the faculty member's personal life, the less satisfied they were with their WLB, the more often they felt used up at the end of the day, the more often they have been bothered by trouble falling asleep, the higher their depression score, the higher their anxiety score, and the higher their stress score. The emotional labor demands also significantly predicted WLB satisfaction, anxiety, and stress, but not feeling used up, depression, and sleep problems. Faculty who worked more during the academic year 2020-2021 reported less WLB satisfaction and more often feeling used up at the end of the day. By increasing the spillover from work to family, the emotional labor demands, and the number of work hours during its intermediate stage, the pandemic continued to harm the well-being of workers and their families.

How to Gain Symbolic Legitimation in Indonesian Contemporary Literary Field

When a young novelist appeared in the world of literature, how can he be recognized as a literary writer; who determines and how is the contestation, so the young novelist is considered a figure of literature; while others fail. This article examines the struggle to win symbolic legitimacy in the arena of Indonesian literature, through the case of a young writer named Eka Kurniawan, whose novels have been translated into various foreign languages. Eka gained symbolic legitimacy in the Indonesian literary field — amidst various agents (both individuals and institutions) who are considered to be legitimate figures of literature, with their contesting dominant views (doxa). Borrowing the theoretical framework of the Cultural Production from Pierre Bourdieu, this qualitative study reveals the structure of contestation that works behind the literary arena, and that to 'win' the symbolic legitimacy, a young emerging novelist has to be first recognized by those who hold the dominant views, and has to have relevant habitus and capitals. This research finding shows that before entering contemporary Indonesian literary field, Eka Kurniawan had a habitus and capital that did not diverge from the field thus it enabled the actors to survive and adapt to the field. Eka performed a practice and strategy that support the capital addition or production that he did not possess when he has dwelled in the literary field. The increasing of capital ownership (social, cultural and symbolic) in the arena has been brought Eka to become literary actor who succeeded in achieving recognition from legitimate literary actors (specific legitimacy) in the arena of contemporary Indonesian literature to occupy the different degrees of position comparing with first time he entered the literary field.

"the Role of Civil Society to Foster Bottom-up Approaches in Policy Reform (Study Case: Indonesian Open Government Partnership)"

Access to Justice is currently an important subject on the global Development agenda, focused on incorporating the concept of people-centered justice into the creation of policies. To ensure the enforceability of this principle, the government, as a policy maker, must engage in cooperation and active involvement with civil society organizations. This article explores the effective implementation of a social justice reform agenda in Indonesia by examining the interaction between the government and civil society actors. Specifically, it will focus on the Open Government Partnership platform, which has achieved success in establishing regulations enhancing access to legal aid for vulnerable groups in Indonesia. Based on the 2023 Democracy Index Report by The Economist Intelligence Unit (EIU), Indonesia's democracy index was recorded at a score of 6.53. Even though Indonesia's score and ranking decreased compared to the previous year, this shows that the Indonesian government still foster participation from civil society organizations in terms of policy formulation. This is also proven by the increase of the civic participation aspect in the Open Government sub-factors in Indonesia's World Justice Project Index with a score of 0.55. This article will analyze further the dynamics of the observed relationship and the underlying reasons behind the successful efforts of civil society organizations in advocating for policy reform with Indonesian government officials. Through qualitative research, this article will emphasize socio-legal perspectives by conducting in-depth interviews and observation of relevant study, and administrative documents. The results of this research will be expected to serve as a record of best practices and a reference for strengthening future policy change through bottom-up approaches in Indonesia. By documenting successful methods and strategies, the article provide insights into how Indonesian civil society can offer grassroots perspectives and local knowledge that can be meaningfully integrated into Indonesian decision-making in justice sectors

*Status Returns to Spatial Mobility in the Transition from School
 to Work*

Spatial mobility drives status attainment, contributing to the perpetuation of social inequalities. While most research focused on adult workers' monetary returns from commuting or relocating, early career gains in occupational status may be more significant from a life course perspective. This study examines the transition from school to Vocational Education and Training (VET) in Germany, asking: 1) Do spatially mobile young people obtain higher-status VET positions? 2) To what extent are such status returns to spatial mobility moderated by young people's local opportunity structures and the institutional constraints related to their level of schooling?

We use longitudinal data from the German National Educational Panel Study merged with geospatial data at the district level (NUTS-3). Our dependent variable is status attainment, measured by the International Socio-Economic Index (ISEI). To account for self-selection in spatial mobility, we consider young people's occupational status aspirations, also measured by ISEI, as a control variable in our conditional regression models, alongside established control variables.

Our findings indicate that spatial mobility particularly benefits young people from structurally weak regions and those with higher levels of schooling. This has important implications for social inequalities. First, young people facing limited local opportunity structures can improve their career prospects through spatial mobility, potentially reducing regional inequalities in status attainment. Second, spatial mobility tends to widen the gap in status attainment between those with higher and those with lower secondary education. Notably, spatial mobility does not expand occupational options for individuals with lower secondary education, highlighting strong institutional barriers tied to educational credentials.

WICKSTRÖM, LAURA* (The Polin Institute, Åbo Akademi
 University, Finland)

*Ecocide As Nonviolent Environmental Activism in Climate Justice
 and Governance in the Mediterranean*

Climate and environmental justice are ubiquitous terms in global climate governance today. The "Ecocide" -movement is an apt example of nonviolent environmental activism, aiming at making ecocide a fifth crime in the Rome Statute of the International Criminal Court (ICC). The goal of the Paris Agreement in 2015 is to provide financing to developing countries to mitigate climate change, strengthen resilience and enhance their abilities to adapt to climate impacts. The Mediterranean is a geographical area where people are affected by a faster warming than the global average. Climate activists in the Mediterranean region have pointed out that existing concepts which seem to provide solutions to climate change in fact reproduce and legitimize existing inequalities. Based on ethnographic research in the region, this paper argues that the environmental movement, such as the Ecocide, in the Mediterranean is gaining ground but faces simultaneously great challenges.

Four Contemporary Voices of Eco-Islam on Climate Change

This paper presents four distinguished theorists and activists within the environmental discourses in Islam, or what could be called Islamic eco-theology or eco-Islam, and their views on climate change. These four scholars are Fazlun Khalid (1932-), Ibrahim Abdul-Matin (1977-2023), Nawal Ammar (1958-), and Ibrahim Özdemir (1960-). Khalid is the leading figure of Islamic environmentalism and the founder of the Islamic environmental organization Islamic Foundation for Ecology and Environmental Sciences (IFEES). Abdul-Matin is the founder of an Islamic environmental movement called the Green Deen and was an advocate of an eco-sensitive lifestyle. Throughout her work, Nawal Ammar has emphasized the diversity within Islam based on various indicators such as geography, technology, culture, education, socio-economic

status and political engagement. In discussing environmental ethics, Ammar has used the Arabic word *hay'a*, which could have a positive impact on the concept of nature. Ibrahim Özdemir is a Turkish scholar and the first Muslim to complete a Ph.D. in Islam and environmental philosophy. He was part of a group of Muslims who began to reflect on Muslim perceptions of the environment and climate change in response to the 2015 Paris conference. This later resulted in the Islamic Declaration of Climate Change.

These scholars and activists are selected because of their importance and inspiration for the development of the environmental thinking and environmental action. They also represent different interpretations of Sunni Islam. Although Sufism contains a rich tradition of environmental understanding, this paper focuses primarily on the Sunni textual tradition and the environmental activism based on the interpretations of that textual tradition. The aim is not to conduct a Qur'anic study, but to present the interpretations and arguments of these four scholars and activists through the concepts of social justice, reinterpretation and, radical environmentalism.

WIEGEL, SILVIA* (University of Bayreuth, Germany)

*Traditional and Emerging Non-Profit Food Rescue
 Organisations in Germany: Intra- and Inter-Organisational
 Networks Driving Social Inclusion of Socio-Economically
 Disadvantaged People*

In Germany, 11 million tonnes of food waste are generated annually, with 41% originating from the production, processing, distribution, and out-of-home catering sectors (as of 2022). At the same time, demographical changes and inflation are increasing the number of individuals struggling to meet their nutritional needs due to financial constraints. This makes the question of a more socio-ecological approach to food distribution increasingly urgent. Non-profit organisations such as the more traditional food pantries and emerging food-sharing initiatives address this issue by collecting surplus food from companies in the value chain and redistributing it (largely for free) to people usually outside the typical consumer base. Specifically, these non-profit organisations present opportunities for promoting social sustainability as they facilitate social inclusion into various societal subsystems by creating communicative spaces and decision-making structures that offer access to resources and services for socio-economically disadvantaged groups, in line with Luhmann's Systems Theory. These organisations play a decisive role in shaping mechanisms of inclusion and exclusion by establishing specific expectations for the behaviour of their target groups, thereby influencing their capacity for social participation. However, there remains a gap in the literature regarding how traditional and emerging food rescue organisations differ in their structures, target group focus, and ability to enhance social participation and food security of socio-economically disadvantaged populations.

This paper draws on 24 qualitative interviews with managers of traditional and emerging food rescue organisations, exploring the intra- and inter-organisational networks that support their food redistribution efforts. The analysis highlights how these networks are critical to the reproduction of practices that foster inclusivity and sustainability, shedding light on the organisation's potential to contribute to food security and social participation for those most in need.

WIGEN, ALLISON* (Boston University, USA)

Fisherpoets: Confronting Climate Crisis through Art and Work

Every February, hundreds of people gather in Astoria, Oregon to hear the performances of "fisherpoets": people working in the commercial fishing industry who write and share poetry about their work and lives. These fisherpoets include commercial fishermen nospanning the Pacific and Atlantic coasts. They write of the dangers of the fishing industry, of loss and grief, of nature, and of strenuous labor. While the Fisherpoets Gathering has been held in Astoria since 1997, preliminary data have shown that the cultural significance of the gathering, and fishermen's cultural production, have evolved amid the context of escalating climate crisis. Today, commercial fishing is both blamed for and affected by climate change. This duality leads to commercial fishermen being portrayed as blights on the environment, when in fact many fishermen perceive themselves as fierce advocates for the ecosystems that comprise their livelihoods. In this paper presentation, I will share observations from my in-progress ethnographic and interview-based study of this community of fisherpoets. I will explore the social side of the climate crisis by demonstrating how, when, and why commercial fishermen employ artmaking and storytelling to make sense of climate change and create political pressure for sustainable fisheries. My preliminary findings suggest that many fisherpoets engage in resistance through artmaking on a variety of fronts. So far, four themes have emerged from the data: resistance to loss, resistance to erasure, resistance to climate change, and resistance

to gender roles. Sociologist Rebecca Elliott (2018) frames the sociology of climate crisis as a “sociology of loss.” This paper seeks to make space for the complexity of loss—cultural loss, ecological knowledge loss, material and environmental loss—while also documenting the individual and community practices that resist this erasure.

Ukrainian Forced Migrants and Their Civic Right to the City in Four European Capitals

This paper presents the results of exploratory qualitative project which studies four European cities and their “civil regimes” (Henrekson et al. 2020), through the eyes of Ukrainian forced migrants. Analyzing the perception those newcomers have of their new urban environment, we focus on civic dimension of their right to the city (Lefebvre 1968), namely opportunities to engage and integrate in civil society and entrepreneurial activities. Through our study we put forward a question concerning enablers and barriers to the refugees striving to exercise their right to the (new host) city as active agents instead of passive receivers of support (Darling 2017). Our study covers four European capitals: Berlin (Germany), Stockholm (Sweden), Vienna (Austria), and Warsaw (Poland) which received significant numbers of war refugees since 2022. In each city, 10 individual in-depth interviews are conducted, based on the same interview guide. City-level study allows us to better understand local context and specific opportunities and threats refugees encounter in pursuit to exercise their rights. In our interpretations, we employ the concept of civic traditions as described by Putnam (1993) and urban citizenship in transnational context (Purcell 2003). As the research is ongoing, we were able to formulate first reflections concerning local urban civic traditions and civil regimes as experienced by Ukrainian refugees. We describe them using a metaphor of two (sometimes interconnected) ladders of civic participation relating to home-city and host-city engagement and rights-exercising opportunities. We found that digital technologies have a crucial role in sustaining civic engagement in home-city, but also navigating refugees' engagement in host-cities. Also, opportunities to exercise newcomers' right to participate depends on “local civil regime” in their host-city. While Warsaw and Berlin context enabled a more smooth continuation of the previous forms of engagement, in Stockholm and Vienna refugees had to adapt to different rules and opportunities.

WIKTOR-MACH, DOBROSLAWA* (Krakow University of Economics, Poland)

From Extraction to Contamination: Illegal Refineries, Polluted Waters and Environmental Activism in Iraqi Kurdistan

This paper explores the interplay between extractivism, river pollution, and the proliferation of illegal oil refineries in the Kurdistan Region of Iraq. Positioned within the framework of the Capitalocene, the study highlights how systemic socio-ecological harm is not merely a by-product of economic activity but a component of the capitalist systems encouraged locally by power constellations and social dialectics. The paper examines the transformation of the Tanjero River, which became a symbol of ecological disaster, driven by the proliferation of illegal oil refineries and the region's deregulated extractive practices. Through fieldwork conducted in 2021 and 2022, including interviews with environmentalists, governmental officials, and community members, this paper argues that the ecological disaster in the Kurdistan Region of Iraq is fundamentally driven by the dynamics of the Capitalocene and extractivism, which find fertile grounds in new frontiers marked by non-governance, fragility of the state and regulatory failures. Recently, however, environmental activists have mobilised to combat river pollution and reclaim natural landscapes, highlighting both the destructive impacts of unchecked extractivism and the potential for community-driven resistance and restoration.

Classism and Everyday Stigma: The Lived Experiences of Homeless Youths in Germany

Background:

Homeless youths in Germany face multiple layers of systemic stigma, with classism at the forefront of their exclusion from society. This stigmatization manifests in their everyday lives, influencing how they are treated in public spaces, how they access services, and how they interact with institutions. While classism is central to their marginalization, other forms of discrimination, such as racism, ageism, and sexism, also play a significant role. This study investigates how these intersecting forms of stigma shape the survival strategies and social realities of homeless youths.

Methodology:

The study draws on 14 qualitative, problem-centered interviews (PZI) with homeless youths aged 14 to 23 in Nürnberg and Berlin, with ongoing efforts to diversify the sample. Conducted in collaboration with social services and youth outreach programs, the interviews explore personal narratives about how these youths experience class-based and other forms of discrimination. The data is analyzed using thematic analysis, grounded theory, and deep hermeneutics to highlight key patterns in their everyday struggles with stigma.

Results:

Preliminary findings reveal that classism deeply influences how homeless youths are perceived and treated. They are frequently labeled as ‘undesirable,’ ‘lazy,’ or ‘failures,’ leading to social exclusion and barriers to accessing services. These youths often resort to survival strategies such as invisibility or seeking support within informal networks. The intersection of classism with other factors, such as racial or gender discrimination, further exacerbates their marginalization and shapes their coping mechanisms.

Summary and Discussion:

The findings illustrate how classism and intersecting forms of discrimination shape the lived experiences of homeless youths. Addressing these issues requires more accessible support services, targeted efforts to reduce class-based stigma, and broader societal changes to challenge exclusionary attitudes.

To Take a Coronavirus Vaccine or Reject It? an Examination of Factors Influencing Vaccine Hesitancy Amongst Newcomers in Mexico, USA and Canada

Vaccine hesitancy is not new. Governments and public health officials have been educating the public about the safety of vaccines for decades. But the vaccine for coronavirus posed a different challenge. The “speed” at which the mRNA vaccine for coronavirus was developed did not make it easier to convince an already skeptical public of its safety and efficacy. For many officials, convincing the newcomer populations to take the vaccine was assumed to be a major challenge because of an assumption that many newcomers would lack the education and confidence in government officials needed to assure them of the safety of the vaccination. To examine the public's willingness or reluctance to receive a coronavirus vaccine, our team surveyed residents of Mexico, USA and Canada weekly from March 20 2020 through July 2021. Follow up surveys were conducted every three months for a two-year period after. As a result, we have a large longitudinal database that allows us to examine various beliefs, behaviours and intentions of Mexicans, Americans and Canadians during the pandemic. In today's presentation, we examine the vaccine uptake and myth beliefs of citizens and immigrants in the three countries to answer the question: to what extent does immigrant status influence vaccine uptake and belief in myths in Mexico, USA and Canada? Our results indicate that newcomers in Canada and Mexico are the most likely to accept the vaccine and less likely to believe in vaccine myths and that residents of the USA are the least likely to take the vaccine and most likely to believe in myths. We identify other factors that influence myth belief and vaccine rejection including gender, age, geography, political leaning, religiosity. Using intersectional risk theory, we find that marginalized communities may not blanketly reject science, medical theory or vaccines as has been previously suggested.

WILL, JEFFRY* (University of North Florida, USA)
MILLIGAN, TRACY (UNF Center for Community Initiatives, USA)

A Pirate Looks at 30: Three Decades of Community Based Applied and Clinical Sociology in an Urban University.

Upon arriving at the University of North Florida in 1993, I began working with two colleagues to develop an Applied Sociology Research Center. Since being formally recognized by the University in 1994, The Northeast Florida Center for Community Initiatives has partnered with dozens of local agencies, non-profits, and state government to study myriad social issues facing this community. Applied and Clinical project areas range from partnering with programs to reduce infant mortality and teen pregnancy, neighborhood needs and assets assessments, to examining the extent and consequences of race relations in the broader community, to assessing the extent of Hunger and Homelessness in the area, and even the Economic Impact of the Arts. In each of these projects, our motto of "Quality Research At Community Prices" has guided our approach – "we can't do it for free but we are reasonable." In this paper we examine a sample of these projects to better understand how academic Sociologists' efforts in the community work to provide local organizations information and expertise on addressing local economic, health and social issues, yet have to navigate the political and social mine-fields of race, sex and social class. We also look at the realignment that was necessary as we coped with the disruptions thrown at us by the COVID-19 Pandemic, including how we refocused our efforts to include new areas of research. We provide experiential suggestions for how Applied and Clinical Social Scientists need to negotiate the political and interpersonal/interagency relationships inherent in social service delivery and evaluation. Most importantly, we examine (question?) where we should go next, and how, in the social climate affecting or society, we can hope to make a difference.

WILLIAMS, JAMIE* (Woodstock School, India)

Winds of Change: New Directions for Environmental Justice Jurisprudence in India

India's legal framework for environmental protection, while multifaceted, has lacked a clear focus on environmental justice for citizens. The recent Supreme Court case of *MK Ranjitsinh & Ors v. Union of India & Ors.* appears to have changed that, articulating for the first time in domestic Indian jurisprudence the Constitutional right to be free from the adverse effects of climate change. This progressive stance echoes other emerging cases around the world, creating a promising pathway to domestic enforcement of international environmental treaty obligations.

A growing number of countries in the Global South are turning to jurisprudence as a mechanism for enforcing environmental rights and pursuing climate justice. As this litigation develops, the "green versus green" phenomenon in courts represents the complex interactions between important environmental priorities, in which opposing parties each advocate from environmentally conscious perspectives. For example, efforts toward sustainable development, clean energy, and reduction of carbon emissions can come into tension with conservation and biodiversity goals, as seen in the recent *Ranjitsinh* case.

How can environmental justice advocates promote balance among important environmental objectives before the courts, avert attempts at greenwashing purely economic interests, and keep human rights at the forefront of environmental litigation?

How is the newly articulated right to be free from the adverse effects of climate change inspiring and empowering public interest litigation in India as a tool to hold parties in power accountable for environmental harm, creating space for more tailored approaches to address impacts on specific vulnerable groups?

This presentation will explore the *MK Ranjitsinh & Ors v. Union of India & Ors.* case, the Indian environmental legal context in which it sits, and its potential as a foundation for renewed environmental justice efforts in India.

RC21-307.3

WILLIAMS, RASHAD* (University of Minnesota, USA)

The Reparative Ideology: The Limits of Liberal Antiracism

This paper critically examines the ideological underpinnings of two prominent municipal reparative programs initiated in the wake of the George Floyd Rebellion: Minneapolis's Truth and Reconciliation Commission (TRC) and St. Paul's Community Reparations Commission (CRC). Through a rigorous analysis of official texts, public statements, and interviews with key stakeholders, the paper interrogates the explanatory frameworks and causal

assumptions that shape these programs. Drawing on a range of theoretical perspectives, including Marxist critiques, critical race materialism, and liberal egalitarianism, this study explores the inherent tensions between race and class in reparative politics. While acknowledging the limitations of both liberal antiracism and race-reductive frameworks, this paper argues for a reparative planning approach that refuses the decoupling of race from political economy. In advancing the constructive view of reparations as a form of "worldmaking" (Táiwò, 2022), it proposes a reparative justice agenda capable of transforming the social, political, and economic structures responsible for the (re)production of racial inequality.

RC24-JS-144.1

WILLIAMS, TRAVIS* (Virginia Commonwealth University, USA)

High Tech Toxics and the Right-to-Know Movement in Silicon Valley

During the 1980s, in the wake of public exposure of a major groundwater disaster in Silicon Valley that was linked to leaking underground storage tanks at high tech facilities, a local anti-toxics resistance coalition of labor, community, and environmental advocates emerged. The organizing efforts of this coalition were grounded primarily in public consciousness raising and the development of environmental legislation, and the common thread of their advocacy campaigns was publicizing and expanding access to information about high tech industrial environmental hazards. This coalition launched a series of grassroots advocacy campaigns in the 1980s that built on the momentum of the Right-to-Know movement to demand more transparency and accountability from the high tech industry concerning its role in the production of environmental hazards. Drawing from qualitative interviews and archival research, this paper explains how one of the key strategies of domination historically employed by Silicon Valley's high tech industry to exploit local workers and ecosystems was the systematic production of public ignorance about the environmental hazards of electronics manufacturing. Additionally, this paper analyzes the resistance strategies employed by anti-toxics activists to hold the industry accountable for the environmental hazards to which it exposes workers and communities.

WILLIAMSON, HOWARD* (University of South Wales, United Kingdom)

The Milltown Boys - a Longitudinal Ethnography over 50 Years

In 1973, Howard Williamson, as a student, moved to a 'poor neighbourhood', an area of social deprivation comprising some 30,000 people, eight pubs, a few shops and no leisure or commercial amenities such as sports centres or banks.

He got to know a large group of young people (born around 1960) who had little else to do but hang around the streets. That initial relationship led on to a more formalised, classic participation observation study of those young people as they moved towards young adulthood through classical working-class youth transitions.

Contact with the 'Milltown Boys', as Williamson designated them, then diminished over time but was never completely lost or abandoned. That allowed for a second study, anchored through semi-structured interviews, when the Boys were around the age of 40, sociologists were writing about 'choice biographies' and 'risk society', and policy was increasingly concerned about the consequences facing young people who became 'NEET' (Not in Employment, Education or Training), or 'status zero' (as Williamson himself had depicted this group, though *not* through research on the Milltown Boys, in 1994). Many of the Milltown Boys had technically been 'NEET' in the late 1970s; what had happened to them?

Williamson interviewed 30 of the Boys in 1999, half of those on a list of 67 individuals he had drawn up with one of the Boys (seven of whom were already dead). By 2004, he had shaken hands with 47 of them.

When the Covid-19 pandemic struck, the Boys were approaching 60 years of age. Williamson interviewed 12 of them online, but referred to many more, through attention to social media and word of mouth.

Transitions persist. Those like the Boys do not look too far back, or indeed too far forward. The study has significant messages for research, for policy and for practice.

WILLIAMSON FA, STEFAN* (University of Cambridge, United Kingdom)

Food Encounters: Muslim Food-Aid and Inter-Religious Entanglements in Britain

The recent surge in food insecurity amongst households in the UK has prompted an increasing number of people to seek immediate assistance through food banks and soup kitchens. This trend has particularly impacted ethnic minorities, including Muslims, who are often less inclined to engage with conventional aid channels due to cultural and social barriers (Power 2023, *Hunger, Whiteness and Religion in Neoliberal Britain*). While significant research highlights the Christian genealogies and foundations of food aid initiatives in Britain—most notably the UK's leading food bank network, which is "based on, shaped, and guided by Christian principles"—less attention has been devoted to the emergence of Muslim responses to hunger and poverty in the country.

This paper presents findings from recent fieldwork conducted across various Muslim-run food aid initiatives in the UK. It explores the unique characteristics of these organisations, compared to traditional food assistance programs, particularly focusing on how they seek to embody Islamic principles of care amidst the backdrop of rising Islamophobia. Central to this inquiry are the dynamics between volunteers and service users, as well as the ways in which food serves as a medium for inter-religious encounters.

By employing an interdisciplinary approach combining perspectives from material religion and recent discussion on the ethics of care within the anthropology of Islam (Mittermaier 2019, *Giving to God*), this study emphasises the sensory and material aspects of food while addressing the ethical concerns of those involved in such initiatives. It aims to illuminate how these initiatives do not only provide essential temporary relief but also create spaces for encounter among diverse people within the British foodscape.

WILLIS, LESHAR* (Trent University, Canada)

Exploring ANTI-BLACK Racism in the Lives of Young BLACK Girls in EARLY Childhood Education and Care Settings

Systemic racism is deeply rooted in the fibre of Canadian society and institutions including Early Childhood Education and Care as evidenced through discourses of multiculturalism and diversity, dominant Western developmental paradigms, and the lack of culturally relevant pedagogy (Abawi & Berman, 2019; Nxumalo and Pacini-Ketchabaw, 2023). In such a way that neoliberal multiculturalism shapes how conversations on race and racism are(not) taken up in the field of early education. Recent research attests to the various ways in which Black children between eighteen months to five years-old experience forms of anti-Black violence in early learning settings, mirroring the educational experiences of Black students' from k-12 (Bernard & Smith, 2018; Essien & Wood, 2020; George, 2020; James & Turner, 2017; Litchmore, 2021; MacNevin & Berman, 2017; McPherson, 2021; Pimentel et al., 2023; Sterling-Cameron et al., 2023; Watson et al., 2023). Although young children experience racism in early learning settings, these incidents remain unacknowledged by early childhood educators through colourblind and race neutral attitudes (Abawi & Berman, 2019; Berman et al., 2017; Daniel & Escayg, 2019). Missing from the scholarship are the marginal experiences of young Black girls from preschool to grade three. Through a comparative exploratory research design using in-depth interviews, the proposed research project seeks to engage with African Nova Scotian ECEs and ECEs of African descent located in Ontario and Nova Scotia to answer the following research questions: How do Black ECEs understand and respond to racial incidences involving Black girls between 3-8 years-old? What patterns of exclusion do Black ECEs identify for Black girls? How do Black ECEs support the well-being of Black girls? This study draws on critical race theory, Black feminist epistemologies and Black girlhood theory to understand the experiences of Black girls as observed by Black female ECE's.

RC53-820.2

WILLIS, LESHAR* (Trent University, Canada)

Exploring the Education Experiences of BLACK Girls K-12

Recent research suggests that anti-Black racism is a persistent reality for Black students living in Canada and the U.S. Experiencing anti-Black racism within the education system has contributed to the disparities that exist and the disparate treatment impacting the educational achievement of Black students. Over the past few decades, research that examines the inequitable education experiences of Black youth consistently highlights the experiences of Black male students leading to interventions and supports that solely focus

on Black males. Although the education experiences of Black male students are important to understand, this has resulted in the misrepresentation and invisibility of the experiences of Black girls and their adverse education experiences. This research study intends to examine the education experiences of Black girls and how gender intersects with anti-Blackness to shape the experiences of Black girls in schools. Using Black Girlhood Theory (BGT) as a theoretical lens to guide this research which considers age, race and gender, the following research question was examined: 1) What are the specific ways in which Black girls experience anti-Black racism in the education system? Using a systemic narrative literature review, findings revealed that Black girls are subjected to adultification which is the removal of the consideration of childhood as a factor in a child's behaviour. As such, Black girls experience differential treatment, surveillance, inequitable disciplinary consequences, over policing and gendered microaggressions.

WILTSHIRE, ANNE HILDA* (Cohere Solutions, South Africa)

Who Cares? Conceptual Problem of the Sustainable Development Goals: The Neglect of Children.

This presentation explores the historical roots and their contemporary implications in the conceptual tensions on work in homes in social legislation, policy, theory, and practice. It argues outdated norms and policy gaps perpetuate the exclusion of work in homes, particularly child work, from formal recognition. This hinders efforts to address hazardous working conditions and leads to systemic child neglect. The analysis reveals that existing frameworks often overlook certain types of work, resulting in significant underestimations of the scale of the issue and ability to meet the national and international SDG Social Development goals. To address these challenges, the adoption of a dialectical materialist methodology and a re-evaluation of social conceptual frameworks is advocated for to better understand and address contemporary social disjunctures.

Explaining Social Selectivity between General and Vocational Educational Routes to Higher Education Entrance Qualification and Access to Higher Education in Germany

In Germany, there are mainly two routes to higher education entrance qualification (HEEQ). The traditional route (67% of HEEQs) via general upper secondary schools (GUSS) is chosen after primary school. An alternative route via vocational upper secondary schools (VUSS) is entered after different forms of general lower secondary education. Evidence suggests that attaining a HEEQ is socially selective in both GUSS and VUSS, although VUSS as a form of "second chance" education were intended to decrease social inequality in educational participation. Our research questions are: *Are there differences in social inequality in attaining a HEEQ and transitioning to higher education (HE) between VUSS and GUSS? What explains different effects of social inequality between the two pathways?* Based on rational choice theories of educational inequality we expect that social inequality regarding the probability to achieve a HEEQ and to access HE is stronger for students in GUSS than for students in VUSS due to stronger status maintenance motives, higher subjective success probabilities and subjectively perceived benefits, and lower subjectively perceived costs. Using longitudinal data by NEPS SC4, we apply logistic regression and mediation models for both GUSS and VUSS and two dependent variables ("attaining a HEEQ: yes/no", $N = 5,093$; "transitioning to HE or vocational education and training (VET) after acquiring a HEEQ: yes/no", $N = 4,597$). Our analyses show that compared to students in GUSS, students in VUSS have a substantially lower socioeconomic status, are less likely to attain a HEEQ and to enter HE but more likely to enter VET. The results suggest that institutional differentiation contributes to the fact that students with less favorable social backgrounds tend to be channelled into lower-tier schools, where they can obtain HEEQ but remain to be less likely to successfully transition to HE.

How Does the Local State Mediate the Relationship between Technological Change and Work? Evidence from Warehousing in England

The debate on technology and the future of work has so far engaged little with the local state. This is surprising, since the local state's role as a potentially progressive actor in employment relations systems is attracting interest in sociological scholarship. Through a study of warehousing in Yorkshire, England, we examine how local state actors mediated the relationship between technological change and work. We show that they often questioned the policy orthodoxy that private employer-led technological innovation always benefitted local populations, and identify *engagement*, *advocacy*, and *conditionality* strategies through which these actors sought to respond to technological trajectories in warehousing workplaces. However, our study also shows how the opacity of technological innovation in warehousing limited local states' regulatory capacity.

Institutional Dynamics of Inclusion and Exclusion: Child Language Brokers in the School-Child-Family Triad

Our study investigates how students' roles as language brokers within their families impact their experiences in the institutional setting of the school, particularly within the school-child-family triad. Focusing on participants' perceptions of their translation efforts in school contexts, we explore how these roles influence their relationships with parents, teachers, and peers, as well as how these dynamics affect their experiences within the educational system. Ultimately, we highlight how institutional arrangements within schools—such as localized policies, routines, and practices—either facilitate or hinder the social inclusion of multilingual, newly arrived migrant children and youth, sometimes leading to their exclusion from meaningful participation in educational opportunities.

Employing qualitative methods, including semi-structured interviews with individuals who served as language mediators during childhood and focus groups with newly arrived parents and students, we investigate the dynamics of multilingualism and language brokering in German school settings within postmigrant contexts (cf. Foroutan 2019; Yildiz 2015) from an intersectional perspective (cf. Haschemi Yekani & Nowicka 2022). Key questions guiding our investigation include: How do different students perceive their roles as translators in school settings, and how do institutional responses—such as support or neglect—affect their experiences? To what extent does their mediation role influence their relationships across family and educational environments?

Drawing on Meyer and Rowan's (1977) concept of neo-institutionalism, we explore how organizational rules are translated into institutional actions and delineate how institutional arrangements within the school-family-child triad enact processes of inclusion and exclusion. Our analysis specifically investigates whether these arrangements reinforce or counteract exclusionary practices, particularly for children and youth from multilingual, newly arrived migrant families within the school-child-family triad. Additionally, we aim to identify solutions and best practices that could enhance inclusive approaches within educational institutions, fostering a more equitable learning environment for all students.

WISETHPOLCHAI, BUSSABONG* (ThaiHealth Academy, Thai Health Promotion Foundation, Thailand)

How Commercial Determinants of Health Affect Vulnerable and Planetary Health.

Commercial determinants of health (CDOH) is the complex and often negative influences of commercial actors on human and planetary health. The CDOH covers three areas. First, they relate to unhealthy commodities that are contributing to ill health. Secondly, they include business, market, and political practices that are harmful to health and used to sell these commodities and secure a favorable policy environment. Finally, they include the global drivers of ill health, such as market-driven economies and globalization, that have

facilitated the use of such harmful practices. Even though CDOH affects everyone, vulnerable groups such as migrant workers are especially at risk and worsen pre-existing economic, social, and racial inequities.

Data from the Thailand Office of Migrant Workers Administration in 2021 shows that there are 3.3 million legally registered migrant workers, about half of whom live in Bangkok and surrounding areas. While illegal migrant workers are likely to be around 3-4 times more numerous, and most of them are unskilled workers. We explore how CDOH affects migrant workers through three illegal migrant workers who live in Bangkok. Sao is an illegal migrant worker from Laos who was abandoned by her Chinese employer who opened a shop in Sampeng Market after she had a work accident. Peng, Burmese migrant workers in Yaowarat, who were left homeless after a fire broke out in Soi Pho, a cheap accommodation area for migrant workers. Sky, a Cambodian male sex worker, contracted HIV from a drug-fueled sex party. They all fled their homes due to the impacts of dam construction, the war in Burma, and global warming caused by capitalist control.

However, the CDOH concept, like other concepts, cannot be used alone to explain complex phenomena but rather requires other concepts to understand and address these *planetary* health phenomena that affect people.

Grounded Theory and the Decolonizing Agenda: Possibilities and Limitations

Grounded Theory (GT), a pioneer of qualitative research strategies, has gained its place in academia as a systematic inductive approach to research. The founders of GT such as Glaser, Strauss, and Corbin, as well as Charmaz and Clarke who developed GT further after the constructivist and post-structuralism turn explored and developed the approach in several directions and across various research fields from medical care to social anthropology.

Evolving as an alternative approach, GT embodies fundamental processes and procedures, which allows its users to pulse, reflect, position and consciously adopt measures to deconstruct and disempower orthodox and taken for granted nuances of research relationships, processes and interactions.

As voices get louder for the decolonization of knowledge production and qualitative research in particular, it is important to assess how much of an alternative is GT as it moves into mainstream research. Taking also into account the advancement of current understandings of epistemic injustice.

In this paper, we draw on experience doing research in rural and urban settings in East and North-East Africa to explore inherent characteristics and processes of the methodology, such as optimal ignorance, flexibility, inductive data gatherings, and coding. Providing concrete examples of doing, we demonstrate the possibilities and limitations for reversing power relations, co-creating knowledge and producing de-colonial research processes and knowledge beyond global south - north asymmetries.

The Fight for Windmills. Individual Efforts to Preserve a Troublesome Cultural Heritage in Poland

In the proposed presentation, we focus on two cases of people who strive to preserve the material cultural heritage in the form of old windmills. To achieve this goal, they must convince the local community, visiting tourists and, above all, the authorities and potential sponsors about the uniqueness of the facility they care for.

Using the association with the classical topos and Alfred Schutz's classical analyses of Don Quixote, we try to analyze how the caretakers of windmills reduce the dissonance between the dominant discourses of foreignness (a German windmill), backwardness (a wooden structure) and otherness (a windmill different from all the others in the area) and the positive discourse of caring for local heritage, a testament to ancient craftsmanship and progress and the exceptional skills of ancestors.

The fight to preserve the windmill may seem like a fight against windmills in its metaphorical sense. It involves not only efforts to preserve the windmill materially, but also requires reformulating its meaning, its history.

We compare the case of a private wooden windmill, which is passed down in a family from generation to generation and, although it is no longer economically useful, is an important point of reference for the family and local heritage with the case of a brick windmill with a wooden mechanism, which passed from hand to hand between owners from different countries and with different ideas for its development.

The modern Don Quixote does not fight windmills, but fights to preserve windmills, which are not only becoming a troublesome heritage due to their contemporary uselessness in production and the costs of their maintenance and renovation, but also because of the memory of things, due to the difficult history they bear witness to and which they evoke.

Addressing Sexual Violence in Polish Higher Education: Final Results of a Nationwide Survey

A 2018 report by the Polish Ombudsman reveals that more than 31% of students have experienced at least one sexual harassment behavior since starting college. It is an example of gender based violence, where the majority of victims are women.

The present research was conducted using a quantitative method to collect data on sexual violence from university students and a qualitative method in the form of semi-structured interviews with university staff and analysis from a feminist theory perspective.

Poland, at least officially, boasts universal gender equality and low rates of gender-based violence. In reality, inequalities are significant and acts of violence go unreported. Despite apparent legal and moral modernisation, the state does not act to expand disciplinary power to effectively punish perpetrators of sexual violence - it uses outdated categories, if compared to dominant Western discourses and international law regulations, many acts do not come within the scope of sexual violence as understood by the legislator. Moreover, the government does not recognise the existence of individuals that do not fit into a binary division, as a result of which it becomes almost impossible to conduct legal research using gender/queer categories - which is a major limitation of our research.

The research focused on many specific aspects of the problem of sexual violence. The study identified not only the main profile of the perpetrator, but also of the victim. In addition, the relationship between intra-university procedures, including disciplinary procedures, and criminal proceedings was explored, as national law does not clearly regulate this issue. The most important findings are respondents' opinions on the possible reasons why students do not report incidents of sexual violence to university authorities and the role of preventive measures.

SKAPTADOTTIR, UNNUR (University of Iceland, Iceland)

Environmental Justices and Labour Mobility in the Peripheries of Europe

The presentation builds on data from over three-year of ethnographic fieldwork conducted in five different rural areas in Iceland. In the last years Iceland witnessed unprecedented increase of foreign population. Just within thirty years, the share of immigrants in the total population grew from 2% at the beginning of 1990s to 17% in 2023. The migration is predominantly labour driven, with people coming to work in construction industry, low-skilled service jobs and food processing. In our presentation we focus on young migrants coming to work in rapidly expanding tourist sector in rural areas in Iceland. We are particularly look at narratives of those who moved to Iceland following their idea of the country as remote, peripheral and unspoiled. Many of them arrived to Iceland seeking for a slower and less hectic lifestyle, away from market economy, environmental insecurity, as well as economic and social injustice, affording hope for an alternative future. However, by undertaking temporary and precarious jobs in tourism, they confirm to the employers' demand for flexible labour. Consequently, reinforcing instability created by neoliberal economy. In our presentation we discuss these apparent contradictions in the recent migration trends by apply theories of escapism and alternative futures.

Racialised Labour Markets, the Work-Citizenship Nexus, and Platform Work: Comparing Job Quality and Worker Organising in the United States and South Africa

Much has been written already about job quality in the platform economy (e.g., ILO, 2021; Anwar and Graham, 2021; Wood et al., 2019). But far less has been written about how social biases are reproduced in the labour markets through the platform economy. Digital labour platforms and clients/employers exert control over workers and labour process through the mechanisms of ratings, feedback, payment methods, and user profile registrations, also known as the algorithmic management (Rosenblat 2018; Gandini, 2019). This raises concerns about the job quality impacts of platforms, particularly among those that are already marginalised such as women workers, people with disability, people of colour, migrants, and refugees. These groups represent not only a vast majority of the poor, unemployed and those in the low-paid informal work in both countries, they are also increasingly represented in platform work (ILO, 2021). Exploring two socio-political contexts, the United States and South Africa, both of which have a history of structural racism in their labour markets, this study explores issues of job quality and worker resistance among platform workers. Utilizing innovative social media survey methodology this study employs targeted Facebook Ads to survey platform workers in both countries about their racialised experience with platform work. The study seeks to uncover the experiences of marginalised populations undertaking gig work within these countries to understand the similarities and differences in cross country context. We seek to uncover the experiences of economically marginalised in the platform economy to understand how digital transformation is perpetuating and embedding structural racism into the future of work and how workers are resisting these systems.

Accountability in Environmental Governance

The inadequacy of responses to problems such as climate change, biodiversity loss, and economic inequality invites theorization and empirical analysis of mechanisms that coordinate i) behavior, strategy, and investment at the level of individuals and organizations and ii) regulation at the level of communities, sectors, and nation states. Combining ideas from environmental governance scholarship and critical institutional analysis -- study of the implications of existing and imagined socioeconomic coordination mechanisms -- I present an integrated co-evolutionary model of cognitive, institutional, socioeconomic, and biophysical dynamics. The model highlights pathways to address socioecological problems and raises difficult questions regarding intersections between liberalism, justice and sustainability.

RC15-227.6

WOLFSON, MARK* (University of California, Riverside, USA)
On the Dominance of Mass Persuasion over Policy in Addressing the Global Epidemic of Obesity

According to the World Health Organization, obesity is a global pandemic. Over two billion adults worldwide are overweight; about 1/3 of these individuals may be classified as obese. Rates of obesity continue to increase at an alarming rate in high, middle, and low-income nations. Historically, persuasion and education strategies—such as mass media campaigns, school-based education, and one-on-one counseling in medical settings—have dominated obesity prevention efforts in the United States and, to some extent, globally. Examples include the Center for Disease Control and Prevention's Verb® campaign in the U.S. and World Obesity Day globally. However, a number of studies suggest that such education and persuasion efforts have had a limited impact. Other strategies employing policy, such as taxation of sugar-sweetened beverages, limits on portion sizes, bans of trans fats, and restrictions on food and beverage industry advertising may offer greater promise for impact. I examine four categories of explanation for overreliance on persuasion: cultural preference, policymaker preference, preferences of industries that could be affected by regulation, and financial interests of the global advertising industry. I conclude by offering suggestions for development of research and policy agendas to correct over-reliance on persuasion in global obesity prevention and control efforts.

RC30-481.2**WOLKENHAUER, ANNA*** (University of Bremen, Germany)*Exploring the Potential of Interlinking Social and Economic Policies for Structural Transformation: The Case of Botswana*

Interlinking social and economic policies holds much promise for inclusive growth and structural transformation in Africa, as several authors have pointed out with regards to foregone eras of developmentalism. Yet, in many countries, social policy is used mainly as a poverty alleviation tool instead of underpinning a process of economic restructuring into higher value activities for more and better employment. This can be at least partly attributed to the strong donor presence in the field of social protection and social policy, who act in silos and/or follow neoliberal scripts of poverty targeted social protection and market-driven economic development.

In my paper, I begin from this observation to explore the social policy in Botswana for its transformative content. Botswana has been singled out in much of the Development Studies literature as an exceptional case in Sub-Saharan Africa; exceptional for its growth trajectory, developmentalism and policy autonomy. In fact, donors do not have much influence on the government's policy choices, given its fiscal independence as a middle-income country. This context thus lends itself to studying the possibilities of interlinking social and economic policies under an overall, domestically-driven developmental ideology.

Emerging empirical findings, however, indicate that social and economic policies exhibit a similar kind of non-transformative character as elsewhere in the region, despite sufficient policy space. Social protection in Botswana is also highly poverty-targeted and limited by the wide-spread fear of making poor people "dependent" on the state, while education policies tend to be misaligned to the needs of the labour market. Moreover, economic strategies continue to rely on private investors for the allocation of resources, leaving the country's economy undiversified and biased towards a few urbanised centres. While acknowledging Botswana's large post-Independence achievements, the paper thus sheds some doubt on its characterisation as a development state.

RC12-178.4**WOLKMER, ANTONIO CARLOS*** (La Salle University, Brazil)*Towards a Transposition of the Anthropocene: Human Rights in a Scenario of Sustainability of Life*

Towards a Transposition of the Anthropocene: human rights in a scenario of sustainability of Life The initial problem posed is how to conceive of a new era for humanity and planet Earth in the face of the risks of destruction and extinction of living beings, stemming from the depletion of survival conditions and the limits of natural resources. In this scenario, with a possible apocalyptic outcome, what role will normative processes and, especially, Human Rights play in the future? A range of questions arises concerning the future of human life and living beings in the Anthropocene era: not only the coexistence of Human Rights with Non-Human Rights but, above all, how the prevailing traditional conception of Human Rights would be able to address these new adversities. The central problem is: how to position Human Rights within this future scenario, including the integration of Non-Human Rights? This concern also introduces the controversial implications of the Anthropocene era, which brings into question the future of humanity and planet Earth itself. The proposed reflection is to, in light of the gravity of socio-environmental, political, legal, and natural crises, highlight alternatives in different fields of human activity, not only interdependent mechanisms that foster resistance to the hegemonic civilizational model present in the Anthropocene but also constitutive processes capable of advancing beyond the current normative frameworks, recreating ecocentric forms of the Human Right to life, of Human Rights as integrated with the Rights of Nature.

RC25-JS-179.2**WONG, FRANKIE HO CHUN*** (Lingnan University, Hong Kong)*Between Negative Ageism and Compassionate Ageism: Post-COVID-19 Media Representation of Older People in Hong Kong*

Older people were among the groups most at risk in pandemics such as COVID-19. Previous studies found that, during COVID-19, the media not only subjected older people to negative ageism that stereotypically victimized them, but also compassionate ageism that prompted unsolicited concern out of pity or goodwill. Both types of ageism could undermine the mental health of older people and prompt inadequate health behaviors for disease prevention due to a distorted risk perception imposed on the age group. This study analyzes narratives about older people in the media in Hong Kong in 2024, when the city fully retreated from pandemic mode. Deconstructing

these narratives helps unpack the (re)imagination of old age post-COVID. The case of Hong Kong not only demonstrates the dynamics between negative and compassionate ageism in a highly secular Chinese society, but also the health inequality embedded in the information environment.

This study utilizes a large dataset of media coverage on health in Hong Kong, consisting of about 500,000 online and offline articles. A human-in-the-loop computational mixed methods analytical approach is adopted. Media texts about older people are filtered and analyzed by natural language processing techniques. Machine learning is applied to content-analyze media articles. First, Topic Modeling identifies the health issue being discussed. Next, ageist narratives are identified by supervised machine learning, where researchers trained text models through qualitative content analysis, which teaches the computer to classify ageist narratives in the sea of data. Finally, results are combined to map the prevalence of both types of ageism in the media sphere on COVID-19 and across different health topics. The findings are compared to the study conducted in 2020 to demonstrate the evolution of media representation of older people. This study also generates nuanced contextual evidence that addresses ageism in the post-pandemic world and its relations with health inequality.

RC54-830.2**WONG, YEN NEE*** (University of Leeds, United Kingdom)*Persistence of Cis-Genderism in LGBT+ Inclusive Dancesport Competitions in the United Kingdom: Disciplining Trans* Sporting Bodies to Fit in?*

Dance is unique to many art forms in that it is expressed in and through the human body, which becomes a symbolic embodiment of culturally patterned notions of genders, sexualities and moralities. This paper draws on an autoethnographic study of the United Kingdom's Equality Dancesport scene and 35 semi-structured interviews with LGBT+ dancers to problematise the cis-genderist practices in competitive ballroom dancing. Equality Dancesport is a competitive ballroom dance scene which emerged from the LGBT+ community. As a sporting activity, Equality Dancesport is governed by rules and regulations around its participation. These competition rules were revised in 2019 with the aim to promote greater inclusivity of trans* dancers, specifically to be applied to equality dance competitions hosted in the United Kingdom. In this paper, I examine the discourses shaping this recent revisions in the rules and the accompanying experiences of trans* equality dancers within this competitive arena. Findings suggest that despite challenging some cis and heteronormative practices in mainstream Dancesport spaces, essentialist notions of sex and gender continue to shape Equality Dancesport competition rules. This means that trans* dancers continue to face several challenges participating in a competitive sport which operates on a binary sex system. Illustrating instances of institutional violence perpetuated against trans* equality dancers, the paper concludes with a proposal for radical regulatory and policy changes to facilitate the development of LGBT+ inclusive sporting contexts. Proposed changes include (1) questioning the epistemological understandings of sex and gender, and (2) celebrating other values in competitive sports such as camaraderie, empathy, respect and the embodiment of queer joy, apart from the current overemphasis on fair play and winning.

RC47-JS-38.4**WOOD, LESLEY*** (York University, Canada)*Can't Stop, Won't Stop! Maintaining Momentum amidst Grief and Fear*

How does a local solidarity movement maintain momentum in the face of overwhelming odds? Using models of sustained mobilization, this paper examines over 600 pro-Palestine/pro-ceasefire protests in Toronto during the first year of the attacks on Gaza, showing how local activists found ways to maintain momentum and solidarity, despite local repression, and unremitting violence in Israel/Palestine. It examines the mechanisms of shifting goals, frames, temporal conceptions, and tactics, as well as the ways factionalization, radicalization and institutionalization mattered in the struggle to maintain momentum.

RC47-739.1**WOOD, LESLEY*** (York University, Canada)*Looking Back, Moving Forward: Movement History, Movement Strategy*

When and how do activists use movement history to shape their strategy? This paper aims to sensitize models of social movement strategy to fluctuations in temporal orientation. It analyses interviews with activists involved in movement history projects including archives, reading groups, and

oral history in the US, Canada, Australia and the UK, alongside the authors experiences, and finds that, first; movement history is sought out and valued during periods of uncertainty that occur at transitions in the cycle of protest. Second, activists use movement history within processes of collective identity to socialize new members, inspire commitment, legitimize and defend identities, strategies and gains. Third, movement history is also used in ways that weaken strategic capacity. The paper concludes by proposing to incorporate an orientation to the past in models of movement strategizing.

WOODMAN, DAN* (University of Melbourne, Australia)

What Comes after the Political Economy of Youth? Is It the Sociology of Youth?

This presentation engages in debates about the political economy of youth. It aims to combine a focus on different aspects of young lives in the context of social continuity and change and attention to 'linked lives' to show limitations with recent calls for a strengthened political economy of youth approach. Many intergenerational supports from parents to children once associated with teenage years now characterise youth and young adulthood and parents in Australia (with the capacity) are increasingly financially supporting their children well into young adulthood. It is established these financial transfers are being used to support young adults' housing transitions, particularly home ownership, but the effects of the 'bank of mum and dad' are potentially far wider, shaping education, career, and relationship transitions and the cultural engagements young people can undertake. Using mixed-methods data from a longitudinal study in Australia, the presentation shows that these intergenerational supports are being used to manage financial insecurity and a cost-of-living crisis in some cases, but in others parents are helping their children to pursue extended education and manage a period of insecure and poorly paid employment on the way to more secure and well-paid careers in areas such as medicine, academia, and journalism and to pursue so called 'DIY' careers. I use this analysis to argue that recent approaches to the political economy of youth do not have the tools to understand young lives and shifting inequalities sociologically, and instead a sociological approach that treats lives holistically and as embedded in relationships across and within generations can provide these tools.

(Un)Surprising Disconnect? Young People's Perceptions of Climate Change, Disasters and Climate Action, Living in Australia's Disaster-Affected Regional and Rural Communities in Victoria.

In regional and rural communities in Australia, young people already experience escalating disasters and the compounding impact of the climate crisis in their communities. While the consequences of the Anthropocene era are widely debated, for young people living and working outside of urban centres there is little intersection between this scholarship and the disproportionate impact of disaster(s). Furthermore, young people with lived experience of disaster residing outside of urban centres, appear to be largely absent from the broader national and global climate action conversation.

The aim of this paper is to introduce the perceptions of regional and rural young people into this conversation and examine the effects of climate disasters, the climate change mitigation policies of governments and the related uncertainty of the Anthropocene, in their lives. This paper draws on data from focus groups conducted with young people (17-22 years old) with lived-experience of climate-related disasters (including bushfires, floods and landslides) in regional and rural communities in the state of Victoria, Australia over the past five years.

The paper focuses on young people's concerns regarding speaking up about climate change in their communities and the difficulties taking part in every-day political activities and larger climate protest actions. It highlights the complexity of the manner in which climate-related disasters and the climate change mitigation policies of governments shape young people's understanding of, and response to, the climate crisis. The research further revealed concerns that their climate change action was constrained by their own or family members' income generation from resource-extractive industries in their local contexts. This paper brings together scholarship from three significant fields of knowledge (disasters, climate change/the Anthropocene and youth studies) to enable opportunities for consciousness-raising and to consider alternative ways to foster young people's every-day political climate action in regional and rural communities.

WG11-942.1

WOODS, COLLEEN* (University of Maryland, USA)

Small Arms and Economies of Violence

An "economy of violence" often refers to how states or militaries calculate the amount of violence needed to achieve political aims. This paper examines the afterlives of small arms that are transferred to foreign governments or abandoned in the wake of wars and fall into the hands of civilians. I show that these arms can alter economies of violence and give rise to types of violence that are not easily contained by states nor easily interpreted by scholars. I will use the post-WWII civil war in the Philippines as a case study to examine these questions.

The development of expensive, powerful weapons or weapons systems are thought of as deterrents to inter-state violence and are considered "high-value" weapons that are closely monitored by states. On the other end of the scale are small arms—namely guns—that have, since the Cold War, increasingly circulated through military aid and are not well tracked, and, most importantly, often "left behind" after major military operations. Small arms are often overlooked and are, in fact, even categorized by the state in non-violent terms—in the aftermath of WWII small arms are termed "surplus property" and since at least the early 1970s have been referred to by the State Department as "spare parts." However, in the aftermath of WWII, small arms dramatically altered the economy of violence as millions of dollars of worth armaments were left in territories, including the Philippines, at the end of the war. These "leftover weapons," I argue, produced a new economy of violence in the Philippines that not only made possible a six-year campaign of state violence against a civilian population but also led to other types of violence—such as intrapersonal violence—that fit neither the category of anti-colonial resistance nor state oppression.

WORM, ARNE* (University of Goettingen, Germany)

The (Re)Construction of Migration Biographies through Citizenship. Ambivalences of Integrationism in Germany

Integration, a concept that has long been the subject of controversy in academia and civil society, appears to have undergone a remarkable revival in public debates and the political management of migration in Germany since 2015, particularly in light of the so-called 'refugee crisis.' In many other 'arrival contexts,' integrationist (or assimilationist) thinking also plays a crucial role in negotiating relationships between migrants and non-migrants and, more broadly, within the structure of migration and citizenship regimes. Integrationism can be understood as a social order of access and belonging, produced and reproduced through a complex bundle of legal and administrative procedures, everyday practices of 'doing differences,' and moral claims regarding the legitimacy of positionalities and inequality.

In this presentation, I will share empirical findings on the biographies and experiences of people who fled the civil war in Syria for Germany, examining integrationism as a component of 'doing migration,' 'doing citizenship,' and 'doing difference.' How do integrationist practices and discourses in the 'arrival context' relate to the (re)construction of biography, particularly when life histories are shaped by the experience of fleeing collective violence? What diverging consequences does integrationism have for the (re)construction of the temporal order of one's life, specifically regarding the relationships between past, present, and future? How do experiences of state-subject relations change in the context of varying family and life histories? I will argue that 'individual' responses to and consequences of integrationism are intricately intertwined with overall biographical processes, particularly regarding how positions within various figurations, such as transnational networks, shift throughout the course of flight. Furthermore, integrationism not only relies on the construction of differences between migrants and non-migrants but also involves morally charged practices of 'doing difference' within migrant groupings.

Decolonizing the Governance of Indigenous Land Use: Possibilities and Dilemmas Under Taiwan's Transitional Justice Practices

Since the Qing Dynasty, Taiwan's Indigenous peoples have been subjected to the rule of various foreign colonial regimes until the current Taiwan government in 1947. The land used by Indigenous peoples has been continually reduced due to these foreign colonizers. More significantly, the introduction of the European individual land ownership registration system

led to the establishment of the "Indigenous Reserved Land" system, which caused Indigenous peoples to gradually abandon their previous traditional of communal land use and mobile farming practices. Instead, they were forced into "modernized" individual ownership and fixed-point farming methods, which resulted in even more severe land fragmentation. Additionally, although the Indigenous Reserved Land system limits ownership to Indigenous peoples, the upper limit of compensated ownership has not been restricted. Furthermore, through practices like borrowed name registration, lands intended to safeguard Indigenous rights have instead become part of the modern property exchange market, completely contradicting the original purpose of the Reserved Land system.

Starting in 2018, Taiwan implemented a series of transitional justice legal frameworks. Then-President Tsai Ing-wen became the first head of state to apologize to the Indigenous peoples and established the "Presidential Office Indigenous Historical Justice and Transitional Justice Committee". However, the governance of Indigenous land remains governed by the "Regulations on Development and Management of the Lands Reserved for Indigenous People" established in 1990, and the legal framework has yet to align with Taiwan's transitional justice discourse to achieve decolonized governance that meets the contemporary needs of Indigenous communities and individuals. Instead, it appears to continue replicating colonial governance logic, keeping Indigenous peoples trapped under colonialism. This paper will analyze potential future reform directions and the challenges that must be overcome by examining Taiwan's transitional justice theory, including constitutional recognition, legal frameworks, changes in Indigenous land use regulations, and relevant case studies.

Does Exposure to Armed Conflict Affect Women's Attitudes Toward Intimate Partner Violence? Evidence from Vietnam

This study combines individual-level survey data and province-level data on wartime bombing to assess the long-term impact of the Vietnam War on Vietnamese women's attitudes toward intimate partner violence (IPV). To establish a causal link between war exposure and IPV attitudes, I use a province's distance to the arbitrarily drawn border between North Vietnam and South Vietnam as an instrument for bombing intensity in that province. I find that women living in heavily bombed provinces are more likely to accept IPV. The instrumental variable estimates are greater in magnitude compared to the ordinary least squares estimates across various specifications, pointing to measurement error in conflict exposure. Exposure to bombing does not seem to make women more tolerant of IPV through education or marital matching. Instead, the war is likely to directly affect women's views about IPV because of the normalization of and desensitization to violence in the private sphere.

WU, HANBO* (New York University Abu Dhabi, United Arab Emirates)

Gender Revolution amid Gender Inequality? Uncovering the Multidimensional Complexity of Gender Ideology in Contemporary India

Recent studies have challenged the assumption that gender ideology falls along a single continuum with gender egalitarianism at one end and traditionalism at the other. Using latent class analysis with nationally representative data, this paper extends the literature by exploring the patterns of gender ideology in India, where gender inequality is a much severer issue compared with many countries previously investigated. I find that fully egalitarian class and traditional class account for 8% and 19% of the sample, respectively, while the rest of the sample are divided into four classes that distinctively combine gender egalitarianism and traditionalism in different domains, reflecting the widespread multidimensionality of gender ideology in modern India. In particular, I show that individuals in these ambivalent classes generally favored dual-breadwinner model, women's participation in household decision-making and politics, and men's involvement in domestic work. But at the same time they held traditional beliefs emphasizing male primacy in intimate relationship, labor market, and cultural traditions like handling parents' funeral. The findings indicate that even in the context of profound and prolonged gender inequality, there have been some signs of gender revolution taking place in India, but social norms enhancing patriarchy made configurations of gender role attitudes rather complex.

Optimistic or Pessimistic? Estimating Social Mobility Beliefs and Related Perceptual Inaccuracy in China

This study focuses on the subjective evaluation of the overall social mobility, namely, mobility beliefs in China. Using a quasi-experimental vignette design in a originally collected Web survey (N=3003), we constructed a "rank-rank correlation" measure of educational and income mobility beliefs and compared them with corresponding objective mobility indicators (rank-rank correlation of intergenerational education/income percentiles extracted from multiple waves of survey data and census data). By such comparison, we try to accurately estimate patterns of perceptual bias on social mobility. The comparison between subjective and objective social mobility reveals the complexity of mobility belief biases in China: (1) Optimistic belief of absolute mobility, where people overestimate the likelihood of upward mobility from lower family background, particularly for education; (2) Optimistic belief of relative educational mobility, where people underestimate the intergenerational persistence of education (parent-child educational rank-rank correlation); (3) Pessimistic belief of relative income mobility, where people overestimate the intergenerational persistence of income (parent-child income rank-rank correlation). Results from the multilevel linear model analysis further show that the aforementioned patterns of perceptual bias do not vary according to respondent characteristics and may therefore be widespread.

The "Separated-but-Not-Broken" Families and the Intergenerational Social Closure in China Use Rank-Based Approach to Study Family Structure and Social Mobility

As one of the core axes of social stratification, family structure has been widely emphasized to lead to "diverging destinies for children" and shape social mobility. This paper examines the moderating effects of a special form of family structure: separated-but-not-broken families on Inter-Generational social Closure (IGC) across generations. Using the unique retrospective information of family structure from the CFPS 2010 baseline data, combined with the occupational information of the younger generation from the five follow-up rounds from 2012 to 2020, we formed a unique dataset that simultaneously includes childhood family structure, parental occupational status (origin), and children's occupational status (destination), nospanning multiple cohorts. We defined the separated-but-not-broken families as families where either the father or mother did not live with the child for more than three months when the child was 0 to 12 years old. To avoid the impact of the remarkable transformation of the occupational structure across generations and cohorts on the measurement of IGC, we used a new rank-based method, namely, LACOP (*Latent Bivariate Copula* regression framework, Tam, Wang and Xiang, 2023), to analyze IGC across family structures. This new method links the discrete observable data (such as class, occupational status, and education) with latent continuous distributions, enabling the IGC estimation as a margin-free Copula dependence. Our main findings include: (1) the occupational IGC is stronger in separated families compared to intact families; (2) the stronger occupational IGC in separated families is mainly observed for people who hold rural Hukou; (3) the stronger occupational IGC in separated families was mainly observed among males and in the cohort of 1958 to 1977.

Chinese Queer Males' Memories of Negotiating and Practicing Queer Identities in Educational Spaces

The argument that educational settings are spaces where gender and sexual expressions and practices are policed and under surveillance is well established in literature (e.g., Xu, Schweisfurth, & Read, 2022; Brett, 2024). Heterosexual and heteronormative norms prevalently shape school curriculums, teacher-student interactions, and peer cultures; rendering the experiences of those identifying as gender non-binary or non-heterosexual invisible and marginalised. Under the political regime of hegemonic masculinity in China, however, there is limited knowledge regarding how Chinese queer students negotiate their gender and sexual identities in school places. This paper thus presents the memories of 20 Chinese queer males

(aged 19 to 28 years old), concerning their school experiences and their practices of queer identity in school space. Through biographical interviews, the participants recalled that they actively engaged in negotiating queer identity and in producing queer school space under the surveillance imposed by schools and the wider society. The strategies emerged include for example, establishing a network of allies including *fujoshi* and queer role models; co-creating knowledge about queer identity; empowerment through academic achievements; and the separation between school and family spaces. The findings point to a person-centred approach in supporting Chinese queer students in school contexts, focusing on individual and collective agency and empowerment.

Hybrid Queer Spaces: Chinese Queer Males' Negotiations of Surveillance through Digital Platform in Chengdu, China

In the context of hegemonic heteronormativity in Chinese society, public spaces regulate gender and sexual expressions, often marginalizing non-heterosexual and gender non-binary identities. Heterosexual norms render queer experiences invisible and suppressed in public spaces. However, the rise of digital platforms - from web-based media to locative and multi-platform applications - has reshaped how individuals engage with both physical and digital spaces, especially in urban settings. Scholarship concerning hybrid queer spaces continues to flourish in Western contexts. In China, however, there is a notable paucity of knowledge regarding how queer individuals in non-first-tier Chinese cities utilize digital technologies to participate in, practice, and produce urban queer spaces. Addressing this gap, this paper presents the self-reported experiences of 45 adult Chinese queer males living in Chengdu, China.

Through biographical interviews, respondents reminisced about strategies for participating in, operating, and producing hybrid queer spaces under the social surveillance in the digital era. They illustrate how digital platforms act as social infrastructures that mediate access to invisible physical queer spaces while also creating social networks that transcend geographical constraints. The findings show that hybrid queer spaces in Chengdu are sustained through the interaction of multiple platforms, rather than being confined to any singular social media. Moreover, these platforms (Blued, WeChat, Douyin) have become digital marketing avenues for physical queer spaces, drawing in queer individuals for events, thereby achieving profit-making and volunteer recruitment to sustain the basic operations of queer spaces.

This research provides fresh insights into how digital technologies mediate social interactions, identity formation, and spatial production within marginalized communities. The paper calls for future research, particularly in the fields of digital society, to move beyond functional studies of singular queer digital platform and focus on how queer individuals utilize these digital platform - their methods, outcomes, and limitations.

Community-Based Professional Associations' Support Towards Animal Farming Community's Evacuation during the 2021 Pacific Northwest Floods in Fraser Valley, British Columbia (BC), Canada

The animal farming communities in the Fraser Valley were devastated by the 2021 Pacific Northwest floods. These communities, community-based professional associations (e.g., BC Dairy Association and BC Poultry Association), and government rescue teams were engaged in the evacuation. This study employs a phenomenological approach by examining these cross-sectoral, multi-stakeholder engagements in evacuation decision-making to identify promising practices and areas for improvement. Through qualitative interviews of animal farm owners, community-based professional associations, and governmental emergency responders, this project discovers that during the decision-making stage of the disaster evacuation (1) at the grassroots level, the animal farmers' long-term engagement with their natural, built, and social environments enabled them to develop the initiatives for evacuation strategies but lacked resources and equipment to facilitate their evacuation; (2) at the mezzo-level, community-based professional associations were equipped with specific knowledge, skills, and services to support the animal farmers' evacuation but lacked the capacity of large-scale coordination; and (3) at the macro-level, the governmental emergency responders could swiftly coordinate different resources to support the evacuation in Fraser Valley, but did not comprehensive understand the animal farming communities' characteristics. These three-level challenges enable the community-based professional associations to connect the local residents with governmental rescue teams to collaborate to use their strengths to improve their weaknesses and develop a community-driven evacuation plan.

This cross-sectoral collaboration shed light on an innovative approach for effective emergency decision-making, facilitating a two-way communication approach so that community-based individual and collective expertise can be engaged in governmental emergency response efforts to enhance grassroots coping capacity. Broadly, the community-based professional associations' contributions will inform disaster-specific political interventions for building resilience, especially in vulnerable rural farming communities.

Dual-Gendered Leadership in Public Health Emergency Response of the COVID-19 Pandemic in Atlantic Canada

Traditionally, disaster and emergency management is male dominated while healthcare is female led. The emergency response of public health emergency of the COVID-19 pandemic merged these two domains together. During the first and second waves of COVID-19, a dual-gendered leadership, namely women chief medical officers and men prime ministers, were developed across Canada. Among the four provinces of Atlantic Canada (New Brunswick, Newfoundland and Labrador, Nova Scotia, and Prince Edward Island), three provinces had benefitted from this inclusive emergency response leadership, making the Atlantic region a great example domestically and internationally of successfully mitigating the pandemic while maintaining societal operation. This presentation aims to identify the influence of woman leadership on improving the traditional man-dominated scientific-political communication towards positive COVID-19-driven public health interventions. This study utilized a scoping media coverage review approach, qualitatively examining how gender-inclusive scientific-political cooperation supported effective provincial responses in Atlantic Canada during the first two waves of COVID-19. The review discovers that (1) at the provincial government level, woman leadership of mitigation, advocating, and coordination encouraged provincial authorities to adapt science-based interventions and deliver consistent and supportive public health information to the general public; and (2) at the community level, this DGL advanced community cohesion toward managing the community-based spread of COVID-19. The top-down and bottom-up benefits illustrated in the gender-inclusive scientific-political cooperation inform the future gender-inclusive leadership for the pandemic response.

Segmented Labour Market and Unequal Maternal Employment Trajectories between Immigrant and Native Mothers in Spain: A Sequential Analysis Approach

Despite a persistent 'motherhood penalty' on women's labor market outcomes, structural changes in the labor market have also created new divisions of labor, leading to growing inequalities in job stability between native-born and migrant mothers, especially in countries with a highly segmented labour market and a high incidence of temporary employment, such as Spain. Using retrospective information on employment histories from the Spanish Fertility Survey 2018 (EF-2018) and a sequence analysis approach, this study examines how migrant background differentially shapes the transitions of women's employment patterns after the transition to motherhood by looking at changes in job quality, distinguishing between different types of employment contracts. Our results show that women with a migrant background experience high levels of job insecurity and are more likely to experience employment interruptions or even exit from the labour market after childbirth compared to their native-born counterparts. These findings highlight the underlying inequalities that lead to a differential impact of motherhood on women's employment conditions based on immigrant status, which can inform future policy recommendations in the context of increasing social inequality.

From Aiming for Economic Performance to Political Performance: Two Distinct Periods of Reproduction of Traditions in a Southeastern Chinese Village

This article highlights the dynamic role of lineage activities and local religion in the unending transitions of industrialization. It presents the key motivations behind the reproduction of traditions since the reform and opening-up in the late 1970s through an ethnographic study in a Hokkien village in Southeastern China, located in a county renowned for its economic miracle due to its light industry and trade. The data used in the article were collected through field studies from 2023 to 2024 and several follow-up in-depth interviews. This article reveals an intriguing fact: At the first stage, the revival of lineage activities and local religion served as a medium for emerging merchants' construction of identity and social fields after the Communist Revolution, local authorities were less involved due to the influence of the Campaign to destroy the Four Olds in the Mao era. At the second stage, the reproduction of traditions has gradually stood closer to political goals, as Xiism employs tradition as a vehicle for the mixing of nationalism and communist state framework, it becomes a visual indicator of local authority performance. Importantly, this article explains that the reason why the range of participants is narrowing while the reproduction of traditions seems to be reinforced is emerging merchants have taken control of the traditional ceremony participation and made it a cronyism game and such new 'local elite' have not reproduced the traditional function of the former 'gentry' with their responsibilities for this community, who used to assume the role of localization of governance over the last few centuries before the Communist Revolution. Furthermore, the shift in attention to reproducing traditions from the economic to the political seems to indicate that economic development is no longer the priority, possibly rooted in rapid industrialization lacking the process of forming Weberian modern capitalism.

Un/Silencing the 'Undesirables': The Politics of Remembering and Forgetting the Forcibly Deported Chinese Immigrants in Imperial Britain

In 1946 the UK Home Office called a secret meeting on 'Compulsory Repatriation of Undesirable Chinese Seamen' which led to the ensuing forced deportation of thousands of Chinese immigrant seamen in Liverpool. This history remained silent in both official archives and public memory for more than half a century until a small number of the descendants of these disappeared men started to campaign for truth. It is at this historical moment of unsilencing that this research begins. Thinking with Trouillot's writing on the production of silence and politics of memory, this paper investigates how this history was silenced in both archival sources and public memory. This paper does so by, first of all, interrogating the silences in the archives. As Trouillot (1995/2015: 51) wrote, '[s]ilences are inherent in the creation of sources, the first moment of historical production.' In this sense, silences in the archive speak; they provoke critical questions of the logic of empire and state archives. Furthermore, this paper analyses how the process of racialization and dehumanisation of immigrant bodies – a key epistemological apparatus of the imperial project – play a significant role in constructing and justifying the undesirability and deportability of Chinese immigrant labour. Finally, drawing on in-depth interviews and participant observations with descendants of the disappeared seamen, this paper explores how the afterlife of historical silence manifests its violence in the shape of intergenerational traumas and struggles in the process of unsilencing.

Men's Grievances and Discontent? an Analysis of Digital Discourse on "Feminist Buffet" in Taiwan's Manosphere

Online gender-based violence is a critical issue in Taiwan. We examine the discourse of misogyny in Taiwan's digital space where men's rights activists have coined the term "feminist buffet" to criticize alleged reverse gender oppression, accusing women of advocating gender equality only when it benefits them, without accepting corresponding responsibilities. They call feminists as sows, garbage, and retards. The prevalence of such hate speech online reflects the existence of male grievances and dissatisfaction in reality. Our study aims to explore the broader contexts of these discourses to further dialogues toward gender equality.

We analyze posts related to "Feminist Buffet" from Taiwan's largest anonymous forum, PTT, nospanning 2019-2023. Through quantitative content analysis, we identify common themes and focal points such as perceived men's oppression and women's responsibilities. Additionally, representative posts (such as those with significant numbers of replies and likes) were selected for qualitative discourse analysis to understand the cultural logic. We also recruited some men for in-depth interviews.

Our research findings indicate that men's grievances focus on criticisms about women's expectations within intimate relationships, especially concerning financial obligations and accusations of sexual harassment. Complaints include fundamental issues in dating and marriage, such as financial distribution, division of household labor, and wives' interactions with men's families. At a broader, national level, concerns are raised about military service, declining birth rates, and women's perceived lack of participation in roles related to reproduction and national defense. Further dissatisfaction is expressed about transgender issues, particularly in competitive sports and university housing.

These men feel pressured by economic responsibilities linked to the traditional breadwinner role, often viewing intimacy and marriage as exchanges requiring balanced contributions from both genders. Despite advocating for fair exchange, their arguments tend to lean on traditional gender roles, ultimately seeking to preserve a heteronormative patriarchy without fully considering women's autonomy.

Environmental Awareness and Global Health: The Importance of Environmental Education of Health Professional

This presentation explores the presence and importance of environmental education on nursing education curriculum through a sociological lens. By analyzing curriculum content, pedagogical strategies, and discourse patterns, we aim to uncover how language shapes environmental consciousness and promotes sustainable practices in higher educational settings questioning the risk of young people becoming tired of environmental discourses.

Our analysis is grounded in sociology of health and the sociology of education. We also employ a critical sociological perspective to examine how educational discourse reflects and reinforces broader societal values and is crucial for attend global health.

The contents of the nursing course curriculum will be considered in order to highlight the language associated with environmental issues. What teaching strategies are used inside and outside the classroom? How different pedagogical approaches use language to facilitate or hinder environmental understanding. The language of environmental issues in media and popular culture also impacts educational contexts. We examine how environmental narratives in films, social media, and news outlets shape students' environmental consciousness and expectations from their education.

Students' own language and discourse around environmental topics provide insights into their understanding and attitudes. By looking to student discussions, writings, and projects, we gain a deeper understanding of how they interpret and internalize environmental messages.

The focus of the research of all these fields will be the language used to educate nursing students about environmental issues as they relate to global health.

Environmental Awareness in Higher Education: A Case Study in Nursing

Language plays a pivotal role in framing how environmental issues are understood and addressed within educational contexts. This presentation explores the intersection of language, environment, and health education through a sociological lens, examining how linguistic choices influence environmental awareness and behaviour among nursing students. By analyzing curriculum content, pedagogical strategies, and discourse patterns, we aim to uncover how language shapes environmental consciousness and promotes sustainable practices in higher educational settings questioning the risk of young people becoming tired of environmental discourses.

Our analysis is grounded in sociolinguistic theory and the sociology of education. We also employ a critical sociological perspective to examine how educational discourse reflects and reinforces broader societal values.

The contents of the nursing course curriculum will be considered in order to highlight the language associated with environmental issues. What teaching strategies are used inside and outside the classroom? How different pedagogical approaches use language to facilitate or hinder environmental understanding. The language of environmental issues in media and popular culture also impacts educational contexts. We examine how environmental narratives in films, social media, and news outlets shape students' environmental consciousness and expectations from their education. Students' own language and discourse around environmental topics provide insights into their understanding and attitudes. By looking to student discussions, writings, and projects, we gain a deeper understanding of how they interpret and internalize environmental messages.

The focus of the research of all these fields will be the language used to educate nursing students about environmental issues as they relate to health. Considering that these students have already been sensitised to the subject in secondary school, we need to explore how to work on the environmental messages. Language in environmental education should be carefully considered to maximize its impact.

Sustainable Welfare State and Eco-Social Risks: How Intergenerational Housing Inequality Matters?

This paper aims to contribute to the literature on the sustainable welfare state and eco-social risks by exploring the perspective of intergenerational housing inequality. Housing inequality is understood in terms of access and the quality of dwellings. Despite growing attention to housing and inequality, little research has been conducted to assess the extent to which it influences the future of welfare, citizens' aspirations, and the role of governments in promoting sustainability across generations. The concept of sustainable welfare — a social policy system that supports the satisfaction of human needs within planetary boundaries — offers an alternative approach to welfare provision and policy development.

The paper employs an exploratory approach with mixed methods research. In the first phase, it utilizes quantitative secondary data from the SILC microdata. In the second phase, it develops a qualitative framework through semi-structured interviews, deliberative forums, and focus groups conducted across four generations (Baby Boomers, Generation X, Millennials, and Generation Z).

Preliminary findings suggest that young adults today are more likely to live in their parents' homes for longer, delaying homeownership and family formation compared to previous generations like the Baby Boomers. Housing serves as a key source of wealth accumulation, intergenerational transfers, and social mobility. It is not only essential for promoting prosperity and welfare but also for reshaping inequality within and across generations. The growing concentration of housing wealth impacts future housing opportunities for families and generations, which in turn will affect the welfare state.

This paper makes an original contribution to eco-social policy by providing new evidence on a sustainable welfare state that addresses the needs of future generations. First, it highlights eco-social risks as emerging forms of inequality. Second, it discusses the role of intergenerational justice in shaping new social contracts and offers recommendations for mitigating inequalities.

"Traps" in Digital Mediated Activities and the Response: Short Video Practices in a County-Level Posture Training School in China

This study investigates the integration and consequences of short video platforms, such as Douyin and WeChat Channels, which were initially perceived as entertainment, in professional and educational settings at a posture training school for women in a fourth-tier city in central China. Drawing on the anthropology of traps and fieldwork in that school, this study explores how the school staff utilise digital technologies to design and deploy "traps" in different activities to captivate prospective clients/students, encouraging them to purchase training plans and continue consuming. These digital practices include short video marketing, the design and editing of video content, as well as the construction and promotion of values aligned with students' social backgrounds. Beyond attracting target clients, staff also attempt to avoid drawing in undesirable customers through specific trap designs, although this attempt is of uncertainty. The study also finds that the "capture" strategies have complex and ambivalent effects. On the one hand, students' privacy may be jeopardised during filming and posting of videos, raising unexpected ethical concerns; on the other hand, the usage of short videos has empowered some less confident students by improving their self-presentation and identity construction. Through the lens of traps, this study offers critical insights into the intersection of digital technology, business strategy, consumer culture, and the human body. These "traps" create force and dynamics at both the individual and collective levels, affecting the experiences and relationships of those involved.

The Gendered Politics of Sexuality Under Authoritarianism: The Case of China

As the world's most powerful authoritarian, China presents itself as an alternative to Western liberal democracy. Part of the anti-democratic climate is the assault on feminism and queer politics, which are seen as 'western' corruptions of 'traditional family values.' China's regime shares in this view. Whereas feminism had some, albeit limited, opportunity to flourish after Beijing 1995, it is now severely constrained. Queer community organisations have also suffered from this crackdown. Under Xi Jinping, China's regime has reinforced heteronormative gendered relations while rigorously suppressing any form of mobilisation outside the party-state. Xi is promoting a form of familial nationalism whereby citizens are enjoined to unite love of family with love of nation. Xi urges them to strengthen 'family values' (*jiafeng*) as a vital spiritual force to realize his 'Chinese Dream' of national rejuvenation. Women are called upon to uphold traditional values as 'virtuous wives and good mothers'. In this paper we explore the gendered implications of familial nationalism for sexual politics and the politics of sexuality in China and beyond. In so doing we draw on feminist analyses of heterosexuality (Jackson 2019) and critical perspectives on Asian familism (Ochiai 2014)

The Great Gatsby Tradeoff: Perceived Complementarity between Economic Inequality and Social Mobility

Economic equality, social mobility, and economic growth are societal features highly valued by most citizens in contemporary society. However, contrary to the implications of the Great Gatsby Curve—which suggests a negative correlation between economic inequality and social mobility—many people may accept high levels of economic inequality if it is accompanied by high social mobility. In this paper, we propose and test the hypothesis that many Americans perceive a tradeoff between economic inequality and social mobility. Through an online survey experiment with approximately 20,000 U.S. respondents in 2023, we examine how individuals navigate this tradeoff.

Our study reveals three key findings. First, while respondents express an aversion to inequality, they consistently exhibit a strong preference for upward mobility and economic growth. Second, increased opportunities for upward mobility lead to greater tolerance for income inequality, particularly among Asian American respondents in comparison to White respondents. Third, contrary to expectations based on the existing literature, exposure to income inequality does not significantly diminish beliefs in social mobility.

Together, these findings support the hypothesis of a perceived tradeoff in public attitudes toward societal inequality and mobility.

Legitimacy and Social Movement Steering: Mechanisms of the Central Cultural Revolution Group's Steering in Beijing Red Guard Movements, 1966-1968

The steering process and mechanisms of the Central Cultural Revolution Group (CCRG) in the university Red Guard Movements in Beijing are relatively understudied. One lingering question is: what determines the effectiveness of CCRG's steering? Combining qualitative historical analysis and social network analysis, this paper provides a systematic examination of the mechanisms behind the differential effectiveness of the CCRG's steering process in two phases of the movement. This paper argues that legitimacy is the fundamental determinant of both the steering behavior and its outcomes, and it operates through three sets of mechanisms: the manipulation of conformity through unequal legitimacy status of Red Guard factions; the collaboration with external forces to implement coercion; and the formation of discrepant assent to the CCRG's legitimacy as the result of the prior scattered and individualized steering behavior.

Social Media VS News: International Education Decision Making Negotiation between Parents and Students in the Digital Era

Digital technologies have transformed various aspects of educational practice, including teaching methods, student engagement, and access to information (Haleem et al., 2022; Alenezi, 2023). However, their influence on educational decision-making, particularly regarding international study choices, remains underexplored. This study addresses this gap by examining how digitalization has impacted the decision-making processes of Chinese international students, the largest group of outbound students globally. Using data from the Panel Study of Chinese University Students (PSCUS) from 2019 to 2022, this research investigates how factors such as students' family background, university type, and major selection influence these their decisions of study abroad. The findings reveal notable shifts post-2021, driven by global events like the COVID-19 pandemic and escalating US-China tensions, which have redefined international education landscapes as noted by scholars (Mok, Xiong, & Cheung, 2021; Marginson, 2022). Amid rising nationalism and geopolitical tensions, many students have to reconsider their study destinations, or even abandon their study plan (Kim & Park, 2024). Interviews with students further support these findings, and highlight distinct patterns in how students and their families navigate choices amid geopolitical challenges. The study underscores students' agency in decision-making (Marginson, 2014), often mediated through complex negotiations with parents. Specifically, digital platforms, particularly social media and news outlets, have emerged as vital tools, enabling students and their parents to reshape and deliver the understanding of opportunities and risks associated with international study to each other. This research provides insights into the complex dynamics of student decision-making, emphasizing the role of information in shaping choices and negotiation processes. Overall, it sheds light on how Chinese students' decisions regarding international study are evolving in an era marked by digital transformation and global uncertainty, contributing to discussions on student agency in challenging or reinforcing established knowledge structures within a shifting global educational paradigm.

Understanding Medical Decision-Making Among Migrant Populations in Belgium: A Vignette Study

This research examines the preferences that patients with a migration background hold and the challenges they are confronted with when making medical decisions (MDM), thereby focusing on the degree of family involvement and information disclosure, two aspects identified in the literature as particularly relevant. We use data from The Social Study (TSS), an online probability panel of Belgium's general population aged 16 and above. Data was collected in the fall of 2024, but not released at the moment of the abstract submission (N: approximately 1250). A TSS module, developed by the authors, assesses our research objectives through a vignette survey consisting of two hypothetical situations describing a clinical consult about cancer (melanoma) and depression diagnosis, with the latter varying randomly by severity level. Respondents (potential patients) were asked about their preferences for the degree of family involvement and information disclosure concerning each of these vignettes. In addition, detailed socio-demographic and -economic information was collected. The data will allow us to examine whether and when patients with a migration background prefer a different type of family involvement and information disclosure compared to the majority population in Belgium and/or whether other sociodemographic and -economic characteristics underlie this variation. In addition, it allows us to assess whether this variation manifests itself differently by the type and severity of the medical condition.

We are eager to share the results with the audience during the International Sociological Association (ISA). This ongoing research underscores the importance of culturally sensitive healthcare practices in adjusting to the needs of migrant populations in Belgium's medical decision-making processes.

What Is Required of the Labor Movement?: From Capitalism to Post-Capitalism

Since the inception of the twentieth century, when socialism became a reality in the world, the labor movement has seemingly pursued the transformation of social relationships, that is, the replacement of capitalist relations with "post-capitalist" ones.

However, as is also true with social movement unionism in recent years, it has really seemed to pursue the replacement of "precapitalist" relations with capitalist relations. It is because social movement unionism, for example, has been improving deteriorated working conditions—extremely low wages and *personalistic* labor control—and establishing new institutions for capitalist justice. These relations cannot be capitalist but "precapitalist" ones, through which workers are super-exploited and their personalities are degraded.

Therefore, winning living wage and/or higher minimum wage can make industrial relations truly "capitalist". Nevertheless, given that globalization and neoliberal ideology are expanding capitalist market, the labor movement should also pursue the formation of "post-capitalist" relationships, not "capitalist" ones.

From the neo-Polanyian perspective, this paper theoretically attempts to suggest that the labor movement should aim at the formation of "postcapitalist"

relationships. In neo-Polanyianism, instead of market exchange, reciprocity and redistribution should be more recovered to embed the economy in society and stabilize it. This paper considers that "post-capitalist" relations can contain recovered reciprocity and redistribution.

First, this paper tries to indicate that the conventional labor movement has paradoxically had tendency to pursue the formation of "capitalist" relations". Second, this paper asserts that the labor movement should be required to pursue "post-capitalist" relations through recovering reciprocity and redistribution in globalization. Third, clarifying the concept of reciprocity, this paper is focused on the issue of recovering reciprocity and addresses some examples for such attempts in the labor movement in a wide sense. It examines the significance of workers' collectives as an example inside enterprises and immigrant community organizing as an example outside enterprises.

Women's Efforts to Withdraw from the Handicraft Hierarchy and Transform Crafting into Lifelong Learning Resources - Mom Art Activity in Kobe, Japan

1. "Mom Art" as a Handicraft Work

The term "Mom Art" originated from an internet forum and refers to simple crafts made quickly with familiar materials. Popularised during Japan's second post-war handicraft boom (1976-1986), these crafts are distinct from complex techniques like embroidery. In 2005, the presenter began exploring regional resources in Kobe and discovered "Mom Art" during visits to local shops, small factories, and homes. Since 2009, annual "Mom Art Exhibitions" have been held, with participation from five artists under study.

2. Research Question

Discussions about handicrafts in Japan often focus on topics such as the "public/private divide," the "norms of handicraft, often reflecting maternal care," and the "hierarchy in the handicraft world." However, the five artists freely engage in creative activities that contribute to lifelong learning, independent of these debates. This research aims to explore the relationship between the artists' lives and these discussions, and to investigate why they pursue such creative freedom.

3. Research Methodology

From March to April 2022, semi-structured interviews were conducted with the five artists. Life graphs were created to visualise the relationship between their lives and creative activities. The vertical axis of the graph shows activities like caregiving and creation, while the horizontal axis marks age and significant life events.

4. Results

As of 2024, the five artists, aged 69-84, experienced various life stages during significant societal changes in Japan. Factors contributing to their departure from the "public/private divide" include acquiring skills through schools or workplaces, enabling them to continue economic activities even after marriage or child-rearing. Additionally, they have withdrawn from the traditional "hierarchy in the handicraft world" by embracing their own styles and focusing on creativity over conformity. They evolved from individual creators to educators, promoting lifelong learning through "Mom Art," engaging with others and society on their own terms.

Decolonial Futures in Coffee and Cacao: Bridging Farmers' and Scientists' Assemblages for Sustainable Agroforestry

This paper focuses on distinctions and interplays between smallholder farmers' and scientists' practice assemblages in Aceh Gayo and Bali, Indonesia. Throughout this investigation, I aim to *privilege relations over categories* by offering an agroforestry perspective on what can constitute "decolonial futures" in coffee and cacao production. Approaching these practices as performed by assemblages of interrelating humans and nonhumans (Callon, 2007), I argue that such relational approaches challenge the often-silenced political dynamics of knowledge productions and values interconnectedness of social and ecological systems. Political assemblages composed of many forms of relations allow one to be explicit about the role of power in performing practices without neglecting the importance of other relations, such as care and solidarity. The unequal relations are pinpointed to different alternatives, associations and knowledge generated by farmers and scientists that coexist with each other. What farmers' assemblages ultimately afford is a constant dialogue between plural ways of knowing as multiple coexisting forms of socio-material relations. Framed by qualitative methods, I used various data collection techniques such as interviews, photovoice and observations. By integrating critical Science and Technology Studies (STS)

with decolonial thinking, this work contributes to ongoing efforts to reshape knowledge production within the coffee and cocoa supply chain towards a more equitable future, where local and Indigenous perspectives are not only included but foregrounded as central to agroecological innovation and sustainability.

Integrating Islamic Values in Climate Change Adaptation: The Role of Non-State Actors in Terengganu, Malaysia

Non-state actors can bridge local communities with climate advocacy through climate literacy with religious understanding. While religion is known to form risk perception, influence of Islamic values on non-state actors' climate adaptation actions remains unfamiliar. This study employs semi-structured interview with 12 non-state actors from different organisations, in Terengganu, Malaysia, to evaluate influence of Islamic values in climate adaptation strategies. Drawing from theories of Motivation theory and Cultural Theory of Risk, non-state actors frame their actions toward environment with Islamic values such as Khalifa (stewardship) and Al-Mizan (balance). Six key actions were recognised and several were identified to be affected by religious effects: advocacy in conservation policy where Fatwa Religious law Banning of turtle eggs was established, information communication with state-actors, education (raising climate awareness) through religious teachings, complementary role that partners with stakeholders to execute climate action, observational role that provides data to state actors, and developing faith-based innovation strategies. Analysis also indicates a mix of egalitarian, hierarchy and fatalism worldview among the respondents. Challenges like poverty and low climate awareness may deter the integration of Islamic values in climate adaptation strategies due to priorities held in different organisations. However, non-state actors emphasised that the state government should take part in facilitating climate literacy to the community while including religious values in climate adaptation strategies to foster climate resiliency among Terengganu community.

Unveiling the Market: The Commodification of Women's Bodies in Male-Only Surrogacy Fairs

Surrogacy is often regarded as "the last resort for infertile heterosexual couples." Many countries and states have legalized surrogacy, restricting it to infertile heterosexual couples and altruistic surrogacy. Despite these limitations, commercial surrogacy is increasingly being pursued overseas by men—male couples and single men who are not medically infertile, at least at present. The growing use of surrogacy by men is further driven and legitimized by male-only surrogacy fairs held globally in the US, UK, Europe, and East Asia, including regions where surrogacy is not legal.

Currently, various organizations worldwide host these male-only surrogacy fairs. In 2023, I conducted an in-depth study of one such fair, collecting and analyzing data from materials distributed to participants and other related sources. Based on this data, I examine how surrogate mothers, egg donors, and both fetuses and already-born children created through these arrangements are commodified within the male surrogacy market. First, I present a price list for female reproductive functions, including remuneration for surrogacy, compensation for abortions, and even payments in cases of hysterectomy or loss of fertility. This analysis reveals the stark reality of the commodification of women, fetuses, and children, including unborn entities.

Second, I analyze cultural representations such as leaflets, fliers, panel presentations, and floor discussions. I explore how these materials attempt to reframe surrogacy as an acceptable practice, easing feelings of guilt by invoking the concept of "diversity" rather than acknowledging the commodification of human life.

Finally, I conclude with a discussion on how the objectification of women's bodies is subtly achieved under the guise of surrogacy being portrayed as a noble act stemming from women's voluntary compassion.

Emotional Framing in the Chilean Uprising: The Role of Memories in Building an Antagonist Identity

Through a case study of the 'Chile Despertó' movement (2019-2020), this paper addresses the relationship between collective memory and the processes of framing emotions in a social movement. Critiques of resource mobilization theory have prompted a reevaluation of the strategic role of emotions in protest cycles driven by social movements. A significant contribution to this discourse is the concept of emotional framing, which highlights how emotions are constructed and framed by social movement organizations. This paper advances the literature by exploring both collective and individual memories and their influence on the emotions of protesters and their collective identity. This is achieved through an examination of the Chilean uprising, where high levels of repression and militarization triggered the resurgence of emotions linked to the dictatorial past. Based on 38 qualitative interviews with movement participants, this study explores how feelings of indignation and anger relate to the construction of an antagonistic identity and the role that memory plays in this relationship. This complex process reveals that collective memories are a contested space where organizational memories coexist and compete with personal and institutional memories. The findings indicate that memories at various levels are crucial in how emotions mobilize protesters, thereby enhancing our understanding of the interaction between the rational and cultural dimensions of social movements.

Strategic Capacity in Spontaneous Uprisings: The Role of Collective Memory in the 'Chile Despertó' Movement (2019-2020)

Based on a case study of the 'Chile Despertó' movement (2019-20), this article examines the strategic capacity of social uprisings and how cultural factors, such as memory, influence its deployment. While strategy is typically seen as a power of social movement organizations, this raises the question of what strategic capacity exists in spontaneous uprisings where organizations lack control over tactics. This paper contributes to this discussion through a case study of the Chilean uprising, characterized by a high involvement of unaffiliated demonstrators and a rejection of political organizations. After the government deployed harsh police repression against the protesters, collective memories of the political violence enacted during the military dictatorship (1973-1989) were triggered, impacting the movement in various ways. Thus, this study explores how collective memories influence the movement's tactical development. Interviews with 38 active participants reveal two main influences: the activation of past tactics and the framing of the conflict as part of historical continuity. Furthermore, this not only shapes how protesters adopt certain tactics but also affects how they confront and cope with repression. This study contributes to the understanding of how cultural aspects of collective action, such as collective memories, influence the strategic capacity of social uprisings. The results are particularly relevant for grasping collective action in individualized societies, where individuals often resist organized struggle.

YANG, TAOYI* (Freie Universität Berlin, Germany)

Senses As Bodily Apparatuses of Generating and Perceiving Affects

This presentation aims to explore how the concept of senses can be employed in the sociological analysis of affects and affective practices. By "affect", I refer to relational dynamics between human and nonhuman bodies (Slaby & von Scheve, 2019), which represents a more basic mode of affecting or being affected by the world, distinct from more cognitive affectivity phenomena such as moods, feelings, or emotions. However, this does not imply that affect is exclusively pre-discursive and non-intentional. Instead, I align with the argument (von Scheve, 2017) that affect can very well be experienced as a phenomenal feeling and further conceptualized into more cognitive emotional experiences like discrete emotions, while it may well remain a non-conceptual, implicit phenomenon. In terms of senses' conceptual alignment with affects, I argue that senses can be understood as bodily apparatuses for generating and perceiving affects. On the one hand, in cultural affect theory, affect is the term used to bracket "movement/sensation" and their unmediated connection (Massumi, 2002: 1), suggesting that affect

caused by other bodies is sensed by human bodies and directly represented as fluctuations and changes in human sensations. On the other hand, extant sensory studies (e.g., Vannini et al., 2012; Howes & Classen, 2014; Sabido Ramos, 2023) have explored how senses and sensations organize practices through both hard-wired, pre-linguistic and symbolic, discursive aspects. This indicates that empirical investigation and analysis of sensory experiences can enable researchers to simultaneously analyze both the hard-wired, pre-reflective, indescribable aspect of affects, as well as their discursive, meaning-making, and socioculturally conceptualized components. I will illustrate this by using my digital ethnographic research on affective treatment – a sociocultural practice aimed at improving personal health and well-being by increasing positive feelings or alleviating unwell feelings via the establishment of specific forms of affective relationality and the modulation of affects.

Rethinking Queer Migration: The Case of Skilled Chinese LGBTQ+ Migrants in North America

Queer migration scholarship has established sexuality as an important axis of power that shapes and is shaped by migration processes. To further conceptualize how and when sexuality matters, this article bridges queer migration with other modes of migration. Drawing from in-depth interviews with 48 skilled Chinese LGBTQ+ migrants in North America, I examine the organization of sexuality in queer migration through the pathway of international student migration/mobility. My findings reveal how sexuality has transitioned from hidden to affirmed, and finally to unconstrained across three stages of the migration trajectory in shifting institutional contexts. By examining the temporal variation of queerness in the process of migration, I show the co-evolution of identity and mobility mediated by migration pathways.

Reworking Identity, Reworking Heteronormativity: The Case of Tongqi in China

Scholars have studied the mundane reproduction of heteronormativity in everyday life. What happens when heteronormativity is disrupted? We shed light on this question using data from in-depth interviews with 34 heterosexual women (*tongqi*) in China who are unwittingly married to men who have sex with men (MSM). Our analysis reveals four ways in which *tongqi* draw upon heteronormativity to rework their identities in response to the disclosure of their husbands' sexuality: oppositional identity work to restore an unblemished identity, relational identity work to distance oneself from other *tongqi*, maintenance identity work to sustain the marriage, and subversive identity work to challenge heteronormativity. The ways in which *tongqi* negotiate gender and sexual hierarchies in relational power dynamics show the inherent link between gender and sexuality in the maintenance of gender order. More broadly, we highlight how identity provides a crucial link between individuals' management of the contradictions in the dominant sexual binary and the reproduction of heteronormativity.

Traditional Gender Norms and Licit Substance Use Among Chinese Gen-Z Youths

With changes in demographic structure and socio-economic development, gender norms among Chinese adolescents have quietly shifted, and corresponding behavioral norms have also influenced the trends in at-risk health behaviors. We conducted a nation-wide survey between 2022 and 2023 across China, focusing on alcohol, tobacco, and electronic cigarette use among Generation Z youth (born between 1995 and 2010). The results that the rates of ever and current use of electronic cigarettes were 4.6% and 1.8%, respectively. The rates of ever and current tobacco use were 3.5% and 5.1%, respectively. The rates of ever and current alcohol use were 6.9% and 34.8%, respectively, with a severe problem drinking rate of 6.3%. Males exhibited significantly higher susceptibility to electronic cigarettes and tobacco compared to females, but the susceptibility to alcohol was not significantly higher. Males also scored significantly higher on traditional gender norms than females. Multiple regression analysis found that traditional gender norms strengthened the positive attitudes of both males and females towards addictive substances, with a stronger effect on females. Traditional gender norms were positively correlated with cigarette use in both genders. The inhibitory effect of traditional gender norms on addictive substances was only evident in the future susceptibility to alcohol among females.

Localizing a Development Project in the Context of Aid-Dependent Hierarchy: Learning from a Global Collaboration in Cambodia for Climate Change Adaptation

As local inclusion and participation have become central themes of development in the name of global justice, the role of local actors' agencies cannot be overexaggerated. They are also called 'translators' or 'intermediaries,' linking local, regional, national, and global levels. The roles of these intermediary agents are often taken up by NGOs/CSOs and/or by a group of people from the communities concerned, such as Village Committees. While the importance of local agencies has been well-documented in the literature, what we mean by referring to 'the locals' remains unclear. They are often unspecified, especially in aid activities, which often occur at crossroads with different levels of actors or stakeholders.

This study is based on the author's three-year research project in Cambodia. This global research collaboration measured climate-driven disaster (flood) resilience across three selected villages, where Habitat Cambodia implemented an aid-supported climate change adaptation project. The current study delivers the author's personal reflections and discusses what she has noted and learned from an angle of 'localization.' How are the meanings and claims of the validity of global norms (here, referring to local inclusion and participation) negotiated in the local context? What kinds of strategies do international development experts use to embed their agendas locally, and how do local actors react to these interventions? To what extent do local actors succeed in modifying these agendas if applicable? The insights discussed here are from multi-source data collected during the three years of the research; the data itself include internal documents, field observations, expert and key informants' interviews, and focused group discussions with local villagers. Findings and discussions are expected to provide practical lessons to help global development projects be more locally accepted, if not locally led at all.

The Transformation of Diaspora Political Subjectivity through Social Movement Participation: A Case Study on Young Chinese Feminists Organising in Japan

Recent data has shown increased immigration from China to Japan since COVID-19, especially after the "A4 revolution" outburst against strict COVID-19 infection control policies at the end of 2022. Against the backdrop of these events in the past few years, diasporic Chinese feminist networks have emerged on social media and organised various offline protests and assemblies in cities of liberal democracies, including Japan, while such activities are severely prohibited in China. Unlike earlier generations of diasporic Chinese activists, young feminists not only protest about Chinese domestic issues but also advocate for local and transnational movements. Existing literature contends the transformative effect on individuals through social movement participation. Based on insights from previous studies and interviews with participants, this study presents young Chinese feminists' reflections on their personal experiences before and after social movement participation in Japan after 2020. This study constructs the analysis through the concept of "political subjectivity", which is closely related to belief, worldview, sense of belonging and identity, and argues that diasporic young Chinese feminists' political subjectivity is shaped by the intersection of opportunities for activism in liberal democracies, experiencing new agency, interaction with different authorities and concerns for personal safety. This study concludes with the potential social impacts that the emerging diaspora political subjectivity can bring.

Unveiling Hidden Power: Lessons from Diverse Elderly Care Workers in East Asia

Purpose

Building upon Joan C. Tronto's ethic of care, this research aims to explore and introduce the hidden strengths of elderly care workers in East Asia, who, while experiencing diverse work patterns and lifestyles, are deeply misunderstood and underestimated by outsiders.

Background

In the context of New Social Risks (NSRs), issues such as elder care and the conflict between work and family responsibilities have become pressing social concerns, particularly in East Asia. The region faces a rapidly aging population and ongoing work-life balance challenges, which are compounded for elderly care workers. These professionals, who view "care" as a vocation, are predominantly women, low-paid, and often foreign. While society increasingly recognizes their importance as essential welfare supporters, they have long been regarded as weak. Policy makers and scholars frequently target them when addressing aging-related issues, yet their lived experiences reveal a persistent lack of understanding from the so-called upper echelons of society.

Methods

To explore the lives of elderly care workers while minimizing the imposition of external assumptions as much as possible, this study employs a qualitative approach. Semi-structured interviews, lasting around 45 minutes in average, focus on everyday life questions. Fieldwork has been completed in Shanghai, Jilin Province (China), and Taipei, with further research planned in Osaka and Hong Kong.

Results

Interviews with 25 elderly care workers, nospanning different job types and life routines across three metropolitan areas, reveal that the prevailing academic view of these workers is narrow and incomplete. Extending Tronto's care theory, this study uncovers the complex, soft, yet potent power embedded within elderly care workers.

Discussion

This research urges scholars to reassess elderly care workers with humility, recognizing that the seemingly weak and marginalized hold a unique and dynamic strength that we frequently overlook.

Art As a Catalyst for Transnational Dialogue: Cinematic Insights into Turkish-German Relations

This paper is based on first findings of our ongoing DAAD-TÜBITAK-funded bilateral project 'Distant Neighbors: Exploring Political Narratives and Visual Culture in Turkish-German Relations' that aims at challenging the dominant narrative among contemporary prevailing scholarly debates on Turkish-German relations that mainly focus on political elites and decision-making processes on the diplomatic level of high politics (e.g. Arisan-Eralp et al. 2022; Aydın-Düzgüt and Tocci 2015; Turhan 2019). From such a point of view, for example in the research fields of European Union studies and foreign policy analysis (e.g. Reiners and Turhan 2021; Tekin and Schönlaue 2022) scholars often diagnose a growing distant and pragmatic relationship between Germany and Turkey due to an alienation in the European integration process and the strategic game between both countries around geopolitical concerns, the EU-Turkey deal on refugees and currently the Israel-Gaza war. Following this focus of analysis, the relationship is characterized as a transformation from a befriended to a rather pragmatic mode of cooperation.

By broadening the empirical scope from political elites to the art scene and cultural actors (filmmakers, novelists, musicians, artists etc.) from both countries in their European and transnational context, we argue that these actors, have developed and established practices and creative techniques in transnational cooperation and thereby overcome the nationalist-driven narratives of a distant relationship. Given both countries' growing ties in light of the 1960s labor migration from Turkey to Germany, today's postmigrant and culturally diverse societies gave birth to a vivid transnational cultural scene. This paper investigates the influence of cinema in shaping present-day Turkish-German relations.

Lived Religion in Iran: Beyond the Scope of Institutionalized Religion

The concept of lived religion embraces different types of phenomena to which an individual is exposed, and which lead them to reconsider religion on a daily basis. Institutionalized religion, which is one component of the repertoire to which individuals can refer as sources of thought, belief and practice, is giving way to many alternatives. The dynamics of this trend vary according to context and the vigor of religious institutions. In a context like Iran's, where religious institutions are influential and well-funded, this trend could prove much more challenging.

My research focuses on individuals' self-identification of changes in their religiosity over recent years in the context of the city of Tehran, Iran. The study is based on qualitative interviews using open questions that inquire of individuals about the religion into which they were baptized, other religions and interesting insights they may have found beyond the realm of religion, in order to understand how they bring these diverse elements together to live religion.

In an ongoing research project, the results reveal that individuals in this particular context, even if they show affinities with certain aspects of institutionalized religion, easily overstep the boundaries by placing elements such as humanity at the heart of their religious and/or spiritual beliefs. This move often involves new understandings of certain concepts that may be associated with individuals' evolving religiosity in one way or another.

Une Analyse Des Rapports Entre Les Compréhensions Individuelles De La Justice Sociale Et La Religiosité Dans Le Contexte Iranien

Quitter la religion doit être considéré un processus qui commence par des motifs qui poussent les individus à se distancer de la religion institutionnelle et à creuser cette distance au fil du temps, ce qui peut aboutir à une séparation d'avec la religion. Ce phénomène est beaucoup plus étonnant dans les contextes où la religion institutionnalisée occupe une place plus prépondérante dans la politique et la culture de la société, entre autres.

L'Iran, en tant que contexte doté d'un système politique basé sur une interprétation spécifique de l'islam chiite, est le contexte d'étude de cette recherche. Les compréhensions individuelles de la justice sociale sont étudiées dans ce contexte en tant que motif de prise de distance, voire de rupture avec la religion. Cet exposé vise à présenter les résultats d'une recherche en cours basée sur près de 50 entretiens qualitatifs utilisant une trentaine de questions ouvertes et semi-structurées qui se concentrent sur les compréhensions individuelles de la justice sociale d'une part et sur la religiosité des individus d'autre part, afin d'analyser la relation de cause à effet entre ces deux aspects.

Alors que les personnes interrogées affirment leurs croyances et leur pratique de la religion, allant d'une loyauté totale à l'abandon de la religion, il est curieux d'établir un lien entre cette évolution et leur compréhension individuelle de la justice sociale.

Sociostructural Challenges of the Kharkiv Academy: Migration, Mobilization, and Gender in Times of War

Kharkiv is a city with a population of over a million people, which is located on the border with the aggressor country. At the same time, Kharkiv is a city of students and scientists, with one of the largest number of higher education institutions and scientific institutes. The full-scale phase of the invasion of Ukraine in 2022 caused incredible damage to the academy in terms of destroyed buildings, destroyed scientific equipment, libraries, etc. The key role is played by people - scientists, and students, who actually do science. Being under constant shelling, and power cuts, many cannot work, many leave their living place to save their families. If we talk about the male part of the population, many employees go to defend our country voluntarily, here we should not forget about the structural and financial constraints that the war brought. But the academy lives continues to provide education, continues its research, and gives hope for the future of the city, and with it science and the country. However, the question arises: at the expense of what resources this movement continues, how the academy preserve its human capital despite its difficult regional location and, as a consequence, unequal conditions with other institutions of higher education and scientific institutions of Ukraine which are located in safer territory and what other socio-structural challenges face. The paper is based on the results of semi-structured interviews with representatives of the Kharkiv academy and expert interviews with the management and administration of scientific and higher education institutions. The research raises such issues as the migration of scientists and affiliation with more than one higher education institution, as well as examines gender dimension of the specificities of mobilization in relation to the academic community.

YASMINE, BOUCHFAR* (Institut Universitaire des études africaines et euro-méditerranéennes et ibéro-américaines - Rabat, Morocco)

"Migration Narratives in Media: Representation, Social Perceptions, and Migrant Self-Representation"

This paper examines media representations of migration in Morocco, focusing on how these narratives shape social perceptions and influence migrant self-representation. As migration dominates global headlines, Morocco—both a transit and destination country—has become central to complex debates balancing hospitality and caution. Media narratives play a powerful role in shaping public perceptions, often framing migrants either as vulnerable victims or potential threats to socio-economic stability. Such representations contribute to anti-migrant sentiments, reinforcing stereotypes and biases that influence public policy and social attitudes.

However, the rise of social media has provided migrants with a platform to document their experiences and challenge dominant narratives, offering counter-narratives that question stereotypical portrayals. By sharing their own stories, migrants can confront the depiction of themselves as passive subjects and instead assert their identities and resilience. This paper draws on recent research into media narratives on migration (Esses, 2013), examining how Moroccan media outlets and social platforms handle these stories. The analysis explores patterns of representation across different media channels and highlights the ways in which migrant groups use social media to foster understanding and empathy, creating space for new narratives that counteract harmful stereotypes.

This study ultimately suggests that these counter-narratives have the potential to reshape public perceptions by presenting a more nuanced view of the migrant experience. Through this approach, we uncover how research on media representations of migration lends itself to innovative methodological frameworks, facilitating a deeper understanding of contemporary migration narratives.

The Impact of European Immigration Policies on Multicultural Coexistence in Japan

Japan has accepted a large number of foreign workers as fact, although it does not officially accept immigration. In response to the ongoing multiculturalisation of society, the Japanese Government has adopted a policy of multicultural coexistence. This calls for intercultural understanding,

communication between cultural groups and equal relations between cultural groups, and reflects the ideal of multiculturalism that has developed in Europe and Canada. However, this government policy, which does not recognise the social rights of immigrants, has been severely criticised.

On the other hand, in the absence of a national immigration policy, multicultural coexistence has been implemented at the local government level in response to the increase in the number of foreigners. Specific measures are mainly focused on providing services for foreign residents and reducing problems caused by language and cultural differences, and not much has been done to promote the independence of foreign residents and their participation in the local community. However, from the perspective of diversity, some municipalities are trying to establish coexistence with foreign residents as a vitality of the city.

This study focuses on the recent policy process of such foreign residents in the municipalities, which is known as Multicultural Coexistence 2.0. These municipalities have formulated their guidelines by referring to the policies of European migrant catchment cities. Many local authorities in Japan have formulated 'guidelines and plans for the promotion of multicultural coexistence', some of which make reference to Western multiculturalism and interculturalism. Therefore, this study scrutinises these guidelines and plans, with particular emphasis on the parts that address the policies of European cities. We will investigate and examine how Japanese local authorities perceive the policy trends in Europe and try to utilise them in their policies for multicultural coexistence. We reconsider the future of multicultural coexistence in Japan, where further multiculturalisation is expected.

Platform Politics: Corporate Power, Grassroots Movements and the Sharing Economy

The platform economy, powered by companies like Airbnb, Uber and Deliveroo, promised to revolutionize the way we work and live. My presentation shows how platform capitalism is not only shaped by business decisions, but is a result of struggles involving social movements, consumer politics and state interventions. It focuses in particular on the controversial tactics used by platform giants to avoid regulation. It identifies some common trajectories of political struggle across contexts and across several 'lean platforms'. It discusses platform rhetoric, the contentious and confrontational language and stories told by platform businesses. Using a case study of former Airbnb workers, it also delves into 'platform power', the ways in which platforms mobilise their users and allies to shape or avoid state regulation. These concern the imaginaries, potential and future of the new digital economy: platform possibility.

Understanding Strategy in Contentious Collective Action: A Research Agenda

Strategy is central to work on collective action, and to the way that we think about the future, but is undertheorised and rarely directly investigated. Our paper proposes a research agenda for addressing this. We disaggregate the term in three sections: *strategic action*, a qualifier to refer to goal-directed or effective activity; *strategizing*, involving practices by which actors coordinate; and *strategies*, a form of future orientation that guides practices. The first part argues that literature on strategic action, especially field theory, presents strategy as an important, yet opaque, quality. To address this and test assumptions about certain forms of future-coordinating being more efficacious, the next sections discuss the potential of analysing strategizing using theories of practice; and strategies using work on projectivity. To advance the agenda, we recommend several moves, including investigating both more and less formal modes of strategizing or dedicated and emergent coordinating practices, identifying and analysing the elements of coordinating practices; considering and measuring the form of future orientations using Ann Mische's work on projectivity; and examining a wider range of the content of future orientations which guide and inspire action and cultural change.

YEGHIAZARYAN, ANUSH* (University Konstanz, Germany)
 YELIENA, KOVALSKA* (University Konstanz, Germany)

Women's Time, Women's Space. a Study of Ukrainian Forced Migrant Women in Konstanz. the Roles and Paths of Women Mastering Their Lives in Germany.

Every migration, especially those caused by war or other

disasters, has the power to challenge family and family roles in a far-reaching and stressful, sometimes upsetting way. The main components are intensified, the responsibilities, connections, relationships are emphasized in their functioning and non-functioning aspects, and new problems are created. In our paper, we would like to explore these questions based on our data collected with qualitative and quantitative methods (with help of narrative interviews and a web survey). The focus is on refugees from Ukraine who have found a new home at Lake Konstanz. Families of varying composition have arrived in Konstanz and the surrounding area: single mothers, young women with parents and grandparents; siblings with families; women who left their husbands in Ukraine, women who were single parents (separated or divorced)

already before the war began, women who took their unresolved family situations with them to Germany. Different generations are represented. Migrants from different cities and regions of Ukraine are represented. As women are clearly the largest group (83%), we would like to pay particular attention to their needs and living conditions. How do women organize their lives? What do they do in Germany? What do they expect? What are they interested in? What problems characterize their lives in Germany? What are the most important meeting places, how is time and space organized for them? What are they looking for and how do they perceive German reality? What are the most important changes, challenges, but also opportunities and chances? Examining the paths and the "map of life" that the women use in their everyday lives would show how the offers could be designed to suit their lives. Finally, the question of how they see their future prospects would also be an important part of the discussion. The special features of Konstanz and the surrounding area as a (southern) German and European region would also enrich the discussion.

Methodological Challenges of Conducting Sociological Research in Ukraine during the War

Conducting sociological research in conflict zones poses unique methodological challenges, especially in a country like Ukraine, where ongoing war and large-scale displacement significantly disrupt data collection efforts. This study explores the specific difficulties faced by researchers in Ukraine during the Russian-Ukrainian war, highlighting issues related to data reliability, sampling, and the representativeness of surveys.

One of the major challenges is the absence of up-to-date demographic data, as the last full census was conducted in 2001. The war has exacerbated this issue, with high levels of forced internal and external migration complicating the identification and description of the target population. Researchers have had to rely on outdated data and alternative approaches, such as online surveys and recruitment through social media, to reach respondents. This shift to digital data collection, while necessary, introduces new biases and errors, such as non-random sampling and potential accessibility issues for respondents affected by the war.

The study also addresses the ethical implications of conducting research in conflict zones, including maintaining confidentiality and data protection under extreme conditions. Online methods, though offering broader reach and real-time data collection, also raise concerns about respondent safety and data accuracy.

Despite these challenges, the research underscores the resilience and adaptability of Ukrainian sociologists in navigating these complex conditions. By employing innovative methodologies and continuously refining their approaches, researchers are able to capture valuable insights into the social dynamics of a country at war. This work contributes to the broader understanding of conducting empirical social research in crisis contexts and highlights the critical need for methodological flexibility and ethical vigilance.

Ethnic and Social Inequalities in Access to Health Care: Evidence from a Nation-Wide Field Experiment in Germany

Inequalities in health care access are a potentially important driver of social and ethnic inequalities in health. We conducted a large nation-wide field experiment to assess discrimination in accessing German private practices in five medical specialties (general practitioners, pediatricians, radiologists, dermatologists, and psychotherapists). Fictitious patients contacted approximately 7,000 practices by email, describing their condition and requesting an appointment as soon as possible. Patients with German-sounding names received a positive response in 50.5% and were offered a concrete appointment in 19.7% of cases. These numbers are substantially lower for patients with Turkish-sounding (44.4/15.4%) and Nigerian-sounding names (43.3%/16.1%). Positive response and appointment offer rates were also substantially higher for patients with a doctoral title (as opposed to no title) and for those with private (as opposed to statutory) insurance, with higher doctor remuneration for treating privately insured patients likely being a primary driver of the latter effect. Interactive specifications indicate that minority-ethnicity patients benefit less from having private insurance or a doctoral title than patients with German-sounding names, a result that is at odds with a simple statistical discrimination interpretation of ethnicity effects. Further analyses will explore effect heterogeneity in terms of physician/patient interactions (e.g., according to name-proxied physician gender and migration background) and contextual variation (e.g., according to physician density as a measure of competition and right-wing vote shares as indicators of local anti-immigrant sentiment).

YEMPELLI, DR. BHASKAR* (Rishihood University, India)

Primitive Accumulation As a Source of Feudal Power: A Case Study of Non-Tribal Migration into Tribal Villages in India.

This study addresses how Non-tribal communities, who are more inclined towards private property, migrated into tribal societies, where common property is prevalent and accumulated land by all means, end up feudal lords of those villages. Telangana region of India has seen non-tribal influx into tribal areas in two phases. Part of the 'Green Revolution' Indian government implemented pro farmers' policies in Coastal Andhra Pradesh. Because of these policies land tenancy rates in this area has increased enormously. For the peasant farmers in the coastal region it was beneficial to lease out their lands and migrate to rich soil areas of Godavari and Krishna valley of telangana and mimic the 'green revolution' for self (private) created incentives by using cheaper land, irrigation and labour resources. Even though they were small and medium peasants in their region when they migrated to tribal areas they established themselves as the dominant class of the society, mostly feudal. Their social background, dominant caste, helped them practice and establish their traditional caste structure to commit extra economic coercion.

The other migration took place in the aftermath of the occupation of Hyderabad state into India in 1948. Most of the small medium peasants from plain areas of Telangana migrated to tribal areas of the region. They were poor peasants with no means of production with the experience and practice of private property and accumulation. Initially tribal communities treated them equal and shared their resources including land and livestock with them. However these immigrant peasants turned common property into private property, accumulated land and alienated tribes from their means of production and looted them to be poor forever. The non-tribal peasants also got their non-tribal labour to help them cultivate these lands by using traditional *vesti* system and established traditional Hindu hierarchical societies.

Unraveling Class Dynamics in Energy Transition in Turkey

While the energy transition holds promise for the climate crisis, it simultaneously presents a conundrum of labor implications that defy simplicity. This theoretical exploration delves into the intricate facets of the energy transition, offering qualitative insights to unravel its profound impact on labour and class dynamics. Historically, transitions in labour, such as the transition from coal to gas, as exemplified by Timothy Mitchell's concept of

"carbon democracy" or transformations in the capitalist mode of production in the 1960s and 1970s, marked by the emergence of the "mass-worker" and the increase in the automated processes have fundamentally reshaped the class dynamics. Yet, the transition from fossil fuels to renewables is no ordinary shift; it entails a complex narrative that has frequently been oversimplified by assuming that change occurs primarily from the bottom up, through grassroots movements, or via policy-oriented pathways, overlooking the intricate power plays, authority structures, and divergent interests of different stakeholders. This paper endeavors to illuminate the interplay of class dynamics and the energy transition, by utilizing a Gramscian framework and incorporating a Marxist class analysis. This theoretical exploration contributes to the broader discourse on achieving a just and sustainable energy transition. By adequately incorporating class dynamics into the framework, the understanding of power structures, the potential impacts on different classes, and the distribution of benefits and burdens can be enhanced.

Ethno-Regional Cleavages and Socio-Politically Motivated Animosities in Cameroon: Elements for Understanding Incipient Xenophobic Tendencies

Cameroon is a complex mosaic of ethnic categories that fashion identities but are also the source of tensions, frictions and conflicts. These are in the main what in some older literature was labelled tribal but which are in fact ethno-linguistic groupings (with more than 250 micro identities), the socio-linguistic (with a major division structured around the two official languages of European origins), and the religious that are further segmented into multiple denominations and fraternities. Over time, administrative divisions inherited from colonial demarcations with a prolongation into the postcolonial period have generated a new sense of belonging and identification. This has developed into ethno-regionalism that obviously runs counter to the affirmed project of nation-building or unifying statecraft. Competition in access to public space, offices and public goods often degenerates into mutual distrust that has often implied a growing tendency towards xenophobia or xenophobic tendencies in some areas of Cameroon. This paper traces the development of the ethno-regional imaginary and its xenophobic corollary over the relatively short political history of the country. The argument is that this imaginary has taken on itself the character of a mobilizing force in politics and exists as the unique state ideology without a corresponding reality necessitating its deconstruction. The latter will entail a revision of the basis of the state as a colonial construct, revisiting the basis of identification and its recognition between state and civil society, ridding identities other than the national of political contents and introducing a new politics of plurality that combines multiculturalism, recognition and a cosmopolitan outlook. Such a politics re-direct attention towards the territorial development components (regions) as realities in their own right as opposed to their transformation into ethno-political entities with the capacity to drift into objects of exclusion.

New Roles in Care for Elderly Patients in Cameroon: The Case of the Extended Setting of the Kumbo West Health District

Health problems of Cameroon's 3.5% aging population hitherto attended to exclusively within formal health care settings are increasingly the object of care out of health facilities creating new roles for new types of care givers drawn from extended care settings. These are crucial for the extension of life in a context where the average life nospan has moved from slightly more than 50 to 61 years in 10 years. As more people are found within the 60 - 80 age bracket, they are faced with multiple biomedical problems associated with aging (musculoskeletal, sensory-motor, neurological, respiratory, vascular, cardio-vascular) that are attended to by the modern health care system which also offers some degree of nursing care. There is also a growing need for complementary but critical care that is offered by kinship and social networks in the administration of medication and other health care, self-care, mobility tasks, household tasks, psycho-social support, advocacy and surrogacy. These pose problems of specific kinds for care givers where such activities are not structured and in the absence of a care services sector. This is the substance of an ethnographic study of caregiving activities in the extended caregiving setting of the Kumbo West Health District of Cameroon among elderly patients and their caregivers. The study showed that the burden of care devolves on younger generations of relations (children and dependents) and social support networks. While this has generated new forms of work and professions or a care industry elsewhere, in Cameroon, it has led to the emergence of new informal but critical

social roles that are embedded in the indigenous structures of social support and local social capital with attendant complications and challenges, such that the support networks themselves need to be supported and integrated in the modern sector of care and social work.

How Kazakh Youth Sees the Future?

Examining the future becomes essential to comprehending current social and political dynamics in light of global upheavals and hybrid realities. Our presentation's main objective is to analyze Kazakhstan's youth's outlook for the next two decades. Based on focus group talks with 101 participants from different parts of Kazakhstan, ages 18 to 29, our study seeks to determine what values and symbols influence their perception of Kazakhstan in 20 years. The period of data collection was February 9–18, 2024.

Participants in focus groups were positioned in a "mapped space". Nine symbols have to be used to symbolize the future: a sport, an animal, a profession, an economic sector, a building, music, a tree, a color, and a state emblem. The findings indicate that professionalism, education, and advanced technology are the three main concepts in understanding the future for young people. Young people clearly understand the importance of education, particularly in light of the advancements in artificial intelligence and digitalization. Important societal issues including emigration, corruption, and responsibility were also recognized by young people. We conceived the future visions created by youth using the discourse analysis method, which helped better understand how youth perceive social change and develop expectations.

According to the study, Kazakhstan must consider a number of significant trends while developing its long-term plans. The first is a significant increase in the number of young people throughout the following twenty years. Second, a reevaluation of values is necessary due to global shifts, where professionalism and high standards of work become crucial principles. Furthermore, the growth of mental stability and emotional intelligence will enable youth to adjust to shifts in the job market and remain prepared for lifelong learning. The study's findings emphasize how important it is to incorporate adolescent perspectives into strategic planning and public policy.

YETKIN, EREN* (Catholic University of Applied Sciences Berlin, Germany)

Deconstructing Power Asymmetries through Participation? on Participatory Research in Multimethod Frameworks

This paper explores the implications of combining participatory approaches with other empirical methods. Since its first hours, participatory research has aimed to question, deconstruct, or 'decolonize' hierarchical forms of interactions in various research contexts. It has been a means to empower the vulnerable and marginalized, particularly in the Americas (Fals-Borda 1987; Wallerstein et al. 2019) and similar to indigenous methodologies (Kovach 2010). Participatory research aims to foster a critical reflection of power relations, stimulate a process of powersharing, and engage the co-researchers and professional researchers to learn from each other, regardless of individual academic records.

Participatory approaches can reveal social aspects that other methods could miss. Nevertheless, as new studies demonstrate (Bundschuh et al., forthcoming), more than such approaches are needed to understand social mechanisms. This point inevitably leads us to multimethod considerations. However, method combinations also raise questions of whether one method dominates the design and what it means for the power relations between the (co-)researchers. How can we avoid new regimes of dominance in this complexity and the cooperation with co-researchers? Moreover, how can professional researchers secure ethical standards when the participation is foregrounded?

This paper focuses on the multimethod project 'Participatory Remembrance Education in Koblenz and the surroundings' that used semi-structured individual and group interviews, ethnographic documentation, and participatory approaches. Among others, the project collaborated with marginalized, migrantized, and racialized young people who frequently visited a youth centre located in a small western German town. Some young people were invited to tell their stories; others participated actively in the research workshops. In this process, an excursion focusing on racism in Germany took place with the young participants. Based on this case study, this paper aims to exemplify the chances and challenges of participatory designs in the multimethod complexities.

Acceleration in the Urban Margins : Paris Olympics, Urban Entrepreneurial Interventions and Precarious Inhabitations in Saint-Denis

"In Seine-Saint-Denis, Olympic and Paralympic Games of Paris 2024 are the accelerators of history(s)" read the official signboards advertised by the Olympic Committee. This paper explores the implications of this acceleration on inhabitability in Saint-Denis for the marginalized residents of the banlieue. The department of Seine-Saint-Denis, located in northern Paris, has the highest poverty rates in mainland France and its youngest population. The commune Saint-Denis, which also harbours the Stade de France, is the city's most stigmatised territory to this day, whilst the official discourses vary at this conjuncture, referring to it with carefully chosen adjectives such as 'dynamic quartier' or 'territory in motion'. The discursive re/ordering of the place is accompanied by concrete material investments such as the demolition of the infamous social housing estates (cités), simultaneous construction works, and urban regeneration projects that will either bring Saint-Denis closer to the metropolitan core or to social, democratic, and environmental degradation, depending on whom you speak to. Amid this whirlwind, the inhabitants of Saint-Denis, *Dionysiens*, grapple with questions of belonging and temporal ruptures, caught in the profoundly accelerating rhythms of their previously neglected commune as it rushes towards to synchronize with the metropolitan Paris. The accelerated socio-spatial interventions in the commune are often perceived as erasing the 'histories' that make up this place without 'repair' and the communal mechanisms and infrastructures that have evolved to address longstanding neglect – in ways that are profoundly heterogeneous across everyday and militant spheres. Based on twelve months of intensive ethnographic work and participant observation in Saint-Denis, walk-with practices, staged talks and interviews with *Dionysiens* and grassroots militants, this paper analyses urban entrepreneurial techniques of extracting value from urban margins, spatio-temporal precarities they produce and the emerging tensions and fragmentations in making and remaking Saint-Denis.

Did the Marshall Plan Cover the Expectation: Turkey's Entanglement in Agricultural Development in the 1950s

In the midst of the 1940s, Turkish policymakers shifted policy paradigm from inward-oriented economic policy, which aimed at setting up industrialization in the economy, to outward-oriented policies, which is so-called agricultural development fueled by the international organizations, such as the IMF and World Bank. Initially, Turkish policymakers had pondered on industrial plans, which was fueled with foreign resources in the post-war era. Despite their hopes, the Marshall Plan did not meet expectations, as Turkey was intended to serve as the agricultural supplier, so-called the breadbasket, for Western Europe. In the perception of Turkish policymakers, the Marshall Plan served two main goals. First and foremost, it invigorated the Turkish economy with overseas capital and rendered technical assistance, comprising both machinery and skilled know-how. Additionally, it was anticipated that this would lead to an enhancement of the nation's infrastructure capabilities. Second, The Marshall Plan, in the imagination of Turkish policymakers, was the way to be part of the liberal world order led the USA after the WWII.

This presentation will delve into the motivations and mechanisms that prompted Turkish policymakers to move away from inward-oriented industrialization, which depended on domestic savings, towards an outward-oriented agricultural development model that was bolstered by foreign capital in the late 1940s. Although the Marshall Plan assigned Turkey the function of an agricultural country, Turkish policymakers circumvented this specified role within the initiative. Between the hammer of the international order and the national policy preferences, they looked for a way out to perform both industrial policy and the agricultural development program. In this sense, Turkey's entanglement in the agricultural development illustrates the dichotomy between the developing world and international organizations.

YILDIZ, ÜMIT KEMAL* (University of Manchester, United Kingdom)

Prevent and 'Fundamental British Values': Policing British Muslims within and Outside the Education System.

Muslim communities are one of the most heavily policed and least protected in the UK (Tufail, 2015). Since the 9/11 attacks in the USA and the 7/7 bombings in the UK, the policing of Muslims has become normalised within the education system, from pre-school through to higher education (Yildiz, 2021). In response to these events, the UK government introduced its first comprehensive counterterrorism strategy, CONTEST, which includes four key areas: Prevent, Pursue, Protect, and Prepare. The 'Prevent' aspect focuses on the 'pre-crime' space, aiming to prevent individuals from becoming terrorists in the future. It is also known as the de-radicalisation programme.

Prevent places a duty on schools, colleges, and universities to 'safeguard' young people at risk of radicalisation, effectively making educational institutions the frontline of national security efforts. Teachers are tasked with identifying signs of 'extremism' and 'radicalisation' among students and reporting these concerns to the Prevent officer. One of the tools used to detect 'extremism' is assessing whether a student demonstrates opposition to 'fundamental British values,' which are defined within the Prevent strategy as part of the broader definition of extremism. The strategy defines extremism as:

"vocal or active opposition to *fundamental British values*, including democracy, the rule of law, individual liberty, and mutual respect and tolerance of different faiths and beliefs" (HO, 2011).

Since 2007, thousands of young people have been identified as 'extremists' or 'radicals' and referred to the de-radicalisation programme, with the overwhelming majority coming from Muslim communities.

This paper will argue that Prevent and the concept of 'fundamental British values' are rooted in racism and represent an 'acceptable' form of 'othering' Muslims.

YILMAZ, AYSE* (Bahçeşehir University, Turkey)

Exploration of Children's Digital Socialization Using Arts-Based Methods on Digital Environments

The aim of this presentation is to discuss the methodology and findings of research on intergenerationalism using arts-based qualitative research methods in a digital environment.

In the contemporary landscape, technology has become an integral facet of socialization, especially for children growing up in the digital age. The once distinct realms of the digital and physical worlds now intersect seamlessly, shaping the social experiences of children in profound ways, including the dynamics of parent-child relationships. This study explores the interplay between children and adults in the digital realm, focusing on how technology influences the parent-child relationship and children's digital socialization. It also seeks to explore children's perspectives on their digital experiences and their role in shaping the use of technology in the family environment.

Working with 20 secondary school children aged 11-13 and their parents, the research examines patterns of use across a range of social platforms to shed light on children's experiences of digital tools and technologies. Through regular online meetings with the children, using process drama and P4C as data collection methods, their digital interactions were explored, alongside separate sessions with parents to gather their perspectives. The study aims to challenge traditional notions of children as mere recipients of technology, and to shed light on their active participation and impact on family dynamics in the digital age. The findings reveal significant differences between the experiences of secondary school children and their parents, highlighting the need for improved intergenerational communication to bridge the understanding between adults and children regarding digital tools and socialisation methods, thereby fostering stronger intergenerational interactions.

WG08-JS-123.4

YILMAZ, FERRUH* (Tulane University, USA)

Affect, Rhetoric, and Identity

In this presentation, I propose a novel understanding of populism as a political /rhetorical strategy rather than ideology, discourse or political logic. I argue that affect, or emotional attachment to an identity, precedes rhetoric. Rhetoric serves as a means of explaining and justifying this affective investment. Drawing on the insights of Laclau, Toulmin, Burke, and Copjec, I contend that affect is a fundamental force that subverts logic and meaning.

The Rhetoricity of the Social

Laclau and traditional rhetoricians view rhetoric as a means of representing the social that is otherwise heterogeneous, or as the persuasive aspect of communication. My perspective expands on this by emphasizing the goal-oriented nature of discourse and its role in shaping the social world. The inherent fragmentation and inconsistency of the social world make it difficult to articulate consistent identities.

I argue that our sense of the social world is primarily shaped by affective orientation rather than discursive patterns. Affective investment in collectivities, whether identity categories, social movements, or other groups, defies meaning and articulation. These collectivities are formed around affect, which functions as a magnet drawing diverse elements together. In political discourse, affect is often created through the perception of threat, which in turn produces a sense of community or solidarity.

Populist Strategy: Moral Panics

The populist far-right rhetorical strategy is centered on provoking sustained moral panics. These emotional events, which focus on issues like immigration, drugs, or cultural/moral norms, produce strong connections to the populist right's message of restoring order and tradition. By appealing to emotions, they produce affective investment in cultural identities against the "cultural elites" defining elites based on their cultural and moral characteristics rather than class status. This transforms our ontological horizon, emphasizing cultural differences as the fundamental basis for social division or unity.

RC35-587.1

YILMAZ, FERRUH* (Tulane University, USA)

The Ambiguity of Populist Logic

This presentation will use the movie, *They Live* from 1988 and the interpretations of it as a way of approaching the question of ambiguity.

My main question is that even though the movie's main message is meant to be criticism of "unrestrained capitalism and yuppies" (Carpenter), what happens when populist far right thinks the movie reflects their arguments precisely? Is it a simple question of polysemy?

I think not. The right and left logics are pretty similar when it comes to conspiracy theories about the global elites. Both far (fascist) right and part of the left read John Carpenter's *They Live* as an allegory of what they have been saying all along. In the film, a global elite co-opted by aliens control finance and the media. They rule through ideological propaganda in advertisements and TV programs.

The far right conspiracy site *The Vigilant Citizen*, for example, argues that the elite in the movie is the Illuminati. Others point to the "Jewish control of finance and media." Alex Jones of *Infowars* cannot stop praising the film. On the other side, Slavoj Žižek thinks that the film points at "the extreme violence of liberation." The director himself objects to the conspiracist interpretations.

This is a quote from a review: "The message that is communicated here: Mass media is the elite's favorite tool to indoctrinate the masses and to keep them in servitude."

So, how to read it?

If the message of the movie *They Live* is a critique of finance capitalism and its total control of the media that can easily be owned by the far right, then there must be something about the populist logic that characterizes insurgent movements regardless of their political orientation. This presentation will draw also on several other movies to make its argument.

YILMAZ SENER, MELTEM* (VID Specialized University, Norway)

Stigma and Discrimination Based on Non-Native Accent

This article aims to contribute to the scant sociological literature on discrimination based on non-native/L2 accent. It depends on semi-structured interviews with 40 Turkish highly-skilled migrants who left Turkey as adults with at least undergraduate degrees to have further degrees or professional careers in the US, and returned back to Turkey after living in the US for at least five years. In this paper, I focus on their experiences as non-native speakers of English during their stay in the US. I discuss that although they had left Turkey with certified proficiency in English, their everyday life in the US was negatively shaped by the fact that they had non-native accents. Although the respondents did not name their difficulties related to accent as discrimination, depending on their accounts, I argue that their non-native accent functioned as a basis of stigma, marking them as foreigners, and became a basis for negative differential treatment in different spheres of life in the US. I demonstrate in what ways non-native accent can become a basis for discrimination in the context of the US, and also discuss why those migrants who experience discriminatory treatment do not call it discrimination.

YIN, BOYANG* (University of Sheffield, United Kingdom)

'Language and Symbolic Power': The Friendships of Rural-Urban Migrant Children in China

Over recent decades, the deep-rooted economic divide between rural and urban areas in China has led to large-scale family migration, with rural children moving to cities with their parents in search of better employment opportunities and improved living conditions.

Based on an eight-month ethnography conducted in a primary school containing both migrant and non-migrant children in China in 2023, this qualitative research employed observation, interviews with parents, teachers, and children, and an art-based method (children's drawings) to explore children's friendships.

Drawing on Bourdieu's concepts and tools of capital and 'language and symbolic power,' the study found that language, particularly accent, plays a key role in children's integration. Firstly, echoing Bourdieu, language is an implicitly acknowledged legitimate form of culture that is part of a national ideology. This implicit legitimization operates as a form of symbolic dominance, ingrained in the daily operations of institutions and potentially leading to prejudice. Children speaking standard Mandarin are considered more legitimate and have a higher level of peer acceptance than children with accents. Secondly, apart from Mandarin, local accents in megacities can be a source of pride, as they carry significant cultural value and are often associated with property ownership and imply ancestral wealth passed down over generations. Thirdly, intersecting with economic capital, middle-class children use a more elaborated linguistic code, which is more aligned with the education system in China. This study uses Bourdieu's concepts to examine how language can serve as an audible marker of social division for migrant children. The study also contributes to a reflection on Bourdieu's theory by considering children's agency in how they perceive accents. While parents and educators often view accents as 'gatekeeper' that children must overcome to form friendships, children themselves perceive accents differently. For them, accent can sometimes serve as a positive resource in building friendships.

YON JORQUERA, ROCÍO* (Centro de Estudios Interculturales e Indígenas, Chile)

Desigualdad Socioecológica y Crisis Climática. Articulaciones Políticas De Mujeres Indígenas Urbanas y Su Relación Con La Política Climática En Chile.

La organización y creciente participación de mujeres indígenas a nivel global ha facilitado su reconocimiento como actrices clave en la lucha por la justicia climática y la gobernanza. No obstante, su involucramiento en espacios decisivos sigue siendo marginal. Tal es el caso de Chile, si bien el país se ha suscrito a convenios internacionales, como el Acuerdo de París, que promueve los derechos de los pueblos indígenas y la igualdad de género, a nivel nacional, la política climática aún no ha incluido de manera significativa a las mujeres indígenas. Este escenario es problemático, las mujeres indígenas continúan siendo consideradas como una población vulnerable o beneficiaria de programas de conservación, y se desconoce su rol en la gobernanza climática.

A pesar de esta limitada incidencia en el ámbito institucional, el desarrollo de instrumentos de gestión del cambio climático ha impulsado nuevas dinámicas de inclusión, organización política, exclusión y desigualdad socioecológica que afectan a mujeres indígenas en Chile. Estas dinámicas ofrecen un campo de estudio fértil sobre el cuál aportar una mirada crítica y situada.

Esta ponencia forma parte de un proyecto de investigación doctoral que busca entender cómo, en contextos de múltiples crisis surgen articulaciones políticas entre mujeres indígenas urbanas organizadas en Chile, en torno a las desigualdades socioecológicas y la crisis climática. Desde una perspectiva multiescalar, se pretende reconstruir los diversos conocimientos y experiencias que informan estas articulaciones, así como las relaciones de poder que subyacen a los repertorios políticos relacionados con la crisis. En esta ponencia, exploro la relación entre estas articulaciones y la política climática. Para esto, utilizo metodologías cualitativas y participativas, colaborando con mujeres indígenas en la Región Metropolitana de Chile. A partir de sus redes, se logra acceder a diversas actorías e interlocutores con los que estas interactúan y con su entrelazamiento con la política climática.

RC31-503.1

YOON, IN-JIN* (Korea University, South Korea)

Between Foreigners and Compatriots: Social Integration of Ethnic Koreans in Korea

Ethnic Koreans (foreign nationals of Korean descent) are the largest migrant group in South Korea, numbering 848,724 in 2023 and accounting for 33.8% of the foreign population. Far from being just “overseas Koreans,” they have become integral members of their ancestral homeland. This study explores their social integration in Korea and the factors influencing this process, with a focus on South Korea’s immigration policy, which differentiates immigrants based on factors like human capital, their role in the labor market, and whether they are of Korean descent. These distinctions determine their residency status and limit their participation in the labor market.

Using data from the 2021 Survey on Immigrant Residence Status and Employment, the study plans to update its findings with 2023 survey data to examine whether policy changes between 2021 and 2023—such as expanding the industries in which overseas Koreans can work—have improved their socioeconomic status.

The descriptive analysis shows that ethnic Koreans, particularly those on work visit visas, face disadvantages compared to other migrant groups, including non-professional and professional workers and marriage migrants. These disadvantages are evident in areas such as employment, income, housing, health, insurance, pension coverage, and life satisfaction. Additionally, their sense of belonging to Korean society and local communities is lower than that of other migrant groups.

These challenges appear to arise from government policies that restrict residency and employment opportunities for ethnic Koreans to protect the domestic labor market. The findings contradict the assumption that ethnic Koreans, due to their cultural and linguistic familiarity and more favorable residency status, would have an advantage in integrating into Korean society. Moreover, the negative perception of Korean Chinese as being more loyal to China contributes to their social and cultural isolation, further limiting their opportunities.

YOSHIDA, MAI* (The University of Kitakyushu, Japan)

Indigenous Peoples As “Non-Movers”: A Case of Pinatubo Aetas in the Philippines

This study describes the mechanism of immobility of “non-movers” through the case of indigenous peoples in the Philippines. The number of international migrants and refugees has increased over the decades, bringing with it rising concerns in the era of mobility. But there are also many non-movers who cannot cross borders. This immobility of non-movers will be discussed in contrast to those who cross borders. As movers, migrants and refugees flow into the bottom of the host society. They are monitored by the host state with limited public protection. In the same way, non-movers are left at the bottom of their society without guarantee of their basic needs and rights. The Pinatubo Aetas are among the indigenous peoples of the Philippines who are under constant threat of losing their ancestral domain and their rights restricted. The US army, national authorities, and multinational land developers supported by the state have exploited their ancestral lands. With their ancestral domain targeted and their movements heavily monitored, some have been forced to stay or be *imprisoned* in their own land to protect their claim to their domain and preserve their way of life. Some are included in the local labor market as cheap labor, subordinately included in development projects, while others escape to the mountains to avoid conflicts. The study shows the various aspects of the Aetas’ immobility through its historical, economic, and political context. This will provide an important insight into our understanding of the selective process and factors that force marginalized people to either become migrants or non-movers.

The Nexus of Human and Non-Human Movements, Changing Ecosystem, and Social Policies and Practices Following the Great East Japan Disaster: Participatory Analysis through Photovoice

Drawing on the PhotoVoice Project, a 13-year longitudinal participatory action research project, this contribution examines the nexus of post-disaster movements of human and non-human, environmental substances, and their mutually constitutive relations with social policies and socioculturally rooted practices. The project began in 2011 in collaboration with women’s NGOs

shortly after the Great East Japan Disaster, a cascade of massive earthquakes, tsunamis, and nuclear accidents.

Using PhotoVoice methodologies and community engagement, the project places women affected by the disaster at the center of inquiry. Across 10 sites, over 65 women have engaged in repeated photo-taking and small group discussions and created “voices,” many of which reflect ongoing collective analyses of the government, opportunists, communities, and society at large.

Members’ photographs and narratives illustrate complex movements of not only people but also animals, plants, water, air, soil, along with pollutants and contaminants.

Residents of governmentally designated evacuation areas were ordered to move. Many from outside those areas, especially children and mothers, also evacuated fearing radioactive contamination. Classified as “voluntary” evacuees, they received little assistance from the repatriation-promoting government.

In addition to survivors evacuating, cremated remains of the deceased moved. Forced or not, alive or dead, people moved multiple times.

In some severely affected areas, along with residents, the city hall, its functions and staff, relocated. This created an interesting twist on the notion that all disasters are local, reminding us that the local is not standstill.

Polluted air moved across the line that separated governmentally designated evacuation zones from non-evacuation zones. Contaminated soils were piled up by the roadside and doorsteps for a protracted period; slowly most, but not all, have been moved to temporary storage locations.

Weaving through members’ photographs and narratives, this contribution highlights interactive relations among human movements, changing ecosystems, and social policies and socioculturally-rooted practices.

Women’s Experiences with the Great East Japan Disaster: Critical Feminist Participatory Analyses through Photovoice

This contribution focuses on women’s experiences with the Great East Japan Disaster, a cascade of massive earthquakes, colossal tsunamis, and grave nuclear accidents. We present the findings from a feminist participatory action research project with women affected by the disaster, the PhotoVoice Project, initiated in 2011 shortly after the disaster in collaboration with local women’s NGOs.

Using PhotoVoice methodology—a participatory method involving repeated photo-taking, small group discussions, and creation of voices (written messages), the project seeks to promote more inclusive, gender-responsive disaster policies and programs in Japan and beyond.

Since 2011, across 10 sites, over 65 women of diverse backgrounds have co-produced knowledge with researchers and local collaborators. Through their photographs and voices, participating members have explicated various ways in which gendered structural inequity, social norms, and socioculturally rooted practices impacted women and children in and after the disaster.

Ongoing participatory analyses of members’ photographs and voices have also exposed failures and contradictions of disaster policies and responses, which compromised the safety and rights of women and children affected by the disaster. Through repeated discussions, we have interrogated various widely advocated notions, such as *Build Back Better* and disaster resilient society while also problematizing policies and governmental actions, such as repatriation-focused interventions and the promotion of so-called *Fukko Olympics* (Olympics Games to support reconstruction).

Increasingly, members have been participating in social action, obtaining certifications and appointments as disaster prevention specialists, running for office and winning, and advocating for policy and institutional changes through various channels.

In addition to the long-lasting impact of the disaster and radioactive contamination, this presentation will also present visions for the future, promoting disaster prevention, risk reduction, and reconstruction grounded in the rights and needs of local residents.

Reciprocity and Intimacy in the Digital Age: Bonding and Contributions to Social Issues through Japanese Live Music Fandom

The COVID-19 pandemic has fundamentally altered the way people interact, particularly through digital platforms. This study examines how Japanese female fans have built intimate relationships through the exchange of "gifts" within fandoms in both physical and digital spaces, while simultaneously contributing to the resolution of social issues. In this context, "gifts" refer to fan-created works, information, and services shared within the fandom according to established norms. Traditionally, these fans participated in live concerts, fostering strong bonds through mutual support and the exchange of gifts. However, with the suspension of live events during the pandemic, fans increasingly relied on online platforms such as live chats, streaming services, and virtual events to maintain their connections. This shift not only allowed fans to experience live music globally but also promoted activism addressing social issues through online interactions. Fans' digital activism—focused on addressing issues like environmental destruction, bullying, and discrimination based on race or sexual orientation, while fostering a sense of cross-border solidarity—has gained considerable attention. Yet, concerns have also been raised about potential negative outcomes, such as the exploitation of fans or the co-opting of popular music in extreme social movements under the guise of social justice. The bonds within these fandoms are not based on traditional ties like kinship, geography, or education but are instead formed around shared personal interests, such as entertainment and hobbies. The concept of reciprocity, in both physical and digital forms, serves as a crucial metaphor for maintaining intimacy and addressing social challenges while pursuing personal enjoyment. This study provides insights into how personal and social relationships are being restructured through digitalization in the Anthropocene. It offers a vision for sustaining community, intimacy, and social justice without falling into the traps of overproduction or exploitation, presenting a pathway toward a more sustainable and equitable future.

Government Inaction Created By Organization of Ignorance

Firms can scientifically prove the effectiveness of their products, so customers can trust them and promote their sales. The focus of this study is that this customer product approval process creates corporate blind trust and organization of ignorance.

This study takes the case of the cervical cancer vaccine in Japan. I demonstrate the social impact of organization of ignorance regarding the cervical cancer vaccine.

The Japanese vaccine marketing firms were deluded about the scientific efficacy of the vaccine and believed that proof of the efficacy of the vaccine would gain the support of most physicians. They further believed that support from physicians would translate into support from the public who would be vaccinated.

However, physician support alone was not sufficient for active vaccination. It is essential to have support not only from physicians but also from the public, and the vaccine marketing firms were ignorant of the importance of gaining support from the public. For ten years, citizens did not endorse vaccines that were not supported by the public, while the government approved them as products. As a result, the government's inaction led to an increase in the number of cervical cancer cases.

Organization of ignorance creates distrust from customers, and customer distrust leads to government inaction. This study demonstrated through natural language network analysis on SNS that the process of organization of ignorance contributes to negative social effects.

Rethinking Protest: Women Farmworkers Shaping Agricultural Spaces in Southern Morocco

In southern Morocco, female farm workers laid off by a French agri-food group have taken to the streets to launch an al-Ucha - an occupation of the public space. Triggered by the widespread adoption of precarious employment within national and international agri-food companies, these movements react to the isolation of workers and the dwindling capacity for collective mobilisation. Thus, through al-Ucha, they seek to create an entirely different kind of space conducive to the assertion of rights, the affirmation of

a collective voice, the construction of a community, or a new political identity. In this article, I seek to challenge the dominant methodologies of analysing and interpreting streets and everyday spaces from a gendered perspective, moving beyond the notion of a feminised private space and a masculine public one. Instead, I show how rural women working in the Moroccan agricultural sector have challenged the perception of the everyday spaces as a site of protest predominantly associated with a specific body—namely, the organised male presence.

La Relation Entre Pauvreté Et Solidarité: Analyse Sociologique Des Liens Sociaux Et De La Dépendance.

L'étude présentée porte sur la relation entre la pauvreté et la solidarité, elle consiste à chercher la possibilité de généraliser le projet de Serge Paugam dans le contexte d'impact des liens sociaux non seulement sur le côté économique mais aussi sur la protection de l'existence sociale de l'individu, tout en prenant en considération la dépendance du pauvre quel que soit la forme de sa pauvreté, ce qui implique directement le concept de la solidarité face aux insécurités et aux inégalités.

La pauvreté selon Paugam dépend de la typologie différentielle des sociétés, et pour cela il s'est basé sur la comparaison des différents types des pays ce qui nous mène à se focaliser sur l'influence de la conscience de chaque société à ses propres actions vis-à-vis les diverses formes de la pauvreté et son gouvernance quel que soit personnelle ou collectif, traditionnelle ou moderne, ainsi que sur l'influence de réseaux de solidarité sur la densité de la pauvreté.

Notre cadre théorique est donc basé sur la comparaison entre les sociétés sud et Nord européenne déjà étudié par Serge Paugam et notre société marocaine; s'appuyant sur une vision compréhensive dans les travaux, les enquêtes et les recherches effectuées ainsi qu'une poursuite analytique des plusieurs facteurs dégagés dans la réalité de la pauvreté et de la fragilité au sein de la société marocaine (rurale et urbaine) et surtout l'affaiblissement ou la transformation de la solidarité et des liens sociaux pour pouvoir interpréter la possibilité de généralisation et d'implication du cadre conceptuel et théorique dans l'étude de la pauvreté et la solidarité au niveau de la société marocaine tout en prenant en considération le régime d'attachement proprement typique à chaque société, l'évolution et le changement social comme étant contrainte et défi pour la société marocaine et l'existence de nouvelles liens.

Competing Imaginaries and Renegotiating Knowledge Hierarchies: International Student Experiences and Perceptions at a Chinese Branch Campus in Malaysia

China's growing role as an exporter of transnational higher education (TNHE) has significant implications for reshaping global educational landscapes. Yet, research has primarily focused on China as an importer, leaving this emerging role underexplored. Furthermore, existing studies largely focus on top-down policy narratives—how China employs TNHE as a tool for soft power and knowledge diplomacy. However, at the micro level, how international students renegotiate these top-down narratives within existing Western-hegemonic knowledge hierarchies remain largely underexplored.

This presentation addresses the conference theme by contributing an empirical case study of international student experiences at a Chinese international branch campus in Malaysia, embedded in post-colonial geographies. Reflecting competing imaginaries, the campus combines Chinese cultural symbols with English as the medium of instruction, where local Malays become an ethnic minority. The diverse student body includes 7,100 students from over 40 countries, with around 30% Chinese and 60% Malaysian. Based on 40 student interviews, our study reveals how different groups of international students renegotiate Chinese state policy narratives—particularly under the Belt and Road Initiative—alongside post-colonial discourses, such as the quota system limiting Malaysian Chinese access to higher education, and the broader global knowledge hierarchy dominated by the Global North. Perceptions of the Chinese international branch campus vary: Chinese students view it as 'domestic education overseas', Malaysian Chinese see it through historical ties to China, while other international students are attracted by its association with modernity.

The findings offer a nuanced, multifaceted understanding of the renegotiation of knowledge hierarchies at a Chinese international branch

campus in Malaysia. These hierarchies are reinforced by macro-level post-colonial narratives in Malaysia and the use of English as the language of instruction on campus; contested by students' aspirations for China both in terms of history and modernity; and complicated by the neoliberalism for university's financial sustainability.

Astronaut Households: The Lived Experience of Pseudo-Single Chinese Immigrant Mothers with Pregnancy and Childcare in Canada

Chinese immigrants created the term *taikongren jiating*, or "astronaut household," to describe families where the wife and children are relocated overseas while the husband stays in another country, especially in China. In these circumstances, women might go through pregnancy alone and adapt to a pseudo-single parenting style as the sole decision-maker and childcare provider. This paper aims to understand their lived experiences, motivations for immigration, and challenges they face to inform service providers, policymakers, and people planning to immigrate. In-depth semi-structured interviews are used to gather personal stories regarding pregnancy, "sitting the month," or the traditional Chinese month-long postpartum care rituals and childcare practices of Chinese immigrant mothers. Research is limited to Montreal, Quebec, Canada, to allow for between-participant comparisons in immigration policy, social services, healthcare, and sociocultural experiences. I aim to recruit 15 Chinese immigrant mothers who have experienced the "astronaut household" arrangement in the past five years with at least one child under five. With the seven interviews so far, common themes have already emerged. The language barriers are significant in both English and French, especially with medical terminologies. It is difficult to follow the postpartum rituals immediately after childbirth in Canadian hospitals or at home with limited family and social support. Chinese immigrants can rarely continue working in their qualified professions, as in China, many husbands choose to stay back to provide financial support for the family. Another common reason for the arrangement is to care for aging parents. Transnational families face different challenges, either bringing their elderly parents to a foreign country or leaving them back in China, sometimes with no other caretakers due to the one-child policy. On top of the everyday challenges mothers face in providing childcare, mothers in "astronaut households" are concerned about the potential influence this arrangement has on their young children.

YU, YINAN* (McGill University, Canada)

"Leftover" or Choosing to be Single: Dilemmas of "Leftover Women" in Sandwich Generations in China and Their Mental Health Outcomes

Since 1980, most families have been restricted to one child despite the traditional preference for larger families. The one-child policy has created a unique generation of sole caretakers for their parents with no sibling help. The policy officially ended in 2015 in response to concerns about the aging population. However, instead of a significant increase in newborns that many predicted or hoped for, the birth rate in China has been decreasing. *Shengnu*, "leftover women", or career-oriented women who remain single in their late twenties and beyond, embody clashing ideologies in modern China. Some view *shengnu* as a byproduct of the one-child policy, which allowed women to gain greater educational and professional achievements with more allocated resources as the only child in their households. On the one hand, the derogatory label is used to chastise women who are "left" like damaged goods for lacking traditional feminine virtues, being self-centred, having unrealistically high expectations for romantic partners, and abandoning traditional gender roles. On the other hand, many women take pride in their autonomy in choosing to be single or childless. *Shengnu* represents the other side of the coin of the sandwich generation. When *shengnu* avoid the fate of being a "family donkey," caring for parents, parents-in-law, potentially grandparents, and child/children, they face social humiliation, family pressure, and the demand for higher achievements to justify their choices. Research on the mental health outcomes of *shengnu* is extremely limited. This paper provides a historical, social, and cultural analysis of the phenomenon and lays the groundwork for understanding their mental health outcomes concerning dating potential, career advancement, filial piety, freedom, and sense of completeness. Understanding *shengnu* will complement our understanding of the sandwich generations and how women respond to the increasing double burden of family and work.

How Acculturation Affects Settlement Intentions of Chinese Rural-Urban Migrants: The Mediating Roles of Socioeconomic Status and Psychological Well-Being

Rural-urban migrants in China inevitably experience a process of acculturation, which has been identified as a key factor influencing migration and settlement patterns. However, few studies have addressed the mechanisms through which acculturation affects the settlement intentions of Chinese rural-urban migrants. Using data from a survey of rural-urban migrants in 2015-2016 in Guangdong, China, this study explores the mediating roles of socioeconomic status (SES) and psychological well-being in the relationship between acculturation and settlement intentions. Acculturation is considered as a multidimensional (including changes of cultural practices, values, and identifications) and bicultural (with orientation towards both the culture of original rural society and the host culture of urban society) process. Using latent class analysis, the study identifies four categories of acculturation, including two subtypes of integration and two subtypes of separation. Our findings indicate that migrants in both integration subtypes are more inclined to return home and seek nonagricultural jobs compared to those in the separation subtypes. The settlement effect of acculturation is partially mediated by socioeconomic status (assessed by perceived SES and income) and psychological well-being (assessed by life satisfaction). Integrated migrants generally enjoy higher levels of socioeconomic status and psychological well-being, through which acculturation increases their likelihood of returning home to engage in nonagricultural jobs. For integrated migrants, rural culture not only attracts them to return but also serves as a vital safety net, providing support that helps them sustain their work and life in urban areas. Maintaining aspects of rural culture can contribute to their psychological well-being, which in turn can enhance their intention to settle in cities or return home to engage in nonagricultural work.

Diversification of the Student Lives and Self-Positioning of Japanese University Students

The aim of this research is to clarify how Japanese university students spend their university lives and how they position their own lives.

Japanese university students have diverse experiences during the transition period between April matriculation and the simultaneous recruiting of new graduates, which is a unique system. Previous research on the diversification of university students in Japan has focused on the diversification of attributes, but it is difficult to say that it fully captures the diversity of university students. Two specific issues can be pointed out. The first is that the specific and concrete perspective of focusing on the lives of individual students is being overlooked. The phenomenon of "diversifying of students" is familiar to higher education researchers, starting from Trow Martin. However, there is no narrative from the students themselves, and the day-to-day activities of what each individual thinks and feels and how they live their student lives are being ignored. The diversity that has not been captured until now would be revealed in the narratives of these specific experiences. The second is that the research does not consider where the students position themselves, or how they give meaning to their lives. In research on sociology of education, it is said that the image of university students is found based on their attributes and lifestyles, but it would be largely influenced by how the students position themselves. The subjective criteria by which actual university students evaluate their own and others' student lives has not been within the scope of previous research.

For this reason, this study will conduct semi-structured interviews with current Japanese university students. It will then use the rich narratives of university students to get to the bottom of the reality of "diversification".

"Why I Don't Become a Perpetrator": The Life Story of Individuals Seen As "Potential Perpetrators"

This paper focuses on individuals labeled as "potential perpetrators" who, nonetheless, do not commit harmful acts. Specifically, non-offending pedophiles' narratives in Japan are examined to explore how sociological biography can critically engage with "perpetrator identity" discourses. Despite

being confined to the dominant narrative of being “destined offenders,” they create counter-narratives. By exploring life stories of “not becoming a perpetrator,” the potential and challenges of biographical research on violence are discussed from a contrasting but complementary perspective.

Although pedophilia has been widely studied, most research has targeted criminal perpetrators. Additionally, some recent discussions in Japan have misleadingly suggested that pedophiles’ sexuality, including that of non-offenders, essentially arises from patriarchal culture. However, misogynistic culture has no inherent link to pedophilia as an innate orientation, and many child sex offenders are not actually pedophiles. As labeling theory indicates, deviant behaviors are shaped through various social interactions, not a single ideology. This paper thus explores how non-offending pedophiles struggle to articulate a non-offending identity, especially during youth, in a social space dominated by the potentially self-fulfilling prophecy of “destined offenders.”

The discussion focuses on a female informant attracted to young girls, supplemented by other male cases. The study examines how she navigates among discourses like “masculinity as violence,” “femininity as victimhood,” and “lenient local culture toward sex crimes.” Considering how some Foucauldian arguments defending male (offending) pedophiles often overlook the suffering of rape survivors, I address whether this study unduly emphasizes an exceptional female case, potentially reinforcing societal leniency toward offending. Significantly, however, her narrative aims not only to empower non-offending young pedophiles labeled as future perpetrators but also to prevent its misuse as a pretext for offending by others. This is why biographical research has an important role in making her complex story visible, while carefully weighing related ethical and political considerations.

Variegated Student Mobilities between China and Southeast Asia: Belt-Road Initiative, Region-Making, and Alternative Knowledges and Cultural Capitals

Since its announcement in 2013, Belt-Road Initiative promoted by China's top leadership is shifting the tide of international student mobilities regionally, and globally. China has emerged as a growing destination for international students from the Global South. And Southeast Asia becomes new attraction for China's educationally mobile students. These new developments invite questions about alternative knowledges and cultural capitals beyond the body of (universal, western-centric and English-mediated) knowledge in Western universities. When students from BRI partner countries go to China, what do they expect to learn from China's curricula, culture and society? Likewise, how do Chinese students intend to experience and achieve during/post their education in Southeast Asian societies? Based on survey and interview data from a multinational research project, we conduct a case study of three destinations in Asia (China, Singapore and Thailand). We analyze students' academic specializations, motivations, selection rationales, experiences and career plans, highlighting variegated mobilities and future orientations. Singapore continues to attract Chinese students with its high-quality, English-medium education catering to STEM subjects, demonstrating the persistent dominance of English and related knowledge system in a globalized world. China, with rich cultural heritage, rising economic power and generous BRI support, becomes a magnet for students from its neighbors, making Chinese increasingly a regional *lingua franca*. The case of Chinese students in Thailand with an intention to acquire cultural and linguistic knowledge for future careers in BRI-related industries underscores the significance of bilateral ties and localized expertise. By focusing on alternative knowledges and cultural capitals, this research contributes new empirical evidence and fresh theoretical perspectives into the relationship between international student mobilities, knowledge systems and region-making. The findings suggest that the BRI is facilitating region-making by promoting diverse flows and talent development across Asia, marking a shift toward a more interconnected and pluralistic era of higher education mobility.

YUSUPOV, MUSA* (Chechen State University, Russian Federation)

Neutralization of Social Inequality By Cultural Equality in Communication

Social inequality is considered as a key indicator in assessing the state of society and the level of social justice. It is characterized by its uniqueness in different eras and periods of history and is a reason for the aggravation of social contradictions, the experience of crisis and instability. Today, there is an economic inequality between states and inequality within the state between different groups and strata. The question arises of how to neutralize the negative impact of inequality on the public sentiment. The urgent task is to minimize it, but it is impossible to completely eliminate it in society. Inequality plays a major role in stimulating individuals and groups to be active, changing their own social status, as well as the environment. Civil equality in the rights to freedom of voice, choice, and protection from external arbitrariness can neutralize the negative side of inequality. However, in the emotional and psychological sense, cultural equality in everyday life, in different spheres of life, family, public places, and at work is very important. This is facilitated by following the moral and ethical rules of communication. The report describes the historical and cultural experience of ensuring equality in the communicative space of Chechen society. The focus is on the dominance of cultural stratification in social life compared to social stratification. The social basis for such institutions was the predominance of the “middle class” in society, an insignificant number of rich and poor. In the conditions of the predominance of cultural paradigms in social arrangement and community life, many generations have changed and this has a strong influence on the course of life processes in modern post-Soviet Chechnya, despite the political, legal and socio-economic difficulties experienced. The report presents data from the sociological surveys on respondents' understanding of equality, preferred values and communication norms.

RC25-410.1

YUSUPOV, MUSA* (Chechen State University, Russian Federation)

Representation of Life Values By Bilinguals in the Anthropocene

In the world, human activity has led to technical and social progress, well-being has increased in many countries, while at the same time there is a threat to the natural environment at the local and planetary levels. The situation can be radically improved by changing a person's attitude to nature, updating the values of preserving the environment, and forming responsible environmental behavior. The report examines the bilingual perception of life values.

The subject of research: life values of bilinguals. **Objective:** to reveal the understanding of life values by bilinguals using the example of native speakers of Chechen and Russian.

Materials and method. The study used a sociocultural approach, a method of sociological survey of the population and teachers, it was planned to determine the hierarchy of life values, their significance and the social level of their functioning in two languages.

Results. The motivation of social behavior, attitude to the environment largely depends on the individual and collective values. Monitoring sociological surveys shows the continuity of values between generations in different age groups. Respondents name such values as family, material well-being, health, children's well-being, respect and others as preferable. At the same time, the value hierarchy and set of values are not the same in their representation in the Chechen and Russian languages. This is influenced by

different codes of culture and social experience accumulated in the languages. In surveys in the Chechen language, honor, dignity, rivalry in nobility and others are often singled out as values. At the same time, respondents rarely note environmental values as vital, which indicates a weakening of civic and traditional environmental culture. In reality, egoism and a consumer attitude to life and nature dominate among some people. The conclusion emphasizes the role of municipal government bodies in the formation of environmental values and culture.

Social Imprints of Political and Cultural Values. the Case of Kazakhstan

The social structure of society should be explored in order to identify the factors that influence the establishment of a given political regime and the reasons for the formation of various political systems and institutions in various societies. Since there are currently no well-defined approaches for examining the democratic nations that arose following the fall of the USSR, we investigate Kazakhstan as a nation with a developing democratic government. As we analyze the connection between political values and socioeconomic status, we aim to address the following research questions: which political values are more ingrained in Kazakhstani society? How much within society do the political beliefs of various social groupings align and diverge? The study's empirical foundation consisted of data from a national representative social survey that was conducted by KISI in June 2024.

Social status has been chosen as a social class indicator for the research. The eleven-stage socio-professional stratification scheme (EGP) created by J. Goldthorpe was selected to place a respondent into a specific social class. The three categories of social relationships—employers, employees, and entrepreneurs—are the foundation of the analysis.

A left-right scale with two opposing poles is typically taken into consideration when examining political values. According to our study, respondents' attitudes on social policy, economic involvement by the state, and social inequality reflect the differences between these two categories of values. Finally, our political values scale is exclusively focused on the economic side because it was constructed only on the basis of inquiries concerning the function of the state in the economy. Therefore, people who support little government involvement in economic affairs are described by the right pole, while those who oppose cutting government spending and think the state should give its citizens good pensions and unemployment benefits are represented by the left pole.

El Concepto De Progreso

La ponencia abordará la génesis y desarrollo conceptual de la idea de progreso y sus relaciones con la esperanza de un mejor futuro relacionado con el avance y aplicación del conocimiento.

Con este fin, el trabajo analiza cómo el concepto se ha transformado a lo largo del tiempo respondiendo a los diversos transformaciones económicas, políticas y sociales. Para el análisis histórico sobre la génesis los cambios en el significado de esta categoría, se destacan las tesis al respecto de alguna escuela de pensamiento como la Ilustración, el Positivismo, el Darwinismo Social. Durante el siglo XX el concepto de progreso adquirirá una nueva dimensión frente al optimismo del crecimiento y los proyectos de industrialización y urbanización propios de algunas regiones como América Latina.

El estudio también analiza las críticas a la idea de progreso que se han expresado en distintas épocas y que está presente en la corriente marxista y en el historicismo de finales el siglo XIX. Durante el siglo XX con la Gran Depresión, la intensidad de los conflictos bélicos y las nuevas armas tecnológicas, las bondades sociales de los avances de la ciencia y del progreso fueron cuestionadas por los autores de *La Escuela de Frankfurt*.

En el pensamiento contemporáneo, la noción de progreso ha despertado nuevas críticas que cuestiona la noción del desarrollo económico y científico lleve a un mejor futuro sobre todo considerando sus efectos en seguridad, el desplazamiento de puestos de trabajo, la calidad de vida, la conservación del medio ambiente, la presencia la recientes epidemias y otros fenómenos propios "sociedad de riesgo".

Las fuentes de la ponencia incluyen referencias tanto autores de Estados Unidos y de Europa como de América Latina. También se incorporan las propuestas generadas por autoras mujeres.

The Expansion of Sociology in Mexico (1959–1980)

At the end of the 1950s, Mexico faced unfavorable economic conditions, and the protest of different labor movements, which aroused a new concern for social inequality in the country. In 1968, the violent governmental reaction to the student movement changed the vision of a peaceful progress according to the so-called "Mexican Miracle." Under the new social circumstances and the expectations generated by the outbreak of the Cuban Revolution, the decade of the 1970s was characterized by the eruption of Marxism in the universities. Due to the rise of authoritarianism and the growth of military regimes in Latin America, many South American intellectuals arrived at Mexico as professors in the social science departments. Sociology experienced a process of expansion both in student enrollment and in the founding of journals and new academic institutions. The chapter analyses these transformations together with the changes to the sociology curricula, in the main journals, and publications, in the studies undertaken by Mexican sociologists, as well as the contributions from foreign authors that had an important impact in Mexican social science.

Casa's Lessons from Two Decades of Tenant Organizing in the South Bronx

This paper explores the activism of CASA (Community Action for Safe Apartments), a tenant organizing initiative that has been active in the Southwest Bronx, in New York City, since 2005. CASA is composed of and led by local tenants who collectively fight for the preservation and improvement of the area's affordable housing stock. Over the past two decades, in addition to organizing tenants block by block, CASA has played a key role in shaping local and national struggles for housing justice. It has spurred campaigns for local participatory re-zoning, for low-income tenants' right to legal representation in eviction proceedings, and for a ban on evictions during the outbreak of the covid-19 pandemic, among other actions. The paper builds on oral history interviews with CASA leaders who reflect on how their diverse life trajectories brought them to this collective organizing, on the campaigns they took part in, and on their outlook on their city's main challenges in providing dignified housing for all. It reflects on how these leaders have turned their housing precarity into a driver for collective organizing and for questioning the rules and power hierarchies of the housing market, including the legitimacy of evictions in the first place.

ZACHOU, CHRYSSANTHI* (American College of Greece-Deree, Greece)

Migration As a Response to Climate Change: Adaptation or Failure to Adapt?

Although environmental changes have always been a driver for human mobility, climate change has accelerated (internal and international) migration and displacement and has complicated the interrelationship between the environment and migration. Climate change is seriously impacting the individuals' livelihoods and well-being, the local economies, and the social lives of communities. Whether in the form of environmental hazards or gradual environmental degradation, it has variable (in)direct effects on the affected areas and individuals, resulting in different responses and outcomes. Yet, migration theories and interdisciplinary studies have documented the multi-causal character of migration. Several compounding factors (economic, social, political, cultural, and demographic) along with environmental challenges influence not only the decision to migrate and the volume, direction, and duration of migration flows but also individuals' experiences in origin and destination. Thus, scholars have recently questioned binary schemes (e.g. forced-voluntary, labor-environmental migration), and attribute migration (or immobility) to the complex interplay of multiple macro, meso, and micro-level factors. Moreover, the likelihood of migration is influenced by the affected areas' vulnerability in the absence of mitigating measures, as well as the individuals' capability and access to (material and social) resources to move.

As insecurity and risks intensify, migration can represent a viable solution, an adaptation to the impacts of climate change that allows individuals to seek safety, and better opportunities elsewhere. However, migration is neither an option for all, -as it is the most vulnerable who are mostly affected and less likely to move- nor is it a problem-free experience. Migrants are likely to face multiple challenges in destination areas and they often have to replace

one type of precarity for another. The success of migration as adaptation is intimately linked to the outcomes in the destination area. Inequalities, structural conditions (and occasionally) new environmental hazards may reinforce their vulnerability and impact their well-being.

The Transformation of Intimacy: Generation Z's Love and Friendship Relationships Redefined

The sociological literature on emotions and love has pointed out that, today's uninhibited emotional freedom in the choice of potential partners has, paradoxically, led to emotional ambiguity, insecurity, and a "commitment-phobia". This emotional ambivalence is amplified by the modern imperative of self-realization which contradicts the self-sacrificing requirements of love commitment. As Ilouz (2019) writes, freedom facilitates the opposite of what it sought to achieve. As relationships become more "liquid" and likely to (quickly) dissolve, "negative sociability" and "unloving" -the individual's choice not to love- become common phenomena worthy of our sociological attention.

Through semi-structured interviews, this study aims to empirically investigate today's transformation of intimacy and the changing perceptions of love and friendship by focusing on the experiences of Greek undergraduate students. Student life is characterized by flexibility of choices, spontaneity, and the questing of mainstream social norms and conventions. As part of the age cohort which is frequently identified by the popular media and researchers as GenZ, the study's population is a technology-savvy group of (new)digital natives, who have spent their formative years during the pandemic. Their early engagement with technology, especially with social media, as well as evolving social norms, have shaped their perceptions of self and others, their notions of intimacy, and the "instrumental" way of communicating emotions.

Today's youth is caught up between two co-existing conflicting cultural scripts which on the one hand continue to reproduce idealized, everlasting notions of love promoted by the media and consumer cultures, and on the other overpromote the rationalization of emotions and relationships. Taking also into account cultural and gender differences, the study intends to address how the emphasis on individualism, self-realization, and the rationalization of love -whereby love becomes an object of endless investigation and self-scrutiny - shape today's youth's understanding of self and their experience of intimate relationships.

Digital Objects of Devotion: Online Relationality in a Shi'a Ecology

What *matters* in religious life-worlds? What is the stuff of Shi'a ritual?

When a Shi'a practitioner caresses an image of an *'alam* on an iPhone screen, what is being brought into proximity? What is *being* touched and touching *back*? how is this mediated?

The proliferation of digital technology throws materiality in religion into new relief. My ethnographic work with Shi'a communities in the Netherlands revolves around questions of digital materiality. Focusing on a Pakistani-Dutch Twelver Shi'a community and women's WhatsApp group, I explore everyday digital objects that are embedded in Shi'a ecology. Using case studies of e-cards, majlis invitations, and WhatsApp stickers, I locate how certain digital objects are produced and circulated within Shi'a ritual spheres.

I conceptualize Shi'a ecology as an interconnected, dynamic, living system of relationships that includes understandings of the *kaināt* (cosmos), *qudrat* (nature), *ghayb* (unseen), the *Ahl-al-bayt* (house of Muhammad) and materiality. Ecology here relates to plural environments, including digital atmospheres, as well as processes and relationships that constitute it. I draw attention to these evolving and fluid relationships, as well as gatherings/nodes in the form of digital objects. Therefore, I imagine Shi'a ecology as a zone of entanglement encompassing human, beyond-human, organic, electric, spiritual, animate matters.

Digital objects are ontologically ambiguous, making them valuable subjects of research to explore how meaning-making, relationships, and communication pulses through religious communities. Specific material properties of digital objects allow them to elicit sensations in particular ways: visually, sonically, haptically. However, the messages they carry and meaning they convey are still rendered sensible through the ecologies they are embedded within. Digital objects function as communicative, political, historical, mnemonic and interactive agents, facilitating access to the *Ahl-al-bayt* and co-creating the bricolage of a ritual. I explore how sensation, memory, and experience are conveyed through digital matter within religious ecologies

ZAICHENKO, LIUDMILA* (HSE University, Russian Federation)

The Practice of Liminality As a Sociology of Concern

Current study explores the segregated context of Estonian education system, where Estonian and Russian-medium schools coexist. Using the underrepresented theory of liminality in sociology in combination with the theory of reflexivity of Margaret Archer, I examine the vulnerable positions of teachers in Russian medium schools. The empirical data for this qualitative study was gathered in 2021 and 2022 - when the transition of all Russian-medium schools in Estonia into Estonian language of instruction had been discussed ardently. My findings reveal that these teachers experience different forms of liminality, shaped by self-defined, socially constructed, and ontological constraints.

These liminal moments foster teacher reflexivity, serving as a catalyst for their transformations while navigating the state of 'betweenness'. Concurrently, their practices of replication and reproduction, which nurture their liminal positions, may be consciously chosen by them as signs of opposition, self-protection, or adherence to their own culture. These teachers' ongoing concerns are not only connected with their inability to change the situation in their contexts (inability to teach in Estonian in the Russian-medium schools) but are also an intimate expression of 'what they care about most'. Their cultural projects are an intersection of their concerns, inspirations, and the practice of resistance.

This study was made as a part of my PhD project at Tallinn University; the dissertation was successfully defended on January 29, 2024.

Navigating Gendered and Structural Barriers to Aspirations through Feminist Action-Research: Experiences of Youth in Kalyanpuri, New Delhi

Feminist action-research is a powerful tool for bridging theoretical research and social change, combining real-world engagement with academic rigor. Drawing on Jean Dreze's (2002) insights, this paper explores how integrating research and action enhances knowledge while fostering social emancipation, particularly in contexts of inequality. Dreze's work highlights how action-research democratizes knowledge by engaging with communities and influencing policy from a grassroots perspective, challenging purely academic models.

This study carried out in an informal settlement, Kalyanpuri, in New Delhi, India, exemplifies this by using participatory methodologies to explore the socio-cultural barriers constraining marginalized youth, especially girls. Grounded in the capability approach by Amartya Sen (1995, 1999) and Martha Nussbaum (2011), the study shifts the focus from access to resources to expanding youth capabilities and agency. It shows how gender norms, economic hardship, and social resources shape aspirations and limit opportunities, with girls facing particular challenges in education, mobility, and safety. This paper explores how feminist action-research empowers girls belonging to underprivileged backgrounds, fostering collective agency, to drive change in discriminatory social norms and practices. We will discuss the use of mixed and multi methods, particularly the use of participatory tools based on theatre of the oppressed, reflexivity, participant observations, and case studies, emphasizing their role in highlighting the lived experiences of marginalized groups. The paper highlights how action-research challenges power structures, supports sustainable development, and facilitates community empowerment, serving as a catalyst for social transformation.

Moralizing Space? Islam, (in)Security and Territoriality in Urban Kampung of Jakarta

My dissertation's research studies the role of Islam in the production of (dis)order and (in)security in the everyday life of urban kampung of Jakarta. This project attempts to unravel the intricate relationship between religion, security, and territoriality and seeks to contribute to conceptual debates about authority, morality, materiality, and spatiality. In doing so, it employs an ethnographic exploration of the everyday religious and security practices of the residents in an inner city kampung of urban Jakarta. This research argues that any contemporary analysis of religion and security must attend to the complex entanglements between morality, materiality, and spatiality. It introduces the conceptual framework of "moral space" that allows us to analyse the interconnections between religion, security, and territoriality in urban Jakarta and beyond.

Taking insights from the recent debates on the anthropology of morality, 'material turn' in the religious and security studies, and 'urban religious infrastructure', I argue that Islamic morality and materiality have significantly shaped the ways in which (in)security is sensed, embodied, spatialized, and enacted in the everyday life of 'urban majority' in Jakarta. In doing so, this study demonstrates that Islamic morality, manifested in embodied religious practices and material culture like built-environments and objects, has played a critical role in authorizing vernacular security practices, remaking political subjectivity, and rendering particular moral aspiration tangible.

The Multi-Faced Social Dynamics of a Community Plunging into the Groundwater Economy: A Case in the Middle Atlas, Morocco

Analyses of the development of intensive agriculture based on groundwater have often focused on the economic and environmental changes this development triggered. Yet, this development takes place within and interacts with multi-faced social dynamics. The study assesses such interactions in the Ain Tinguenay community, in the Middle Atlas region of Morocco. In the past, the social organization of this community was mainly based around a religious brotherhood, and there were well-delineated symbolic and social differences between various fractions. The development of groundwater use led first to an increase of a sense of "socioeconomic" individual freedom of farmers. Second, it enabled the development of new forms of collective actions, especially around the creation of farmers' cooperatives and associations. The "modernization" in social relations led to deep changes in the way these relations are organized. However, collective capacities to take initiatives remain actually fragile. The area is nowadays facing a rapid drop of groundwater levels, which is threatening the sustainability of the intensive agricultural development model. This crisis has emerged very quickly. The community faces the challenge of developing collective initiatives to adapt to this crisis in the short term.

Artisanal Cooperatives between Traditional and Digital Exploring Social Attitudes and Representations

In the current context, where digital technology is booming, Morocco, like many developing countries, is demonstrating, through the New Development Model for Morocco and the "Maroc Digital 2030" strategy, its determination to make digital technology a tool for inclusive development. The aim is to make digital a means of social and economic transformation. This calls for sociological reflection on the relationship between the social representations of players in craft cooperatives and their attitudes towards digital.

Our research focuses on craft cooperatives in the Fès-Meknès region, known for its rich cultural heritage and its importance in the craft sector. The aim is to understand, through a qualitative study based on semi-directive interviews with 20 cooperatives, these craftsmen's perceptions of digital, including their attitudes, beliefs and opinions.

Our problem statement is as follows: How do social representations influence the attitudes of artisan cooperatives, and to what extent can these cooperatives integrate digital while preserving their traditional practices?

To answer this research question, we aim to show that craft cooperatives see digital as an opportunity to develop their activities and improve their socio-economic situation. However, the lack of digital skills is a major obstacle, highlighting an urgent need for training and support for these artisans. Furthermore, craftspeople express reluctance about the impact of digital technology on their traditional practices, stressing the need to preserve the authenticity of their know-how and cultural identity.

Caring, Giving and Receiving: Relationships of Solidarity in the Study of Forced Migration

This paper examines solidarity relationships between mainstream civil society and refugees based on long-term ethnographic fieldwork in the German context (Zalewski 2022). Set in the years after the “long summer of migration” and before the coronavirus pandemic, it analyzes the emotionally close relationships between myself as a German-born ethnographer and young men with a Syrian refugee background. A methodology of “strong reflexivity” (Kühner et al. 2016) was applied together with Donna Haraway’s (1988) idea of situated knowledge: it was important not to fall for the “God trick” of a universal, i.e. unmarked, perspective, but to adhere to an ethical demand for accountability.

As a result, on the one hand, dynamics of giving and receiving in these relationships will be pointed out. Following Marcel Mauss (1925), who conceived his theory as a non-utilitarian practice to reveal forms of “corporate solidarity” (Moebius 2006), I draw on the mixing of person and thing in the exchange of gifts by disclosing situations in which I experienced shame. On the other hand, the realm of “reciprocal experiences of loving care” (Honneth 1996) based on unconditionality is approached: the mutual empathy and the sincere sharing of each other’s lives.

IRFAN, HIFZA* (Quaid-i-Azam University Islamabad, Pakistan)

Stateless Children in Pakistan

UNHCR estimates about 4.2 million children are stateless in the world and Pakistan is no exception. Pakistan, the country of migrants, has thousands of stateless children: Kashmiri, Afghani and Rohingya children are some of the examples but the country still unable to accommodate these children. This paper articulates the state of the art, selected through systematic review of the existing body of knowledge. It shed light on the plight of the global stateless children. By using the ESCI articles, analyzing it in MAX QDA, NVivo, it was revealed that birth registration, laws related to the parental nationality, conflict and violence were some of the reasons of the stateless children. These children were desperate for their identity, existence, and recognition in the society. It was found that these children were Not in Education, Employment and in Training (NEET). They were without life skills. These children were hapless, without future perspectives, without their identity and recognition. These stateless children were either on streets or off the streets (in home, concentrated places or in custody). It seems imperative to analyze this phenomenon with the child centric Lense as well as human rights lenses and understand the subjective wellbeing of the stateless children. This phenomenon is without the territorial and regional boundaries and needs attentions of the global scholarship and intellectual insight.

ZAMORA LEYTON, MARÍA PAZ* (Pontificia Universidad Católica de Chile, Chile)

EN Vías De Civilización: La Producción DEL Niño- Ciudadano Global EN Las Políticas Educativas Chilenas

Una de las políticas educativas recientes sobre educación ciudadana en Chile es la Ley 20.911 “Plan de Formación Ciudadana” (PCF) que establece la obligatoriedad a las escuelas reconocidas por el Estado de incluir un plan de formación ciudadana dentro de sus planes de estudios. La siguiente investigación tiene como objetivo mapear la producción y legitimación de la noción de ciudadanía global en las políticas educativas chilenas contemporáneas, bajo el supuesto de que existe una producción universal de las infancias en base a valores y creencias del Norte Global. Desde una perspectiva nuevo-materialista y a través de una metodología basada en la teoría de los ensamblajes de Deleuze y Guattari, se analizaron documentos nacionales e internacionales sobre formación ciudadana en educación básica con el objetivo de rastrear las fuerzas materiales y discursivas que estarían operando en la producción del niño-ciudadano global en las políticas educativas chilenas. Los resultados evidencian una producción normativa y legitimada de niño-ciudadano global por medio de lógicas coloniales, discursos sobre el progreso, el respeto a la diversidad, la representación del riesgo y la intervención. De esta manera, se imagina un niño-ciudadano chileno/a como un sujeto en vías de civilización y, por tanto, como un riesgo para el desarrollo del sistema social, político y económico de las naciones.

Fixing the Black Box? the Maintenance of Confessional Booths As Infrastructural Repair in 18th Century Italy.

In the 19th and 20th centuries, the confessional booth—a wooden box that (usually) hosts a confessor and a layperson, providing a Goffmanian backstage for the verbal confession of sins that leads to Sacramental Absolution—has become a cultural icon of the ritual itself (Reeves & Stoneman, 2024). In popular culture, the confessional booth has come to signify the private and often secret character of face-to-face interaction while offering a privileged site for social critique (for the inappropriate conduct of priests). However, this cultural object has escaped empirical scrutiny and theoretical conceptualization except for some early modern historians’ work (De Boer, 1991). By combining concepts borrowed from historical sociology on disciplinary revolutions (Gorski, 2003) and Science and Technology Studies (Bowker & Star, 2000; Henke & Sims, 2020; Denis & Pontille, 2023), in this paper, I argue how the activities of surveillance and maintenance of confessional booths in 18th century Verona, Italy, configure instances of infrastructural repair. By using archival data and primary sources such as the reports of pastoral visitations (during which bishops inspected confessionals, commanding their reparation), petitions via which parish priests asked permission to change them (as they were part of parish churches and they couldn’t intervene on them as they wished), and anonymous denunciations made by laypeople who wanted to signal to bishops the inappropriateness of confessional booths, I show how the material character of disciplinary infrastructures (Gorski, 2003) and their physical decay proves to be decisive in organizing surveillance practices and creating the interactional circumstances in which classifications can be constructed, selves can be performed, and discourses can be mobilized.

ZAMPONI, LORENZO* (Scuola Normale Superiore, Italy)

“That’s the Bet”: Theories of Change in Climate Justice Action

The explosion of youth climate protest since 2018 has sparked a renewed interest on the issue of climate-centred collective action. What has been happening in the last four years, with massive numbers of young people showing their concern and engagement with the issue of climate change in different venues, including the streets and squares of several countries around the world, has little precedent in history. Such a significant and widespread movement, of international characteristics, with a specific generational characterisation and a clear focus on the issue of climate change, represents an exceptional and exciting case for scholars interested in collective action. This movement was not born out of nothing; rather, it is rooted in a long trajectory of mobilisation. Research has been focusing for a long time on the emergence of the “climate justice” frame within this trajectory as a way out of post-political understanding of climate action. Furthermore, research has been pointing out internal tensions on the “radical” vs. “reformist” axis. Still, recent cases of climate action such as FFF, XR and the A22 network seem to call for a deeper analysis: while the climate justice framework is ubiquitous, internal tensions within the movement are far from over. This paper aims at

addressing this issue focusing on the strategic choices of movement actors, and in particular on the ideational component of strategy, trying to shed light on the “theories of change”, i.e. the meta-strategic visions/logics on which actors base their strategic choices, in the context of climate action. The paper draws on qualitative interviews of FFF, XR and A22 activists in Italy.

‘Dirty Hands’ of the Global Supply Chain: Southeast Asian Maritime Workers across Globalized Asian Economies

Indonesian, Filipino, Vietnamese and Chinese are the new workers of global supply chain capitalism in Asia. The transformations of Asian economies and labor markets significantly channel Southeast Asian migrant labor into two emerging economic sectors: fishing and shipping. These workers’ migration and labor pathways align with the shifting circuits of the global supply chain. They daily move the world, playing a crucial role in driving global trade, yet facing severe precarity. Sometimes, they are even victims of forced labor, smuggled as crew members. Young, with varying levels of education, these workers face ethno-racial hierarchies aboard vessels, confined to lower-skilled positions—the “dirty hands” of container ships. On fishing and commercial vessels, their labor experiences are marked by *floating* work tasks and schedules, fragile legal status, and delayed wages. In ports or across the ocean, they remain largely invisible. This paper seeks to explore the daily realities of labor and work on fishing and shipping vessels. What are the labor migration pathways for Southeast Asian maritime migrant workers today? How do these migrant seafarers and fishers experience globalized labor regimes? Drawing on ethnographic methods, including 100 interviews with Indonesian, Filipino, Vietnamese, and Chinese workers, participant observation of their daily work on vessels and in ports, this paper examines migrants’ maritime labor and migration pathways, experiences of inequality, and the socio-economic strategies to cope with precarity. It illustrates precarious work experiences and practices, highlighting how these migrants’ marginalization serves as a mechanism for exploitable, flexible labor regimes within neoliberal economies. Through fresh empirical evidence, it contributes to the contemporary scholarly debates about migrant labor precarity in global capitalism, and advances theoretical discussions on invisibility in labor markets, exploring how migrant laborers, despite playing an essential role in the global economy, are systematically excluded from visibility, rights, and protections, thus reinforcing social and economic inequalities.

ZARIAS, ALEXANDRE* (Fundação Joaquim Nabuco, Brazil)

Navigating Uncertainty: Fear As a Barrier to Teaching and Learning in the Socialization of Sociology Master’s Students in Brazil

The aim of this communication is to analyze the different configurations of fear in the teaching and learning socialization processes among Sociology teachers who are also master’s students. For this purpose, qualitative data were produced through an online focus group. The group was composed of twenty-six public basic education teachers who were also students in the National Network Professional Master’s Degree in Sociology (ProfSocio) at the Joaquim Nabuco Foundation (Fundaj) in Recife, Pernambuco. The activity took place during the virtual delivery of the research methodology course in 2021, a period when social distancing measures were adopted to contain the COVID-19 pandemic. In investigating which emotions present themselves as barriers in the teaching and learning processes, fear stood out among the responses. This fear refers mainly to the fear of making mistakes, which is associated with failure, academic failure, perfectionism, and the inability to meet the demands of professors in the school and university context. Because the focus group participants were simultaneously basic education teachers and master’s students, reflection on fear allowed for correlating the experiences and sensations lived in the past with those of the present. In this sense, fear connects different types of socialization that the teacher-master’s students have undergone, revealing past traumas associated with their school experiences in elementary, middle, and higher education, and also expressing anxieties regarding the completion of the professional master’s degree in Sociology. The results of this investigation point to the affective dimensions in teaching and learning processes, which are neglected throughout school and academic life. This fact constitutes a rich field for the anthropology and sociology of emotions in their task of investigating social relations in contemporary times.

Trans Bodies: An Assessment of Bills on Gender-Affirming Surgery (GAS) in Brazil (2006-2023)

This study analyzes the bills concerning Gender-affirming surgery (GAS) for trans and intersex people in Brazil (2006-2023), identifying advancements and setbacks in the guarantee of rights and access to healthcare. Sex reassignment surgery, also known as gender affirmation surgery or gender confirmation surgery, is a medical procedure that involves modifying a person’s body to align their physical characteristics with the gender they identify with. These procedures may include genital surgeries (such as vaginoplasty or phalloplasty), but can also involve non-genital surgeries such as mastectomy or facial feminization, depending on the individual’s desires and their transition plan, following established norms and predetermined medical protocols. The body is not only a biological object but also a cultural and political one. Trans bodies, when undergoing surgery, challenge traditional gender norms and expose how these norms are socially constructed. In deciding on surgical interventions, trans individuals confront the boundaries between biology and culture concerning the idea of a socially legitimized body. The methodology includes content analysis of official documents and a literature review. The results reveal a complex legislative landscape, with proposals seeking both to expand and restrict access to GAS, reflecting the social and political tensions surrounding gender identity. The study highlights the importance of public policies that ensure comprehensive healthcare and the exercise of citizenship for trans and intersex people, emphasizing how different social and political contexts shape legislative proposals in Brazil.

ZARYCKI, TOMASZ* (University of Warsaw, Poland)

“Naive Theories of Society in the Past” As an Object of Sociological Research: The Case of Historiographical Discourses and Family Narratives about Polish Bourgeois Clans

The proposed paper examines multi-generational Polish-Jewish bourgeois families from the mid-19th century to the present, analyzing how their social status and history are interpreted through different lenses. The research employs Bourdieu’s sociological tools, particularly his field theory, to reconstruct the historical sociological context of these families while minimizing presentist bias. This theoretical framework provides a robust foundation for understanding the complex interplay between historical reality and contemporary interpretation.

The study contrasts three distinct perspectives on these families’ social positions: first, a reconstruction using relational historical sociology; second, representations in published biographies (both scholarly and popular); and third, narratives from family descendants, gathered through interviews and published accounts. This triangulation reveals mechanisms of handling family history and creating presentist interpretations of the past, while highlighting the varying ways social status and cultural capital are understood across generations.

I argue that these presentist readings can themselves be analyzed using Bourdieu’s sociological framework, as they emerge from contemporary families and academic institutions whose positions can be sociologically mapped. This analysis leads to the development of a concept of “naive (implicit) theories of society/social structure” as a crucial component of both historiographical discourse and family historical memory.

While biographical studies typically focus on individual families or persons, this research demonstrates that both professional historical studies and informal family narratives contain implicit assumptions about social structures of specific historical periods. The paper will show how these “naive theories of past societies” can be systematically reconstructed and compared with more rigorously developed historical-sociological models. This comparison yields valuable insights into how different social actors conceptualize and narrativize past social structures, contributing to our understanding of historical memory, sociological interpretation, and the transmission of family legacies across generations.

ZARZYCKI, ROLAND* (Collegium Civitas, Poland)

Beyond Hypocrisy: Sacrifice and Outrage As Tools for Building Moral Capital

How do we measure good and evil from a sociological perspective? These concepts are complex and multifaceted, making them intriguing subjects of analysis. Building on the notion of moral capital, we propose a provocative framework in which good and evil are measured by the effort and resources an individual, organisation, or state is willing to expend to gain moral recognition or avoid blame. In this context, we reinterpret sacrifice and moral outrage as standard techniques within the economics of morality. We argue that these phenomena are crucial to the functioning of states and societies, both due to the strategic significance of perceptions of moral responsibility in geopolitical contexts and the potential internal instabilities driven by moral panic.

Our analysis is based on two empirical studies. The first, a large-scale survey on public perceptions of brand responsibility, identifies three dominant attitudes among respondents: (a) committed activists, (b) passive observers, and (c) conformists. Interestingly, each one of them corresponds to typical responses to cognitive and emotional dissonance. The second study, consisting of case analyses, measures practical efforts expended in demonstrating moral goodness and evading blame. This study also confronts the empirical results obtained in the aforementioned research processes with conclusions coming from the interviews with a group of AI-agents, thus offering an innovative comparison between human and machine perceptions of moral effort. Our findings contribute to understanding how sacrifice and outrage function as deliberate strategies for building and protecting moral capital.

ZAVALETA BETANCOURT, JOSE ALFREDO* (Universidad Veracruzana México, Mexico)

Reensamblar Lo Ilegal. Circuitos, Incremento De Generalidad y Lanzadores De Alertas En La Región Golfo-Sureste En México

El presente trabajo describe e interpreta con base en entrevistas semiestructuradas los procesos multilocalizados de ensamble regional de circuitos mercantiles ilegales, el uso de instituciones estatales subnacionales para la extracción de renta y la relocalización de actores ilegales en la región. Para tal efecto, utiliza la teoría del actor red y de los ensambles (Deleuze y Guattari, 1980; Latour, 2008; De Landa, 2021) para observar empíricamente la configuración de la valorización, institucionalización y algunos elementos de las carreras criminales de quienes participan de estos procesos.

La descripción se focaliza en el incremento de generalidad de las actividades ilegales de mercados paralelos en rancherías, poblados y colonias periféricas, basada en el despojo, valorización, el control de circuitos y las alarmas lanzadas por periodistas, académicos y actores sociales acerca de los riesgos y peligros de los ensambles o bisagras (Lomnitz, 2023) ilegales que afectan a la población.

La interpretación sugiere que los circuitos ilegales se ensamblan en ciclos económico-políticos, en los márgenes estatales, mediante un mecanismo protección de reproducción de capitales ilegales que destruyen los obstáculos y resistencias al proceso de valorización. En esta lógica, los circuitos ilegales cuyos componentes de mercantilización de migrantes, mercados de droga, extracción de ductos, corrupción institucional, asesinatos de ediles, agresiones a lanzadores de alertas, dinámicas cuyos componentes globales son evidentes en las entrevistas, se articulan estatalmente y se incorporan a los mercados legales y procesos regionales de construcción del estado mexicano en la región.

Role of Religious Beliefs in Polarization of Abortion Attitudes in Poland

In 2020, Poland's Constitutional Tribunal imposed a near-total abortion ban, a decision strongly influenced by the ruling far-right Law and Justice (PiS) party and backed by fundamentalist religious organizations. This ruling sparked some of the largest protests in Poland's recent history, revealing deep-seated tensions between those who view morality as fixed and others who see it as flexible and context-dependent.

While religious beliefs have long shaped public opinion on abortion in Poland, the Constitutional Tribunal's decision may have intensified this

polarization. Does the "culture wars" hypothesis accurately capture the divide in abortion attitudes between conflicting religious identities? Alternatively, could the radicalization of abortion laws primarily reflect the views of a minority of religious fundamentalists while the majority of the public holds more moderate opinions? Exploring these questions in the Polish context is important, given the simultaneous trends of increasing secularization and the rise of far-right sentiments.

To empirically test the "culture wars" hypothesis in Poland, I will compare abortion attitudes among individuals with various religious identities using data from representative surveys conducted before (N=1,104) and after (N=993) the Constitutional Tribunal's decision. This study will contribute to the discussion on the utility of the "culture wars" framework for understanding divisions over moral issues within the European context.

Development and Validation of the Internet-Related Quality of Life Scale in Older Adults

The aging process, increasing level of migration, long-term effect of world crises such as COVID-19 pandemic or outbreak of the war in Ukraine may significantly affect individual's perception of quality of life. The massive development of modern technologies, which could be seen as a solution for some problems that older populations are facing with (e.g. the weakening social ties, loneliness), is also significant for quality of life. These may result in a need for revision of the quality of life indicators. The new tool for measuring quality of life in older population, that reflects the observed societal changes, including the growing development of new information and communication technologies, is needed.

One of the aims of the project "COURAGE - Poland-Comparison After Decade" was to develop and validate the Internet-related quality of life scale – a tool designed to measure the impact of internet use on quality of life in the population of older adults.

After conceptualization and operationalization, a preliminary version of the scale was created. Content validity based on the expert assessment and evaluation of the questions by the convenience sample from the target population was performed. The scale was piloted and the final version was tested in cross-sectional study conducted in 2024. Face-to face interviews with 2000 people aged 50+, randomly selected from the population of older Poles, were done.

The initial pool of 36 items were developed based on the WHO multidimensional definition of quality of life. After content validity assessment (e.g. the two rounds of experts assessment of relevance, clarity and ambiguity) and pilot study, 15 items were chosen to use them in the field study. The Item Response Theory is going to be used to assess construct validity and reliability of the scale.

The Moderating Role of Online Social Networks in the Association between Loneliness and Well-Being in Polish Older Adults – Preliminary Results

The relationship between feeling of loneliness and poor assessment of wellbeing and quality of life was confirmed in previous studies (e.g. Tobiasz-Adamczyk & Zawisza, 2017 and Nyqvist et al., 2021). Concurrently, results demonstrated that supportive relationships are important for reducing the negative impact of loneliness on youth well-being. As offline social networks are weakening in older age due to losses of close relatives and friends, occupational inactivity as well as deteriorating in functional activity and mobility, the question is to what extent new communication technologies allow older people for the developing of new forms of social ties.

In this context, the aim of the study is to assess the moderating role of online social networks in the association between feeling of loneliness and well-being in Polish older adults.

The analysis is based on the cross-sectional study "Research on ageing in Poland - The role of psychosocial determinants in relation to health conditions in ageing process of Polish population (COURAGE - Poland - Comparison After Decade)". Face-to face interviews were conducted in 2024 year with 2000 randomly selected people aged 50+ from among general Polish population. The structured questionnaire included the following tools: the 3-item UCLA Loneliness Scale, Life Satisfaction Index, positive and negative affect indices based on Day Reconstruction Method. Online social networks were assessed by developed measurement of various types of social media activities.

Digital Paradoxes: Technology, Education and Unintended Transformations

In late 2018, Egypt began implementing an audacious reform project involving the "digital transformation" of its public education system. Located within a state-led project to build a New Digital Egypt and forge a New Digital Citizen and accelerated with the coronavirus pandemic, this educational digitalization promised to transform Egyptian education and solve its entrenched problems. This research presents an inquiry into the realities of digital technologies in education. Deploying a critical sociological lens, it moves away from idealized visions and utopian promises of positive technological transformations. Instead, it examines the empirical realities, unintended consequences, and politics of techno-educational reforms, situating them within their political-economic and socio-historical contexts. Using the case of Egypt and building on three years of digital ethnographic fieldwork, this research shows how digital technologies produce paradoxes in education, contradictions between digital promises and educational realities, on the levels of educational institutions, learning and assessment processes, social inequalities, and resistance practices. With those contradictions, it contends that while technology indeed transforms education, it transforms it in unintended and conflicting ways. By offering an empirically rich, theoretically grounded, methodologically innovative and practically significant intervention from the global South, this research contributes to timely conversations on technology, education and society; speaks to students, scholars, practitioners and policymakers; and has critical implications for digital and educational futures beyond Egypt.

Youth Futures: A Comparative Analysis of Young People across Eight European Countries

This paper explores young people's future orientations within the framework of risk and uncertainty, drawing on data from 169 narrative interviews with youth aged 18 to 29 from eight European Union countries: Portugal, Spain, Germany, Italy, Finland, Poland, Bulgaria, and Greece. The analysis reveals that young people conceptualize their futures in diverse ways, demonstrating varying "capacities to aspire" (Appadurai, 2004). Regardless of regional differences or individual circumstances, the central theme in young adults' reflections on the future is a strong desire to improve their living conditions, which is most commonly associated with securing well-paying jobs with favorable working conditions.

The emphasis on access to stable employment highlights the continued importance attributed to work in shaping the life courses of these young people (Carmo, Cantante, & Alves, 2014). This finding cuts across regional and socio-economic lines, underscoring that employment remains a key factor in how young people plan and envision their futures. Furthermore, young people in vulnerable situations, regardless of whether they live in thriving or declining regions, face similar constraints and uncertainties when navigating precarious labor markets and socio-political challenges (Beck, 1992; Giddens, 1999).

Using data from these 169 interviews, this paper shows how youth in precarious conditions tend to prioritize immediate, practical goals over long-term aspirations, largely due to their limited resources and support networks (Ball, 2003). The role of economic, social, and cultural capital (Bourdieu, 1986) is critical in understanding how these young people mitigate risk and uncertainty. The findings point to the need for policy interventions that address both structural inequalities and the specific challenges faced by vulnerable youth across Europe.

'born of a Fraud' - a Documentary Podcast on Insemination Fraud

The purpose of this paper is to present a podcast series on insemination fraud. Insemination fraud refers to situations where the physician performing the insemination knowingly substitutes the sperm sample chosen by the parents with a different sperm sample (including his own, another donor's or another clinic patient's), without the parents' knowledge or consent. The idea for this podcast emerged in the wake of two research projects that gathered data from over 30 people (parents and donor-conceived people) who had been victims of insemination fraud in Europe and North and South America. The scant research carried out on insemination fraud all point to the lack of social and legal recognition surrounding it. On the one hand, the experience of those affected is invisible, and the repercussions they suffer are downplayed. Indeed, their feelings come up against a social context marked by unequal relations between doctors who enjoy prestige due to their socio-economic position, and their status of patient grappling with fertility issues and therefore perceived as "desperate". On the other hand, although insemination fraud can in theory give rise to civil and criminal proceedings, prescription periods, the destruction of evidence (such as medical registers) and the lack of concordance between the doctor's actions and the provisions of civil and criminal law, make it very difficult to convict them. Social non-recognition is therefore coupled with legal non-recognition. By choosing the podcast format, we want to give a voice to those concerned, and actively involve them in the process of disseminating knowledge. Our aim is to build knowledge not just *about*, but also *with*, the people concerned. The format chosen is that of a (scripted) documentary podcast. Each episode follows the same structure: a narrative interspersed with testimonials from people who have been victims of insemination fraud and interviews with various experts.

'i Am Not the Child My Mother Paid for' - a Qualitative Study on the Experience of Insemination Fraud from the Perspective of Donor-Conceived People

For several years, concerns about third-party reproduction have been evident in many countries. However, despite growing concerns, several loopholes remain in the legislation governing sperm donation. This state of affairs has led to a number of abuses, such as insemination fraud, which occurs when the physician performing an insemination knowingly substitutes a different sperm sample (from another donor, another patient, or the physician himself) for the sperm sample chosen by the parents without their knowledge or consent. Today, over 50 physicians were found to have committed such acts all over the world. Although these cases have received significant media attention, they have largely gone un-addressed by academia.

This paper presentation aims to broaden our understanding of insemination fraud by examining the experiences of donor-conceived adults affected by it.

A qualitative study was conducted, involving semi-structured interviews with 21 participants (12 women and 9 men) who discovered they were conceived with the sperm of a different man than the one intended by their parents. Participants were aged between 23 and 60 and came from different countries: USA (9), Canada (8), The Netherlands (2), England (1), Ecuador (1). A thematic analysis was conducted on all the transcripts.

Two main themes emerged from the preliminary analysis of the data: 1. Misaligned identity; 2. RNished identity. The first theme refers to the fact that insemination fraud implies that a previously thought genetic tie no longer exists and that a previously unsuspected one is (potentially) unveiled, which can lead to a sense of loss, disorientation and a redefinition of one's identity. The second theme underlies the fact that insemination fraud implies that the very conception of donor-conceived people rests on an ethically questionable act, which can lead to feelings of shame, guilt and the questioning of the very legitimacy of one's existence.

ZEIN, DALIA* (Tampere University, Finland)

Orbiting Octobers: From a Lifestyle Movement to Intersectional Veganism in Post-2019 Lebanon

This paper seeks to explore how a global movement is disrupted and re-organized locally through major sociopolitical shifts. As veganism gained momentum as a new lifestyle movement (Gheihman 2021) in Lebanon in 2018-2019 shortly before the October 2019 uprising, vegan advocates found themselves moving from a focus on individual consumption to a more collective and intersectional political action (e.g. the founding of the political party Al-Nahda). These activists have since then been continuously pushed to become political shape shifters adapting to every turn of events, be it the Beirut port blast of August 2020 and the exacerbating economic crisis, the Israeli war on Gaza since October 2023, or the current intensification of the Israeli war on Lebanon in October 2024. Data collected via semi-structured interviews demonstrates that vegan activists in Lebanon constantly grapple with the challenge of legitimizing a cause that is perceived as dispensable amid war and crisis, and the complication of uniting vegan activists under one banner amid tensions brought forth by divergent local political leanings. Turning to recent work on negativity and negative binding in geography (Bissell et al 2021), I argue that it is "events of rupture, exhaustion, interruption, hesitancy, and loss" (Maddrell 2021, 119) which play a key role in shaping Lebanon's intersectional vegan movement rather than a hopeful and optimistic vision of Lebanon's future. This argument dialogues with the discussion of futurelessness in global activism amid the "exhaustion of utopian imaginaries of the future" (Tutton 2023, 447). The paper does not only pursue a chronological tracing of the vegan movement in Lebanon over the last six years, but to especially advance a study of movements via a focus on the individual embodied and affective experiences of local (and global) sociopolitical change.

A Case Study of Chinese Multinational Corporations in Ethiopia in the Era of Belt and Road Initiative: Competing Discourses, Local Practices, and Development Implications

The influx of mature Chinese Multinational Corporations (MNCs) to Africa has increased since 2013, following the launch of the historic Belt and Road Initiative (BRI), the world's largest development program ever undertaken by a single country. However, the contribution of Chinese MNCs to local development in host countries has been contested due to competing discourses, theories, and research findings. The contestation is fuelled by China's BRI-built development infrastructure in Africa, which has boosted China-Africa relations while weakening the US-Africa relation. Marxist critics consider Chinese MNCs in Africa as neo-colonial extensions of "resource extraction," while modernization and neoliberal advocates see them as "agents of transformation." These "transformative-extractive" narratives either glorify or vilify Chinese MNCs while neglecting the role of other crucial local and global actors like companies from other countries and the states of host African countries. The goal of this research is, therefore, to go beyond polarized discourses through analysing the developmental impact of Chinese MNCs in the Ethiopian Hawassa Industrial Park (HIP) in the context of diverse actors competing over meanings, resources, and institutional legitimacy. An ethnographic fieldwork was conducted over ten months, involving interviews, and discussions and field observation. A total of 70 people participated in the study. Field data shows that Chinese MNCs in HIP are driven by corporate welfare from local and extra local settings, not resource extraction. Chinese MNCs build infrastructure, create jobs and generate foreign currency, but their long-term development implications are limited due to enclave nature of HIP and other issues embedded in the Ethiopian industrialization model.

Engaging Older Adults in Participatory Research: A Journey of ACTIVE Involvement

More than a decade ago, European countries declared 2012 the European Year for Active Ageing to highlight the situation of older people who play an active role in society. Lithuania and Italy, like other European countries, have been developing a strategic policy on active ageing. The documents emphasise the need to ensure that positive experiences of a long life are accompanied by opportunities for quality of life and well-being when developing policies to support older people. The ageing of the population and the need for more inclusive and responsive services have contributed to the growing interest in participatory research (collaborative research) with older people. Fudge et al. (2007) define 'co-research' as research doing research 'with' or 'by' older adults rather than 'about' or 'for' them. For Hayley and Tine (2022), collaborative research is a values-based approach to conducting research that supports the importance of diversity and a commitment to valuing older people's perspectives and lived experiences, while critically exploring the structural factors that lead to exclusion, oppression or loneliness in later life. Participatory research seeks to fully engage older people in the research process and has the potential to reverse established power imbalances and contribute to social action aimed at improving quality of life in later life (Buffel, 2018).

The aim of this presentation is to discuss older adults' experience in participatory research as a factor for active participation in community life. Research method: participatory research, interviews with co-research participants.

During the conference, the results of participatory research carried out in the framework of international and interdisciplinary cooperation between Lithuania and Italy will be presented.

ZEMMIN, FLORIAN* (Freie Universität Berlin, Germany)

Towards a Global History of Pre-Institutional Sociological Perspectives on Religion: Arabic Contributions from the Early Twentieth Century

The institutional origins and centers of sociology of religion can be located rather clearly in European countries, foremost France and Germany. On the epistemic level, however, the formation of sociological perspectives on religion is a more global affair, as this paper claims. Not least questions of social order, of morality, civilization, and progress were shared between European and Arabic publics since the second half of the nineteenth century. The role of religion and reason, respectively, figured prominently in intellectuals' responses to these questions. In this setting, the role and function of religion came also to be evaluated according to its social utility and usefulness. Moreover, manifestations of religion were categorically distinguished into absolute, transcendent aspects and historically and socially contingent ones. This amounts to a basic sociological perspective on religion. On this basis, an institutionalized sociology that considers religion purely as a product of society, should be considered as but one variant of sociological perspectives, notably also among European intellectuals. Pointing out pre-institutionalized perspectives is a starting point towards a more global history of the sociology of religion, beyond its known European centers.

Emotions, Solidarity and Social Work in Situation of Poverty

The aim of the presentation is to describe the first results of a qualitative, exploratory and preliminary research aimed to explore if and how the emotional dimension intervenes in poverty and what role it may have in the processes of entering or exiting this reality as well as in strengthening or undermining social cohesion and solidarity. In order to explore this issue we carried out a content analysis on forty interviews with parents in conditions of economic poverty conducted within the framework of the Research Project of National Interest (PRIN) "Constructions of parenthood on uncertain ground. What role for social work". The analysis allowed to highlight the wide range of emotions felt by people in poverty which contribute to gain a complete and more complex image of them in which we can see more positive aspects than negative ones. What emerged, in fact, were not only emotions like shame and desperation that are usually ascribed to poor people, but also many other positive emotions which are not usually considered to affect them. In particular, the analysis focuses on three of these positive emotions - gratitude, solidarity and pride - and highlight how they develop in the relationship between people living in poverty and who are not in this condition, and how they contribute to strengthening social cohesion and solidarity. Moreover our analysis allow to recognize how social workers may contribute to enforce the positive impact of emotions that results in enabling processes as well as to reduce it with the consequence of disabling poor people to cope with hardship. The results confirm that the sociology of emotions is a promising perspective to deepen the conditions of people living in poverty and contribute to counteract stereotypes and prejudice about them, and open new pathways for further research.

ZENKL, THOMAS* (University of Graz, Austria)

Avoiding While Gaming, Optimizing While Taming – the Ambiguous Faces of Algorithmic Resistance

In their eponymous book, Bonini and Treré (2024) identify various ways in which "Algorithms of Resistance" are both stakes (resistance to) and repertoires (resistance through) in violating platforms' ToS ("terms of services") along two axes: different moralities of algorithmic agency and their tactical vs. strategic manifestations.

My contribution builds on their findings complements it with a sociological perspective: by understanding algorithms through the regimes of knowledge and truth they establish, I argue to overcome the necessity of normatively anchoring practices of resistance at the violation of ToS, thus expanding notions of what such resistance could entail. The investigation is based on a qualitative content analysis of recent research literature exploring the various applications of the often-romanticized but rarely explicated idea of algorithmic "resistances" and a systematization of the practices, dimensions, aims, and results expressed therein.

Next to promoting a broader understanding of the various forms of (both collective and individual) resistance, this lens allows to interrogate

algorithmic practices towards the situated power and emergent agencies that express within them while at the same time acknowledges their inherent contradictions and ambiguities: resisting algorithmic control may manifest as efforts to repair what appears to be broken (and vice-versa), "gaming" systems may inform optimization, and the disruption of algorithms may eventually become a necessity for their stabilization.

RC07-JS-220.1

ZENKL, THOMAS* (University of Graz, Austria)

The Dialectical Taming of AI Futures from below

Applications of artificial intelligence are anticipated to impact the delivery of public employment services (PES). Sparked by discourses between utopian notions of automated job allocation and rather dystopian side effects of discrimination and loss of agency (Allhutter et al., 2020; Busemeyer, 2022), this study explores perceptions and anticipated effects of algorithmic technologies from the perspective of frontline-workers as "analog interfaces of the digital welfare state" (Kaun & Liminga, 2023).

Based on 23 interviews with employees of the Austrian PES, I find that concerns associated with the use of algorithms and AI (loss of jobs, biases, formalisation) are being "tamed" within workers' aspirations of futures (Appadurai 2013) by emphasizing the importance of the "human", while simultaneously affirming technological developments. Situated within the entanglement of digital transformations of the welfare state and the resulting shifts in governance regimes (from "street-level" to "system-level" bureaucracies, Lipsky 1981; Bovens & Zouridis, 2002), such aspirations are rooted within problematisations of present working conditions (not enough time for clients and resources) and role reconfigurations (administration of systems instead of supporting clients) which they envision to repair.

By synthesising futures that promote the values of a truly "human" counselling situation through "machinic" means, such taming is dialectical: As prevailing logics of datafication are sought to be overcome by resorting to imaginations prioritizing workers' "humanity" and highlighting the necessity of "customer care" over "data/system care", these sociotechnical futures challenge a perceived status quo while intrinsically relying on the very means of computation that are considered responsible for it.

Between Political Resistance, Care, and Emotions: Life Stories of Women from Urban Peripheries in Chile

Historically, women's role in city-making has been invisible. Although they participate in land occupation or acquisition and in housing construction, their role is overshadowed by men, neglecting the crucial role women play in city-building (Deere & León, 2014; Rolnik, 2011).

This work aims to recover the contribution of women in city-making within "poblaciones emblemáticas" (historical poor neighborhoods) in Chile, particularly where self-construction has been a key mode of housing and neighborhood creation. These neighborhoods were established between 1960 and the early 1970s and were harshly repressed during the military dictatorship in Chile. This study explores how this violence impacted their public participation, shaping them as political subjects.

The research examines life stories of women leaders in Santiago and Valparaíso, daughters of land occupation founders. Their accounts reveal the effects of repressive violence, with many experiencing forced disappearances. Women, often left alone, took on both caregiving and economic support, balancing affection in their homes with fear in the public sphere. Silence became a form of protection. Since the 1990s, these women have promoted citizen participation and social support in their neighborhoods, highlighting an ethic of care. They learned to manage the daily tension between home and the fear of public spaces. Military repression restricted their freedom, but self-care enabled them to continue. Today, their political and community action reflects the emotions of growing up under dictatorship, merging the domestic and public realms, embodying dignity.

 LINK, FELIPE (Pontificia Universidad Católica de Chile, Chile)
Doubling the Crisis: Residential Trajectories, Barriers, and Housing Access Strategies Among Two Migrant Populations in Valparaíso and Viña Del Mar, Chile

This presentation explores the housing challenges faced by migrants within recent mobility patterns. It aims to examine the main difficulties they encounter when seeking adequate housing and the strategies they employ to secure accommodation in a highly uncertain context. Certain residential trajectories of "living in motion" emerge, allowing for a discussion on residential mobility. These trajectories serve as useful tools to understand the residential practices of low-income migrants.

Chile has seen significant growth in Latin American and Caribbean immigration in recent decades (CEPAL and ILO, 2017), accompanied by major changes in migration patterns. While some flows, like those from Andean countries, have remained stable or intensified, others, such as Venezuelan and Haitian migrants, have surged. This research contrasts the residential experiences of these two groups, now the largest migrant communities in Chile. Both groups face racialization, manifested through institutional discrimination (Bonhomme & Alfaro, 2022). This study highlights the difficulties these migrants face in securing housing and the strategies they develop to navigate these challenges.

The analysis explores the dual crises of migration and housing in Chile. Conceptually, it discusses the transformation of migration in the region, focusing on the influx of non-traditional migrants in Chile's history. Haitian migrants, who tend to be more vulnerable, face cultural and linguistic barriers, while Venezuelans, generally better educated, experience a broader range of conditions. These migration patterns coincide with Chile's ongoing housing crisis, marked by a housing deficit of approximately 650,000 units, rising rents, and an increase in informal settlements. These factors create barriers to housing access in the metropolitan area of Valparaíso, shaping the geography of residential mobility.

ZEPEDA, SANDRA* (Universidad de Guadalajara, Mexico)
 DUARTE PIMENTEL, THIAGO (Federal University of Juiz de Fora (UFJF), Brazil)
From North to South: The Political Dimension of International Retirement Migration in Mexico

International Retirement Migration (IRM) is a global North-to-South phenomenon that impacts receiving and sending societies. Mexico is the principal receiving country in Latin America for U.S. retirees and the first for Canadian tourists (OIM, 2022). This paper offers a *Critical Realist Evaluation* of the Mexican foreign policy framed in the North American Free Trade Agreement (NAFTA) signed in 1992 by Canada, Mexico, and the United States and how it has motivated an increase in the number of international residents in Mexico.

This large-scale migration results in the appropriation of local space, profoundly impacting communities. Pawson and Tilley's realist evaluation approach, using the Context, Mechanism, and Outcome (CMO) model, provided a robust alternative to traditional methodologies, offering a richer, more contextualized analysis of public policies/programs. By examining the dynamic interplay between context, mechanisms, and outcomes, the CMO analysis of NAFTA reveals that its effectiveness as a policy depends heavily on the context in which it was implemented and the mechanisms it activated. Critical Realism's stratified framework demonstrates that while NAFTA was intended to promote economic growth and regional integration, its impact has varied considerably across different sectors and populations. Notably, a transnational organizational field in the real estate and housing construction industries has emerged, creating unintended negative consequences, particularly for rural communities and small-scale farmers, due to land speculation on an international scale.

The study concludes that Mexican foreign policy and NAFTA have played a pivotal role in increasing the number of foreign residents in the country, underpinned by an international division of labor. This has reshaped the socio-economic landscape of Mexican localities, transforming them into prime destinations for North American retirees.

"New Fathers" Care?! Evidence from an Interview Study with Fathers, Grandfathers and Great-Grandfathers in Germany and Poland

Currently, the international literature on fatherhood focuses on 'new fatherhood' and highlights the increasing involvement of fathers in raising children and the transition of masculine social patterns towards greater involvement in care as well as greater emotional involvement which is inherently associated with changes towards a caring masculinity (Elliott 2015) as well as in masculine emotionality (Bosoni et al. 2019). This transition takes place in parallel with abandoning patriarchal social patterns and it occurs in the context of a still dominant hegemonic masculinity (Connell 1987). The multifactorial background of changes in the role of fathers is well presented in e.g. Scandinavian studies that demonstrate how welfare policies, feminist culture as well as educational strategies impact fatherhood.

In our project, we explore modern fatherhood as a sphere of culture and practices in the context of intergenerational as well as intercultural continuity and change. We aim to establish which patterns are passed onto the next generations of men, which patterns remain constant, and which patterns change in the transmission process. Therefore, we will examine three generations of men in family lines – great-grandfathers, grandfathers and fathers. The focus lies on their experience of fatherhood, be it as father or as a son of a father. We would like to compare data collected in two countries: Poland and Germany.

First results of the intergenerational comparison support current state of the art that fatherhood is shaped largely by surrounding contexts such as the partnership, the fathers' employment conditions as well as experiences with their own fathers. The main task of the intercultural comparison will then be to identify fatherhood concepts and practices in Germany and Poland at different historical moments. We will ask how they differ and resemble and if/how they depend on the social and political conditions of each generation.

 MERT, BENGİSU (Galatasaray University, Turkey)
Les Droits Des Animaux De L'Empire Ottoman a La Turquie Moderne

En Turquie, traiter les animaux avec compassion est un héritage de l'Empire ottoman. Les ottomans croyaient, selon les préceptes de l'islam, dans le respect due aux animaux. Comme une application culturelle, les ottomans nourrissaient les animaux dans les espaces privés et publics et respectaient leur dignité. Cependant, après la déclaration de la deuxième monarchie constitutionnelle, les animaux ont été bannis de l'espace public. Cette situation s'explique par les efforts d'occidentalisation, les pays européens étant considérés comme un modèle à imiter en la matière. Avant ce bouleversement, l'Empire ottoman avait construit de nombreux nichoirs et ouvert de nombreuses fondations pour les protéger.

De nos jours, même si les droits des animaux n'étaient pas un sujet de débat public, il existait une norme sociale qui imposait de bien traiter les animaux. On trouvait alors dans les rues plein de animaux errant, le soutien d'élevage par le gouvernement et ce, jusqu'à récemment furent le fruit de choix politiques. Toutefois, l'augmentation des importations ces dernières années a fait passer l'élevage au second plan et les chiens errants sont devenu la cible de lois prônant leur éradication. Ces lois ont profondément affecté la société turque, qui a toujours eu une compassion à l'égard des animaux errants depuis longtemps, et de nombreuses manifestations ont vu le jour pour contester ces lois nouvelles.

Dans cette étude, les droits des animaux en Turquie seront examinés à la lumière travers d'une revue littéraire.

Sociological Teaching in Asynchronous Classrooms—How to Encourage Social Interaction and Critical Thinking in Online Classrooms

Since Covid-19, online classes have grown rapidly. Growing numbers of universities have started to offer online BA and MA degrees in sociology. This paper explores teaching pedagogies in asynchronous teaching in sociology. Using qualitative data from students (n=860) in the last 4 years of online asynchronous classes, this author raises 3 critical questions about sociological teaching online: 1. How to generate students' interaction in asynchronous online classrooms? 2. How to create an environment of critical thinking in asynchronous online classes? And 3. How to check teaching effectiveness in online asynchronous classes? Study findings revealed that asynchronous classes, when assisted with proper online learning tools, can generate and encourage students' interactions at their own time and space. Traditionally shy or quiet students have a chance to speak up in the comfort of their home or office. Discussions are freer and more open. The ways to enhance critical thinking in asynchronous online classes include experiential learning, comparative learning projects, and summary and reflective learning projects. Teaching effectiveness can be checked through combining quizzes, essays, learning projects, and learning reflections. Online asynchronous classes meet the demands of students who are working and studying or who have families with young children. Developing effective sociological teaching pedagogy for online classes is critical for the future of sociological teaching.

Belief-in-Field: Reconsider Beliefs of China's Secondary Mathematics Teachers in a Bourdieuan Perspective

This paper critiques the prevalent view in existing belief literature where beliefs are understood as external representations of actors' internal state of mind. I first propose a Bourdieuan framework, which reconceptualizes beliefs as a form of habitus—bodily dispositions shaped by persistent practices within a field. This reconsidered belief framework critiques traditional representationalist model by introducing a dispositional explanation of beliefs and recognizing their plasticity as conditional. The paper then presents an empirical study of Chinese secondary school mathematics teachers, examining the belief-in-field that "knowledge point is capital." It discusses how such beliefs direct classroom practices, forming a resistance to educational reforms, and are shaped by the inertia of field conditions. Despite teachers' propositional acceptance of progressive pedagogical ideologies like connectionism, their actual practice remains transmissionism, influenced by the educational field's symbolic violence and societal pressures. The article concludes by proposing directions for future research and reform. It suggests that meaningful educational change requires dialoguing with teachers' deep-seated, unconscious beliefs and addressing the structural inequalities inherent in the educational field. A re-evaluation of reform strategies is recommended, focusing on actual field conditions influencing teacher beliefs, moving away from an over-reliance on individualistic efforts and the fallacy of flexible beliefs adapting readily to arbitrary reform proposals.

Urban Amenities, Household Economic Conditions, and Emotional and Psychological Outcomes of Hong Kong Residents during the COVID-19 Pandemic

This study aims to provide empirical evidence on whether and how individuals' emotional and psychological outcomes were influenced by urban service accessibility, household economic conditions, and personal characteristics during a public health crisis. This study uses geocoded survey data from three waves of the Hong Kong Panel Study of Social Dynamics collected during the COVID-19 pandemic, and the Point of Interest of urban amenities from a map database, linking individual-level observations to the spatial distribution of urban service. A series of emotional and psychological outcomes were considered, namely, fear of getting infected, feelings of isolation, anxiety, and future life envisions. Results of generalized linear regressions and logistic regressions show that people with economic conditions affected by COVID-19 are more worried about being infected, have worse HSCL, and are more pessimistic about their lives in the five years to come. Besides, living in local areas with better accessibility to urban services is associated with lower concern about getting infected with COVID-19; also associated with less isolated feelings, less HSCL, and better life envision, albeit

not significant. Hong Kong natives are less worried about getting infected but have worse HSCL scores and less positive life envision; the difference in HSCL diminishes in the period of low COVID-19 transmission while the difference in future life envision does not. Marital status is the major factor affecting the feeling of isolation: single people, including never married and separated/divorced/widowed, are more likely to feel isolated. These associations held when control variables were added, as well as individual's previous HSCL or life envision were included. Concern about getting infected, the feeling of isolation, and HSCL during the COVID-19 outbreak period negatively impact future life envision even in a mild transmission period.

The Lost Tradition: How the Younger Generation in China Is Severing Family Ties

With the rapid development of China's socio-economic landscape and the acceleration of modernization, there has been a noticeable alienation and even severance of relationships between the younger generation and their family relatives, a phenomenon known as "severing family ties." The root causes of this phenomenon can be attributed to two main factors. On one hand, the development of modernization has instilled a modern contractual spirit and corresponding rules of interaction in the younger generation. On the other hand, the decline of traditional Chinese family structures and the loss of traditional family culture have led to a weakening of kinship relationships that were traditionally built on clan ethics. Moreover, contemporary China has undergone multiple transformations in terms of residential patterns, family composition, social capital, emotional support, and lifestyle habits. These changes have not only profoundly reshaped the new generation's views on kinship but have also fostered the formation of a new cognitive model centered on the individual, based on personal emotions and interests. This paper analyzes the causes of the "severing family ties" phenomenon from the perspectives of cultural and social structural changes and offers a corresponding theoretical interpretation.

Between Tradition and Modernity: Emotional Changes and Expressions of Chinese Society

This presentation attempts to use emotion as the core concept to explore the historical pedigree of China. Chinese culture has always attached great importance to emotion. Traditional Chinese rule was highly dependent on notions of human kindness and compassion. Since the encounter with the Western world, the Chinese revolution gave birth to a unique emotional mode, and this had a great impact on the Chinese society. Contemporary China bid farewell to the revolution and started its market-oriented reforms. An emotional mode of consumerism has become the dominant one. Based on Raymond Williams's theory of structure of feeling, this article divides the emotional patterns in Chinese history into the traditional structure of feeling, the revolutionary structure of feeling and the consumerist structure of feeling. This does not mean a simplified analysis of history and its complex emotional patterns, but an attempt to explore the complex interaction and social consequences of these models.

TikTok Brings Me Home : a Case Study on How Short Videos Promote the Return of Labor in Northwest China

The return of labor is critical to the local sustainability, especially in poor rural areas. With the popularity of short videos like TikTok, many people have chosen to return to their hometown to become a video blogger, profiting from the production of short videos that showcase local agricultural culture to the outside world. With the "Targeted Poverty Alleviation Strategy" implemented by the Chinese government, the local community has given significant technical and financial support to this endeavor. Based on the grounded theory of sociology, this paper explores the contribution of short video production to the living preservation of agricultural culture and the extent to which this process drives the return of labor through a survey of a village in Qingyang, one of the poorest regions of northwest China. We coded the field data and

used NVivo12 software to validate a model of the mechanism between the popularity of short videos showcasing local agricultural culture and the return of labor. The results show that 1) there is a significant relationship between the regional usage of instant video users and the return of labor, 2) there is a significant relationship between technical support from local government and the return of labor, and 3) the emotional strategies and local knowledge employed in their videos are vital to this mechanism. This research can help local communities build more competitive strategies, while helping bloggers produce more communicative works to present their agricultural heritage (e.g., ensuring a balance of authenticity and interestingness in their works) and to ensure a sustainable relationship between encouraging cultural heritage preservation in agriculture and increasing economic returns.

ZHANG, MEISHAN* (Maynooth University, Ireland)

From Undocumented to Integrated: Chinese Immigrants' Journey through Ireland's Regularisation of Long-Term Undocumented Migrant Scheme – a Policy Report Perspective

This research investigates the experiences of Chinese immigrants who applied for Ireland's Long-Term Undocumented Migrant Scheme, launched in 2022. The scheme offers a pathway to regularise the status of the undocumented migrants who have lived in the country for certain periods of time. Drawing on both quantitative surveys and qualitative interviews, this study delves into the socio-economic, psychological, and cultural impacts of living undocumented, as well as the challenges immigrants face after acquiring legal status. While legal regularisation provides security and access to the formal labour market, it is not synonymous with full integration into Irish society.

The findings reveal that gaining legal status does not automatically resolve issues such as economic marginalisation, social exclusion, and cultural alienation. Many Chinese immigrants continue to face barriers in accessing stable, well-paying jobs and often experience underemployment due to language barriers, unrecognised qualifications, and discrimination. Furthermore, social integration remains elusive for many, with limited opportunities for cultural exchange or participation in local community life, leaving them feeling isolated and disconnected. The study also emphasises the ongoing psychological toll of living undocumented, which persists even after obtaining legal status, manifesting in forms of anxiety, insecurity, and a continued fear of deportation.

The study calls for more robust support structures, including targeted employment services, language programs, mental health resources, and community-building initiatives, to help undocumented immigrants transition from legal recognition to meaningful social, cultural, and economic inclusion.

ZHANG, QIAN FORREST* (Singapore Management University, Singapore)

Sources of Leadership in Village Mobilization for Sustainable Agrifood Initiatives: The Chinese Experience

In rural areas, the transition to sustainable agrifood practices presents significant obstacles for smallholder producers, in terms of both material updates and social restructuring. Strong leadership is crucial for mobilizing and coordinating collective efforts to tackle these numerous challenges. In China's context, however, the mass exodus of young people from the countryside over the past three decades has led to a critical deficit of leadership in rural communities. This paper differentiates three types of villages according to the source of collective leadership: village authority, informal local solidarity groups, and outside activists. It then comparatively evaluates representative cases in their transition to sustainable agrifood alternatives. This study finds that cases led by the village authority tend to prioritize economic goals. Although their pursuits are more likely to be successful, these pursuits have lower degree of alterity, often overlooking social and ecological dimensions of sustainability. When local solidarity groups provide the leadership, they are highly motivated by certain sustainability goals, but their effectiveness in galvanizing collective action varies considerably and their ability to access external resources is severely limited. Finally, when outside activists take up the leadership role, they bring in novel ideas and external resources that can be transformative, but they face challenges in mobilizing local participation, fostering endogenous initiatives, or sustaining long-term commitment.

Neoliberalism and Media Consumption: Reflection of Female Viewers on Gender and Social Inequalities Represented in Chinese TV Shows

Under the influence of social norms and individual perspectives, feminism in China has undergone significant transformations. In the context of globalization, the rise of neoliberal consciousness and postfeminism has profoundly altered how female audiences engage with and interpret television dramas. A key example of this shift is the television series *Ode to Joy*, a drama centered on the professional lives of urban women, which has aired for five seasons and played a critical role in the study of this evolution. The portrayal of female characters in the show and the responses of female viewers to these characters have been particularly impactful. This paper builds upon a theoretical framework combining Adorno's Culture Industry, Baudrillard's Hyper-reality, Foucault's Biopower, Rofel's Subjectivity, and Hall's Encoding-Decoding theories. The study focuses on women aged 18-35, employing thematic analysis and semi-structured interviews to explore their subjectivity and interpretation of television shows like *Ode to Joy*. This research examines how audiences merge the content and form of these shows with mainstream ideologies to promote discussions on gender issues and guide their own behaviors. The paper investigates how Chinese women interpret realist television portrayals in relation to their own experiences of career, family background, gender roles, and female autonomy. The contribution of this study lies in its exploration of the transformation of feminist thought in China within the context of globalization, and how the topic of gender structures is deconstructed, further exacerbating gender and social inequalities. On one hand, this research helps to understand how different feminist ideologies shape female audiences' reflections on media content. On the other hand, the findings of this study provide a solid foundation for researchers interested in the broader fields of media consumption, online gender discourse, and cultural values.

ZHANG, YUJIA* (HKUST(Guangzhou), China)

The Impact of Hukou and Social Capital on Future Aspirations of Migrant Children in China

The developmental trajectory of migrant children in China is crucial due to their increasing numbers and the unique challenges they face. Accounting for over one-third of China's 271 million children, these migrant children navigate complex landscapes shaped by migration status, impacting resource equality, educational equity, healthcare access, psychological adaptation, and social integration. Schools, as primary arenas for socio-emotional development, play a vital role in shaping children's aspirations. However, the local hukou system often restricts access to quality education, influencing aspirations by creating barriers based on rural-urban and local-non-local distinctions.

This paper examines how hukou status and social capital affect migrant children's aspirations, focusing on the emotional and cognitive dimensions often overlooked in existing research. The study explores the mechanisms through which the hukou system influences aspiration inequality, considering rurality and segmented assimilation theory. It highlights how social networks and school environments can either mitigate or exacerbate these effects.

Using data from the China Education Panel Survey (CEPS), the study identifies three migration statuses—local, new local, and non-local migrants—and analyzes their impact on educational, occupational, and residential aspirations. The findings reveal that migrant children generally have lower future aspirations, influenced by limited social capital and institutional barriers. However, changes in peer interactions and school-level hukou diversity can moderate these effects, suggesting that inclusive environments can enhance aspirations.

The research underscores the importance of understanding the interplay between institutional arrangements and social networks in shaping migrant children's futures. The insights gained can inform policy interventions aimed at supporting the aspirational development and overall well-being of migrant children in China. By shifting focus from objective educational outcomes to aspirations, the study offers a comprehensive understanding of migrant children's potential social mobility and future prospects.

ZHANG, YUN* (Sun Yat-sen University, China)

Patterns and Trends of Intergenerational Relationships between Older People and Children in China: 2002-2021

Understanding the patterns of intergenerational relationships between older people and their adult children is crucial for recognizing the caregiving needs within the context of population aging in China. Based on seven waves of data from the Chinese Longitudinal Healthy Longevity Survey (CLHLS) from 2002 to 2021, comprising a total of 87,696 observations, this study employs latent class growth analysis (LCGA) to analyze the types and evolutionary trends of intergenerational relationships between the elderly and their children in China. The study identifies two distinct patterns: "semi-intimate" and "fully intimate." Both patterns reveal close economic and emotional ties between the elderly and their children; however, they differ mainly in co-residence with children, economic independence, and receiving daily care and assistance from children, with the "semi-intimate" type exhibiting a lower degree of these aspects compared to the "fully intimate" type. Overall, approximately 65% of the elderly belong to the "fully intimate" pattern, while about 35% are classified as "semi-intimate." Over time, the proportion of the "fully intimate" elderly is decreasing, whereas the "semi-intimate" type is increasing. Additionally, this study further employs a Hierarchical Age-Period-Cohort (HAPC) model to decompose the variations in these two patterns across age, cohort, and period. The results suggest that close emotional and economic connections are prevalent features of intergenerational relationships in China, with changes prominently reflecting an increase in the elderly's independence. The policy implications of this study indicate that although strengthening family values is a requirement for building new-era families, relying solely on enhancing family concepts to fulfill eldercare functions is insufficient. It highlights the significant market demand for elderly care and assistance that should not be overlooked.

ZHAO, GEORGE RAN* (Renmin University of China, China)

Digital Odyssey: Navigating Cosmopolitanism amid State Intervention in the Consumption of Chinese Console Players

The global console game industry in China operates in a grey zone, with players adopting digital strategies to bypass state-imposed restrictions. Similarly, Jenkins(2004) concept of "pop cosmopolitanism" suggests global popular culture drives consumers away from local culture, fostering an embrace of cosmopolitan identity, but it overlooks the role of state intervention. State intervention is a tangible method of defining market boundaries (Amengual&Bartley,2022), imposing dynamic structural elements on individuals' everyday consumption practices. It accommodates the practical turn in sociology, where practice theory views consumption as an active process involving both personal and institutional factors (Swidler,1986; Reckwitz,2002; Warde,2014).

This study treats both players and the state as actors. By clarifying console game consumption of Chinese players, it explores how state intervention shifts in this grey zone and how players balance cosmopolitan gaming identities with national identity in the face of state intervention.

It conducted in-depth interviews with 24 players and engaged in participant observation of digital intermediary platforms frequently mentioned, with the collection of Chinese policy documents.

It finds that this consumption is built on global information and economic networks, facilitated by players' strategic use of digital platforms. State interventions here primarily include internet firewalls, selective content censorship and public opinion control, with varying degrees of impact influenced by political and economic conditions.

Players create local communities centered around foreign console games, distinguishing their gaming practices from consumption. Although they recognize the challenges posed by state intervention, players do not regard their circumvention efforts as resistance. They perceive console games as an identity-free cultural sanctuary to rationalize their behavior, indicating that their cosmopolitanism coexists with national identity in different layers, challenging the binary opposition between global and local. Furthermore, players even support state intervention, as it aligns with their deeper sense of national identity. Thus, I term this phenomenon "limited cosmopolitanism."

Mediascape Contra-Flow in Popular Culture: Pop Mart Blind Box As a Case Study

Among contemporary youth, blind boxes have gained popularity. These are gambling merchandise, whose toys remain unknown until opened. Although blind boxes originated as Japanese ACGN byproducts, Chinese toymaker Pop Mart created a successful popular mediascapes that has surpassed the original industry in profit and scale. The shift challenges the cultural dominance of developed countries (Straubhaar, 2010).

This study revisits global cultural flow (Appadurai, 1986) and the translation involved in glocalization (Tsing, 2015), applying the cultural transduction framework of market, product, people, and process (Uribe-Jongbloed&Espinosa-Medina, 2014). While the framework effectively examines global transfer and translation, it overlooks frictions and power dynamics in the global cultural economy. To bridge this gap, I incorporate the notion of contra-flow (Thussu, 2006) to provide a more comprehensive analysis.

By articulating the transferring process of the blind box from Japan to China, this study explores how the contra-flow of mediascape is generated and worked, regarding both producer and consumer sides. Thus, this study analyzes the Pop Mart blind box as a case and conducts interviews with 10 consumers and staff.

Pop Mart diversifies its blind box toys and cultivates a cosmopolitan image to mitigate political risks by partnering with globally recognized IPs and developing its own. This strategy creates a shared symbolic value between producers and consumers, connecting them through modern consumer culture. However, as a popular gambling-oriented commodity, the allure of blind boxes lies in their continuous creation of novelty, which simultaneously erodes consumers' established habits.

The contra-flow becomes a bricolage tailored to the demands of commercial logic, often at the expense of national identity. While contra-flow may represent an economic success for developing countries, it also leads to the dissolution of cultural identification. The results challenge the optimistic narrative of cultural ascendancy in emerging nations, viewing it instead as a reproduction of commercial mediascapes.

Differences in Identity Construction and Fan Engagement: A Comparative Study of Theater and Pop Music Fans in China

Concerts and operas are considered as high art, often with higher barriers to entry compared to pop music. This perspective, combined with a lack of promotional efforts from producers, resulted in limited public attention for theater performances. However, the rise of variety shows in recent years has brought high culture into the spotlight for Chinese audiences, leading to a rapid expansion of theater fan communities. This shift has become a significant area of study within Chinese fan culture. It raises an intriguing question: will these emerging theater enthusiasts adopt the engagement strategies of established pop music fans, or will their approaches differ? This paper employs participatory observation and conducts in-depth interviews with 40 fans to explore the unique behaviors and motivations of these two groups, ultimately constructing a model for identity formation among theater lovers and pop music fans. The research findings indicate that, like pop music fans, theater enthusiasts are also driven by self-gratification and idol worship. However, a significant difference lies in the fact that theater lovers actively or passively embody the roles of cultural ambassadors and supporters in their identity construction. Their modes of participation are often closely tied to the cultural narratives they support, reflecting a sense of responsibility and a desire to contribute to preserving and disseminating the art form. This research underscores the importance of understanding the spontaneous nature of fan activities within the context of cultural identity formation, offering new insights into how different fan cultures shape and reflect their identities.

ZHOU, DI* (New York University, USA)

Dynamic Mapping of Class and Occupation: A New Measurement of Class Using Occupational Text Data

Social class is usually measured using aggregate occupational groups. However, this measure of class may encounter the problem of using a fixed occupation-to-class mapping that neglects the important changes occurring *within* each occupation due to technological change and organizational reform that may change an occupation's class location over time. This study overcomes this problem by developing a new method to measure an occupation's class location dynamically using text data and supervised machine learning models based on the neo-Marxist theory of class. Using ONET's occupational tasks information, I evaluated the class location of detailed occupations since the 2000s, and linked the class information to the ACS and OEWS surveys to map out the class structure of the US labor force. Results suggest important between- and within-class structure changes occurred in the past two decades. First, the study finds that the American class structure has been quite stable in the past two decades when viewed in four aggregate classes (capitalists, owner-operators, managers, and non-managerial workers). However, important shifts occurred within these aggregate class categories. From 2003 to 2020, the share of proletarian workers dropped from 49% to 37%. Decomposition analysis suggests that about 30% of the shrinkage is due to changes in occupation size, while 70% of the shrinkage is caused by within-occupation class shifts where proletarian occupations experienced a "shift up" to become semi-autonomous or supervisory occupations. In other words, many of the proletarian jobs have either experienced an "up-skill" or an expansion of tasks that now require workers to take on some supervisory work.

ZHOU, RACHEL* (McMaster University, Canada)

Positioning China in a Rapidly Changing World: A Generational Lens

The transformation of China in the context of contemporary globalization has been predominantly understood through political-economic and geopolitical lenses. Comprising multiple, concurrent processes of urbanization, industrialization, and modernization, China's globalization also means dramatic changes in people's lives. Drawing on data from in-depth interviews with key informants in an empirical study on globalization and nostalgia, this paper presents how the globalization generations in China understand the changing relationship between China and the world (especially the West) since the 1980s. Informed by Beck & Beck-Gernsheim (2009) concept of global generations, I closely attend to the three emerging themes that reveal the intersection of globalization and generation. First, individuals who have experienced the pivotal moments of China's engagement with globalization – such as its open-door policy, participation in the WTO, and the COVID-19 lockdown – often describe them in the context of generations. Second, China's transformation has been accompanied by some distinctive generational characteristics, such as unprecedented mobility, post-materialistic pursuits, individualism and, even, growing disenchantment with the West, though these effects appear uneven across cohorts. Third, China's globalization processes have not precluded young generations experiencing many predicaments, including pressure to marry and procreate (especially for women), shrinking opportunities, and an increased perception of prejudice toward the country by the Western world (especially the US). It is concluded that generation is a unique and fruitful lens through which to examine not only the trajectory of globalization at a micro level but, also, people's divergent experiences (including those across generations). These findings also make visible the nuanced social costs of China's rapid development in its society and the convergent difficulties (e.g., economic stagnation, unemployment, and political division) shared by young generations elsewhere.

ZHOU, RACHEL* (McMaster University, Canada)

Time, Space, and Self: Three Cases of Global Youth in China

The emerging field of global youth studies offers insight into young people born after 1990, a time during which the world has been transformed by globalization, including the rapid advance of information and communication technologies (ICTs). In China, however, globalization also means multiple, simultaneous processes of urbanization, industrialization, and modernization. Its younger generations have experienced not only what Harvey called "time-space compression" but, more saliently, the tensions among multiple, co-existing, time-space dynamics. Focusing on three cases drawn from an empirical study, this paper presents Chinese young people's stories about time, space, and self-expression in this globalized world. The first is about a group of rural-to-urban migrant workers who used flamboyant hairstyles to

express their wishes to be seen when the assembly lines of China's "world factory" have transformed them into standardized, productivity-oriented, machinery appendages with no history and no future. The second case focuses on a Western-educated feminist artist who uses home as a site to illustrate generational clashes about ideas of love, gender norms, and women's work. The third case looks at a controversial street art project by a group of Chinese international students in Brick Lane in East London, where they bluntly painted a Chinese slogan in a propaganda style. Despite the different experiences and positions of the individuals in the three cases, a common theme is their strong desire to express themselves (in the contexts of, respectively, capitalist production, patriarchy, and Eurocentrism) and the challenges and even impasses, deriving from temporal-spatial discrepancies, in their attempts to communicate with a wide audience. It is concluded that while "global youth" is a concept useful for identifying connections among youth across geographies, more nuanced attention should be paid to their specific life worlds that may have become increasingly divergent rather than convergent.

ZHU, DI* (Chinese Academy of Social Sciences, China)

Proposal of the System of Governance, Innovation, Cultural Construction and Lifestyle: Towards a Green and Low-Carbon Society

Existing widely used governance strategies often emphasize agency of individual consumers, with stakeholders such as the government, businesses, the media, and social organizations. All strategies aim to guide consumers, with the ultimate goal of changing consumption behavior by altering consumers' attitudes, perceptions, and consumption habits. This kind of governance strategy, however, overlooks that consumer decisions are social and collective products and are constrained by structural factors. This paper proposes a governance system emphasizing systematic and structural dynamics, mobilizing practices by multiple stakeholders including the government, businesses, research institutions, the media, social organizations, and consumers. By activating the structural dynamic system composed of social governance, social innovation, social culture construction, and social lifestyle, the GICL governance system aims to promote high-quality development of the entire system through the advancement of green and low-carbon consumption. The system configuration emphasizes active participation of multiple stakeholders as well as collaboration of multiple practices. Thus, the GICL system is different from existing governance systems which are either consumer-centered ones that aim to change consumer behavior to achieve green consumption of the society, or government-led ones where the government is in dominant position and all other stakeholders can only be mobilized or instructed by government policies. This system, therefore, has strong empirical and applicable features, capable of engaging in dialogue with the existing low-carbon consumption governance concepts and systems, and helps to promote continuous improvement of China's low-carbon consumption governance system.

ZHU, DI* (Chinese Academy of Social Sciences, China)

Stability and Flexibility: Understanding the New Employment Youth in the Digital Era

With development of the digital economy and the related new business forms, a group of people engaged in new occupations and flexible employment have grown rapidly, among which the youth and migrant workers are the key groups. From the theoretical perspectives of the sociology of labor, social stratification and the intergenerational sociology, this paper uses the data of the National Survey of the New Employment Youth and the Chinese Social Survey to investigate the development characteristics, existing difficulties and demands of this emerging group, and tries to propose policy ideas on how to expand the middle income group. The first is the middle-income characteristics. Income of 'the take away riders' is significantly higher than that of ordinary migrant workers: according to different indicators, about 60% - 80% belong to the middle-income group. The second is the unstable characteristics. The 'high income' is actually based on 'high intensity' and 'low security' labor, so their career is closely associated with anxiety and short-term. The third is the preference for flexibility. It is shown by data that pursuit of flexibility, and paying attention to the balance between work and life, and work and family is also a typical feature of contemporary Chinese youth. Understanding the values and behaviors of the newly employment youth and even the whole youth group is the key to understanding emerging employment groups and stabilizing employment and ensuring their well-being. Based on the empirical analysis, this paper calls for attention to 'both employment stability and employment flexibility', and we should adapt to flexibility and mobility while stabilizing employment and income. This paper suggests innovating and improving labor relations in the new employment and enhancing the social security system, promoting vocational training so as to effectively promote the development of the new employment groups in the digital era.

Comparing Modularity Scores across Different Social Networks: Cautions, Illustrations, and Suggestions

In the thriving field of computational social sciences, scholars often employ techniques and methods developed by natural or computer scientists to model social phenomena. One salient example is the recently emerging practice of social scientists comparing modularity scores across different social networks to evaluate the variation of network-module-related substantive concepts such as the levels of consensus, polarization, or community boundary rigidity. Although the rationale for this practice is comprehensible, we caution that it may suffer from various conceptual and empirical issues. Conceptually, modularity scores may misalign with the substantive concepts in which social scientists are interested. Empirically, the commonly used modularity metrics are highly sensitive to various network characteristics that are irrelevant to those substantive concepts. We illustrate these conceptual and analytical problems with toy examples and systematic simulations. We demonstrate the practical significance of these lessons by re-examining an empirical study that uses modularity scores to evaluate the evolution of the rigidity of occupational mobility in the US labor market. We conclude with a summary of these lessons and offer practical suggestions for future applications.

GUO, KAIDONG (UCL, United Kingdom)

Navigating Ethical Challenges: A Cultural Reflexivity Approach to Research with Children in China

Internationally, dominant paradigms and principles governing children's rights and ethical research practices with children have come under scrutiny due to their inherent Western-centric nature. These paradigms and principles are often informed by and aligned with white, middle-class childhood experiences. Increasing scholarship in the field has pointed out the ethical challenges and dilemmas in non-Western societies when conducting research with children under the guidance of Western ethical frameworks, criticising the fact that such frameworks fail to account for locally- and culturally-sensitive contexts or the diversity and complexity of childhoods. In China, an emerging awareness of the importance of research with children (rather than on children) has brought these ethical challenges and dilemmas to light; however, there are no national-level ethical guidelines for research with children in that country. Empirical research that includes children in Chinese literature often lacks comprehensive elucidation of or reflection on ethical considerations. Furthermore, literature concerning research ethics with children in China remains at a theoretical level, predominantly drawing from frameworks originating in the Global North.

To decolonise ethical frameworks for the Chinese context, in 2022-2023, as an international team comprised of researchers from UK universities and Chinese universities, we conducted six international webinars and six focus groups with 30 participants, including researchers, practitioners, and professionals who have diverse experiences working with children in China. We also conducted a scoping review of 20 carefully selected Chinese and English articles about research ethics in research with children in China. In this presentation, we would like to reflect on what we have learned about the ethical challenges in research with children in China from our previous work and to indicate a series of reflexive questions with underpinning principles so that researchers and practitioners can use them to critically consider their own research in Chinese context.

ZIALI ITAHRIQUAN, KARIMA* (University of Granada, Spain)

Entre El Poder y La Resistencia: Sexo y Virginidad En Las Jóvenes Musulmanas De Europa.

Esta propuesta se enmarca en el desarrollo de mi tesis doctoral llevada a cabo dentro del programa de Estudios Migratorios de la Universidad de Granada. La investigación explora las prácticas y los discursos acerca de la sexualidad de las mujeres musulmanas (18-30 años) de Europa en relación a los vínculos maternofiliales y el papel del islam en el desarrollo de estas experiencias.

Tanto la sexualidad como la filiación, y de forma específica las relaciones maternofiliales, son aspectos fundamentales en los procesos de identificación individuales y colectivos, especialmente a lo largo de la juventud y en un contexto transnacional de múltiples identificaciones que contribuyen a construir una o varias formas de (auto)representación.

En el transcurso de esta investigación y con vistas a entender las diversas formas en las que se implican la sexualidad, la relación maternofilia y la identificación religiosa sobre este grupo focal, ha sido imprescindible un trabajo etnográfico y una metodología de análisis cualitativa y de corte abductiva, para elaborar y relacionar las categorías analíticas pertinentes. Los trabajos desarrollados desde la antropología de género, la crítica feminista, así como la literatura antropológica acerca del islam como tradición discursiva y sobre el islam en Europa han sido esenciales para el desarrollo analítico y teórico de esta investigación.

En suma, el objetivo de esta comunicación es presentar los resultados de seis entrevistas en profundidad. A partir del análisis empírico se aborda la virginidad como categoría analítica que articula las nociones de "poder" y "resistencia". Ambas toman forma en los procesos de transmisión moduladas en las relaciones maternofiliales y contribuyen a construir una cierta percepción del sexo. El papel de la religión, como tradición discursiva, es asumido de forma particular, ya sea como relato que legitima la castidad femenina o de carácter redentor, que permite contrarrestar la sobrevaloración de la virginidad femenina.

Navigating the Digital Battlefield in Morocco: The Dual Role of Social Media in Empowering Female Politicians.

Nowadays, social media serves as a potent instrument for women's empowerment and political engagement. It is an extremely powerful force that has the ability to shape individuals' perspectives and ideologies regarding a variety of issues. However, it may be used either constructively or adversely; that is, it may provide support and solidarity or impose guilt and victimization on Moroccan female politicians. This paper investigates the role of social media platforms as contentious and paradoxical arenas for feminism and political discourse. It tends to explore how social media serves as a powerful tool for raising awareness, mobilizing support, and fostering community among Moroccan political females while also highlighting the challenges of misrepresentation, backlash, and fragmentation of feminist political discourse. The study reveals the complexities inherent in digital activism through case studies, interviews, and critical examination of online activism and social media platforms. Furthermore, it underscores the dual-edged nature of social media as a space for feminist political engagement, where empowerment and conflict coexist, shaping the future of feminist activism in the digital age. Ultimately, this research emphasizes the complex interplay between online spaces and real-world implications, illuminating the transformative potential of women's activism and its political dimensions while acknowledging the inherent tensions within digital activism.

Conciliation Entrepreneuriat-Famille Chez Les Femmes Rurales De La Province d'El Hajeb: Contraintes Et Stratégies

La présente contribution vise à répondre à la question suivante : Quelles sont les difficultés auxquelles les entrepreneures dans les zones rurales font face pour concilier entrepreneuriat -famille, et quelles stratégies adoptent-elles pour les surmonter ?

Bien que pendant de nombreuses années, le travail des femmes rurales se soit limité aux travaux agricoles et domestiques, ces dernières années, elles sont devenues de plus en plus actives dans la sphère entrepreneuriale, en particulier au moyen des coopératives. De ce fait, la conciliation entrepreneuriat-famille est devenue une priorité pour la réussite et la pérennité des projets des femmes en matière d'entrepreneuriat.

En effet, les études qui traitent la question de la conciliation travail - famille sont très abondantes : la majorité mettent en évidence la complexité de la conciliation des responsabilités professionnelles et familiales, notamment les difficultés de conciliation liées aux inégalités persistantes entre les hommes et les femmes (Landour, 2019). Certaines études traitent aussi cette question du point de vue du couple conjugal et parental (Morin, Fortier, Deschenaux 2021).

Cependant, les pouvoirs publics jouent un rôle crucial relativement à cette question, en mettant en place diverses politiques et dispositifs de conciliation pour soutenir les femmes travailleuses (Farah, Jibraili, 2021) Des études portant sur la conciliation entrepreneuriat-famille, mettent en évidence le conflit vécu par les femmes. Néanmoins, l'entrepreneuriat peut être une opportunité de conciliation travail-famille notamment pour les mompreneures (Hider, Haderbach, 2023).

Bien que les travaux antérieurs aient essayé de mettre l'accent sur plusieurs problématiques en lien avec la conciliation travail-famille, nous constatons une absence des études sur les contraintes et les stratégies des femmes entrepreneures rurales pour concilier l'entrepreneuriat-famille. Pour cela, nous avons tenté d'approfondir la recherche sur cette question en ayant recours à des entretiens-semis directifs avec des entrepreneures rurales de la province d'El Hajeb.

From Calculative Idealism to Calculative Pragmatism – the Role of Quantified Knowledge in Constructing the EU Anti-Poverty Policy.

This paper aims to show how quantified knowledge, exemplified by metrics such as indicators and indices, contributes to the construction of EU anti-poverty policy. I argue that due to the limited legal instruments at the EU's disposal, metrics have become a key governance tool in this area, serving both to influence Member States (MS) policies and to reach compromises between EU actors representing different knowledge production regimes and interests. Drawing on in-depth interviews with EC and MS representatives, social and non-governmental partners and experts, I will illustrate how metrics are used to negotiate boundaries in this policy area, and to strengthen its supranational dimension. This is well reflected in the process of agreeing on key metrics, in which a compromise is forged between the EC, MS and other actors on what will be measured and what will be left out of the picture. Such 'commonly agreed' indicators and indices are then institutionalised as key elements of EU anti-poverty policy, legitimising this policy area as a sphere of common European concern, despite the fact that most legal prerogatives remain in the hands of MS. At the same time, those involved in negotiating metrics are aware of their shortcomings and political nature, which indicates a shift from calculative idealism - often presented in the literature as a source of legitimacy that numbers provide to politics - to calculative pragmatism, i.e. from a belief that numbers are purely technical and apolitical, to a recognition that they are imperfect and the result of trade-offs.

Knowledge Creation and Dissemination Beyond the University: Does Scientific Ethos Survive Digital Participation?

The internet and digital technologies has facilitated the participation of non-professionals on a larger scale in some activities that were previously only carried out by professionals. The initial domain of digitally enabled participation is predominantly within the realms of information and knowledge creation and dissemination, including scientific knowledge. Nevertheless, the impact of digitalization on the understanding of authority, professionalism, and authorship is not obvious and entirely clear.

The objective of the presentation is to examine some forms in which non-professionals engage in the creation and dissemination of scientific knowledge. The analysis is aimed to ascertain whether the activities, norms, and values that guide them deviate from the scientific ethos (as defined in the classical work of Robert Merton, 1973) or correspond to it.

There are various forms of digitally enabled participation within the creation and dissemination of scientific knowledge. These range from projects of citizen science that are more or less institutionally and professionally organized and guided, to internet encyclopedias and blogs devoted to scientific topics. Such cases differ not only in terms of their organizational structure, but also in regard to the normative implications that a specific organizational structure may entail. The presentation draws upon an analysis of different forms of such participation, as well as upon semi-structured interviews with individuals engaged in bottom-up organized activities. The analysis is centered upon their understanding of the credibility of sources, authority, authorship, anonymity and different dimensions of it.

ZILINSKAITE, RIMA* (Vilnius University, Lithuania)

Participative Internet and Science: Are Amateurs 'Disrupting Every Activity They Touch'?

The outset of the so-called *social internet* – internet technologies that enabled greater user participation – a couple of decades ago brought about some excitement as well as concerns that amateurs will disrupt 'every activity they touch' (Tapscott and Williams, 2006; Keen, 2007). The initial domain of concern was (and still is) within the areas of the creation and dissemination of information and knowledge, including science.

The involvement of non-professionals in domains previously dominated by professionals can be conceptualized as the participation of users/consumers in the creation of the content/product they themselves consume/use. It can be understood as a user's productive practice, or prosumption (the convergence of production and consumption). The concept of prosumption was employed by some researchers to describe the activities of users in the online space (Ritzer and Jurgenson, 2010).

The aim of the presentation is to examine some forms of internet-enabled participation of *prosumers* in the process of the creation and dissemination of scientific knowledge, with the particular focus on whether their involvement deviates from the values and accepted routines in the institutional science. In other words, do amateurs involved in activities related to science and the dissemination of knowledge disrupt or transform the practice in some particular manner, as pronounced by the early commentators of the *social internet*? Or, on the contrary, do they adhere to the institutional norms? The presentation discusses the findings of the analysis of cases of scientific and knowledge dissemination activities outside the institutional science (semi-structured interviews). It focuses on motivations, routines, values, and understanding of authority and authorship of internet users that participate in such activities.

Being a Researcher-Activist? Contemplations on Ethnographic Methodologies

Researchers who use ethnographic methodologies are often confronted with many questions, especially for those who also understand themselves as activists in the field they are researching. Does my own positionality within my research mean I am 'influencing' my 'outcomes'? How does my activism within the general field of research affect my research? What steps can be taken to guarantee the security of my interlocutors but also myself? Are there ways I can detach myself from the field and acquire a viewpoint from the "outside"? These were the questions I asked myself throughout my field research with members of the organization of Egyptian Revolutionary Socialists. Contemplating my own situatedness as someone who is not detached from her field (I am not neutral on questions of exile, military dictatorships or imprisonment), these are the questions I had to grapple with throughout my 18 months of field research.

In the past, researchers of color have often been accused of not being "objective" if they conduct research on fields that are "close to home." Based on my own experiences as a researcher who is not politically detached from her fieldwork, I argue that notions of "objectivity" in the field are not only not attainable but a farce. Rather, I argue that researchers should attempt to methodologically scrutinize their own situatedness while taking their interlocutors seriously, beyond a researcher / activist divide. This enables poignant research that does not attempt to brush over difficult questions but rather critically engages with questions of being (politically) involved in one's field.

ZOHDI, HELENA* (Department of Social and Cultural Anthropology, Goethe University Frankfurt, Germany)

Beyond the Public Sphere? Egyptian Revolutionary Socialist Interventions in the Palestine Solidarity Movement

As the horrors of the ongoing genocide in Gaza have almost reached 12 months, globally a new generation of activists has simultaneously been politicised on the over 76-year history of settler colonialism and ethnic cleansing in Palestine. Specifically in Germany, which is the second largest weapons supplier to Israel, those who are part of the pro-Palestine movement are threatened with losing their job, police violence and house raids. For those who are migrants, the revoking of residency statuses and deportations are also a looming threat. Even within the broader German Left, solidarity with Palestine is a contested issue. Yet despite criminalisation and repressions, activists in the pro-Palestine movement continue to organise. Within this framework, exiled members of the organisation of Egyptian Revolutionary Socialists have made modest attempts to intervene in the discourse on Palestine.

The Egyptian Revolutionary Socialists (al-īṣṭirākīyyūn at-ṭawriyyūn) grew in popularity during the 2011 Egyptian Revolution and have been forced into the political underground and exile since 2013. Through field research with Egyptian Revolutionary Socialists in Germany, I analyse how members of the organisation in exile intervene in the discourse on Palestine, questioning both the hegemonic state narrative as well as that of the broader German "Left".

Through this case study, I showcase how through events, talks and demonstrations, Egyptian Revolutionary Socialists intervene in the debate on Palestine in Germany regarding questions of solidarity with national liberation movements, united fronts with Islamists, transnational internationalism and peoples' power from below. As these points have been subject to much contention, I delve into how oppressive mechanisms try to quench dissent and stifle public debate, from the state level to inner-Leftist circles. Expanding on work on travelling theory, I highlight how Egyptian Revolutionary Socialists navigate the restrictions on solidarity with Palestine in Germany to manifest their Palestine solidarity from below.

Aligning or Misaligning? the Interplay of Subjective and Objective Social Status in Ten High Income Countries over Two Decades

Subjective social status has attracted a renewed interest in recent sociological research, tapping a dimension of social stratification that was overlooked for decades. However, its relationship with objective social status remains understudied. We offer a novel way to examine this relationship by interpreting one's subjective position as an individual adjustment mechanism to material inequalities. We address a fundamental research question: Upon what factors—individual characteristics, country, and period—do subjective social status and its (mis)alignment with objective status depend?

We mobilize 143,000 observations in the ISSP in ten countries (Denmark, France, Germany, Japan, Norway, Spain, Sweden, Switzerland, Taiwan, and the US) over twenty years (2002-2021) to analyze the interplay between a 10-step subjective social status scale and ISEI scores. We find that, overall, subjective status is slightly inflated and more narrowly distributed around its mean than the objective measure. At the individual level, the alignment of the two measures occurs among respondents in the socioeconomic middle, as well as among the middle-aged and people living in urban areas. Symbolically weaker groups (women and divorcees) also more accurately align their self-perception to their objective position because they tend not to inflate their subjective status.

At the macro level, alignment increases cyclically when unemployment grows and GDP growth declines, with people less likely to inflate their subjective position around 2008 and 2020. While these cycles are similar across countries, between-country differences in alignment persist over time, with respondents in East Asia and France consistently holding more accurate status perceptions than Americans, who tend to overestimate theirs. These between-country disparities cannot be explained by differences in levels of absolute social mobility, suggesting the presence of unobserved cultural mechanisms legitimizing the status quo beyond the social stratification system. Overall, we contend that subjective status inflation particularly reinforces the acceptance of higher levels of inequality.

Gender-Neutral Performance Management: Unfair Competition Intensifying Organizational Conflict?

The purpose of this contribution is to share the very first results of a nationwide research carried out through my PhD course that highlights how the merit system adopted by Italian Public Administrations in the past twenty years has contributed to foster gender inequalities.

In this system, based on what is called "performances cycle", which sets goals, tasks and rewards of both offices and individuals, evaluations are generally conducted by managers with a gender-neutral approach, aiming to make such evaluations as effective and objective as possible. This means that managers do not consider specific gender-based factors, like unpaid care workload of children, disabled and elder relatives due to gender stereotypes, nor sex-based factors, such as pregnancy and birth.

The research is currently examining, through a longitudinal study, the performance evaluations of employees of 12 Italian municipalities. The first results are confirming the existence of gender inequalities patterns, such as fatherhood bonus (Correll et al., 2007) and leaky pipelines (Gaiaschi, 2022) despite Italy has a whole legislation about gender equality.

Therefore, in this contribution I will link the results of the above-mentioned research with the literature on competition, showing how the unequal baseline of the "game" is perpetuated throughout the careers of men and women and how the gender legitimated neutrality used in Italian Public Administrations performance management is fostering organizational and social conflict.

Exploring the Challenges of Family Migration in Contemporary EU Mobilities through a Collaborative Documentary: Benefits and Potential Risks

This paper discusses a collaborative project undertaken with an Italian NGO for a video-documentary on migrants who moved to the UK as part of a family/couple project entitled *Better Together? Migrating as a family in Covid and Brexit times*. The transformative aim of the collaborative project was to bridge the gap between research and practice, highlighting the challenges of family migration while simultaneously documenting their ordinariness and resilience. The audience for the project were policy makers, the general public and would-be migrants. The documentary highlights the challenges and opportunities of family migration (broadly understood) and the strategizing that that involves. It also shows how forced immobility (imposed by Covid and the hardening of borders) affected transnational relationships and impacted participants differently, mainly according to their generation/life course stage. The project was collaborative throughout, from the development of the focus and interview guide based on both the academic's previous research projects and the knowledge of the NGO, to the dissemination of the documentary which took place in both academic and non-academic settings. The documentary combines migrants' stories with insights from the practitioners who advise migrants in a rapidly evolving policy context. The paper will describe how the project was developed and implemented reflecting on the creative potential of such collaborations. It will also highlight the main challenge we encountered, namely the constraints posed by institutional rules around ethics and the different time frames operating in the academic and NGO worlds.

Digital Marginalization in the Context of Sociotechnical Convergence of Humans and AI

We are witnessing a sociotechnical convergence, when modern digital technologies, primarily artificial intelligence systems, are combined with human capabilities in one metasystem to solve certain classes of problems more effectively. An important aspect is the correct use and understanding of the consequences of the implementation of artificial intelligence systems, a critical attitude to their role in dyads with humans and taking measures to minimize negative consequences, including digital marginalization. Among the studies devoted to the processes caused by digitalization and digital transformation, the closest to the problem of marginality are works on social inequality. It should be noted that despite the similarities, the concept of social inequality still differs from the concept of marginalization. Social inequality involves the analysis of social positions arising from inequality of access, skills and opportunities, while marginalization focuses on the state of transition to life on the edges of society, accompanied by alienation, loneliness and hopelessness. In the case of a hybrid society, the marginal is in an intermediate position between the virtual and real worlds. Our study aimed to identify risk groups that may become marginalized in a digital society, being excluded from the emerging new way of life. In this study, we proceeded from the assumption that the intensity of marginalization is associated with the different role of digital resources in the lives of different generations. In the fall of 2024, a study was conducted on issues of digital marginalization in the context of digitalization processes, including the integration of artificial intelligence systems into everyday life. It was found that the perception of these systems as a factor of marginalization depends on generational affiliation. In particular, it was found that the boomer generation is more concerned about the invasion of AI: 71% versus 36% of other generations.

Étude Socio-Éducative Du Rôle Des Centres D'écoute Et D'accueil Dans La Prévention De La Violence Scolaire Le Cas Des Lycées De Kenitra

La violence scolaire est un phénomène complexe qui affecte profondément les systèmes éducatifs et les individus. Les centres d'écoute et d'accueil sont présentés comme des outils potentiels pour prévenir et réduire ce phénomène. Cette étude socio-éducative vise à analyser le rôle de ces centres dans la prévention de la violence scolaire, en prenant comme cas d'étude les lycées de la ville de Kenitra.

L'étude a démontré que pour Réussir un projet d'intervention socio-éducative face à la violence entre élèves nécessite une approche globale, multidimensionnelle et collaborative. Il est essentiel de comprendre les causes profondes de la violence, d'impliquer tous les acteurs, de mettre en place des actions concrètes et de les évaluer régulièrement, ce qui nous a aidé à analyser le rôle des *centres d'écoute et d'accueil* dans la prévention de la violence scolaire au sein des lycées de Kenitra. En s'appuyant sur les théories de l'*interactionnisme symbolique*, du *contrôle social* et de l'*apprentissage social*, cette recherche explore les mécanismes psychologiques et sociaux à l'origine de ces comportements agressifs. À travers des *entretiens* avec les élèves, les enseignants et les personnels d'encadrement, ainsi que par une *analyse de contenu* des documents scolaires, nous chercherons à comprendre comment ces espaces d'écoute peuvent contribuer à améliorer le *climat scolaire* et à réduire les risques de *harcèlement scolaire*.

L'étude a démontré que Les centres d'écoute et d'accueil constituent un outil précieux pour lutter contre la violence scolaire, et vise à mettre en lumière leur rôle et à identifier les leviers d'amélioration pour renforcer leur efficacité.

ZOUITNI, KHADIJA* (Mohammed V University, Morocco)

La Psychiatrie : Science Médicale Ou Science Du Danger Social ?

Contrairement aux maladies aiguës, qui sont souvent de courte durée et se résolvent généralement rapidement, les maladies chroniques sont de longue durée, évolutives, et ont un impact significatif sur la vie quotidienne des personnes affectées. Ceci est d'autant plus vrai quand il s'agit d'une affection aussi déroutante que la maladie mentale. En effet, les affections mentales constituent toujours un mystère, une énigme. Elles touchent l'intentionnalité, dimension qui distingue le vivant humain du vivant animal. C'est cette complexité et ce caractère non organique caractérisant la majeure partie des troubles mentaux, qui confèrent à la pathologie mentale un statut médical ambigu, et à la spécialité qui la prend en charge une place particulière parmi les autres disciplines médicales.

En effet, depuis sa naissance, la psychiatrie a toujours été une pratique professionnelle assaillie de doute et d'incertitude ce qui fait d'elle aujourd'hui encore un sujet à controverses. La présente contribution aborde les différents débats suscités par la pratique psychiatrique qui ont pris de multiples formes selon les différentes phases de son histoire: débats inhérents à sa légitimité et à sa fonction sociale, et débats remettant en cause sa scientificité et sa capacité à expliquer et à guérir les troubles mentaux.

ZOUITNI, KHADIJA* (Mohammed V University, Morocco)

L'Assistante Sociale Marocaine : Entre Rôle Manifeste Et Rôle Latent (cas des assistantes sociales du ministère de la Santé)

Malgré les programmes de couverture médicale tels que le RAMED (Régime d'Assistance Médicale aux Économiquement Démunis), le système de santé marocain fait toujours face à de nombreux défis notamment le manque d'accessibilité pour une grande partie de la population. En 2018, 38 % de la population marocaine ne disposait pas d'une couverture médicale, une situation exacerbée par la crise sanitaire de la COVID-19.[1]

Tout cela explique l'augmentation notable du nombre des usagers des services sociaux et le recours de plus en plus croissant aux prestations des assistantes sociales du ministère de la Santé. Ces dernières exercent un métier aux multiples facettes, elles prennent en charge un public varié (suivi des malades diabétiques, tuberculeux, séropositifs, enfants maltraités ou abandonnés, mères célibataires, personnes âgées, les sans domicile fixe...). Leurs champs d'intervention sont très diversifiés (hôpitaux, centres de santé, crèches, maisons d'arrêt, associations, entreprises...).

À travers des entretiens semi-directifs, cette contribution tend à explorer les opinions et les perceptions des assistantes sociales, relevant du ministère de la Santé, à l'égard de leur rôle, dans ce contexte de manque de moyens, de la faiblesse du dispositif d'aide sociale et du nombre croissant des personnes en difficultés. L'analyse de ces entretiens sera faite à la lumière de la théorie du rôle social de Talcott Parsons et de Robert Merton.

Epistemic Alterity and Buen Vivir: Narratives of Resistance from Latin America

This presentation explores the paradigm of "Buen Vivir" (Good Living), rooted in the traditional knowledge of Indigenous Peoples, which seeks well-being through respect for cultural and environmental diversity, as well as equality and solidarity. "Buen Vivir" offers a profound political and pedagogical vision that disrupts the prevailing logics of profit, commodification, and environmental degradation. Grounded in a holistic worldview, this paradigm emphasizes respect for nature and all living beings, advocating for a way of life that is spiritually connected, ecologically balanced, and community-centered. Indigenous knowledge presents a radical alternative to exploitative systems by recognizing nature as a living entity, entitled to rights, and even capable of legal representation. According to this point of view, the purpose of humans is to develop a spiritual and profound relationship of respect and reciprocity with the environment, based on exchange and care.

While official educational policies in Latin America still fail to respond to the needs and aspirations of Indigenous Peoples, this paper argues that incorporating the principles of "Buen Vivir" into formal education could not only foster critical thinking, but also challenge the established power structures, and disrupt the systemic inequalities that persist within the status quo. But this knowledge has been invisibilized by the hegemony of a western-centric perspective that continues to belittle the epistemic alterity of non-european peoples. We believe that education can play a central role in advancing a diversity of cultures and epistemologies and, at the same time, break with the uniform, homogenizing and colonialist traditions still prevalent in the region.

ZUCCOLO, FRANCESCO* (University of Padova, Italy)

Mapping Discourses of Shared Micromobility Practices and Devices within the Italian Press.

Bikes, cargo bikes, e-bikes and e-scooters are essential to our daily (im)mobilities, shaping narratives that define urban spaces as either liveable – safe, clean, decent, and zero-emission – or not. This paper investigates the newspaper media representation of urban shared micromobility practices and devices in Italy from 2010 to the present.

Micromobility encompasses human-powered and motor-assisted lightweight vehicles (max. 350 kg) operating at low speeds (max. 45 km/h), with fixed or free-floating parking, designed for short distances. We are witnessing the rise of individualized but shared services that leverage geolocation and on-demand travel through smartphone apps (Behrendt et al. 2023). These vehicles are becoming cultural and high-tech objects that promote municipalities' sustainable mobility plans (Boréus et al. 2024).

They are at the centre of vibrant debates regarding regulation, design, nudges, and the planning of urban spaces that accommodate these devices. While they provide mobility services to many, they also impose usage limits based on infrastructure accessibility, device design, gender, age, and occupation. Shared micromobility involves advanced technology, service creators, and (non-)users, along with discourses that shape secure and environmentally friendly everyday urban landscapes.

I will discuss the outcomes of a thematic and discursive analysis of Italian newspaper articles on this subject from the TIPS database (Giardullo & Lorenzet 2016), which is part of my PhD project at the University of Padua.

BRATCHFORD, GARY (Birmingham City University, United Kingdom)

Generating AI Images: Prompting and Human- Machine Imagination

In this presentation we examine visual generative media, mapping how, as visual sociologists, we can begin to better understand the different sociotechnical practices such tech can afford us as social scientists.

AI has penetrated our lives and visual production long before this breakthrough moment where we now 'see it'. AI has long been a part of many mobile phones with camera features and apps like Shazam. From the micro analysis of AI in our pockets to macro-discussions around the use of AI in political misinformation and the economic phenomenon of "digital sweatshops" across the global South the necessity to understand the social implications AI in sociological terms is yet to be fully defined.

While there is a growing body of literature on algorithmization of society (Airolidi, 2024), critical dataset studies (Thylstrup, 2022) and critical AI studies (Lindner, 2024) we argue that with exceptions of a few recent studies (Laba, 2024, Smits, 2024) the visual sociological discussion of AI and visual sphere is still lagging behind.

As a set of technologies AI is positioned at a critical frontier of human-machine interaction, where multiple ethical issues, issue of aesthetics and creative work arise. As we go we raise the following questions: How much time will it take the machine to learn the culturally specific images given the diversity of humankind? While it is becoming evident that AI will augment and inspire creativity – what kind of human-machine creativity it may be?

Based on autoethnographies and interviews with artists and graphic designers who use different AI visual generative media (ChatGPT and Midjourney) we reflect on how text-image dynamics of prompting unfolds during the image manufacturing or co-imagination. We use various instances of AI "hallucinations" to discuss the way machines learn "to see" to predict and to surprise us with the visual outputs.

Industrial Heritage in Macau: Reinventing the Site of the Iec Long Firecracker Factory

Macau is a Special Administrative Region (SAR) located in the south of the People's Republic of China (PRC). Over the centuries as a maritime city Macau saw its fortunes coming as trade boomed in the 16-17 th centuries, however with the establishment of Hong Kong as a port city the importance of Macau decreased. The authorities resorted to gaming and tourism as key sources of tax revenues, however manufacturing continued in Macau until very recently and consisted of textile manufacturing, matchsticks, incense, firecracker production and ship-building.

From the 1930s to 1980s firecracker manufacturing was a large-scale labour intensive industry and involved whole families including children working at home and in the streets. Firecracker manufacturing was a dangerous business, accidents frequently happened and people including children got killed (Kin, 2015) making the current tourist site a part of "difficult heritage" (Nelson, 2019) with traumatic content, a site strikingly different from the surrounding landscape aimed to induce fun, relaxation and festive sociality.

As gaming boomed in Macau in the 2000s, it became the Las Vegas of Asia. During the pandemic gaming revenues declined and the Macau authorities decided to diversify its offer of tourist attractions. Two new attractions were developed to help reposition Macau as a city with a rich cultural history. The two new sites that opened in 2023 were the long abandoned Iec Long firecracker factory and Lai Chi Yun shipyards . Both sites narrate different stories about Macau and its past, thus connecting the visitors with the past in the present. In this paper we use ethnographic data as well as visual analysis of the site to provide a "thick description" of Iec Long firecracker factory and reflect on the cultural and political significance of the industrial memories of hard labour in the recent urban revitalization plan.

ÖKTEM, UBEYD (Bilgi University Economics Department, Turkey)

Evolving Concerns and Shifting Priorities: Youth Perspectives in Türkiye's Dynamic Economic Landscape

In the neoliberal era, technological advancements and evolving economic dynamics—such as the rise of the gig economy, the widespread adoption of remote work following COVID-19, and the proliferation of automation and artificial intelligence—have reshaped the economic landscape for young adults. These developments have introduced instability in job security, raised questions about essential work benefits, and challenged workers' rights, particularly affecting newcomers to the labor market. Extensive research has examined macroeconomic transformations, such as higher unemployment and increasing layoffs in the private sector, as well as organizational changes in work relations, including precarious work conditions, increased reliance on temporary and contract-based employment, and flexible work arrangements. Furthermore, the psychological impacts of these changing dynamics, including work stress, anxiety, and burnout, have been explored. However, a gap remains in the sociological literature regarding how these shifts influence personal and societal priorities.

This study seeks to investigate how concerns about future conditions—such as job insecurity and the capacity to provide quality education for one's children—reshape the perceived importance of family, friends, leisure time, politics, work, and religion among the youth. Utilizing both quantitative and computational methodologies, this research will provide a comprehensive analysis of the evolving priorities among young adults in Türkiye. Specifically, we will employ regression analysis on data from the last two waves of the World Values Survey (2010-2014, 2017-2022) and conduct sentiment analysis on Twitter data (2019-2024) to examine how these key concepts fluctuate over time in the lives of young people. Drawing on existing literature, we hypothesize that, within the dichotomies of leisure versus work, friends versus family, and politics versus religion, there will be a greater emphasis on leisure, friends, and politics. The results from both methodological approaches will be compared to evaluate our hypotheses about the changing priorities of young people entering adulthood in Türkiye.

RC11-160.3

ZULUETA, JOHANNA* (Toyo University, Japan)

Exploring Social Well-Being Among Older Migrants in Rural and Semi-Rural Areas of South Korea

Korea is currently one of the fastest ageing societies in the world, coupled with a very low fertility rate. As the country is facing these realities, the Korean government has implemented various institutional measures to address this social phenomenon. Along with the ageing of Korea's population is the ageing of its long-term foreign residents, many of which have lived most of their adult lives in the country, have families of their own, and see themselves staying longer in their adopted country.

This study examines the experiences of migrants in Korea as they reach their older years. In particular, this research focuses on women from the Philippines who arrived in Korea beginning in the early 1990s, and are currently living in the country's rural and/or semi-rural areas. Most of these women came to Korea as marriage migrants to Korean men living in these regions. Based on qualitative data gathered through interviews and fieldwork in selected areas in Chungcheongnam-do, Jeollabuk-do, and Gyeonggi-do in 2023-2024, this study analyzes ageing, migration, and social well-being from feminist and transnational perspectives. Specifically, this study explores these migrants' perceptions of their ageing process outside their countries of birth, as it relates to their own perceptions on social well-being—particularly its social and cultural aspects—as long-term migrants in Korea. It is argued here that the ageing experience of migration is gendered and intertwined with one's own cultural and social capital. In addition, language and communication, one's status of residence, citizenship, spirituality and religion, and the presence or absence of family are also deemed significant. This study aims to shed light on the challenges that older female migrants in Korea are facing as they navigate their own ageing along with societal changes in their host country.

Older Female Migrants and Transnational Care Circulation: Examining the Case of Migrants in Malaysia

How do older female migrant workers engage in transnational care circulation when faced with the uncertainties of remaining in the country of work? In what ways do these older women migrants negotiate their desire to go home "for good" with the responsibility of caring for their family in the homeland? This study looks at older Filipino migrant women in Malaysia, one of the largest Southeast Asian groups in the country, who mostly work as domestic helpers. Most of these women have been employed by the same employer for a long period of time, thus enabling them to continue working through their late 50s to 60s. Based on semi-structured interviews conducted in Kuala Lumpur and Petaling Jaya in March and August 2018, as well as follow-up conversations through messaging applications such as WhatsApp and Facebook Messenger, this study looks at these women's experiences of ageing, which is thought of as a socio-cultural process that is not only tied to one's physical body, but is also linked to several factors such as gender, social class, as well as societal expectations on their familial roles. This study argues that the performance of care among these women migrants is seen to be more possible when it is done from a distance, where these older migrants can carry out their dual roles as breadwinners and nurturers for family and kin back in the homeland. While many of these older migrants hope to go back to their homeland "for good" soon, doing so prematurely would cause a break in the circulation of care between the migrant and her family, thus disrupting existing intergenerational relationships. This study hopes to contribute to existing literature on migration, transnational ageing, care, and transnational families by analyzing this specific Asian case.

Public Opinion As an Indicator of the Success of the Social Contract

The stable functioning of a democratic system is impossible without a well-established contractual system between the state and citizens. Contractual relations regulate important aspects such as political participation, influence of population on political and administrative decisions, implementation of rights and freedoms of citizens. In context of globalization, technological changes and social transformations, the social contract must be able to respond to new challenges and needs of society. The successful functioning of democratic institutions depends on internal consistency and adaptability of the social contract and its ability to integrate global trends and ensure sustainable development of society in a rapidly changing world as well.

This raises important question: how effective is the contractual system in European countries in maintaining the stability of state institutions and to what extent does it correspond to modern social transformations? One of the adaptation tools may be revision of legislative and political mechanisms, the strengthening of civil society institutions, and introduction of innovations.

In modern democracies, emphasis shifts to ensuring individual rights and freedoms, as well as recognizing the uniqueness and dignity of each person. This reflects a more complex understanding of the social contract, where state institutions must take into account not only collective interests, but also protect and support the rights of each citizen as part of a broader social mass. Modern approaches emphasize the need to integrate diverse interests and needs, thereby ensuring a more just society. In this context, the state becomes not just an arbitrator, but also an active defender of individual rights, promoting harmonious interaction between the individual and society.

Analysis of indicators collected by the regular Eurobarometer survey helps to assess the effectiveness of the existing European public administration system and identify opportunities for its optimization in the context of the demand for an update of the social contract.

"I'll Have Raincoats and Gas Masks with Me, Just in Case" – a Case Study of Youth Engagement in the Protest Against the "Foreign Agents Law" in Georgia

Since the controversial draft law on Foreign Agents was reintroduced by the ruling party in March 2024, the streets of the capital of Georgia, have been filled with continuous mass protests. What began as a protest against the law quickly evolved into a movement for the defense of the country's democracy

and European integration process. The new generation, often referred to as Gen Z, formed the core of these demonstrations, shaping a new ethos for the movement based on self-organization, distinctly civic values, empathy, and solidarity. The protests became a form of learning process, where young people developed new practices of solidarity that had previously been unknown in protest culture in Georgia. During police crackdowns, protesters took care of each other; provided accommodation for participants coming from different regions of Georgia; and cared for stray dogs around the protest area. We witnessed a breaking down of almost every form of social distance. A unique form of transgressive solidarity was displayed on Easter night when religious and non-religious protesters—representatives of different religions—celebrated the holiday together at the protest site.

Gen Z brought strong visual elements to the movement, characterized by spontaneous and flexible actions, as well as the distinct language typical of their generation. The slogans, memes, caricatures, TikTok quotes, references to national epics, colorful raincoats, the flags of Georgia and the European Union, and creatively stencils became the visual representation of the protest's ethos. This presentation aims to offer a sociological analysis of the intersection between the protest, generation, and new forms of solidarity during the protests of spring 2024 in Georgia. It explores how values, as well as global and local cultural traits, were reflected in this movement and examines the role that visual and performative methods played in the engagement of young people.

Life Story in Dialogue with History and Society -Religious Transformation of a Georgian Muslim Women in Adjara

Exploring religion through the practices and narratives of Georgian Muslims allows me to observe how stories are shaped by the religious and secular contexts in which people live. One of my main findings, that Islam here is invisible is caused by socially constructed stories. In a country where Christianity is the dominant religion and a marker of national identity, the adherence to Islam by Adjarians is often seen by society as a betrayal of the "traditional religion." Following Georgia's independence and during the resurgence of religious sentiments, some Adjarians converted to Christianity. This process of religious transformation is closely tied to issues of nationalism, historical trauma, and collective memory. From the beginning of my research on religion in Adjara, it became clear that this study could not solely reflect on Islamic identity. A personal tale was a story of a whole people and a history of political and religious changes in Georgia. When Leila shared her story—how her daughter was baptized as a Christian, how she was also urged to convert, how she grappled with this decision while thinking of her Muslim father, her religious experience, and the prevalent societal attitudes—I realized that this was a life story in dialogue with history. Leila's narrative convinced me that the biographical method was the most effective approach for understanding her lived religious practice - a commitment to both Christian and Islamic traditions, interwoven with elements of folk beliefs. This method allowed us to see her story as a dialectical process between structure and agency. The presentation will feature the life story of a woman, vividly illustrating how people "produce" a biography within particular cultural contexts and social situations. Studying Muslims and their life stories in Adjara highlights how powerful biographical approaches can be in understanding everyday lives.

The Transformative Power of Land Art: Insights from the Field Research

This paper aims to explore the peculiarities of research of Land Art from the perspective of visual sociology. This paper focuses on the transformative role of Land Art in social contexts. As socio-cultural changes unfold, artists encounter new expressive opportunities, with Land Art contributing to diverse aesthetic perspectives and fostering social transformation and identity development.

This paper examines contemporary land art dynamics and origins, highlighting cultural heritage codes reflected in artworks, intertwined with existential symbols, values, national specificity, and religious elements. It also investigates the intricate relationships between local memory, national identity, architectural artifacts, and landscape uniqueness, positioning land art as a sociological study bridging arts, social forms, and cultural transformations.

The visual language of contemporary Land Art incorporates interdisciplinary spatial objects, acting as a catalyst for urban art development. These works

organically integrate into natural landscapes, utilizing local materials and features. Emerging in the 20th century as a social movement, Land Art influenced postmodern art movements, evolving from conceptual and environmental activities to tangible art forms, marking a significant shift in artistic expression.

The interdisciplinary nature of this research draws on cultural studies, art history, heritage conservation, ecology, and anthropology to investigate the intersection of environmental art with socio-cultural identities and societal transformations.

By presenting creative interpretations of visual research and activist projects rooted in land art, this paper contributes to the discourse on public art's role in societal change and environmental awareness. The findings aim to inspire new perspectives on visual media as dynamic tools for expression, reflection, and public engagement in sociocultural transformation and identity studies.
